DDS_DataRepresentationQosPolicy (p. 1639)	**value** (p. 1640)
	<<***spec***>> *(p. 791)* Sequence of representation identifiers.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**kind** (p. 2083)
	<<***spec***>> *(p. 791)* Type consistency kind.

DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_sequence_bounds** (p. 2083)
	<<***spec***>> *(p. 791)* Controls whether sequence bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_string_bounds** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether string bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_member_names** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether member names are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**prevent_type_widening** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether type widening is allowed.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**force_type_validation** (p. 2085)
	<<***spec***>> *(p. 791)* Controls whether type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_Data↩ Reader** (p. 618).
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_enum_literal_names** (p. 2085)
	<<***spec***>> *(p. 791)* Controls whether enumeration constant names are taken into consideration for type assignability.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_code_max_serialized_length** (p. 1751)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Maximum size of serialized string for type code.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_object_max_serialized_length** (p. 1751)
	<<***extension***>> *(p. 796)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_object_max_deserialized_length** (p. 1753)
	<<***extension***>> *(p. 796)* The maximum number of bytes that a deserialized TypeObject v1 can consume.

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**deserialized_type_object_dynamic_allocation_↩ threshold** (p. 1753)
	<<***extension***>> *(p. 796)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**serialized_type_object_dynamic_allocation_↩ threshold** (p. 1752)
	<<***extension***>> *(p. 796)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**endpoint_type_object_lb_serialization_threshold** (p. 1713)
	<<***extension***>> *(p. 796)* Controls when/if the Type↩ Object v1 is compressed when propagated in Simple Endpoint Discovery.

5.77 QoS Mutability

Some QoS are mutable after an entity is enabled, and others are not.

Modules

- **Immutable QoS**

  This page lists all QoS that are immutable after an entity has been enabled.
- **Mutable QoS**

  This page lists all QoS that are always mutable.

5.77.1 Detailed Description

Some QoS are mutable after an entity is enabled, and others are not.

5.78 Immutable QoS

This page lists all QoS that are immutable after an entity has been enabled.

This page lists all QoS that are immutable after an entity has been enabled.

QoS fall into one of three mutability categories:

- Always mutable, wheter an entity is enabled or not (see **Mutable QoS** (p. 952)).
- Immutable after entity creation.
- *Mutable* after creation but *immutable* after an entity is enabled.

The QoS that fall into the second two categories are listed on this page.

Basic Settings

DDS_DurabilityQosPolicy (p. 1762)	**kind** (p. 1765)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The kind of durability.
DDS_DurabilityQosPolicy (p. 1762)	**writer_depth** (p. 1765)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Indicates the number of samples per instance that a durable **DDS_DataWriter** (p. 488) will send to a late-joining **DDS_DataReader** (p. 618).
DDS_DataRepresentationQosPolicy (p. 1639)	**compression_settings** (p. 1640)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Structure that contains the compression settings.
DDS_OwnershipQosPolicy (p. 1867)	**kind** (p. 1871)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The kind of ownership
DDS_LivelinessQosPolicy (p. 1826)	**kind** (p. 1828)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The kind of liveliness desired.
DDS_LivelinessQosPolicy (p. 1826)	**lease_duration** (p. 1828)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The duration within which a **DDS_DataWriter** (p. 488) must be asserted, or else it is assumed to be not alive.
DDS_LivelinessQosPolicy (p. 1826)	**assertions_per_lease_duration** (p. 1829)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* The number of assertions a **DDS_DataWriter** (p. 488) will send during a its **DDS_LivelinessQosPolicy::lease_duration** (p. 1828).
DDS_ReliabilityQosPolicy (p. 1940)	**kind** (p. 1943)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Kind of reliability.
DDS_ReliabilityQosPolicy (p. 1940)	**max_blocking_time** (p. 1943)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The maximum time a DataWriter can block on a write() call.
DDS_DestinationOrderQosPolicy (p. 1688)	**kind** (p. 1690)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Specifies the desired kind of destination order.
DDS_HistoryQosPolicy (p. 1808)	**kind** (p. 1810)

	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* Specifies the kind of history to be kept.
DDS_HistoryQosPolicy (p. 1808)	**depth** (p. 1810)
	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* Specifies the number of samples per instance to be kept, when the `kind` is **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295)
DDS_ResourceLimitsQosPolicy (p. 1953)	**max_samples** (p. 1956)
	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* Represents the maximum samples the middleware can store for any one **DDS_DataWriter** (p. 488) (or **DDS_DataReader** (p. 618)).
DDS_ResourceLimitsQosPolicy (p. 1953)	**max_instances** (p. 1956)
	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* Represents the maximum number of instances a **DDS_DataWriter** (p. 488) (or **DDS_DataReader** (p. 618)) can manage.
DDS_ResourceLimitsQosPolicy (p. 1953)	**initial_samples** (p. 1957)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Represents the initial samples the middleware will store for any one **DDS_DataWriter** (p. 488) (or **DDS_DataReader** (p. 618)).
DDS_ResourceLimitsQosPolicy (p. 1953)	**initial_instances** (p. 1957)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Represents the initial number of instances a **DDS_DataWriter** (p. 488) (or **DDS_DataReader** (p. 618)) will manage.
DDS_PublishModeQosPolicy (p. 1924)	**kind** (p. 1926)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Publishing mode
DDS_WireProtocolQosPolicy (p. 2099)	**participant_id** (p. 2103)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* A value used to distinguish among different participants belonging to the same domain on the same host.
DDS_TransportBuiltinQosPolicy (p. 2057)	**mask** (p. 2058)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Specifies the built-in transports that are registered automatically when the **DDS_DomainParticipant** (p. 76) is enabled.
DDS_TransportMulticastQosPolicy (p. 2064)	**value** (p. 2065)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* A sequence of multicast communications settings.
DDS_DiscoveryQosPolicy (p. 1717)	**initial_peers** (p. 1719)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

DDS_DiscoveryQosPolicy (p. 1717)	**multicast_receive_addresses** (p. 1719)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the DomainParticipant.
DDS_DiscoveryQosPolicy (p. 1717)	**accept_unknown_peers** (p. 1720)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* Whether to accept a new participant that is not in the initial peers list.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_liveliness_lease_duration** (p. 1694)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The liveliness lease duration for the participant.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_liveliness_assert_period** (p. 1694)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The period to assert liveliness for the participant.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_announcement_period** (p. 1694)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).
DDS_DiscoveryConfigQosPolicy (p. 1691)	**initial_participant_announcements** (p. 1696)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The number of initial announcements sent when a participant is first enabled.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**new_remote_participant_announcements** (p. 1696)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The number of participant announcements sent when a remote participant is newly discovered.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**min_initial_participant_announcement_period** (p. 1697)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**max_initial_participant_announcement_period** (p. 1697)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**heartbeat_period** (p. 1968)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* The period at which to send heartbeats.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**fast_heartbeat_period** (p. 1968)
	*<<**basic**>>* (p. *784)* *<<**extension**>>* (p. *796)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

DDS_RtpsReliableWriterProtocol_t (p. 1965)	**late_joiner_heartbeat_period** (p. 1969)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**min_send_window_size** (p. 1978)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Minimum size of send window of unacknowledged samples
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**max_send_window_size** (p. 1978)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Maximum size of send window of unacknowledged samples
DDS_EntityNameQosPolicy (p. 1793)	**name** (p. 1793)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* The name of the entity.
DDS_BatchQosPolicy (p. 1552)	**enable** (p. 1552)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Specifies whether or not batching is enabled.
DDS_BatchQosPolicy (p. 1552)	**max_data_bytes** (p. 1553)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* The maximum cumulative length of all serialized samples in a batch.
DDS_BatchQosPolicy (p. 1552)	**max_samples** (p. 1553)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* The maximum number of samples in a batch.
DDS_ProfileQosPolicy (p. 1902)	**string_profile** (p. 1903)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Sequence of strings containing a XML document to load.
DDS_ProfileQosPolicy (p. 1902)	**url_profile** (p. 1903)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Sequence of **URL groups** (p. 975) containing a set of XML documents to load.
DDS_ProfileQosPolicy (p. 1902)	**ignore_user_profile** (p. 1903)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Ignores the file USER_QOS_PROFILES.xml in the current working directory.
DDS_ProfileQosPolicy (p. 1902)	**ignore_environment_profile** (p. 1903)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Ignores the value of the **NDDS_QOS_PROFILES** (p. 976).
DDS_ProfileQosPolicy (p. 1902)	**ignore_resource_profile** (p. 1904)

	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Ignores the file NDDS_QOS_PROFILES.xml.
DDS_TopicQueryDispatchQosPolicy (p. 2053)	**publication_period** (p. 2054)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Sets the periodic interval at which samples are published.

Advanced Settings

DDS_AvailabilityQosPolicy (p. 1547)	**enable_required_subscriptions** (p. 1550)
	*<<**extension**>> (p. 796)* Enables support for required subscriptions in a **DDS_DataWriter** (p. 488)
DDS_DurabilityQosPolicy (p. 1762)	**direct_communication** (p. 1765)
	*<<**extension**>> (p. 796)* Indicates whether or not a TRANSIENT or PERSISTENT **DDS_DataReader** (p. 618) should receive samples directly from a TRANSIENT or PERSISTENT **DDS_DataWriter** (p. 488)
DDS_DurabilityQosPolicy (p. 1762)	**storage_settings** (p. 1766)
	*<<**extension**>> (p. 796)* Configures durable writer history and durable reader state.
DDS_PersistentStorageSettings (p. 1887)	**enable** (p. 1889)
	*<<**extension**>> (p. 796)* Enables durable writer history in a **DDS_DataWriter** (p. 488) and durable reader state in a **DDS_DataReader** (p. 618).
DDS_PersistentStorageSettings (p. 1887)	**file_name** (p. 1889)
	*<<**extension**>> (p. 796)* The file name where the durable writer history or durable reader state will be stored.
DDS_PersistentStorageSettings (p. 1887)	**trace_file_name** (p. 1889)
	*<<**extension**>> (p. 796)* The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
DDS_PersistentStorageSettings (p. 1887)	**journal_kind** (p. 1890)
	*<<**extension**>> (p. 796)* Sets the journal mode of the persistent storage.
DDS_PersistentStorageSettings (p. 1887)	**synchronization_kind** (p. 1890)
	*<<**extension**>> (p. 796)* Sets the level of synchronization with the physical disk.
DDS_PersistentStorageSettings (p. 1887)	**vacuum** (p. 1890)

	<<***extension***>> *(p. 796)* Sets the auto-vacuum status of the storage.
DDS_PersistentStorageSettings (p. 1887)	**restore** (p. 1891)
	<<***extension***>> *(p. 796)* Indicates if the persisted writer history or reader state must be restored.
DDS_PersistentStorageSettings (p. 1887)	**writer_instance_cache_allocation** (p. 1891)
	<<***extension***>> *(p. 796)* Configures the resource limits associated with the instance durable writer history cache.
DDS_PersistentStorageSettings (p. 1887)	**writer_sample_cache_allocation** (p. 1892)
	<<***extension***>> *(p. 796)* Configures the resource limits associated with the sample durable writer history cache.
DDS_PersistentStorageSettings (p. 1887)	**writer_memory_state** (p. 1893)
	<<***extension***>> *(p. 796)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
DDS_PersistentStorageSettings (p. 1887)	**reader_checkpoint_frequency** (p. 1893)
	<<***extension***>> *(p. 796)* Controls how often the reader state is stored into the database.
DDS_DurabilityServiceQosPolicy (p. 1767)	**service_cleanup_delay** (p. 1768)
	<<***spec***>> *(p. 791)* Controls when the service is able to remove all information regarding a data instances.
DDS_DurabilityServiceQosPolicy (p. 1767)	**history_kind** (p. 1768)
	<<***spec***>> *(p. 791)* The kind of history to apply in recouping durable data.
DDS_DurabilityServiceQosPolicy (p. 1767)	**history_depth** (p. 1768)
	<<***spec***>> *(p. 791)* Setting to use for the **DDS_DurabilityQosPolicy::writer_depth** (p. 1765) when recouping durable data.
DDS_DurabilityServiceQosPolicy (p. 1767)	**max_samples** (p. 1769)
	<<***spec***>> *(p. 791)* Part of resource limits QoS policy to apply when feeding a late joiner.
DDS_DurabilityServiceQosPolicy (p. 1767)	**max_instances** (p. 1769)
	<<***spec***>> *(p. 791)* Part of resource limits QoS policy to apply when feeding a late joiner.
DDS_DurabilityServiceQosPolicy (p. 1767)	**max_samples_per_instance** (p. 1769)
	<<***spec***>> *(p. 791)* Part of resource limits QoS policy to apply when feeding a late joiner.

DDS_CompressionSettings_t (p. 1568)	**compression_ids** (p. 1568)
	<<***extension***>> *(p. 796)* Mask that represents the compression algorithms enabled.
DDS_CompressionSettings_t (p. 1568)	**writer_compression_level** (p. 1569)
	<<***extension***>> *(p. 796)* The level of compression to use when compressing data.
DDS_CompressionSettings_t (p. 1568)	**writer_compression_threshold** (p. 1569)
	<<***extension***>> *(p. 796)* The threshold, in bytes, above which a serialized sample will be eligible to be compressed.
DDS_DataRepresentationQosPolicy (p. 1639)	**value** (p. 1640)
	<<***spec***>> *(p. 791)* Sequence of representation identifiers.
DDS_PresentationQosPolicy (p. 1894)	**access_scope** (p. 1897)
	<<***spec***>> *(p. 791)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
DDS_PresentationQosPolicy (p. 1894)	**coherent_access** (p. 1897)
	<<***spec***>> *(p. 791)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
DDS_PresentationQosPolicy (p. 1894)	**ordered_access** (p. 1897)
	<<***spec***>> *(p. 791)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
DDS_PresentationQosPolicy (p. 1894)	**drop_incomplete_coherent_set** (p. 1898)
	<<***extension***>> *(p. 796)* Indicates whether or not a **DDS_DataReader** (p. 618) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.
DDS_ReliabilityQosPolicy (p. 1940)	**acknowledgment_kind** (p. 1943)
	<<***extension***>> *(p. 796)* Kind of reliable acknowledgment
DDS_ReliabilityQosPolicy (p. 1940)	**instance_state_consistency_kind** (p. 1944)
	<<***extension***>> *(p. 796)* Whether instance state consistency is enabled
DDS_ReliabilityQosPolicy (p. 1940)	**exact_reliability_kind_match** (p. 1944)

	<<***extension***>> *(*p. *796)* Whether an exact reliability kind match is required for endpoint matching.
DDS_DestinationOrderQosPolicy (p. 1688)	**scope** (p. 1690)
	<<***spec***>> *(*p. *791)* Specifies the desired scope of the source destination order.
DDS_DestinationOrderQosPolicy (p. 1688)	**source_timestamp_tolerance** (p. 1690)
	<<***extension***>> *(*p. *796)* Allowed tolerance between source timestamps of consecutive samples.
DDS_ResourceLimitsQosPolicy (p. 1953)	**max_samples_per_instance** (p. 1956)
	<<***spec***>> *(*p. *791)* Represents the maximum number of samples of any one instance a **DDS_DataWriter** (p. 488) (or **DDS_DataReader** (p. 618)) can manage.
DDS_ResourceLimitsQosPolicy (p. 1953)	**instance_hash_buckets** (p. 1958)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Number of hash buckets for instances.
DDS_TransportPriorityQosPolicy (p. 2068)	**value** (p. 2070)
	<<***spec***>> *(*p. *791)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.
DDS_TypeSupportQosPolicy (p. 2087)	**plugin_data** (p. 2088)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Value to pass into the type plugin's de-/serialization function
DDS_TypeSupportQosPolicy (p. 2087)	**cdr_padding_kind** (p. 2088)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Determines whether or not the padding bytes will be set to zero during CDR serialization.
DDS_PublishModeQosPolicy (p. 1924)	**flow_controller_name** (p. 1926)
	<<***extension***>> *(*p. *796)* Name of the associated flow controller
DDS_PublishModeQosPolicy (p. 1924)	**priority** (p. 1928)
	<<***extension***>> *(*p. *796)* Publication priority
DDS_AsynchronousPublisherQosPolicy (p. 1539)	**disable_asynchronous_write** (p. 1540)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Disable asynchronous publishing.
DDS_AsynchronousPublisherQosPolicy (p. 1539)	**thread** (p. 1540)
	<<***extension***>> *(*p. *796)* Settings of the publishing thread.
DDS_AsynchronousPublisherQosPolicy (p. 1539)	**disable_asynchronous_batch** (p. 1541)

	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Disable asynchronous batch flushing.
DDS_AsynchronousPublisherQosPolicy (p. 1539)	**asynchronous_batch_thread** (p. 1541)
	<<***extension***>> *(p. 796)* Settings of the batch flushing thread.
DDS_AsynchronousPublisherQosPolicy (p. 1539)	**disable_topic_query_publication** (p. 1542)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Disable topic query publication.
DDS_AsynchronousPublisherQosPolicy (p. 1539)	**topic_query_publication_thread** (p. 1542)
	<<***extension***>> *(p. 796)* Settings of the **DDS_Topic↩ Query** (p. 708) publication thread.
DDS_WriterDataLifecycleQosPolicy (p. 2112)	**autodispose_unregistered_instances** (p. 2113)
	<<***spec***>> *(p. 791)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **DDS_DataWriter** (p. 488) unregisters from the instance by means of the unregister operations.
DDS_WriterDataLifecycleQosPolicy (p. 2112)	**autopurge_unregistered_instances_delay** (p. 2113)
	<<***extension***>> *(p. 796)* Maximum duration for which the **DDS_DataWriter** (p. 488) will maintain information regarding an instance once it has unregistered the instance.
DDS_WriterDataLifecycleQosPolicy (p. 2112)	**autopurge_disposed_instances_delay** (p. 2114)
	<<***extension***>> *(p. 796)* Maximum duration for which the **DDS_DataWriter** (p. 488) will maintain information regarding an instance once it has disposed the instance.
DDS_ReaderDataLifecycleQosPolicy (p. 1934)	**autopurge_nowriter_samples_delay** (p. 1936)
	<<***spec***>> *(p. 791)* Minimum duration for which the **DDS_DataReader** (p. 618) will maintain samples for an instance once its `instance_state` becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716).
DDS_ReaderDataLifecycleQosPolicy (p. 1934)	**autopurge_disposed_samples_delay** (p. 1936)
	<<***spec***>> *(p. 791)* Minimum duration for which the **DDS_DataReader** (p. 618) will maintain samples for an instance once its `instance_state` becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_↩ STATE** (p. 716).
DDS_ReaderDataLifecycleQosPolicy (p. 1934)	**autopurge_disposed_instances_delay** (p. 1936)

	<<***extension***>> *(*p. *796)* Minimum duration for which the **DDS_DataReader** (p. 618) will maintain information about a received instance once its `instance_state` becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE↩ _STATE** (p. 716) and there are no samples for the instance in the DataReader queue.
DDS_ReaderDataLifecycleQosPolicy (p. 1934)	**autopurge_nowriter_instances_delay** (p. 1937)
	<<***extension***>> *(*p. *796)* Minimum duration for which the **DDS_DataReader** (p. 618) will maintain information about a received instance once its `instance_↩ state` becomes **DDS_NOT_ALIVE_NO_WRITERS↩ _INSTANCE_STATE** (p. 716) and there are no samples for the instance in the DataReader queue.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**kind** (p. 2083)
	<<***spec***>> *(*p. *791)* Type consistency kind.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_sequence_bounds** (p. 2083)
	<<***spec***>> *(*p. *791)* Controls whether sequence bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_string_bounds** (p. 2084)
	<<***spec***>> *(*p. *791)* Controls whether string bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_member_names** (p. 2084)
	<<***spec***>> *(*p. *791)* Controls whether member names are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**prevent_type_widening** (p. 2084)
	<<***spec***>> *(*p. *791)* Controls whether type widening is allowed.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**force_type_validation** (p. 2085)
	<<***spec***>> *(*p. *791)* Controls whether type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_Data↩ Reader** (p. 618).
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_enum_literal_names** (p. 2085)

	<<***spec***>> *(p. 791)* Controls whether enumeration constant names are taken into consideration for type assignability.
DDS_WireProtocolQosPolicy (p. 2099)	**rtps_host_id** (p. 2103)
	<<***extension***>> *(p. 796)* The RTPS Host ID of the domain participant.
DDS_WireProtocolQosPolicy (p. 2099)	**rtps_app_id** (p. 2104)
	<<***extension***>> *(p. 796)* The RTPS App ID of the domain participant.
DDS_WireProtocolQosPolicy (p. 2099)	**rtps_instance_id** (p. 2104)
	<<***extension***>> *(p. 796)* The RTPS Instance ID of the **DDS_DomainParticipant** (p. 76).
DDS_WireProtocolQosPolicy (p. 2099)	**rtps_well_known_ports** (p. 2105)
	<<***extension***>> *(p. 796)* Configures the RTPS well-known port mappings.
DDS_WireProtocolQosPolicy (p. 2099)	**rtps_reserved_port_mask** (p. 2105)
	<<***extension***>> *(p. 796)* Specifies which well-known ports to reserve when enabling the participant.
DDS_WireProtocolQosPolicy (p. 2099)	**rtps_auto_id_kind** (p. 2106)
	<<***extension***>> *(p. 796)* Kind of auto mechanism used to calculate the GUID prefix.
DDS_WireProtocolQosPolicy (p. 2099)	**compute_crc** (p. 2106)
	<<***extension***>> *(p. 796)* Adds RTPS CRC submessage to every message when this field is set to **DDS_↩ BOOLEAN_TRUE** (p. 1203).
DDS_WireProtocolQosPolicy (p. 2099)	**check_crc** (p. 2106)
	<<***extension***>> *(p. 796)* Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to **DDS_BOOLEAN_TRUE** (p. 1203).
DDS_TransportSelectionQosPolicy (p. 2070)	**enabled_transports** (p. 2071)
	<<***extension***>> *(p. 796)* A sequence of transport aliases that specifies the transport instances available for use by the entity.
DDS_TransportUnicastQosPolicy (p. 2071)	**value** (p. 2073)
	<<***extension***>> *(p. 796)* A sequence of unicast communication settings.
DDS_TransportMulticastMappingQosPolicy (p. 2062)	**value** (p. 2064)

	<<***extension***>> *(*p. *796)* A sequence of multicast communication mappings.
DDS_TransportMulticastQosPolicy (p. 2064)	**kind** (p. 2065)
	<<***extension***>> *(*p. *796)* A value that specifies a way to determine how to obtain the multicast address.
DDS_DiscoveryQosPolicy (p. 1717)	**enabled_transports** (p. 1718)
	<<***extension***>> *(*p. *796)* The transports available for use by the Discovery mechanism.
DDS_DiscoveryQosPolicy (p. 1717)	**metatraffic_transport_priority** (p. 1720)
	<<***extension***>> *(*p. *796)* The transport priority to use for the Discovery meta-traffic.
DDS_DiscoveryQosPolicy (p. 1717)	**enable_endpoint_discovery** (p. 1721)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Whether to automatically enable endpoint discovery for all the remote participants.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_remote_writers** (p. 1621)
	<<***extension***>> *(*p. *796)* The maximum number of remote writers from which a **DDS_DataReader** (p. 618) may read, including all instances.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_remote_writers_per_instance** (p. 1622)
	<<***extension***>> *(*p. *796)* The maximum number of remote writers from which a **DDS_DataReader** (p. 618) may read a single instance.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_samples_per_remote_writer** (p. 1622)
	<<***extension***>> *(*p. *796)* The maximum number of out-of-order samples from a given remote **DDS_DataWriter** (p. 488) that a **DDS_DataReader** (p. 618) may store when maintaining a reliable connection to the **DDS_↩ DataWriter** (p. 488).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_infos** (p. 1623)
	<<***extension***>> *(*p. *796)* The maximum number of info units that a **DDS_DataReader** (p. 618) can use to store **DDS_SampleInfo** (p. 1990).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_remote_writers** (p. 1623)
	<<***extension***>> *(*p. *796)* The initial number of remote writers from which a **DDS_DataReader** (p. 618) may read, including all instances.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_remote_writers_per_instance** (p. 1624)
	<<***extension***>> *(*p. *796)* The initial number of remote writers from which a **DDS_DataReader** (p. 618) may read a single instance.

DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_infos** (p. 1624)
	<<***extension***>> *(p. 796)* The initial number of info units that a **DDS_DataReader** (p. 618) can have, which are used to store **DDS_SampleInfo** (p. 1990).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_outstanding_reads** (p. 1625)
	<<***extension***>> *(p. 796)* The initial number of outstanding calls to read/take (or one of their variants) on the same **DDS_DataReader** (p. 618) for which memory has not been returned by calling **FooDataReader_return_loan** (p. 649).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_outstanding_reads** (p. 1625)
	<<***extension***>> *(p. 796)* The maximum number of outstanding read/take calls (or one of their variants) on the same **DDS_DataReader** (p. 618) for which memory has not been returned by calling **FooDataReader_return_loan** (p. 649).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_samples_per_read** (p. 1625)
	<<***extension***>> *(p. 796)* The maximum number of data samples that the application can receive from the middleware in a single call to **FooDataReader_read** (p. 628) or **FooDataReader_take** (p. 629). If more data exists in the middleware, the application will need to issue multiple read/take calls.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**disable_fragmentation_support** (p. 1626)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Determines whether the **DDS_DataReader** (p. 618) can receive fragmented samples.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_fragmented_samples** (p. 1626)
	<<***extension***>> *(p. 796)* The maximum number of samples for which the **DDS_DataReader** (p. 618) may store fragments at a given point in time.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_fragmented_samples** (p. 1627)
	<<***extension***>> *(p. 796)* The initial number of samples for which a **DDS_DataReader** (p. 618) may store fragments.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_fragmented_samples_per_remote_writer** (p. 1627)
	<<***extension***>> *(p. 796)* The maximum number of samples per remote writer for which a **DDS_DataReader** (p. 618) may store fragments.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_fragments_per_sample** (p. 1628)

	<<***extension***>> *(*p. *796)* Maximum number of fragments for a single sample.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**dynamically_allocate_fragmented_samples** (p. 1628)
	<<***extension***>> *(*p. *796)* Determines whether the **DDS_DataReader** (p. 618) pre-allocates storage for storing fragmented samples.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_total_instances** (p. 1629)
	<<***extension***>> *(*p. *796)* Maximum number of instances for which a DataReader will keep state.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_remote_virtual_writers** (p. 1630)
	<<***extension***>> *(*p. *796)* The maximum number of remote virtual writers from which a **DDS_DataReader** (p. 618) may read, including all instances.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_remote_virtual_writers** (p. 1630)
	<<***extension***>> *(*p. *796)* The initial number of remote virtual writers from which a **DDS_DataReader** (p. 618) may read, including all instances.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_remote_virtual_writers_per_instance** (p. 1631)
	<<***extension***>> *(*p. *796)* The maximum number of virtual remote writers that can be associated with an instance.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_remote_virtual_writers_per_instance** (p. 1631)
	<<***extension***>> *(*p. *796)* The initial number of virtual remote writers per instance.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_remote_writers_per_sample** (p. 1632)
	<<***extension***>> *(*p. *796)* The maximum number of remote writers allowed to write the same sample.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_query_condition_filters** (p. 1632)
	<<***extension***>> *(*p. *796)* The maximum number of query condition filters a reader is allowed.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_app_ack_response_length** (p. 1633)
	<<***extension***>> *(*p. *796)* Maximum length of application-level acknowledgment response data
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**keep_minimum_state_for_instances** (p. 1633)
	<<***extension***>> *(*p. *796)* Whether or not keep a minimum instance state for up to **DDS_DataReader**↩ **ResourceLimitsQosPolicy::max_total_instances** (p. 1629).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**initial_topic_queries** (p. 1634)

	<<***extension***>> *(p. 796)* The initial number of Topic↩ Queries allocated by a **DDS_DataReader** (p. 618).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**max_topic_queries** (p. 1634)
	<<***extension***>> *(p. 796)* The maximum number of active TopicQueries that a **DDS_DataReader** (p. 618) can create.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**shmem_ref_transfer_mode_attached_segment_↩ allocation** (p. 1635)
	<<***extension***>> *(p. 796)* Allocation resource for the shared memory segments attached by the **DDS_Data↩ Reader** (p. 618).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**instance_replacement** (p. 1635)
	<<***extension***>> *(p. 796)* Sets the kind of instances allowed to be replaced for each instance state (**DDS↩ _InstanceStateKind** (p. 715)) when a DataReader reaches **DDS_ResourceLimitsQosPolicy::max_↩ instances** (p. 1956).
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**autopurge_remote_not_alive_writer_delay** (p. 1636)
	<<***extension***>> *(p. 796)* Maximum duration for which the **DDS_DataReader** (p. 618) will maintain information regarding a **DDS_DataWriter** (p. 488) once the **DDS_↩ DataWriter** (p. 488) has become not alive.
DDS_DataReaderResourceLimitsQosPolicy (p. 1619)	**lazily_allocate_batch_resources** (p. 1637)
	<<***extension***>> *(p. 796)* Determines whether the **DDS_DataReader** (p. 618) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**initial_concurrent_blocking_threads** (p. 1675)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* The initial number of threads that are allowed to concurrently block on write call on the same **DDS_DataWriter** (p. 488).
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_concurrent_blocking_threads** (p. 1676)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* The maximum number of threads that are allowed to concurrently block on write call on the same **DDS_Data↩ Writer** (p. 488).
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_remote_reader_filters** (p. 1676)
	<<***extension***>> *(p. 796)* The maximum number of remote DataReaders for which the **DDS_DataWriter** (p. 488) will perform content-based filtering.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**initial_batches** (p. 1677)

	<<***extension***>> *(*p. *796)* Represents the initial number of batches a **DDS_DataWriter** (p. 488) will manage.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_batches** (p. 1677)
	<<***extension***>> *(*p. *796)* Represents the maximum number of batches a **DDS_DataWriter** (p. 488) will manage.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**instance_replacement** (p. 1678)
	<<***extension***>> *(*p. *796)* Sets the kinds of instances allowed to be replaced when instance resource limits are reached.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**replace_empty_instances** (p. 1678)
	<<***extension***>> *(*p. *796)* Whether or not to replace empty instances during instance replacement
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**autoregister_instances** (p. 1679)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Whether or not to automatically register new instances
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_virtual_writers** (p. 1680)
	<<***extension***>> *(*p. *796)* The maximum number of virtual writers supported by a **DDS_DataWriter** (p. 488)
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**initial_virtual_writers** (p. 1679)
	<<***extension***>> *(*p. *796)* The initial number of virtual writers supported by a **DDS_DataWriter** (p. 488)
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**initial_remote_readers** (p. 1683)
	<<***extension***>> *(*p. *796)* Controls the initial memory allocation for the matched remote readers of a **DDS↩ _DataWriter** (p. 488).
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_remote_readers** (p. 1680)
	<<***extension***>> *(*p. *796)* The maximum number of remote readers supported by a **DDS_DataWriter** (p. 488)
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_app_ack_remote_readers** (p. 1680)
	<<***extension***>> *(*p. *796)* The maximum number of application-level acknowledging remote readers supported by a **DDS_DataWriter** (p. 488)
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**initial_active_topic_queries** (p. 1681)
	<<***extension***>> *(*p. *796)* Represents the initial number of active topic queries a **DDS_DataWriter** (p. 488) will manage.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**max_active_topic_queries** (p. 1681)

	<<***extension***>> *(p. 796)* Represents the maximum number of active topic queries a **DDS_DataWriter** (p. 488) will manage.
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**writer_loaned_sample_allocation** (p. 1682)
	<<***extension***>> *(p. 796)* Represents the allocation settings of loaned samples managed by a **DDS_Data↩ Writer** (p. 488).
DDS_DataWriterResourceLimitsQosPolicy (p. 1674)	**initialize_writer_loaned_sample** (p. 1682)
	<<***extension***>> *(p. 796)* Whether or not to initialize loaned samples returned by a **DDS_DataWriter** (p. 488)
DDS_DataWriterTransferModeQosPolicy (p. 1684)	**shmem_ref_settings** (p. 1685)
	<<***extension***>> *(p. 796)* Settings related to transferring data using shared memory references.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**virtual_guid** (p. 1597)
	<<***extension***>> *(p. 796)* The virtual GUID (Global Unique Identifier).
DDS_DataReaderProtocolQosPolicy (p. 1596)	**rtps_object_id** (p. 1597)
	<<***extension***>> *(p. 796)* The RTPS Object ID.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**rtps_reliable_reader** (p. 1599)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **DDS_DataReader** (p. 618). This parameter only has effect if the reader is configured with **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) **DDS↩ _ReliabilityQosPolicyKind** (p. 1324).
DDS_DataReaderProtocolQosPolicy (p. 1596)	**expects_inline_qos** (p. 1597)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Specifies whether this DataReader expects inline QoS with every sample.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**disable_positive_acks** (p. 1598)
	<<***extension***>> *(p. 796)* Whether the reader sends positive acknowledgements to writers.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**propagate_dispose_of_unregistered_instances** (p. 1598)
	<<***extension***>> *(p. 796)* Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_↩ DISPOSED_INSTANCE_STATE** (p. 716) state without being in the **DDS_ALIVE_INSTANCE_STATE** (p. 716) state.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**propagate_unregister_of_disposed_instances** (p. 1599)

	<<***extension***>> *(p. 796)* Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_NO↩ _WRITERS_INSTANCE_STATE** (p. 716) state directly from the **DDS_NOT_ALIVE_DISPOSED_INSTANCE↩ _STATE** (p. 716).
DDS_DataWriterProtocolQosPolicy (p. 1649)	**virtual_guid** (p. 1650)
	<<***extension***>> *(p. 796)* The virtual GUID (Global Unique Identifier).
DDS_DataWriterProtocolQosPolicy (p. 1649)	**rtps_object_id** (p. 1650)
	<<***extension***>> *(p. 796)* The RTPS Object ID.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**push_on_write** (p. 1651)
	<<***extension***>> *(p. 796)* Whether to push sample out when write is called.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**disable_positive_acks** (p. 1651)
	<<***extension***>> *(p. 796)* Controls whether or not the writer expects positive acknowledgements from matching readers.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**disable_inline_keyhash** (p. 1652)
	<<***extension***>> *(p. 796)* Controls whether or not a keyhash is propagated on the wire with each sample.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**serialize_key_with_dispose** (p. 1652)
	<<***extension***>> *(p. 796)* Controls whether or not the serialized key is propagated on the wire with dispose samples.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**propagate_app_ack_with_no_response** (p. 1653)
	<<***extension***>> *(p. 796)* Controls whether or not a **DDS_DataWriter** (p. 488) receives **DDS_DataWriter↩ Listener::on_application_acknowledgment** (p. 1648) notifications with an empty or invalid response.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**rtps_reliable_writer** (p. 1653)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **DDS_DataWriter** (p. 488). This parameter only has effect if both the writer and the matching reader are configured with **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) **DDS_ReliabilityQosPolicyKind** (p. 1324).
DDS_DataWriterProtocolQosPolicy (p. 1649)	**initial_virtual_sequence_number** (p. 1654)
	<<***extension***>> *(p. 796)* Determines, the initial virtual sequence number for this DataWriter.
DDS_SystemResourceLimitsQosPolicy (p. 2030)	**max_objects_per_thread** (p. 2031)

	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* The maximum number of objects that can be stored per thread for a **DDS_DomainParticipantFactory** (p. 32).
DDS_SystemResourceLimitsQosPolicy (p. 2030)	**initial_objects_per_thread** (p. 2031)
	<<***extension***>> *(p. 796)* The number of objects per thread for a **DDS_DomainParticipantFactory** (p. 32) for which infrastructure will initially be allocated.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_writer_allocation** (p. 1737)
	<<***extension***>> *(p. 796)* Allocation settings applied to local DataWriters.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_reader_allocation** (p. 1738)
	<<***extension***>> *(p. 796)* Allocation settings applied to local DataReaders.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_publisher_allocation** (p. 1738)
	<<***extension***>> *(p. 796)* Allocation settings applied to local Publisher.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_subscriber_allocation** (p. 1738)
	<<***extension***>> *(p. 796)* Allocation settings applied to local Subscriber.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_topic_allocation** (p. 1739)
	<<***extension***>> *(p. 796)* Allocation settings applied to local Topic.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_writer_allocation** (p. 1739)
	<<***extension***>> *(p. 796)* Allocation settings applied to remote DataWriters.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_reader_allocation** (p. 1739)
	<<***extension***>> *(p. 796)* Allocation settings applied to remote DataReaders.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_participant_allocation** (p. 1740)
	<<***extension***>> *(p. 796)* Allocation settings applied to remote DomainParticipants.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**matching_writer_reader_pair_allocation** (p. 1740)

	<<***extension***>> *(p. 796)* Allocation settings applied to matching local writer and remote/local reader pairs.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**matching_reader_writer_pair_allocation** (p. 1740)
	<<***extension***>> *(p. 796)* Allocation settings applied to matching local reader and remote/local writer pairs.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**ignored_entity_allocation** (p. 1741)
	<<***extension***>> *(p. 796)* Allocation settings applied to ignored entities.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**content_filtered_topic_allocation** (p. 1741)
	<<***extension***>> *(p. 796)* Allocation settings applied to content filtered topic.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**content_filter_allocation** (p. 1741)
	<<***extension***>> *(p. 796)* Allocation settings applied to content filter.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**read_condition_allocation** (p. 1742)
	<<***extension***>> *(p. 796)* Allocation settings applied to read condition pool.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**query_condition_allocation** (p. 1742)
	<<***extension***>> *(p. 796)* Allocation settings applied to query condition pool.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**outstanding_asynchronous_sample_allocation** (p. 1742)
	<<***extension***>> *(p. 796)* Allocation settings applied to the maximum number of samples (from all **DDS_Data↩ Writer** (p. 488)) waiting to be asynchronously written.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**flow_controller_allocation** (p. 1743)
	<<***extension***>> *(p. 796)* Allocation settings applied to flow controllers.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_writer_hash_buckets** (p. 1743)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Hash_Buckets settings applied to local DataWriters.

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_reader_hash_buckets** (p. 1743)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for local DataReaders.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_publisher_hash_buckets** (p. 1744)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for local Publisher.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_subscriber_hash_buckets** (p. 1744)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for local Subscriber.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**local_topic_hash_buckets** (p. 1744)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for local Topic.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_writer_hash_buckets** (p. 1745)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for remote DataWriters.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_reader_hash_buckets** (p. 1745)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for remote DataReaders.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_participant_hash_buckets** (p. 1745)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for remote DomainParticipants.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**matching_writer_reader_pair_hash_buckets** (p. 1746)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for matching local writer and remote/local reader pairs.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**matching_reader_writer_pair_hash_buckets** (p. 1746)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for matching local reader and remote/local writer pairs.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**ignored_entity_hash_buckets** (p. 1746)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for ignored entities.

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**content_filtered_topic_hash_buckets** (p. 1747)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for content filtered topics.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**content_filter_hash_buckets** (p. 1747)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for content filters.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**flow_controller_hash_buckets** (p. 1747)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for flow controllers.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**max_gather_destinations** (p. 1748)
	<<***extension***>> (p. *796*) Maximum number of destinations per RTI Connext send.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**participant_user_data_max_length** (p. 1748)
	<<***extension***>> (p. *796*) Maximum length of user data in **DDS_DomainParticipantQos** (p. 1729) and **DDS_ParticipantBuiltinTopicData** (p. 1873)
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**topic_data_max_length** (p. 1748)
	<<***extension***>> (p. *796*) Maximum length of topic data in **DDS_TopicQos** (p. 2048), **DDS_TopicBuiltinTopicData** (p. 2040), **DDS_PublicationBuiltinTopicData** (p. 1909) and **DDS_SubscriptionBuiltinTopicData** (p. 2018)
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**publisher_group_data_max_length** (p. 1749)
	<<***extension***>> (p. *796*) Maximum length of group data in **DDS_PublisherQos** (p. 1922) and **DDS_PublicationBuiltinTopicData** (p. 1909)
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**subscriber_group_data_max_length** (p. 1749)
	<<***extension***>> (p. *796*) Maximum length of group data in **DDS_SubscriberQos** (p. 2016) and **DDS_SubscriptionBuiltinTopicData** (p. 2018)
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**writer_user_data_max_length** (p. 1749)

	<<***extension***>> *(p. 796)* Maximum length of user data in **DDS_DataWriterQos** (p. 1666) and **DDS_↩ PublicationBuiltinTopicData** (p. 1909)
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**reader_user_data_max_length** (p. 1750)
	<<***extension***>> *(p. 796)* Maximum length of user data in **DDS_DataReaderQos** (p. 1611) and **DDS_↩ SubscriptionBuiltinTopicData** (p. 2018)
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**max_partitions** (p. 1750)
	<<***extension***>> *(p. 796)* Maximum number of partition name strings allowable in a **DDS_PartitionQosPolicy** (p. 1884).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**max_partition_cumulative_characters** (p. 1750)
	<<***extension***>> *(p. 796)* Maximum number of combined characters allowable in all partition names in a **DDS_PartitionQosPolicy** (p. 1884).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_code_max_serialized_length** (p. 1751)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Maximum size of serialized string for type code.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_object_max_serialized_length** (p. 1751)
	<<***extension***>> *(p. 796)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_object_max_deserialized_length** (p. 1753)
	<<***extension***>> *(p. 796)* The maximum number of bytes that a deserialized TypeObject v1 can consume.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**deserialized_type_object_dynamic_allocation_↩ threshold** (p. 1753)
	<<***extension***>> *(p. 796)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**serialized_type_object_dynamic_allocation_↩ threshold** (p. 1752)
	<<***extension***>> *(p. 796)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**contentfilter_property_max_length** (p. 1754)
	<<***extension***>> *(p. 796)* This field is the maximum length of all data related to a Content-filtered topic.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**channel_seq_max_length** (p. 1754)
	<<***extension***>> *(p. 796)* Maximum number of channels that can be specified in **DDS_MultiChannelQos↩ Policy** (p. 1860) for MultiChannel DataWriters.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**channel_filter_expression_max_length** (p. 1755)
	<<***extension***>> *(p. 796)* Maximum length of a channel **DDS_ChannelSettings_t::filter_expression** (p. 1564) in a MultiChannel DataWriter.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**participant_property_list_max_length** (p. 1755)
	<<***extension***>> *(p. 796)* Maximum number of properties associated with the **DDS_DomainParticipant** (p. 76).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**participant_property_string_max_length** (p. 1755)
	<<***extension***>> *(p. 796)* Maximum string length of the properties associated with the **DDS_DomainParticipant** (p. 76).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**writer_property_list_max_length** (p. 1756)
	<<***extension***>> *(p. 796)* Maximum number of properties associated with a **DDS_DataWriter** (p. 488).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**writer_property_string_max_length** (p. 1756)
	<<***extension***>> *(p. 796)* Maximum string length of the properties associated with a **DDS_DataWriter** (p. 488).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**reader_property_list_max_length** (p. 1756)
	<<***extension***>> *(p. 796)* Maximum number of properties associated with a **DDS_DataReader** (p. 618).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**reader_property_string_max_length** (p. 1757)
	<<***extension***>> *(p. 796)* Maximum string length of the properties associated with a **DDS_DataReader** (p. 618).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**max_endpoint_groups** (p. 1757)

	<<***extension***>> *(*p. *796)* Maximum number of **DDS_EndpointGroup_t** (p. 1787) allowable in a **DDS_AvailabilityQosPolicy** (p. 1547).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**max_endpoint_group_cumulative_characters** (p. 1757)
	<<***extension***>> *(*p. *796)* Maximum number of combined role_name characters allowed in all **DDS_EndpointGroup_t** (p. 1787) in a **DDS_AvailabilityQosPolicy** (p. 1547).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**transport_info_list_max_length** (p. 1758)
	<<***extension***>> *(*p. *796)* Maximum number of installed transports to send and receive information about in **DDS_ParticipantBuiltinTopicData::transport_info** (p. 1877).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**ignored_entity_replacement_kind** (p. 1758)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_allocation** (p. 1741) are reached.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_topic_query_allocation** (p. 1758)
	<<***extension***>> *(*p. *796)* Allocation settings applied to remote TopicQueries.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_topic_query_hash_buckets** (p. 1759)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Number of hash buckets for remote TopicQueries.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**writer_data_tag_list_max_length** (p. 1759)
	<<***extension***>> *(*p. *796)* Maximum number of data tags associated with a **DDS_DataWriter** (p. 488).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**writer_data_tag_string_max_length** (p. 1760)
	<<***extension***>> *(*p. *796)* Maximum string length of the data tags associated with a **DDS_DataWriter** (p. 488).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**reader_data_tag_list_max_length** (p. 1760)
	<<***extension***>> *(*p. *796)* Maximum number of data tags associated with a **DDS_DataReader** (p. 618).

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**reader_data_tag_string_max_length** (p. 1760)
	<<***extension***>> *(p. 796)* Maximum string length of the data tags associated with a **DDS_DataReader** (p. 618).
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**shmem_ref_transfer_mode_max_segments** (p. 1761)
	<<***extension***>> *(p. 796)* Maximum number of segments created by all DataWriters belonging to a **DDS_DomainParticipant** (p. 76).
DDS_EventQosPolicy (p. 1796)	**thread** (p. 1796)
	<<***extension***>> *(p. 796)* Event thread QoS.
DDS_EventQosPolicy (p. 1796)	**initial_count** (p. 1797)
	<<***extension***>> *(p. 796)* The initial number of events.
DDS_EventQosPolicy (p. 1796)	**max_count** (p. 1797)
	<<***extension***>> *(p. 796)* The maximum number of events.
DDS_DatabaseQosPolicy (p. 1581)	**thread** (p. 1582)
	<<***extension***>> *(p. 796)* Database thread settings.
DDS_DatabaseQosPolicy (p. 1581)	**shutdown_timeout** (p. 1583)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The maximum wait time during a shutdown.
DDS_DatabaseQosPolicy (p. 1581)	**cleanup_period** (p. 1583)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The period at which the database thread wakes up to remove deleted records.
DDS_DatabaseQosPolicy (p. 1581)	**shutdown_cleanup_period** (p. 1583)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The clean-up period used during database shut-down.
DDS_DatabaseQosPolicy (p. 1581)	**initial_records** (p. 1584)
	<<***extension***>> *(p. 796)* The initial number of total records.
DDS_DatabaseQosPolicy (p. 1581)	**max_skiplist_level** (p. 1584)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The maximum level of the skiplist.
DDS_DatabaseQosPolicy (p. 1581)	**initial_weak_references** (p. 1585)
	<<***extension***>> *(p. 796)* The initial number of weak references.

DDS_DatabaseQosPolicy (p. 1581)	**max_weak_references** (p. 1584)
	<<***extension***>> *(p. 796)* The maximum number of weak references.
DDS_ReceiverPoolQosPolicy (p. 1938)	**thread** (p. 1939)
	<<***extension***>> *(p. 796)* Receiver pool thread(s).
DDS_ReceiverPoolQosPolicy (p. 1938)	**buffer_size** (p. 1939)
	<<***extension***>> *(p. 796)* The receive buffer size in bytes.
DDS_ReceiverPoolQosPolicy (p. 1938)	**buffer_alignment** (p. 1940)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The receive buffer alignment.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**remote_participant_purge_kind** (p. 1695)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**max_liveliness_loss_detection_period** (p. 1695)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_reader_resource_limits** (p. 1698)
	<<***extension***>> *(p. 796)* Resource limits.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**publication_reader** (p. 1698)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**publication_reader_resource_limits** (p. 1699)
	<<***extension***>> *(p. 796)* Resource limits.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**subscription_reader** (p. 1699)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**subscription_reader_resource_limits** (p. 1700)
	<<***extension***>> *(p. 796)* Resource limits.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_message_writer** (p. 1704)

	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **DDS_RELIABLE↩ _RELIABILITY_QOS** (p. 1325) **DDS_ReliabilityQos↩ PolicyKind** (p. 1324).
DDS_DiscoveryConfigQosPolicy (p. 1691)	**publication_writer_publish_mode** (p. 1705)
	<<***extension***>> *(p. 796)* Publish mode policy for the built-in publication writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**subscription_writer_publish_mode** (p. 1706)
	<<***extension***>> *(p. 796)* Publish mode policy for the built-in subscription writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**asynchronous_publisher** (p. 1706)
	<<***extension***>> *(p. 796)* Asynchronous publishing settings for the discovery **DDS_Publisher** (p. 446) and all entities that are created by it.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**default_domain_announcement_period** (p. 1706)
	<<***extension***>> *(p. 796)* The period to announce a participant to the default domain 0.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**ignore_default_domain_announcements** (p. 1707)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_message_reader_reliability_kind** (p. 1703)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Reliability policy for a built-in participant message reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_message_reader** (p. 1704)
	<<***extension***>> *(p. 796)* RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **DDS_DiscoveryConfigQosPolicy::participant_↩ message_reader_reliability_kind** (p. 1703) is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325).
DDS_DiscoveryConfigQosPolicy (p. 1691)	**publication_writer** (p. 1700)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**publication_writer_data_lifecycle** (p. 1701)

	<<***extension***>> *(*p. *796)* Writer data lifecycle settings for a built-in publication writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**subscription_writer** (p. 1702)
	<<***extension***>> *(*p. *796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**subscription_writer_data_lifecycle** (p. 1702)
	<<***extension***>> *(*p. *796)* Writer data lifecycle settings for a built-in subscription writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**builtin_discovery_plugins** (p. 1703)
	<<***extension***>> *(*p. *796)* Mask of built-in discovery plugin kinds.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**enabled_builtin_channels** (p. 1703)
	<<***extension***>> *(*p. *796)* The mask specifying which built-in channels should be enabled.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**service_request_writer** (p. 1707)
	<<***extension***>> *(*p. *796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in **DDS_ServiceRequest** (p. 2006) writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**service_request_writer_data_lifecycle** (p. 1708)
	<<***extension***>> *(*p. *796)* Writer data lifecycle settings for a built-in **DDS_ServiceRequest** (p. 2006) writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**service_request_writer_publish_mode** (p. 1708)
	<<***extension***>> *(*p. *796)* Publish mode policy for the built-in service request writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**service_request_reader** (p. 1709)
	<<***extension***>> *(*p. *796)* RTPS reliable reader protocol-related configuration settings for a built-in **DDS_ServiceRequest** (p. 2006) reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**locator_reachability_assert_period** (p. 1709)
	<<***extension***>> *(*p. *796)* Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**locator_reachability_change_detection_period** (p. 1710)
	<<***extension***>> *(*p. *796)* Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**secure_volatile_writer** (p. 1711)

	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**secure_volatile_writer_publish_mode** (p. 1712)
	<<***extension***>> *(p. 796)* Publish mode policy for the built-in secure volatile writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**secure_volatile_reader** (p. 1712)
	<<***extension***>> *(p. 796)* RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**endpoint_type_object_lb_serialization_threshold** (p. 1713)
	<<***extension***>> *(p. 796)* Controls when/if the Type↩ Object v1 is compressed when propagated in Simple Endpoint Discovery.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**dns_tracker_polling_period** (p. 1713)
	<<***extension***>> *(p. 796)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_configuration_reader** (p. 1716)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_configuration_reader_resource_limits** (p. 1716)
	<<***extension***>> *(p. 796)* Resource limits for the built-in topic participant configuration reader.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_configuration_writer_publish_mode** (p. 1714)
	<<***extension***>> *(p. 796)* Publish mode policy for the built-in participant configuration writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_configuration_writer** (p. 1714)
	<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_configuration_writer_data_lifecycle** (p. 1715)
	<<***extension***>> *(p. 796)* Writer data lifecycle settings for a built-in participant configuration writer.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**request_types_filter** (p. 1716)

	<<***extension***>> *(p. 796)* Topic name pattern for requesting all types via Type Lookup Service.
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**min_heartbeat_response_delay** (p. 1960)
	<<***extension***>> *(p. 796)* The minimum delay to respond to a heartbeat.
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**max_heartbeat_response_delay** (p. 1960)
	<<***extension***>> *(p. 796)* The maximum delay to respond to a heartbeat.
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**heartbeat_suppression_duration** (p. 1961)
	<<***extension***>> *(p. 796)* The duration a reader ignores consecutively received heartbeats
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**nack_period** (p. 1961)
	<<***extension***>> *(p. 796)* The period at which to send NACKs
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**receive_window_size** (p. 1962)
	<<***extension***>> *(p. 796)* The number of received out-of-order samples a reader can keep at a time
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**round_trip_time** (p. 1962)
	<<***extension***>> *(p. 796)* The duration from sending a NACK to receiving a repair of a sample
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**app_ack_period** (p. 1963)
	<<***extension***>> *(p. 796)* The period at which application-level acknowledgment messages are sent
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**min_app_ack_response_keep_duration** (p. 1963)
	<<***extension***>> *(p. 796)* Minimum duration for which application-level acknowledgment response data is kept
DDS_RtpsReliableReaderProtocol_t (p. 1959)	**samples_per_app_ack** (p. 1964)
	<<***extension***>> *(p. 796)* The minimum number of samples acknowledged by one application-level acknowledgment message
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**low_watermark** (p. 1966)
	<<***extension***>> *(p. 796)* When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED↩ _STATUS** (p. 1236) is considered to have changed.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**high_watermark** (p. 1967)

	<<***extension***>> *(*p. *796)* When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED↩ _STATUS** (p. 1236) is considered to have changed.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**virtual_heartbeat_period** (p. 1970)
	<<***extension***>> *(*p. *796)* The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**samples_per_virtual_heartbeat** (p. 1970)
	<<***extension***>> *(*p. *796)* The number of samples that a reliable writer has to publish before sending a virtual heartbeat.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**max_heartbeat_retries** (p. 1971)
	<<***extension***>> *(*p. *796)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**inactivate_nonprogressing_readers** (p. 1971)
	<<***extension***>> *(*p. *796)* Whether to treat remote readers as inactive when their NACKs do not progress
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**heartbeats_per_max_samples** (p. 1972)
	<<***extension***>> *(*p. *796)* The number of piggyback heartbeats sent per max send window.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**min_nack_response_delay** (p. 1973)
	<<***extension***>> *(*p. *796)* The minimum delay to respond to a NACK or NACK_FRAG.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**max_nack_response_delay** (p. 1973)
	<<***extension***>> *(*p. *796)* The maximum delay to respond to a NACK or NACK_FRAG.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**nack_suppression_duration** (p. 1974)
	<<***extension***>> *(*p. *796)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**max_bytes_per_nack_response** (p. 1974)
	<<***extension***>> *(*p. *796)* The maximum total message size when resending rejected samples or data fragments.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_enable_adaptive_sample_↩ keep_duration** (p. 1976)

	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Enables dynamic adjustment of sample keep duration in response to congestion.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_min_sample_keep_duration** (p. 1975)
	<<***extension***>> *(*p. *796)* The minimum duration a sample is queued for ACK-disabled readers.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_max_sample_keep_duration** (p. 1976)
	<<***extension***>> *(*p. *796)* The maximum duration a sample is queued for ACK-disabled readers.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_decrease_sample_keep_duration_factor** (p. 1977)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Controls rate of contraction of dynamic sample keep duration.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_increase_sample_keep_duration_factor** (p. 1977)
	[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Controls rate of growth of dynamic sample keep duration.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**send_window_update_period** (p. 1979)
	<<***extension***>> *(*p. *796)* Period in which send window may be dynamically changed
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**send_window_increase_factor** (p. 1980)
	<<***extension***>> *(*p. *796)* Increases send window size by this percentage when reacting dynamically to network conditions
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**send_window_decrease_factor** (p. 1981)
	<<***extension***>> *(*p. *796)* Decreases send window size by this percentage when reacting dynamically to network conditions
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**enable_multicast_periodic_heartbeat** (p. 1982)
	<<***extension***>> *(*p. *796)* Whether periodic heartbeat messages are sent over multicast
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**multicast_resend_threshold** (p. 1982)
	<<***extension***>> *(*p. *796)* The minimum number of requesting readers needed to trigger a multicast resend
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_repair_piggyback_heartbeat** (p. 1983)
	<<***extension***>> *(*p. *796)* Prevents piggyback heartbeats from being sent with repair samples

DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**initial_samples** (p. 1558)
	<<***extension***>> *(p. 796)* Initial number of samples.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_samples** (p. 1558)
	<<***extension***>> *(p. 796)* Maximum number of samples.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**initial_infos** (p. 1559)
	<<***extension***>> *(p. 796)* Initial number of sample infos.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_infos** (p. 1559)
	<<***extension***>> *(p. 796)* Maximum number of sample infos.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**initial_outstanding_reads** (p. 1559)
	<<***extension***>> *(p. 796)* The initial number of outstanding reads that have not called finish yet on the same built-in topic **DDS_DataReader** (p. 618).
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_outstanding_reads** (p. 1560)
	<<***extension***>> *(p. 796)* The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDS_DataReader** (p. 618).
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_samples_per_read** (p. 1560)
	<<***extension***>> *(p. 796)* Maximum number of samples that can be read/taken on a same built-in topic **DDS_DataReader** (p. 618).
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**disable_fragmentation_support** (p. 1560)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Determines whether the built-in topic **DDS_DataReader** (p. 618) can receive fragmented samples.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_fragmented_samples** (p. 1561)
	<<***extension***>> *(p. 796)* The maximum number of samples for which the built-in topic **DDS_DataReader** (p. 618) may store fragments at a given point in time.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**initial_fragmented_samples** (p. 1561)
	<<***extension***>> *(p. 796)* The initial number of samples for which a built-in topic **DDS_DataReader** (p. 618) may store fragments.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_fragmented_samples_per_remote_writer** (p. 1562)

	<<***extension***>> *(p. 796)* The maximum number of samples per remote writer for which a built-in topic **DDS_DataReader** (p. 618) may store fragments.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**max_fragments_per_sample** (p. 1562)
	<<***extension***>> *(p. 796)* Maximum number of fragments for a single sample.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**dynamically_allocate_fragmented_samples** (p. 1563)
	<<***extension***>> *(p. 796)* Determines whether the built-in topic **DDS_DataReader** (p. 618) pre-allocates storage for storing fragmented samples.
DDS_DataTags (p. 1641)	**tags** (p. 1642)
	<<***spec***>> *(p. 791)* Sequence of data tags.
DDS_EntityNameQosPolicy (p. 1793)	**role_name** (p. 1794)
	<<***extension***>> *(p. 796)* The entity role name.
DDS_ServiceQosPolicy (p. 2005)	**kind** (p. 2005)
	<<***extension***>> *(p. 796)* The kind of service.
DDS_BatchQosPolicy (p. 1552)	**max_flush_delay** (p. 1554)
	<<***extension***>> *(p. 796)* The maximum flush delay.
DDS_BatchQosPolicy (p. 1552)	**source_timestamp_resolution** (p. 1554)
	<<***extension***>> *(p. 796)* Batch source timestamp resolution.
DDS_BatchQosPolicy (p. 1552)	**thread_safe_write** (p. 1555)
	<<***extension***>> *(p. 796)* Determines whether or not the write operation is thread safe.
DDS_ChannelSettings_t (p. 1564)	**multicast_settings** (p. 1564)
	<<***extension***>> *(p. 796)* A sequence of **DDS_↩ TransportMulticastSettings_t** (p. 2066) used to configure the multicast addresses associated with a channel.
DDS_ChannelSettings_t (p. 1564)	**filter_expression** (p. 1564)
	<<***extension***>> *(p. 796)* A logical expression used to determine the data that will be published in the channel.
DDS_ChannelSettings_t (p. 1564)	**priority** (p. 1565)
	<<***extension***>> *(p. 796)* Publication priority
DDS_MultiChannelQosPolicy (p. 1860)	**channels** (p. 1861)
	<<***extension***>> *(p. 796)* A sequence of **DDS_↩ ChannelSettings_t** (p. 1564) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

DDS_MultiChannelQosPolicy (p. 1860)	**filter_name** (p. 1861)
	<<***extension***>> *(p. 796)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.
DDS_TopicQueryDispatchQosPolicy (p. 2053)	**enable** (p. 2054)
	<<***extension***>> *(p. 796)* Allows this writer to dispatch TopicQueries
DDS_TopicQueryDispatchQosPolicy (p. 2053)	**samples_per_period** (p. 2055)
	<<***extension***>> *(p. 796)* Sets the maximum number of samples to publish in each publication_period.

5.79 Mutable QoS

This page lists all QoS that are always mutable.

This page lists all QoS that are always mutable.

Mutable QoS can always be changed regardless of whether the entity has been enabled or not. QoS that are immutable after an entity has been enabled are listed on the **Immutable QoS** (p. 916) page.

Basic Settings

DDS_DeadlineQosPolicy (p. 1685)	**period** (p. 1687)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* Duration of the deadline period.
DDS_OwnershipStrengthQosPolicy (p. 1872)	**value** (p. 1873)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* The strength value used to arbitrate among multiple writers.
DDS_TimeBasedFilterQosPolicy (p. 2038)	**minimum_separation** (p. 2040)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* The minimum separation duration between subsequent samples.
DDS_PartitionQosPolicy (p. 1884)	**name** (p. 1886)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* A list of partition names
DDS_EntityFactoryQosPolicy (p. 1791)	**autoenable_created_entities** (p. 1792)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* Specifies whether the entity acting as a factory automatically enables the instances it creates.

DDS_LifespanQosPolicy (p. 1818)	**duration** (p. 1819)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* Maximum duration for the data's validity.
DDS_PropertyQosPolicy (p. 1905)	**value** (p. 1907)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Sequence of properties.
DDS_LoggingQosPolicy (p. 1834)	**verbosity** (p. 1835)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The verbosities at which RTI Connext diagnostic information is logged.
DDS_LoggingQosPolicy (p. 1834)	**category** (p. 1835)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Categories of logged messages.
DDS_LoggingQosPolicy (p. 1834)	**output_file** (p. 1835)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Specifies the file to which log messages will be redirected to.
DDS_LoggingQosPolicy (p. 1834)	**output_file_suffix** (p. 1836)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Sets the file suffix when logging to a set of files
DDS_MonitoringEventDistributionSettings (p. 1843)	**publication_period** (p. 1846)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.
DDS_MonitoringPeriodicDistributionSettings (p. 1855)	**polling_period** (p. 1856)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Period at which the periodic metric thread polls and publishes the periodic metrics.
DDS_MonitoringLoggingDistributionSettings (p. 1846)	**max_historical_logs** (p. 1848)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.
DDS_MonitoringLoggingDistributionSettings (p. 1846)	**publication_period** (p. 1849)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Period at which the logging thread publishes log messages.
DDS_MonitoringDedicatedParticipantSettings (p. 1839)	**enable** (p. 1839)

	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Enables the use of a dedicated **DDS_DomainParticipant** (p. 76) to distribute the RTI Connext application telemetry data.
DDS_MonitoringDedicatedParticipantSettings (p. 1839)	**domain_id** (p. 1840)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The domain ID used in the creation of RTI Monitoring Library 2.0 **DDS_DomainParticipant** (p. 76).
DDS_MonitoringDedicatedParticipantSettings (p. 1839)	**collector_initial_peers** (p. 1840)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **DDS_MonitoringDistributionSettings**↩ **::dedicated_participant** (p. 1842).
DDS_MonitoringLoggingForwardingSettings (p. 1850)	**middleware_forwarding_level** (p. 1850)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Log messages with **NDDS_CONFIG_LOG_FACILITY_**↩ **MIDDLEWARE** (p. 1449) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
DDS_MonitoringLoggingForwardingSettings (p. 1850)	**security_event_forwarding_level** (p. 1850)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Log messages with **NDDS_CONFIG_LOG_FACILITY_**↩ **SECURITY_EVENT** (p. 1449) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
DDS_MonitoringLoggingForwardingSettings (p. 1850)	**service_forwarding_level** (p. 1851)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Log messages with **NDDS_CONFIG_LOG_FACILITY_**↩ **SERVICE** (p. 1449) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
DDS_MonitoringLoggingForwardingSettings (p. 1850)	**user_forwarding_level** (p. 1851)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Log messages with **NDDS_CONFIG_LOG_FACILITY_**↩ **USER** (p. 1449) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
DDS_MonitoringTelemetryData (p. 1859)	**metrics** (p. 1859)

	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Sequence of **DDS_MonitoringMetricSelection** (p. 1852) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.
DDS_MonitoringTelemetryData (p. 1859)	**logs** (p. 1859)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* **DDS_MonitoringLoggingForwardingSettings** (p. 1850) containing the **NDDS_Config_Syslog↩ Verbosity** (p. 1449) levels that will be forwarded for the different **NDDS_Config_LogFacility** (p. 1448).
DDS_MonitoringQosPolicy (p. 1856)	**enable** (p. 1857)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.
DDS_MonitoringQosPolicy (p. 1856)	**application_name** (p. 1857)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The name of the resource that represents this RTI Connext application.

Advanced Settings

DDS_UserDataQosPolicy (p. 2092)	**value** (p. 2093)
	<<***spec***>> *(p. 791)* a sequence of octets
DDS_GroupDataQosPolicy (p. 1806)	**value** (p. 1807)
	<<***spec***>> *(p. 791)* a sequence of octets
DDS_AvailabilityQosPolicy (p. 1547)	**max_data_availability_waiting_time** (p. 1550)
	<<***extension***>> *(p. 796)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
DDS_AvailabilityQosPolicy (p. 1547)	**max_endpoint_availability_waiting_time** (p. 1550)
	<<***extension***>> *(p. 796)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
DDS_AvailabilityQosPolicy (p. 1547)	**required_matched_endpoint_groups** (p. 1551)
	<<***extension***>> *(p. 796)* A sequence of endpoint groups.
DDS_LatencyBudgetQosPolicy (p. 1816)	**duration** (p. 1818)
	<<***spec***>> *(p. 791)* Duration of the maximum acceptable delay.

DDS_LoggingQosPolicy (p. 1834)	**print_format** (p. 1835)
	<<***extension***>> *(p. 796)* The format used to output RTI Connext diagnostic information.
DDS_LoggingQosPolicy (p. 1834)	**max_bytes_per_file** (p. 1836)
	<<***extension***>> *(p. 796)* Specifies the maximum number of bytes a single file can contain
DDS_LoggingQosPolicy (p. 1834)	**max_files** (p. 1837)
	<<***extension***>> *(p. 796)* Specifies the maximum number of files to create before overwritting the previous ones.
DDS_MonitoringEventDistributionSettings (p. 1843)	**concurrency_level** (p. 1844)
	<<***extension***>> *(p. 796)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.
DDS_MonitoringEventDistributionSettings (p. 1843)	**datawriter_qos_profile_name** (p. 1845)
	<<***extension***>> *(p. 796)* The fully qualified name of the profile used to configure the **DDS_DataWriter** (p. 488) that distributes event metrics.
DDS_MonitoringEventDistributionSettings (p. 1843)	**thread** (p. 1845)
	<<***extension***>> *(p. 796)* The settings of the event metric thread.
DDS_MonitoringPeriodicDistributionSettings (p. 1855)	**datawriter_qos_profile_name** (p. 1855)
	<<***extension***>> *(p. 796)* The fully qualified name of the profile used to configure the **DDS_DataWriter** (p. 488) that distributes periodic metrics.
DDS_MonitoringPeriodicDistributionSettings (p. 1855)	**thread** (p. 1855)
	<<***extension***>> *(p. 796)* The settings of the periodic metric thread.
DDS_MonitoringLoggingDistributionSettings (p. 1846)	**concurrency_level** (p. 1847)
	<<***extension***>> *(p. 796)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
DDS_MonitoringLoggingDistributionSettings (p. 1846)	**datawriter_qos_profile_name** (p. 1848)
	<<***extension***>> *(p. 796)* The fully qualified name of the profile used to configure the **DDS_DataWriter** (p. 488) that distributes log messages.

DDS_MonitoringLoggingDistributionSettings (p. 1846)	**thread** (p. 1849)
	<<***extension***>> *(p. 796)* The settings of the logging thread.
DDS_MonitoringDedicatedParticipantSettings (p. 1839)	**participant_qos_profile_name** (p. 1840)
	<<***extension***>> *(p. 796)* The fully qualified name of the profile used to configure the **DDS_Domain↩ Participant** (p. 76) that will be used to distribute telemetry data.
DDS_MonitoringDistributionSettings (p. 1841)	**dedicated_participant** (p. 1842)
	<<***extension***>> *(p. 796)* Configures the use of a dedicated **DDS_DomainParticipant** (p. 76) to distribute the RTI Connext application telemetry data.
DDS_MonitoringDistributionSettings (p. 1841)	**publisher_qos_profile_name** (p. 1842)
	<<***extension***>> *(p. 796)* The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.
DDS_MonitoringDistributionSettings (p. 1841)	**event_settings** (p. 1842)
	<<***extension***>> *(p. 796)* Configures the distribution of event metrics.
DDS_MonitoringDistributionSettings (p. 1841)	**periodic_settings** (p. 1843)
	<<***extension***>> *(p. 796)* Configures the distribution of periodic metrics.
DDS_MonitoringDistributionSettings (p. 1841)	**logging_settings** (p. 1843)
	<<***extension***>> *(p. 796)* Configures the distribution of logging messages.
DDS_MonitoringMetricSelection (p. 1852)	**resource_selection** (p. 1852)
	<<***extension***>> *(p. 796)* An expression pattern that selects a subset of resources by matching the pattern to the resource names. **DDS_MonitoringMetric↩ Selection::enabled_metrics_selection** (p. 1853) and **DDS_MonitoringMetricSelection::disabled_↩ metrics_selection** (p. 1853) are applied to this subset of resources.
DDS_MonitoringMetricSelection (p. 1852)	**enabled_metrics_selection** (p. 1853)
	<<***extension***>> *(p. 796)* A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **DDS_MonitoringMetric↩ Selection::resource_selection** (p. 1852).
DDS_MonitoringMetricSelection (p. 1852)	**disabled_metrics_selection** (p. 1853)

	<<***extension***>> *(p. 796)* A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **DDS_MonitoringMetric↩ Selection::resource_selection** (p. 1852).
DDS_MonitoringQosPolicy (p. 1856)	**distribution_settings** (p. 1858)
	<<***extension***>> *(p. 796)* Configures the distribution of telemetry data.
DDS_MonitoringQosPolicy (p. 1856)	**telemetry_data** (p. 1858)
	<<***extension***>> *(p. 796)* Configures the telemetry data that will be distributed.

5.80 Other QoS Attributes

These attributes are characteristics of the QoS – for example if they are **mutable** (p. 952) or **immutable** (p. 916), or if they **apply per-instance** (p. 958).

Modules

- **Applied Per-Instance**

  These QoS are applied per-instance.
- **Discovery Metadata**

  These QoS are sent as part of one of the built-in discovery topics.
- **Matching**

  These QoS affect participant and endpoint matching.

5.80.1 Detailed Description

These attributes are characteristics of the QoS – for example if they are **mutable** (p. 952) or **immutable** (p. 916), or if they **apply per-instance** (p. 958).

5.81 Applied Per-Instance

These QoS are applied per-instance.

These QoS are applied per-instance.

For example, the **DDS_HistoryQosPolicy::depth** (p. 1810) configures the number of samples that are stored in the DataWriter and DataReader queues *per-instance*.

Basic Settings

DDS_DurabilityQosPolicy (p. 1762)	**writer_depth** (p. 1765)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Indicates the number of samples per instance that a durable **DDS_DataWriter** (p. 488) will send to a late-joining **DDS_DataReader** (p. 618).
DDS_DeadlineQosPolicy (p. 1685)	**period** (p. 1687)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Duration of the deadline period.
DDS_OwnershipQosPolicy (p. 1867)	**kind** (p. 1871)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The kind of ownership
DDS_OwnershipStrengthQosPolicy (p. 1872)	**value** (p. 1873)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The strength value used to arbitrate among multiple writers.
DDS_TimeBasedFilterQosPolicy (p. 2038)	**minimum_separation** (p. 2040)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The minimum separation duration between subsequent samples.
DDS_DestinationOrderQosPolicy (p. 1688)	**kind** (p. 1690)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Specifies the desired kind of destination order.
DDS_HistoryQosPolicy (p. 1808)	**kind** (p. 1810)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Specifies the kind of history to be kept.
DDS_HistoryQosPolicy (p. 1808)	**depth** (p. 1810)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Specifies the number of samples per instance to be kept, when the `kind` is **DDS_↩ KEEP_LAST_HISTORY_QOS** (p. 1295)

Advanced Settings

DDS_DurabilityServiceQosPolicy (p. 1767)	**history_kind** (p. 1768)
	*<<**spec**>> (p. 791)* The kind of history to apply in recouping durable data.
DDS_DurabilityServiceQosPolicy (p. 1767)	**history_depth** (p. 1768)
	*<<**spec**>> (p. 791)* Setting to use for the **DDS_DurabilityQos↩ Policy::writer_depth** (p. 1765) when recouping durable data.
DDS_PresentationQosPolicy (p. 1894)	**access_scope** (p. 1897)

	<<***spec***>> *(*p. *791)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
DDS_PresentationQosPolicy (p. 1894)	**ordered_access** (p. 1897)
	<<***spec***>> *(*p. *791)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
DDS_DestinationOrderQosPolicy (p. 1688)	**scope** (p. 1690)
	<<***spec***>> *(*p. *791)* Specifies the desired scope of the source destination order.
DDS_DestinationOrderQosPolicy (p. 1688)	**source_timestamp_tolerance** (p. 1690)
	<<***extension***>> *(*p. *796)* Allowed tolerance between source timestamps of consecutive samples.

5.82 Discovery Metadata

These QoS are sent as part of one of the built-in discovery topics.

These QoS are sent as part of one of the built-in discovery topics.

DDS_SubscriptionBuiltinTopicData (p. 2018)

Basic Settings

DDS_DurabilityQosPolicy (p. 1762)	**kind** (p. 1765)
	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* The kind of durability.
DDS_DataRepresentationQosPolicy (p. 1639)	**compression_settings** (p. 1640)
	<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Structure that contains the compression settings.
DDS_DeadlineQosPolicy (p. 1685)	**period** (p. 1687)
	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* Duration of the deadline period.
DDS_OwnershipQosPolicy (p. 1867)	**kind** (p. 1871)
	<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* The kind of ownership

DDS_OwnershipStrengthQosPolicy (p. 1872)	**value** (p. 1873)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The strength value used to arbitrate among multiple writers.
DDS_LivelinessQosPolicy (p. 1826)	**kind** (p. 1828)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The kind of liveliness desired.
DDS_LivelinessQosPolicy (p. 1826)	**lease_duration** (p. 1828)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The duration within which a **DDS_DataWriter** (p. 488) must be asserted, or else it is assumed to be not alive.
DDS_TimeBasedFilterQosPolicy (p. 2038)	**minimum_separation** (p. 2040)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The minimum separation duration between subsequent samples.
DDS_PartitionQosPolicy (p. 1884)	**name** (p. 1886)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* A list of partition names
DDS_ReliabilityQosPolicy (p. 1940)	**kind** (p. 1943)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Kind of reliability.
DDS_ReliabilityQosPolicy (p. 1940)	**max_blocking_time** (p. 1943)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* The maximum time a DataWriter can block on a write() call.
DDS_DestinationOrderQosPolicy (p. 1688)	**kind** (p. 1690)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Specifies the desired kind of destination order.
DDS_LifespanQosPolicy (p. 1818)	**duration** (p. 1819)
	*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Maximum duration for the data's validity.
DDS_TransportMulticastQosPolicy (p. 2064)	**value** (p. 2065)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* A sequence of multicast communications settings.
DDS_DiscoveryQosPolicy (p. 1717)	**multicast_receive_addresses** (p. 1719)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Specifies the multicast group addresses on which discovery-related **metatraffic** can be received by the DomainParticipant.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_liveliness_lease_duration** (p. 1694)
	*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* The liveliness lease duration for the participant.

DDS_PropertyQosPolicy (p. 1905)	**value** (p. 1907)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Sequence of properties.
DDS_EntityNameQosPolicy (p. 1793)	**name** (p. 1793)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The name of the entity.

Advanced Settings

DDS_UserDataQosPolicy (p. 2092)	**value** (p. 2093)
	<<***spec***>> *(p. 791)* a sequence of octets
DDS_GroupDataQosPolicy (p. 1806)	**value** (p. 1807)
	<<***spec***>> *(p. 791)* a sequence of octets
DDS_DurabilityQosPolicy (p. 1762)	**direct_communication** (p. 1765)
	<<***extension***>> *(p. 796)* Indicates whether or not a TRANSIENT or PERSISTENT **DDS_DataReader** (p. 618) should receive samples directly from a TRANSIENT or PERSISTENT **DDS_DataWriter** (p. 488)
DDS_DurabilityServiceQosPolicy (p. 1767)	**service_cleanup_delay** (p. 1768)
	<<***spec***>> *(p. 791)* Controls when the service is able to remove all information regarding a data instances.
DDS_DurabilityServiceQosPolicy (p. 1767)	**history_kind** (p. 1768)
	<<***spec***>> *(p. 791)* The kind of history to apply in recouping durable data.
DDS_DurabilityServiceQosPolicy (p. 1767)	**history_depth** (p. 1768)
	<<***spec***>> *(p. 791)* Setting to use for the **DDS_↩ DurabilityQosPolicy::writer_depth** (p. 1765) when recouping durable data.
DDS_DurabilityServiceQosPolicy (p. 1767)	**max_samples** (p. 1769)
	<<***spec***>> *(p. 791)* Part of resource limits QoS policy to apply when feeding a late joiner.
DDS_DurabilityServiceQosPolicy (p. 1767)	**max_instances** (p. 1769)
	<<***spec***>> *(p. 791)* Part of resource limits QoS policy to apply when feeding a late joiner.
DDS_DurabilityServiceQosPolicy (p. 1767)	**max_samples_per_instance** (p. 1769)
	<<***spec***>> *(p. 791)* Part of resource limits QoS policy to apply when feeding a late joiner.

DDS_CompressionSettings_t (p. 1568)	**compression_ids** (p. 1568)
	<<***extension***>> *(p. 796)* Mask that represents the compression algorithms enabled.
DDS_DataRepresentationQosPolicy (p. 1639)	**value** (p. 1640)
	<<***spec***>> *(p. 791)* Sequence of representation identifiers.
DDS_PresentationQosPolicy (p. 1894)	**access_scope** (p. 1897)
	<<***spec***>> *(p. 791)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
DDS_PresentationQosPolicy (p. 1894)	**coherent_access** (p. 1897)
	<<***spec***>> *(p. 791)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
DDS_PresentationQosPolicy (p. 1894)	**ordered_access** (p. 1897)
	<<***spec***>> *(p. 791)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
DDS_LatencyBudgetQosPolicy (p. 1816)	**duration** (p. 1818)
	<<***spec***>> *(p. 791)* Duration of the maximum acceptable delay.
DDS_ReliabilityQosPolicy (p. 1940)	**acknowledgment_kind** (p. 1943)
	<<***extension***>> *(p. 796)* Kind of reliable acknowledgment
DDS_ReliabilityQosPolicy (p. 1940)	**instance_state_consistency_kind** (p. 1944)
	<<***extension***>> *(p. 796)* Whether instance state consistency is enabled
DDS_ReliabilityQosPolicy (p. 1940)	**exact_reliability_kind_match** (p. 1944)
	<<***extension***>> *(p. 796)* Whether an exact reliability kind match is required for endpoint matching.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**kind** (p. 2083)
	<<***spec***>> *(p. 791)* Type consistency kind.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_sequence_bounds** (p. 2083)
	<<***spec***>> *(p. 791)* Controls whether sequence bounds are taken into consideration for type assignability.

DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_string_bounds** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether string bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_member_names** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether member names are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**prevent_type_widening** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether type widening is allowed.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**force_type_validation** (p. 2085)
	<<***spec***>> *(p. 791)* Controls whether type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_DataReader** (p. 618).
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_enum_literal_names** (p. 2085)
	<<***spec***>> *(p. 791)* Controls whether enumeration constant names are taken into consideration for type assignability.
DDS_TransportUnicastQosPolicy (p. 2071)	**value** (p. 2073)
	<<***extension***>> *(p. 796)* A sequence of unicast communication settings.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**virtual_guid** (p. 1597)
	<<***extension***>> *(p. 796)* The virtual GUID (Global Unique Identifier).
DDS_DataReaderProtocolQosPolicy (p. 1596)	**expects_inline_qos** (p. 1597)
	[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Specifies whether this DataReader expects inline QoS with every sample.
DDS_DataReaderProtocolQosPolicy (p. 1596)	**disable_positive_acks** (p. 1598)
	<<***extension***>> *(p. 796)* Whether the reader sends positive acknowledgements to writers.
DDS_DataWriterProtocolQosPolicy (p. 1649)	**virtual_guid** (p. 1650)
	<<***extension***>> *(p. 796)* The virtual GUID (Global Unique Identifier).
DDS_DataWriterProtocolQosPolicy (p. 1649)	**disable_positive_acks** (p. 1651)

	<<***extension***>> *(p. 796)* Controls whether or not the writer expects positive acknowledgements from matching readers.
DDS_DataTags (p. 1641)	**tags** (p. 1642)
	<<***spec***>> *(p. 791)* Sequence of data tags.
DDS_EntityNameQosPolicy (p. 1793)	**role_name** (p. 1794)
	<<***extension***>> *(p. 796)* The entity role name.
DDS_ServiceQosPolicy (p. 2005)	**kind** (p. 2005)
	<<***extension***>> *(p. 796)* The kind of service.
DDS_MultiChannelQosPolicy (p. 1860)	**channels** (p. 1861)
	<<***extension***>> *(p. 796)* A sequence of **DDS_ChannelSettings_t** (p. 1564) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.
DDS_MultiChannelQosPolicy (p. 1860)	**filter_name** (p. 1861)
	<<***extension***>> *(p. 796)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.
DDS_TopicQueryDispatchQosPolicy (p. 2053)	**enable** (p. 2054)
	<<***extension***>> *(p. 796)* Allows this writer to dispatch TopicQueries

5.83 Matching

These QoS affect participant and endpoint matching.

These QoS affect participant and endpoint matching.

See the pages of each individual QoS for a desription of how the QoS must be set in order for two applications to be considered matching. Look for information about compatibility or request-offered (**RxO** (p. 1247)) semantics.

Basic Settings

DDS_DurabilityQosPolicy (p. 1762)	**kind** (p. 1765)
	<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* The kind of durability.
DDS_DataRepresentationQosPolicy (p. 1639)	**compression_settings** (p. 1640)
	<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Structure that contains the compression settings.

DDS_DeadlineQosPolicy (p. 1685)	**period** (p. 1687)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) Duration of the deadline period.
DDS_OwnershipQosPolicy (p. 1867)	**kind** (p. 1871)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) The kind of ownership
DDS_LivelinessQosPolicy (p. 1826)	**kind** (p. 1828)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) The kind of liveliness desired.
DDS_LivelinessQosPolicy (p. 1826)	**lease_duration** (p. 1828)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) The duration within which a **DDS_DataWriter** (p. 488) must be asserted, or else it is assumed to be not alive.
DDS_PartitionQosPolicy (p. 1884)	**name** (p. 1886)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) A list of partition names
DDS_ReliabilityQosPolicy (p. 1940)	**kind** (p. 1943)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) Kind of reliability.
DDS_DestinationOrderQosPolicy (p. 1688)	**kind** (p. 1690)
	*<<**basic**>>* (p. *784*) *<<**spec**>>* (p. *791*) Specifies the desired kind of destination order.

Advanced Settings

DDS_CompressionSettings_t (p. 1568)	**compression_ids** (p. 1568)
	*<<**extension**>>* (p. *796*) Mask that represents the compression algorithms enabled.
DDS_DataRepresentationQosPolicy (p. 1639)	**value** (p. 1640)
	*<<**spec**>>* (p. *791*) Sequence of representation identifiers.
DDS_PresentationQosPolicy (p. 1894)	**access_scope** (p. 1897)
	*<<**spec**>>* (p. *791*) Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
DDS_PresentationQosPolicy (p. 1894)	**coherent_access** (p. 1897)
	*<<**spec**>>* (p. *791*) Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.

DDS_PresentationQosPolicy (p. 1894)	**ordered_access** (p. 1897)
	<<***spec***>> *(p. 791)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
DDS_LatencyBudgetQosPolicy (p. 1816)	**duration** (p. 1818)
	<<***spec***>> *(p. 791)* Duration of the maximum acceptable delay.
DDS_ReliabilityQosPolicy (p. 1940)	**acknowledgment_kind** (p. 1943)
	<<***extension***>> *(p. 796)* Kind of reliable acknowledgment
DDS_ReliabilityQosPolicy (p. 1940)	**instance_state_consistency_kind** (p. 1944)
	<<***extension***>> *(p. 796)* Whether instance state consistency is enabled
DDS_ReliabilityQosPolicy (p. 1940)	**exact_reliability_kind_match** (p. 1944)
	<<***extension***>> *(p. 796)* Whether an exact reliability kind match is required for endpoint matching.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**kind** (p. 2083)
	<<***spec***>> *(p. 791)* Type consistency kind.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_sequence_bounds** (p. 2083)
	<<***spec***>> *(p. 791)* Controls whether sequence bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_string_bounds** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether string bounds are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_member_names** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether member names are taken into consideration for type assignability.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**prevent_type_widening** (p. 2084)
	<<***spec***>> *(p. 791)* Controls whether type widening is allowed.
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**force_type_validation** (p. 2085)

	<<***spec***>> *(p. 791)* Controls whether type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_Data↩Reader** (p. 618).
DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)	**ignore_enum_literal_names** (p. 2085)
	<<***spec***>> *(p. 791)* Controls whether enumeration constant names are taken into consideration for type assignability.

5.84 Deprecated QoS

Deprecated QoS.

Deprecated QoS.

This page lists the QoS that are deprecated. Deprecated QoS are still supported, but RTI will not support them in future releases.

DDS_ResourceLimitsQosPolicy (p. 1953)	**instance_hash_buckets** (p. 1958)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Number of hash buckets for instances.
DDS_TypeSupportQosPolicy (p. 2087)	**plugin_data** (p. 2088)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Value to pass into the type plugin's de-/serialization function

	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for remote DomainParticipants.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**matching_writer_reader_pair_hash_buckets** (p. 1746)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for matching local writer and remote/local reader pairs.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**matching_reader_writer_pair_hash_buckets** (p. 1746)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for matching local reader and remote/local writer pairs.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**ignored_entity_hash_buckets** (p. 1746)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for ignored entities.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**content_filtered_topic_hash_buckets** (p. 1747)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for content filtered topics.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**content_filter_hash_buckets** (p. 1747)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for content filters.

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**flow_controller_hash_buckets** (p. 1747)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for flow controllers.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**type_code_max_serialized_length** (p. 1751)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Maximum size of serialized string for type code.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**ignored_entity_replacement_kind** (p. 1758)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **DDS_DomainParticipantResourceLimits↩ QosPolicy::ignored_entity_allocation** (p. 1741) are reached.
DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)	**remote_topic_query_hash_buckets** (p. 1759)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) Number of hash buckets for remote TopicQueries.
DDS_DatabaseQosPolicy (p. 1581)	**shutdown_timeout** (p. 1583)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) The maximum wait time during a shutdown.
DDS_DatabaseQosPolicy (p. 1581)	**cleanup_period** (p. 1583)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) The period at which the database thread wakes up to remove deleted records.
DDS_DatabaseQosPolicy (p. 1581)	**shutdown_cleanup_period** (p. 1583)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) The clean-up period used during database shut-down.
DDS_DatabaseQosPolicy (p. 1581)	**max_skiplist_level** (p. 1584)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) The maximum level of the skiplist.
DDS_ReceiverPoolQosPolicy (p. 1938)	**buffer_alignment** (p. 1940)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) The receive buffer alignment.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**remote_participant_purge_kind** (p. 1695)
	[DEPRECATED] (p. **968**) <<***extension***>> (p. *796*) The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

DDS_DiscoveryConfigQosPolicy (p. 1691)	**max_liveliness_loss_detection_period** (p. 1695)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**ignore_default_domain_announcements** (p. 1707)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
DDS_DiscoveryConfigQosPolicy (p. 1691)	**participant_message_reader_reliability_kind** (p. 1703)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Reliability policy for a built-in participant message reader.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1976)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Enables dynamic adjustment of sample keep duration in response to congestion.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_decrease_sample_keep_duration_factor** (p. 1977)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Controls rate of contraction of dynamic sample keep duration.
DDS_RtpsReliableWriterProtocol_t (p. 1965)	**disable_positive_acks_increase_sample_keep_duration_factor** (p. 1977)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Controls rate of growth of dynamic sample keep duration.
DDS_BuiltinTopicReaderResourceLimits_t (p. 1557)	**disable_fragmentation_support** (p. 1560)
	[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Determines whether the built-in topic **DDS_DataReader** (p. 618) can receive fragmented samples.

5.85 System Properties

System Properties.

System Properties.

RTI Connext uses the **DDS_PropertyQosPolicy** (p. 1905) of a DomainParticipant to maintain a set of properties that provide system information such as hostname.

Unless the default **DDS_DomainParticipantQos** (p. 1729) value is overwritten, the system properties are automatically set in the **DDS_DomainParticipantQos** (p. 1729) obtained by calling the function **DDS_DomainParticipantFactory↩ _get_default_participant_qos** (p. 40) or using the constant **DDS_PARTICIPANT_QOS_DEFAULT** (p. 64).

System properties are also automatically set in the **DDS_DomainParticipantQos** (p. 1729) loaded from an XML QoS profile unless you disable property inheritance using the attribute **inherit** in the XML tag <**property**>.

By default, the system properties are propagated to other DomainParticipants in the system and can be accessed through **DDS_ParticipantBuiltinTopicData::property** (p. 1874).

You can disable the propagation of individual properties by setting the flag **DDS_Property_t::propagate** (p. 1905) to **DDS_BOOLEAN_FALSE** (p. 1203) or by removing the property using the function **DDS_PropertyQosPolicyHelper↩ _remove_property** (p. 1316).

The number of system properties set on the **DDS_DomainParticipantQos** (p. 1729) is platform specific.

5.85.1 System Properties List

The following table lists the supported system properties. For more information, see `System Properties`, in the Core Libraries User's Manual.

Property Name	Description
dds.sys_info.hostname	Name of the host where the process is running
dds.sys_info.process_id	Process ID
dds.sys_info.username	Name of the user running the process
dds.sys_info.execution_timestamp	Time when the execution started
dds.sys_info.creation_timestamp	Time when the executable was created
dds.sys_info.executable_filepath	Name and full path of the executable
dds.sys_info.target	Architecture for which the library was compiled

5.85.2 System Resource Consideration

System properties are affected by the resource limits **DDS_DomainParticipantResourceLimitsQosPolicy↩ ::participant_property_list_max_length** (p. 1755) and **DDS_DomainParticipantResourceLimitsQosPolicy↩ ::participant_property_string_max_length** (p. 1755).

5.86 Configuring QoS Profiles with XML

APIs related to XML QoS Profiles.

APIs related to XML QoS Profiles.

5.86.1 Loading QoS Profiles from XML Resources

A 'QoS profile' is a group of QoS settings, specified in XML format. By using QoS profiles, you can change QoS settings without recompiling the application.

The Qos profiles are loaded the first time any of the following operations are called:

- **DDS_DomainParticipantFactory_create_participant** (p. 41)
- **DDS_DomainParticipantFactory_create_participant_with_profile** (p. 42)
- **DDS_DomainParticipantFactory_set_default_participant_qos_with_profile** (p. 39)
- **DDS_DomainParticipantFactory_get_default_participant_qos** (p. 40)
- **DDS_DomainParticipantFactory_set_default_library** (p. 47)
- **DDS_DomainParticipantFactory_set_default_profile** (p. 48)
- **DDS_DomainParticipantFactory_get_participant_qos_from_profile** (p. 51)
- **DDS_DomainParticipantFactory_get_topic_qos_from_profile** (p. 55)
- **DDS_DomainParticipantFactory_get_topic_qos_from_profile_w_topic_name** (p. 56)
- **DDS_DomainParticipantFactory_get_publisher_qos_from_profile** (p. 52)
- **DDS_DomainParticipantFactory_get_subscriber_qos_from_profile** (p. 52)
- **DDS_DomainParticipantFactory_get_datawriter_qos_from_profile** (p. 54)
- **DDS_DomainParticipantFactory_get_datawriter_qos_from_profile_w_topic_name** (p. 55)
- **DDS_DomainParticipantFactory_get_datareader_qos_from_profile** (p. 53)
- **DDS_DomainParticipantFactory_get_datareader_qos_from_profile_w_topic_name** (p. 53)
- **DDS_DomainParticipantFactory_get_qos_profile_libraries** (p. 57)
- **DDS_DomainParticipantFactory_get_qos_profiles** (p. 57)
- **DDS_DomainParticipantFactory_load_profiles** (p. 46)

The QoS profiles are reloaded replacing previously loaded profiles when the following operations are called:

- **DDS_DomainParticipantFactory_set_qos** (p. 45)
- **DDS_DomainParticipantFactory_reload_profiles** (p. 46)

The **DDS_DomainParticipantFactory_unload_profiles** (p. 47) operation will free the resources associated with the XML QoS profiles.

There are five ways to configure the XML resources (listed by load order):

- The file NDDS_QOS_PROFILES.xml in $NDDSHOME/resource/xml is loaded if it exists and **DDS_ProfileQos↩ Policy::ignore_resource_profile** (p. 1904) in **DDS_ProfileQosPolicy** (p. 1902) is set to **DDS_BOOLEAN_↩ FALSE** (p. 1203) (first to be loaded). An example file, `NDDS_QOS_PROFILES.example.xml`, is available for reference.

- The URL groups separated by semicolons referenced by the enviroment variable NDDS_QOS_PROFILES are loaded if they exist and **DDS_ProfileQosPolicy::ignore_environment_profile** (p. 1903) in **DDS_ProfileQos↩ Policy** (p. 1902) is set to **DDS_BOOLEAN_FALSE** (p. 1203).

- The file USER_QOS_PROFILES.xml in the working directory will be loaded if it exists and **DDS_ProfileQos↩ Policy::ignore_user_profile** (p. 1903) in **DDS_ProfileQosPolicy** (p. 1902) is set to **DDS_BOOLEAN_FALSE** (p. 1203).

- The URL groups referenced by **DDS_ProfileQosPolicy::url_profile** (p. 1903) in **DDS_ProfileQosPolicy** (p. 1902) will be loaded if specified.

- The sequence of XML strings referenced by **DDS_ProfileQosPolicy::string_profile** (p. 1903) will be loaded if specified (last to be loaded).

The above methods can be combined together.

5.86.2 URL

The location of the XML resources (only files and strings are supported) is specified using a URL (Uniform Resource Locator) format. For example:

File Specification: `file:///usr/local/default_dds.xml`

String Specification: str://"<dds><qos_library> . . . lt;/qos_library>&lt/dds>"

If the URL schema name is omitted, RTI Connext will assume a file name. For example:

File Specification: /usr/local/default_dds.xml

5.86.2.1 URL groups

To provide redundancy and fault tolerance, you can specify multiple locations for a single XML document via URL groups. The syntax of a URL group is as follows:

[URL1 | URL2 | URL2 | . . .| URLn]

For example:

[`file:///usr/local/default_dds.xml` | `file:///usr/local/alternative_default_↩ dds.xml`]

Only one of the elements in the group will be loaded by RTI Connext, starting from the left.

Brackets are not required for groups with a single URL.

5.86.2.2 NDDS_QOS_PROFILES environment variable

The environment variable NDDS_QOS_PROFILES contains a list of URL groups separated by ';'

The URL groups referenced by the environment variable are loaded if they exist and **DDS_ProfileQosPolicy::ignore_environment_profile** (p. 1903) is set to **DDS_BOOLEAN_FALSE** (p. 1203)

5.86.2.3 Built-In QoS Profiles

There are also a number of built-in QoS profiles that can be used without having to load any configurations from outside XML resources. For more information on these built-in profiles see **Built-in Qos Profiles** (p. 1395).

For more information on XML Configuration, refer to the `User's Manual`.

5.87 Publication Example

A data publication example.

A data publication example.

5.87.1 A typical publication example

Prep

- Create user data types using rtiddsgen. See the `Code Generator User's Manual`.

Set up

- **Get the factory** (p. 978)
- **Set up participant** (p. 978)
- **Set up publisher** (p. 983)
- **Register user data type(s)** (p. 980)
- **Set up topic(s)** (p. 980)
- **Set up data writer(s)** (p. 984)

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 991)

Send data

- **Send data** (p. 985)

Tear down

- **Tear down data writer(s)** (p. 985)
- **Tear down topic(s)** (p. 980)
- **Tear down publisher** (p. 983)
- **Tear down participant** (p. 979)

5.88 Subscription Example

A data subscription example.

A data subscription example.

5.88.1 A typical subscription example

Prep

- Create user data types using rtiddsgen. See the `Code Generator User's Manual`.

Set up

- **Get the factory** (p. 978)
- **Set up participant** (p. 978)
- **Set up subscriber** (p. 985)
- **Register user data type(s)** (p. 980)
- **Set up topic(s)** (p. 980)
- **Set up data reader(s)** (p. 988)

- **Set up data reader** (p. 988) **OR Set up subscriber** (p. 986) to receive data

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 991)

Receive data

- Access received data either **via a reader** (p. 989) **OR via a subscriber** (p. 986) (possibly in a **ordered or coherent** (p. 987) manner)

Tear down

- **Tear down data reader(s)** (p. 990)
- **Tear down topic(s)** (p. 980)
- **Tear down subscriber** (p. 987)
- **Tear down participant** (p. 979)

5.89 Participant Use Cases

Working with domain participants.

Working with domain participants.

5.89.1 Turning off auto-enable of newly created participant(s)

- **Get the factory** (p. 978)

- Change the value of the **ENTITY_FACTORY** (p. 1291) for the **DDS_DomainParticipantFactory** (p. 32)

```
struct DDS_DomainParticipantFactoryQos factory_qos = DDS_DomainParticipantFactoryQos_INITIALIZER;
if (DDS_DomainParticipantFactory_get_qos(factory, &factory_qos)
            != DDS_RETCODE_OK) {
    printf("***Error: failed to get domain participant factory qos\n");
}
/* Change the QosPolicy to create disabled participants */
factory_qos.entity_factory.autoenable_created_entities = DDS_BOOLEAN_FALSE;
if (DDS_DomainParticipantFactory_set_qos(factory,  &factory_qos)
                        != DDS_RETCODE_OK) {
    printf("***Error: failed to set domain participant factory qos\n");
}

DDS_DomainParticipantFactoryQos_finalize(&factory_qos);
```

5.89.2 Getting the factory

- Get the DDS_DomainParticipantFactory instance:

```
DDS_DomainParticipantFactory* factory = NULL;
factory = DDS_DomainParticipantFactory_get_instance();
if (factory == NULL) {
    printf("***Error: failed to get domain participant factory\n");
}
```

5.89.3 Setting up a participant

- **Get the factory** (p. 978)

- Create DDS_DomainParticipant:

```
struct DDS_DomainParticipantQos participant_qos =
    DDS_DomainParticipantQos_INITIALIZER;
DDS_DomainParticipant* participant;
struct DDS_DomainParticipantListener participant_listener =
    DDS_DomainParticipantListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* Set the initial peers. These list all the computers the application
   may communicate with along with the maximum number of RTI Data
   Distribution Service participants that can concurrently run on that
   computer. This list only needs to be a superset of the actual list of
   computers and participants that will be running at any time.
*/
const char* NDDS_DISCOVERY_INITIAL_PEERS[] = {
    "host1",
    "10.10.30.192",
    "1@localhost",
    "2@host2",
    "my://", /* all unicast addresses on transport plugins with alias "my" */
    "2@shmem://", /* shared memory */
    "FF00:ABCD::0",
    "sf://0/0/R", /* StarFabric transport plugin */
```

```
    "1@FF00:0:1234::0",
    "225.1.2.3",
    "3@225.1.0.55",
    "FAA0::0#0/0/R",
};
const long NDDS_DISCOVERY_INITIAL_PEERS_LENGTH =
            sizeof(NDDS_DISCOVERY_INITIAL_PEERS)/sizeof(const char*);

/* MyDomainParticipantListener_* functions are user defined to match
   DDS_DomainParticipantListener functions */
participant_listener.as_topiclistener.on_inconsistent_topic =
    MyDomainParticipantListener_InconsistentTopic;
participant_listener.as_publisherlistener.as_datawriterlistener.on_offered_deadline_missed =
    MyDomainParticipantListener_OfferedDeadlineMissed;
participant_listener.as_publisherlistener.as_datawriterlistener.on_offered_incompatible_qos =
    MyDomainParticipantListener_OfferedIncompatibleQos;
participant_listener.as_publisherlistener.as_datawriterlistener.on_liveliness_lost =
    MyDomainParticipantListener_LivelinessLost;
participant_listener.as_publisherlistener.as_datawriterlistener.on_publication_matched =
    MyDomainParticipantListener_PublicationMatch;
participant_listener.as_subscriberlistener.on_data_on_readers =
    MyDomainParticipantListener_DataOnReaders;
participant_listener.as_subscriberlistener.as_datareaderlistener.on_requested_deadline_missed =
    MyDomainParticipantListener_RequestedDeadlineMissed;
participant_listener.as_subscriberlistener.as_datareaderlistener.on_requested_incompatible_qos =
    MyDomainParticipantListener_RequestedIncompatibleQos;
participant_listener.as_subscriberlistener.as_datareaderlistener.on_sample_rejected =
    MyDomainParticipantListener_SampleRejected;

    MyDomainParticipantListener_LivelinessChanged;
participant_listener.as_subscriberlistener.as_datareaderlistener.on_data_available =
    MyDomainParticipantListener_DataAvailable;
participant_listener.as_subscriberlistener.as_datareaderlistener.on_subscription_matched =
    MyDomainParticipantListener_SubscriptionMatched;
participant_listener.as_subscriberlistener.as_datareaderlistener.on_sample_lost =
    MyDomainParticipantListener_SampleLost;
/* initialize participant_qos with default values */
retcode = DDS_DomainParticipantFactory_get_default_participant_qos(factory,
                                                    &participant_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default participant qos\n");
}
if (!DDS_StringSeq_from_array(&participant_qos.discovery.initial_peers,
                        NDDS_DISCOVERY_INITIAL_PEERS,
                        NDDS_DISCOVERY_INITIAL_PEERS_LENGTH)) {
    printf("***Error: failed to set discovery.initial_peers qos\n");
}

/* Create the participant */
participant =
    DDS_DomainParticipantFactory_create_participant(factory,
                                            domain_id,
                                            &participant_qos,
                        &participant_listener /* or NULL */,
                                            DDS_STATUS_MASK_ALL);
 if (participant == NULL) {
    printf("***Error: failed to create domain participant\n");
}
return participant;
```

5.89.4 Tearing down a participant

- **Get the factory** (p. 978)
- Delete DDS_DomainParticipant:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipantFactory_delete_participant(
    factory, participant);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete domain participant\n");
}
```

5.90 Topic Use Cases

Working with topics.

Working with topics.

5.90.1 Registering a user data type

- **Set up participant** (p. 978)
- Register user data type of type T under the name "My_Type"

```
const char* type_name = "My_Type";
DDS_ReturnCode_t retcode;
retcode = FooTypeSupport_register_type(participant, type_name);
if (retcode != DDS_RETCODE_OK) {
     printf("***Error: failed to register type\n");
}
```

5.90.2 Setting up a topic

- **Set up participant** (p. 978)
- **Ensure user data type is registered** (p. 980)
- Create a DDS_Topic under the name "my_topic"

```
const char* topic_name = "my_topic";
const char* type_type = "My_Type";   /* user data type */
struct DDS_TopicQos topic_qos = DDS_TopicQos_INITIALIZER;
DDS_Topic* topic;
struct DDS_TopicListener topic_listener = DDS_TopicListener_INITIALIZER;
/* MyTopicListener_InconsistentTopic function is user defined to match
   DDS_TopicListener_InconsistentTopicCallback */
topic_listener.on_inconsistent_topic = MyTopicListener_InconsistentTopic;
retcode = DDS_DomainParticipant_get_default_topic_qos(participant,
                                                      &topic_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default topic qos\n");
}
topic = DDS_DomainParticipant_create_topic(participant,
                                           topic_name,
                                           type_name,
                                           &topic_qos,
                                           &topic_listener /* or NULL */,
                                       DDS_STATUS_MASK_ALL);
if (topic == NULL) {
    printf("***Error: failed to create topic\n");
}
```

5.90.3 Tearing down a topic

- Delete DDS_Topic:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipant_delete_topic(participant, topic);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete topic\n");
}
```

5.91 FlowController Use Cases

Working with flow controllers.

Working with flow controllers.

5.91.1 Creating a flow controller

- **Set up participant** (p. 978)
- Create a flow controller

```
DDS_ReturnCode_t retcode;
DDS_FlowController *controller = NULL;
struct DDS_FlowControllerProperty_t property = DDS_FlowControllerProperty_t_INITIALIZER;
retcode = DDS_DomainParticipant_get_default_flowcontroller_property(
    participant, &property);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default flow controller property\n");
}
/* optionally modify flow controller property values */
controller = DDS_DomainParticipant_create_flowcontroller(
    participant, "my flow controller name", &property);
if (controller == NULL) {
    printf("***Error: failed to create flow controller\n");
}
```

5.91.2 Flow controlling a data writer

- **Set up participant** (p. 978)
- **Create flow controller** (p. 981)
- Create an asynchronous data writer, **FooDataWriter** (p. 2119), of user data type **Foo** (p. 2116):

```
struct DDS_DataWriterQos writer_qos = DDS_DataWriterQos_INITIALIZER;
DDS_DataWriter* writer;
struct DDS_DataWriterListener writer_listener =
    DDS_DataWriterListener_INITIALIZER;
/* MyWriterListener_* functions are user defined to match
   DDS_DataWriterListener functions */
writer_listener.on_offered_deadline_missed =
    MyWriterListener_OfferedDeadlineMissed;
writer_listener.on_offered_incompatible_qos =
    MyWriterListener_OfferedIncompatibleQos;
writer_listener.on_liveliness_lost = MyWriterListener_LivelinessLost;
writer_listener.on_publication_matched = MyWriterListener_PublicationMatch;
retcode = DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default datawriter qos\n");
}
/* Change the writer QoS to publish asnychronously */
writer_qos.publish_mode.kind = DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS;
/* Setup to use the previously created flow controller */
writer_qos.publish_mode.flow_controller_name =
    DDS_String_dup("my flow controller name");
/* Samples queued for asynchronous write are subject to the History Qos policy */
writer_qos.history.kind = DDS_KEEP_ALL_HISTORY_QOS;
writer = DDS_Publisher_create_datawriter(publisher,
                                         topic,
                                         &writer_qos,
                                         &writer_listener /* or NULL */,
                                         DDS_STATUS_MASK_ALL);
if (writer == NULL) {
    printf("***Error: failed to create writer\n");
}
/* Send data asynchronously... */
/* Wait for asynchronous send completes, if desired */
retcode = DDS_DataWriter_wait_for_asynchronous_publishing(writer, &timout);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to wait for asynchronous publishing\n");
}
```

5.91.3 Using the built-in flow controllers

RTI Connext provides several built-in flow controllers.

The **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 567) built-in flow controller provides the basic asynchronous writer behavior. When calling **FooDataWriter_write** (p. 499), the call signals the **DDS_Publisher** (p. 446) asynchronous publishing thread (**DDS_PublisherQos::asynchronous_publisher** (p. 1924)) to send the actual data. As with any **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321) **DDS_DataWriter** (p. 488), the **FooDataWriter_write** (p. 499) call returns immediately afterwards. The data is sent immediately in the context of the **DDS_Publisher** (p. 446) asynchronous publishing thread.

When using the **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 567) flow controller, data is also sent in the context of the **DDS_Publisher** (p. 446) asynchronous publishing thread, but at a regular fixed interval. The thread accumulates samples from different **DDS_DataWriter** (p. 488) instances and generates data on the wire only once per **DDS_FlowControllerTokenBucketProperty_t::period** (p. 1805).

In contrast, the **DDS_ON_DEMAND_FLOW_CONTROLLER_NAME** (p. 568) flow controller permits flow only when **DDS_FlowController_trigger_flow** (p. 566) is called. The data is still sent in the context of the **DDS_Publisher** (p. 446) asynchronous publishing thread. The thread accumulates samples from different **DDS_DataWriter** (p. 488) instances (across any **DDS_Publisher** (p. 446)) and sends all data since the previous trigger.

The properties of the built-in **DDS_FlowController** (p. 562) instances can be adjusted.

- **Set up participant** (p. 978)
- Lookup built-in flow controller

```
DDS_FlowController *controller = NULL;
controller = DDS_DomainParticipant_lookup_flowcontroller(
    participant, DDS_DEFAULT_FLOW_CONTROLLER_NAME);
/* This should never happen, built-in flow controllers are always created */
if (controller == NULL) {
    printf("***Error: failed to lookup flow controller\n");
}
```

- Change property of built-in flow controller, if desired

```
DDS_ReturnCode_t retcode;
struct DDS_FlowControllerProperty_t property = DDS_FlowControllerProperty_t_INITIALIZER;
/* Get the property of the flow controller */
retcode = DDS_FlowController_get_property(controller, &property);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get flow controller property\n");
}
/* Change the property value as desired */
property.token_bucket.period.sec = 2;
property.token_bucket.period.nanosec = 0;
/* Update the flow controller property */
retcode = DDS_FlowController_set_property(controller, &property);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to set flow controller property\n");
}
```

- **Create a data writer using the correct flow controller name** (p. 981)

5.91.4 Shaping the network traffic for a particular transport

- **Set up participant** (p. 978)
- **Create the transports** (p. 994)
- **Create a separate flow controller for each transport** (p. 981)
- Configure **DDS_DataWriter** (p. 488) instances to only use a single transport
- **Associate all data writers using the same transport to the corresponding flow controller** (p. 981)
- For each transport, the corresponding flow controller limits the network traffic based on the token bucket properties

5.91.5 Coalescing multiple samples in a single network packet

- **Set up participant** (p. 978)
- **Create a flow controller with a desired token bucket period** (p. 981)
- **Associate the data writer with the flow controller** (p. 981)
- Multiple samples written within the specified period will be coalesced into a single network packet (provided that `tokens_added_per_period` and `bytes_per_token` permit).

5.92 Publisher Use Cases

Working with publishers.

Working with publishers.

5.92.1 Setting up a publisher

- **Set up participant** (p. 978)
- Create a DDS_Publisher

```
struct DDS_PublisherQos publisher_qos = DDS_PublisherQos_INITIALIZER;
DDS_Publisher* publisher;
struct DDS_PublisherListener publisher_listener =
    DDS_PublisherListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* MyPublisherListener_* functions are user defined to match
   DDS_PublisherListener functions */
publisher_listener.as_datawriterlistener.on_offered_deadline_missed =
    MyPublisherListener_OfferedDeadlineMissed;
publisher_listener.as_datawriterlistener.on_offered_incompatible_qos =
    MyPublisherListener_OfferedIncompatibleQos;
publisher_listener.as_datawriterlistener.on_liveliness_lost =
    MyPublisherListener_LivelinessLost;
publisher_listener.as_datawriterlistener.on_publication_matched =
    MyPublisherListener_PublicationMatch;
retcode = DDS_DomainParticipant_get_default_publisher_qos(participant,
                                                          &publisher_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default publisher qos\n");
}
publisher = DDS_DomainParticipant_create_publisher(participant,
                                                   &publisher_qos,
                                                   &publisher_listener /* or NULL */,
                                                DDS_STATUS_MASK_ALL);
if (publisher == NULL) {
    printf("***Error: failed to create publisher\n");
}
```

5.92.2 Tearing down a publisher

- Delete DDS_Publisher:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipant_delete_publisher(participant, publisher);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete publisher\n");
}
```

5.93 DataWriter Use Cases

Working with data writers.

Working with data writers.

5.93.1 Setting up a data writer

- **Set up publisher** (p. 983)
- **Set up a topic** (p. 980)
- Create a data writer, **FooDataWriter** (p. 2119), of user data type **Foo** (p. 2116) **:**

```
struct DDS_DataWriterQos writer_qos = DDS_DataWriterQos_INITIALIZER;
DDS_DataWriter* writer;
struct DDS_DataWriterListener writer_listener =
    DDS_DataWriterListener_INITIALIZER;
/* MyWriterListener_* functions are user defined to match
   DDS_DataWriterListener functions */
writer_listener.on_offered_deadline_missed =
    MyWriterListener_OfferedDeadlineMissed;
writer_listener.on_offered_incompatible_qos =
    MyWriterListener_OfferedIncompatibleQos;
writer_listener.on_liveliness_lost = MyWriterListener_LivelinessLost;
writer_listener.on_publication_match = MyWriterListener_PublicationMatch;
retcode = DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default datawriter qos\n");
}
writer = DDS_Publisher_create_datawriter(publisher,
                                         topic,
                                         &writer_qos,
                                         &writer_listener /* or NULL */,
                                   DDS_STATUS_MASK_ALL);
if (writer == NULL) {
    printf("***Error: failed to create writer\n");
}
```

5.93.2 Managing instances

- Getting an instance "key" value of user data type **Foo** (p. 2116)

```
struct Foo* data = ...;     /* user data */
retcode = FooDataWriter_get_key_value(writer, data, &instance_handle);
if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

- Registering an instance of type **Foo** (p. 2116)

```
DDS_InstanceHandle_t instance_handle = DDS_HANDLE_NIL;
instance_handle = FooDataWriter_register_instance(writer, data);
```

- Unregistering an instance of type **Foo** (p. 2116)

```
retcode = FooDataWriter_unregister_instance(writer, data, &instance_handle);
if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

- Disposing of an instance of type **Foo** (p. 2116)

```
retcode = FooDataWriter_dispose(writer, data, &instance_handle);
if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

5.93.3 Sending data

- **Set up data writer** (p. 984)
- **Register instance** (p. 984)
- Write instance of type **Foo** (p. 2116)

```
struct Foo* data = ...;     /* user data */
DDS_InstanceHandle_t instance_handle =
    DDS_HANDLE_NIL; /* or a valid registered handle */
DDS_ReturnCode_t retcode;
retcode = FooDataWriter_write(writer, data, &instance_handle);
if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

5.93.4 Tearing down a data writer

- Delete DDS_DataWriter:

```
DDS_ReturnCode_t retcode;
retcode = DDS_Publisher_delete_datawriter(publisher, writer);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete writer\n");
}
```

5.94 Subscriber Use Cases

Working with subscribers.

Working with subscribers.

5.94.1 Setting up a subscriber

- **Set up participant** (p. 978)
- Create a DDS_Subscriber

```
struct DDS_SubscriberQos subscriber_qos = DDS_SubscriberQos_INITIALIZER;
DDS_Subscriber* subscriber;
struct DDS_SubscriberListener subscriber_listener = DDS_SubscriberListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* MySubscriberListener_* functions are user defined to match
   DDS_SubscriberListener functions */
subscriber_listener.on_data_on_readers =
    MySubscriberListener_DataOnReaders;
subscriber_listener.as_datareaderlistener.on_requested_deadline_missed =
    MySubscriberListener_RequestedDeadlineMissed;
subscriber_listener.as_datareaderlistener.on_requested_incompatible_qos =
    MySubscriberListener_RequestedIncompatibleQos;
subscriber_listener.as_datareaderlistener.on_sample_rejected =
    MySubscriberListener_SampleRejected;
subscriber_listener.as_datareaderlistener.on_liveliness_changed =
    MySubscriberListener_LivelinessChanged;
subscriber_listener.as_datareaderlistener.on_data_available =
    MySubscriberListener_DataAvailable;
subscriber_listener.as_datareaderlistener.on_subscription_matched =
    MySubscriberListener_SubscriptionMatch;
subscriber_listener.as_datareaderlistener.on_sample_lost =
    MySubscriberListener_SampleLost;
retcode = DDS_DomainParticipant_get_default_subscriber_qos(participant,
                                                           &subscriber_qos);
if (retcode != DDS_RETCODE_OK) {
```

```
    printf("***Error: failed to get default subscriber qos\n");
}
subscriber =  DDS_DomainParticipant_create_subscriber(participant,
                                                      &subscriber_qos,
                                                      &subscriber_listener /*or NULL*/,
                                                  DDS_STATUS_MASK_ALL);
if (subscriber == NULL) {
    printf("***Error: failed to create subscriber\n");
}
```

5.94.2 Set up subscriber to access received data

- **Set up subscriber** (p. 985)
- Set up to handle the DDS_DATA_ON_READERS_STATUS status, in one or both of the following two ways.
- **Enable DDS_DATA_ON_READERS_STATUS for the DDS_SubscriberListener associated with the subscriber** (p. 991)
  - The processing to handle the status change is done in the DDS_SubscriberListener_on_data_on_readers() method of the attached listener.
  - Typical processing will **access the received data** (p. 986), either in arbitrary order or in a **coherent and ordered manner** (p. 987).
- **Enable DDS_DATA_ON_READERS_STATUS for the DDS_StatusCondition associated with the subscriber** (p. 992)
  - The processing to handle the status change is done **when the subscriber's attached status condition is triggered** (p. 993) and the DDS_DATA_ON_READERS_STATUS status on the subscriber is changed.
  - Typical processing will **access the received data** (p. 986), either in an arbitrary order or in a **coherent and ordered manner** (p. 987).

5.94.3 Access received data via a subscriber

- **Ensure subscriber is set up to access received data** (p. 986)
- Get the list of readers that have data samples available:

```
struct DDS_DataReaderSeq reader_seq = DDS_SEQUENCE_INITIALIZER;
long                     max_samples = DDS_LENGTH_UNLIMITED;
DDS_SampleStateMask      sample_state_mask = DDS_NOT_READ_SAMPLE_STATE;
DDS_ViewStateMask        view_state_mask = DDS_ANY_VIEW_STATE;
DDS_InstanceStateMask    instance_state_mask = DDS_ANY_INSTANCE_STATE;
DDS_ReturnCode_t retcode = DDS_RETCODE_OK;
retcode = DDS_Subscriber_get_datareaders(subscriber,
                                         &reader_seq,
                                         max_samples,
                                         sample_state_mask,
                                         view_state_mask,
                                         instance_state_mask);
if (retcode != DDS_RETCODE_OK) {
       printf("***Error: failed to access received data via subscriber\n");
       return;
}
```

- Upon successfully getting the list of readers with data, process the data readers to either:
  - **Read the data in each reader** (p. 990), **OR**
  - **Take the data in each reader** (p. 989)

If the intent is to access the data **coherently or in order** (p. 987), the list of data readers *must* be processed in the order returned:

```
int i;
for(i = 0; i < DDS_DataReaderSeq_get_length(&reader_seq); ++i) {

  TDataReader* reader = DDS_DataReaderSeq_get_reference(&reader_seq, i);
  /* Take the data from reader,
                OR
     Read the data from reader  */
}
```

- **Alternatively**, call **DDS_Subscriber_notify_datareaders** (p. 593) to invoke the **DDS_DataReaderListener** (p. 1593) for each of the data readers.

```
DDS_ReturnCode_t retcode;
retcode = DDS_Subscriber_notify_datareaders(subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to notify datareaders\n");
}
```

5.94.4 Access received data coherently and/or in order

To access the received data coherently and/or in an ordered manner, according to the settings of the **DDS_↩ PresentationQosPolicy** (p. 1894) attached to a DDS_Subscriber:

- **Ensure subscriber is set up to access received data** (p. 986)
- Indicate that data will be accessed via the subscriber:

```
retcode = DDS_Subscriber_begin_access(subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to begin access\n");
}
```

- **Access received data via the subscriber, making sure that the data readers are processed in the order returned.** (p. 986)
- Indicate that the data access via the subscriber is done:

```
retcode = DDS_Subscriber_end_access(subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to end access\n");
}
```

5.94.5 Tearing down a subscriber

- Delete DDS_Subscriber:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipant_delete_subscriber(participant, subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete subscriber\n");
}
```

5.95 DataReader Use Cases

Working with data readers.

Working with data readers.

5.95.1 Setting up a data reader

- **Set up subscriber** (p. 985)
- **Set up a topic** (p. 980)
- Create a data reader, **FooDataReader** (p. 2119), of user data type **Foo** (p. 2116):

```
struct DDS_DataReaderQos reader_qos = DDS_DataReaderQos_INITIALIZER;
DDS_DataReader* reader;
struct DDS_DataReaderListener reader_listener =
    DDS_DataReaderListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* MyReaderListener_* functions are user defined to match
   DDS_ReaderListener functions */
reader_listener.on_requested_deadline_missed =
    MyReaderListener_RequestedDeadlineMissed;
reader_listener.on_requested_incompatible_qos =
    MyReaderListener_RequestedIncompatibleQos;
reader_listener.on_sample_rejected = MyReaderListener_SampleRejected;
reader_listener.on_liveliness_changed =
    MyReaderListener_LivelinessChanged;
reader_listener.on_data_available = MyReaderListener_DataAvailable;
reader_listener.on_subscription_match =
    MyReaderListener_SubscriptionMatch;
reader_listener.on_sample_lost = MyReaderListener_SampleLost;
retcode = DDS_Subscriber_get_default_datareader_qos(
            subscriber, &reader_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default datareader qos\n");
}
reader = DDS_Subscriber_create_datareader(subscriber,
            DDS_Topic_as_topicdescription(topic),
            &reader_qos,
            &reader_listener /* or NULL */,
      DDS_STATUS_MASK_ALL);
if (reader == NULL) {
    printf("***Error: failed to create reader\n");
}
```

5.95.2 Managing instances

- Given a data reader

```
FooDataReader* reader = ...;
```

- Getting an instance "key" value of user data type **Foo** (p. 2116)

```
struct Foo* data = ...;     /* user data of type Foo */
retcode = FooDataReader_get_key_value(reader, data, &instance_handle);
if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

5.95.3 Set up reader to access received data

- **Set up data reader** (p. 988)
- Set up to handle the DDS_DATA_AVAILABLE_STATUS status, in one or both of the following two ways.
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDS_DataReaderListener associated with the data reader** (p. 991)
  - The processing to handle the status change is done in the DDS_DataReaderListener_on_data_available() method of the attached listener.
  - Typical processing will **access the received data** (p. 989).

- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSStatusCondition associated with the data reader** (p. 992)

  - The processing to handle the status change is done **when the data reader's attached status condition is triggered** (p. 993) and the DDS_DATA_AVAILABLE_STATUS status on the data reader is changed.
  - Typical processing will **access the received data** (p. 989).

5.95.4 Access received data via a reader

- **Ensure reader is set up to access received data** (p. 988)
- Access the received data, by either:
  - **Taking the received data in the reader** (p. 989), **OR**
  - **Reading the received data in the reader** (p. 990)

5.95.5 Taking data

- **Ensure reader is set up to access received data** (p. 988)
- Take samples of user data type `T`. The samples are removed from the Service. The caller is responsible for deallocating the buffers.

```
DDS_SampleStateMask   sample_state_mask = DDS_ANY_SAMPLE_STATE;
DDS_ViewStateMask     view_state_mask = DDS_ANY_ VIEW_STATE;
DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
struct FooSeq data_seq = FooSeq_INITIALIZER;
struct DDS_SampleInfoSeq info_seq = DDS_SampleInfoSeq_INITIALIZER;
DDS_ReturnCode_t retcode;
retcode = FooDataReader_take(reader, &data_seq, &info_seq,
                             max_samples,
                             sample_state_mask,
                             view_state_mask,
                             instance_state_mask);
if (retcode == DDS_RETCODE_NO_DATA) {
    return;
} else { if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to access data from the reader\n");
}
```

- Use the received data

```
struct Foo* data = NULL;
struct DDS_SampleInfo* info = NULL;
int i;
for(i = 0; i <  FooSeq_get_length(&data_seq); ++i) {
    info = DDS_SampleInfoSeq_get_reference(&info_seq, i);
    data = FooSeq_get_reference(&data_seq, i);
    /* Note that depending on the info->sample_state
      it is possible that data will be NULL
     */
    /* ... */
}
```

- Return the data samples and the information buffers back to the middleware. *IMPORTANT*: Once this call returns, you must not retain any pointers to any part of any sample or sample info object.

```
DDS_ReturnCode_t retcode;
retcode = FooDataReader_return_loan(reader, &data_seq, &info_seq);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to return loan\n");
}
```

5.95.6 Reading data

- **Ensure reader is set up to access received data** (p. 988)
- Read samples of user data type **Foo** (p. 2116). The samples are not removed from the Service. It remains responsible for deallocating the buffers.

```
DDS_SampleStateMask   sample_state_mask = DDS_ANY_SAMPLE_STATE;
DDS_ViewStateMask     view_state_mask = DDS_ANY_ VIEW_STATE;
DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
struct FooSeq data_seq = FooSeq_INITIALIZER;
struct DDS_SampleInfoSeq info_seq = DDS_SampleInfoSeq_INITIALIZER;
DDS_ReturnCode_t retcode;
retcode = FooDataReader_read(reader, &data_seq, &info_seq,
                             max_samples,
                             sample_state_mask,
                             view_state_mask,
                             instance_state_mask);
if (retcode == DDS_RETCODE_NO_DATA) {
    return;
} else if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to access data from the reader\n");
}
```

- Use the received data

```
struct Foo* data = NULL;
struct DDS_SampleInfo* info = NULL;
int i;
for(i = 0; i <  FooSeq_get_length(&data_seq); ++i) {
    info = DDS_SampleInfoSeq_get_reference(&info_seq, i);
    data = FooSeq_get_reference(&data_seq, i);
    /* Note that depending on the info->sample_state
      it is possible that data will be NULL
     */
    /* ... */
}
```

- Return the data samples and the information buffers back to the middleware

```
retcode = FooDataReader_return_loan(reader, &data_seq, &info_seq);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to return loan\n");
}
```

5.95.7 Tearing down a data reader

- Delete DDS_DataReader:

```
DDS_ReturnCode_t retcode;
retcode = DDS_Subscriber_delete_datareader(subscriber, reader);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete reader\n");
}
```

5.96 Entity Use Cases

Working with entities.

Working with entities.

5.96.1 Enabling an entity

- To enable an **DDS_Entity** (p. 1362)

```
    if (DDS_Entity_enable((DDS_Entity*)entity) != DDS_RETCODE_OK) {
        printf("***Error: failed to enable entity\n");
    }
```

5.96.2 Checking if a status changed on an entity.

- Given an **DDS_Entity** (p. 1362) and a **DDS_StatusKind** (p. 1229) to check for, get the list of statuses that have changed since the last time they were respectively cleared.

```
DDS_StatusMask status_changes_mask;

status_changes_mask = DDS_Entity_get_status_changes(entity);
```

- Check if `status_kind` was changed since the last time it was cleared. A plain communication status change is cleared when the status is read using the entity's `get_<plain communication status>()` method. A read communication status change is cleared when the data is taken from the middleware via a TDataReader_↩ take() call [see **Changes in Status** (p. 1226) for details].

```
if (status_changes_mask & status_kind) {
    return 1; /* ... YES, status_kind changed ... */
} else {
    return 0; /* ... NO, status_kind did NOT change ... */
}
```

5.96.3 Changing the QoS for an entity

The QoS for an entity can be specified at the entity creation time. Once an entity has been created, its QoS can be manipulated as follows.

- Get an entity's QoS settings using **get_qos (abstract)** (p. 1364)

```
if (DDS_DomainParticipant_get_qos(entity, &qos) != DDS_RETCODE_OK) {
    printf("***Error: failed to get qos\n");
}
```

- Change the desired qos policy fields

```
/* Change the desired qos policies */
/* qos.policy.field = ... */
```

- Set the qos using **set_qos (abstract)** (p. 1363).

```
switch (DDS_DomainParticipant_set_qos(entity, &qos)) {
    case DDS_RETCODE_OK: { /* success */
    } break;
    case DDS_RETCODE_IMMUTABLE_POLICY: {
        printf("***Error: tried changing a policy that can only be"
               "          set at entity creation time\n");
    } break;
    case DDS_RETCODE_INCONSISTENT_POLICY: {
        printf("***Error: tried changing a policy to a value inconsistent"
               "          with other policy settings\n");
    } break;
    default: {
        printf("***Error: some other failure\n");
    }
}

DDS_DomainParticipantQos_finalize(&qos);
```

5.96.4 Changing the listener and enabling/disabling statuses associated with it

The listener for an entity can be specified at the entity creation time. By default the listener is *enabled* for all the statuses supported by the entity.

Once an entity has been created, its listener and/or the statuses for which it is enabled can be manipulated as follows.

- User defines entity listener methods
```
/* ... methods defined by EntityListener ... */
MyEntityListener_LivelinessChanged(   /* one example method */
                    void* listener_data,
                    DDS_Entity* entity,
                    const struct DDS_LivelinessChangedStatus *status);
```

- Set the entity_listener functions
```
/* ... set the listener struct to the previously defined functions ...
       one example is shown */
entity_listener.on_liveliness_changed = MyEntityListener_LivelinessChanged;
```

- Get an entity's listener using **get_listener (abstract)** (p. 1365)
```
entity_listener = DDS_Entity_get_listener(entity);
```

- Enable `status_kind` for the `listener`
```
enabled_status_list |= status_kind;
```

- Disable `status_kind` for the `listener`
```
enabled_status_list &= ~status_kind;
```

- Set an entity's listener to `entity_listener` using **set_listener (abstract)** (p. 1364). Only enable the listener for the statuses specified by the `enabled_status_list`.
```
if (DDS_Entity_set_listener(entity, &entity_listener, enabled_status_list)
                != DDS_RETCODE_OK) {
    printf("***Error: setting entity listener\n");
}
```

5.96.5 Enabling/Disabling statuses associated with a status condition

Upon entity creation, by default, all the statuses are *enabled* for the DDS_StatusCondition associated with the entity.

Once an entity has been created, the list of statuses for which the DDS_StatusCondition is triggered can be manipulated as follows.

- Given an `entity`, a `status_kind`, and the associated `status_condition`:
```
statuscondition = DDS_Entity_get_statuscondition(entity);
```
  - Get the list of statuses enabled for the `status_condition`
```
enabled_status_list = DDS_StatusCondition_get_enabled_statuses(statuscondition);
```

- Check if the given `status_kind` is enabled for the `status_condition`
```
if (enabled_status_list & status_kind) {
    /*... YES, status_kind is enabled ... */
} else {
    /* ... NO, status_kind is NOT enabled ... */
}
```

- Enable `status_kind` for the `status_condition`
```
if (DDS_StatusCondition_set_enabled_statuses(status_condition,
                                enabled_status_list | status_kind)
            != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

- Disable `status_kind` for the `status_condition`
```
if (DDS_StatusCondition_set_enabled_statuses(status_condition,
                    enabled_status_list & ~status_kind)
            != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

5.97 Waitset Use Cases

Using wait-sets and conditions.

Using wait-sets and conditions.

5.97.1 Setting up a wait-set

- Create a wait-set
```
DDS_WaitSet* waitset = DDS_WaitSet_new();
```
- Attach conditions
```
DDS_Condition* cond1 = ...;
DDS_Condition* cond2 = DDS_StatusCondition_as_condition(
                        DDS_Entity_get_statuscondition(entity));
DDS_Condition* cond3 = DDS_ReadCondition_as_condition(
                        DDS_DataReader_create_readcondition(
                                reader,
                                                DDS_NOT_READ_SAMPLE_STATE,
                                DDS_ANY_VIEW_STATE,
                                DDS_ANY_INSTANCE_STATE));
DDS_Condition* cond4 = DDS_GuardCondition_as_condition(
                        DDS_GuardCondition_new());
DDS_Condition* cond5 = ...;
DDS_ReturnCode_t retcode;
retcode = DDS_WaitSet_attach_condition(waitset, cond1);
if (retcode != DDS_RETCODE_OK) {
    /* ... error */
}
retcode = DDS_WaitSet_attach_condition(waitset, cond2);
if (retcode != DDS_RETCODE_OK) {
    /* ... error */
}
retcode = DDS_WaitSet_attach_condition(waitset, cond3);
if (retcode != DDS_RETCODE_OK) {
    /* ... error */
}
retcode = DDS_WaitSet_attach_condition(waitset, cond4);
if (retcode != DDS_RETCODE_OK) {
    /* ... error */
}
retcode = DDS_WaitSet_attach_condition(waitset, cond5);
if (retcode != DDS_RETCODE_OK) {
    /* ... error */
}
```

5.97.2 Waiting for condition(s) to trigger

- **Set up a wait-set** (p. 993)
- Wait for a condition to trigger or `timeout`, whichever occurs first
```
#define TRUE 1
#define FALSE 0
struct DDS_Duration_t timeout = { 0, 1000000 }; /* 1ms */
struct DDS_ConditionSeq active_conditions = DDS_SEQUENCE_INITIALIZER; /* holder for active conditions */
int is_cond1_triggered = FALSE;
int is_cond2_triggered = FALSE;
int i;
DDS_ReturnCode_t retcode;
retcode = DDS_WaitSet_wait(waitset, &active_conditions, &timeout);
if (retcode == DDS_RETCODE_TIMEOUT){
    /* handle timeout */
} else if (retcode != DDS_RETCODE_OK) {
    /* check for other cause of failure */
} else {
    /* success */
    /* check if "cond1" or "cond2" are triggered: */
```

```
        for(i = 0; i < DDS_ConditionSeq_get_length(&active_conditions); ++i) {
            if (DDS_ConditionSeq_get(&active_conditions, i) == cond1) {
                printf("Cond1 was triggered!");
                is_cond1_triggered = TRUE;
            }
            if (DDS_ConditionSeq_get(&active_conditions, i) == cond2) {
                printf("Cond2 was triggered!");
                is_cond2_triggered = TRUE;
            }
            if (is_cond1_triggered && is_cond2_triggered) {
                break;
            }
        }
    }
    if (is_cond1_triggered) {
        /* ... do something because "cond1" was triggered ... */
    }
    if (is_cond2_triggered) {
        /* ... do something because "cond2" was triggered ... */
    }
```

5.97.3 Tearing down a wait-set

- Delete the wait-set
```
DDS_WaitSet_delete(waitset);
waitset = NULL;
```

5.98 Transport Use Cases

Working with pluggable transports.

Working with pluggable transports.

5.98.1 Changing the automatically registered built-in transports

- The **DDS_TRANSPORTBUILTIN_MASK_DEFAULT** (p. 1334) specifies the transport plugins that will be automatically registered with a newly created **DDS_DomainParticipant** (p. 76) by default.
- This default can be changed by changing the value of the value of **TRANSPORT_BUILTIN** (p. 1333) Qos Policy on the **DDS_DomainParticipant** (p. 76)
- To change the **DDS_DomainParticipantQos::transport_builtin** (p. 1731) Qos Policy:
```
    struct DDS_DomainParticipantQos participant_qos = DDS_DomainParticipantQos_INITIALIZER;

    DDS_DomainParticipantFactory_get_default_participant_qos(factory, &participant_qos);

    participant_qos.transport_builtin.mask = DDS_TRANSPORTBUILTIN_SHMEM |
                                             DDS_TRANSPORTBUILTIN_UDPv4;
```

5.98.2 Changing the properties of the automatically registered builtin transports

The behavior of the automatically registered builtin transports can be altered by changing their properties.

- Tell the **DDS_DomainParticipantFactory** (p. 32) to create the participants disabled, as described in **Turning off auto-enable of newly created participant(s)** (p. 978)
- Get the property of the desired builtin transport plugin, say ::**UDPv4 Transport** (p. 1043)

```
struct NDDS_Transport_UDPv4_Property_t property = NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT;

if (NDDS_Transport_Support_get_builtin_transport_property(
                                    participant,
                                    DDS_TRANSPORTBUILTIN_UDPv4,
                                    (struct NDDS_Transport_Property_t*)&property)
       != DDS_RETCODE_OK) {
    printf("***Error: get builtin transport property\n");
}
```

- Change the property fields as desired. Note that the properties should be changed carefully, as inappropriate values may prevent communications. For example, the ::**UDPv4 Transport** (p. 1043) properties can be changed to support **large messages** (assuming the underlying operating system's UDPv4 stack supports the large message size). Note: if message_size_max is increased from the default for any of the built-in transports, then the **DDS_ReceiverPoolQosPolicy::buffer_size** (p. 1939) on the DomainParticipant should also be changed.

```
/* Decrease the UDPv4 maximum message size to 9K (small messages). */
property.parent.message_size_max =  9216;
property.recv_socket_buffer_size =  9216;
property.send_socket_buffer_size =  9216;
```

- Set the property of the desired builtin transport plugin, say ::**UDPv4 Transport** (p. 1043)

```
if (NDDS_Transport_Support_set_builtin_transport_property(
                                    participant,
                                    DDS_TRANSPORTBUILTIN_UDPv4,
                                    (struct NDDS_Transport_Property_t*)&property)
       != DDS_RETCODE_OK) {
    printf("***Error: set builtin transport property\n");
}
```

- **Enable the participant** (p. 990) to turn on communications with other participants in the domain using the new properties for the automatically registered builtin transport plugins.

5.98.3 Creating a transport

- A transport plugin is created using methods provided by the supplier of the transport plugin.
- For example to create an instance of the ::**UDPv4 Transport** (p. 1043)

```
NDDS_Transport_Plugin* transport = NULL;
struct NDDS_Transport_UDPv4_Property_t property = NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT;
transport = NDDS_Transport_UDPv4_new(&property);
if (transport == NULL) {
   printf("***Error: creating transport plugin\n");
}
```

5.98.4 Deleting a transport

- A transport plugin can only be deleted only after the **DDS_DomainParticipant** (p. 76) with which it is registered is deleted.
- The virtual destructor provided by the abstract transport plugin API can be used to delete a transport plugin.

```
transport->delete_cEA(transport, NULL);
```

5.98.5 Registering a transport with a participant

The basic steps for setting up transport plugins for use in an RTI Connext application are described below.

- Tell the **DDS_DomainParticipantFactory** (p. 32) to create the participants disabled, as described in **Turning off auto-enable of newly created participant(s)** (p. 978)

Optionally **Changing the automatically registered built-in transports** (p. 994)

Optionally **Changing the properties of the automatically registered builtin transports** (p. 995)

- Create a disabled **DDS_DomainParticipant** (p. 76), as described in **Setting up a participant** (p. 978)
- Decide on the **network address** (p. 725) for the transport plugin. The network address should be chosen so that the resulting fully qualified address is globally unique (across all transports used in the domain).

```
/* Decide on a network address (96 bits for UDPv4), such that the fully
   qualified unicast address for the transport's interfaces will be
   globally unique. For example, we use the network address:
            1234:1234:1234:0000
   It will be prepended to the unicast addresses of the transport plugin's
   interfaces, to give a fully qualified address that is unique in the
   domain.
*/
NDDS_Transport_Address_t network_address = {{1,2,3,4, 1,2,3,4, 1,2,3,4, 0,0,0,0}};
```

- Decide on the **aliases** (p. 722) for the transport plugin. An alias can refer to one or more transport plugins. The transport class name (see **Builtin Transport Class Names** (p. 1360)) are automatically appended to the user-provided aliases. Alias names are useful in creating logical groupings of transports, e.g. all the transports that are configured to support large messages may be given the alias "large_message".

```
/* Decide aliases, i.e. the names by which this transport plugin will be known */
const char* ALIASES[] = {
    "my",
    "large_message",
};
const DDS_Long ALIASES_LENGTH = sizeof(ALIASES)/sizeof(const char*);

/* Initialize the aliases StringSeq */
struct DDS_StringSeq aliases = DDS_SEQUENCE_INITIALIZER;
if (!DDS_StringSeq_from_array(&aliases, ALIASES, ALIASES_LENGTH)) {
    printf("***Error: creating initializing aliases\n");
}
```

- Register the transport plugin with the **DDS_DomainParticipant** (p. 76). Note that a transport plugin should **NOT be registered with more than one DomainParticipant**. It is the responsibility of the application programmer to ensure that this requirement is not violated.

```
NDDS_Transport_Handle_t handle = NDDS_TRANSPORT_HANDLE_NIL;

handle = NDDS_Transport_Support_register_transport(
                      participant,          /* Disabled Domain Participant */
                      transport,            /* Transport plugin */
                      &aliases,             /* Transport aliases */
                      &network_address);    /* Transport network address */
if (NDDS_Transport_Handle_is_nil(&handle)) {
   printf("***Error: registering transport\n");
}

/* Finalize the aliases StringSeq */
DDS_StringSeq_finalize(&aliases);
```

Optionally **Adding receive routes for a transport** (p. 997)

Optionally **Adding send routes for a transport** (p. 997)

- **Enable the participant** (p. 990) to turn on communications with other participants in the domain, using the newly registered transport plugins, and automatically registered builtin transport plugins (if any).

5.98.6 Adding receive routes for a transport

- Receive routes can be added to restrict address ranges on which incoming messages can be received. Any number of receive routes can be added, but these must be done before the participant is enabled.
- To restrict the address range from which incoming messages can be received by the transport plugin:

```
/* Restrict to receiving messages only on interfaces
           1234:1234:1234:10.10.*.*
*/
NDDS_Transport_Address_t subnet = {{1,2,3,4, 1,2,3,4, 1,2,3,4, 10,10,0,0}};
if (NDDS_Transport_Support_add_receive_route(&handle, &subnet, 112)
                           != DDS_RETCODE_OK) {
   printf("***Error: adding receive route\n");
}
```

5.98.7 Adding send routes for a transport

- Send routes can be added to restrict the address ranges to which outgoing messages can be sent by the transport plugin. Any number of send routes can be added, but these must be done before the participant is enabled.
- To restrict address ranges to which outgoing messages can be sent by the transport plugin:

```
/* Restrict to sending messages only to addresses (subnets)
             1234:1234:1234:10.10.30.*
*/
NDDS_Transport_Address_t subnet = {{1,2,3,4, 1,2,3,4, 1,2,3,4, 10,10,30,0}};
if (NDDS_Transport_Support_add_send_route(&handle, &subnet, 120)
                           != DDS_RETCODE_OK) {
   printf("***Error: adding send route\n");
}
```

5.99 Filter Use Cases

Working with data filters.

Working with data filters.

5.99.1 Introduction

RTI Connext supports filtering data either during the exchange from **DDS_DataWriter** (p. 488) to **DDS_DataReader** (p. 618), or after the data has been stored at the **DDS_DataReader** (p. 618).

Filtering during the exchange process is performed by a **DDS_ContentFilteredTopic** (p. 176), which is created by the **DDS_DataReader** (p. 618) as a way of specifying a subset of the data samples that it wishes to receive.

Filtering samples that have already been received by the **DDS_DataReader** (p. 618) is performed by creating a **DDS_QueryCondition** (p. 700), which can then used to check for matching samples, be alerted when matching samples arrive, or retrieve matching samples through use of the **FooDataReader_read_w_condition** (p. 633) or **FooDataReader_take_w_condition** (p. 635) functions. (Conditions may also be used with the APIs **FooDataReader_read_next_instance_w_condition** (p. 646) and **FooDataReader_take_next_instance_w_condition** (p. 648).)

Filtering may be performed on any topic, either keyed or un-keyed, except the **Built-in Topics** (p. 164). Filtering may be perfomed on any field, subset of fields, or combination of fields, subject only to the limitations of the filter syntax, and some restrictions against filtering some *sparse value types* of the **Dynamic Data** (p. 315) API.

RTI Connext contains built in support for filtering using SQL syntax, described in the **Queries and Filters Syntax** (p. 739) module.

5.99.1.1 Overview of ContentFilteredTopic

Each **DDS_ContentFilteredTopic** (p. 176) is created based on an existing **DDS_Topic** (p. 174). The **DDS_Topic** (p. 174) specifies the **field_names** and **field_types** of the data contained within the topic. The **DDS_ContentFiltered↩ Topic** (p. 176), by means of its `filter_expression` and `expression_parameters`, further specifies the *values* of the data which the **DDS_DataReader** (p. 618) wishes to receive.

Custom filters may also be constructed and utilized as described in the **Creating Custom Content Filters** (p. 1000) module.

Once the **DDS_ContentFilteredTopic** (p. 176) has been created, a **DDS_DataReader** (p. 618) can be created using the filtered topic. The filter's characteristics are exchanged between the **DDS_DataReader** (p. 618) and any matching **DDS_DataWriter** (p. 488) during the discovery process.

If the **DDS_DataWriter** (p. 488) allows (by **DDS_DataWriterResourceLimitsQosPolicy::max_remote_reader_filters** (p. 1676)), and the **DDS_DataReader** (p. 618) 's **DDS_TransportMulticastQosPolicy** (p. 2064) is empty, then the **DDS_DataWriter** (p. 488) will filter out samples that don't meet the filtering criteria.

If disallowed by the **DDS_DataWriter** (p. 488), or the **DDS_DataReader** (p. 618) has set the **DDS_TransportMulticast↩ QosPolicy** (p. 2064), then the **DDS_DataWriter** (p. 488) sends all samples to the **DDS_DataReader** (p. 618), and the **DDS_DataReader** (p. 618) discards any samples that do not meet the filtering criteria.

The `expression_parameters` can be modified using **DDS_ContentFilteredTopic_set_expression_parameters** (p. 201). Any changes made to the filtering criteria by means of **DDS_ContentFilteredTopic_set_expression_↩ parameters** (p. 201), will be conveyed to any connected **DDS_DataWriter** (p. 488). New samples will be subject to the modified filtering criteria, but samples that have already been accepted or rejected are unaffected. However, if the **DDS_DataReader** (p. 618) connects to a **DDS_DataWriter** (p. 488) that *re-sends* its data, the re-sent samples will be subjected to the new filtering criteria.

5.99.1.2 Overview of QueryCondition

DDS_QueryCondition (p. 700) combine aspects of the content filtering capabilities of **DDS_ContentFilteredTopic** (p. 176) with state filtering capabilities of **DDS_ReadCondition** (p. 695) to create a reconfigurable means of filtering or searching data in the **DDS_DataReader** (p. 618) queue.

DDS_QueryCondition (p. 700) may be created on a disabled **DDS_DataReader** (p. 618), or after the **DDS_DataReader** (p. 618) has been enabled. If the **DDS_DataReader** (p. 618) is enabled, and has already recevied and stored samples in its queue, then all data samples in the are filtered against the **DDS_QueryCondition** (p. 700) filter criteria at the time that the **DDS_QueryCondition** (p. 700) is created. (Note that an exclusive lock is held on the **DDS_DataReader** (p. 618) sample queue for the duration of the **DDS_QueryCondition** (p. 700) creation).

Once created, incoming samples are filtered against all **DDS_QueryCondition** (p. 700) filter criteria at the time of their arrival and storage into the **DDS_DataReader** (p. 618) queue.

The number of **DDS_QueryCondition** (p. 700) filters that an individual **DDS_DataReader** (p. 618) may create is set by **DDS_DataReaderResourceLimitsQosPolicy::max_query_condition_filters** (p. 1632), to an upper maximum of 32.

5.99.2 Filtering with ContentFilteredTopic

- **Set up subscriber** (p. 985)
- **Set up a topic** (p. 980)
- Create a ContentFilteredTopic, of user data type **Foo** (p. 2116):

```
DDS_ContentFilteredTopic *cft = NULL;
struct DDS_StringSeq cft_parameters;
const char* cft_param_list[] = {"1", "100"};
DDS_StringSeq_initialize(&cft_parameters);
DDS_StringSeq_set_maximum(&cft_parameters, 2);
DDS_StringSeq_from_array(&cft_parameters, param_list, 2);
cft = DDS_DomainParticipant_create_contentfilteredtopic(participant,
                                                        "ContentFilteredTopic",
                                                        Foo_topic,
                                                        "value > %0 AND value < %1",
                                                        &cft_parameters);
if (cft == NULL) {
    printf("create_contentfilteredtopic error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

- Create a FooReader using the ContentFilteredTopic:

```
DDS_DataReader* reader;
FooDataReader* Foo_reader;
reader = DDS_Subscriber_create_datareader(subscriber,
                                          DDS_ContentFilteredTopic_as_topicdescription(cft),
                                          &reader_qos, /* or DDS_DATAREADER_QOS_DEFAULT */
                                          &reader_listener, /* or NULL */
                                          DDS_STATUS_MASK_ALL);
if (reader == NULL) {
    printf("create_datareader error\n");
    subscriber_shutdown(participant);
    return -1;
}
Foo_reader = FooDataReader_narrow(reader);
if (Foo_reader == NULL) {
    printf("DataReader narrow error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

  Once setup, reading samples with a **DDS_ContentFilteredTopic** (p. 176) is exactly the same as normal reads or takes, as decribed in **DataReader Use Cases** (p. 987).

- Changing filter crieria using set_expression_parameters:

```
DDS_String_free(DDS_StringSeq_get(&parameters, 0));
DDS_String_free(DDS_StringSeq_get(&parameters, 1));
*DDS_StringSeq_get_reference(&parameters, 0) = DDS_String_dup("5");
*DDS_StringSeq_get_reference(&parameters, 1) = DDS_String_dup("9");
retcode = DDS_ContentFilteredTopic_set_expression_parameters(cft,
                                                             &parameters);
if (retcode != DDS_RETCODE_OK) {
    printf("set_expression_parameters error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

5.99.3 Filtering with Query Conditions

- Given a data reader of type **Foo** (p. 2116)

```
DDS_DataReader* reader = ...;
FooDataReader* Foo_reader = FooDataReader_narrow(reader);
```

- Creating a QueryCondition

```
DDS_QueryCondition *queryCondition = NULL;
struct DDS_StringSeq qc_parameters;
const char *qc_param_list[] = {"1","100"};
DDS_StringSeq_initialize(&qc_parameters);
```

```
DDS_StringSeq_set_maximum(&qc_parameters, 2);
DDS_StringSeq_from_array(&qc_parameters, qc_param_list, 2);
queryCondition = DDS_DataReader_create_querycondition(reader,
                                                      DDS_NOT_READ_SAMPLE_STATE,
                                                      DDS_ANY_VIEW_STATE,
                                                      DDS_ALIVE_INSTANCE_STATE,
                                                      "value > %0 AND value < %1",
                                                      &qc_parameters);
if (queryCondition == NULL) {
    printf("create_query_condition error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

- Reading matching samples with a **DDS_QueryCondition** (p. 700)

```
struct FooSeq data_seq = DDS_SEQUENCE_INITIALIZER;
struct DDS_SampleInfoSeq info_seq = DDS_SEQUENCE_INITIALIZER;
retcode = FooDataReader_read_w_condition(Foo_reader,
                                         &data_seq, &info_seq,
                                         DDS_LENGTH_UNLIMITED,
                                         queryCondition);
if (retcode == DDS_RETCODE_NO_DATA) {
    printf("no matching data\n");
} else if (retcode != DDS_RETCODE_OK) {
    printf("read_w_condition error %d\n", retcode);
    subscriber_shutdown(participant);
    return -1;
} else {
    for (i = 0; i < FooSeq_get_length(&data_seq); ++i) {
        if (DDS_SampleInfoSeq_get_reference(&info_seq, i)->valid_data) {
            /* process your data here */
        }
    retcode = FooDataReader_return_loan(Foo_reader,
                                        &data_seq, &info_seq);
    if (retcode != DDS_RETCODE_OK) {
        printf("return loan error %d\n", retcode);
        subscriber_shutdown(participant);
        return -1;
    }
}
```

- **DDS_QueryCondition_set_query_parameters** (p. 701) is used similarly to **DDS_ContentFilteredTopic_set_expression_parameters** (p. 201), and the same coding techniques can be used.
- Any **DDS_QueryCondition** (p. 700) that have been created must be deleted before the **DDS_DataReader** (p. 618) can be deleted. This can be done using **DDS_DataReader_delete_contained_entities** (p. 675) or manually as in:

```
retcode = DDS_DataReader_delete_readcondition(reader,
                                              queryCondition);
```

5.99.4 Filtering Performance

Although RTI Connext supports filtering on any field or combination of fields using the SQL syntax of the built-in filter, filters for keyed topics that filter solely on the contents of key fields have the potential for much higher performance. This is because for key-only filters, the **DDS_DataReader** (p. 618) caches the results of the filter (pass or not pass) for each instance. When another sample of the same instance is seen at the **DDS_DataReader** (p. 618), the filter results are retrieved from the cache, dispensing with the need to call the filter function.

This optimization applies to all filtering using the built-in SQL filter, performed by the **DDS_DataReader** (p. 618), for either **DDS_ContentFilteredTopic** (p. 176) or **DDS_QueryCondition** (p. 700). This does *not* apply to filtering perfomed for **DDS_ContentFilteredTopic** (p. 176) by the **DDS_DataWriter** (p. 488).

5.100 Creating Custom Content Filters

Working with custom content filters.

Working with custom content filters.

5.100.1 Introduction

By default, RTI Connext creates content filters with the DDS_SQL_FILTER, which implements a superset of the DDS-specified SQL WHERE clause. However, in many cases this filter may not be what you want. Some examples are:

- The default filter can only filter based on the content of a sample, not on a computation on the content of a sample. You can use a custom filter that is customized for a specific type and can filter based on a computation of the type members.
- You want to use a different filter language then SQL

This HOWTO explains how to write your own custom filter and is divided into the following sections:

- **The Custom Content Filter API** (p. 1001)
- **Example Using C format strings** (p. 1002)

5.100.2 The Custom Content Filter API

A custom content filter is created by calling the **DDS_DomainParticipant_register_contentfilter** (p. 119) function with a **DDS_ContentFilter** (p. 1571) that contains a **compile**, an **evaluate** function and a **finalize** function. **DDS_Content↩ FilteredTopic** (p. 176) can be created with **DDS_DomainParticipant_create_contentfilteredtopic_with_filter** (p. 118) to use this filter.

A custom content filter is used by RTI Connext at the following times during the life-time of a **DDS_ContentFilteredTopic** (p. 176) (the function called is shown in parenthesis).

- When a **DDS_ContentFilteredTopic** (p. 176) is created (**compile** (p. 1001))
- When the filter parameters are changed on the **DDS_ContentFilteredTopic** (p. 176) (**compile** (p. 1001)) with **DDS_ContentFilteredTopic_set_expression_parameters** (p. 201)
- When a sample is filtered (**evaluate** (p. 1001)). This function is called by the RTI Connext core with a de-serialized sample
- When a **DDS_ContentFilteredTopic** (p. 176) is deleted (**finalize** (p. 1002))

5.100.2.1 The compile function

The **compile** (p. 1002) function is used to **compile** a filter expression and expression parameters. Please note that the term **compile** is intentionally loosely defined. It is up to the user to decide what this function should do and return.

See **DDS_ContentFilter::compile** (p. 1572) for details.

5.100.2.2 The evaluate function

The **evaluate** (p. 1002) function is called each time a sample is received to determine if a sample should be filtered out and discarded.

See **DDS_ContentFilter::evaluate** (p. 1574) for details.

5.100.2.3 The finalize function

The **finalize** (p. 1003) function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

See **DDS_ContentFilter::finalize** (p. 1576) for details.

5.100.3 Example Using C format strings

Assume that you have a type **Foo** (p. 2116).

You want to write a custom filter function that will drop all samples where the value of Foo.x $>$ x and x is a value determined by an expression parameter. The filter will **only** be used to filter samples of type **Foo** (p. 2116).

5.100.3.1 Writing the Compile Function

The first thing to note is that we can ignore the filter expression, since we already know what the expression is. The second is that x is a parameter that can be changed. By using this information, the compile function is very easy to implement. Simply return the parameter string. This string will then be passed to the evaluate function every time a sample of this type is filtered.

Below is the entire **compile** (p. 1001) function.

```
DDS_ReturnCode_t
howto_write_simple_compile_function(void *handle,
                                    void **new_compile_data,
                                    const char *expression,
                                    const struct DDS_StringSeq *parameters,
                                    const struct DDS_TypeCode *type_code,
                                    const char *type_class_name,
                                    void *old_compile_data)
{
    *new_compile_data = (void*)DDS_String_dup(*DDS_StringSeq_get_reference(parameters,0));
    return DDS_RETCODE_OK;
}
```

5.100.3.2 Writing the Evaluate Function

The next step is to implement the **evaluate** function. The evaluate function receives the parameter string with the actual value to test against. Thus the evaluate function must read the actual value from the parameter string before evaluating the expression. Below is the entire **evaluate** (p. 1001) function.

```
DDS_Boolean
howto_write_simple_evaluate_function(void *filter_data,
                                     void *compile_data,
                                     const void *sample,
                                     const struct DDS_FilterSampleInfo * meta_data)
{
    char *parameter = (char*)compile_data;
    DDS_Long x;
    Foo *foo_sample = (Foo*)sample;
    sscanf(parameter,"%d",&x);
    return (foo_sample->x > x ? DDS_BOOLEAN_FALSE : DDS_BOOLEAN_TRUE);
}
```

5.100.3.3 Writing the Finalize Function

The last function to write is the finalize function. It is safe to free all resources used by this particular instance of the custom content filter that is allocated in **compile**. Below is the entire **finalize** (p. 1002) function.

```
void
howto_write_simple_finalize_function(void *filter_data,
                                     void *compile_data)
{
    /* free parameter string from compile function */
    DDS_String_free((char *)compile_data);
}
```

5.100.3.4 Registering the Filter

Before the custom filter can be used, it must be registered with RTI Connext:

```
    struct DDS_ContentFilter filter = DDS_ContentFilter_INITIALIZER;
    filter.compile = howto_write_simple_compile_function;
    filter.evaluate = howto_write_simple_evaluate_function;
    filter.finalize = howto_write_simple_finalize_function;
    filter.filter_data = NULL;
    if (DDS_DomainParticipant_register_contentfilter(
        participant, "MyCustomFilter", &filter) != DDS_RETCODE_OK) {
        printf("Failed to register custom filter\n");
    }
```

5.100.3.5 Unregistering the Filter

When the filter is no longer needed, it can be unregistered from RTI Connext:

```
    if (DDS_DomainParticipant_unregister_contentfilter(
        participant, "MyCustomFilter" ) != DDS_RETCODE_OK) {
        printf("Failed to unregister custom filter\n");
    }
```

5.101 Large Data Use Cases

Working with large data types.

Working with large data types.

5.101.1 Introduction

RTI Connext supports data types whose size exceeds the maximum message size of the underlying transports. A **DDS_DataWriter** (p. 488) will fragment data samples when required. Fragments are automatically reassembled at the receiving end.

Once all fragments of a sample have been received, the new sample is passed to the **DDS_DataReader** (p. 618) which can then make it available to the user. Note that the new sample is treated as a regular sample at that point and its availability depends on standard QoS settings such as **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956) and **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295).

The large data feature is fully supported by all DDS API's, so its use is mostly transparent. Some additional considerations apply as explained below.

5.101.2 Writing Large Data

In order to use the large data feature with the **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) setting, the **DDS_↩ DataWriter** (p. 488) must be configured as an asynchronous writer (**DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321)) with associated **DDS_FlowController** (p. 562).

While the use of an asynchronous writer and flow controller is optional when using the **DDS_BEST_EFFORT_↩ RELIABILITY_QOS** (p. 1325) setting, most large data use cases will benefit from the use of a flow controller to prevent flooding the network when fragments are being sent.

- **Set up writer** (p. 984)
- **Add flow control** (p. 981)

5.101.3 Receiving Large Data

Large data is supported by default and in most cases, no further changes are required.

The **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619) allows tuning the resources available to the **DDS_Data↩ Reader** (p. 618) for reassembling fragmented large data.

- **Set up reader** (p. 988)

5.102 Request-Reply Examples

Examples on how to use the request-reply API .

Examples on how to use the request-reply API .

Request-Reply code examples.

5.102.1 Request-Reply Examples

Requesters and Repliers provide a way to use the Request-Reply communication pattern on top of the DDS entities. An application uses a Requester to send requests to a Replier; another application using a Replier receives a request and can send one or more replies for that request. The Requester that sent the request (and only that one) will receive the reply (or replies).

DDS Types

RTI Connext uses DDS data types for sending and receiving requests and replies. Valid types are those generated by the rtiddsgen code generator, the DDS built-in types, and `DynamicData`. Refer to the `Core Libraries User's Manual` and the following links for more information:

- Code Generator User's Manual,
- **Using the DDS built-in types** (p. 307),
- **Using DynamicData** (p. 315)

Set up

- **Create a DomainParticipant** (p. 978)
- **Create a requester** (p. 1006)
- **Create a requester with parameters** (p. 1006)
- **Create a replier** (p. 1009)

Requester: sending requests and receiving replies

- **Requester example** (p. 1007)
- **Taking loaned samples** (p. 1007)
- **Correlation between requests and replies** (p. 1008)

Replier: receiving requests and sending replies

- **Replier example** (p. 1010)
- **SimpleReplier example** (p. 1011)
- **Taking loaned samples** (p. 1007)

Note

To use Request-Reply you need to build and link your application with the additional `rticonnextmsgc` library.

The examples in this section require the following header files:

```
#include "connext_c/connext_c_requester.h"
#include "connext_c/connext_c_replier.h"
#include "connext_c/connext_c_simple_replier.h"
```

5.102.2 Creating a Requester

- **Setting up a participant** (p. 978)
- Instantiate the declaration of a **FooBarRequester** (p. 2117), a requester that sends requests of type **Foo** (p. 2116) and receives replies of type Bar (for example, in FooBarRequester.h)

```
/* Instantiate the FooBarRequester structure and declare its functions, for
 * example in a file named FooBarRequester.h
 *
 * The request type is Foo
 * The reply type is Bar
 * The name of the requester struct and prefix for the operations is FooBarRequester
 *
 */
RTI_CONNEXT_REQUESTER_DECL(Foo, Bar, FooBarRequester)
```

- Instantiate the implementation of a **FooBarRequester** (p. 2117) (for example, in FooBarRequester.c)

```
/* Instantiate the implementation of the FooBarRequester functions,
 * for example in a file named FooBarRequester.c.
 *
 *
 */
#define TReq Foo
#define TRep Bar
#define TRequester FooBarRequester
#include "connext_c/generic/connext_c_requestreply_TReqTRepRequester.gen"
```

- Create a Requester

```
    DDS_DomainParticipant * participant;
    FooBarRequester * requester;
    /* Create a DomainParticipant */
    participant = DDS_DomainParticipantFactory_create_participant(
            DDS_DomainParticipantFactory_get_instance(),
            domain_id, &DDS_PARTICIPANT_QOS_DEFAULT,
            NULL, DDS_STATUS_MASK_NONE);
    if (participant == NULL) {
        printf("Error creating participant\n");
    }
    /* Create a Requester */
    requester = FooBarRequester_create(participant, "TestService");
    if (requester == NULL) {
        printf("Error creating requester\n");
    }
```

5.102.3 Creating a Requester with optional parameters

- **Setting up a participant** (p. 978)
- Creating a Requester with optional parameters

```
    DDS_DomainParticipant * participant;
    FooBarRequester * requester;
    struct RTI_Connext_RequesterParams params =
        RTI_Connext_RequesterParams_INITIALIZER;
    /* Create a DomainParticipant */
    participant = DDS_DomainParticipantFactory_create_participant(
            DDS_DomainParticipantFactory_get_instance(),
            domain_id, &DDS_PARTICIPANT_QOS_DEFAULT,
            NULL, DDS_STATUS_MASK_NONE);
    if (participant == NULL) {
        printf("Error creating participant\n");
    }
    /* Set the parameters */
    /* The participant is always required */
    params.participant = participant;
    /* The service name is required, or alternatively
       params.request_topic_name and params.reply_topic_name can be used */
    params.service_name = (char *) "TestService";
    /* Create a Requester with a QoS profile (located for example in
       USER_QOS_PROFILES.xml, in the current working directory) */
    params.qos_library_name = (char *) "RequestReplyExampleProfiles";
    params.qos_profile_name = (char *) "RequesterExampleProfile";
    /* Create a Requester */
```

```
requester = FooBarRequester_create_w_params(&params);
if (requester == NULL) {
    printf("Error creating requester\n");
}
```

5.102.5 Taking loaned samples

- **Creating a Requester** (p. 1006)
- Get iterator to loaned replies (no copies)

```
int i;
DDS_ReturnCode_t retcode;
struct BarSeq replies = DDS_SEQUENCE_INITIALIZER;
struct DDS_SampleInfoSeq infos = DDS_SEQUENCE_INITIALIZER;
/* Get loaned samples
   Unlike receive_replies(), take_replies() doesn't block and returns an
   empty collection if there are no replies at that moment.
  (before that we can call requester.wait_for_replies)
*/
retcode = FooBarRequester_take_replies(
```

```
    requester, &replies, &infos, DDS_LENGTH_UNLIMITED);
if (retcode == DDS_RETCODE_NO_DATA) {
    printf("No replies are available\n");
    return;
} else if (retcode != DDS_RETCODE_OK) {
    printf("Error getting replies\n");
    return;
}
for (i = 0; i < BarSeq_get_length(&replies); i++) {
    Bar * reply = BarSeq_get_reference(&replies, i);
    struct DDS_SampleInfo * info = DDS_SampleInfoSeq_get_reference(&infos, i);
    if (info->valid_data) {
        printf("Received reply: %s\n", reply->message);
    }
}
/* Return the loan */
FooBarRequester_return_loan(requester, &replies, &infos);
```

5.102.6 Correlating requests and replies

- **Creating a Requester** (p. 1006)
- Example 1) Waiting for a reply for a specific request

```
DDS_ReturnCode_t retcode;
Foo * request;
struct DDS_WriteParams_t request_info1 = DDS_WRITEPARAMS_DEFAULT;
struct DDS_WriteParams_t request_info2 = DDS_WRITEPARAMS_DEFAULT;
Bar * reply;
struct DDS_SampleInfo reply_info;
struct DDS_SampleIdentity_t related_sample_id;
/* Note: error checking omitted for simplicity */
request = FooTypeSupport_create_data();
/* Send first request */
strcpy(request->message, "Request 1");
FooBarRequester_send_request_w_params(requester, request, &request_info1);
/* Send second request */
strcpy(request->message, "Request 2");
FooBarRequester_send_request_w_params(requester, request, &request_info2);
/* Wait for one reply to the second request */
retcode = RTI_Connext_Requester_wait_for_replies_for_related_request(
    (RTI_Connext_Requester *) requester, 1, &MAX_WAIT,
    &request_info2.identity);
if (retcode != DDS_RETCODE_OK) {
    printf("Did not receive reply for request 2\n");
    return;
}
/* Take that reply */
reply = BarTypeSupport_create_data();
retcode = FooBarRequester_take_reply_for_related_request(
    requester, reply, &reply_info, &request_info2.identity);
/* This postcondition should always be true */
DDS_SampleInfo_get_related_sample_identity(&reply_info, &related_sample_id);
if (!DDS_SampleIdentity_equals(&related_sample_id, &request_info2.identity)) {
    printf("postcondition failed\n");
}
if (reply_info.valid_data) {
    printf("Received reply for request 2: %s\n", reply->message);
}
/* Wait for one reply to the second request */
retcode = RTI_Connext_Requester_wait_for_replies_for_related_request(
    (RTI_Connext_Requester *) requester, 1, &MAX_WAIT,
    &request_info1.identity);
if (retcode != DDS_RETCODE_OK) {
    printf("Did not receive reply for request 1\n");
    return;
}
```

```
/* Take that reply */
retcode = FooBarRequester_take_reply_for_related_request(
    requester, reply, &reply_info, &request_info1.identity);
/* This postcondition should always be true */
DDS_SampleInfo_get_related_sample_identity(&reply_info, &related_sample_id);
if (!DDS_SampleIdentity_equals(&related_sample_id, &request_info1.identity)) {
    printf("postcondition failed\n");
}
if (reply_info.valid_data) {
    printf("Received reply for request 1: %s\n", reply->message);
}
FooTypeSupport_delete_data(request);
BarTypeSupport_delete_data(reply);
```

- Example 2) Correlate reply after receiving it

```
int i;
DDS_ReturnCode_t retcode;
Foo * request;
struct DDS_WriteParams_t request_info1 = DDS_WRITEPARAMS_DEFAULT;
struct DDS_WriteParams_t request_info2 = DDS_WRITEPARAMS_DEFAULT;
struct BarSeq replies = DDS_SEQUENCE_INITIALIZER;
struct DDS_SampleInfoSeq infos = DDS_SEQUENCE_INITIALIZER;
struct DDS_SampleIdentity_t related_sample_id;
/* Note: error checking omitted for simplicity */
request = FooTypeSupport_create_data();
/* Send first request */
strcpy(request->message, "Request 1");
FooBarRequester_send_request_w_params(requester, request, &request_info1);
/* Send second request */
strcpy(request->message, "Request 2");
FooBarRequester_send_request_w_params(requester, request, &request_info2);
/* Wait for two replies. In this case we don't mind the reception order */
retcode = RTI_Connext_Requester_wait_for_replies(
    (RTI_Connext_Requester *) requester, 2, &MAX_WAIT);
if (retcode != DDS_RETCODE_OK) {
    printf("Replies not received\n");
    return;
}
retcode = FooBarRequester_take_replies(
    requester, &replies, &infos, DDS_LENGTH_UNLIMITED);
for (i = 0; i < BarSeq_get_length(&replies); i++) {
    Bar * reply = BarSeq_get_reference(&replies, i);
    struct DDS_SampleInfo * info = DDS_SampleInfoSeq_get_reference(&infos, i);
    DDS_SampleInfo_get_related_sample_identity(info, &related_sample_id);
    if (DDS_SampleIdentity_equals(&related_sample_id, &request_info1.identity)) {
        printf("Received reply for request 1: %s\n", reply->message);
    } else if (DDS_SampleIdentity_equals(&related_sample_id, &request_info2.identity)) {
        printf("Received reply for request 2: %s\n", reply->message);
    } else {
        /* Should not happen */
        printf("Received unexpected reply\n");
    }
}
/* Return the loan */
FooBarRequester_return_loan(requester, &replies, &infos);
FooTypeSupport_delete_data(request);
```

Requester example (p. 1007)

Replier example (p. 1010)

5.102.7 Creating a Replier

- **Setting up a participant** (p. 978)
- Instantiate the declaration of a **FooBarReplier** (p. 2116), a replier that receives requests of type **Foo** (p. 2116) and sends replies of type Bar (for example, in FooBarReplier.h)

```
/* Instantiate the FooBarReplier structure and declare its functions, for
 * example in a file named FooBarReplier.h
 *
```

```
 * The request type is Foo
 * The reply type is Bar
 * The name of the replier struct and prefix for the operations is FooBarReplier
 */
RTI_CONNEXT_REPLIER_DECL(Foo, Bar, FooBarReplier)
```

- Instantiate the implementation of a **FooBarReplier** (p. 2116) (for example, in FooBarReplier.c)

```
/* Instantiate the implementation of the FooBarReplier functions,
 * for example in a file named FooBarReplier.c.
 *
 *
 */
#define TReq Foo
#define TRep Bar
#define TReplier FooBarReplier
#include "connext_c/generic/connext_c_requestreply_TReqTRepReplier.gen"
```

- Create a Replier

```
DDS_DomainParticipant * participant;
FooBarReplier * replier;
/* Create a DomainParticipant */
participant = DDS_DomainParticipantFactory_create_participant(
        DDS_DomainParticipantFactory_get_instance(),
        domain_id, &DDS_PARTICIPANT_QOS_DEFAULT,
        NULL, DDS_STATUS_MASK_NONE);
if (participant == NULL) {
    printf("Error creating participant\n");
}
/* Create a Replier */
replier = FooBarReplier_create(participant, "TestService");
if (replier == NULL) {
    printf("Error creating replier\n");
}
```

5.102.8 Replier example

- **Creating a Replier** (p. 1009)

- Replier example

```
DDS_ReturnCode_t retcode;
Foo * request;
Bar * reply;
struct DDS_SampleInfo request_info;
struct DDS_SampleIdentity_t request_id;
/* Note: error checking omitted for simplicity */
/* Receive one request */
request = FooTypeSupport_create_data();
retcode = FooBarReplier_receive_request(
    replier, request, &request_info, &MAX_WAIT);
if (retcode != DDS_RETCODE_OK) {
    printf("Request not received\n");
    FooTypeSupport_delete_data(request);
    return 0;
}
if (request_info.valid_data) {
    reply = BarTypeSupport_create_data();
    sprintf(reply->message, "Reply for %s", request->message);
    /* Send a reply for that request */
    DDS_SampleInfo_get_sample_identity(&request_info, &request_id);
    retcode = FooBarReplier_send_reply(replier, reply, &request_id);
    /* Note: a replier can send more than one reply for the same request */
    BarTypeSupport_delete_data(reply);
}
FooTypeSupport_delete_data(request);
```

See also

Requester example (p. 1007)

5.102.9 SimpleReplier example

- Instantiate the declaration of a **FooBarSimpleReplier** (p. 2118), a replier that receives requests of type **Foo** (p. 2116) and sends replies of type Bar (for example, in FooBarSimpleReplier.h)

```
/* Instantiate the FooBarSimpleReplier structure and declare its functions, for
 * example in a file named FooBarSimpleReplier.h
 *
 * The request type is Foo
 * The reply type is Bar
 * The name of the simple replier struct and prefix for the operations is
 * FooBarSimpleReplier
 *
 */
RTI_CONNEXT_SIMPLEREPLIER_DECL(Foo, Bar, FooBarSimpleReplier)
```

- Instantiate the implementation of a **FooBarSimpleReplier** (p. 2118) (for example, in FooBarSimpleReplier.c)

```
/* Instantiate the implementation of the FooBarSimpleReplier functions,
 * for example in a file named FooBarSimpleReplier.c.
 *
 *
 */
#define TReq Foo
#define TRep Bar
#define TSimpleReplier FooBarSimpleReplier
#include "connext_c/generic/connext_c_requestreply_TReqTRepSimpleReplier.gen"
```

- A **FooBarSimpleReplier** (p. 2118) wraps a **FooBarReplier** (p. 2116), which has to be defined as well. If you haven't already, instantiate the declaration and definition of **FooBarReplier** (p. 2116) as described in **Creating a Replier** (p. 1009) (you can do this in the same .h and .c files you just used for **FooBarSimpleReplier** (p. 2118)).

- Implement a listener

```
void * MySimpleReplierListener_on_request_available(
    RTI_Connext_SimpleReplierListener * listener,
    const void * request_untyped, const struct DDS_SampleInfo * info)
{
    Bar * reply;
    Foo * request = (Foo *) request_untyped;
    if (!info->valid_data) {
        /* In this example we don't reply to invalid-data samples.
           In other cases it could make sense to reply
           to a disposed instance, for example. */
        return NULL;
    }
    reply = BarTypeSupport_create_data();
    sprintf(reply->message, "Simple reply for %s", request->message);
    return (void *) reply;
}
void MySimpleReplierListener_on_return_loan(
    RTI_Connext_SimpleReplierListener * listener,
    void * reply)
{
    /* Delete the data we created on request available
     *
     * Note: we can store a single reply sample in listener->user_data
     *       and reuse it to avoid reserving and deleting memory on every call
     *       to on_request_available/on_return_loan
     */
    BarTypeSupport_delete_data(reply);
}
```

- And create a SimpleReplier with the listener:

```
    RTI_Connext_SimpleReplierListener listener;
    FooBarSimpleReplier * replier;
    /* Note: error checking omitted for simplicity */
    listener.on_request_available = MySimpleReplierListener_on_request_available;
    listener.return_loan = MySimpleReplierListener_on_return_loan;
    replier = FooBarSimpleReplier_create(participant, "TestService", &listener);
    /* After creation the SimpleReplier is already active and may call
       the listener */
```

Requester example (p. 1007)

5.102.10 Configuring Request-Reply QoS profiles

If you do not specify your own quality of service parameters (in **RTI_Connext_RequesterParams** (p. 2180) and **RTI_Connext_ReplierParams** (p. 2176)), a **FooBarRequester** (p. 2117) and **FooBarReplier** (p. 2116) are created using a default configuration defined in the built-in profile **DDS_PROFILE_PATTERN_RPC** (p. 1413). You use this built-in profile as the base for your own profiles:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="http://community.rti.com/schema/current/rti_dds_profiles.xsd">
    <qos_library name="RequestReplyExampleProfiles">
        <!-- Use these profiles to customize the Requester or Replier QoS -->
        <!-- These profiles inherit from the built-in profile
             BuiltinQosLib::Pattern.RPC, which defines the default values for
             the DataWriters and DataReaders created by a Requester or Replier
        -->
        <qos_profile name="RequesterExampleProfile" base_name="BuiltinQosLib::Pattern.RPC">
            <!-- Set the QoS for the DataReader created by the Requester -->
            <!--
            <datareader_qos>
                ...
            </datareader_qos>
            -->
            <!-- Set the QoS for the DataWriter created by the Requester -->
            <!--
            <datawriter_qos>
                ...
            </datawriter_qos>
            -->
        </qos_profile>
        <qos_profile name="ReplierExampleProfile" base_name="BuiltinQosLib::Pattern.RPC">
            <!-- Set the QoS for the DataReader created by the Replier -->
            <!--
            <datareader_qos>
                ...
            </datareader_qos>
            -->
            <!-- Set the QoS for the DataWriter created by the Replier -->
            <!--
            <datawriter_qos>
                ...
            </datawriter_qos>
            -->
        </qos_profile>
    </qos_library>
</dds>
```

The example **Creating a Requester with optional parameters** (p. 1006) shows how to create a **FooBarRequester** (p. 2117) using this profile.

Configuring QoS Profiles with XML (p. 973)

5.103 Documentation Roadmap

This section contains a roadmap for the new user with pointers on what to read first.

If you are new to RTI Connext, we recommend starting in the following order:

- See the `Getting Started Guide`. This document provides download and installation instructions. It also lays out the core value and concepts behind the product and takes you step-by-step through the creation of a simple example application.

- The `User's Manual` describes the features of the product and how to use them. It is organized around the structure of the DDS APIs and certain common high-level tasks.

- The documentation in the **RTI Connext DDS API Reference** (p. 1015) provides an overview of API classes and modules for the DDS data-centric publish-subscribe (DCPS) package from a programmer's perspective. Start by reading the documentation on the main page.
- After reading the high level module documentation, look at the **Publication Example** (p. 976) and **Subscription Example** (p. 977) for step-by-step examples of creating a publication and subscription. These are hyperlinked code snippets to the full API documentation, and provide a good place to begin learning the APIs.

- Next, work through your own application using the example code files generated by rtiddsgen. See the `Code Generator User's Manual`.
- To integrate similar code into your own application and build system, you will likely need to refer to the `Platform Notes`.

5.104 Conventions

This section describes the conventions used in the API documentation.

5.104.1 Unsupported Features

[Not supported (optional)] This note means that the optional feature from the DDS specification is not supported in the current release.

5.104.2 API Naming Conventions

5.104.2.1 Structure & Class Names

RTI Data Distribution Service 4 makes a distinction between *value types* and *interface types*. Value types are types such as primitives, enumerations, strings, and structures whose identity and equality are determined solely by explicit state. Interface types are those abstract opaque data types that conceptually have an identity apart from their explicit state. Examples include all of the **DDS_Entity** (p. 1362) subtypes, the **DDS_Condition** (p. 1372) subtypes, and **DDS_WaitSet** (p. 1373). Instances of value types are frequently transitory and are declared on the stack. Instances of interface types typically have longer lifecycles, are accessible by pointer only, and may be managed by a factory object.

Value type structures are made more explicit through the use of C's structure tag syntax. For example, a **DDS_↩ Duration_t** (p. 1770) object must be declared as being of type "struct DDS_Duration_t," not simply "DDS_Duration_t." Interface types, by contrast, are always of typedef'ed types; their underlying representations are opaque.

5.104.3 API Documentation Terms

In the API documentation, the term module refers to a logical grouping of documentation and elements in the API.

At this time, typedefs that occur in the API, such as **DDS_ReturnCode_t** (p. 1223) do not show up in the compound list or indices. This is a known limitation in the generated HTML.

5.104.4 Stereotypes

Commonly used stereotypes in the API documentation include the following.

5.104.4.1 Basic Qos

- *<<**basic**>> (p. 784)*
  - A QoS that Connext considers Basic.
  - See **Basic QoS** (p. 784) for a full list.

5.104.4.2 Extensions

- *<<**spec**>>* (p. *791)*
  - Part of a DDS standard specification.
  - See **DDS Specification QoS** (p. 791) for a full list of the QoS policies and fields that are part of a DDS standard specification.
- *<<**extension**>>* (p. *1014)*
  - An RTI Connext product extension to the DDS standard specification.
  - The extension APIs complement the standard APIs specified by the OMG DDS specification. They are provided to improve product usability and enable access to product-specific features such as pluggable transports.
  - See **DDS Extension QoS** (p. 796) for a full list of QoS policies and fields that are extensions.

5.104.4.3 Experimental

- *<<**experimental**>> (p. 1014)*
  - RTI Connext experimental features are used to evaluate new features and get user feedback.
  - These features are not guaranteed to be fully supported and might be implemented only of some of the programming languages supported bt RTI Connext
  - The functional APIs corresponding to experimental features can be distinguished from other APIs by the suffix '_exp'.
  - Experimental features may or may not appear in future product releases.
  - The name of the experimental features APIs will change if they become officially supported. At the very least the suffix '_exp' will be removed.
  - Experimental features should not be used in production.

5.104.4.4 Types

- <<***interface***>> *(*p. *1015)*
  - Pure interface type with *no state*.
  - Languages such as Java natively support the concept of an *interface* type, which is a collection of function signatures devoid of any dynamic state.
  - In C++, this is achieved via a class with all *pure virtual* methods and devoid of any instance variables (ie no dynamic state).
  - Interfaces are generally organized into a type hierarchy. Static typecasting along the interface type hierarchy is "safe" for valid objects.
- <<***generic***>> *(*p. *1015)*
  - A *generic* type is a *skeleton* class written in terms of generic parameters. Type-specific instantiations of such types are conventionally referred to in this documentation in terms of the hypothetical type "Foo"; for example: **FooSeq** (p. 2120), FooDataType, **FooDataWriter** (p. 2119), and **FooDataReader** (p. 2119).
  - For portability and efficiency, we implement generics using C preprocessor macros, rather than using C++ templates.
  - A *generic* type interface is declared via a #define macro.
  - Concrete types are generated from the generic type statically at compile time. The implementation of the concrete types is provided via the generic macros which can then be compiled as normal C or C++ code.
- <<***singleton***>> *(*p. *1015)*
  - Singleton class. There is a single instance of the class.
  - Generally acccessed via a `get_instance()` static function.

5.104.4.5 Method Parameters

- <<***in***>> *(*p. *1015)*
  - An *input* parameter.
- <<***out***>> *(*p. *1015)*
  - An *output* parameter.
- <<***inout***>> *(*p. *1015)*
  - An *input* and *output* parameter.

5.105 RTI Connext DDS API Reference

RTI Connext modules following the DDS module definitions.

Modules

- **Domain Module**

  *Contains the **DDS_DomainParticipant** (p. 76) class that acts as an entrypoint of RTI Connext and acts as a factory for many of the classes. The **DDS_DomainParticipant** (p. 76) also acts as a container for the other objects that make up RTI Connext.*
- **Topic Module**

  *Contains the **DDS_Topic** (p. 174), **DDS_ContentFilteredTopic** (p. 176), and **DDS_MultiTopic** (p. 184) classes, the **DDS_TopicListener** (p. 2047) interface, and more generally, all that is needed by an application to define **DDS_Topic** (p. 174) objects and attach QoS policies to them.*
- **Publication Module**

  *Contains the **DDS_FlowController** (p. 562), **DDS_Publisher** (p. 446), and **DDS_DataWriter** (p. 488) classes as well as the **DDS_PublisherListener** (p. 1921) and **DDS_DataWriterListener** (p. 1644) interfaces, and more generally, all that is needed on the publication side.*
- **Subscription Module**

  *Contains the **DDS_Subscriber** (p. 575), **DDS_DataReader** (p. 618), **DDS_ReadCondition** (p. 695), **DDS_QueryCondition** (p. 700), and **DDS_TopicQuery** (p. 708) classes, as well as the **DDS_SubscriberListener** (p. 2014) and **DDS_DataReaderListener** (p. 1593) interfaces, and more generally, all that is needed on the subscription side.*
- **Infrastructure Module**

  Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.
- **Transports**

  APIs related to RTI Connext pluggable transports.
- **Queries and Filters Syntax**
- **Logging and Version**

  APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connext.
- **General Utilities and Compliance Configuration**

  API of general utilities used in the RTI Connext distribution.
- **Observability Framework**

  RTI Connext Observability Framework modules and APIs.
- **Durability and Persistence**

  APIs related to RTI Connext Durability and Persistence.

- **Additional RTI Connext Communication Patterns**

  Extensions to the RTI Connext publish-subscribe functionality.

5.105.1 Detailed Description

RTI Connext modules following the DDS module definitions.

5.105.2 Overview

Information flows with the aid of the following constructs: **DDS_Publisher** (p. 446) and **DDS_DataWriter** (p. 488) on the sending side, **DDS_Subscriber** (p. 575) and **DDS_DataReader** (p. 618) on the receiving side.

- A **DDS_Publisher** (p. 446) is an object responsible for data distribution. It may publish data of different data types. A TDataWriter acts as a *typed* (i.e. each **DDS_DataWriter** (p. 488) object is dedicated to one application data type) accessor to a publisher. A **DDS_DataWriter** (p. 488) is the object the application must use to communicate to a publisher the existence and value of data objects of a given type. When data object values have been communicated to the publisher through the appropriate data-writer, it is the publisher's responsibility to perform the distribution (the publisher will do this according to its own QoS, or the QoS attached to the corresponding data-writer). A *publication* is defined by the association of a data-writer to a publisher. This association expresses the intent of the application to publish the data described by the data-writer in the context provided by the publisher.
- A **DDS_Subscriber** (p. 575) is an object responsible for receiving published data and making it available (according to the Subscriber's QoS) to the receiving application. It may receive and dispatch data of different specified types. To access the received data, the application must use a *typed* TDataReader attached to the subscriber. Thus, a *subscription* is defined by the association of a data-reader with a subscriber. This association expresses the intent of the application to subscribe to the data described by the data-reader in the context provided by the subscriber.

DDS_Topic (p. 174) objects conceptually fit between publications and subscriptions. Publications must be known in such a way that subscriptions can refer to them unambiguously. A **DDS_Topic** (p. 174) is meant to fulfill that purpose: it associates a name (unique in the domain i.e. the set of applications that are communicating with each other), a data type, and QoS related to the data itself. In addition to the topic QoS, the QoS of the **DDS_DataWriter** (p. 488) associated with that Topic and the QoS of the **DDS_Publisher** (p. 446) associated to the **DDS_DataWriter** (p. 488) control the behavior on the publisher's side, while the corresponding **DDS_Topic** (p. 174), **DDS_DataReader** (p. 618) and **DDS_Subscriber** (p. 575) QoS control the behavior on the subscriber's side.

When an application wishes to publish data of a given type, it must create a **DDS_Publisher** (p. 446) (or reuse an already created one) and a **DDS_DataWriter** (p. 488) with all the characteristics of the desired publication. Similarly, when an application wishes to receive data, it must create a **DDS_Subscriber** (p. 575) (or reuse an already created one) and a **DDS_DataReader** (p. 618) to define the subscription.

5.105.3 Conceptual Model

The overall conceptual model is shown below.

Notice that all the main communication objects (the specializations of Entity) follow unified patterns of:

- Supporting QoS (made up of several QosPolicy); QoS provides a generic mechanism for the application to control the behavior of the Service and tailor it to its needs. Each **DDS_Entity** (p. 1362) supports its own specialized kind of QoS policies (see **All QoS Policies** (p. 1240)).
- Accepting a **DDS_Listener** (p. 1819); listeners provide a generic mechanism for the middleware to notify the application of relevant asynchronous events, such as arrival of data corresponding to a subscription, violation of a QoS setting, etc. Each **DDS_Entity** (p. 1362) supports its own specialized kind of listener. Listeners are related to changes in status conditions (see **Status Kinds** (p. 1224)).

  Note that only one Listener per entity is allowed (instead of a list of them). The reason for that choice is that this allows a much simpler (and, thus, more efficient) implementation as far as the middleware is concerned. Moreover, if it were required, the application could easily implement a listener that, when triggered, triggers in return attached 'sub-listeners'.

- Accepting a **DDS_StatusCondition** (p. 1373) (and a set of **DDS_ReadCondition** (p. 695) objects for the **DDS_DataReader** (p. 618)); conditions (in conjunction with **DDS_WaitSet** (p. 1373) objects) provide support for an alternate communication style between the middleware and the application (i.e., wait-based rather than notification-based).

All DCPS entities are attached to a **DDS_DomainParticipant** (p. 76). A domain participant represents the local membership of the application in a domain. A *domain* is a distributed concept that links all the applications able to communicate with each other. It represents a communication plane: only the publishers and the subscribers attached to the same domain may interact.

DDS_DomainEntity (p. 1365) is an intermediate object whose only purpose is to state that a DomainParticipant cannot contain other domain participants.

At the DCPS level, data types represent information that is sent atomically. For performance reasons, only plain data structures are handled by this level.

By default, each data modification is propagated individually, independently, and uncorrelated with other modifications. However, an application may request that several modifications be sent as a whole and interpreted as such at the recipient side. This functionality is offered on a Publisher/Subscriber basis. That is, these relationships can only be specified among **DDS_DataWriter** (p. 488) objects attached to the same **DDS_Publisher** (p. 446) and retrieved among **DDS_DataReader** (p. 618) objects attached to the same **DDS_Subscriber** (p. 575).

By definition, a **DDS_Topic** (p. 174) corresponds to a single data type. However, several topics may refer to the same data type. Therefore, a **DDS_Topic** (p. 174) identifies data of a single type, ranging from one single instance to a whole collection of instances of that given type. This is shown below for the hypothetical data type **Foo** (p. 2116).

In case a set of instances is gathered under the same topic, different instances must be distinguishable. This is achieved by means of the values of some data fields that form the **key** to that data set. The *key description* (i.e., the list of data fields whose value forms the key) has to be indicated to the middleware. The rule is simple: *different data samples with the same key value represent successive values for the same instance, while different data samples with different key values represent different instances*. If no key is provided, the data set associated with the **DDS_Topic** (p. 174) is restricted to a *single instance*.

Topics need to be known by the middleware and potentially propagated. Topic objects are created using the create operations provided by **DDS_DomainParticipant** (p. 76).

The interaction style is straightforward on the publisher's side: when the application decides that it wants to make data available for publication, it calls the appropriate operation on the related **DDS_DataWriter** (p. 488) (this, in turn, will trigger its **DDS_Publisher** (p. 446)).

On the subscriber's side however, there are more choices: relevant information may arrive when the application is busy doing something else or when the application is just waiting for that information. Therefore, depending on the way the application is designed, asynchronous notifications or synchronous access may be more appropriate. Both interaction modes are allowed, a **DDS_Listener** (p. 1819) is used to provide a callback for synchronous access and a **DDS_WaitSet** (p. 1373) associated with one or several **DDS_Condition** (p. 1372) objects provides asynchronous data access.

The same synchronous and asynchronous interaction modes can also be used to access changes that affect the middleware communication status (see **Status Kinds** (p. 1224)). For instance, this may occur when the middleware asynchronously detects an inconsistency. In addition, other middleware information that may be relevant to the application (such as the list of the existing topics) is made available by means of **built-in topics** (p. 164) that the application can access as plain application data, using built-in data-readers.

5.105.4 Modules

DCPS consists of five modules:

- **Infrastructure module** (p. 717) defines the abstract classes and the interfaces that are refined by the other modules. It also provides support for the two interaction styles (notification-based and wait-based) with the middleware.
- **Domain module** (p. 26) contains the **DDS_DomainParticipant** (p. 76) class that acts as an entrypoint of the Service and acts as a factory for many of the classes. The **DDS_DomainParticipant** (p. 76) also acts as a container for the other objects that make up the Service.
- **Topic module** (p. 166) contains the **DDS_Topic** (p. 174) class, the **DDS_TopicListener** (p. 2047) interface, and more generally, all that is needed by the application to define **DDS_Topic** (p. 174) objects and attach QoS policies to them.
- **Publication module** (p. 441) contains the **DDS_Publisher** (p. 446) and **DDS_DataWriter** (p. 488) classes as well as the **DDS_PublisherListener** (p. 1921) and **DDS_DataWriterListener** (p. 1644) interfaces, and more generally, all that is needed on the publication side.
- **Subscription module** (p. 570) contains the **DDS_Subscriber** (p. 575), **DDS_DataReader** (p. 618), **DDS_ReadCondition** (p. 695), and **DDS_QueryCondition** (p. 700) classes, as well as the **DDS_SubscriberListener** (p. 2014) and **DDS_DataReaderListener** (p. 1593) interfaces, and more generally, all that is needed on the subscription side.

5.106 Additional RTI Connext Communication Patterns

Extensions to the RTI Connext publish-subscribe functionality.

Modules

- **Request-Reply Pattern**

  Support for the request-reply communication pattern.
- **Utilities**

  Utilities for the RTI Connext Messaging module.

5.106.1 Detailed Description

Extensions to the RTI Connext publish-subscribe functionality.

This section includes the **Request-Reply API** (p. 746).

5.107 Programming How-To's

These "How To"s illustrate how to apply RTI Connext APIs to common use cases.

Modules

- **Publication Example**

  A data publication example.
- **Subscription Example**

  A data subscription example.
- **Participant Use Cases**

  Working with domain participants.
- **Topic Use Cases**

  Working with topics.
- **FlowController Use Cases**

  Working with flow controllers.
- **Publisher Use Cases**

  Working with publishers.
- **DataWriter Use Cases**

  Working with data writers.
- **Subscriber Use Cases**

  Working with subscribers.
- **DataReader Use Cases**

  Working with data readers.
- **Entity Use Cases**

  Working with entities.
- **Waitset Use Cases**

  Using wait-sets and conditions.
- **Transport Use Cases**

  Working with pluggable transports.
- **Filter Use Cases**

  Working with data filters.
- **Creating Custom Content Filters**

  Working with custom content filters.
- **Large Data Use Cases**

  Working with large data types.
- **Request-Reply Examples**

  Examples on how to use the request-reply API .

5.107.1 Detailed Description

These "How To"s illustrate how to apply RTI Connext APIs to common use cases.

These are a good starting point to familiarize yourself with DDS. You can use these code fragments as "templates" for writing your own code.

5.108 Interface

Abstraction of a Transport Plugin network interface.

Data Structures

- struct **NDDS_Transport_Interface_t**

  Storage for the description of a network interface used by a Transport Plugin.

Enumerations

- enum **NDDS_Transport_Interface_Status_t** {
  NDDS_TRANSPORT_INTERFACE_OFF = 0 ,
  NDDS_TRANSPORT_INTERFACE_ON = 1 }

  Interface status.

5.108.1 Detailed Description

Abstraction of a Transport Plugin network interface.

A Transport Plugin may be able to use several logical or physical network interfaces in a single node (machine). For example, there may be multiple NICs for IP networks or multiple serial ports for serial networks.

An instance of a Transport Plugin is a conduit to one or more network interfaces associated with the transport.

Instances of a Transport Plugin must assign a unique unicast address to each of the network interfaces that it can use to send and receive messages. The unicast address should be within the range of addresses that are addressable by the Transport Plugin (as defined by the plugin itself).

Then, when RTI Connext sends a message to an unicast destination address, the destination address will be made of two parts. The network address and an interface address. The network address portion will be used by RTI Connext to select the Transport Plugin instance that will send the message. The interface address portion is passed to the Transport Plugin instance as the destination interface to which the message should be sent.

5.108.2 Enumeration Type Documentation

5.108.2.1 NDDS_Transport_Interface_Status_t

`enum` **`NDDS_Transport_Interface_Status_t`**

Interface status.

Enumerator

NDDS_TRANSPORT_INTERFACE_OFF	The transport interface is OFF.
NDDS_TRANSPORT_INTERFACE_ON	The transport interface is ON.

5.109 Transport Plugins Configuration

Transport plugins configuration with RTI Connext.

Data Structures

- struct **NDDS_Transport_UUID**

  Unequivocally identifies a transport plugin instance.
- struct **TransportAllocationSettings_t**

  Allocation settings used by various internal buffers.
- struct **NDDS_Transport_Property_t**

  Base configuration structure that must be inherited by derived Transport Plugin classes.

Macros

- #define **NDDS_TRANSPORT_PORT_INVALID** ((**NDDS_Transport_Port_t**) 0)

  Port 0 is considered to be invalid.
- #define **NDDS_TRANSPORT_UUID_SIZE** 12

  *Size of a **NDDS_Transport_UUID** (p. 2171).*
- #define **NDDS_TRANSPORT_LENGTH_UNLIMITED** -1

  Represent an unlimited length.
- #define **NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN** 0

  Rank interface as unknown or not yet set.
- #define **NDDS_TRANSPORT_UUID_UNKNOWN**

  Value for UUIDs that have no known value. Used as default.
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (-1)

  *The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 2188).*
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC** (-1)

  *The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 2188).*
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT**

  *The constant used as default value for the struct **TransportAllocationSettings_t** (p. 2188).*
- #define **NDDS_TRANSPORT_CLASSID_INVALID** (-1)

  Invalid Transport Class ID.
- #define **NDDS_TRANSPORT_CLASSID_UDPv4** (1)

  Builtin IPv4 UDP/IP Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_SHMEM** (0x01000000)

  Builtin Shared-Memory Transport Plugin class ID.

- #define **NDDS_TRANSPORT_CLASSID_SHMEM_510** (2)

  Builtin Shared-Memory Transport Plugin class ID for Connext 5.1.0 and earlier.
- #define **NDDS_TRANSPORT_CLASSID_UDPv6** (2)

  Builtin IPv6 UDP/IP Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_UDPv6_510** (5)

  Builtin IPv6 UDP/IP Transport Plugin class ID for Connext 5.1.0 and earlier.
- #define **NDDS_TRANSPORT_CLASSID_TCPV4_LAN** (8)

  IPv4 TCP/IP Transport Plugin class ID for LAN case.
- #define **NDDS_TRANSPORT_CLASSID_TCPV4_WAN** (9)

  IPv4 TCP/IP Transport Plugin class ID for WAN case.
- #define **NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN** "tcpv4_wan"

  IPv4 TCP/IP Transport Plugin class name for WAN case.
- #define **NDDS_TRANSPORT_CLASSID_TLSV4_LAN** (10)

  IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.
- #define **NDDS_TRANSPORT_CLASSID_TLSV4_WAN** (11)

  IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.
- #define **NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (0x01000001)

  Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (1000)

  Transport Plugin class IDs below this are reserved by RTI.
- #define **NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED** (0x2)

  Specified zero-copy behavior of transport.
- #define **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN** (3)

  Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

Typedefs

- typedef RTI_UINT32 **NDDS_Transport_Port_t**

  Type for storing RTI Connext RTPS ports.
- typedef RTI_INT32 **NDDS_Transport_ClassId_t**

  Type for storing RTI Connext Transport Plugin class IDs.

5.109.1 Detailed Description

Transport plugins configuration with RTI Connext.

Transport plugins are configured using properties. Each transport plugin must derive its property from a base configuration structure **NDDS_Transport_Property_t** (p. 2128).

To see how to configure the Built-in Transport Plugins, see **Built-in Transport Plugins** (p. 737).

See also

Built-in Transport Plugins (p. 737)

5.109.2 Macro Definition Documentation

5.109.2.1 NDDS_TRANSPORT_PORT_INVALID

```
#define NDDS_TRANSPORT_PORT_INVALID (( NDDS_Transport_Port_t) 0)
```

Port 0 is considered to be invalid.

5.109.2.2 NDDS_TRANSPORT_UUID_SIZE

```
#define NDDS_TRANSPORT_UUID_SIZE 12
```

Size of a **NDDS_Transport_UUID** (p. 2171).

5.109.2.3 NDDS_TRANSPORT_LENGTH_UNLIMITED

```
#define NDDS_TRANSPORT_LENGTH_UNLIMITED -1
```

Represent an unlimited length.

5.109.2.4 NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN

```
#define NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN 0
```

Rank interface as unknown or not yet set.

5.109.2.5 NDDS_TRANSPORT_UUID_UNKNOWN

```
#define NDDS_TRANSPORT_UUID_UNKNOWN
```

Value:

```
{ \
  { \
    0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0 \
  } \
}
```

Value for UUIDs that have no known value. Used as default.

5.109.2.6 NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED (-1)
```

The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 2188).

5.109.2.7 NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC (-1)
```

The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 2188).

Automatic means the buffer size will double at every reallocation.

5.109.2.8 NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT
```

Value:

```
        {                                   \
        2L, /* initial_count */                                                 \
        NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED, /* max_count */     \
        NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC /* incremental_count */ \
}
```

The constant used as default value for the struct **TransportAllocationSettings_t** (p. 2188).

The default value defined in this constant, sets the buffer to have:

- initial_count = 2 elements
- max_count = **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (p. 1024)
- incremental_count = NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC

5.109.2.9 NDDS_TRANSPORT_CLASSID_INVALID

```
#define NDDS_TRANSPORT_CLASSID_INVALID (-1)
```

Invalid Transport Class ID.

Transport-Plugins implementations should set their class ID to a value different than this.

5.109.2.10 NDDS_TRANSPORT_CLASSID_UDPv4

```
#define NDDS_TRANSPORT_CLASSID_UDPv4 (1)
```

Builtin IPv4 UDP/IP Transport Plugin class ID.

5.109.2.11 NDDS_TRANSPORT_CLASSID_SHMEM

```
#define NDDS_TRANSPORT_CLASSID_SHMEM (0x01000000)
```

Builtin Shared-Memory Transport Plugin class ID.

5.109.2.12 NDDS_TRANSPORT_CLASSID_SHMEM_510

```
#define NDDS_TRANSPORT_CLASSID_SHMEM_510 (2)
```

Builtin Shared-Memory Transport Plugin class ID for Connext 5.1.0 and earlier.

5.109.2.13 NDDS_TRANSPORT_CLASSID_UDPv6

```
#define NDDS_TRANSPORT_CLASSID_UDPv6 (2)
```

Builtin IPv6 UDP/IP Transport Plugin class ID.

5.109.2.14 NDDS_TRANSPORT_CLASSID_UDPv6_510

```
#define NDDS_TRANSPORT_CLASSID_UDPv6_510 (5)
```

Builtin IPv6 UDP/IP Transport Plugin class ID for Connext 5.1.0 and earlier.

5.109.2.15 NDDS_TRANSPORT_CLASSID_TCPV4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_LAN (8)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case.

5.109.2.16 NDDS_TRANSPORT_CLASSID_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_WAN (9)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case.

5.109.2.17 NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN "tcpv4_wan"
```

IPv4 TCP/IP Transport Plugin class name for WAN case.

5.109.2.18 NDDS_TRANSPORT_CLASSID_TLSV4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TLSV4_LAN (10)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.

5.109.2.19 NDDS_TRANSPORT_CLASSID_TLSV4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TLSV4_WAN (11)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.

5.109.2.20 NDDS_TRANSPORT_CLASSID_UDPv4_WAN

```
#define NDDS_TRANSPORT_CLASSID_UDPv4_WAN (0x01000001)
```

Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.

5.109.2.21 NDDS_TRANSPORT_CLASSID_RESERVED_RANGE

```
#define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (1000)
```

Transport Plugin class IDs below this are reserved by RTI.

User-defined Transport-Plugins should use a class ID greater than this number.

5.109.2.22 NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED

```
#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (0x2)
```

Specified zero-copy behavior of transport.

A Transport Plugin may commit to one of three behaviors for zero copy receives:

1. Always does zero copy.
2. Sometimes does zero copy, up to the transport discretion.
3. Never does zero copy.

This bit should be set only if the Transport Plugin commits to always doing a zero copy receive, or more specifically, always loaning a buffer through its `receive_rEA()` call.

In that case, RTI Connext will not need to allocate storage for a message that it retrieves with the `receive_rEA()` call.

5.109.2.23 NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN

```
#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN (3)
```

Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

For the **NDDS_Transport_Property_t** (p. 2128) structure to be valid, the value of **NDDS_Transport_Property_t↩ ::gather_send_buffer_count_max** (p. 2131) must be greater than or equal to this value.

5.109.3 Typedef Documentation

5.109.3.1 NDDS_Transport_Port_t

```
typedef RTI_UINT32 NDDS_Transport_Port_t
```

Type for storing RTI Connext RTPS ports.

Unlike IPv4 Socket API ports, which are 2 bytes long, the RTI Connext representation of an RTPS port is 4 bytes.

5.109.3.2 NDDS_Transport_ClassId_t

```
typedef RTI_INT32 NDDS_Transport_ClassId_t
```

Type for storing RTI Connext Transport Plugin class IDs.

Each implementation of a Transport Plugin must have a unique ID. For example, a UDP/IP Transport Plugin implementation must have a different ID than a Shared Memory Transport Plugin.

User-implemented Transport Plugins must have an ID higher than **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 1027).

5.110 Transport Address

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

Data Structures

- struct **NDDS_Transport_Address_t**

  Addresses are stored individually as network-ordered bytes.

Macros

- #define **NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER**

  An invalid transport address. Used as an initializer.
- #define **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (72)

  *The minimum size of the buffer that should be passed to **NDDS_Transport_Address_to_string** (p. 1031).*

Functions

- RTIBool **NDDS_Transport_Address_to_string** (const **NDDS_Transport_Address_t** *self, char *buffer_inout, size_t buffer_size_in)

  Converts a numerical address to a printable string representation.
- RTIBool **NDDS_Transport_Address_to_string_with_protocol_family_format** (const **NDDS_Transport_Address_t** *me, char *buffer, size_t buffer_size_in, RTIOsapiSocketAFKind family)

  Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.
- RTI_INT32 **NDDS_Transport_Address_from_string** (**NDDS_Transport_Address_t** *address_out, const char *address_in)

  Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.
- void **NDDS_Transport_Address_print** (const **NDDS_Transport_Address_t** *address_in, const char *desc_in, RTI_INT32 indent_in)

  Prints an address to standard out.
- RTI_INT32 **NDDS_Transport_Address_is_ipv4** (const **NDDS_Transport_Address_t** *address_in)

  Checks if an address is an IPv4 address.
- RTI_INT32 **NDDS_Transport_Address_is_multicast** (const **NDDS_Transport_Address_t** *address_in)

  Checks if an address is an IPv4 or IPv6 multicast address.

Variables

- const **NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID**

  An invalid transport address.

5.110.1 Detailed Description

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

The APIs of RTI Connext uses IPv6 address notation for all transports.

Transport Plugin implementations that are not IP-based are required to map whatever addressing scheme natively used by the physical transport (if any) to an address in IPv6 notation and vice versa.

IPv6 addresses are numerically stored in 16 bytes. An IPv6 address can be presented In string notation in a variety of ways. For example,

```
"00AF:0000:0037:FE01:0000:0000:034B:0089"
"AF:0:37:FE01:0:0:34B:89"
"AF:0:37:FE01::34B:89"
```

are all valid IPv6 presentation of the same address.

IPv4 address in dot notation can be used to specify the last 4 bytes of the address. For example,

```
"0000:0000:0000:0000:0000:0000:192.168.0.1"
"0:0:0:0:0:0:192.168.0.1"
"::192.168.0.1"
```

are all valid IPv6 presentation of the same address.

For a complete description of valid IPv6 address notation, consult the IPv6 Addressing Architecture (RFC 2373).

Addresses are divided into unicast addresses and multicast addresses.

Multicast addresses are defined as

- Addresses that start with 0xFF. That is `FFxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`.

or an IPv4 multicast address

- Address in the range [::224.0.0.0, ::239.255.255.255]

Multicast addresses do not refer to any specific destination (network interface). Instead, they usually refer to a group of network interfaces, often called a "multicast group".

Unicast addresses always refer to a specific network interface.

5.110.2 Macro Definition Documentation

5.110.2.1 NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER

```
#define NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER
```

Value:

```
  { \
    { \
      0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0 \
    } \
  }
```

An invalid transport address. Used as an initializer.

For example: **NDDS_Transport_Address_t** (p. 2126) address = NDDS_TRANSPORT_ADDRESS_INVALID_↩ INITIALIZER;

5.110.2.2 NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE

```
#define NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (72)
```

The minimum size of the buffer that should be passed to **NDDS_Transport_Address_to_string** (p. 1031).

For regular addresses, the string size needs to be at least 40 to include space for 8 tuples of 4 characters each plus 7 delimiting colons plus a terminating NULL.

To support UDPv4_WAN strings, it has been adjusted to 72 to fit the following representation (plus NULL terminator): f=XXXXRBPU,u={FF,FF,FF,FF,FF,FF,FF,FF},p=255.255.255.255:65555:65555

5.110.3 Function Documentation

5.110.3.1 NDDS_Transport_Address_to_string()

```
RTIBool NDDS_Transport_Address_to_string (
            const  NDDS_Transport_Address_t * self,
            char * buffer_inout,
            size_t buffer_size_in )
```

Converts a numerical address to a printable string representation.

Precondition

The `buffer_inout` provided must be at least **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 1031) characters long.

Parameters

self	<<***in***>> *(p. 1015)* The address to be converted.
buffer_inout	<<***inout***>> *(p. 1015)* Storage passed in which to return the string corresponding to the address.
buffer_size_in	<<***in***>> *(p. 1015)* The size of the storage buffer. Must be >= **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 1031)

Returns

1 upon success; 0 upon failure (not enough space in the provided buffer)

5.110.3.2 NDDS_Transport_Address_to_string_with_protocol_family_format()

```
RTIBool NDDS_Transport_Address_to_string_with_protocol_family_format (
            const  NDDS_Transport_Address_t * me,
            char * buffer,
            size_t buffer_size_in,
            RTIOsapiSocketAFKind family )
```

Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.

Precondition

The `buffer_inout` provided must be at least **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 1031) characters long.

Parameters

me	<<***in***>> *(p. 1015)* The address to be converted.
buffer	<<***inout***>> *(p. 1015)* Storage passed in which to return the string corresponding to the address.
buffer_size_in	<<***in***>> *(p. 1015)* The size of the storage buffer. Must be >= **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 1031)
family	<<***in***>> *(p. 1015)* The protocol family RTI_OSAPI_SOCKET_AF_INET or RTI_OSAPI_SOCKET_AF_INET6

Returns

RTI_TRUE upon success; 0 upon failure (not enough space in the provided buffer)

5.110.3.3 NDDS_Transport_Address_from_string()

```
RTI_INT32 NDDS_Transport_Address_from_string (
              NDDS_Transport_Address_t * address_out,
             const char * address_in )
```

Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.

The address string must be in IPv4 dotted notation (X.X.X.X) or IPv6 presentation notation. The string cannot be a hostname since this function does not perform a hostname lookup.

Parameters

address_out	<<***out***>> *(*p. *1015)* Numerical value of the address.
address_in	<<***in***>> *(*p. *1015)* String representation of an address.

Returns

1 if address_out contains a valid address, 0 if it was not able to convert the string into an address.

5.110.3.4 NDDS_Transport_Address_print()

```
void NDDS_Transport_Address_print (
             const  NDDS_Transport_Address_t * address_in,
             const char * desc_in,
             RTI_INT32 indent_in )
```

Prints an address to standard out.

Parameters

address_in	<<***in***>> *(*p. *1015)* Address to be printed.
desc_in	<<***in***>> *(*p. *1015)* A prefix to be printed before the address.
indent_in	<<***in***>> *(*p. *1015)* Indentation level for the printout.

5.110.3.5 NDDS_Transport_Address_is_ipv4()

```
RTI_INT32 NDDS_Transport_Address_is_ipv4 (
             const  NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 address.

Parameters

address_in	<<**in**>> *(p. 1015)* Address to be tested.

Note

May be implemented as a macro for efficiency.

Returns

1 if address is an IPv4 address, 0 otherwise.

5.110.3.6 NDDS_Transport_Address_is_multicast()

```
RTI_INT32 NDDS_Transport_Address_is_multicast (
            const  NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 or IPv6 multicast address.

Parameters

address_in	<<**in**>> *(p. 1015)* Address to be tested.

May be implemented as a macro for efficiency.

Returns

1 if address is a multicast address, 0 otherwise.

5.110.4 Variable Documentation

5.110.4.1 NDDS_TRANSPORT_ADDRESS_INVALID

```
const  NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID  [extern]
```

An invalid transport address.

5.111 UDP Transport Plugin definitions

UDP Transport Plugin definitions.

Data Structures

- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo**

  Type for storing UDP WAN communication ports.

Macros

- #define **NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT** (0)

  *Default value of **NDDS_Transport_Property_t::properties_bitmap*** (p. *2130*).
- #define **NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (16)

  *Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max*** (p. *2131*).
- #define **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX** RTI_OSAPI_UDP_SOCKET_↩ BUFFER_SIZE_OS_MAX

  Used to specify that os maximum be used to specify socket buffer size.
- #define **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT** RTI_OSAPI_UDP_SOCKET↩ _BUFFER_SIZE_OS_DEFAULT

  Used to specify that os default be used to specify socket buffer size.
- #define **NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT** RTI_OSAPI_UDP_SEND↩ _SOCKET_BUFFER_SIZE_DEFAULT

  Default value of send_socket_buffer_size.
- #define **NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT** RTI_OSAPI_UDP_RECV↩ _SOCKET_BUFFER_SIZE_DEFAULT

  Default value of recv_socket_buffer_size.
- #define **NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT** (1)

  Default value of multicast_ttl.

Typedefs

- typedef RTI_UINT16 **NDDS_Transport_UDP_Port**

  UDP port.

5.111.1 Detailed Description

UDP Transport Plugin definitions.

5.111.2 Macro Definition Documentation

5.111.2.1 NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT (0)
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 2130).

5.111.2.2 NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (16)
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131).

This is also the maximum value that can be used when instantiating the udp transport.

16 is sufficient for RTI Connext, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

5.111.2.3 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX

```
#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX  RTI_OSAPI_UDP_SOCKET_BUFFER_SIZE_OS_MAX
```

Used to specify that os maximum be used to specify socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. If the platform does not support this property, then the property will be set to **NDDS_Transport_UDP_Plugin::NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1036) or **NDDS_Transport_UDP_Plugin::NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1037), depending on the property being set. See the Platform Notes to determine if this property is supported on your platform.

This value is -2.

5.111.2.4 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT  RTI_OSAPI_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT
```

Used to specify that os default be used to specify socket buffer size.

This property, if set, uses the default size set in your OS for send and receive socket buffer sizes. If you update the default size in your OS settings, then RTI Connext will automatically pick up that change.

This value is -1.

5.111.2.5 NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT  RTI_OSAPI_UDP_SEND_SOCKET_BUFFER_↩
SIZE_DEFAULT
```

Default value of send_socket_buffer_size.

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

5.111.2.6 NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT  RTI_OSAPI_UDP_RECV_SOCKET_BUFFER_↩
SIZE_DEFAULT
```

Default value of recv_socket_buffer_size.

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

5.111.2.7 NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT (1)
```

Default value of multicast_ttl.

5.111.3 Typedef Documentation

5.111.3.1 NDDS_Transport_UDP_Port

```
typedef RTI_UINT16  NDDS_Transport_UDP_Port
```

UDP port.

5.112 Shared Memory Transport

Built-in transport plug-in for inter-process communications using shared memory (**NDDS_TRANSPORT_CLASSID_↩SHMEM** (p. 1026)) .

Data Structures

- struct **NDDS_Transport_Shmem_Property_t**

  *Subclass of **NDDS_Transport_Property_t** (p. 2128) allowing specification of parameters that are specific to the shared-memory transport.*

Macros

- #define **NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT** (-96)

  *Default value of **NDDS_Transport_Property_t::address_bit_count*** (p. 2130).
- #define **NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT** (**NDDS_TRANSPORT_↩ PROPERTY_BIT_BUFFER_ALWAYS_LOANED**)

  *Default value of **NDDS_Transport_Property_t::properties_bitmap*** (p. 2130).
- #define **NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (1024)

  *Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max*** (p. 2131).
- #define **NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT** (65536)

  *Default value of **NDDS_Transport_Property_t::message_size_max*** (p. 2131).
- #define **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (64)

  *Default value of **NDDS_Transport_Shmem_Property_t::received_message_count_max*** (p. 2137).
- #define **NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT**

  *Default value of **NDDS_Transport_Shmem_Property_t::receive_buffer_size*** (p. 2137).
- #define **NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX** (2)

  Major version for the transport plugin after fixing bug 14240 (RTI-28)
- #define **NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT**

  Use this to initialize stack variable.

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_Shmem_new** (const struct **NDDS_Transport_Shmem_↩ Property_t** *property_in)

  Create a new shmem process transport.
- NDDS_Transport_Plugin * **NDDS_Transport_Shmem_create** (**NDDS_Transport_Address_t** *default_↩ network_address_out, const struct **DDS_PropertyQosPolicy** *property_in, const struct **DDS_Product↩ Version_t** *minimum_compatibility_version)

  Create a new shmem process transport, using PropertyQosPolicy.

5.112.1 Detailed Description

Built-in transport plug-in for inter-process communications using shared memory (**NDDS_TRANSPORT_CLASSID_↩ SHMEM** (p. 1026)) .

This transport plugin uses System Shared Memory to send messages between processes on the same node. This transport is installed as a built-in transport plugin with the alias **DDS_TRANSPORTBUILTIN_SHMEM_ALIAS** (p. 1336).

5.112.2 Compatibility of Sender and Receiver Transports

Opening a receiver "port" on shared memory corresponds to creating a shared memory segment using a name based on the port number. The transport plugin's properties are embedded in the shared memory segment.

When a sender tries to send to the shared memory port, it verifies that properties of the receiver's shared memory transport are compatible with those specified in its transport plugin. If not, the sender will fail to attach to the port and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_attachShmem:failed to initialize incompatible properties

NDDS_Transport_Shmem_attachShmem:countMax 0 > -19417345 or max size -19416188 > 2147482624
```

In this scenario, the properties of the sender or receiver transport plugin instances should be adjusted, so that they are compatible.

5.112.3 Crashing and Restarting Programs

If a process using shared memory crashes (say because the user typed in ^C), resources associated with its shared memory ports may not be properly cleaned up. Later, if another RTI Connext process needs to open the same ports (say, the crashed program is restarted), it will attempt to reuse the shared memory segment left behind by the crashed process.

The reuse is allowed iff the properties of transport plugin are compatible with those embedded in the shared memory segment (i.e., of the original creator). Otherwise, the process will fail to open the ports, and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_create_recvresource_rrEA:failed to initialize shared

    memory resource Cannot recycle existing shmem: size not compatible for key 0x1234
```

In this scenario, the shared memory segments must be cleaned up using appropriate platform specific commands. For details, please refer to the `Platform Notes`.

5.112.4 Shared Resource Keys

The transport uses the **shared memory segment keys**, given by the formula below.
`0x400000 + port`

The transport also uses signaling **shared semaphore** keys given by the formula below.
`0x800000 + port`

The transport also uses mutex **shared semaphore keys** given by the formula below.
`0xb00000 + port`

wher the `port` is a function of the `domain_id` and the `participant_id`, as described in **DDS_WireProtocol↩ QosPolicy::participant_id** (p. 2103)

See also

DDS_WireProtocolQosPolicy::participant_id (p. 2103)

NDDS_Transport_Support_set_builtin_transport_property() (p. 736)

5.112.5 Creating and Registering Shared Memory Transport Plugin

RTI Connext can implicitly create this plugin and register with the **DDS_DomainParticipant** (p. 76) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 2057).

To specify the properties of the builtin shared memory transport that is implicitly registered, you can either:

- call **NDDS_Transport_Support_set_builtin_transport_property** (p. 736) or
- specify the pre-defined property names in **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_↩ DomainParticipant** (p. 76). (see **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 1040)).

Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 1905) always overwrite the ones specified through **NDDS_Transport_Support_set_builtin_transport_property()** (p. 736). The default value is assumed on any unspecified property. Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. See **Built-in Transport Plugins** (p. 737) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, **NDDS_Transport_Shmem_new()** (p. 1042) should be called. The instance should be registered with RTI Connext, see **NDDS_Transport_Support_register_transport** (p. 731). In some configurations, you may have to disable the builtin shared memory transport plugin instance (**DDS_TransportBuiltin↩ QosPolicy** (p. 2057), **DDS_TRANSPORTBUILTIN_SHMEM** (p. 1336)), to avoid port conflicts with the newly created plugin instance.

5.112.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **DDS_DomainParticipantQos::property** (p. 1732) to to configure the builtin shared memory transport plugin.

Table 5.819 ***Property Strings for Shared Memory Transport***

Name	Descriptions
dds.transport.shmem.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_count** (p. 2130)
dds.transport.shmem.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_bitmap** (p. 2130)
dds.transport.shmem.builtin.parent.gather_send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131)
dds.transport.shmem.builtin.parent.message_size_max	See **NDDS_Transport_Property_t::message_size_max** (p. 2131)
dds.transport.shmem.builtin.parent.allow_interfaces	See **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131) and **NDDS_Transport_Property_t::allow_interfaces_list_length** (p. 2132). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_interfaces	See **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132) and **NDDS_Transport_Property_t::deny_interfaces_list_length** (p. 2133). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.allow_multicast_interfaces	See **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133) and **NDDS_Transport_Property_t::allow_multicast_interfaces_list_length** (p. 2134). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_multicast_interfaces	See **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134) and **NDDS_Transport_Property_t::deny_multicast_interfaces_list_length** (p. 2134). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.max_interface_count	See **NDDS_Transport_Property_t::max_interface_count** (p. 2135)
dds.transport.shmem.builtin.parent.thread_name_prefix	See **NDDS_Transport_Property_t::thread_name_prefix** (p. 2135)
dds.transport.shmem.builtin.received_message_count_max	See **NDDS_Transport_Shmem_Property_t::received_message_count_max** (p. 2137)

Name	Descriptions
dds.transport.shmem.builtin.receive_buffer_size	See **NDDS_Transport_Shmem_Property_t::receive_buffer_size** (p. 2137)
dds.transport.shmem.builtin.enable_udp_debugging	See **NDDS_Transport_Shmem_Property_t::enable_udp_debugging** (p. 2138)
dds.transport.shmem.builtin.udp_debugging_address	See **NDDS_Transport_Shmem_Property_t::udp_debugging_address** (p. 2138)
dds.transport.shmem.builtin.udp_debugging_port	See **NDDS_Transport_Shmem_Property_t::udp_debugging_port** (p. 2139)

5.112.7 Macro Definition Documentation

5.112.7.1 NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT (-96)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 2130).

5.112.7.2 NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT ( NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED)
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 2130).

5.112.7.3 NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (1024)
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131).

5.112.7.4 NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT (65536)
```

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).

5.112.7.5 NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT (64)
```

Default value of **NDDS_Transport_Shmem_Property_t::received_message_count_max** (p. 2137).

5.112.7.6 NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT
```

Value:

```
(NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT \
 * NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT / 4)
```

Default value of **NDDS_Transport_Shmem_Property_t::receive_buffer_size** (p. 2137).

5.112.7.7 NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX

```
#define NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX (2)
```

Major version for the transport plugin after fixing bug 14240 (RTI-28)

5.112.7.8 NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT
```

Use this to initialize stack variable.

5.112.8 Function Documentation

5.112.8.1 NDDS_Transport_Shmem_new()

```
NDDS_Transport_Plugin * NDDS_Transport_Shmem_new (
            const struct  NDDS_Transport_Shmem_Property_t * property_in )
```

Create a new shmem process transport.

An application may create multiple transports, possibly for use in different domains.

Parameters

property_in	<<***in***>> (p. *1015)* Desired behavior of this transport. May be NULL for default property. The transport plugin can only support one unicast receive interface; therefore the interface selection lists are ignored.

Returns

handle to a Shmem inter-process Transport Plugin on success

NULL on failure.

5.112.8.2 NDDS_Transport_Shmem_create()

```
NDDS_Transport_Plugin * NDDS_Transport_Shmem_create (
             NDDS_Transport_Address_t * default_network_address_out,
            const struct  DDS_PropertyQosPolicy * property_in,
            const struct  DDS_ProductVersion_t * minimum_compatibility_version )
```

Create a new shmem process transport, using PropertyQosPolicy.

An application may create multiple transports, possibly for use in different domains.

Parameters

default_network_address_out	<<***out***>> (p. *1015)* Network address to be used when registering the transport.
property_in	<<***in***>> (p. *1015)* Desired behavior of this transport. May be NULL for default property. The transport plugin can only support one unicast receive interface; therefore the interface selection lists are ignored.
minimum_compatibility_version	<<***in***>> (p. *1015)* Desired product version for the shared memory transport. If NULL, the default shared memory transport is used (no additional compatibility restrictions for the transport version). Please refer to the minimum_compatibility_version property for more information.

Returns

handle to a Shmem inter-process Transport Plugin on success

NULL on failure.

5.113 UDPv4 Transport

Transport plug-in using UDP/IPv4 (**NDDS_TRANSPORT_CLASSID_UDPv4** (p. 1025)) .

Data Structures

- struct **NDDS_Transport_UDPv4_Property_t**

  Configurable IPv4/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT** (32)

  *Default value of **NDDS_Transport_Property_t::address_bit_count*** (p. *2130*).
- #define **NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT** (128)

  *Default value of **NDDS_Transport_Property_t::address_bit_count*** (p. *2130*) *for UDPv4 asymmetric transport.*
- #define **NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_↩ PROPERTIES_BITMAP_DEFAULT**

  *Default value of **NDDS_Transport_Property_t::properties_bitmap*** (p. *2130*).
- #define **NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** **NDDS_↩ TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT**

- #define **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT** **NDDS_TRANSPORT_↩ UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT**

  OS default to be used to specify the socket buffer size.
- #define **NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_↩ UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT**

  *Default value for **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size*** (p. *2142*) *and **NDDS_Transport_↩ UDPv4_WAN_Property_t::send_socket_buffer_size*** (p. *2152*).
- #define **NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_↩ UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT**

  *Default value for **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size*** (p. *2143*) *and **NDDS_Transport_↩ UDPv4_WAN_Property_t::recv_socket_buffer_size*** (p. *2153*).
- #define **NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX** (65507)

  *Maximum value of **NDDS_Transport_Property_t::message_size_max*** (p. *2131*).
- #define **NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT** **NDDS_TRANSPORT_UDPV4_↩ PAYLOAD_SIZE_MAX**

  *Maximum value of **NDDS_Transport_Property_t::message_size_max*** (p. *2131*).
- #define **NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT** **NDDS_TRANSPORT_UDP_↩ MULTICAST_TTL_DEFAULT**

  *Default value of **NDDS_Transport_UDPv4_Property_t::multicast_ttl*** (p. *2144*).
- #define **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER**

  *Value for **NDDS_Transport_UDPv4_Property_t::send_blocking*** (p. *2146*) *to specify non-blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS**

  [default]** Value for **NDDS_Transport_UDPv4_Property_t::send_blocking (p. *2146*) *to specify blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT** NDDS_TRANSPORT_UDP_BLOCKING_↩ DEFAULT

  *Default value for **NDDS_Transport_UDPv4_Property_t::send_blocking*** (p. *2146*) *to specify blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT**

  *Use this to initialize a **NDDS_Transport_UDPv4_Property_t*** (p. *2140*) *structure.*
- #define **NDDS_Transport_UDPv4_string_to_address_cEA** NDDS_Transport_UDP_string_to_address_cEA

  Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_new** (const struct **NDDS_Transport_UDPv4_Property_t** *property_in)

  Create an instance of a UDPv4 Transport Plugin.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_create** (**NDDS_Transport_Address_t** *default_network_address_out, const struct **DDS_PropertyQosPolicy** *property_in)

  Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_create_from_properties_with_prefix** (**NDDS_Transport_Address_t** *default_network_address_out, const struct **DDS_PropertyQosPolicy** *property_in, const char *propertyPrefix)

  Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv4_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

5.113.1 Detailed Description

Transport plug-in using UDP/IPv4 (**NDDS_TRANSPORT_CLASSID_UDPv4** (p. 1025)) .

This transport plugin uses UDPv4 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **DDS_TRANSPORTBUILTIN_UDPv4_ALIAS** (p. 1336).

You can configure an instance of this plugin to only use unicast or only use multicast, see **NDDS_Transport_UDPv4_Property_t::unicast_enabled** (p. 2143) and **NDDS_Transport_UDPv4_Property_t::multicast_enabled** (p. 2144).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 2135) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132), **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133), **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134)).

RTI Connext can implicitly create this plugin and register with the **DDS_DomainParticipant** (p. 76) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 2057).

To specify the properties of the builtin UDPv4 transport that is implicitly registered, you can either:

- call **NDDS_Transport_Support_set_builtin_transport_property** (p. 736) or
- specify the predefined property names in **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_DomainParticipant** (p. 76). (see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 1046)). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 1905) always overwrite the ones specified through **NDDS_Transport_Support_set_builtin_transport_property()** (p. 736). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 737) for details on when a builtin transport is registered. To explicitly create an instance of this plugin, **NDDS_Transport_UDPv4_new()** (p. 1051) should be called. The instance should be registered with RTI Connext, see **NDDS_Transport_Support_register_transport** (p. 731). In some configurations one may have to disable the builtin UDPv4 transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 2057), **DDS_TRANSPORTBUILTIN_UDPv4** (p. 1336)), to avoid port conflicts with the newly created plugin instance.

5.113.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **DDS_DomainParticipantQos::property** (p. 1732) to configure the builtin UDPv4 transport plugin.

Table 5.822 ***Property Names for UDPv4 Transport Plugin***

Property Name	Description
dds.transport.UDPv4.builtin.parent.classid	See **NDDS_Transport_Property_t::classid** (p. 2129) Should be set to "**NDDS_TRANSPORT_CLASSID_UDPv6** (p. 1025)"
dds.transport.UDPv4.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_count** (p. 2130)
dds.transport.UDPv4.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_bitmap** (p. 2130)
dds.transport.UDPv4.builtin.parent.gather_send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131)
dds.transport.UDPv4.builtin.parent.message_size_max	See **NDDS_Transport_Property_t::message_size_max** (p. 2131)
dds.transport.UDPv4.builtin.parent.allow_interfaces	See **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131) and **NDDS_Transport_Property_t::allow_interfaces_list_length** (p. 2132). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_interfaces	See **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132) and **NDDS_Transport_Property_t::deny_interfaces_list_length** (p. 2133). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.allow_multicast_interfaces	See **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133) and **NDDS_Transport_Property_t::allow_multicast_interfaces_list_length** (p. 2134). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_multicast_interfaces	See **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134) and **NDDS_Transport_Property_t::deny_multicast_interfaces_list_length** (p. 2134). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.max_interface_count	See **NDDS_Transport_Property_t::max_interface_count** (p. 2135)
dds.transport.UDPv4.builtin.parent.thread_name_prefix	See **NDDS_Transport_Property_t::thread_name_prefix** (p. 2135)
dds.transport.UDPv4.builtin.send_socket_buffer_size	See **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size** (p. 2142)
dds.transport.UDPv4.builtin.recv_socket_buffer_size	See **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size** (p. 2143)

Property Name	Description
dds.transport.UDPv4.builtin.unicast_enabled	See **NDDS_Transport_UDPv4_Property_t::unicast_enabled** (p. 2143)
dds.transport.UDPv4.builtin.multicast_enabled	See **NDDS_Transport_UDPv4_Property_t::multicast_enabled** (p. 2144)
dds.transport.UDPv4.builtin.multicast_ttl	See **NDDS_Transport_UDPv4_Property_t::multicast_ttl** (p. 2144)
dds.transport.UDPv4.builtin.multicast_loopback_disabled	See **NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled** (p. 2144)
dds.transport.UDPv4.builtin.ignore_loopback_interface	See **NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface** (p. 2144)
dds.transport.UDPv4.builtin.ignore_nonrunning_interfaces	See **NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces** (p. 2145)
dds.transport.UDPv4.builtin.ignore_nonup_interfaces	**[DEPRECATED]** See **NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces** (p. 2145)
dds.transport.UDPv4.builtin.no_zero_copy	**[DEPRECATED]** See **NDDS_Transport_UDPv4_Property_t::no_zero_copy** (p. 2146)
dds.transport.UDPv4.builtin.send_blocking	See **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 2146)
dds.transport.UDPv4.builtin.transport_priority_mask	See **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 2147)
dds.transport.UDPv4.builtin.transport_priority_mapping_low	See **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 2147)
dds.transport.UDPv4.builtin.transport_priority_mapping_high	See **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 2147)
dds.transport.UDPv4.builtin.send_ping	See **NDDS_Transport_UDPv4_Property_t::send_ping** (p. 2148)
dds.transport.UDPv4.builtin.force_interface_poll_detection	See **NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection** (p. 2148)
dds.transport.UDPv4.builtin.interface_poll_period	See **NDDS_Transport_UDPv4_Property_t::interface_poll_period** (p. 2148)
dds.transport.UDPv4.builtin.reuse_multicast_receive_resource	See **NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource** (p. 2148)
dds.transport.UDPv4.builtin.protocol_overhead_max	See **NDDS_Transport_UDPv4_Property_t::protocol_overhead_max** (p. 2149)
dds.transport.UDPv4.builtin.disable_interface_tracking	See **NDDS_Transport_UDPv4_Property_t::disable_interface_tracking** (p. 2149)
dds.transport.UDPv4.builtin.public_address	See **NDDS_Transport_UDPv4_Property_t::public_address** (p. 2150)
dds.transport.UDPv4.builtin.join_multicast_group_timeout	See **NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout** (p. 2149)
dds.transport.UDPv4.builtin.port_offset	See **NDDS_Transport_UDPv4_Property_t::port_offset** (p. 2150)

NDDS_Transport_Support_set_builtin_transport_property() (p. 736)

5.113.3 Macro Definition Documentation

5.113.3.1 NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT (32)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 2130).

5.113.3.2 NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT (128)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 2130) for UDPv4 asymmetric transport.

5.113.3.3 NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT   NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_↩
DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 2130).

5.113.3.4 NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT   NDDS_TRANSPORT_UDP_GATHER_↩
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for RTI Connext, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

5.113.3.5 NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX

```
#define NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX   NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_↩
OS_MAX
```

OS maximum to be used to specify the socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. See the `Platform Notes` to determine if this property is supported on your platform.

5.113.3.6 NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT   NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↩
SIZE_OS_DEFAULT
```

OS default to be used to specify the socket buffer size.

5.113.3.7 NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_SEND_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size** (p. 2142) and **NDDS_Transport↩ _UDPv4_WAN_Property_t::send_socket_buffer_size** (p. 2152).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

5.113.3.8 NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_RECV_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size** (p. 2143) and **NDDS_Transport↩ _UDPv4_WAN_Property_t::recv_socket_buffer_size** (p. 2153).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

5.113.3.9 NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX (65507)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).

5.113.3.10 NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT   NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).

5.113.3.11 NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT   NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv4_Property_t::multicast_ttl** (p. 2144).

5.113.3.12 NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 2146) to specify non-blocking sockets.

5.113.3.13 NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS
```

[default] Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 2146) to specify blocking sockets.

5.113.3.14 NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT  NDDS_TRANSPORT_UDP_BLOCKING_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 2146) to specify blocking sockets.

5.113.3.15 NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv4_Property_t** (p. 2140) structure.

5.113.3.16 NDDS_Transport_UDPv4_string_to_address_cEA

```
#define NDDS_Transport_UDPv4_string_to_address_cEA  NDDS_Transport_UDP_string_to_address_cEA
```

Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Converts a host name string to a IPv4 address.

Parameters

self	NOT USED. May be NULL.
address_out	<<***out***>> *(*p. *1015)* The corresponding numerical value in IPv4 format.
address_in	<<***in***>> *(*p. *1015)* The name of the IPv4 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

5.113.4 Function Documentation

5.113.4.1 NDDS_Transport_UDPv4_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_new (
            const struct  NDDS_Transport_UDPv4_Property_t * property_in )
```

Create an instance of a UDPv4 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDP_↩ Property_t::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.∗.∗
- 192.168.1.∗
- etc. Strings not in the correct format will be ignored.

Parameters

property_in	<<***in***>> *(*p. *1015)* Desired behavior of this transport. May be NULL for default property.

Returns

A UDPv4 Transport Plugin instance on success; or NULL on failure.

5.113.4.2 NDDS_Transport_UDPv4_create()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create (
             NDDS_Transport_Address_t * default_network_address_out,
            const struct  DDS_PropertyQosPolicy * property_in )
```

Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv4_Property_t::parent** (p. 2142):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

default_network_address_out	<<***out***>> *(*p. *1015)* Network address to be used when registering the transport.
property_in	<<***in***>> *(*p. *1015)* Desired behavior of this transport as defined in the **DDS_DomainParticipantQos::property** (p. 1732).

Returns

A UDPv4 Transport Plugin instance on success; or NULL on failure.

5.113.4.3 NDDS_Transport_UDPv4_create_from_properties_with_prefix()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create_from_properties_with_prefix (
             NDDS_Transport_Address_t * default_network_address_out,
            const struct  DDS_PropertyQosPolicy * property_in,
            const char * propertyPrefix )
```

Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv4_↩ create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

Parameters

default_network_address_out	<<***out***>> *(*p. *1015)* Network address to be used when registering the transport.
property_in	<<***in***>> *(*p. *1015)* Desired behavior of this transport as defined in the **DDS_DomainParticipantQos::property** (p. 1732).
propertyPrefix	a prefix for the properties. Expected UDP properties have the form prefix.property_name

5.114 Real-Time WAN Transport

Transport plug-in using UDP/IPv4 for WAN communications. (**NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (p. 1027)) .

Data Structures

- struct **NDDS_Transport_UDPv4_WAN_Property_t**

  Configurable IPv4/UDP WAN Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPV4_WAN_MESSAGE_SIZE_MAX_DEFAULT** (1400)

  *Maximum value of **NDDS_Transport_Property_t::message_size_max** (*p. *2131).*
- #define **NDDS_TRANSPORT_UDPV4_WAN_PROPERTY_DEFAULT**

  *Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t** (*p. *2151) structure.*

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_new** (const struct **NDDS_Transport_UDPv4_WAN_Property_t** *property_in)

  Create an instance of a UDPv4_WAN Transport Plugin.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_create** (**NDDS_Transport_Address_t** *default_network_address_out, const struct **DDS_PropertyQosPolicy** *property_in)

  Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_create_from_properties_with_prefix** (**NDDS_Transport_Address_t** *default_network_address_out, const struct **DDS_PropertyQosPolicy** *property_in, const char *propertyPrefix)

  Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv4_WAN_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

5.114.1 Detailed Description

Transport plug-in using UDP/IPv4 for WAN communications. (**NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (p. 1027)) .

RTI Real-Time WAN Transport (RWT) is a transport that enables secure, scalable, and high-performance communication over wide area networks (WANs), including public networks.

It extends RTI Connext capabilities to WAN environments. Real-Time WAN Transport uses UDPv4 as the underlying IP transport-layer protocol to better anticipate and adapt to the challenges of diverse network conditions, device mobility, and the dynamic nature of WAN system architectures.

Real-Time WAN Transport, in combination with RTI Cloud Discovery Service (CDS), provides a complete, seamless solution out of the box for WAN connectivity.

This transport is not installed as part of an RTI Connext package; it must be downloaded and installed separately.

Real-Time WAN Transport replaces the transport capabilities of the Secure WAN Transport optionally available with previous RTI Connext releases (prior to 7.0.0), and provides the following capabilities:

- NAT (Network Address Translator) traversal: Ability to communicate between DomainParticipants running in a Local Area Network (LAN) that is behind a NAT-enabled router, and DomainParticipants on the outside of the NAT across a WAN. This functionality is provided in combination with Cloud Discovery Service.

- IP mobility: Support for network transitions and changes in IP addresses in any of the DomainParticipants participating in the communication.

- Security: Secure communications between DomainParticipants using Security Plugins.

Real-Time WAN Transport does not require third-party components, such as STUN servers, or protocols like SIP to handle session establishment. Using a single API and security model, you can leverage the extensive capabilities of the RTI Connext framework and ecosystem, including tools and infrastructure services, even for real-time connectivity from edge to cloud and back in highly distributed systems that communicate across wide area networks.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports unicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **DDS_↩ TRANSPORTBUILTIN_UDPv4_WAN_ALIAS** (p. 1336).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 2135) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131), **NDDS_Transport_Property_t::deny_↩ interfaces_list** (p. 2132)).

RTI Connext can implicitly create this plugin and register with the **DDS_DomainParticipant** (p. 76) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 2057).

To specify the properties of the Real-Time WAN Transport that is implicitly registered, you can either:

- call **NDDS_Transport_Support_set_builtin_transport_property** (p. 736) or
- specify the predefined property names in **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_↩ DomainParticipant** (p. 76). (see **Real-Time WAN Transport Property** (p. 1055)). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 1905) always overwrite the ones specified through **NDDS_↩ Transport_Support_set_builtin_transport_property()** (p. 736). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 737) for details on when a builtin transport is registered. To explicitly create an instance of this plugin, **NDDS_Transport_UDPv4_↩ WAN_new()** (p. 1058) should be called. The instance should be registered with RTI Connext, see **NDDS_Transport↩ _Support_register_transport** (p. 731). In some configurations one may have to disable the builtin UDPv4 transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 2057), **DDS_TRANSPORTBUILTIN_UDPv4_WAN** (p. 1336)), to avoid port conflicts with the newly created plugin instance.

For additional details on how to configure and use the Real-Time WAN Transport, see the `Core Libraries User's Manual`.

5.114.2 Real-Time WAN Transport Property

Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **DDS_DomainParticipantQos::property** (p. 1732) to configure the Real-Time WAN Transport plugin.

Table 5.827 ***Property Names for Real-Time WAN Transport Plugin***

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.classid	See **NDDS_Transport_Property_t::classid** (p. 2129) Should be set to "**NDDS_TRANSPORT_CLASSID_↩ UDPv4_WAN** (p. 1027)"
dds.transport.UDPv4_WAN.builtin.parent.address_bit↩ _count	See **NDDS_Transport_Property_t::address_bit_↩ count** (p. 2130)
dds.transport.UDPv4_WAN.builtin.parent.properties_↩ bitmap	See **NDDS_Transport_Property_t::properties_↩ bitmap** (p. 2130)
dds.transport.UDPv4_WAN.builtin.parent.gather_↩ send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_↩ buffer_count_max** (p. 2131)
dds.transport.UDPv4_WAN.builtin.parent.message_↩ size_max	See **NDDS_Transport_Property_t::message_size_↩ max** (p. 2131)
dds.transport.UDPv4_WAN.builtin.parent.allow_↩ interfaces	See **NDDS_Transport_Property_t::allow_↩ interfaces_list** (p. 2131) and **NDDS_Transport_↩ Property_t::allow_interfaces_list_length** (p. 2132). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.deny_↩ interfaces	See **NDDS_Transport_Property_t::deny_interfaces↩ _list** (p. 2132) and **NDDS_Transport_Property_t↩ ::deny_interfaces_list_length** (p. 2133). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.max_↩ interface_count	See **NDDS_Transport_Property_t::max_interface_↩ count** (p. 2135)
dds.transport.UDPv4_WAN.builtin.parent.thread_↩ name_prefix	See **NDDS_Transport_Property_t::thread_name_↩ prefix** (p. 2135)
dds.transport.UDPv4_WAN.builtin.send_socket_↩ buffer_size	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::send_socket_buffer_size** (p. 2152)
dds.transport.UDPv4_WAN.builtin.recv_socket_buffer↩ _size	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::recv_socket_buffer_size** (p. 2153)
dds.transport.UDPv4_WAN.builtin.ignore_loopback_↩ interface	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::ignore_loopback_interface** (p. 2153)
dds.transport.UDPv4_WAN.builtin.ignore_nonrunning↩ _interfaces	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::ignore_nonrunning_interfaces** (p. 2154)
dds.transport.UDPv4_WAN.builtin.ignore_nonup_↩ interfaces	**[DEPRECATED]** See **NDDS_Transport_UDPv4_↩ WAN_Property_t::ignore_nonup_interfaces** (p. 2153)
dds.transport.UDPv4_WAN.builtin.no_zero_copy	**[DEPRECATED]** See **NDDS_Transport_UDPv4_↩ WAN_Property_t::no_zero_copy** (p. 2154)
dds.transport.UDPv4_WAN.builtin.send_blocking	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::send_blocking** (p. 2155)
dds.transport.UDPv4_WAN.builtin.transport_priority_↩ mask	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::transport_priority_mask** (p. 2155)
dds.transport.UDPv4_WAN.builtin.transport_priority_↩ mapping_low	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::transport_priority_mapping_low** (p. 2156)
dds.transport.UDPv4_WAN.builtin.transport_priority_↩ mapping_high	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::transport_priority_mapping_high** (p. 2156)

Property Name	Description
dds.transport.UDPv4_WAN.builtin.send_ping	See **NDDS_Transport_UDPv4_WAN_Property_t::send_ping** (p. 2156)
dds.transport.UDPv4_WAN.builtin.force_interface_poll_detection	See **NDDS_Transport_UDPv4_WAN_Property_t::force_interface_poll_detection** (p. 2157)
dds.transport.UDPv4_WAN.builtin.interface_poll_period	See **NDDS_Transport_UDPv4_WAN_Property_t::interface_poll_period** (p. 2157)
dds.transport.UDPv4_WAN.builtin.protocol_overhead_max	See **NDDS_Transport_UDPv4_WAN_Property_t::protocol_overhead_max** (p. 2157)
dds.transport.UDPv4_WAN.builtin.disable_interface_tracking	See **NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking** (p. 2157)
dds.transport.UDPv4_WAN.builtin.public_address	See **NDDS_Transport_UDPv4_WAN_Property_t::public_address** (p. 2158)
dds.transport.UDPv4_WAN.builtin.comm_ports	See **NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list** (p. 2158)
dds.transport.UDPv4_WAN.builtin.port_offset	See **NDDS_Transport_UDPv4_WAN_Property_t::port_offset** (p. 2160)
dds.transport.UDPv4_WAN.builtin.binding_ping_period	See **NDDS_Transport_UDPv4_WAN_Property_t::binding_ping_period** (p. 2160)

5.114.3 Macro Definition Documentation

5.114.3.1 NDDS_TRANSPORT_UDPV4_WAN_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_WAN_MESSAGE_SIZE_MAX_DEFAULT (1400)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).

5.114.3.2 NDDS_TRANSPORT_UDPV4_WAN_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_WAN_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t** (p. 2151) structure.

5.114.4 Function Documentation

5.114.4.1 NDDS_Transport_UDPv4_WAN_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_new (
            const struct  NDDS_Transport_UDPv4_WAN_Property_t * property_in )
```

Create an instance of a UDPv4_WAN Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface "white" and "black" lists specified in the NDDS_Transport_UDP_Property_t↩ ::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132),

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.∗.∗
- 192.168.1.∗
- etc. Strings not in the correct format will be ignored.

Parameters

property↩ _in	<<***in***>> *(p. 1015)* Desired behavior of this transport. May be NULL for default property.

Returns

A UDPv4_WAN Transport Plugin instance on success; or NULL on failure.

5.114.4.2 NDDS_Transport_UDPv4_WAN_create()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_create (
```

```
 NDDS_Transport_Address_t * default_network_address_out,
const struct  DDS_PropertyQosPolicy * property_in )
```

Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface "white" and "black" lists specified in the **NDDS_Transport_UDPv4_WAN_↩ Property_t::parent** (p. 2152):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132),

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.∗.∗
- 192.168.1.∗
- etc. Strings not in the correct format will be ignored.

Parameters

default_network_address_out	*<<**out**>> (p. 1015)* Network address to be used when registering the transport.
property_in	*<<**in**>> (p. 1015)* Desired behavior of this transport as defined in the **DDS_DomainParticipantQos::property** (p. 1732).

Returns

A UDPv4_WAN Transport Plugin instance on success; or NULL on failure.

5.114.4.3 NDDS_Transport_UDPv4_WAN_create_from_properties_with_prefix()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_create_from_properties_with_prefix (
 NDDS_Transport_Address_t * default_network_address_out,
const struct  DDS_PropertyQosPolicy * property_in,
const char * propertyPrefix )
```

Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_↩ UDPv4_WAN_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

Parameters

default_network_address_out	<<***out***>> *(*p. *1015)* Network address to be used when registering the transport.
property_in	<<***in***>> *(*p. *1015)* Desired behavior of this transport as defined in the **DDS_DomainParticipantQos::property** (p. 1732).
propertyPrefix	Prefix for the properties. Expected UDP properties have the form prefix.property_name

5.115 UDPv6 Transport

Transport plug-in using UDP/IPv6 (**NDDS_TRANSPORT_CLASSID_UDPv6** (p. 1026)) .

Data Structures

- struct **NDDS_Transport_UDPv6_Property_t**

  Configurable IPv6/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_COUNT** (128)

  *Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 2130).*
- #define **NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_↩ PROPERTIES_BITMAP_DEFAULT**

  *Default value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).*

- #define **NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT** **NDDS_TRANSPORT_UDP_↩ MULTICAST_TTL_DEFAULT**

  *Default value of **NDDS_Transport_UDPv6_Property_t::multicast_ttl** (p. 2164).*
- #define **NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER**

  *Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 2166) to specify non-blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS**

  ***[default]** Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 2166) to specify blocking sockets.*
- #define **NDDS_Transport_UDPv6_string_to_address_cEA** NDDS_Transport_UDP_string_to_address_cEA

  Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv6_new** (const struct **NDDS_Transport_UDPv6_↩ Property_t** *property_in)

  Create an instance of a UDPv6 Transport Plugin.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv6_create** (**NDDS_Transport_Address_t** *default_↩ network_address_out, const struct **DDS_PropertyQosPolicy** *property_in)

  Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv6_create_from_properties_with_prefix** (**NDDS_↩ Transport_Address_t** *default_network_address_out, const struct **DDS_PropertyQosPolicy** *property_in, const char *propertyPrefix)

  Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv6_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

5.115.1 Detailed Description

Transport plug-in using UDP/IPv6 (**NDDS_TRANSPORT_CLASSID_UDPv6** (p. 1026)) .

This transport plugin uses UDPv6 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **DDS_TRANSPORTBUILTIN_UDPv6_ALIAS** (p. 1336).

You can configure an instance of this plugin to only use unicast or only use multicast, see **NDDS_Transport_UDPv6↩ _Property_t::unicast_enabled** (p. 2163) and **NDDS_Transport_UDPv6_Property_t::multicast_enabled** (p. 2164).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **NDDS_Transport_↩ Property_t::max_interface_count** (p. 2135) and the "white" and "black" lists in the base property's fields (**NDDS↩ _Transport_Property_t::allow_interfaces_list** (p. 2131), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132), **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133), **NDDS_Transport_Property_↩ t::deny_multicast_interfaces_list** (p. 2134)).

RTI Connext can implicitly create this plugin and register it with the **DDS_DomainParticipant** (p. 76) if this transport is specified in the **DDS_TransportBuiltinQosPolicy** (p. 2057).

To specify the properties of the builtin UDPv6 transport that is implicitly registered, you can either:

- call **NDDS_Transport_Support_set_builtin_transport_property** (p. 736) or
- specify the predefined property names in **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_DomainParticipant** (p. 76). (see **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 1062)). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 1905) always overwrite the ones specified through **NDDS_Transport_Support_set_builtin_transport_property()** (p. 736). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties that are set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 737) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, **NDDS_Transport_UDPv6_new()** (p. 1067) should be called. The instance should be registered with RTI Connext, see **NDDS_Transport_Support_register_transport** (p. 731). In some configurations, you may have to disable the builtin UDPv6 transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 2057), **DDS_TRANSPORTBUILTIN_UDPv6** (p. 1336)), to avoid port conflicts with the newly created plugin instance.

5.115.2 UDPv6 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in **DDS_PropertyQosPolicy** (p. 1905) of a **DDS_DomainParticipant** (p. 76) to configure the builtin UDPv6 transport plugin.

Table 5.831 ***Property Names for UDPv6 Transport Plugin***

Property Name	Description
dds.transport.UDPv6.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_count** (p. 2130)
dds.transport.UDPv6.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_bitmap** (p. 2130)
dds.transport.UDPv6.builtin.parent.gather_send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131)
dds.transport.UDPv6.builtin.parent.message_size_max	See **NDDS_Transport_Property_t::message_size_max** (p. 2131)
dds.transport.UDPv6.builtin.parent.allow_interfaces	See **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131) and **NDDS_Transport_Property_t::allow_interfaces_list_length** (p. 2132). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_interfaces	See **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132) and **NDDS_Transport_Property_t::deny_interfaces_list_length** (p. 2133). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.allow_multicast_interfaces	See **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133) and **NDDS_Transport_Property_t::allow_multicast_interfaces_list_length** (p. 2134). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For
	example: 127.0.0.1,eth0

Property Name	Description
dds.transport.UDPv6.builtin.parent.deny_multicast_↩ interfaces	See **NDDS_Transport_Property_t::deny_multicast↩ _interfaces_list** (p. 2134) and **NDDS_Transport_↩ Property_t::deny_multicast_interfaces_list_length** (p. 2134). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.max_interface_count	See **NDDS_Transport_Property_t::max_interface_↩ count** (p. 2135)
dds.transport.UDPv6.builtin.parent.thread_name_prefix	See **NDDS_Transport_Property_t::thread_name_↩ prefix** (p. 2135)
dds.transport.UDPv6.builtin.send_socket_buffer_size	See **NDDS_Transport_UDPv6_Property_t::send_↩ socket_buffer_size** (p. 2162)
dds.transport.UDPv6.builtin.recv_socket_buffer_size	See **NDDS_Transport_UDPv6_Property_t::recv_↩ socket_buffer_size** (p. 2163)
dds.transport.UDPv6.builtin.unicast_enabled	See **NDDS_Transport_UDPv6_Property_t::unicast↩ _enabled** (p. 2163)
dds.transport.UDPv6.builtin.multicast_enabled	See **NDDS_Transport_UDPv6_Property_t↩ ::multicast_enabled** (p. 2164)
dds.transport.UDPv6.builtin.multicast_ttl	See **NDDS_Transport_UDPv6_Property_t↩ ::multicast_ttl** (p. 2164)
dds.transport.UDPv6.builtin.multicast_loopback_↩ disabled	See **NDDS_Transport_UDPv6_Property_t↩ ::multicast_loopback_disabled** (p. 2164)
dds.transport.UDPv6.builtin.ignore_loopback_interface	See **NDDS_Transport_UDPv6_Property_t::ignore_↩ loopback_interface** (p. 2164)
dds.transport.UDPv6.builtin.ignore_nonrunning_↩ interfaces	See **NDDS_Transport_UDPv6_Property_t::ignore_↩ nonrunning_interfaces** (p. 2165)
dds.transport.UDPv6.builtin.no_zero_copy	**[DEPRECATED]** See **NDDS_Transport_UDPv6_↩ Property_t::no_zero_copy** (p. 2165)
dds.transport.UDPv6.builtin.send_blocking	See **NDDS_Transport_UDPv6_Property_t::send_↩ blocking** (p. 2166)
dds.transport.UDPv6.builtin.enable_v4mapped	See **NDDS_Transport_UDPv6_Property_t::enable_↩ v4mapped** (p. 2166)
dds.transport.UDPv6.builtin.transport_priority_mask	See **NDDS_Transport_UDPv6_Property_t↩ ::transport_priority_mask** (p. 2166)
dds.transport.UDPv6.builtin.transport_priority_↩ mapping_low	See **NDDS_Transport_UDPv6_Property_t↩ ::transport_priority_mapping_low** (p. 2167)

5.115.3 Macro Definition Documentation

5.115.3.1 NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_COUNT (128)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 2130).

5.115.3.2 NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 2130).

5.115.3.3 NDDS_TRANSPORT_UDPV6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for NDDS, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

5.115.3.4 NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX

```
#define NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX   NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_↩
OS_MAX
```

OS maximum to be used to specify the socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. See the `Platform Notes` to determine if this property is supported on your platform.

5.115.3.5 NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT   NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↩
SIZE_OS_DEFAULT
```

OS default to be used to specify the socket buffer size.

5.115.3.6 NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_SEND_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size** (p. 2162).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

5.115.3.7 NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_RECV_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size** (p. 2163).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

5.115.3.8 NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX (65487)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).

5.115.3.9 NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT   NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX
```

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 2131).

5.115.3.10 NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT   NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv6_Property_t::multicast_ttl** (p. 2164).

5.115.3.11 NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 2166) to specify non-blocking sockets.

5.115.3.12 NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS
```

[default] Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 2166) to specify blocking sockets.

5.115.3.13 NDDS_Transport_UDPv6_string_to_address_cEA

```
#define NDDS_Transport_UDPv6_string_to_address_cEA  NDDS_Transport_UDP_string_to_address_cEA
```

Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Converts a host name string to a IPv6 address.

Parameters

self	NOT USED. May be NULL.
address_out	<<***out***>> *(*p. *1015)* The corresponding numerical value in IPv6 format.
address_in	<<***in***>> *(*p. *1015)* The name of the IPv6 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

5.115.4 Function Documentation

5.115.4.1 NDDS_Transport_UDPv6_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_new (
            const struct  NDDS_Transport_UDPv6_Property_t * property_in )
```

Create an instance of a UDPv6 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv6_Property_t::parent** (p. 2162):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

property_in	<<***in***>> *(p. 1015)* Desired behavior of this transport. May be NULL for default property.

Returns

A UDPv6 Transport Plugin instance on success; or NULL on failure.

5.115.4.2 NDDS_Transport_UDPv6_create()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_create (
            NDDS_Transport_Address_t * default_network_address_out,
           const struct  DDS_PropertyQosPolicy * property_in )
```

Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv6_Property_t::parent** (p. 2162):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 2131),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 2132),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 2133),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 2134)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- *:*:*:*:*:*:*:*
- FE80:aBc::202:*:*
- *:aBC::*2*::2*
- etc. Strings not in the correct format will be ignored.

Parameters

default_network_address_out	<<***out***>> *(*p. *1015)* Network address to be used when registering the transport.
property_in	<<***in***>> *(*p. *1015)* Desired behavior of this transport as defined in the **DDS_DomainParticipantQos::property** (p. 1732).

Returns

A UDPv6 Transport Plugin instance on success; or NULL on failure.

5.115.4.3 NDDS_Transport_UDPv6_create_from_properties_with_prefix()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_create_from_properties_with_prefix (
             NDDS_Transport_Address_t * default_network_address_out,
            const struct  DDS_PropertyQosPolicy * property_in,
            const char * propertyPrefix )
```

Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv6_↩ create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

Parameters

default_network_address_out	<<***out***>> *(*p. *1015)* Network address to be used when registering the transport.
property_in	<<***in***>> *(*p. *1015)* Desired behavior of this transport as defined in the **DDS_DomainParticipantQos::property** (p. 1732).
propertyPrefix	a prefix for the properties. Expected UDP properties have the form prefix.property_name

5.116 AsyncWaitSet

<<***extension***>> *(*p. *1014)* A specialization of **DDS_WaitSet** (p. 1373) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDS_Condition** (p. 1372).

Data Structures

- struct **DDS_AsyncWaitSetProperty_t**

  *Specifies the **DDS_AsyncWaitSet** (*p. *1072) behavior.*
- struct **DDS_AsyncWaitSetListener**

  <<***interface***>> *(*p. *1015) Listener for receiving event notifications related to the thread pool of the **DDS_AsyncWaitSet** (*p. *1072).*

Macros

- #define **DDS_AsyncWaitSetListener_INITIALIZER**

  *Initializer for new **DDS_AsyncWaitSetListener** (*p. *1543).*

Typedefs

- typedef struct DDS_AsyncWaitSetImpl **DDS_AsyncWaitSet**

  *A class for dispatching **DDS_Condition** (p. 1372) objects using separate threads of execution. You can see this class as an extension of a **DDS_WaitSet** (p. 1373) that allows asynchronously waiting for the attached **DDS_Condition** (p. 1372) objects to trigger and provide a notification by calling **DDS_Condition_dispatch** (p. 1377).*
- typedef struct DDS_AsyncWaitSetCompletionTokenImpl **DDS_AsyncWaitSetCompletionToken**

  *<<**interface**>> (p. 1015) Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **DDS_AsyncWaitSet** (p. 1072) behavior.*
- typedef void(∗ **DDS_AsyncWaitSetListener_OnThreadSpawnedCallback**) (void ∗listener_data, **DDS_↩UnsignedLongLong** thread_id)

  *Prototype of a **DDS_AsyncWaitSetListener::on_thread_spawned** (p. 1544) function.*
- typedef void(∗ **DDS_AsyncWaitSetListener_OnThreadDeletedCallback**) (void ∗listener_data, **DDS_↩UnsignedLongLong** thread_id)

  *Prototype of a **DDS_AsyncWaitSetListener::on_thread_deleted** (p. 1544) function.*
- typedef void(∗ **DDS_AsyncWaitSetListener_OnWaitTimeoutCallback**) (void ∗listener_data, **DDS_↩UnsignedLongLong** thread_id)

  *Prototype of a **DDS_AsyncWaitSetListener::on_wait_timeout** (p. 1544) function.*
- typedef struct DDS_DataReaderStatusConditionHandlerImpl **DDS_DataReaderStatusConditionHandler**

  *<<**interface**>> (p. 1015) Realization of a **DDS_ConditionHandler** (p. 1570) that handles the status of a **DDS_Data↩Reader** (p. 618).*

Functions

- **DDS_ReturnCode_t DDS_AsyncWaitSetCompletionToken_wait** (**DDS_AsyncWaitSetCompletionToken** ∗self, const struct **DDS_Duration_t** ∗max_wait)

  *Waits for the request associated to an operation made on the **DDS_AsyncWaitSet** (p. 1072) to complete.*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_get_property** (**DDS_AsyncWaitSet** ∗self, struct **DDS_Async↩WaitSetProperty_t** ∗property)

  *Retrieves the **DDS_AsyncWaitSetProperty_t** (p. 1544) configuration of the associated **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_detach_condition** (**DDS_AsyncWaitSet** ∗self, **DDS_Condition** ∗condition)

  *Deaches the specified **DDS_Condition** (p. 1372) from this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_detach_condition_with_completion_token** (**DDS_AsyncWait↩Set** ∗self, **DDS_Condition** ∗condition, **DDS_AsyncWaitSetCompletionToken** ∗completion_token)

  *Detaches the specified **DDS_Condition** (p. 1372) from this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_attach_condition** (**DDS_AsyncWaitSet** ∗self, **DDS_Condition** ∗condition)

  *Attaches the specified **DDS_Condition** (p. 1372) to this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_attach_condition_with_completion_token** (**DDS_AsyncWaitSet** ∗self, **DDS_Condition** ∗condition, **DDS_AsyncWaitSetCompletionToken** ∗completion_token)

  *Attaches the specified **DDS_Condition** (p. 1372) to this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_unlock_condition** (**DDS_AsyncWaitSet** ∗self, **DDS_Condition** ∗condition)

  *Allows the **DDS_Condition** (p. 1372) under dispatch to be available for concurrent dispatch from another thread from the pool.*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_get_conditions** (**DDS_AsyncWaitSet** ∗self, struct **DDS_↩ConditionSeq** ∗attached_conditions)

  *Retrieves the list of attached **DDS_Condition** (p. 1372) (s).*

- **DDS_ReturnCode_t DDS_AsyncWaitSet_stop** (**DDS_AsyncWaitSet** ∗self)

  *Initiates the stop procedure on this **DDS_AsyncWaitSet** (p. 1072) that will stop the asynchronous wait.*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_stop_with_completion_token** (**DDS_AsyncWaitSet** ∗self, **DDS_AsyncWaitSetCompletionToken** ∗completion_token)

  *Initiates the stop procedure on this **DDS_AsyncWaitSet** (p. 1072) that will stop the asynchronous wait.*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_start** (**DDS_AsyncWaitSet** ∗self)

  *Initiates the asynchronous wait on this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_start_with_completion_token** (**DDS_AsyncWaitSet** ∗self, **DDS_AsyncWaitSetCompletionToken** ∗completion_token)

  *Initiates the asynchronous wait on this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_Boolean DDS_AsyncWaitSet_is_started** (**DDS_AsyncWaitSet** ∗self)

  *Returns whether this **DDS_AsyncWaitSet** (p. 1072) is started.*
- **DDS_AsyncWaitSetCompletionToken** ∗ **DDS_AsyncWaitSet_create_completion_token** (**DDS_Async↩ WaitSet** ∗self)

  *Creates a new **DDS_AsyncWaitSetCompletionToken** (p. 1075).*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_delete_completion_token** (**DDS_AsyncWaitSet** ∗self, **DDS_↩ AsyncWaitSetCompletionToken** ∗completion_token)

  *Deletes a **DDS_AsyncWaitSetCompletionToken** (p. 1075) previously created from this **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_AsyncWaitSet** ∗ **DDS_AsyncWaitSet_new** (const struct **DDS_AsyncWaitSetProperty_t** ∗property)

  *Single-argument constructor that allows creating a a **DDS_AsyncWaitSet** (p. 1072) with custom behavior.*
- **DDS_AsyncWaitSet** ∗ **DDS_AsyncWaitSet_new_with_listener** (const struct **DDS_AsyncWaitSetProperty↩ _t** ∗property, struct **DDS_AsyncWaitSetListener** ∗listener)

  *Constructor that allows specifying a **DDS_AsyncWaitSetListener** (p. 1543).*
- **DDS_AsyncWaitSet** ∗ **DDS_AsyncWaitSet_new_with_thread_factory** (const struct **DDS_AsyncWaitSet↩ Property_t** ∗property, struct **DDS_AsyncWaitSetListener** ∗listener, struct **DDS_ThreadFactory** ∗thread_↩ factory)

  *Constructor with arguments that allow specifying behavior different than the default one, including specifying a **DDS_↩ ThreadFactory** (p. 2033) for the creation and deletion of the threads within the thread pool.*
- **DDS_ReturnCode_t DDS_AsyncWaitSet_delete** (**DDS_AsyncWaitSet** ∗self)

  *Deletes a **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_DataReaderStatusConditionHandler** ∗ **DDS_DataReaderStatusConditionHandler_new** (**DDS_↩ DataReader** ∗reader, const struct **DDS_DataReaderListener** ∗listener, **DDS_StatusMask** listener_mask)

  *Creates a new **DDS_DataReaderStatusConditionHandler** (p. 1077) instance.*
- **DDS_ReturnCode_t DDS_DataReaderStatusConditionHandler_delete** (**DDS_DataReaderStatus↩ ConditionHandler** ∗self)

  *Deletes a **DDS_DataReaderStatusConditionHandler** (p. 1077) instance previously created with **DDS_DataReader↩ StatusConditionHandler_new** (p. 1091).*

Variables

- **DDS_AsyncWaitSetCompletionToken** ∗const **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_↩ IMPLICIT_AND_WAIT**

  *For the operations that allow an **DDS_AsyncWaitSetCompletionToken** (p. 1075), this sentinel can be provided to indicate an **DDS_AsyncWaitSet** (p. 1072) to use the implicit completion token and wait on it for request completion.*
- **DDS_AsyncWaitSetCompletionToken** ∗const **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE**

  *For the operations that allow an **DDS_AsyncWaitSetCompletionToken** (p. 1075), this sentinel can be provided to indicate an **DDS_AsyncWaitSet** (p. 1072) to perform the action associating a 'null' completion token.*
- const struct **DDS_AsyncWaitSetProperty_t DDS_ASYNC_WAITSET_PROPERTY_DEFAULT**

  *Constant that defines the default property for a **DDS_AsyncWaitSet** (p. 1072).*

5.116.1 Detailed Description

<<***extension***>> *(p. 1014)* A specialization of **DDS_WaitSet** (p. 1373) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDS_Condition** (p. 1372).

This class is a realization of the `Proactor` pattern applied to WaitSets and Conditions that provide a powerful component for your application process events leveraging concurrency.

5.116.2 Macro Definition Documentation

5.116.2.1 DDS_AsyncWaitSetListener_INITIALIZER

```
#define DDS_AsyncWaitSetListener_INITIALIZER
```

Initializer for new **DDS_AsyncWaitSetListener** (p. 1543).

No memory is allocated. New **DDS_AsyncWaitSetListener** (p. 1543) Instances stored in the stack should be initialized with this value before they are passed to any functions.

DDS_AsyncWaitSet_new (p. 1088)

DDS_AsyncWaitSetListener (p. 1543)

5.116.3 Typedef Documentation

5.116.3.1 DDS_AsyncWaitSet

```
typedef struct DDS_AsyncWaitSetImpl  DDS_AsyncWaitSet
```

A class for dispatching **DDS_Condition** (p. 1372) objects using separate threads of execution. You can see this class as an extension of a **DDS_WaitSet** (p. 1373) that allows asynchronously waiting for the attached **DDS_Condition** (p. 1372) objects to trigger and provide a notification by calling **DDS_Condition_dispatch** (p. 1377).

DDS_AsyncWaitSet (p. 1072) provides a proactive model to process application events through **DDS_Condition** (p. 1372) objects. **DDS_AsyncWaitSet** (p. 1072) owns a pool of threads to asynchronously wait for the attached **DDS_Condition** (p. 1372) objects to trigger and dispatch them upon wakeup. The asynchronous behavior is the main key different with regards to the **DDS_WaitSet** (p. 1373).

The class diagram and its collaborators is shown below:

5.116.4 AsyncWaitSet Thread Orchestration

DDS_AsyncWaitSet (p. 1072) internally applies a leader-follower pattern for the orchestration of the thread pool. Once a **DDS_AsyncWaitSet** (p. 1072) starts, it will create the thread pool of `M` threads from which only one thread will become the Leader thread, and remaining threads will become the Followers, where:

- The `Leader` thread is the one waiting for the attached **DDS_Condition** (p. 1372) to trigger. Remaining threads in the pool, if any, are either idle awaiting to become the leader or busy while processing active **DDS_Condition** (p. 1372).
- Upon wait wakeup, the `Leader` thread resigns its leader status to become a `Processor` thread and dispatch the next active **DDS_Condition** (p. 1372) through the **DDS_Condition_dispatch** (p. 1377) operation.
- One of the `Follower` threads wakes up and becomes the new leader to resume the wait for **DDS_Condition** (p. 1372).

"Thread orchestration in a ::DDS_AsyncWaitSet"

This behavior implies the following considerations:

- Only one thread a time can wait for the attached **DDS_Condition** (p. 1372) objects to trigger. From a pool of `M` threads, only one is the leader, `P` are processing active **DDS_Condition** (p. 1372), and `F` are idle followers.
- A thread can dispatch only one active **DDS_Condition** (p. 1372) at a time.
- **DDS_AsyncWaitSet** (p. 1072) efficiently distributes threads to dispatch **DDS_Condition** (p. 1372) objects on demand. This avoids underutilizing a thread if **DDS_Condition** (p. 1372) objects do not trigger or trigger unfrequently.
- At a given time, all the threads in the pool could be in processing state. In this situation, the **DDS_AsyncWaitSet** (p. 1072) is not able to wait for more **DDS_Condition** (p. 1372) objects until one thread becomes the leader.

DDS_AsyncWaitSet (p. 1072) has a built-in dispatcher that guarantees fairness and avoids starvation of **DDS_Condition** (p. 1372) objects. By applying a round-robin distribution policy, each attached and active **DDS_Condition** (p. 1372) is dispatched within a finite period of time, assuming the **DDS_ConditionHandler** (p. 1570) always return control after the **DDS_Condition_dispatch** (p. 1377) operation.

5.116.5 AsyncWaitSet Thread Safety

A key aspect of the **DDS_AsyncWaitSet** (p. 1072) is the thread safety. **DDS_AsyncWaitSet** (p. 1072) interface is thread safe, so you can concurrently call any operation on the **DDS_AsyncWaitSet** (p. 1072) object from multiple threads in your application.

Furthermore, **DDS_AsyncWaitSet** (p. 1072) also safely interacts with its own thread pool. Internally, the **DDS_AsyncWaitSet** (p. 1072) applies the asynchronous completion token pattern to perform activities that involve synchronization with the thread pool.

For instance to detach a **DDS_Condition** (p. 1372), the **DDS_AsyncWaitSet** (p. 1072) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token.

Note

The asynchronous completion token behavior only takes place if the **DDS_AsyncWaitSet** (p. 1072) is started. Otherwise the internal request will be directly executed by the calling thread.

For a finer control on this behavior, each **DDS_AsyncWaitSet** (p. 1072) operation where this applies comes in two flavors:

- `Default:` the operation hides all the details of the completion token and returns after the operation completes. Operations of this kind internally use an implicit **DDS_AsyncWaitSetCompletionToken** (p. 1075). The **DDS_AsyncWaitSet** (p. 1072) creates and reuses **DDS_AsyncWaitSetCompletionToken** (p. 1075) objects as needed. This is the recommended flavor unless your application has special resource needs.
- `With completion token:` An overloaded version of the default one that also receives an **DDS_Async↩ WaitSetCompletionToken** (p. 1075) object on which you can wait on at any time for the actual operation to complete. This flavor is available to assist applications with resource constraints and that want more control on the interaction with the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

5.116.5.1 Condition Locking

DDS_AsyncWaitSet (p. 1072) incorporates a safety mechanism that prevents calling **DDS_Condition_dispatch** (p. 1377) concurrently. **DDS_AsyncWaitSet** (p. 1072) locks the **DDS_Condition** (p. 1372) while a processor thread is dispatching it so no other thread within the pool can dispatch it again.

This mechanism ensures not only unexpected concurrent dispatch of a **DDS_Condition** (p. 1372) but also spurious thread activity. Because it is responsibility of your application to reset the Condition trigger, there is a period of time in which the dispatched condition may remain active, causing the **DDS_AsyncWaitSet** (p. 1072) to enter in a continous immediate wakeup from the wait. This behavior typically leads to thread hogging and high CPU usage.

Nevertheless, your application may still want to receive concurrent and controlled dispatch notifications. **DDS_Async↩ WaitSet** (p. 1072) will still allows you to unlock a **DDS_Condition** (p. 1372) so any other available thread can dispatch the same condition concurrently while preventing the above mentioned problems. You can achive this by calling **DDS↩ _AsyncWaitSet_unlock_condition** (p. 1082) on the Condition being dispatched within the dispatch callback. Note that the AsyncWaitSet locks a Condition each time it dispatches it. Hence you need to unlock the Condition each time you want to enable a concurrent dispatch.

5.116.6 AsyncWaitSet Events and Resources

Besides **DDS_Condition** (p. 1372) processing, you can listen to other kind of internal events related to the **DDS_↩ AsyncWaitSet** (p. 1072) and its thread pool by means of the **DDS_AsyncWaitSetListener** (p. 1543).

DDS_AsyncWaitSet (p. 1072) exposes operations to start and stop the asynchronous wait, which involves the creation and deletion of the thread pool respectively.

DDS_AsyncWaitSet (p. 1072) relies on thread-specific storage to provide the described functionality. Each application thread that calls an operation on a **DDS_AsyncWaitSet** (p. 1072) will generate resources that will be associated with such thread. You can free these resources upon thread termination by calling **DDS_DomainParticipantFactory_↩ unregister_thread** (p. 57).

MT Safety:

Safe.

DDS_AsyncWaitSetListener (p. 1543)

DDS_AsyncWaitSetCompletionToken (p. 1075).

DDS_AsyncWaitSetProperty_t (p. 1544)

5.116.6.1 DDS_AsyncWaitSetCompletionToken

`typedef struct DDS_AsyncWaitSetCompletionTokenImpl` **DDS_AsyncWaitSetCompletionToken**

<<***interface***>> *(p. 1015)* Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **DDS_AsyncWaitSet** (p. 1072) behavior.

A **DDS_AsyncWaitSetCompletionToken** (p. 1075) can be in one of the following states:

- `READY`: The completion token can be used to associate a new request. Calling **DDS_AsyncWaitSet↩ CompletionToken_wait** (p. 1078) on a ready completion token will return immediately with success. A ready completion token can only transition to the queued state.
- `QUEUED`: The completion token has an associated request that is pending processing. Calling **DDS_Async↩ WaitSetCompletionToken_wait** (p. 1078) on a queued completion token will block until the request completes or times out. A queued completion token can only transition to the processed state.
- `PROCESS`: The completion token has an associated request that has been processed but the application did not call **DDS_AsyncWaitSetCompletionToken_wait** (p. 1078) yet. Calling **DDS_AsyncWaitSetCompletion↩ Token_wait** (p. 1078) on a processed completion token will return immediately with the return code result of processing the associated request. A processed completion token can transition to both ready or queued states.

5.116.7 AsyncWaitSetCompletionToken management

The same **DDS_AsyncWaitSetCompletionToken** (p. 1075) instance can be reused reused multiple times to associate a request and wait for its completion. Reusing is allowed only if the completion token is either in `READY` or `PROCESSED` state. Otherwise the **DDS_AsyncWaitSet** (p. 1072) operation that associates the completion token will fail with **DDS↩ _RETCODE_PRECONDITION_NOT_MET** (p. 1224).

The completion token functionality can be viewed as a **DDS_AsyncWaitSet** (p. 1072) internal detail from which your application should not need to know. In general, it is recommended to use the default flavor of **DDS_AsyncWaitSet** (p. 1072) operations that handle the internals of the completion tokens for you.

Nevertheless, if a completion token represents an expensive resource in your environment, your application may want to have full control of how and when completion tokens are created. It's for these reasons why is exposed as a public collaborator of the **DDS_AsyncWaitSet** (p. 1072).

MT Safety:

Safe.

DDS_AsyncWaitSet (p. 1072)

5.116.7.1 DDS_AsyncWaitSetListener_OnThreadSpawnedCallback

```
typedef void(* DDS_AsyncWaitSetListener_OnThreadSpawnedCallback) (void *listener_data, DDS_↩
UnsignedLongLong thread_id)
```

Prototype of a **DDS_AsyncWaitSetListener::on_thread_spawned** (p. 1544) function.

Each thread that comprises the thread pool of the **DDS_AsyncWaitSet** (p. 1072) will invoke this operation sequentially as soon as the thread is spawned and right before it becomes the leader or a follower thread.

This callback is invoked by each thread comprising the pool and from its own context, right after it is spawned and the underlying operating system has allocated the necessary resources.

Parameters

listener_data	<<***in***>> *(p. 1015)* Data associated with the listener when the listener is set.
thread_id	<<***in***>> *(p. 1015)* Thread ID of the current context.

5.116.7.2 DDS_AsyncWaitSetListener_OnThreadDeletedCallback

```
typedef void(* DDS_AsyncWaitSetListener_OnThreadDeletedCallback) (void *listener_data, DDS_↩
UnsignedLongLong thread_id)
```

Prototype of a **DDS_AsyncWaitSetListener::on_thread_deleted** (p. 1544) function.

Each thread that comprises the thread pool of the **DDS_AsyncWaitSet** (p. 1072) will invoke this operation sequentially right before the thread finalizes its execution due to a stop request or an internal error.

This callback is invoked by each thread comprising the pool and from its own context, right before the underlying operating system releases the associarted resources.

Parameters

listener_data	<<***in***>> *(p. 1015)* Data associated with the listener when the listener is set.
thread_id	<<***in***>> *(p. 1015)* Thread ID of the current context.

5.116.7.3 DDS_AsyncWaitSetListener_OnWaitTimeoutCallback

```
typedef void(* DDS_AsyncWaitSetListener_OnWaitTimeoutCallback) (void *listener_data, DDS_Unsigned↩
LongLong thread_id)
```

Prototype of a **DDS_AsyncWaitSetListener::on_wait_timeout** (p. 1544) function.

The leader thread of the **DDS_AsyncWaitSet** (p. 1072) invokes this callback each time the wait operation timed out while waiting for the attached **DDS_Condition** (p. 1372) objects to trigger.

Parameters

listener_data	*<<**in**>> (p. 1015)* Data associated with the listener when the listener is set.
thread_id	*<<**in**>> (p. 1015)* Thread ID of the current context. It always corresponds to the current leader thread.

See also

DDS_WaitSet_wait (p. 1383)

5.116.7.4 DDS_DataReaderStatusConditionHandler

```
typedef struct DDS_DataReaderStatusConditionHandlerImpl DDS_DataReaderStatusConditionHandler
```

*<<**interface**>> (p. 1015)* Realization of a **DDS_ConditionHandler** (p. 1570) that handles the status of a **DDS_Data↩Reader** (p. 618).

A **DDS_DataReaderStatusConditionHandler** (p. 1077) demultiplexes a **DDS_DataReader** (p. 618) status change into the corresponding callback of a provided **DDS_DataReaderListener** (p. 1593) implementation.

Note that the **DDS_DataReaderListener** (p. 1593) notifications have different considerations than if the were made by the **DDS_DataReader** (p. 618) directly:

- Context: The **DDS_DataReaderListener** (p. 1593) callback context is the one of the thread that dispatches the **DDS_Condition** (p. 1372) where this handler is set. For instance, if you attach the condition to a **DDS_Async↩WaitSet** (p. 1072), the context will be one of the threads within the pool.
- Status clearing: All the **DDS_DataReader** (p. 618)'s enabled statuses are cleared upon condition dispatch except the **DDS_DATA_AVAILABLE_STATUS** (p. 1232), which will not be cleared until your application reads the data.
- Exclusive Area: Restrictions depend on the context of the dipsatching thread. For instance, if the **DDS_Async↩WaitSet** (p. 1072) dispatches the condition, the listener notications are free of any exclusive area restrictions.

The **DDS_DataReaderStatusConditionHandler** (p. 1077) is a convenience to handle the status changes of a **DDS↩_DataReader** (p. 618). You can install a **DDS_DataReaderStatusConditionHandler** (p. 1077) as the handler of a reader's **DDS_StatusCondition** (p. 1373). You can then attach it to a **DDS_WaitSet** (p. 1373) or **DDS_AsyncWaitSet** (p. 1072) and receive status changes notifications through a specific **DDS_DataReaderListener** (p. 1593) implementation instance.

5.116.8 Function Documentation

5.116.8.1 DDS_AsyncWaitSetCompletionToken_wait()

```
DDS_ReturnCode_t DDS_AsyncWaitSetCompletionToken_wait (
            DDS_AsyncWaitSetCompletionToken * self,
           const struct  DDS_Duration_t * max_wait )
```

Waits for the request associated to an operation made on the **DDS_AsyncWaitSet** (p. 1072) to complete.

This operation will block the calling thread for a maximum amount of time specified by `max_wait` until the **DDS_↩AsyncWaitSet** (p. 1072) request associated with this completion token completes.

If there is no timeout, upon return it is guaranteed that the request associated with this token completed. This operation may fail due to an error during the wait or while processing the associated request.

If this operation is called from within the context of one of the threads that comprise the thread pool of the **DDS_↩AsyncWaitSet** (p. 1072), it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

If the operation failed with **DDS_RETCODE_TIMEOUT** (p. 1224) your application can wait again on this completion token.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
max_wait	<<***in***>> *(p. 1015)* Cannot be NULL. Maximum time to wait for the request associated to this completion token to complete before timeout.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet (p. 1072)

5.116.8.2 DDS_AsyncWaitSet_get_property()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_get_property (
            DDS_AsyncWaitSet * self,
           struct  DDS_AsyncWaitSetProperty_t * property )
```

Retrieves the **DDS_AsyncWaitSetProperty_t** (p. 1544) configuration of the associated **DDS_AsyncWaitSet** (p. 1072).

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
property	<<***out***>> *(*p. *1015)*

Returns

One of the **Standard Return Codes** (p. 1223)

5.116.8.3 DDS_AsyncWaitSet_detach_condition()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_detach_condition (
            DDS_AsyncWaitSet * self,
            DDS_Condition * condition )
```

Deaches the specified **DDS_Condition** (p. 1372) from this **DDS_AsyncWaitSet** (p. 1072).

This operation is equivalent to call **DDS_AsyncWaitSet_detach_condition_with_completion_token** (p. 1079) providing **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) as a `completion_token`.

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **DDS_Condition** (p. 1372) is detached.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
condition	<<***in***>> *(*p. *1015)* **DDS_Condition** (p. 1372) to be detached.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_detach_condition_with_completion_token (p. 1079)

5.116.8.4 DDS_AsyncWaitSet_detach_condition_with_completion_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_detach_condition_with_completion_token (
            DDS_AsyncWaitSet * self,
```

```
DDS_Condition * condition,
DDS_AsyncWaitSetCompletionToken * completion_token )
```

Detaches the specified **DDS_Condition** (p. 1372) from this **DDS_AsyncWaitSet** (p. 1072).

If this operation succeeds, a detach request has been scheduled and your application can use the provided `completion_token` to wait for this **DDS_AsyncWaitSet** (p. 1072) to process the request. If the **DDS_AsyncWaitSetCompletionToken_wait** (p. 1078) operation returns successfully, it is guaranteed that the **DDS_Condition** (p. 1372) is detached from this **DDS_AsyncWaitSet** (p. 1072).

Once the **DDS_Condition** (p. 1372) is detached, it is guaranteed that the **DDS_AsyncWaitSet** (p. 1072) will no longer process it so it is safe for your application to release any resources associated with the detached **DDS_Condition** (p. 1372).

DDS_Condition (p. 1372) may be detached at any time independently of the state of the **DDS_AsyncWaitSet** (p. 1072).

If the same **DDS_Condition** (p. 1372) had been previously attached multiple times, only a single detach is required; the **DDS_Condition** (p. 1372) is considered attached only once.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
condition	<<***in***>> *(*p. *1015)* **DDS_Condition** (p. 1372) to be detached.
completion_token	<<***inout***>> *(*p. *1015)* a valid **DDS_AsyncWaitSetCompletionToken** (p. 1075) instance that can be used by your application to wait for the detach request to complete. You can provide one of the special sentinels **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) and **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE** (p. 1092).

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_detach_condition (p. 1079)

DDS_AsyncWaitSet_attach_condition_with_completion_token (p. 1081)

DDS_AsyncWaitSetCompletionToken_wait (p. 1078)

5.116.8.5 DDS_AsyncWaitSet_attach_condition()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_attach_condition (
            DDS_AsyncWaitSet * self,
            DDS_Condition * condition )
```

Attaches the specified **DDS_Condition** (p. 1372) to this **DDS_AsyncWaitSet** (p. 1072).

This operation is equivalent to calling **DDS_AsyncWaitSet_attach_condition_with_completion_token** (p. 1081) providing **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) as a `completion_token`.

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **DDS_Condition** (p. 1372) is attached.

If the same **DDS_Condition** (p. 1372) is attached multiple times, only the first attachment has any effect. Subsequent attempts to attach the same **DDS_Condition** (p. 1372) are silently ignored. As a result, the **DDS_Condition** (p. 1372) is only considered attached once and must only be detached once.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
condition	*<<**in**>> (p. 1015)* **DDS_Condition** (p. 1372) to be attached.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_attach_condition_with_completion_token (p. 1081)

5.116.8.6 DDS_AsyncWaitSet_attach_condition_with_completion_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_attach_condition_with_completion_token (
            DDS_AsyncWaitSet * self,
            DDS_Condition * condition,
            DDS_AsyncWaitSetCompletionToken * completion_token )
```

Attaches the specified **DDS_Condition** (p. 1372) to this **DDS_AsyncWaitSet** (p. 1072).

If this operation succeeds, an attach request has been scheduled and your application can use the output parameter `completion_token` to wait for this **DDS_AsyncWaitSet** (p. 1072) to process the request. **DDS_AsyncWaitSet↩ CompletionToken_wait** (p. 1078) operation returns successfully, it is guaranteed that the **DDS_Condition** (p. 1372) is attached to this **DDS_AsyncWaitSet** (p. 1072).

Once the **DDS_Condition** (p. 1372) is attached, its trigger value may cause the leader thread of the **DDS_AsyncWait↩ Set** (p. 1072) to wake up call the **DDS_Condition_dispatch** (p. 1377) operation.

DDS_Condition (p. 1372) may be attached at any time independently of the state of the **DDS_AsyncWaitSet** (p. 1072).

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
condition	*<<**in**>> (p. 1015)* **DDS_Condition** (p. 1372) to be attached.
completion_token	*<<**inout**>> (p. 1015)* a valid **DDS_AsyncWaitSetCompletionToken** (p. 1075) instance that can be used by your application to wait for the attach request to complete. You can provide one of the special sentinels **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) and **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE** (p. 1092).

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_attach_condition (p. 1080)

DDS_AsyncWaitSet_detach_condition_with_completion_token (p. 1079)

DDS_AsyncWaitSetCompletionToken_wait (p. 1078)

5.116.8.7 DDS_AsyncWaitSet_unlock_condition()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_unlock_condition (
            DDS_AsyncWaitSet * self,
            DDS_Condition * condition )
```

Allows the **DDS_Condition** (p. 1372) under dispatch to be available for concurrent dispatch from another thread from the pool.

This operation can be called from the dispatch callback of the **DDS_Condition** (p. 1372) this **DDS_AsyncWaitSet** (p. 1072) is dispatching. After succesfully calling this operation, if the **DDS_Condition** (p. 1372) becomes active this **DDS_AsyncWaitSet** (p. 1072) is allowed to dispatch it again from any available thread from the pool.

You may call this operation any time you need the same **DDS_Condition** (p. 1372) to be dispatched concurrently.

This operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224) if you call it from a different context than the dispatch callback or on a different **DDS_Condition** (p. 1372).

Returns

One of the **Standard Return Codes** (p. 1223)

5.116.8.8 DDS_AsyncWaitSet_get_conditions()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_get_conditions (
            DDS_AsyncWaitSet * self,
           struct  DDS_ConditionSeq * attached_conditions )
```

Retrieves the list of attached **DDS_Condition** (p. 1372) (s).

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
attached_conditions	*<<**inout**>> (p. 1015)* a **DDS_ConditionSeq** (p. 1571) object where the list of attached conditions will be returned.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_attach_condition (p. 1080)

DDS_AsyncWaitSet_detach_condition (p. 1079)

5.116.8.9 DDS_AsyncWaitSet_stop()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_stop (
            DDS_AsyncWaitSet * self )
```

Initiates the stop procedure on this **DDS_AsyncWaitSet** (p. 1072) that will stop the asynchronous wait.

This operation is equivalent to calling **DDS_AsyncWaitSet_stop_with_completion_token** (p. 1083) providing **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) as a `completion_token`.

This operation will block until the stop request completes. Upon successful return, it is guaranteed that this **DDS_AsyncWaitSet** (p. 1072) stopped the asynchronous wait and dispatch.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_start_with_completion_token (p. 1084)

DDS_AsyncWaitSet_stop (p. 1083)

5.116.8.10 DDS_AsyncWaitSet_stop_with_completion_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_stop_with_completion_token (
            DDS_AsyncWaitSet * self,
            DDS_AsyncWaitSetCompletionToken * completion_token )
```

Initiates the stop procedure on this **DDS_AsyncWaitSet** (p. 1072) that will stop the asynchronous wait.

If this operation succeeds, a stop request has been scheduled and your application can use the provided `completion_token` to wait for this **DDS_AsyncWaitSet** (p. 1072) to process the request. If the **DDS_AsyncWaitSetCompletionToken_wait** (p. 1078) operation returns successfully, it is guranteed that the thread pool has been deleted and this **DDS_AsyncWaitSet** (p. 1072) no longer process any of the attached **DDS_Condition** (p. 1372) objects.

Once this **DDS_AsyncWaitSet** (p. 1072) is stopped, the **DDS_Condition_dispatch** (p. 1377) will no longer be called on any of the attached **DDS_Condition** (p. 1372), no matter what their trigger value is.

The stop procedure causes the **DDS_AsyncWaitSet** (p. 1072) to delete all the threads within the thread pool, which involves the underlying operating system to release the associated thread stack and context of each thread. If a **DDS_AsyncWaitSetListener** (p. 1543) is installed, this **DDS_AsyncWaitSet** (p. 1072) will sequentially invoke the **DDS_AsyncWaitSetListener::on_thread_deleted** (p. 1544) once per deleted thread.

If this **DDS_AsyncWaitSet** (p. 1072) is already stopped, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
completion_token	*<<**inout**>> (p. 1015)* a valid **DDS_AsyncWaitSetCompletionToken** (p. 1075) instance that can be used by your application to wait for the stop request to complete. You can provide one of the special sentinels **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) and **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE** (p. 1092).

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_stop (p. 1083)

DDS_AsyncWaitSet_start_with_completion_token (p. 1084)

5.116.8.11 DDS_AsyncWaitSet_start()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_start (
            DDS_AsyncWaitSet * self )
```

Initiates the asynchronous wait on this **DDS_AsyncWaitSet** (p. 1072).

This operation is equivalent to calling **DDS_AsyncWaitSet_start_with_completion_token** (p. 1084) providing **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) as a `completion_token`.

This operation blocks until the start request completes. Upon successful return, it is guaranteed that this **DDS_AsyncWaitSet** (p. 1072) has initiated the asynchronous wait and dispatch.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_start_with_completion_token (p. 1084)

DDS_AsyncWaitSet_stop (p. 1083)

5.116.8.12 DDS_AsyncWaitSet_start_with_completion_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_start_with_completion_token (
            DDS_AsyncWaitSet * self,
            DDS_AsyncWaitSetCompletionToken * completion_token )
```

Initiates the asynchronous wait on this **DDS_AsyncWaitSet** (p. 1072).

If this operation succeeds, a start request has been scheduled and your application can use the provided `completion_token` to wait for this **DDS_AsyncWaitSet** (p. 1072) to process the request. If the **DDS_Async↩ WaitSetCompletionToken_wait** (p. 1078) operation returns successfully, it is guranteed that the thread pool has been created and the leader thread is waiting for the attached **DDS_Condition** (p. 1372) to trigger.

Once this **DDS_AsyncWaitSet** (p. 1072) is started, attached **DDS_Condition** (p. 1372) will be dispatched through the **DDS_Condition_dispatch** (p. 1377) operation when they trigger.

The start procedure causes the **DDS_AsyncWaitSet** (p. 1072) to spawn all the threads within the thread pool, which involves the underlying operating system to allocate the associated thread stack and context for each thread. If a **DDS↩ _AsyncWaitSetListener** (p. 1543) is installed, this **DDS_AsyncWaitSet** (p. 1072) will sequentially invoke the **DDS_↩ AsyncWaitSetListener::on_thread_spawned** (p. 1544) once per spwaned thread.

A **DDS_AsyncWaitSet** (p. 1072) can be restarted after a stop. If this **DDS_AsyncWaitSet** (p. 1072) is already started, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
completion_token	<<***inout***>> *(p. 1015)* a valid **DDS_AsyncWaitSetCompletionToken** (p. 1075) instance that can be used by your application to wait for the start request to complete. You can provide one of the special sentinels **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 1092) and **DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE** (p. 1092).

Returns

One of the **Standard Return Codes** (p. 1223)

```
DDS_Boolean DDS_AsyncWaitSet_is_started (
            DDS_AsyncWaitSet * self )
```

Returns whether this **DDS_AsyncWaitSet** (p. 1072) is started.

A **DDS_AsyncWaitSet** (p. 1072) is started if all the threads within the thread pool have been created and are running.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if started.

5.116.8.14 DDS_AsyncWaitSet_create_completion_token()

```
DDS_AsyncWaitSetCompletionToken * DDS_AsyncWaitSet_create_completion_token (
            DDS_AsyncWaitSet * self )
```

Creates a new **DDS_AsyncWaitSetCompletionToken** (p. 1075).

All the created **DDS_AsyncWaitSetCompletionToken** (p. 1075) must be deleted by calling **DDS_AsyncWaitSet_↩ delete_completion_token** (p. 1087).

Returns

A new **DDS_AsyncWaitSetCompletionToken** (p. 1075) or NULL on error.

See also

DDS_AsyncWaitSet_delete_completion_token (p. 1087)

DDS_AsyncWaitSet_delete (p. 1090)

5.116.8.15 DDS_AsyncWaitSet_delete_completion_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_delete_completion_token (
            DDS_AsyncWaitSet * self,
            DDS_AsyncWaitSetCompletionToken * completion_token )
```

Deletes a **DDS_AsyncWaitSetCompletionToken** (p. 1075) previously created from this **DDS_AsyncWaitSet** (p. 1072).

This operation will fail the if the specified `completion_token` was not created from this **DDS_AsyncWaitSet** (p. 1072).

This operation will fail if the specified `completion_token` is associated with a request that has not completed yet.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
completion_token	*<<**inout**>> (p. 1015)* a valid **DDS_AsyncWaitSetCompletionToken** (p. 1075) created from this **DDS_AsyncWaitSet** (p. 1072).

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_AsyncWaitSet_create_completion_token (p. 1087)

DDS_AsyncWaitSet_delete (p. 1090)

5.116.8.16 DDS_AsyncWaitSet_new()

```
DDS_AsyncWaitSet * DDS_AsyncWaitSet_new (
            const struct  DDS_AsyncWaitSetProperty_t * property )
```

Single-argument constructor that allows creating a a **DDS_AsyncWaitSet** (p. 1072) with custom behavior.

You can provide **DDS_ASYNC_WAITSET_PROPERTY_DEFAULT** (p. 1092) as `property` to create an **DDS_↩ AsyncWaitSet** (p. 1072) with default behavior.

The **DDS_AsyncWaitSet** (p. 1072) is created with no listener installed.

Parameters

property	*<<**in**>> (p. 1015)* configuration **DDS_AsyncWaitSetProperty_t** (p. 1544)

Returns

A new **DDS_AsyncWaitSet** (p. 1072) or NULL if one could not be allocated.

5.116.8.17 DDS_AsyncWaitSet_new_with_listener()

```
DDS_AsyncWaitSet * DDS_AsyncWaitSet_new_with_listener (
            const struct  DDS_AsyncWaitSetProperty_t * property,
            struct  DDS_AsyncWaitSetListener * listener )
```

Constructor that allows specifying a **DDS_AsyncWaitSetListener** (p. 1543).

Creates a new **DDS_AsyncWaitSet** (p. 1072) with the specified property **DDS_AsyncWaitSetProperty_t** (p. 1544) and **DDS_AsyncWaitSetListener** (p. 1543).

Parameters

property	<<***in***>> *(*p. *1015)* configuration **DDS_AsyncWaitSetProperty_t** (p. 1544)
listener	<<***in***>> *(*p. *1015)* the **DDS_AsyncWaitSetListener** (p. 1543). Cannot be NULL.

Returns

A new **DDS_AsyncWaitSet** (p. 1072) or NULL if one could not be allocated.

5.116.8.18 DDS_AsyncWaitSet_new_with_thread_factory()

```
DDS_AsyncWaitSet * DDS_AsyncWaitSet_new_with_thread_factory (
            const struct  DDS_AsyncWaitSetProperty_t * property,
            struct  DDS_AsyncWaitSetListener * listener,
            struct  DDS_ThreadFactory * thread_factory )
```

Constructor with arguments that allow specifying behavior different than the default one, including specifying a **DDS_↩ ThreadFactory** (p. 2033) for the creation and deletion of the threads within the thread pool.

This operation extends **DDS_AsyncWaitSet_new_with_listener** (p. 1088) by allowing to provide a **DDS_Thread↩ Factory** (p. 2033)

Parameters

property	<<***in***>> *(*p. *1015)* configuration **DDS_AsyncWaitSetProperty_t** (p. 1544)
listener	<<***in***>> *(*p. *1015)* the **DDS_AsyncWaitSetListener** (p. 1543). Cannot be NULL.
thread_factory	<<***in***>> *(*p. *1015)* **DDS_ThreadFactory** (p. 2033) for the creation and deletion of threads.

Returns

A new **DDS_AsyncWaitSet** (p. 1072) or NULL if one could not be allocated.

5.116.8.19 DDS_AsyncWaitSet_delete()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_delete (
            DDS_AsyncWaitSet * self )
```

Deletes a **DDS_AsyncWaitSet** (p. 1072).

If the **DDS_AsyncWaitSet** (p. 1072) is started, this operation will initiate the stop procedure and block until it completes.

The deletion will fail if there are outstanding **DDS_AsyncWaitSetCompletionToken** (p. 1075) that have not been deleted.

Any outstanding **DDS_AsyncWaitSet** (p. 1072) must be deleted before finalizing the **DDS_DomainParticipantFactory** (p. 32). Otherwise undefined behavior may occur.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

See also

DDS_AsyncWaitSet_new (p. 1088)

5.116.8.20 DDS_DataReaderStatusConditionHandler_new()

```
DDS_DataReaderStatusConditionHandler * DDS_DataReaderStatusConditionHandler_new (
            DDS_DataReader * reader,
           const struct  DDS_DataReaderListener * listener,
            DDS_StatusMask listener_mask )
```

Creates a new **DDS_DataReaderStatusConditionHandler** (p. 1077) instance.

The created DataReaderStatusConditionHandler can set as **DDS_ConditionHandler** (p. 1570) in any **DDS_Condition** (p. 1372) and will demultiplex the specified status changes from the specified **DDS_DataReader** (p. 618)

Parameters

reader	<<***in***>> *(*p. *1015)* The **DDS_DataReader** (p. 618) for which the status changes are demultiplexed to the specified `listener`
listener	<<***in***>> *(*p. *1015)* that receives the status changes notifications from the specified `reader`.
listener_mask	<<***in***>> *(*p. *1015)* Specifies which status changes from `the` reader to demultiplex to the `listener`.

Returns

A new instance or NULL on error.

See also

DDS_DataReader_set_listener (p. 691)

DDS_StatusCondition (p. 1373)

DDS_ConditionHandler (p. 1570)

5.116.8.21 DDS_DataReaderStatusConditionHandler_delete()

```
DDS_ReturnCode_t DDS_DataReaderStatusConditionHandler_delete (
            DDS_DataReaderStatusConditionHandler * self )
```

Deletes a **DDS_DataReaderStatusConditionHandler** (p. 1077) instance previously created with **DDS_DataReader↩StatusConditionHandler_new** (p. 1091).

Returns

One of the **Standard Return Codes** (p. 1223)

5.116.9 Variable Documentation

5.116.9.1 DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT

```
DDS_AsyncWaitSetCompletionToken* const DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT
```

For the operations that allow an **DDS_AsyncWaitSetCompletionToken** (p. 1075), this sentinel can be provided to indicate an **DDS_AsyncWaitSet** (p. 1072) to use the implicit completion token and wait on it for request completion.

If this sentinel is used, the **DDS_AsyncWaitSet** (p. 1072) will use the completion token associated with the calling thread and will wait with an infinite timeout until the request completes successfully.

5.116.9.2 DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE

```
DDS_AsyncWaitSetCompletionToken* const DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE
```

For the operations that allow an **DDS_AsyncWaitSetCompletionToken** (p. 1075), this sentinel can be provided to indicate an **DDS_AsyncWaitSet** (p. 1072) to perform the action associating a 'null' completion token.

This sentinel is a realization of the null object pattern of an **DDS_AsyncWaitSetCompletionToken** (p. 1075). If this object is provided to a **DDS_AsyncWaitSet** (p. 1072) operation, the resulting operation request will be associated with a 'null' completion token that behaves as no-op.

When 'nul' completion token is provided, the **DDS_AsyncWaitSet** (p. 1072) operation returns immediately after it issues the internal request, and there is no mean for your application to wait for the request to complete.

You can use this sentinel when your application can operate on an **DDS_AsyncWaitSet** (p. 1072) without needing to known when operation requests complete or your application uses other strategies to synchronize resources.

This sentinel is also useful when you need to perform operations on **DDS_AsyncWaitSet** (p. 1072) from within one of the threads from its thread pool, where waiting on a valid **DDS_AsyncWaitSetCompletionToken** (p. 1075) is forbidden.

5.116.9.3 DDS_ASYNC_WAITSET_PROPERTY_DEFAULT

```
const struct DDS_AsyncWaitSetProperty_t DDS_ASYNC_WAITSET_PROPERTY_DEFAULT
```

Constant that defines the default property for a **DDS_AsyncWaitSet** (p. 1072).

Value: `wait_set_property` = **DDS_WaitSetProperty_t_INITIALIZER** (p. 1371), `thread_pool_size` = 1, `thread_settings` DDS_THREAD_SETTINGS_DEFAULT, `thread_base_name` = NULL `wait_timeout` = **DDS_DURATION_INFINITE** (p. 1210) `level` = 1

5.117 Participant Built-in Topics

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.

Data Structures

- struct **DDS_ParticipantBuiltinTopicData**

  Entry created when a DomainParticipant object is discovered.
- struct **DDS_ParticipantBuiltinTopicDataSeq**

  Instantiates ***FooSeq*** *(p. 2120)* < ***DDS_ParticipantBuiltinTopicData*** *(p. 1873)* > .
- struct **DDS_ParticipantBuiltinTopicDataTypeSupport**

  Instantiates `TypeSupport` < ***DDS_ParticipantBuiltinTopicData*** *(p. 1873)* > .

Typedefs

- typedef struct **DDS_ParticipantBuiltinTopicData** **DDS_ParticipantBuiltinTopicData**

  Entry created when a DomainParticipant object is discovered.
- typedef struct **DDS_ParticipantBuiltinTopicDataDataReader** **DDS_ParticipantBuiltinTopicDataDataReader**

  Instantiates `DataReader` < ***DDS_ParticipantBuiltinTopicData*** *(p. 1873)* > .

Variables

- const char * **DDS_PARTICIPANT_TOPIC_NAME**

  Participant topic name.

5.117.1 Detailed Description

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.

5.117.2 Typedef Documentation

5.117.2.1 DDS_ParticipantBuiltinTopicData

```
typedef struct DDS_ParticipantBuiltinTopicData DDS_ParticipantBuiltinTopicData
```

Entry created when a DomainParticipant object is discovered.

Data associated with the built-in topic **DDS_PARTICIPANT_TOPIC_NAME** (p. 1094). It contains QoS policies and additional information that apply to the remote **DDS_DomainParticipant** (p. 76).

See also

DDS_PARTICIPANT_TOPIC_NAME (p. 1094)

DDS_ParticipantBuiltinTopicData (p. 1873)

DDS_ParticipantBuiltinTopicDataDataReader (p. 1094)

5.118 Topic Built-in Topics

Data Structures

- struct **DDS_TopicBuiltinTopicData**

  Entry created when a Topic object discovered.
- struct **DDS_TopicBuiltinTopicDataSeq**

  Instantiates ***FooSeq*** *(p. 2120) < **DDS_TopicBuiltinTopicData** (p. 2040) > .*
- struct **DDS_TopicBuiltinTopicDataTypeSupport**

  Instantiates `TypeSupport` *< **DDS_TopicBuiltinTopicData** (p. 2040) > .*

Typedefs

- typedef struct **DDS_TopicBuiltinTopicData** **DDS_TopicBuiltinTopicData**

  Entry created when a Topic object discovered.
- typedef struct **DDS_TopicBuiltinTopicDataDataReader** **DDS_TopicBuiltinTopicDataDataReader**

  Instantiates `DataReader` *< **DDS_TopicBuiltinTopicData** (p. 2040) > .*

Variables

- const char * **DDS_TOPIC_TOPIC_NAME**

  Topic topic name.

5.118.1 Detailed Description

Builtin topic for accessing information about the Topics discovered by RTI Connext.

5.118.2 Typedef Documentation

5.118.2.1 DDS_TopicBuiltinTopicData

`typedef struct` **DDS_TopicBuiltinTopicData** **DDS_TopicBuiltinTopicData**

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS_TOPIC_TOPIC_NAME** (p. 1096). It contains QoS policies and additional information that apply to the remote **DDS_Topic** (p. 174).

Note: The **DDS_TopicBuiltinTopicData** (p. 2040) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS_PublicationBuiltinTopicData** (p. 1909) and **DDS_Subscription↩ BuiltinTopicData** (p. 2018)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

See also

DDS_TOPIC_TOPIC_NAME (p. 1096)

DDS_TopicBuiltinTopicDataDataReader (p. 1095)

5.118.2.2 DDS_TopicBuiltinTopicDataDataReader

```
typedef struct DDS_TopicBuiltinTopicDataDataReader DDS_TopicBuiltinTopicDataDataReader
```

Instantiates DataReader < **DDS_TopicBuiltinTopicData** (p. 2040) > .

DDS_DataReader (p. 618) of topic **DDS_TOPIC_TOPIC_NAME** (p. 1096) used for accessing **DDS_TopicBuiltin↩ TopicData** (p. 2040) of the remote **DDS_Topic** (p. 174).

Note: The **DDS_TopicBuiltinTopicData** (p. 2040) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS_PublicationBuiltinTopicData** (p. 1909) and **DDS_Subscription↩ BuiltinTopicData** (p. 2018)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

Instantiates:

<<***generic***>> *(*p. *1015)* **FooDataReader** (p. 2119)

5.120 Subscription Built-in Topics

Builtin topic for accessing information about the Subscriptions discovered by RTI Connext.

Data Structures

- struct **DDS_SubscriptionBuiltinTopicData**

  *Entry created when a **DDS_DataReader** (p. 618) is discovered in association with its Subscriber.*
- struct **DDS_SubscriptionBuiltinTopicDataSeq**

  *Instantiates **FooSeq** (p. 2120) < **DDS_SubscriptionBuiltinTopicData** (p. 2018) > .*
- struct **DDS_SubscriptionBuiltinTopicDataTypeSupport**

  *Instantiates TypeSupport < **DDS_SubscriptionBuiltinTopicData** (p. 2018) > .*

Typedefs

- typedef struct **DDS_SubscriptionBuiltinTopicData** **DDS_SubscriptionBuiltinTopicData**

  *Entry created when a **DDS_DataReader** (p. 618) is discovered in association with its Subscriber.*
- typedef struct **DDS_SubscriptionBuiltinTopicDataDataReader** **DDS_SubscriptionBuiltinTopicDataData↩ Reader**

  *Instantiates DataReader < **DDS_SubscriptionBuiltinTopicData** (p. 2018) > .*

Variables

- const char * **DDS_SUBSCRIPTION_TOPIC_NAME**

  Subscription topic name.

5.120.1 Detailed Description

Builtin topic for accessing information about the Subscriptions discovered by RTI Connext.

5.120.2 Typedef Documentation

5.120.2.1 DDS_SubscriptionBuiltinTopicData

```
typedef struct DDS_SubscriptionBuiltinTopicData DDS_SubscriptionBuiltinTopicData
```

Entry created when a **DDS_DataReader** (p. 618) is discovered in association with its Subscriber.

Data associated with the built-in topic **DDS_SUBSCRIPTION_TOPIC_NAME** (p. 1100). It contains QoS policies and additional information that apply to the remote **DDS_DataReader** (p. 618) the related **DDS_Subscriber** (p. 575).

See also

DDS_SUBSCRIPTION_TOPIC_NAME (p. 1100)

DDS_SubscriptionBuiltinTopicDataDataReader (p. 1099)

5.120.2.2 DDS_SubscriptionBuiltinTopicDataDataReader

5.121 ServiceRequest Built-in Topic

Builtin topic for accessing requests from different services within RTI Connext.

Data Structures

- struct **DDS_ServiceRequest**

  A request coming from one of the built-in services.
- struct **DDS_ServiceRequestSeq**

  Instantiates ***FooSeq*** *(p. 2120) < **DDS_ServiceRequest** (p. 2006) > .*
- struct **DDS_ServiceRequestTypeSupport**

  Instantiates `TypeSupport` *< **DDS_ServiceRequest** (p. 2006) > .*

Typedefs

- typedef struct **DDS_ServiceRequest DDS_ServiceRequest**

  A request coming from one of the built-in services.
- typedef struct **DDS_ServiceRequestDataReader DDS_ServiceRequestDataReader**

  Instantiates `DataReader` *< **DDS_ServiceRequest** (p. 2006) > .*

Variables

- const **DDS_Long DDS_UNKNOWN_SERVICE_REQUEST_ID**

  An invalid Service Id.
- const **DDS_Long DDS_TOPIC_QUERY_SERVICE_REQUEST_ID**

  *Service Id for the **DDS_TopicQuery** (p. 708) Service.*
- const **DDS_Long DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID**

  Service Id for the Locator Reachability Service.
- const **DDS_Long DDS_INSTANCE_STATE_SERVICE_REQUEST_ID**

  Service Id for the Instance State Request service.
- const **DDS_Long DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID**

  Service Id for RTI Monitoring Library 2.0 Command Service Request.
- const **DDS_Long DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID**

  Service Id for RTI Monitoring Library 2.0 Reply Service Requests.
- const char * **DDS_SERVICE_REQUEST_TOPIC_NAME**

  Service Request topic name.

5.121.1 Detailed Description

Builtin topic for accessing requests from different services within RTI Connext.

Currently, the **DDS_TopicQuery** (p. 708), Locator Reachability Instance State Consistency and Controlability (part of Observability) all rely on this topic.

See also

Topic Queries (p. 704) for an explanation of how TopicQueries use ServiceRequests and how you can access the ServiceRequests for debugging purposes in the section **The Built-in ServiceRequest DataReader** (p. 707).

5.121.2 Typedef Documentation

5.121.2.1 DDS_ServiceRequest

`typedef struct` **DDS_ServiceRequest** **DDS_ServiceRequest**

A request coming from one of the built-in services.

Data associated with the built-in topic **DDS_SERVICE_REQUEST_TOPIC_NAME** (p. 1103). It contains service-specific information.

See also

DDS_SERVICE_REQUEST_TOPIC_NAME (p. 1103)

DDS_ParticipantBuiltinTopicDataDataReader (p. 1094)

5.121.2.2 DDS_ServiceRequestDataReader

`typedef struct` **DDS_ServiceRequestDataReader** **DDS_ServiceRequestDataReader**

Instantiates `DataReader` < **DDS_ServiceRequest** (p. 2006) > .

DDS_DataReader (p. 618) of topic **DDS_SERVICE_REQUEST_TOPIC_NAME** (p. 1103) used for accessing **DDS_↩ ServiceRequest** (p. 2006) samples.

Instantiates:

<<***generic***>> *(*p. *1015)* **FooDataReader** (p. 2119)

See also

DDS_ServiceRequest (p. 2006)

DDS_SERVICE_REQUEST_TOPIC_NAME (p. 1103)

5.121.3 Variable Documentation

5.121.3.1 DDS_UNKNOWN_SERVICE_REQUEST_ID

```
const DDS_Long DDS_UNKNOWN_SERVICE_REQUEST_ID [extern]
```

An invalid Service Id.

5.121.3.2 DDS_TOPIC_QUERY_SERVICE_REQUEST_ID

```
const DDS_Long DDS_TOPIC_QUERY_SERVICE_REQUEST_ID [extern]
```

Service Id for the **DDS_TopicQuery** (p. 708) Service.

5.121.3.3 DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID

```
const DDS_Long DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID [extern]
```

Service Id for the Locator Reachability Service.

5.121.3.4 DDS_INSTANCE_STATE_SERVICE_REQUEST_ID

```
const DDS_Long DDS_INSTANCE_STATE_SERVICE_REQUEST_ID [extern]
```

Service Id for the Instance State Request service.

5.121.3.5 DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID

```
const DDS_Long DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID [extern]
```

Service Id for RTI Monitoring Library 2.0 Command Service Request.

RTI Monitoring Library 2.0 remote commands are sent using this service.

5.121.3.6 DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID

```
const DDS_Long DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID [extern]
```

Service Id for RTI Monitoring Library 2.0 Reply Service Requests.

Replies to RTI Monitoring Library 2.0 remote commands are sent using this service.

5.121.3.7 DDS_SERVICE_REQUEST_TOPIC_NAME

```
const char* DDS_SERVICE_REQUEST_TOPIC_NAME  [extern]
```

Service Request topic name.

Topic name of the **DDS_ServiceRequestDataReader** (p. 1102)

5.122 Common types and functions

Types and functions related to the built-in topics.

Data Structures

- struct **DDS_Locator_t**

  *<<**extension**>> (p. 796) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.*
- struct **DDS_LocatorSeq**

  *Declares IDL `sequence` < **DDS_Locator_t** (p. 1830) >*
- struct **DDS_ProtocolVersion_t**

  *<<**extension**>> (p. 1014) Type used to represent the version of the RTPS protocol.*
- struct **DDS_VendorId_t**

  *<<**extension**>> (p. 1014) Type used to represent the vendor of the service implementing the RTPS protocol.*
- struct **DDS_ProductVersion_t**

  *<<**extension**>> (p. 1014) Type used to represent the current version of RTI Connext.*
- struct **DDS_TransportInfo_t**

  Contains the class_id and message_size_max of an installed transport.
- struct **DDS_TransportInfoSeq**

  *Instantiates **FooSeq** (p. 2120) < **DDS_TransportInfo_t** (p. 2058) > .*
- struct **DDS_BuiltinTopicKey_t**

  The key type of the built-in topic types.
- struct **DDS_ContentFilterProperty_t**

  *<<**extension**>> (p. 1014) Type used to provide all the required information to enable content filtering.*

Macros

- #define **DDS_LOCATOR_ADDRESS_LENGTH_MAX** 16

  Declares length of address field in locator.
- #define **DDS_PROTOCOLVERSION_1_0** { 1, 0 }

  The protocol version 1.0.
- #define **DDS_PROTOCOLVERSION_1_1** { 1, 1 }

  The protocol version 1.1.
- #define **DDS_PROTOCOLVERSION_1_2** { 1, 2 }

  The protocol version 1.2.
- #define **DDS_PROTOCOLVERSION_2_0** { 2, 0 }

  The protocol version 2.0.
- #define **DDS_PROTOCOLVERSION_2_1** { 2, 1 }

  The protocol version 2.1.
- #define **DDS_PROTOCOLVERSION** { 2, 1 }

  The most recent protocol version. Currently 2.1.
- #define **DDS_VENDOR_ID_LENGTH_MAX** 2

  Length of vendor id.
- #define **DDS_PRODUCTVERSION_UNKNOWN**

  The value used when the product version is unknown.
- #define **DDS_BuiltinTopicKey_t_INITIALIZER**

  Initializer for new Keys.

Typedefs

- typedef struct **DDS_Locator_t** **DDS_Locator_t**

  <<***extension***>> (p. *796) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.*
- typedef struct **DDS_ProtocolVersion_t** **DDS_ProtocolVersion_t**

  <<***extension***>> (p. *1014) Type used to represent the version of the RTPS protocol.*
- typedef struct **DDS_BuiltinTopicKey_t** **DDS_BuiltinTopicKey_t**

  The key type of the built-in topic types.

Functions

- **DDS_Boolean** **DDS_BuiltinTopicKey_equals** (const **DDS_BuiltinTopicKey_t** *self, const **DDS_Builtin↩TopicKey_t** *other)

  Compares this Key with another Key for equality.
- void **DDS_BuiltinTopicKey_copy** (**DDS_BuiltinTopicKey_t** *dst, const **DDS_BuiltinTopicKey_t** *src)

  Copies another Key into this Key.
- void **DDS_BuiltinTopicKey_to_guid** (const **DDS_BuiltinTopicKey_t** *self, **DDS_GUID_t** *dst)

  Converts this Key into a GUID.
- void **DDS_BuiltinTopicKey_from_guid** (**DDS_BuiltinTopicKey_t** *self, const **DDS_GUID_t** *src)

  Initializes this Key from the input GUID.
- **DDS_Boolean** **DDS_BuiltinTopicKey_to_instance_handle** (const **DDS_BuiltinTopicKey_t** *self, **DDS_↩InstanceHandle_t** *dst)

  Converts this Key into an InstanceHandle.
- **DDS_Boolean** **DDS_BuiltinTopicKey_from_instance_handle** (**DDS_BuiltinTopicKey_t** *self, const **DDS↩_InstanceHandle_t** *src)

  Initializes this Key from the input InstanceHandle.

Variables

- const struct **DDS_Locator_t DDS_LOCATOR_INVALID**

  An invalid locator.
- const **DDS_Long DDS_LOCATOR_KIND_INVALID**

  Locator of this kind is invalid.
- const **DDS_UnsignedLong DDS_LOCATOR_PORT_INVALID**

  An invalid port.
- const **DDS_Octet DDS_LOCATOR_ADDRESS_INVALID** [**DDS_LOCATOR_ADDRESS_LENGTH_MAX**]

  An invalid address.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv4**

  A locator for a UDPv4 address.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv4_WAN**

  A locator for a UDPv4 asymmetric transport address.
- const **DDS_Long DDS_LOCATOR_KIND_SHMEM**

  A locator for an address acessed via shared memory.
- const **DDS_Long DDS_LOCATOR_KIND_SHMEM_510**

  A locator for an address acessed via shared memory for RTI Connext 5.1.0 and earlier.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv6**

  A locator for a UDPv6 address.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv6_510**

  A locator for a UDPv6 address for RTI Connext 5.1.0 and earlier.
- const **DDS_Long DDS_LOCATOR_KIND_RESERVED**

  Locator of this kind is reserved.
- DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE **DDS_BuiltinTopicKey_t::value** [DDS_BUILTIN_TOPIC_KEY_↩ TYPE_NATIVE_LENGTH]

  *An array of four integers that uniquely represents a remote **DDS_Entity** (p. 1362).*
- const struct **DDS_BuiltinTopicKey_t DDS_BUILTIN_TOPIC_KEY_UNKNOWN**

  Constant representing an unknown value.

5.122.1 Detailed Description

Types and functions related to the built-in topics.

5.122.2 Macro Definition Documentation

5.122.2.1 DDS_LOCATOR_ADDRESS_LENGTH_MAX

```
#define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16
```

Declares length of address field in locator.

5.122.2.2 DDS_PROTOCOLVERSION_1_0

```
#define DDS_PROTOCOLVERSION_1_0 { 1, 0 }
```

The protocol version 1.0.

5.122.2.3 DDS_PROTOCOLVERSION_1_1

```
#define DDS_PROTOCOLVERSION_1_1 { 1, 1 }
```

The protocol version 1.1.

5.122.2.4 DDS_PROTOCOLVERSION_1_2

```
#define DDS_PROTOCOLVERSION_1_2 { 1, 2 }
```

The protocol version 1.2.

5.122.2.5 DDS_PROTOCOLVERSION_2_0

```
#define DDS_PROTOCOLVERSION_2_0 { 2, 0 }
```

The protocol version 2.0.

5.122.2.6 DDS_PROTOCOLVERSION_2_1

```
#define DDS_PROTOCOLVERSION_2_1 { 2, 1 }
```

The protocol version 2.1.

5.122.2.7 DDS_PROTOCOLVERSION

```
#define DDS_PROTOCOLVERSION { 2, 1 }
```

The most recent protocol version. Currently 2.1.

5.122.2.8 DDS_VENDOR_ID_LENGTH_MAX

```
#define DDS_VENDOR_ID_LENGTH_MAX 2
```

Length of vendor id.

5.122.2.9 DDS_PRODUCTVERSION_UNKNOWN

```
#define DDS_PRODUCTVERSION_UNKNOWN
```

Value:

```
  { \
  DDS_PRODUCTVERSION_MAJOR_UNKNOWN, \
  DDS_PRODUCTVERSION_MINOR_UNKNOWN, \
  DDS_PRODUCTVERSION_RELEASE_UNKNOWN, \
  DDS_PRODUCTVERSION_REVISION_UNKNOWN \
}
```

The value used when the product version is unknown.

5.122.2.10 DDS_BuiltinTopicKey_t_INITIALIZER

```
#define DDS_BuiltinTopicKey_t_INITIALIZER
```

Initializer for new Keys.

5.122.3 Typedef Documentation

5.122.3.1 DDS_Locator_t

```
typedef struct DDS_Locator_t DDS_Locator_t
```

<<***extension***>> *(*p. *796)* Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

5.122.3.2 DDS_ProtocolVersion_t

```
typedef struct DDS_ProtocolVersion_t DDS_ProtocolVersion_t
```

<<***extension***>> *(*p. *1014)* Type used to represent the version of the RTPS protocol.

5.122.3.3 DDS_BuiltinTopicKey_t

```
typedef struct  DDS_BuiltinTopicKey_t  DDS_BuiltinTopicKey_t
```

The key type of the built-in topic types.

Each remote **DDS_Entity** (p. 1362) to be discovered can be uniquely identified by this key. This is the key of all the built-in topic data types.

See also

DDS_ParticipantBuiltinTopicData (p. 1873)

DDS_PublicationBuiltinTopicData (p. 1909)

DDS_SubscriptionBuiltinTopicData (p. 2018)

5.122.4 Function Documentation

5.122.4.1 DDS_BuiltinTopicKey_equals()

```
DDS_Boolean DDS_BuiltinTopicKey_equals (
            const  DDS_BuiltinTopicKey_t * self,
            const  DDS_BuiltinTopicKey_t * other )
```

Compares this Key with another Key for equality.

Parameters

self	<<***in***>> *(p. 1015)* This Key. Cannot be NULL.
other	<<***in***>> *(p. 1015)* The other Key to be compared with this Key. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the two Keys have equal values, or **DDS_BOOLEAN_FALSE** (p. 1203) otherwise.

5.122.4.2 DDS_BuiltinTopicKey_copy()

```
void DDS_BuiltinTopicKey_copy (
             DDS_BuiltinTopicKey_t * dst,
            const  DDS_BuiltinTopicKey_t * src )
```

Copies another Key into this Key.

Parameters

dst	<<***out***>> *(*p. *1015)* This Key. Cannot be NULL.
src	<<***in***>> *(*p. *1015)* The other Key to be copied. Cannot be NULL.

5.122.4.3 DDS_BuiltinTopicKey_to_guid()

```
void DDS_BuiltinTopicKey_to_guid (
             const  DDS_BuiltinTopicKey_t * self,
              DDS_GUID_t * dst )
```

Converts this Key into a GUID.

Parameters

self	<<***in***>> *(*p. *1015)* This Key. Cannot be NULL.
dst	<<***out***>> *(*p. *1015)* The destination GUID. Cannot be NULL.

5.122.4.4 DDS_BuiltinTopicKey_from_guid()

```
void DDS_BuiltinTopicKey_from_guid (
              DDS_BuiltinTopicKey_t * self,
             const  DDS_GUID_t * src )
```

Initializes this Key from the input GUID.

Parameters

self	<<***out***>> *(*p. *1015)* This Key. Cannot be NULL.
src	<<***in***>> *(*p. *1015)* The GUID to be used to initialize this Key. Cannot be NULL.

5.122.4.5 DDS_BuiltinTopicKey_to_instance_handle()

```
DDS_Boolean DDS_BuiltinTopicKey_to_instance_handle (
             const  DDS_BuiltinTopicKey_t * self,
              DDS_InstanceHandle_t * dst )
```

Converts this Key into an InstanceHandle.

Parameters

self	<<***in***>> *(*p. *1015)* This Key. Cannot be NULL.
dst	<<***out***>> *(*p. *1015)* The destination InstanceHandle. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 1203) on success or **DDS_BOOLEAN_FALSE** (p. 1203) on failure

5.122.4.6 DDS_BuiltinTopicKey_from_instance_handle()

```
DDS_Boolean DDS_BuiltinTopicKey_from_instance_handle (
            DDS_BuiltinTopicKey_t * self,
           const  DDS_InstanceHandle_t * src )
```

Initializes this Key from the input InstanceHandle.

Parameters

self	<<***out***>> *(*p. *1015)* This Key. Cannot be NULL.
src	<<***in***>> *(*p. *1015)* The InstanceHandle to be used to initialize this Key. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 1203) on success or **DDS_BOOLEAN_FALSE** (p. 1203) on failure

5.122.5 Variable Documentation

5.122.5.1 DDS_LOCATOR_INVALID

```
const struct  DDS_Locator_t DDS_LOCATOR_INVALID  [extern]
```

An invalid locator.

5.122.5.2 DDS_LOCATOR_KIND_INVALID

```
const  DDS_Long DDS_LOCATOR_KIND_INVALID  [extern]
```

Locator of this kind is invalid.

5.122.5.3 DDS_LOCATOR_PORT_INVALID

```
const DDS_UnsignedLong DDS_LOCATOR_PORT_INVALID [extern]
```

An invalid port.

5.122.5.4 DDS_LOCATOR_ADDRESS_INVALID

```
const DDS_Octet DDS_LOCATOR_ADDRESS_INVALID[ DDS_LOCATOR_ADDRESS_LENGTH_MAX] [extern]
```

An invalid address.

5.122.5.5 DDS_LOCATOR_KIND_UDPv4

```
const DDS_Long DDS_LOCATOR_KIND_UDPv4 [extern]
```

A locator for a UDPv4 address.

5.122.5.6 DDS_LOCATOR_KIND_UDPv4_WAN

```
const DDS_Long DDS_LOCATOR_KIND_UDPv4_WAN [extern]
```

A locator for a UDPv4 asymmetric transport address.

5.122.5.7 DDS_LOCATOR_KIND_SHMEM

```
const DDS_Long DDS_LOCATOR_KIND_SHMEM [extern]
```

A locator for an address acessed via shared memory.

5.122.5.8 DDS_LOCATOR_KIND_SHMEM_510

```
const DDS_Long DDS_LOCATOR_KIND_SHMEM_510 [extern]
```

A locator for an address acessed via shared memory for RTI Connext 5.1.0 and earlier.

5.122.5.9 DDS_LOCATOR_KIND_UDPv6

```
const DDS_Long DDS_LOCATOR_KIND_UDPv6 [extern]
```

A locator for a UDPv6 address.

5.122.5.10 DDS_LOCATOR_KIND_UDPv6_510

```
const DDS_Long DDS_LOCATOR_KIND_UDPv6_510 [extern]
```

A locator for a UDPv6 address for RTI Connext 5.1.0 and earlier.

5.122.5.11 DDS_LOCATOR_KIND_RESERVED

```
const DDS_Long DDS_LOCATOR_KIND_RESERVED [extern]
```

Locator of this kind is reserved.

5.122.5.12 value

```
DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE DDS_BuiltinTopicKey_t::value[DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE↩
_LENGTH]
```

An array of four integers that uniquely represents a remote **DDS_Entity** (p. 1362).

5.122.5.13 DDS_BUILTIN_TOPIC_KEY_UNKNOWN

```
const struct DDS_BuiltinTopicKey_t DDS_BUILTIN_TOPIC_KEY_UNKNOWN [extern]
```

Constant representing an unknown value.

5.123 String Built-in Type

Built-in type consisting of a single character string.

Data Structures

- struct **DDS_StringTypeSupport**

  <<***interface***>> *(*p. *1015) String type support.*

Typedefs

- typedef struct **DDS_StringDataWriter** **DDS_StringDataWriter**

  <<***interface***>> *(*p. *1015) Instantiates* `DataWriter` *<* *char** *>.*
- typedef struct **DDS_StringDataReader** **DDS_StringDataReader**

  <<***interface***>> *(*p. *1015) Instantiates* `DataReader` *<* *char** *>.*

Functions

- **DDS_ReturnCode_t** **DDS_StringTypeSupport_register_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  Allows an application to communicate to RTI Connext the existence of the char data type.*
- **DDS_ReturnCode_t** **DDS_StringTypeSupport_unregister_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  Allows an application to unregister the char data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.*
- const char * **DDS_StringTypeSupport_get_type_name** (void)

  Get the default name for the char type.*
- void **DDS_StringTypeSupport_print_data** (const char *a_data)

  <<***extension***>> *(*p. *1014) Print value of data type to standard out.*
- **DDS_TypeCode** * **DDS_StringTypeSupport_get_typecode** (void)

  <<***extension***>> *(*p. *1014) Retrieves the TypeCode for the Type.*
- **DDS_ReturnCode_t** **DDS_StringTypeSupport_serialize_data_to_cdr_buffer** (char *buffer, unsigned int *length, const char *a_data)

  <<***extension***>> *(*p. *1014) Serializes the input sample into a CDR buffer of octets.*
- **DDS_ReturnCode_t** **DDS_StringTypeSupport_serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int *length, const char *a_data, **DDS_DataRepresentationId_t** representation)

  <<***extension***>> *(*p. *1014) Serializes the input sample into a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_StringTypeSupport_deserialize_data_from_cdr_buffer** (char **a_data, const char *buffer, unsigned int length)

  <<***extension***>> *(*p. *1014) Deserializes a sample from a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_StringTypeSupport_data_to_string** (const char *sample, char *str, **DDS_UnsignedLong** *str_size, **DDS_PrintFormatProperty** *property)

  <<***extension***>> *(*p. *1014) Get the string representation of an input sample.*
- **DDS_StringDataWriter** * **DDS_StringDataWriter_narrow** (**DDS_DataWriter** *writer)

  Narrow the given ***DDS_DataWriter*** *(*p. *488) pointer to a* ***DDS_StringDataWriter*** *(*p. *1116) pointer.*
- **DDS_DataWriter** * **DDS_StringDataWriter_as_datawriter** (**DDS_StringDataWriter** *writer)

  Widen the given ***DDS_StringDataWriter*** *(*p. *1116) pointer to a* ***DDS_DataWriter*** *(*p. *488) pointer.*
- char * **DDS_StringDataWriter_create_data** (**DDS_StringDataWriter** *self)

  Creates a string data instance.
- **DDS_Boolean** **DDS_StringDataWriter_delete_data** (**DDS_StringDataWriter** *self, char *sample)

  Destroys a string data instance created by ***DDS_StringDataWriter_create_data*** *(*p. *1121).*

- **DDS_ReturnCode_t DDS_StringDataWriter_write** (**DDS_StringDataWriter** ∗self, const char ∗instance_data, const **DDS_InstanceHandle_t** ∗handle)

  Modifies the value of a string data instance.
- **DDS_ReturnCode_t DDS_StringDataWriter_write_w_timestamp** (**DDS_StringDataWriter** ∗self, const char ∗instance_data, const **DDS_InstanceHandle_t** ∗handle, const struct **DDS_Time_t** ∗source_timestamp)

  *Performs the same function as **DDS_StringDataWriter_write** (p. 1121) except that it also provides the value for the `source_timestamp`.*
- **DDS_ReturnCode_t DDS_StringDataWriter_write_w_params** (**DDS_StringDataWriter** ∗self, const char ∗instance_data, struct **DDS_WriteParams_t** ∗params)

  *Performs the same function as **DDS_StringDataWriter_write** (p. 1121) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS_StringDataReader** ∗ **DDS_StringDataReader_narrow** (**DDS_DataReader** ∗reader)

  *Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_StringDataReader** (p. 1116) pointer.*
- **DDS_DataReader** ∗ **DDS_StringDataReader_as_datareader** (**DDS_StringDataReader** ∗reader)

  *Widen the given **DDS_StringDataReader** (p. 1116) pointer to a **DDS_DataReader** (p. 618) pointer.*
- **DDS_ReturnCode_t DDS_StringDataReader_read** (**DDS_StringDataReader** ∗self, struct **DDS_StringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_StringDataReader_take** (**DDS_StringDataReader** ∗self, struct **DDS_StringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_mask, **DDS_ViewStateMask** view_mask, **DDS_InstanceStateMask** instance_mask)

  *Access a collection of data-samples from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_StringDataReader_read_w_condition** (**DDS_StringDataReader** ∗self, struct **DDS_StringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_↩ ReadCondition** ∗condition)

  *Accesses via **DDS_StringDataReader_read** (p. 1123) the samples that match the criteria specified in the **DDS_Read↩ Condition** (p. 695).*
- **DDS_ReturnCode_t DDS_StringDataReader_take_w_condition** (**DDS_StringDataReader** ∗self, struct **DDS_StringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_↩ ReadCondition** ∗condition)

  *Analogous to **DDS_StringDataReader_read_w_condition** (p. 1124) except it accesses samples via the **DDS_String↩ DataReader_take** (p. 1123) operation.*
- **DDS_ReturnCode_t DDS_StringDataReader_read_next_sample** (**DDS_StringDataReader** ∗self, char ∗received_data, struct **DDS_SampleInfo** ∗sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_StringDataReader_take_next_sample** (**DDS_StringDataReader** ∗self, char ∗received_data, struct **DDS_SampleInfo** ∗sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_StringDataReader_return_loan** (**DDS_StringDataReader** ∗self, struct **DDS_↩ StringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq)

  *Indicates to the **DDS_DataReader** (p. 618) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 618).*

5.123.1 Detailed Description

Built-in type consisting of a single character string.

5.123.2 Typedef Documentation

5.123.2.1 DDS_StringDataWriter

```
typedef struct DDS_StringDataWriter DDS_StringDataWriter
```

<<***interface***>> *(*p. *1015)* Instantiates `DataWriter` < char* >.

See also

FooDataWriter (p. 2119)

DDS_DataWriter (p. 488)

String Support (p. 1526)

5.123.2.2 DDS_StringDataReader

```
typedef struct DDS_StringDataReader DDS_StringDataReader
```

<<***interface***>> *(*p. *1015)* Instantiates `DataReader` < char* >.

See also

FooDataReader (p. 2119)

DDS_DataReader (p. 618)

String Support (p. 1526)

5.123.3 Function Documentation

5.123.3.1 DDS_StringTypeSupport_register_type()

```
DDS_ReturnCode_t DDS_StringTypeSupport_register_type (
            DDS_DomainParticipant * participant,
           const char * type_name )
```

Allows an application to communicate to RTI Connext the existence of the char* data type.

By default, The char* built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_StringTypeSupport_get_type_name** (p. 1118). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_↩ type.auto_register".

This function can also be used to register the same **DDS_StringTypeSupport** (p. 2011) with a **DDS_Domain↩ Participant** (p. 76) using different values for the type_name.

If `register_type` is called multiple times with the same **DDS_DomainParticipant** (p. 76) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	<<***in***>> *(*p. *1015)* the **DDS_DomainParticipant** (p. 76) to register the data type char* with. Cannot be NULL.
type_name	<<***in***>> *(*p. *1015)* the type name under with the data type char* is registered with the participant; this type name is used when creating a new **DDS_Topic** (p. 174). (See **DDS_DomainParticipant_create_topic** (p. 114).) The name may not be NULL or longer than 255 characters.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDS_DomainParticipant_create_topic (p. 114)

5.123.3.2 DDS_StringTypeSupport_unregister_type()

```
DDS_ReturnCode_t DDS_StringTypeSupport_unregister_type (
            DDS_DomainParticipant * participant,
           const char * type_name )
```

Allows an application to unregister the char* data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The char* type with `type_name` is registered with the participant and all **DDS_Topic** (p. 174) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS_Topic** (p. 174) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 1224).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	<<***in***>> *(*p. *1015)* the **DDS_DomainParticipant** (p. 76) to unregister the data type char∗ from. Cannot be NULL.
type_name	<<***in***>> *(*p. *1015)* the type name under with the data type char∗ is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_BAD_PARAMETER** (p. 1224) or **DDS_RETCODE_ERROR** (p. 1224)

MT Safety:

SAFE.

See also

DDS_StringTypeSupport_register_type (p. 1116)

5.123.3.3 DDS_StringTypeSupport_get_type_name()

```
const char * DDS_StringTypeSupport_get_type_name (
             void  )
```

Get the default name for the char∗ type.

Can be used for calling **DDS_StringTypeSupport_register_type** (p. 1116) or creating **DDS_Topic** (p. 174).

Returns

default name for the char∗ type.

See also

DDS_StringTypeSupport_register_type (p. 1116)

DDS_DomainParticipant_create_topic (p. 114)

5.123.3.4 DDS_StringTypeSupport_print_data()

```
void DDS_StringTypeSupport_print_data (
             const char * a_data )
```

<<***extension***>> *(*p. *1014)* Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

a_data	<<***in***>> *(*p. *1015)* String to be printed.

5.123.3.5 DDS_StringTypeSupport_get_typecode()

```
DDS_TypeCode * DDS_StringTypeSupport_get_typecode (
            void  )
```

<<***extension***>> *(*p. *1014)* Retrieves the TypeCode for the Type.

See also

FooTypeSupport_get_typecode (p. 225)

5.123.3.6 DDS_StringTypeSupport_serialize_data_to_cdr_buffer()

```
DDS_ReturnCode_t DDS_StringTypeSupport_serialize_data_to_cdr_buffer (
            char * buffer,
            unsigned int * length,
            const char * a_data )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.123.3.7 DDS_StringTypeSupport_serialize_data_to_cdr_buffer_ex()

```
DDS_ReturnCode_t DDS_StringTypeSupport_serialize_data_to_cdr_buffer_ex (
            char * buffer,
            unsigned int * length,
            const char * a_data,
             DDS_DataRepresentationId_t representation )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.123.3.8 DDS_StringTypeSupport_deserialize_data_from_cdr_buffer()

```
DDS_ReturnCode_t DDS_StringTypeSupport_deserialize_data_from_cdr_buffer (
            char ** a_data,
            const char * buffer,
            unsigned int length )
```

<<***extension***>> *(p. 1014)* Deserializes a sample from a buffer of octets.

See also

FooTypeSupport_deserialize_data_from_cdr_buffer (p. 224)

5.123.3.9 DDS_StringTypeSupport_data_to_string()

```
DDS_ReturnCode_t DDS_StringTypeSupport_data_to_string (
            const char * sample,
            char * str,
             DDS_UnsignedLong * str_size,
             DDS_PrintFormatProperty * property )
```

<<***extension***>> *(p. 1014)* Get the string representation of an input sample.

See also

FooTypeSupport_data_to_string (p. 224)

5.123.3.10 DDS_StringDataWriter_narrow()

```
DDS_StringDataWriter * DDS_StringDataWriter_narrow (
             DDS_DataWriter * writer )
```

Narrow the given **DDS_DataWriter** (p. 488) pointer to a **DDS_StringDataWriter** (p. 1116) pointer.

See also

FooDataWriter_narrow (p. 493)

5.123.3.11 DDS_StringDataWriter_as_datawriter()

```
DDS_DataWriter * DDS_StringDataWriter_as_datawriter (
            DDS_StringDataWriter * writer )
```

Widen the given **DDS_StringDataWriter** (p. 1116) pointer to a **DDS_DataWriter** (p. 488) pointer.

See also

FooDataWriter_as_datawriter (p. 493)

5.123.3.12 DDS_StringDataWriter_create_data()

```
char * DDS_StringDataWriter_create_data (
            DDS_StringDataWriter * self )
```

Creates a string data instance.

The size of the instance including the NULL terminated character is determined by the DataWriter property **dds.builtin_type.string.alloc_size**.

Default size: **dds.builtin_type.string.max_size** property of DomainParticipant if defined. Otherwise 1024.

Created instances must be deleted with **DDS_StringDataWriter_delete_data** (p. 1121).

Returns

Newly created string data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types

5.123.3.13 DDS_StringDataWriter_delete_data()

```
DDS_Boolean DDS_StringDataWriter_delete_data (
            DDS_StringDataWriter * self,
           char * sample )
```

Destroys a string data instance created by **DDS_StringDataWriter_create_data** (p. 1121).

Returns

DDS_BOOLEAN_TRUE (p. 1203) upon successful deletion.

5.123.3.14 DDS_StringDataWriter_write()

```
DDS_ReturnCode_t DDS_StringDataWriter_write (
             DDS_StringDataWriter * self,
            const char * instance_data,
            const  DDS_InstanceHandle_t * handle )
```

Modifies the value of a string data instance.

See also

FooDataWriter_write (p. 499)

5.123.3.15 DDS_StringDataWriter_write_w_timestamp()

```
DDS_ReturnCode_t DDS_StringDataWriter_write_w_timestamp (
             DDS_StringDataWriter * self,
            const char * instance_data,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_StringDataWriter_write** (p. 1121) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.123.3.16 DDS_StringDataWriter_write_w_params()

```
DDS_ReturnCode_t DDS_StringDataWriter_write_w_params (
             DDS_StringDataWriter * self,
            const char * instance_data,
            struct  DDS_WriteParams_t * params )
```

Performs the same function as **DDS_StringDataWriter_write** (p. 1121) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter_write_w_params (p. 504)

5.123.3.17 DDS_StringDataReader_narrow()

```
DDS_StringDataReader * DDS_StringDataReader_narrow (
            DDS_DataReader * reader )
```

Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_StringDataReader** (p. 1116) pointer.

See also

FooDataReader_narrow (p. 627)

5.123.3.18 DDS_StringDataReader_as_datareader()

```
DDS_DataReader * DDS_StringDataReader_as_datareader (
            DDS_StringDataReader * reader )
```

Widen the given **DDS_StringDataReader** (p. 1116) pointer to a **DDS_DataReader** (p. 618) pointer.

See also

FooDataReader_as_datareader (p. 627)

5.123.3.19 DDS_StringDataReader_read()

```
DDS_ReturnCode_t DDS_StringDataReader_read (
             DDS_StringDataReader * self,
            struct  DDS_StringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read (p. 628)

5.123.3.20 DDS_StringDataReader_take()

```
DDS_ReturnCode_t DDS_StringDataReader_take (
             DDS_StringDataReader * self,
            struct  DDS_StringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_SampleStateMask sample_mask,
             DDS_ViewStateMask view_mask,
             DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take (p. 629)

5.123.3.21 DDS_StringDataReader_read_w_condition()

```
DDS_ReturnCode_t DDS_StringDataReader_read_w_condition (
             DDS_StringDataReader * self,
            struct  DDS_StringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_StringDataReader_read** (p. 1123) the samples that match the criteria specified in the **DDS_Read↩ Condition** (p. 695).

See also

FooDataReader_read_w_condition (p. 633)

5.123.3.22 DDS_StringDataReader_take_w_condition()

```
DDS_ReturnCode_t DDS_StringDataReader_take_w_condition (
             DDS_StringDataReader * self,
            struct  DDS_StringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Analogous to **DDS_StringDataReader_read_w_condition** (p. 1124) except it accesses samples via the **DDS_String↩ DataReader_take** (p. 1123) operation.

See also

FooDataReader_take_w_condition (p. 635)

5.123.3.23 DDS_StringDataReader_read_next_sample()

```
DDS_ReturnCode_t DDS_StringDataReader_read_next_sample (
             DDS_StringDataReader * self,
            char * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_next_sample (p. 636)

5.123.3.24 DDS_StringDataReader_take_next_sample()

```
DDS_ReturnCode_t DDS_StringDataReader_take_next_sample (
             DDS_StringDataReader * self,
            char * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_next_sample (p. 637)

5.123.3.25 DDS_StringDataReader_return_loan()

```
DDS_ReturnCode_t DDS_StringDataReader_return_loan (
             DDS_StringDataReader * self,
            struct  DDS_StringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS_DataReader** (p. 618) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 618).

See also

FooDataReader_return_loan (p. 649)

5.124 KeyedString Built-in Type

Built-in type consisting of a string payload and a second string that is the key.

Data Structures

- struct **DDS_KeyedString**

  Keyed string built-in type.
- struct **DDS_KeyedStringSeq**

  Instantiates ***FooSeq*** *(p. 2120) < **DDS_KeyedString** (p. 1815) > .*
- struct **DDS_KeyedStringTypeSupport**

  *<<**interface**>> (p. 1015) Keyed string type support.*

Typedefs

- typedef struct **DDS_KeyedString** **DDS_KeyedString**

  Keyed string built-in type.
- typedef struct **DDS_KeyedStringDataWriter** **DDS_KeyedStringDataWriter**

  *<<**interface**>> (p. 1015) Instantiates `DataWriter` < **DDS_KeyedString** (p. 1815) >.*
- typedef struct **DDS_KeyedStringDataReader** **DDS_KeyedStringDataReader**

  *<<**interface**>> (p. 1015) Instantiates `DataReader` < **DDS_KeyedString** (p. 1815) >.*

Functions

- **DDS_KeyedString** * **DDS_KeyedString_new** (void)

  Constructor.
- **DDS_KeyedString** * **DDS_KeyedString_new_w_size** (int key_size, int size)

  Constructor that specifies the allocated sizes.
- void **DDS_KeyedString_delete** (**DDS_KeyedString** *self)

  Destructor.
- **DDS_ReturnCode_t** **DDS_KeyedStringTypeSupport_register_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  *Allows an application to communicate to RTI Connext the existence of the **DDS_KeyedString** (p. 1815) data type.*
- **DDS_ReturnCode_t** **DDS_KeyedStringTypeSupport_unregister_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  *Allows an application to unregister the **DDS_KeyedString** (p. 1815) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.*
- const char * **DDS_KeyedStringTypeSupport_get_type_name** (void)

  *Get the default name for the **DDS_KeyedString** (p. 1815) type.*
- void **DDS_KeyedStringTypeSupport_print_data** (const **DDS_KeyedString** *a_data)

  *<<**extension**>> (p. 1014) Print value of data type to standard out.*
- **DDS_TypeCode** * **DDS_KeyedStringTypeSupport_get_typecode** (void)

  *<<**extension**>> (p. 1014) Retrieves the TypeCode for the Type.*
- **DDS_ReturnCode_t** **DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer** (char *buffer, unsigned int *length, const **DDS_KeyedString** *a_data)

  *<<**extension**>> (p. 1014) Serializes the input sample into a CDR buffer of octets.*
- **DDS_ReturnCode_t** **DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int *length, const **DDS_KeyedString** *a_data, **DDS_DataRepresentationId_t** representation)

  *<<**extension**>> (p. 1014) Serializes the input sample into a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_KeyedStringTypeSupport_deserialize_data_from_cdr_buffer** (**DDS_KeyedString** *a_data, const char *buffer, unsigned int length)

<<***extension***>> (p. *1014) Deserializes a sample from a buffer of octets.*

- **DDS_ReturnCode_t DDS_KeyedStringTypeSupport_data_to_string** (const **DDS_KeyedString** *sample, char *str, **DDS_UnsignedLong** *str_size, **DDS_PrintFormatProperty** *property)

  <<***extension***>> (p. *1014) Get the string representation of an input sample.*

- **DDS_KeyedStringDataWriter** * **DDS_KeyedStringDataWriter_narrow** (**DDS_DataWriter** *writer)

  *Narrow the given **DDS_DataWriter** (p. 488) pointer to a **DDS_KeyedStringDataWriter** (p. 1131) pointer.*

- **DDS_DataWriter** * **DDS_KeyedStringDataWriter_as_datawriter** (**DDS_KeyedStringDataWriter** *writer)

  *Widen the given **DDS_KeyedStringDataWriter** (p. 1131) pointer to a **DDS_DataWriter** (p. 488) pointer.*

- **DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance** (**DDS_KeyedStringDataWriter** *self, const **DDS_KeyedString** *instance_data)

  Informs RTI Connext that the application will be modifying a particular instance.

- **DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key** (**DDS_KeyedStringDataWriter** *self, const char *key)

  <<***extension***>> (p. *1014) Informs RTI Connext that the application will be modifying a particular instance.*

- **DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_timestamp** (**DDS_KeyedStringDataWriter** *self, const **DDS_KeyedString** *instance_data, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same functions as **DDS_KeyedStringDataWriter_register_instance** (p. 1137) except that the application provides the value for the `source_timestamp`.*

- **DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key_w_timestamp** (**DDS_KeyedStringDataWriter** *self, const char *key, const struct **DDS_Time_t** *source_timestamp)

  <<***extension***>> (p. *1014) Performs the same functions as **DDS_KeyedStringDataWriter_register_instance_w_key** (p. 1138) except that the application provides the value for the `source_timestamp`.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance** (**DDS_KeyedStringDataWriter** *self, const **DDS_KeyedString** *instance_data, const **DDS_InstanceHandle_t** *handle)

  *Reverses the action of **DDS_KeyedStringDataWriter_register_instance** (p. 1137).*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key** (**DDS_KeyedStringDataWriter** *self, const char *key, const **DDS_InstanceHandle_t** *handle)

  <<***extension***>> (p. *1014) Reverses the action of **DDS_KeyedStringDataWriter_register_instance_w_key** (p. 1138).*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_timestamp** (**DDS_KeyedStringDataWriter** *self, const **DDS_KeyedString** *instance_data, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same function as **DDS_KeyedStringDataWriter_unregister_instance** (p. 1139) except that it also provides the value for the `source_timestamp`.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key_w_timestamp** (**DDS_KeyedStringDataWriter** *self, const char *key, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  <<***extension***>> (p. *1014) Performs the same function as **DDS_KeyedStringDataWriter_unregister_instance_w_key** (p. 1139) except that it also provides the value for the `source_timestamp`.*

- **DDS_KeyedString** * **DDS_KeyedStringDataWriter_create_data** (**DDS_KeyedStringDataWriter** *self)

  Creates a keyed string data instance.

- **DDS_Boolean DDS_KeyedStringDataWriter_delete_data** (**DDS_KeyedStringDataWriter** *self, **DDS_KeyedString** *sample)

  *Destroys a keyed string data instance created by **DDS_KeyedStringDataWriter_create_data** (p. 1140).*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_write** (**DDS_KeyedStringDataWriter** *self, const **DDS_KeyedString** *instance_data, const **DDS_InstanceHandle_t** *handle)

  *Modifies the value of a **DDS_KeyedString** (p. 1815) data instance.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key** (**DDS_KeyedStringDataWriter** *self, const char *key, const char *str, const **DDS_InstanceHandle_t** *handle)

  <<***extension***>> (p. *1014) Modifies the value of a **DDS_KeyedString** (p. 1815) data instance.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_timestamp** (**DDS_KeyedStringDataWriter** ∗self, const **DDS_KeyedString** ∗instance_data, const **DDS_InstanceHandle_t** ∗handle, const struct **DDS_Time_t** ∗source_timestamp)

  *Performs the same function as **DDS_KeyedStringDataWriter_write** (p. 1141) except that it also provides the value for the `source_timestamp`.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_timestamp** (**DDS_KeyedStringDataWriter** ∗self, const char ∗key, const char ∗str, const **DDS_InstanceHandle_t** ∗handle, const struct **DDS_Time_t** ∗source_timestamp)

  *<<**extension**>> (p. 1014) Performs the same function as **DDS_KeyedStringDataWriter_write_string_w_key** (p. 1141) except that it also provides the value for the `source_timestamp`.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_params** (**DDS_KeyedStringDataWriter** ∗self, const **DDS_KeyedString** ∗instance_data, struct **DDS_WriteParams_t** ∗params)

  *Performs the same function as **DDS_KeyedStringDataWriter_write** (p. 1141) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_params** (**DDS_KeyedStringDataWriter** ∗self, const char ∗key, const char ∗str, struct **DDS_WriteParams_t** ∗params)

  *<<**extension**>> (p. 1014) Performs the same function as **DDS_KeyedStringDataWriter_write_string_w_key** (p. 1141) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose** (**DDS_KeyedStringDataWriter** ∗self, const **DDS_KeyedString** ∗instance_data, const **DDS_InstanceHandle_t** ∗instance_handle)

  Requests the middleware to delete the data.

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key** (**DDS_KeyedStringDataWriter** ∗self, const char ∗key, const **DDS_InstanceHandle_t** ∗instance_handle)

  *<<**extension**>> (p. 1014) Requests the middleware to delete the data.*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_timestamp** (**DDS_KeyedStringDataWriter** ∗self, const **DDS_KeyedString** ∗instance_data, const **DDS_InstanceHandle_t** ∗instance_handle, const struct **DDS_Time_t** ∗source_timestamp)

  *Performs the same functions as **DDS_KeyedStringDataWriter_dispose** (p. 1143) except that the application provides the value for the `source_timestamp` that is made available to **DDS_DataReader** (p. 618) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1990).*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key_w_timestamp** (**DDS_KeyedStringDataWriter** ∗self, const char ∗key, const **DDS_InstanceHandle_t** ∗instance_handle, const struct **DDS_Time_t** ∗source_timestamp)

  *<<**extension**>> (p. 1014) Performs the same functions as **DDS_KeyedStringDataWriter_dispose_w_key** (p. 1143) except that the application provides the value for the `source_timestamp` that is made available to **DDS_DataReader** (p. 618) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1990).*

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_value** (**DDS_KeyedStringDataWriter** ∗self, **DDS_KeyedString** ∗key_holder, const **DDS_InstanceHandle_t** ∗handle)

  Retrieve the instance `key` that corresponds to an instance `handle`.

- **DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_value_w_key** (**DDS_KeyedStringDataWriter** ∗self, char ∗key, const **DDS_InstanceHandle_t** ∗handle)

  *<<**extension**>> (p. 1014) Retrieve the instance `key` that corresponds to an instance `handle`.*

- **DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance** (**DDS_KeyedStringDataWriter** ∗self, const **DDS_KeyedString** ∗key_holder)

  Retrieve the instance `handle` that corresponds to an instance `key_holder`.

- **DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance_w_key** (**DDS_KeyedStringDataWriter** ∗self, const char ∗key)

  *<<**extension**>> (p. 1014) Retrieve the instance `handle` that corresponds to an instance `key`.*

- **DDS_KeyedStringDataReader** ∗ **DDS_KeyedStringDataReader_narrow** (**DDS_DataReader** ∗reader)

  *Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_KeyedStringDataReader** (p. 1131) pointer.*

- **DDS_DataReader** * **DDS_KeyedStringDataReader_as_datareader** (**DDS_KeyedStringDataReader** *reader)

  *Widen the given **DDS_KeyedStringDataReader** (p. 1131) pointer to a **DDS_DataReader** (p. 618) pointer.*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_read** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_take** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_mask, **DDS_ViewStateMask** view_mask, **DDS_InstanceStateMask** instance_mask)

  *Access a collection of data-samples from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_read_w_condition** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_ReadCondition** *condition)

  *Accesses via **DDS_KeyedStringDataReader_read** (p. 1146) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_take_w_condition** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_ReadCondition** *condition)

  *Analogous to **DDS_KeyedStringDataReader_read_w_condition** (p. 1147) except it accesses samples via the **DDS_KeyedStringDataReader_take** (p. 1146) operation.*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_read_next_sample** (**DDS_KeyedStringDataReader** *self, **DDS_KeyedString** *received_data, struct **DDS_SampleInfo** *sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_take_next_sample** (**DDS_KeyedStringDataReader** *self, **DDS_KeyedString** *received_data, struct **DDS_SampleInfo** *sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_read_instance** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** *a_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_take_instance** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** *a_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_read_instance_w_condition** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** *a_handle, **DDS_ReadCondition** *condition)

  *Accesses via **DDS_KeyedStringDataReader_read_instance** (p. 1148) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).*

- **DDS_ReturnCode_t** **DDS_KeyedStringDataReader_take_instance_w_condition** (**DDS_KeyedStringDataReader** *self, struct **DDS_KeyedStringSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** *a_handle, **DDS_ReadCondition** *condition)

  *Accesses via **DDS_KeyedStringDataReader_take_instance** (p. 1148) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).*

- **DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance** (**DDS_KeyedStringDataReader** ∗self, struct **DDS_KeyedStringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max↩ _samples, const **DDS_InstanceHandle_t** ∗previous_handle, **DDS_SampleStateMask** sample_states, **DDS↩ _ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader*** (p. *618*).
- **DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance** (**DDS_KeyedStringDataReader** ∗self, struct **DDS_KeyedStringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max↩ _samples, const **DDS_InstanceHandle_t** ∗previous_handle, **DDS_SampleStateMask** sample_states, **DDS↩ _ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader*** (p. *618*).
- **DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance_w_condition** (**DDS_Keyed↩ StringDataReader** ∗self, struct **DDS_KeyedStringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info↩ _seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗previous_handle, **DDS_ReadCondition** ∗condition)

  *Accesses via **DDS_KeyedStringDataReader_read_next_instance*** (p. *1149*) *the samples that match the criteria specified in the **DDS_ReadCondition*** (p. *695*).
- **DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance_w_condition** (**DDS_Keyed↩ StringDataReader** ∗self, struct **DDS_KeyedStringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info↩ _seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗previous_handle, **DDS_ReadCondition** ∗condition)

  *Accesses via **DDS_KeyedStringDataReader_take_next_instance*** (p. *1150*) *the samples that match the criteria specified in the **DDS_ReadCondition*** (p. *695*).
- **DDS_ReturnCode_t DDS_KeyedStringDataReader_return_loan** (**DDS_KeyedStringDataReader** ∗self, struct **DDS_KeyedStringSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq)

  *Indicates to the **DDS_DataReader*** (p. *618*) *that the application is done accessing the collection of* `received_data` *and* `info_seq` *obtained by some earlier invocation of read or take on the **DDS_DataReader*** (p. *618*).
- **DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value** (**DDS_KeyedStringDataReader** ∗self, **DDS_KeyedString** ∗key_holder, const **DDS_InstanceHandle_t** ∗handle)

  Retrieve the instance `key` *that corresponds to an instance* `handle`.
- **DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value_w_key** (**DDS_KeyedStringData↩ Reader** ∗self, char ∗key, const **DDS_InstanceHandle_t** ∗handle)

  <<***extension***>> (p. *1014*) *Retrieve the instance* `key` *that corresponds to an instance* `handle`.
- **DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance** (**DDS_KeyedStringDataReader** ∗self, const **DDS_KeyedString** ∗key_holder)

  Retrieve the instance `handle` *that corresponds to an instance* `key_holder`.
- **DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance_w_key** (**DDS_KeyedString↩ DataReader** ∗self, const char ∗key)

  <<***extension***>> (p. *1014*) *Retrieve the instance* `handle` *that corresponds to an instance* `key`.

Variables

- char ∗ **DDS_KeyedString::key**

  Instance key associated with the specified value.
- char ∗ **DDS_KeyedString::value**

  String value.

5.124.1 Detailed Description

Built-in type consisting of a string payload and a second string that is the key.

5.124.2 Typedef Documentation

5.124.2.1 DDS_KeyedString

```
typedef struct DDS_KeyedString DDS_KeyedString
```

Keyed string built-in type.

5.124.2.2 DDS_KeyedStringDataWriter

```
typedef struct DDS_KeyedStringDataWriter DDS_KeyedStringDataWriter
```

<<***interface***>> *(*p. *1015)* Instantiates `DataWriter` < **DDS_KeyedString** (p. 1815) >.

See also

FooDataWriter (p. 2119)

DDS_DataWriter (p. 488)

5.124.2.3 DDS_KeyedStringDataReader

```
typedef struct DDS_KeyedStringDataReader DDS_KeyedStringDataReader
```

<<***interface***>> *(*p. *1015)* Instantiates `DataReader` < **DDS_KeyedString** (p. 1815) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string in a destination data sample is NULL, the middleware will allocate a new string for you of sufficient length to hold the received string. The new string will be allocated with **DDS_String_alloc** (p. 1528); the sample's destructor will delete it.

A non- NULL string is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

DDS_DataReader (p. 618)

5.124.3 Function Documentation

5.124.3.1 DDS_KeyedString_new()

```
DDS_KeyedString * DDS_KeyedString_new (
            void  )
```

Constructor.

The default constructor initializes the newly created object with NULL key and value.

Returns

A new **DDS_KeyedString** (p. 1815) or NULL if failure.

5.124.3.2 DDS_KeyedString_new_w_size()

```
DDS_KeyedString * DDS_KeyedString_new_w_size (
            int key_size,
            int size )
```

Constructor that specifies the allocated sizes.

The allocated strings are initialized to empty ("").

Parameters

key_size	<<***in***>> *(p. 1015)* Size of the allocated key string (with NULL-terminated character). Cannot be smaller than one.
size	<<***in***>> *(p. 1015)* Size of the allocated value string (with NULL-terminated character). Cannot be smaller than one.

Returns

A new **DDS_KeyedString** (p. 1815) or NULL if failure.

5.124.3.3 DDS_KeyedString_delete()

```
void DDS_KeyedString_delete (
             DDS_KeyedString * self )
```

Destructor.

5.124.3.4 DDS_KeyedStringTypeSupport_register_type()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_register_type (
             DDS_DomainParticipant * participant,
            const char * type_name )
```

Allows an application to communicate to RTI Connext the existence of the **DDS_KeyedString** (p. 1815) data type.

By default, The **DDS_KeyedString** (p. 1815) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_KeyedStringTypeSupport_get_type_name** (p. 1134). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same **DDS_KeyedStringTypeSupport** (p. 1816) with a **DDS_Domain↩ Participant** (p. 76) using different values for the type_name.

If `register_type` is called multiple times with the same **DDS_DomainParticipant** (p. 76) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	<<***in***>> *(*p. *1015)* the **DDS_DomainParticipant** (p. 76) to register the data type **DDS_KeyedString** (p. 1815) with. Cannot be NULL.
type_name	<<***in***>> *(*p. *1015)* the type name under with the data type **DDS_KeyedString** (p. 1815) is registered with the participant; this type name is used when creating a new **DDS_Topic** (p. 174). (See **DDS_DomainParticipant_create_topic** (p. 114).) The name may not be NULL or longer than 255 characters.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224) or **DDS↩ _RETCODE_OUT_OF_RESOURCES** (p. 1224).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDS_DomainParticipant_create_topic (p. 114)

5.124.3.5 DDS_KeyedStringTypeSupport_unregister_type()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_unregister_type (
             DDS_DomainParticipant * participant,
            const char * type_name )
```

Allows an application to unregister the **DDS_KeyedString** (p. 1815) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The **DDS_KeyedString** (p. 1815) type with `type_name` is registered with the participant and all **DDS_Topic** (p. 174) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS_Topic** (p. 174) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 1224).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	<<***in***>> *(*p. *1015)* the **DDS_DomainParticipant** (p. 76) to unregister the data type **DDS_KeyedString** (p. 1815) from. Cannot be NULL.
type_name	<<***in***>> *(*p. *1015)* the type name under with the data type **DDS_KeyedString** (p. 1815) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_BAD_PARAMETER** (p. 1224) or **DDS_↩ RETCODE_ERROR** (p. 1224)

MT Safety:

SAFE.

See also

DDS_KeyedStringTypeSupport_register_type (p. 1132)

5.124.3.6 DDS_KeyedStringTypeSupport_get_type_name()

```
const char * DDS_KeyedStringTypeSupport_get_type_name (
            void  )
```

Get the default name for the **DDS_KeyedString** (p. 1815) type.

Can be used for calling **DDS_KeyedStringTypeSupport_register_type** (p. 1132) or creating **DDS_Topic** (p. 174).

Returns

default name for the **DDS_KeyedString** (p. 1815) type.

See also

DDS_KeyedStringTypeSupport_register_type (p. 1132)

DDS_DomainParticipant_create_topic (p. 114)

5.124.3.7 DDS_KeyedStringTypeSupport_print_data()

```
void DDS_KeyedStringTypeSupport_print_data (
            const  DDS_KeyedString * a_data )
```

<<***extension***>> *(p. 1014)* Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

a_data	<<***in***>> *(p. 1015)* **DDS_KeyedString** (p. 1815) to be printed.

5.124.3.8 DDS_KeyedStringTypeSupport_get_typecode()

```
DDS_TypeCode * DDS_KeyedStringTypeSupport_get_typecode (
            void  )
```

<<***extension***>> *(p. 1014)* Retrieves the TypeCode for the Type.

See also

FooTypeSupport_get_typecode (p. 225)

5.124.3.9 DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer (
            char * buffer,
            unsigned int * length,
            const  DDS_KeyedString * a_data )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.124.3.10 DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer_ex()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer_ex (
            char * buffer,
            unsigned int * length,
            const  DDS_KeyedString * a_data,
             DDS_DataRepresentationId_t representation )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.124.3.11 DDS_KeyedStringTypeSupport_deserialize_data_from_cdr_buffer()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_deserialize_data_from_cdr_buffer (
             DDS_KeyedString * a_data,
            const char * buffer,
            unsigned int length )
```

<<***extension***>> *(*p. *1014)* Deserializes a sample from a buffer of octets.

See also

FooTypeSupport_deserialize_data_from_cdr_buffer (p. 224)

5.124.3.12 DDS_KeyedStringTypeSupport_data_to_string()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_data_to_string (
            const  DDS_KeyedString * sample,
            char * str,
             DDS_UnsignedLong * str_size,
             DDS_PrintFormatProperty * property )
```

<<***extension***>> *(*p. *1014)* Get the string representation of an input sample.

See also

FooTypeSupport_data_to_string (p. 224)

5.124.3.13 DDS_KeyedStringDataWriter_narrow()

```
DDS_KeyedStringDataWriter * DDS_KeyedStringDataWriter_narrow (
             DDS_DataWriter * writer )
```

Narrow the given **DDS_DataWriter** (p. 488) pointer to a **DDS_KeyedStringDataWriter** (p. 1131) pointer.

See also

FooDataWriter_narrow (p. 493)

5.124.3.14 DDS_KeyedStringDataWriter_as_datawriter()

```
DDS_DataWriter * DDS_KeyedStringDataWriter_as_datawriter (
             DDS_KeyedStringDataWriter * writer )
```

Widen the given **DDS_KeyedStringDataWriter** (p. 1131) pointer to a **DDS_DataWriter** (p. 488) pointer.

See also

FooDataWriter_as_datawriter (p. 493)

5.124.3.15 DDS_KeyedStringDataWriter_register_instance()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance (
            DDS_KeyedStringDataWriter * self,
           const  DDS_KeyedString * instance_data )
```

Informs RTI Connext that the application will be modifying a particular instance.

See also

FooDataWriter_register_instance (p. 494)

5.124.3.16 DDS_KeyedStringDataWriter_register_instance_w_key()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key (
            DDS_KeyedStringDataWriter * self,
           const char * key )
```

<<***extension***>> *(p. 1014)* Informs RTI Connext that the application will be modifying a particular instance.

See also

FooDataWriter_register_instance (p. 494)

5.124.3.17 DDS_KeyedStringDataWriter_register_instance_w_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_timestamp (
            DDS_KeyedStringDataWriter * self,
           const  DDS_KeyedString * instance_data,
           const struct  DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS_KeyedStringDataWriter_register_instance** (p. 1137) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter_register_instance_w_timestamp (p. 495)

5.124.3.18 DDS_KeyedStringDataWriter_register_instance_w_key_w_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key_w_timestamp (
            DDS_KeyedStringDataWriter * self,
            const char * key,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(p. 1014)* Performs the same functions as **DDS_KeyedStringDataWriter_register_instance_w_key** (p. 1138) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter_register_instance_w_timestamp (p. 495)

5.124.3.19 DDS_KeyedStringDataWriter_unregister_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance (
            DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            const  DDS_InstanceHandle_t * handle )
```

Reverses the action of **DDS_KeyedStringDataWriter_register_instance** (p. 1137).

See also

FooDataWriter_unregister_instance (p. 496)

5.124.3.20 DDS_KeyedStringDataWriter_unregister_instance_w_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key (
            DDS_KeyedStringDataWriter * self,
            const char * key,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Reverses the action of **DDS_KeyedStringDataWriter_register_instance_w_key** (p. 1138).

See also

FooDataWriter_unregister_instance (p. 496)

5.124.3.21 DDS_KeyedStringDataWriter_unregister_instance_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_timestamp (
            DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_KeyedStringDataWriter_unregister_instance** (p. 1139) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_unregister_instance_w_timestamp (p. 498)

5.124.3.22 DDS_KeyedStringDataWriter_unregister_instance_w_key_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key_w_timestamp (
            DDS_KeyedStringDataWriter * self,
            const char * key,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(p. 1014)* Performs the same function as **DDS_KeyedStringDataWriter_unregister_instance_w_key** (p. 1139) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_unregister_instance_w_timestamp (p. 498)

5.124.3.23 DDS_KeyedStringDataWriter_create_data()

```
DDS_KeyedString * DDS_KeyedStringDataWriter_create_data (
            DDS_KeyedStringDataWriter * self )
```

Creates a keyed string data instance.

The size of the instance including the NULL terminated character is determined by the DataWriter property **dds.builtin_type.keyed_string.alloc_size**.

Default size: **dds.builtin_type.keyed_string.max_size** property of DomainParticipant if defined. Otherwise 1024.

Created instances must be deleted with **DDS_KeyedStringDataWriter_delete_data** (p. 1140).

Returns

Newly created keyed string data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types

5.124.3.24 DDS_KeyedStringDataWriter_delete_data()

```
DDS_Boolean DDS_KeyedStringDataWriter_delete_data (
             DDS_KeyedStringDataWriter * self,
             DDS_KeyedString * sample )
```

Destroys a keyed string data instance created by **DDS_KeyedStringDataWriter_create_data** (p. 1140).

Returns

DDS_BOOLEAN_TRUE (p. 1203) upon successful deletion.

5.124.3.25 DDS_KeyedStringDataWriter_write()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write (
             DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            const  DDS_InstanceHandle_t * handle )
```

Modifies the value of a **DDS_KeyedString** (p. 1815) data instance.

See also

FooDataWriter_write (p. 499)

5.124.3.26 DDS_KeyedStringDataWriter_write_string_w_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key (
             DDS_KeyedStringDataWriter * self,
            const char * key,
            const char * str,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Modifies the value of a **DDS_KeyedString** (p. 1815) data instance.

See also

FooDataWriter_write (p. 499)

5.124.3.27 DDS_KeyedStringDataWriter_write_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_timestamp (
             DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_KeyedStringDataWriter_write** (p. 1141) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.124.3.28 DDS_KeyedStringDataWriter_write_string_w_key_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_timestamp (
             DDS_KeyedStringDataWriter * self,
            const char * key,
            const char * str,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(p. 1014)* Performs the same function as **DDS_KeyedStringDataWriter_write_string_w_key** (p. 1141) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.124.3.29 DDS_KeyedStringDataWriter_write_w_params()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_params (
             DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            struct  DDS_WriteParams_t * params )
```

Performs the same function as **DDS_KeyedStringDataWriter_write** (p. 1141) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter_write_w_params (p. 504)

5.124.3.30 DDS_KeyedStringDataWriter_write_string_w_key_w_params()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_params (
             DDS_KeyedStringDataWriter * self,
            const char * key,
            const char * str,
            struct  DDS_WriteParams_t * params )
```

<<***extension***>> *(*p. *1014)* Performs the same function as **DDS_KeyedStringDataWriter_write_string_w_key** (p. 1141) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter_write_w_params (p. 504)

5.124.3.31 DDS_KeyedStringDataWriter_dispose()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose (
             DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            const  DDS_InstanceHandle_t * instance_handle )
```

Requests the middleware to delete the data.

See also

FooDataWriter_dispose (p. 505)

5.124.3.32 DDS_KeyedStringDataWriter_dispose_w_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key (
             DDS_KeyedStringDataWriter * self,
            const char * key,
            const  DDS_InstanceHandle_t * instance_handle )
```

<<***extension***>> *(*p. *1014)* Requests the middleware to delete the data.

See also

FooDataWriter_dispose (p. 505)

5.124.3.33 DDS_KeyedStringDataWriter_dispose_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_timestamp (
            DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * instance_data,
            const  DDS_InstanceHandle_t * instance_handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS_KeyedStringDataWriter_dispose** (p. 1143) except that the application provides the value for the `source_timestamp` that is made available to **DDS_DataReader** (p. 618) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1990).

See also

FooDataWriter_dispose_w_timestamp (p. 506)

5.124.3.34 DDS_KeyedStringDataWriter_dispose_w_key_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key_w_timestamp (
            DDS_KeyedStringDataWriter * self,
            const char * key,
            const  DDS_InstanceHandle_t * instance_handle,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(p. 1014)* Performs the same functions as **DDS_KeyedStringDataWriter_dispose_w_key** (p. 1143) except that the application provides the value for the `source_timestamp` that is made available to **DDS_Data↩Reader** (p. 618) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1990).

See also

FooDataWriter_dispose_w_timestamp (p. 506)

5.124.3.35 DDS_KeyedStringDataWriter_get_key_value()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_value (
            DDS_KeyedStringDataWriter * self,
            DDS_KeyedString * key_holder,
            const  DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataWriter_get_key_value (p. 508)

5.124.3.36 DDS_KeyedStringDataWriter_get_key_value_w_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_value_w_key (
             DDS_KeyedStringDataWriter * self,
            char * key,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataWriter_get_key_value (p. 508)

5.124.3.37 DDS_KeyedStringDataWriter_lookup_instance()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance (
             DDS_KeyedStringDataWriter * self,
            const  DDS_KeyedString * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataWriter_lookup_instance (p. 509)

5.124.3.38 DDS_KeyedStringDataWriter_lookup_instance_w_key()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance_w_key (
             DDS_KeyedStringDataWriter * self,
            const char * key )
```

<<***extension***>> *(p. 1014)* Retrieve the instance `handle` that corresponds to an instance `key`.

See also

FooDataWriter_lookup_instance (p. 509)

5.124.3.39 DDS_KeyedStringDataReader_narrow()

```
DDS_KeyedStringDataReader * DDS_KeyedStringDataReader_narrow (
            DDS_DataReader * reader )
```

Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_KeyedStringDataReader** (p. 1131) pointer.

See also

FooDataReader_narrow (p. 627)

5.124.3.40 DDS_KeyedStringDataReader_as_datareader()

```
DDS_DataReader * DDS_KeyedStringDataReader_as_datareader (
            DDS_KeyedStringDataReader * reader )
```

Widen the given **DDS_KeyedStringDataReader** (p. 1131) pointer to a **DDS_DataReader** (p. 618) pointer.

See also

FooDataReader_as_datareader (p. 627)

5.124.3.41 DDS_KeyedStringDataReader_read()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read (
            DDS_KeyedStringDataReader * self,
           struct  DDS_KeyedStringSeq * received_data,
           struct  DDS_SampleInfoSeq * info_seq,
            DDS_Long max_samples,
            DDS_SampleStateMask sample_states,
            DDS_ViewStateMask view_states,
            DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read (p. 628)

5.124.3.42 DDS_KeyedStringDataReader_take()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_SampleStateMask sample_mask,
             DDS_ViewStateMask view_mask,
             DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take (p. 629)

5.124.3.43 DDS_KeyedStringDataReader_read_w_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_w_condition (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedStringDataReader_read** (p. 1146) the samples that match the criteria specified in the **DDS↩_ReadCondition** (p. 695).

See also

FooDataReader_read_w_condition (p. 633)

5.124.3.44 DDS_KeyedStringDataReader_take_w_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_w_condition (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Analogous to **DDS_KeyedStringDataReader_read_w_condition** (p. 1147) except it accesses samples via the **DDS↩_KeyedStringDataReader_take** (p. 1146) operation.

See also

FooDataReader_take_w_condition (p. 635)

5.124.3.45 DDS_KeyedStringDataReader_read_next_sample()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_sample (
             DDS_KeyedStringDataReader * self,
             DDS_KeyedString * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_next_sample (p. 636)

5.124.3.46 DDS_KeyedStringDataReader_take_next_sample()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_sample (
             DDS_KeyedStringDataReader * self,
             DDS_KeyedString * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_next_sample (p. 637)

5.124.3.47 DDS_KeyedStringDataReader_read_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_instance (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_instance (p. 638)

5.124.3.48 DDS_KeyedStringDataReader_take_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_instance (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_instance (p. 639)

5.124.3.49 DDS_KeyedStringDataReader_read_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_instance_w_condition (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedStringDataReader_read_instance** (p. 1148) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_read_instance_w_condition (p. 641)

5.124.3.50 DDS_KeyedStringDataReader_take_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_instance_w_condition (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedStringDataReader_take_instance** (p. 1148) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_take_instance_w_condition (p. 642)

5.124.3.51 DDS_KeyedStringDataReader_read_next_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_next_instance (p. 643)

5.124.3.52 DDS_KeyedStringDataReader_take_next_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_next_instance (p. 645)

5.124.3.53 DDS_KeyedStringDataReader_read_next_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance_w_condition (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedStringDataReader_read_next_instance** (p. 1149) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_read_next_instance_w_condition (p. 646)

5.124.3.54 DDS_KeyedStringDataReader_take_next_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance_w_condition (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedStringDataReader_take_next_instance** (p. 1150) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_take_next_instance_w_condition (p. 648)

5.124.3.55 DDS_KeyedStringDataReader_return_loan()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_return_loan (
             DDS_KeyedStringDataReader * self,
            struct  DDS_KeyedStringSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS_DataReader** (p. 618) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 618).

See also

FooDataReader_return_loan (p. 649)

5.124.3.56 DDS_KeyedStringDataReader_get_key_value()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value (
             DDS_KeyedStringDataReader * self,
             DDS_KeyedString * key_holder,
            const  DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader_get_key_value (p. 650)

5.124.3.57 DDS_KeyedStringDataReader_get_key_value_w_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value_w_key (
             DDS_KeyedStringDataReader * self,
            char * key,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(*p. *1014)* Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader_get_key_value (p. 650)

5.124.3.58 DDS_KeyedStringDataReader_lookup_instance()

```
DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance (
             DDS_KeyedStringDataReader * self,
            const  DDS_KeyedString * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataReader_lookup_instance (p. 651)

5.124.3.59 DDS_KeyedStringDataReader_lookup_instance_w_key()

```
DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance_w_key (
             DDS_KeyedStringDataReader * self,
            const char * key )
```

<<***extension***>> *(*p. *1014)* Retrieve the instance `handle` that corresponds to an instance `key`.

See also

FooDataReader_lookup_instance (p. 651)

5.124.4 Variable Documentation

5.124.4.1 key

```
char* DDS_KeyedString::key
```

Instance key associated with the specified value.

5.124.4.2 value

```
char* DDS_KeyedString::value
```

String value.

5.125 Octets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes.

Data Structures

- struct **DDS_Octets**

  Built-in type consisting of a variable-length array of opaque bytes.
- struct **DDS_OctetsSeq**

  Instantiates ***FooSeq*** *(*p. *2120) < **DDS_Octets** (*p. *1863) > .*
- struct **DDS_OctetsTypeSupport**

  *<<**interface**>> (*p. *1015) **DDS_Octets** (*p. *1863) type support.*

Typedefs

- typedef struct **DDS_Octets DDS_Octets**

  Built-in type consisting of a variable-length array of opaque bytes.
- typedef struct **DDS_OctetsDataWriter DDS_OctetsDataWriter**

  *<<**interface**>> (*p. *1015) Instantiates* `DataWriter` *< **DDS_Octets** (*p. *1863) >.*
- typedef struct **DDS_OctetsDataReader DDS_OctetsDataReader**

  *<<**interface**>> (*p. *1015) Instantiates* `DataReader` *< **DDS_Octets** (*p. *1863) >.*

Functions

- **DDS_Octets** * **DDS_Octets_new** (void)

  Constructor.
- **DDS_Octets** * **DDS_Octets_new_w_size** (int size)

  Constructor that specifies the size of the allocated octets array.
- void **DDS_Octets_delete** (**DDS_Octets** *self)

  Destructor.
- **DDS_ReturnCode_t** **DDS_OctetsTypeSupport_register_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  *Allows an application to communicate to RTI Connext the existence of the **DDS_Octets** (p. 1863) data type.*
- **DDS_ReturnCode_t** **DDS_OctetsTypeSupport_unregister_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  *Allows an application to unregister the **DDS_Octets** (p. 1863) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.*
- const char * **DDS_OctetsTypeSupport_get_type_name** (void)

  *Get the default name for the **DDS_Octets** (p. 1863) type.*
- void **DDS_OctetsTypeSupport_print_data** (const **DDS_Octets** *a_data)

  *<<**extension**>> (p. 1014) Print value of data type to standard out.*
- **DDS_TypeCode** * **DDS_OctetsTypeSupport_get_typecode** (void)

  *<<**extension**>> (p. 1014) Retrieves the TypeCode for the Type.*
- **DDS_ReturnCode_t** **DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer** (char *buffer, unsigned int *length, const **DDS_Octets** *a_data)

  *<<**extension**>> (p. 1014) Serializes the input sample into a CDR buffer of octets.*
- **DDS_ReturnCode_t** **DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int *length, const **DDS_Octets** *a_data, **DDS_DataRepresentationId_t** representation)

  *<<**extension**>> (p. 1014) Serializes the input sample into a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_OctetsTypeSupport_deserialize_data_from_cdr_buffer** (**DDS_Octets** *a_data, const char *buffer, unsigned int length)

  *<<**extension**>> (p. 1014) Deserializes a sample from a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_OctetsTypeSupport_data_to_string** (const **DDS_Octets** *sample, char *str, **DDS_UnsignedLong** *str_size, **DDS_PrintFormatProperty** *property)

  *<<**extension**>> (p. 1014) Get the string representation of an input sample.*
- **DDS_OctetsDataWriter** * **DDS_OctetsDataWriter_narrow** (**DDS_DataWriter** *writer)

  *Narrow the given **DDS_DataWriter** (p. 488) pointer to a **DDS_OctetsDataWriter** (p. 1156) pointer.*
- **DDS_DataWriter** * **DDS_OctetsDataWriter_as_datawriter** (**DDS_OctetsDataWriter** *writer)

  *Widen the given **DDS_OctetsDataWriter** (p. 1156) pointer to a **DDS_DataWriter** (p. 488) pointer.*
- **DDS_Octets** * **DDS_OctetsDataWriter_create_data** (**DDS_OctetsDataWriter** *self)

  Creates an octet data sequence.
- **DDS_Boolean** **DDS_OctetsDataWriter_delete_data** (**DDS_OctetsDataWriter** *self, **DDS_Octets** *sample)

  *Destroys a octet data sequence created by **DDS_OctetsDataWriter_create_data** (p. 1163).*
- **DDS_ReturnCode_t** **DDS_OctetsDataWriter_write** (**DDS_OctetsDataWriter** *self, const **DDS_Octets** *instance_data, const **DDS_InstanceHandle_t** *handle)

  *Modifies the value of a **DDS_Octets** (p. 1863) data instance.*
- **DDS_ReturnCode_t** **DDS_OctetsDataWriter_write_octets** (**DDS_OctetsDataWriter** *self, const unsigned char *octets, int length, const **DDS_InstanceHandle_t** *handle)

  *<<**extension**>> (p. 1014) Modifies the value of a **DDS_Octets** (p. 1863) data instance.*
- **DDS_ReturnCode_t** **DDS_OctetsDataWriter_write_octets_seq** (**DDS_OctetsDataWriter** *self, const struct **DDS_OctetSeq** *octets, const **DDS_InstanceHandle_t** *handle)

<<**extension**>> (p. 1014) Modifies the value of a **DDS_Octets** (p. 1863) data instance.

- **DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_timestamp** (**DDS_OctetsDataWriter** *self, const **DDS_Octets** *instance_data, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  Performs the same function as **DDS_OctetsDataWriter_write** (p. 1163) except that it also provides the value for the `source_timestamp`.

- **DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_timestamp** (**DDS_OctetsDataWriter** *self, const unsigned char *octets, int length, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  <<**extension**>> (p. 1014) Performs the same function as **DDS_OctetsDataWriter_write_octets** (p. 1164) except that it also provides the value for the `source_timestamp`.

- **DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_timestamp** (**DDS_OctetsDataWriter** *self, const struct **DDS_OctetSeq** *octets, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  <<**extension**>> (p. 1014) Performs the same function as **DDS_OctetsDataWriter_write_octets_seq** (p. 1164) except that it also provides the value for the `source_timestamp`.

- **DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_params** (**DDS_OctetsDataWriter** *self, const **DDS_Octets** *instance_data, struct **DDS_WriteParams_t** *params)

  Performs the same function as **DDS_OctetsDataWriter_write** (p. 1163) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

- **DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_params** (**DDS_OctetsDataWriter** *self, const unsigned char *octets, int length, struct **DDS_WriteParams_t** *params)

  <<**extension**>> (p. 1014) Performs the same function as **DDS_OctetsDataWriter_write_octets** (p. 1164) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

- **DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_params** (**DDS_OctetsDataWriter** *self, const struct **DDS_OctetSeq** *octets, struct **DDS_WriteParams_t** *params)

  <<**extension**>> (p. 1014) Performs the same function as **DDS_OctetsDataWriter_write_octets_seq** (p. 1164) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

- **DDS_OctetsDataReader** * **DDS_OctetsDataReader_narrow** (**DDS_DataReader** *reader)

  Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_OctetsDataReader** (p. 1156) pointer.

- **DDS_DataReader** * **DDS_OctetsDataReader_as_datareader** (**DDS_OctetsDataReader** *reader)

  Widen the given **DDS_OctetsDataReader** (p. 1156) pointer to a **DDS_DataReader** (p. 618) pointer.

- **DDS_ReturnCode_t DDS_OctetsDataReader_read** (**DDS_OctetsDataReader** *self, struct **DDS_OctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  Access a collection of data samples from the **DDS_DataReader** (p. 618).

- **DDS_ReturnCode_t DDS_OctetsDataReader_take** (**DDS_OctetsDataReader** *self, struct **DDS_OctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_mask, **DDS_ViewStateMask** view_mask, **DDS_InstanceStateMask** instance_mask)

  Access a collection of data-samples from the **DDS_DataReader** (p. 618).

- **DDS_ReturnCode_t DDS_OctetsDataReader_read_w_condition** (**DDS_OctetsDataReader** *self, struct **DDS_OctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_ReadCondition** *condition)

  Accesses via **DDS_OctetsDataReader_read** (p. 1168) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

- **DDS_ReturnCode_t DDS_OctetsDataReader_take_w_condition** (**DDS_OctetsDataReader** *self, struct **DDS_OctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_ReadCondition** *condition)

  Analogous to **DDS_OctetsDataReader_read_w_condition** (p. 1169) except it accesses samples via the **DDS_OctetsDataReader_take** (p. 1168) operation.

- **DDS_ReturnCode_t DDS_OctetsDataReader_read_next_sample** (**DDS_OctetsDataReader** *self, **DDS_Octets** *received_data, struct **DDS_SampleInfo** *sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_OctetsDataReader_take_next_sample** (**DDS_OctetsDataReader** *self, **DDS_Octets** *received_data, struct **DDS_SampleInfo** *sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_OctetsDataReader_return_loan** (**DDS_OctetsDataReader** *self, struct **DDS_OctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq)

  *Indicates to the **DDS_DataReader** (p. 618) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 618).*

Variables

- int **DDS_Octets::length**

  Number of octets to serialize.
- unsigned char * **DDS_Octets::value**

  ***DDS_Octets** (p. 1863) array value.*

5.125.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

5.125.2 Typedef Documentation

5.125.2.1 DDS_Octets

`typedef struct` **`DDS_Octets`** **`DDS_Octets`**

Built-in type consisting of a variable-length array of opaque bytes.

5.125.2.2 DDS_OctetsDataWriter

`typedef struct` **`DDS_OctetsDataWriter`** **`DDS_OctetsDataWriter`**

<<***interface***>> *(p. 1015)* Instantiates `DataWriter` < **DDS_Octets** (p. 1863) >.

See also

FooDataWriter (p. 2119)

DDS_DataWriter (p. 488)

5.125.2.3 DDS_OctetsDataReader

```
typedef struct  DDS_OctetsDataReader  DDS_OctetsDataReader
```

<<***interface***>> *(p. 1015)* Instantiates `DataReader` < **DDS_Octets** (p. 1863) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and the byte array in a destination data sample is NULL, the middleware will allocate a new array for you of sufficient length to hold the received data. The new array will be allocated with **DDS_OctetBuffer_alloc** (p. 1501); the sample's destructor will delete it.

A non- NULL array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

DDS_DataReader (p. 618)

5.125.3 Function Documentation

5.125.3.1 DDS_Octets_new()

```
DDS_Octets * DDS_Octets_new (
            void  )
```

Constructor.

The default constructor initializes the newly created object with NULL value, and zero length.

Returns

A new **DDS_Octets** (p. 1863) or NULL if failure.

5.125.3.2 DDS_Octets_new_w_size()

```
DDS_Octets * DDS_Octets_new_w_size (
            int size )
```

Constructor that specifies the size of the allocated octets array.

After this function is called, length is set to zero.

Parameters

size	<<***in***>> *(p. 1015)* Size of the allocated octets array Cannot be smaller than zero.

Returns

A new **DDS_Octets** (p. 1863) or NULL if failure.

5.125.3.3 DDS_Octets_delete()

```
void DDS_Octets_delete (
               DDS_Octets * self )
```

Destructor.

5.125.3.4 DDS_OctetsTypeSupport_register_type()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_register_type (
              DDS_DomainParticipant * participant,
             const char * type_name )
```

Allows an application to communicate to RTI Connext the existence of the **DDS_Octets** (p. 1863) data type.

By default, The **DDS_Octets** (p. 1863) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_OctetsTypeSupport_get_type_name** (p. 1160). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same **DDS_OctetsTypeSupport** (p. 1864) with a **DDS_Domain↩ Participant** (p. 76) using different values for the type_name.

If `register_type` is called multiple times with the same **DDS_DomainParticipant** (p. 76) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	<<***in***>> *(p. 1015)* the **DDS_DomainParticipant** (p. 76) to register the data type **DDS_Octets** (p. 1863) with. Cannot be NULL.
type_name	<<***in***>> *(p. 1015)* the type name under with the data type **DDS_Octets** (p. 1863) is registered with the participant; this type name is used when creating a new **DDS_Topic** (p. 174). (See **DDS_DomainParticipant_create_topic** (p. 114).) The name may not be NULL or longer than 255 characters.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDS_DomainParticipant_create_topic (p. 114)

5.125.3.5 DDS_OctetsTypeSupport_unregister_type()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_unregister_type (
            DDS_DomainParticipant * participant,
           const char * type_name )
```

Allows an application to unregister the **DDS_Octets** (p. 1863) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The **DDS_Octets** (p. 1863) type with `type_name` is registered with the participant and all **DDS_Topic** (p. 174) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS_Topic** (p. 174) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 1224).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	<<***in***>> *(*p. *1015)* the **DDS_DomainParticipant** (p. 76) to unregister the data type **DDS_Octets** (p. 1863) from. Cannot be NULL.
type_name	<<***in***>> *(*p. *1015)* the type name under with the data type **DDS_Octets** (p. 1863) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_BAD_PARAMETER** (p. 1224) or **DDS_RETCODE_ERROR** (p. 1224)

MT Safety:

SAFE.

See also

DDS_OctetsTypeSupport_register_type (p. 1158)

5.125.3.6 DDS_OctetsTypeSupport_get_type_name()

```
const char * DDS_OctetsTypeSupport_get_type_name (
            void  )
```

Get the default name for the **DDS_Octets** (p. 1863) type.

Can be used for calling **DDS_OctetsTypeSupport_register_type** (p. 1158) or creating **DDS_Topic** (p. 174).

Returns

default name for the **DDS_Octets** (p. 1863) type.

See also

DDS_OctetsTypeSupport_register_type (p. 1158)

DDS_DomainParticipant_create_topic (p. 114)

5.125.3.7 DDS_OctetsTypeSupport_print_data()

```
void DDS_OctetsTypeSupport_print_data (
            const  DDS_Octets * a_data )
```

<<***extension***>> *(p. 1014)* Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

a_data	<<***in***>> *(p. 1015)* **DDS_Octets** (p. 1863) to be printed.

5.125.3.8 DDS_OctetsTypeSupport_get_typecode()

```
DDS_TypeCode * DDS_OctetsTypeSupport_get_typecode (
            void  )
```

<<***extension***>> *(*p. *1014)* Retrieves the TypeCode for the Type.

See also

FooTypeSupport_get_typecode (p. 225)

5.125.3.9 DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer (
            char * buffer,
            unsigned int * length,
            const  DDS_Octets * a_data )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.125.3.10 DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer_ex()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer_ex (
            char * buffer,
            unsigned int * length,
            const  DDS_Octets * a_data,
             DDS_DataRepresentationId_t representation )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.125.3.11 DDS_OctetsTypeSupport_deserialize_data_from_cdr_buffer()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_deserialize_data_from_cdr_buffer (
             DDS_Octets * a_data,
            const char * buffer,
            unsigned int length )
```

<<***extension***>> *(p. 1014)* Deserializes a sample from a buffer of octets.

See also

FooTypeSupport_deserialize_data_from_cdr_buffer (p. 224)

5.125.3.12 DDS_OctetsTypeSupport_data_to_string()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_data_to_string (
            const  DDS_Octets * sample,
            char * str,
             DDS_UnsignedLong * str_size,
             DDS_PrintFormatProperty * property )
```

<<***extension***>> *(p. 1014)* Get the string representation of an input sample.

See also

FooTypeSupport_data_to_string (p. 224)

5.125.3.13 DDS_OctetsDataWriter_narrow()

```
DDS_OctetsDataWriter * DDS_OctetsDataWriter_narrow (
             DDS_DataWriter * writer )
```

Narrow the given **DDS_DataWriter** (p. 488) pointer to a **DDS_OctetsDataWriter** (p. 1156) pointer.

See also

FooDataWriter_narrow (p. 493)

5.125.3.14 DDS_OctetsDataWriter_as_datawriter()

```
DDS_DataWriter * DDS_OctetsDataWriter_as_datawriter (
            DDS_OctetsDataWriter * writer )
```

Widen the given **DDS_OctetsDataWriter** (p. 1156) pointer to a **DDS_DataWriter** (p. 488) pointer.

See also

FooDataWriter_as_datawriter (p. 493)

5.125.3.15 DDS_OctetsDataWriter_create_data()

```
DDS_Octets * DDS_OctetsDataWriter_create_data (
            DDS_OctetsDataWriter * self )
```

Creates an octet data sequence.

The size of the instance is determined by the DataWriter property **dds.builtin_type.octets.alloc_size**.

Default size: **dds.builtin_type.octets.max_size** property of DomainParticipant if defined. Otherwise 2048.

Created instances must be deleted with **DDS_OctetsDataWriter_delete_data** (p. 1163).

Returns

Newly created octet sequence data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types.

5.125.3.16 DDS_OctetsDataWriter_delete_data()

```
DDS_Boolean DDS_OctetsDataWriter_delete_data (
            DDS_OctetsDataWriter * self,
            DDS_Octets * sample )
```

Destroys a octet data sequence created by **DDS_OctetsDataWriter_create_data** (p. 1163).

Returns

DDS_BOOLEAN_TRUE (p. 1203) upon successful deletion.

5.125.3.17 DDS_OctetsDataWriter_write()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write (
             DDS_OctetsDataWriter * self,
            const  DDS_Octets * instance_data,
            const  DDS_InstanceHandle_t * handle )
```

Modifies the value of a **DDS_Octets** (p. 1863) data instance.

See also

FooDataWriter_write (p. 499)

5.125.3.18 DDS_OctetsDataWriter_write_octets()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets (
             DDS_OctetsDataWriter * self,
            const unsigned char * octets,
            int length,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Modifies the value of a **DDS_Octets** (p. 1863) data instance.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
octets	<<***in***>> *(p. 1015)* Array of octets to be published.
length	<<***in***>> *(p. 1015)* Number of octets to be published.
handle	<<***in***>> *(p. 1015)* The special value **DDS_HANDLE_NIL** (p. 227) should be used always.

See also

FooDataWriter_write (p. 499)

5.125.3.19 DDS_OctetsDataWriter_write_octets_seq()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq (
             DDS_OctetsDataWriter * self,
            const struct  DDS_OctetSeq * octets,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Modifies the value of a **DDS_Octets** (p. 1863) data instance.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
octets	<<***in***>> *(*p. *1015)* Sequence of octets to be published.
handle	<<***in***>> *(*p. *1015)* The special value **DDS_HANDLE_NIL** (p. 227) should be used always.

See also

FooDataWriter_write (p. 499)

5.125.3.20 DDS_OctetsDataWriter_write_w_timestamp()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_timestamp (
             DDS_OctetsDataWriter * self,
            const  DDS_Octets * instance_data,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_OctetsDataWriter_write** (p. 1163) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.125.3.21 DDS_OctetsDataWriter_write_octets_w_timestamp()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_timestamp (
             DDS_OctetsDataWriter * self,
            const unsigned char * octets,
            int length,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(*p. *1014)* Performs the same function as **DDS_OctetsDataWriter_write_octets** (p. 1164) except that it also provides the value for the `source_timestamp`.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
octets	<<***in***>> *(*p. *1015)* Array of octets to be published.
length	<<***in***>> *(*p. *1015)* Number of octets to be published.
handle	<<***in***>> *(*p. *1015)* The special value **DDS_HANDLE_NIL** (p. 227) should be used always.
source_timestamp	<<***in***>> *(*p. *1015)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See **FooDataWriter_write_w_timestamp** (p. 503). Cannot be NULL.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.125.3.22 DDS_OctetsDataWriter_write_octets_seq_w_timestamp()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_timestamp (
            DDS_OctetsDataWriter * self,
            const struct  DDS_OctetSeq * octets,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(p. 1014)* Performs the same function as **DDS_OctetsDataWriter_write_octets_seq** (p. 1164) except that it also provides the value for the `source_timestamp`.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
octets	<<***in***>> *(p. 1015)* Sequence of octets to be published.
handle	<<***in***>> *(p. 1015)* The special value **DDS_HANDLE_NIL** (p. 227) should be used always.
source_timestamp	<<***in***>> *(p. 1015)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See **FooDataWriter_write_w_timestamp** (p. 503). Cannot be NULL.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.125.3.23 DDS_OctetsDataWriter_write_w_params()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_params (
            DDS_OctetsDataWriter * self,
            const  DDS_Octets * instance_data,
            struct  DDS_WriteParams_t * params )
```

Performs the same function as **DDS_OctetsDataWriter_write** (p. 1163) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter_write_w_params (p. 504)

5.125.3.24 DDS_OctetsDataWriter_write_octets_w_params()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_params (
             DDS_OctetsDataWriter * self,
            const unsigned char * octets,
            int length,
            struct  DDS_WriteParams_t * params )
```

<<***extension***>> *(*p. *1014)* Performs the same function as **DDS_OctetsDataWriter_write_octets** (p. 1164) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
octets	<<***in***>> *(*p. *1015)* Array of octets to be published.
length	<<***in***>> *(*p. *1015)* Number of octets to be published.
params	<<***in***>> *(*p. *1015)* The **DDS_WriteParams_t** (p. 2107) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See **FooDataWriter_write_w_params** (p. 504). Cannot be NULL.

See also

FooDataWriter_write_w_params (p. 504)

5.125.3.25 DDS_OctetsDataWriter_write_octets_seq_w_params()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_params (
             DDS_OctetsDataWriter * self,
            const struct  DDS_OctetSeq * octets,
            struct  DDS_WriteParams_t * params )
```

<<***extension***>> *(*p. *1014)* Performs the same function as **DDS_OctetsDataWriter_write_octets_seq** (p. 1164) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
octets	<<***in***>> *(*p. *1015)* Sequence of octets to be published.
params	<<***in***>> *(*p. *1015)* The **DDS_WriteParams_t** (p. 2107) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See **FooDataWriter_write_w_params** (p. 504). Cannot be NULL.

See also

FooDataWriter_write_w_params (p. 504)

5.125.3.26 DDS_OctetsDataReader_narrow()

```
DDS_OctetsDataReader * DDS_OctetsDataReader_narrow (
            DDS_DataReader * reader )
```

Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_OctetsDataReader** (p. 1156) pointer.

See also

FooDataReader_narrow (p. 627)

5.125.3.27 DDS_OctetsDataReader_as_datareader()

```
DDS_DataReader * DDS_OctetsDataReader_as_datareader (
            DDS_OctetsDataReader * reader )
```

Widen the given **DDS_OctetsDataReader** (p. 1156) pointer to a **DDS_DataReader** (p. 618) pointer.

See also

FooDataReader_as_datareader (p. 627)

5.125.3.28 DDS_OctetsDataReader_read()

```
DDS_ReturnCode_t DDS_OctetsDataReader_read (
            DDS_OctetsDataReader * self,
           struct  DDS_OctetsSeq * received_data,
           struct  DDS_SampleInfoSeq * info_seq,
            DDS_Long max_samples,
            DDS_SampleStateMask sample_states,
            DDS_ViewStateMask view_states,
            DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read (p. 628)

5.125.3.29 DDS_OctetsDataReader_take()

```
DDS_ReturnCode_t DDS_OctetsDataReader_take (
             DDS_OctetsDataReader * self,
            struct  DDS_OctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_SampleStateMask sample_mask,
             DDS_ViewStateMask view_mask,
             DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take (p. 629)

5.125.3.30 DDS_OctetsDataReader_read_w_condition()

```
DDS_ReturnCode_t DDS_OctetsDataReader_read_w_condition (
             DDS_OctetsDataReader * self,
            struct  DDS_OctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_OctetsDataReader_read** (p. 1168) the samples that match the criteria specified in the **DDS_↩ ReadCondition** (p. 695).

See also

FooDataReader_read_w_condition (p. 633)

5.125.3.31 DDS_OctetsDataReader_take_w_condition()

```
DDS_ReturnCode_t DDS_OctetsDataReader_take_w_condition (
             DDS_OctetsDataReader * self,
            struct  DDS_OctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Analogous to **DDS_OctetsDataReader_read_w_condition** (p. 1169) except it accesses samples via the **DDS_↩ OctetsDataReader_take** (p. 1168) operation.

See also

FooDataReader_take_w_condition (p. 635)

5.125.3.32 DDS_OctetsDataReader_read_next_sample()

```
DDS_ReturnCode_t DDS_OctetsDataReader_read_next_sample (
             DDS_OctetsDataReader * self,
             DDS_Octets * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_next_sample (p. 636)

5.125.3.33 DDS_OctetsDataReader_take_next_sample()

```
DDS_ReturnCode_t DDS_OctetsDataReader_take_next_sample (
             DDS_OctetsDataReader * self,
             DDS_Octets * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_next_sample (p. 637)

5.125.3.34 DDS_OctetsDataReader_return_loan()

```
DDS_ReturnCode_t DDS_OctetsDataReader_return_loan (
             DDS_OctetsDataReader * self,
            struct  DDS_OctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS_DataReader** (p. 618) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 618).

See also

FooDataReader_return_loan (p. 649)

5.125.4 Variable Documentation

5.125.4.1 length

```
int DDS_Octets::length
```

Number of octets to serialize.

5.125.4.2 value

```
unsigned char* DDS_Octets::value
```

DDS_Octets (p. 1863) array value.

5.126 KeyedOctets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

Data Structures

- struct **DDS_KeyedOctets**

  Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.
- struct **DDS_KeyedOctetsSeq**

  Instantiates ***FooSeq*** *(p. 2120) < **DDS_KeyedOctets** (p. 1814) >.*
- struct **DDS_KeyedOctetsTypeSupport**

  *<<**interface**>> (p. 1015) **DDS_KeyedOctets** (p. 1814) type support.*

Typedefs

- typedef struct **DDS_KeyedOctets** **DDS_KeyedOctets**

  Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.
- typedef struct **DDS_KeyedOctetsDataWriter** **DDS_KeyedOctetsDataWriter**

  *<<**interface**>> (p. 1015) Instantiates `DataWriter` < **DDS_KeyedOctets** (p. 1814) >.*
- typedef struct **DDS_KeyedOctetsDataReader** **DDS_KeyedOctetsDataReader**

  *<<**interface**>> (p. 1015) Instantiates `DataReader` < **DDS_KeyedOctets** (p. 1814) >.*

Functions

- **DDS_KeyedOctets** * **DDS_KeyedOctets_new** (void)

  Constructor.
- **DDS_KeyedOctets** * **DDS_KeyedOctets_new_w_size** (int key_size, int size)

  Constructor that specifies the allocated sizes.
- void **DDS_KeyedOctets_delete** (**DDS_KeyedOctets** *self)

  Destructor.
- **DDS_ReturnCode_t** **DDS_KeyedOctetsTypeSupport_register_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  *Allows an application to communicate to RTI Connext the existence of the **DDS_KeyedOctets*** (p. *1814) data type.*
- **DDS_ReturnCode_t** **DDS_KeyedOctetsTypeSupport_unregister_type** (**DDS_DomainParticipant** *participant, const char *type_name)

  *Allows an application to unregister the **DDS_KeyedOctets*** (p. *1814) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.*
- const char * **DDS_KeyedOctetsTypeSupport_get_type_name** (void)

  *Get the default name for the **DDS_KeyedOctets*** (p. *1814) type.*
- void **DDS_KeyedOctetsTypeSupport_print_data** (const **DDS_KeyedOctets** *a_data)

  *<<**extension**>> (p. 1014) Print value of data type to standard out.*
- **DDS_TypeCode** * **DDS_KeyedOctetsTypeSupport_get_typecode** (void)

  *<<**extension**>> (p. 1014) Retrieves the TypeCode for the Type.*
- **DDS_ReturnCode_t** **DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer** (char *buffer, unsigned int *length, const **DDS_KeyedOctets** *a_data)

  *<<**extension**>> (p. 1014) Serializes the input sample into a CDR buffer of octets.*
- **DDS_ReturnCode_t** **DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int *length, const **DDS_KeyedOctets** *a_data, **DDS_DataRepresentationId_t** representation)

  *<<**extension**>> (p. 1014) Serializes the input sample into a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_KeyedOctetsTypeSupport_deserialize_data_from_cdr_buffer** (**DDS_KeyedOctets** *a_data, const char *buffer, unsigned int length)

  *<<**extension**>> (p. 1014) Deserializes a sample from a buffer of octets.*
- **DDS_ReturnCode_t** **DDS_KeyedOctetsTypeSupport_data_to_string** (const **DDS_KeyedOctets** *sample, char *str, **DDS_UnsignedLong** *str_size, **DDS_PrintFormatProperty** *property)

  *<<**extension**>> (p. 1014) Get the string representation of an input sample.*
- **DDS_KeyedOctetsDataWriter** * **DDS_KeyedOctetsDataWriter_narrow** (**DDS_DataWriter** *writer)

  *Narrow the given **DDS_DataWriter*** (p. *488) pointer to a **DDS_KeyedOctetsDataWriter*** (p. *1177) pointer.*
- **DDS_DataWriter** * **DDS_KeyedOctetsDataWriter_as_datawriter** (**DDS_KeyedOctetsDataWriter** *writer)

  *Widen the given **DDS_KeyedOctetsDataWriter*** (p. *1177) pointer to a **DDS_DataWriter*** (p. *488) pointer.*
- **DDS_InstanceHandle_t** **DDS_KeyedOctetsDataWriter_register_instance** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data)

  Informs RTI Connext that the application will be modifying a particular instance.
- **DDS_InstanceHandle_t** **DDS_KeyedOctetsDataWriter_register_instance_w_key** (**DDS_KeyedOctetsDataWriter** *self, const char *key)

  *<<**extension**>> (p. 1014) Informs RTI Connext that the application will be modifying a particular instance.*
- **DDS_InstanceHandle_t** **DDS_KeyedOctetsDataWriter_register_instance_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same functions as **DDS_KeyedOctetsDataWriter_register_instance*** (p. *1183) except that the application provides the value for the* `source_timestamp`.

- **DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const struct **DDS_Time_t** *source_timestamp)

  *<<**extension**>> (p. 1014) Performs the same functions as **DDS_KeyedOctetsDataWriter_register_instance_w_key** (p. 1184) except that the application provides the value for the `source_timestamp`.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const **DDS_InstanceHandle_t** *handle)

  *Reverses the action of **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const **DDS_InstanceHandle_t** *handle)

  *<<**extension**>> (p. 1014) Reverses the action of **DDS_KeyedOctetsDataWriter_register_instance_w_key** (p. 1184).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same function as **DDS_KeyedOctetsDataWriter_unregister_instance** (p. 1185) except that it also provides the value for the `source_timestamp`.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  *<<**extension**>> (p. 1014) Performs the same function as **DDS_KeyedOctetsDataWriter_unregister_instance_w_key** (p. 1185) except that it also provides the value for the `source_timestamp`.*
- **DDS_KeyedOctets** * **DDS_KeyedOctetsDataWriter_create_data** (**DDS_KeyedOctetsDataWriter** *self)

  Creates a keyed octet sequence.
- **DDS_Boolean DDS_KeyedOctetsDataWriter_delete_data** (**DDS_KeyedOctetsDataWriter** *self, **DDS_KeyedOctets** *sample)

  *Destroys a string data instance created by **DDS_StringDataWriter_create_data** (p. 1121).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const **DDS_InstanceHandle_t** *handle)

  *Modifies the value of a **DDS_KeyedOctets** (p. 1814) data instance.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const unsigned char *octets, int length, const **DDS_InstanceHandle_t** *handle)

  *<<**extension**>> (p. 1014) Modifies the value of a **DDS_KeyedOctets** (p. 1814) data instance.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const struct **DDS_OctetSeq** *octets, const **DDS_InstanceHandle_t** *handle)

  *<<**extension**>> (p. 1014) Modifies the value of a **DDS_KeyedOctets** (p. 1814) data instance.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same function as **DDS_KeyedOctetsDataWriter_write** (p. 1187) except that it also provides the value for the `source_timestamp`.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const unsigned char *octets, int length, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_w_key** (p. 1187) except that it also provides the value for the `source_timestamp`.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const struct **DDS_OctetSeq** *octets, const **DDS_InstanceHandle_t** *handle, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_seq_w_key** (p. 1188) except that it also provides the value for the `source_timestamp`.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_params** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, struct **DDS_WriteParams_t** *params)

*Performs the same function as **DDS_KeyedOctetsDataWriter_write** (p. 1187) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_params** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const unsigned char *octets, int length, struct **DDS_WriteParams_t** *params)

  *Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_w_key** (p. 1187) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_params** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const struct **DDS_OctetSeq** *octets, struct **DDS_WriteParams_t** *params)

  *Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_seq_w_key** (p. 1188) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const **DDS_InstanceHandle_t** *instance_handle)

  Requests the middleware to delete the data.

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_key** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const **DDS_InstanceHandle_t** *instance_handle)

  *<<**extension**>> (p. 1014) Requests the middleware to delete the data.*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *instance_data, const **DDS_InstanceHandle_t** *instance_handle, const struct **DDS_Time_t** *source_timestamp)

  *Performs the same functions as **DDS_KeyedOctetsDataWriter_dispose** (p. 1191) except that the application provides the value for the `source_timestamp` that is made available to **DDS_DataReader** (p. 618) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1990).*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_key_w_timestamp** (**DDS_KeyedOctetsDataWriter** *self, const char *key, const **DDS_InstanceHandle_t** *instance_handle, const struct **DDS_Time_t** *source_timestamp)

  *<<**extension**>> (p. 1014) Performs the same functions as **DDS_KeyedOctetsDataWriter_dispose_w_key** (p. 1191) except that the application provides the value for the `source_timestamp` that is made available to **DDS_DataReader** (p. 618) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1990).*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_get_key_value** (**DDS_KeyedOctetsDataWriter** *self, **DDS_KeyedOctets** *key_holder, const **DDS_InstanceHandle_t** *handle)

  Retrieve the instance `key` that corresponds to an instance `handle`.

- **DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_get_key_value_w_key** (**DDS_KeyedOctetsDataWriter** *self, char *key, const **DDS_InstanceHandle_t** *handle)

  *<<**extension**>> (p. 1014) Retrieve the instance `key` that corresponds to an instance `handle`.*

- **DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance** (**DDS_KeyedOctetsDataWriter** *self, const **DDS_KeyedOctets** *key_holder)

  Retrieve the instance `handle` that corresponds to an instance `key_holder`.

- **DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance_w_key** (**DDS_KeyedOctetsDataWriter** *self, const char *key)

  *<<**extension**>> (p. 1014) Retrieve the instance `handle` that corresponds to an instance `key`.*

- **DDS_KeyedOctetsDataReader** * **DDS_KeyedOctetsDataReader_narrow** (**DDS_DataReader** *reader)

  *Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_KeyedOctetsDataReader** (p. 1177) pointer.*

- **DDS_DataReader** * **DDS_KeyedOctetsDataReader_as_datareader** (**DDS_KeyedOctetsDataReader** *reader)

  *Widen the given **DDS_KeyedOctetsDataReader** (p. 1177) pointer to a **DDS_DataReader** (p. 618) pointer.*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read** (**DDS_KeyedOctetsDataReader** *self, struct **DDS_KeyedOctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_mask, **DDS_ViewStateMask** view_mask, **DDS_InstanceStateMask** instance_mask)

  *Access a collection of data-samples from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_w_condition** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_ReadCondition** ∗condition)

  *Accesses via **DDS_KeyedOctetsDataReader_read** (p. 1194) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_w_condition** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, **DDS_ReadCondition** ∗condition)

  *Analogous to **DDS_KeyedOctetsDataReader_read_w_condition** (p. 1195) except it accesses samples via the **DDS_KeyedOctetsDataReader_take** (p. 1195) operation.*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_sample** (**DDS_KeyedOctetsDataReader** ∗self, **DDS_KeyedOctets** ∗received_data, struct **DDS_SampleInfo** ∗sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_sample** (**DDS_KeyedOctetsDataReader** ∗self, **DDS_KeyedOctets** ∗received_data, struct **DDS_SampleInfo** ∗sample_info)

  *Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗a_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗a_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance_w_condition** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗a_handle, **DDS_ReadCondition** ∗condition)

  *Accesses via **DDS_KeyedOctetsDataReader_read_instance** (p. 1196) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance_w_condition** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗a_handle, **DDS_ReadCondition** ∗condition)

  *Accesses via **DDS_KeyedOctetsDataReader_take_instance** (p. 1197) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗previous_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance** (**DDS_KeyedOctetsDataReader** ∗self, struct **DDS_KeyedOctetsSeq** ∗received_data, struct **DDS_SampleInfoSeq** ∗info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** ∗previous_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)

  *Access a collection of data samples from the **DDS_DataReader** (p. 618).*

- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance_w_condition** (**DDS_KeyedOctetsDataReader** *self, struct **DDS_KeyedOctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** *previous_handle, **DDS_ReadCondition** *condition)

  *Accesses via **DDS_KeyedOctetsDataReader_read_next_instance*** (p. *1198*) *the samples that match the criteria specified in the **DDS_ReadCondition*** (p. *695*).
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance_w_condition** (**DDS_KeyedOctetsDataReader** *self, struct **DDS_KeyedOctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** *previous_handle, **DDS_ReadCondition** *condition)

  *Accesses via **DDS_KeyedOctetsDataReader_take_next_instance*** (p. *1198*) *the samples that match the criteria specified in the **DDS_ReadCondition*** (p. *695*).
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_return_loan** (**DDS_KeyedOctetsDataReader** *self, struct **DDS_KeyedOctetsSeq** *received_data, struct **DDS_SampleInfoSeq** *info_seq)

  *Indicates to the **DDS_DataReader*** (p. *618*) *that the application is done accessing the collection of* `received_data` *and* `info_seq` *obtained by some earlier invocation of read or take on the **DDS_DataReader*** (p. *618*).
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value** (**DDS_KeyedOctetsDataReader** *self, **DDS_KeyedOctets** *key_holder, const **DDS_InstanceHandle_t** *handle)

  Retrieve the instance `key` *that corresponds to an instance* `handle`.
- **DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value_w_key** (**DDS_KeyedOctetsDataReader** *self, char *key, const **DDS_InstanceHandle_t** *handle)

  <<***extension***>> (p. *1014*) *Retrieve the instance* `key` *that corresponds to an instance* `handle`.
- **DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance** (**DDS_KeyedOctetsDataReader** *self, const **DDS_KeyedOctets** *key_holder)

  Retrieve the instance `handle` *that corresponds to an instance* `key_holder`.
- **DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance_w_key** (**DDS_KeyedOctetsDataReader** *self, const char *key)

  <<***extension***>> (p. *1014*) *Retrieve the instance* `handle` *that corresponds to an instance* `key`.

Variables

- char * **DDS_KeyedOctets::key**

  Instance key associated with the specified value.
- int **DDS_KeyedOctets::length**

  Number of octets to serialize.
- unsigned char * **DDS_KeyedOctets::value**

  DDS_Octets (p. *1863*) *array value.*

5.126.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

5.126.2 Typedef Documentation

5.126.2.1 DDS_KeyedOctets

```
typedef struct DDS_KeyedOctets DDS_KeyedOctets
```

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

5.126.2.2 DDS_KeyedOctetsDataWriter

```
typedef struct DDS_KeyedOctetsDataWriter DDS_KeyedOctetsDataWriter
```

<<***interface***>> *(*p. *1015)* Instantiates `DataWriter` < **DDS_KeyedOctets** (p. 1814) >.

See also

FooDataWriter (p. 2119)

DDS_DataWriter (p. 488)

5.126.2.3 DDS_KeyedOctetsDataReader

```
typedef struct DDS_KeyedOctetsDataReader DDS_KeyedOctetsDataReader
```

<<***interface***>> *(*p. *1015)* Instantiates `DataReader` < **DDS_KeyedOctets** (p. 1814) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string or byte array in a destination data sample is NULL, the middleware will allocate a new string or array for you of sufficient length to hold the received data. New strings will be allocated with **DDS_String_alloc** (p. 1528); new arrays will be allocated with **DDS_OctetBuffer_alloc** (p. 1501). The sample's destructor will delete them.

A non- NULL string or array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

5.126.3 Function Documentation

5.126.3.1 DDS_KeyedOctets_new()

```
DDS_KeyedOctets * DDS_KeyedOctets_new (
            void  )
```

Constructor.

The default constructor initializes the newly created object with NULL key, NULL value, and zero length.

Returns

A new **DDS_KeyedOctets** (p. 1814) or NULL if failure.

5.126.3.2 DDS_KeyedOctets_new_w_size()

```
DDS_KeyedOctets * DDS_KeyedOctets_new_w_size (
            int key_size,
            int size )
```

Constructor that specifies the allocated sizes.

After this function is called, key is initialized with the empty string and length is set to zero.

Parameters

key_size	<<***in***>> *(*p. *1015)* Size of the allocated key (with NULL-terminated character). Cannot be smaller than one.
size	<<***in***>> *(*p. *1015)* Size of the allocated octets array. Cannot be smaller than zero.

Returns

A new **DDS_KeyedOctets** (p. 1814) or NULL if failure.

5.126.3.3 DDS_KeyedOctets_delete()

```
void DDS_KeyedOctets_delete (
            DDS_KeyedOctets * self )
```

Destructor.

5.126.3.4 DDS_KeyedOctetsTypeSupport_register_type()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_register_type (
             DDS_DomainParticipant * participant,
            const char * type_name )
```

Allows an application to communicate to RTI Connext the existence of the **DDS_KeyedOctets** (p. 1814) data type.

By default, The **DDS_KeyedOctets** (p. 1814) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_KeyedOctetsTypeSupport_get_type_name** (p. 1180). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same **DDS_KeyedOctetsTypeSupport** (p. 1815) with a **DDS_Domain↩ Participant** (p. 76) using different values for the type_name.

If `register_type` is called multiple times with the same **DDS_DomainParticipant** (p. 76) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	*<<**in**>> (p. 1015)* the **DDS_DomainParticipant** (p. 76) to register the data type **DDS_Octets** (p. 1863) with. Cannot be NULL.
type_name	*<<**in**>> (p. 1015)* the type name under with the data type **DDS_KeyedOctets** (p. 1814) is registered with the participant; this type name is used when creating a new **DDS_Topic** (p. 174). (See **DDS_DomainParticipant_create_topic** (p. 114).) The name may not be NULL or longer than 255 characters.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224) or **DDS↩ _RETCODE_OUT_OF_RESOURCES** (p. 1224).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDS_DomainParticipant_create_topic (p. 114)

5.126.3.5 DDS_KeyedOctetsTypeSupport_unregister_type()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_unregister_type (
             DDS_DomainParticipant * participant,
            const char * type_name )
```

Allows an application to unregister the **DDS_KeyedOctets** (p. 1814) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The **DDS_KeyedOctets** (p. 1814) type with `type_name` is registered with the participant and all **DDS_Topic** (p. 174) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS_Topic** (p. 174) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 1224).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	<<***in***>> *(*p. *1015)* the **DDS_DomainParticipant** (p. 76) to unregister the data type **DDS_KeyedOctets** (p. 1814) from. Cannot be NULL.
type_name	<<***in***>> *(*p. *1015)* the type name under with the data type **DDS_KeyedOctets** (p. 1814) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_BAD_PARAMETER** (p. 1224) or **DDS_↩ RETCODE_ERROR** (p. 1224)

MT Safety:

SAFE.

See also

DDS_KeyedOctetsTypeSupport_register_type (p. 1178)

5.126.3.6 DDS_KeyedOctetsTypeSupport_get_type_name()

```
const char * DDS_KeyedOctetsTypeSupport_get_type_name (
            void  )
```

Get the default name for the **DDS_KeyedOctets** (p. 1814) type.

Can be used for calling **DDS_KeyedOctetsTypeSupport_register_type** (p. 1178) or creating **DDS_Topic** (p. 174).

Returns

default name for the **DDS_KeyedOctets** (p. 1814) type.

See also

DDS_KeyedOctetsTypeSupport_register_type (p. 1178)

DDS_DomainParticipant_create_topic (p. 114)

5.126.3.7 DDS_KeyedOctetsTypeSupport_print_data()

```
void DDS_KeyedOctetsTypeSupport_print_data (
            const  DDS_KeyedOctets * a_data )
```

<<***extension***>> *(p. 1014)* Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

a_data	<<***in***>> *(p. 1015)* **DDS_KeyedOctets** (p. 1814) to be printed.

5.126.3.8 DDS_KeyedOctetsTypeSupport_get_typecode()

```
DDS_TypeCode * DDS_KeyedOctetsTypeSupport_get_typecode (
            void  )
```

<<***extension***>> *(p. 1014)* Retrieves the TypeCode for the Type.

See also

FooTypeSupport_get_typecode (p. 225)

5.126.3.9 DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer (
            char * buffer,
            unsigned int * length,
            const  DDS_KeyedOctets * a_data )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.126.3.10 DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer_ex()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer_ex (
            char * buffer,
            unsigned int * length,
            const  DDS_KeyedOctets * a_data,
             DDS_DataRepresentationId_t representation )
```

<<***extension***>> *(*p. *1014)* Serializes the input sample into a buffer of octets.

See also

FooTypeSupport_serialize_data_to_cdr_buffer (p. 222)

5.126.3.11 DDS_KeyedOctetsTypeSupport_deserialize_data_from_cdr_buffer()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_deserialize_data_from_cdr_buffer (
             DDS_KeyedOctets * a_data,
            const char * buffer,
            unsigned int length )
```

<<***extension***>> *(*p. *1014)* Deserializes a sample from a buffer of octets.

See also

FooTypeSupport_deserialize_data_from_cdr_buffer (p. 224)

5.126.3.12 DDS_KeyedOctetsTypeSupport_data_to_string()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_data_to_string (
            const  DDS_KeyedOctets * sample,
            char * str,
             DDS_UnsignedLong * str_size,
             DDS_PrintFormatProperty * property )
```

<<***extension***>> *(*p. *1014)* Get the string representation of an input sample.

See also

FooTypeSupport_data_to_string (p. 224)

5.126.3.13 DDS_KeyedOctetsDataWriter_narrow()

```
DDS_KeyedOctetsDataWriter * DDS_KeyedOctetsDataWriter_narrow (
            DDS_DataWriter * writer )
```

Narrow the given **DDS_DataWriter** (p. 488) pointer to a **DDS_KeyedOctetsDataWriter** (p. 1177) pointer.

See also

FooDataWriter_narrow (p. 493)

5.126.3.14 DDS_KeyedOctetsDataWriter_as_datawriter()

```
DDS_DataWriter * DDS_KeyedOctetsDataWriter_as_datawriter (
            DDS_KeyedOctetsDataWriter * writer )
```

Widen the given **DDS_KeyedOctetsDataWriter** (p. 1177) pointer to a **DDS_DataWriter** (p. 488) pointer.

See also

FooDataWriter_as_datawriter (p. 493)

5.126.3.15 DDS_KeyedOctetsDataWriter_register_instance()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance (
            DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * instance_data )
```

Informs RTI Connext that the application will be modifying a particular instance.

See also

FooDataWriter_register_instance (p. 494)

5.126.3.16 DDS_KeyedOctetsDataWriter_register_instance_w_key()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key (
            DDS_KeyedOctetsDataWriter * self,
            const char * key )
```

<<***extension***>> *(p. 1014)* Informs RTI Connext that the application will be modifying a particular instance.

See also

FooDataWriter_register_instance (p. 494)

5.126.3.17 DDS_KeyedOctetsDataWriter_register_instance_w_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_timestamp (
            DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * instance_data,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter_register_instance_w_timestamp (p. 495)

5.126.3.18 DDS_KeyedOctetsDataWriter_register_instance_w_key_w_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key_w_timestamp (
            DDS_KeyedOctetsDataWriter * self,
           const char * key,
           const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(*p. *1014)* Performs the same functions as **DDS_KeyedOctetsDataWriter_register_instance_w_↩ key** (p. 1184) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter_register_instance_w_timestamp (p. 495)

5.126.3.19 DDS_KeyedOctetsDataWriter_unregister_instance()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance (
            DDS_KeyedOctetsDataWriter * self,
           const  DDS_KeyedOctets * instance_data,
           const  DDS_InstanceHandle_t * handle )
```

Reverses the action of **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183).

See also

FooDataWriter_unregister_instance (p. 496)

5.126.3.20 DDS_KeyedOctetsDataWriter_unregister_instance_w_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key (
            DDS_KeyedOctetsDataWriter * self,
           const char * key,
           const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(*p. *1014)* Reverses the action of **DDS_KeyedOctetsDataWriter_register_instance_w_key** (p. 1184).

See also

FooDataWriter_unregister_instance (p. 496)

5.126.3.21 DDS_KeyedOctetsDataWriter_unregister_instance_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_timestamp (
            DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * instance_data,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_unregister_instance** (p. 1185) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_unregister_instance_w_timestamp (p. 498)

5.126.3.22 DDS_KeyedOctetsDataWriter_unregister_instance_w_key_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key_w_timestamp (
            DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

<<***extension***>> *(p. 1014)* Performs the same function as **DDS_KeyedOctetsDataWriter_unregister_instance_w_key** (p. 1185) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_unregister_instance_w_timestamp (p. 498)

5.126.3.23 DDS_KeyedOctetsDataWriter_create_data()

```
DDS_KeyedOctets * DDS_KeyedOctetsDataWriter_create_data (
            DDS_KeyedOctetsDataWriter * self )
```

Creates a keyed octet sequence.

The size of the instance is determined by the DataWriter property **dds.builtin_type.keyed_octets.alloc_size**.

Default size: **dds.builtin_type.keyed_octets.max_size** property of DomainParticipant if defined. Otherwise 2048.

Created instances must be deleted with **DDS_KeyedOctetsDataWriter_delete_data** (p. 1186).

Returns

Newly created keyed octet sequence, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types.

5.126.3.24 DDS_KeyedOctetsDataWriter_delete_data()

```
DDS_Boolean DDS_KeyedOctetsDataWriter_delete_data (
             DDS_KeyedOctetsDataWriter * self,
             DDS_KeyedOctets * sample )
```

Destroys a string data instance created by **DDS_StringDataWriter_create_data** (p. 1121).

Returns

DDS_BOOLEAN_TRUE (p. 1203) upon successful deletion.

5.126.3.25 DDS_KeyedOctetsDataWriter_write()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write (
             DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * instance_data,
            const  DDS_InstanceHandle_t * handle )
```

Modifies the value of a **DDS_KeyedOctets** (p. 1814) data instance.

See also

FooDataWriter_write (p. 499)

5.126.3.26 DDS_KeyedOctetsDataWriter_write_octets_w_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key (
             DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const unsigned char * octets,
            int length,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Modifies the value of a **DDS_KeyedOctets** (p. 1814) data instance.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
key	<<***in***>> *(p. 1015)* Instance key.
octets	<<***in***>> *(p. 1015)* Array of octets to be published.
length	<<***in***>> *(p. 1015)* Number of octets to be published.
handle	<<***in***>> *(p. 1015)* Either the handle returned by a previous call to **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183), or else the special value **DDS_HANDLE_NIL** (p. 227). See **FooDataWriter_write** (p. 499).

See also

FooDataWriter_write (p. 499)

5.126.3.27 DDS_KeyedOctetsDataWriter_write_octets_seq_w_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key (
            DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const struct  DDS_OctetSeq * octets,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(*p. *1014)* Modifies the value of a **DDS_KeyedOctets** (p. 1814) data instance.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
key	<<***in***>> *(*p. *1015)* Instance key.
octets	<<***in***>> *(*p. *1015)* Sequence of octets to be published.
handle	<<***in***>> *(*p. *1015)* Either the handle returned by a previous call to **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183), or else the special value **DDS_HANDLE_NIL** (p. 227). See **FooDataWriter_write** (p. 499).

See also

FooDataWriter_write (p. 499)

5.126.3.28 DDS_KeyedOctetsDataWriter_write_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_timestamp (
            DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * instance_data,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_write** (p. 1187) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter_write_w_timestamp (p. 503)

5.126.3.29 DDS_KeyedOctetsDataWriter_write_octets_w_key_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_timestamp (
             DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const unsigned char * octets,
            int length,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_w_key** (p. 1187) except that it also provides the value for the `source_timestamp`.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
key	*<<**in**>> (p. 1015)* Instance key.
octets	*<<**in**>> (p. 1015)* Array of octets to be published.
length	*<<**in**>> (p. 1015)* Number of octets to be published.
handle	*<<**in**>> (p. 1015)* Either the handle returned by a previous call to **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183), or else the special value **DDS_HANDLE_NIL** (p. 227). See **FooDataWriter_write** (p. 499).
source_timestamp	*<<**in**>> (p. 1015)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See **FooDataWriter_write_w_timestamp** (p. 503). Cannot be NULL.

See also

FooDataWriter_write (p. 499)

5.126.3.30 DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_timestamp (
             DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const struct  DDS_OctetSeq * octets,
            const  DDS_InstanceHandle_t * handle,
            const struct  DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_seq_w_key** (p. 1188) except that it also provides the value for the `source_timestamp`.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
key	*<<**in**>> (p. 1015)* Instance key.
octets	*<<**in**>> (p. 1015)* Sequence of octets to be published.

Parameters

handle	*<<**in**>> (p. 1015)* Either the handle returned by a previous call to **DDS_KeyedOctetsDataWriter_register_instance** (p. 1183), or else the special value **DDS_HANDLE_NIL** (p. 227). See **FooDataWriter_write** (p. 499).
source_timestamp	*<<**in**>> (p. 1015)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See **FooDataWriter_write_w_timestamp** (p. 503). Cannot be NULL.

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_params (
             DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * instance_data,
            struct  DDS_WriteParams_t * params )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_write** (p. 1187) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter_write_w_params (p. 504)

5.126.3.32 DDS_KeyedOctetsDataWriter_write_octets_w_key_w_params()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_params (
             DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const unsigned char * octets,
            int length,
            struct  DDS_WriteParams_t * params )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_w_key** (p. 1187) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
key	*<<**in**>> (p. 1015)* Instance key.
octets	*<<**in**>> (p. 1015)* Array of octets to be published.
length	*<<**in**>> (p. 1015)* Number of octets to be published.
params	*<<**in**>> (p. 1015)* The **DDS_WriteParams_t** (p. 2107) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See **FooDataWriter_write_w_params** (p. 504). Cannot be NULL.

5.126.3.33 DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_params()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_params (
            DDS_KeyedOctetsDataWriter * self,
            const char * key,
            const struct  DDS_OctetSeq * octets,
            struct  DDS_WriteParams_t * params )
```

Performs the same function as **DDS_KeyedOctetsDataWriter_write_octets_seq_w_key** (p. 1188) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
key	<<***in***>> *(p. 1015)* Instance key.
octets	<<***in***>> *(p. 1015)* Sequence of octets to be published.
params	<<***in***>> *(p. 1015)* The **DDS_WriteParams_t** (p. 2107) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See **FooDataWriter_write_w_params** (p. 504). Cannot be NULL.

See also

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance (
             DDS_KeyedOctetsDataWriter * self,
            const  DDS_KeyedOctets * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataWriter_lookup_instance (p. 509)

5.126.3.41 DDS_KeyedOctetsDataWriter_lookup_instance_w_key()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance_w_key (
            DDS_KeyedOctetsDataWriter * self,
           const char * key )
```

<<***extension***>> *(p. 1014)* Retrieve the instance `handle` that corresponds to an instance `key`.

See also

FooDataWriter_lookup_instance (p. 509)

5.126.3.42 DDS_KeyedOctetsDataReader_narrow()

```
DDS_KeyedOctetsDataReader * DDS_KeyedOctetsDataReader_narrow (
            DDS_DataReader * reader )
```

Narrow the given **DDS_DataReader** (p. 618) pointer to a **DDS_KeyedOctetsDataReader** (p. 1177) pointer.

See also

FooDataReader_narrow (p. 627)

5.126.3.43 DDS_KeyedOctetsDataReader_as_datareader()

```
DDS_DataReader * DDS_KeyedOctetsDataReader_as_datareader (
            DDS_KeyedOctetsDataReader * reader )
```

Widen the given **DDS_KeyedOctetsDataReader** (p. 1177) pointer to a **DDS_DataReader** (p. 618) pointer.

See also

FooDataReader_as_datareader (p. 627)

5.126.3.44 DDS_KeyedOctetsDataReader_read()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read (p. 628)

5.126.3.45 DDS_KeyedOctetsDataReader_take()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_SampleStateMask sample_mask,
             DDS_ViewStateMask view_mask,
             DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take (p. 629)

5.126.3.46 DDS_KeyedOctetsDataReader_read_w_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_w_condition (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedOctetsDataReader_read** (p. 1194) the samples that match the criteria specified in the **DDS↩ _ReadCondition** (p. 695).

See also

FooDataReader_read_w_condition (p. 633)

5.126.3.47 DDS_KeyedOctetsDataReader_take_w_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_w_condition (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
             DDS_ReadCondition * condition )
```

Analogous to **DDS_KeyedOctetsDataReader_read_w_condition** (p. 1195) except it accesses samples via the **DDS_KeyedOctetsDataReader_take** (p. 1195) operation.

See also

FooDataReader_take_w_condition (p. 635)

5.126.3.48 DDS_KeyedOctetsDataReader_read_next_sample()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_sample (
             DDS_KeyedOctetsDataReader * self,
             DDS_KeyedOctets * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_next_sample (p. 636)

5.126.3.49 DDS_KeyedOctetsDataReader_take_next_sample()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_sample (
             DDS_KeyedOctetsDataReader * self,
             DDS_KeyedOctets * received_data,
            struct  DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_next_sample (p. 637)

5.126.3.50 DDS_KeyedOctetsDataReader_read_instance()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_instance (p. 638)

5.126.3.51 DDS_KeyedOctetsDataReader_take_instance()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_SampleStateMask sample_states,
             DDS_ViewStateMask view_states,
             DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_instance (p. 639)

5.126.3.52 DDS_KeyedOctetsDataReader_read_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance_w_condition (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedOctetsDataReader_read_instance** (p. 1196) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_read_instance_w_condition (p. 641)

5.126.3.53 DDS_KeyedOctetsDataReader_take_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance_w_condition (
            DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
            DDS_Long max_samples,
            const  DDS_InstanceHandle_t * a_handle,
            DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedOctetsDataReader_take_instance** (p. 1197) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_take_instance_w_condition (p. 642)

            DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
            DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
            DDS_SampleStateMask sample_states,
            DDS_ViewStateMask view_states,
            DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_read_next_instance (p. 643)

5.126.3.55 DDS_KeyedOctetsDataReader_take_next_instance()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance (
            DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
            DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
            DDS_SampleStateMask sample_states,
            DDS_ViewStateMask view_states,
            DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS_DataReader** (p. 618).

See also

FooDataReader_take_next_instance (p. 645)

5.126.3.56 DDS_KeyedOctetsDataReader_read_next_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance_w_condition (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedOctetsDataReader_read_next_instance** (p. 1198) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

FooDataReader_read_next_instance_w_condition (p. 646)

5.126.3.57 DDS_KeyedOctetsDataReader_take_next_instance_w_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance_w_condition (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq,
             DDS_Long max_samples,
            const  DDS_InstanceHandle_t * previous_handle,
             DDS_ReadCondition * condition )
```

Accesses via **DDS_KeyedOctetsDataReader_take_next_instance** (p. 1198) the samples that match the criteria specified in the **DDS_ReadCondition** (p. 695).

See also

5.126.3.58 DDS_KeyedOctetsDataReader_return_loan()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_return_loan (
             DDS_KeyedOctetsDataReader * self,
            struct  DDS_KeyedOctetsSeq * received_data,
            struct  DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS_DataReader** (p. 618) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 618).

See also

FooDataReader_return_loan (p. 649)

5.126.3.59 DDS_KeyedOctetsDataReader_get_key_value()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value (
             DDS_KeyedOctetsDataReader * self,
             DDS_KeyedOctets * key_holder,
            const  DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader_get_key_value (p. 650)

5.126.3.60 DDS_KeyedOctetsDataReader_get_key_value_w_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value_w_key (
             DDS_KeyedOctetsDataReader * self,
            char * key,
            const  DDS_InstanceHandle_t * handle )
```

<<***extension***>> *(p. 1014)* Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader_get_key_value (p. 650)

5.126.3.61 DDS_KeyedOctetsDataReader_lookup_instance()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance (
             DDS_KeyedOctetsDataReader * self,
            const  DDS_KeyedOctets * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataReader_lookup_instance (p. 651)

5.126.3.62 DDS_KeyedOctetsDataReader_lookup_instance_w_key()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance_w_key (
            DDS_KeyedOctetsDataReader * self,
           const char * key )
```

<<***extension***>> *(p. 1014)* Retrieve the instance `handle` that corresponds to an instance `key`.

See also

FooDataReader_lookup_instance (p. 651)

5.126.4 Variable Documentation

5.126.4.1 key

```
char* DDS_KeyedOctets::key
```

Instance key associated with the specified value.

5.126.4.2 length

```
int DDS_KeyedOctets::length
```

Number of octets to serialize.

5.126.4.3 value

```
unsigned char* DDS_KeyedOctets::value
```

DDS_Octets (p. 1863) array value.

5.127 DDS-Specific Primitive Types

Basic DDS value types for use in user data types.

Macros

- #define **DDS_BOOLEAN_TRUE**

  *Defines "true" value of **DDS_Boolean** (*p. *1206) data type.*
- #define **DDS_BOOLEAN_FALSE**

  *Defines "false" value of **DDS_Boolean** (*p. *1206) data type.*

Typedefs

- typedef RTICdrChar **DDS_Char**

  Defines a character data type, equivalent to IDL/CDR `char`*.*
- typedef RTICdrWchar **DDS_Wchar**

  Defines a wide character data type, equivalent to IDL/CDR `wchar`*.*
- typedef RTICdrOctet **DDS_Octet**

  Defines an opaque byte data type, equivalent to IDL/CDR `octet`*.*
- typedef RTICdrOctet **DDS_UInt8**

  Defines a data type, equivalent to IDL/CDR `uint8`*.*
- typedef RTICdrInt8 **DDS_Int8**

  Defines a data type, equivalent to IDL/CDR `int8`*.*
- typedef RTICdrShort **DDS_Short**

  Defines a short integer data type, equivalent to IDL/CDR `short`*.*
- typedef RTICdrUnsignedShort **DDS_UnsignedShort**

  Defines an unsigned short integer data type, equivalent to IDL/CDR `unsigned short`*.*
- typedef RTICdrLong **DDS_Long**

  Defines a long integer data type, equivalent to IDL/CDR `long`*.*
- typedef RTICdrUnsignedLong **DDS_UnsignedLong**

  Defines an unsigned long integer data type, equivalent to IDL/CDR `unsigned long`*.*
- typedef RTICdrLongLong **DDS_LongLong**

  Defines an extra-long integer data type, equivalent to IDL/CDR `long long`*.*
- typedef RTICdrUnsignedLongLong **DDS_UnsignedLongLong**

  Defines an unsigned extra-long data type, equivalent to IDL/CDR `unsigned long long`*.*
- typedef RTICdrFloat **DDS_Float**

  Defines a single-precision floating-point data type, equivalent to IDL/CDR `float`*.*
- typedef RTICdrDouble **DDS_Double**

  Defines a double-precision floating-point data type, equivalent to IDL/CDR `double`*.*
- typedef RTICdrLongDouble **DDS_LongDouble**

  Defines an extra-precision floating-point data type, equivalent to IDL/CDR `long double`*.*
- typedef RTICdrBoolean **DDS_Boolean**

  Defines a Boolean data type, equivalent to IDL/CDR `boolean`*.*
- typedef RTICdrEnum **DDS_Enum**

  Defines an enumerated data type.

5.127.1 Detailed Description

Basic DDS value types for use in user data types.

As part of the finalization of the DDS standard, a number of DDS-specific primitive types will be introduced. By using these types, you will ensure that your data is serialized consistently across platforms even if the C/C++ built-in types have different sizes on those platforms.

In this version of RTI Connext, the DDS primitive types are defined using the OMG's Common Data Representation (CDR) standard. In a future version of RTI Connext, you will be given the choice of whether to use these CDR-based types or C/C++ built-in types through a flag provided to the rtiddsgen tool.

Typedef's that begin with RTICdr are defined in <NDDSHOME>/include/ndds/cdr/cdr_type.h, which uses types that are further defined in <NDDSHOME>/include/ndds/osapi/osapi_type.h.

5.127.2 Macro Definition Documentation

5.127.2.1 DDS_BOOLEAN_TRUE

```
#define DDS_BOOLEAN_TRUE
```

Defines "true" value of **DDS_Boolean** (p. 1206) data type.

Examples

HelloWorld.c, and **HelloWorld_publisher.c**.

5.127.2.2 DDS_BOOLEAN_FALSE

```
#define DDS_BOOLEAN_FALSE
```

Defines "false" value of **DDS_Boolean** (p. 1206) data type.

Examples

HelloWorld.c.

5.127.3 Typedef Documentation

5.127.3.1 DDS_Char

```
typedef RTICdrChar DDS_Char
```

Defines a character data type, equivalent to IDL/CDR `char`.

An 8-bit quantity that encodes a single byte charater from any byte-oriented code set.

5.127.3.2 DDS_Wchar

```
typedef RTICdrWchar DDS_Wchar
```

Defines a wide character data type, equivalent to IDL/CDR `wchar`.

A 16-bit quantity that contains a wide character encoded in UTF-16.

5.127.3.3 DDS_Octet

```
typedef RTICdrOctet DDS_Octet
```

Defines an opaque byte data type, equivalent to IDL/CDR `octet`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

5.127.3.4 DDS_UInt8

```
typedef RTICdrOctet DDS_UInt8
```

Defines a data type, equivalent to IDL/CDR `uint8`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

5.127.3.5 DDS_Int8

```
typedef RTICdrInt8 DDS_Int8
```

Defines a data type, equivalent to IDL/CDR `int8`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

5.127.3.6 DDS_Short

```
typedef RTICdrShort DDS_Short
```

Defines a short integer data type, equivalent to IDL/CDR `short`.

A 16-bit signed short integer value.

5.127.3.7 DDS_UnsignedShort

```
typedef RTICdrUnsignedShort DDS_UnsignedShort
```

Defines an unsigned short integer data type, equivalent to IDL/CDR `unsigned short`.

A 16-bit unsigned short integer value.

5.127.3.8 DDS_Long

```
typedef RTICdrLong DDS_Long
```

Defines a long integer data type, equivalent to IDL/CDR `long`.

A 32-bit signed long integer value.

5.127.3.9 DDS_UnsignedLong

```
typedef RTICdrUnsignedLong DDS_UnsignedLong
```

Defines an unsigned long integer data type, equivalent to IDL/CDR `unsigned long`.

A 32-bit unsigned long integer value.

5.127.3.10 DDS_LongLong

```
typedef RTICdrLongLong DDS_LongLong
```

Defines an extra-long integer data type, equivalent to IDL/CDR `long long`.

A 64-bit signed long long integer value.

5.127.3.11 DDS_UnsignedLongLong

```
typedef RTICdrUnsignedLongLong DDS_UnsignedLongLong
```

Defines an unsigned extra-long data type, equivalent to IDL/CDR `unsigned long long`.

A 64-bit unsigned long long integer value.

5.127.3.12 DDS_Float

```
typedef RTICdrFloat DDS_Float
```

Defines a single-precision floating-point data type, equivalent to IDL/CDR `float`.

A 32-bit floating-point value.

5.127.3.13 DDS_Double

```
typedef RTICdrDouble DDS_Double
```

Defines a double-precision floating-point data type, equivalent to IDL/CDR `double`.

A 64-bit floating-point value.

5.127.3.14 DDS_LongDouble

```
typedef RTICdrLongDouble DDS_LongDouble
```

Defines an extra-precision floating-point data type, equivalent to IDL/CDR `long double`.

A 128-bit floating-point value.

Since some architectures do not support long double, RTI has defined character arrays that match the expected size of this type. On systems that do have native long double, you have to define RTI_CDR_SIZEOF_LONG_DOUBLE as 16 to map them to native types.

5.127.3.15 DDS_Boolean

```
typedef RTICdrBoolean DDS_Boolean
```

Defines a Boolean data type, equivalent to IDL/CDR `boolean`.

An 8-bit Boolean value that is used to denote a data item that can only take one of the values **DDS_BOOLEAN_TRUE** (p. 1203) (1) or **DDS_BOOLEAN_FALSE** (p. 1203) (0).

Examples

HelloWorld.c.

5.127.3.16 DDS_Enum

```
typedef RTICdrEnum DDS_Enum
```

Defines an enumerated data type.

Encoded as a signed 32-bit integer value. By default, the first enum identifier has the numeric value zero (0) (unless the value is provided explicitly). Successive enum identifiers take ascending numeric values, in order of declaration from left to right.

5.128 Time Support

Time and duration types and defines.

Data Structures

- struct **DDS_Duration_t**

  Type for duration representation.
- struct **DDS_Time_t**

  Type for time representation.

Macros

- #define **DDS_TIME_ZERO**

  The default instant in time: zero seconds and zero nanoseconds.

Functions

- **DDS_Boolean DDS_Time_is_zero** (const struct **DDS_Time_t** ∗time)

  Check if time is zero.
- **DDS_Boolean DDS_Time_is_invalid** (const struct **DDS_Time_t** ∗time)
- **DDS_Boolean DDS_Duration_is_infinite** (const struct **DDS_Duration_t** ∗duration)
- **DDS_Boolean DDS_Duration_is_auto** (const struct **DDS_Duration_t** ∗duration)
- **DDS_Boolean DDS_Duration_is_zero** (const struct **DDS_Duration_t** ∗duration)

Variables

- const struct **DDS_Time_t DDS_TIME_MAX**

  The maximum value of time.
- const **DDS_LongLong DDS_TIME_INVALID_SEC**

  A sentinel indicating an invalid second of time.
- const **DDS_UnsignedLong DDS_TIME_INVALID_NSEC**

  A sentinel indicating an invalid nano-second of time.
- const struct **DDS_Time_t DDS_TIME_INVALID**

  A sentinel indicating an invalid time.
- const **DDS_Long DDS_DURATION_INFINITE_SEC**

  An infinite second period of time.
- const **DDS_UnsignedLong DDS_DURATION_INFINITE_NSEC**

  An infinite nano-second period of time.
- const struct **DDS_Duration_t DDS_DURATION_INFINITE**

  An infinite period of time.
- const **DDS_Long DDS_DURATION_AUTO_SEC**

  An auto second period of time.
- const **DDS_UnsignedLong DDS_DURATION_AUTO_NSEC**

An auto nano-second period of time.

- const struct **DDS_Duration_t** **DDS_DURATION_AUTO**

  Duration is automatically assigned.

- const **DDS_Long** **DDS_DURATION_ZERO_SEC**

  A zero-length second period of time.

- const **DDS_UnsignedLong** **DDS_DURATION_ZERO_NSEC**

  A zero-length nano-second period of time.

- const struct **DDS_Duration_t** **DDS_DURATION_ZERO**

  A zero-length period of time.

5.128.1 Detailed Description

Time and duration types and defines.

5.128.2 Macro Definition Documentation

5.128.2.1 DDS_TIME_ZERO

```
#define DDS_TIME_ZERO
```

The default instant in time: zero seconds and zero nanoseconds.

5.128.3 Function Documentation

5.128.3.1 DDS_Time_is_zero()

```
DDS_Boolean DDS_Time_is_zero (
            const struct  DDS_Time_t * time )
```

Check if time is zero.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the given time is equal to **DDS_TIME_ZERO** (p. 1208) or **DDS_BOOLEAN↩_FALSE** (p. 1203) otherwise.

5.128.3.2 DDS_Time_is_invalid()

```
DDS_Boolean DDS_Time_is_invalid (
            const struct  DDS_Time_t * time )
```

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the given time is not valid (i.e. is negative)

5.128.3.3 DDS_Duration_is_infinite()

```
DDS_Boolean DDS_Duration_is_infinite (
            const struct  DDS_Duration_t * duration )
```

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the given duration is of infinite length.

5.128.3.4 DDS_Duration_is_auto()

```
DDS_Boolean DDS_Duration_is_auto (
            const struct  DDS_Duration_t * duration )
```

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the given duration has auto value.

5.128.3.5 DDS_Duration_is_zero()

```
DDS_Boolean DDS_Duration_is_zero (
            const struct  DDS_Duration_t * duration )
```

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the given duration is of zero length.

5.128.4 Variable Documentation

5.128.4.1 DDS_TIME_MAX

```
const struct DDS_Time_t DDS_TIME_MAX [extern]
```

The maximum value of time.

5.128.4.2 DDS_TIME_INVALID_SEC

```
const DDS_LongLong DDS_TIME_INVALID_SEC [extern]
```

A sentinel indicating an invalid second of time.

5.128.4.3 DDS_TIME_INVALID_NSEC

```
const DDS_UnsignedLong DDS_TIME_INVALID_NSEC [extern]
```

A sentinel indicating an invalid nano-second of time.

5.128.4.4 DDS_TIME_INVALID

```
const struct DDS_Time_t DDS_TIME_INVALID [extern]
```

A sentinel indicating an invalid time.

5.128.4.5 DDS_DURATION_INFINITE_SEC

```
const DDS_Long DDS_DURATION_INFINITE_SEC [extern]
```

An infinite second period of time.

5.128.4.6 DDS_DURATION_INFINITE_NSEC

```
const DDS_UnsignedLong DDS_DURATION_INFINITE_NSEC [extern]
```

An infinite nano-second period of time.

5.128.4.7 DDS_DURATION_INFINITE

```
const struct DDS_Duration_t DDS_DURATION_INFINITE [extern]
```

An infinite period of time.

5.128.4.8 DDS_DURATION_AUTO_SEC

```
const DDS_Long DDS_DURATION_AUTO_SEC [extern]
```

An auto second period of time.

5.128.4.9 DDS_DURATION_AUTO_NSEC

```
const DDS_UnsignedLong DDS_DURATION_AUTO_NSEC [extern]
```

An auto nano-second period of time.

5.128.4.10 DDS_DURATION_AUTO

```
const struct DDS_Duration_t DDS_DURATION_AUTO [extern]
```

Duration is automatically assigned.

5.128.4.11 DDS_DURATION_ZERO_SEC

```
const DDS_Long DDS_DURATION_ZERO_SEC [extern]
```

A zero-length second period of time.

5.128.4.12 DDS_DURATION_ZERO_NSEC

```
const DDS_UnsignedLong DDS_DURATION_ZERO_NSEC [extern]
```

A zero-length nano-second period of time.

5.128.4.13 DDS_DURATION_ZERO

```
const struct  DDS_Duration_t DDS_DURATION_ZERO  [extern]
```

A zero-length period of time.

5.129 GUID Support

<<***extension***>> *(*p. *1014)* GUID type and defines.

Data Structures

- struct **DDS_RTPS_EntityId_t**

  From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.
- struct **DDS_RTPS_GUID_t**

  From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.
- struct **DDS_GUID_t**

  Type for GUID (Global Unique Identifier) representation.

Typedefs

- typedef **DDS_Octet** **DDS_RTPS_GuidPrefix_t**[DDS_RTPS_GUID_PREFIX_LENGTH]

  From the DDS-RTPS specification: type used to hold the prefix of the globally-unique RTPS-entity identifiers.
- typedef struct **DDS_RTPS_EntityId_t** **DDS_RTPS_EntityId_t**

  From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.
- typedef struct **DDS_RTPS_GUID_t** **DDS_RTPS_GUID_t**

  From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.
- typedef struct **DDS_GUID_t** **DDS_GUID_t**

  Type for GUID (Global Unique Identifier) representation.

Functions

- **DDS_Boolean** **DDS_GUID_equals** (const struct **DDS_GUID_t** ∗self, const struct **DDS_GUID_t** ∗other)

  Compares this GUID with another GUID for equality.
- int **DDS_GUID_compare** (const struct **DDS_GUID_t** ∗self, const struct **DDS_GUID_t** ∗other)

  Compares two GUIDs.
- void **DDS_GUID_copy** (struct **DDS_GUID_t** ∗self, const struct **DDS_GUID_t** ∗other)

  Copies another GUID into this GUID.

Variables

- const struct **DDS_GUID_t DDS_GUID_AUTO**

  Indicates that RTI Connext should choose an appropriate virtual GUID.
- const struct **DDS_GUID_t DDS_GUID_UNKNOWN**

  Unknown GUID.
- const struct **DDS_GUID_t DDS_GUID_ZERO**

  Zero GUID.

5.129.1 Detailed Description

<<***extension***>> *(*p. *1014)* GUID type and defines.

5.129.2 Typedef Documentation

5.129.2.1 DDS_RTPS_GuidPrefix_t

```
typedef DDS_Octet DDS_RTPS_GuidPrefix_t[DDS_RTPS_GUID_PREFIX_LENGTH]
```

From the DDS-RTPS specification: type used to hold the prefix of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

5.129.2.2 DDS_RTPS_EntityId_t

```
typedef struct DDS_RTPS_EntityId_t DDS_RTPS_EntityId_t
```

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

5.129.2.3 DDS_RTPS_GUID_t

```
typedef struct DDS_RTPS_GUID_t DDS_RTPS_GUID_t
```

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

5.129.2.4 DDS_GUID_t

```
typedef struct  DDS_GUID_t  DDS_GUID_t
```

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

Alternative representation of **DDS_RTPS_GUID_t** (p. 1959). Memory and wire representation for this type is the same as the one for **DDS_RTPS_GUID_t** (p. 1959).

5.129.3 Function Documentation

5.129.3.1 DDS_GUID_equals()

```
DDS_Boolean DDS_GUID_equals (
            const struct  DDS_GUID_t * self,
            const struct  DDS_GUID_t * other )
```

Compares this GUID with another GUID for equality.

Parameters

self	<<***in***>> *(p. 1015)* This GUID.
other	<<***in***>> *(p. 1015)* The other GUID to be compared with this GUID.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the two GUIDs have equal values, or **DDS_BOOLEAN_FALSE** (p. 1203) otherwise.

5.129.3.2 DDS_GUID_compare()

```
int DDS_GUID_compare (
            const struct  DDS_GUID_t * self,
            const struct  DDS_GUID_t * other )
```

Compares two GUIDs.

Parameters

self	<<***in***>> *(p. 1015)* GUID to compare.
other	<<***in***>> *(p. 1015)* GUID to compare.

Returns

If the two GUIDs are equal or NULL, the function returns 0. If self is greater than other, the function returns a positive number; otherwise, it returns a negative number. Note that non-NULL is considered greater than NULL.

5.129.3.3 DDS_GUID_copy()

```
void DDS_GUID_copy (
            struct  DDS_GUID_t * self,
            const struct  DDS_GUID_t * other )
```

Copies another GUID into this GUID.

Parameters

self	<<***in***>> *(p. 1015)* This GUID. Cannot be NULL.
other	<<***in***>> *(p. 1015)* The other GUID to be copied. Cannot be NULL.

5.129.4 Variable Documentation

5.129.4.1 DDS_GUID_AUTO

```
const struct  DDS_GUID_t DDS_GUID_AUTO  [extern]
```

Indicates that RTI Connext should choose an appropriate virtual GUID.

If this special value is assigned to **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p. 1650) or **DDS_DataReader↩ ProtocolQosPolicy::virtual_guid** (p. 1597), RTI Connext will assign the virtual GUID automatically based on the RTPS or physical GUID.

5.129.4.2 DDS_GUID_UNKNOWN

```
const struct  DDS_GUID_t DDS_GUID_UNKNOWN  [extern]
```

Unknown GUID.

5.129.4.3 DDS_GUID_ZERO

```
const struct DDS_GUID_t DDS_GUID_ZERO [extern]
```

Zero GUID.

5.130 Sequence Number Support

<<*extension*>> *(*p. *1014)* Sequence number type and defines.

Data Structures

- struct **DDS_SequenceNumber_t**

  Type for sequence number representation.

Typedefs

- typedef struct **DDS_SequenceNumber_t** **DDS_SequenceNumber_t**

  Type for sequence number representation.

Functions

- void **DDS_SequenceNumber_subtract** (struct **DDS_SequenceNumber_t** *answer, const struct **DDS_SequenceNumber_t** *sn1, const struct **DDS_SequenceNumber_t** *sn2)

  Stores the value (sn1 - sn2) in answer
- void **DDS_SequenceNumber_add** (struct **DDS_SequenceNumber_t** *answer, const struct **DDS_SequenceNumber_t** *sn1, const struct **DDS_SequenceNumber_t** *sn2)

  Stores the value (sn1 + sn2) in answer
- void **DDS_SequenceNumber_plusplus** (struct **DDS_SequenceNumber_t** *sn)

  Increases the value of the input sequence number by one
- void **DDS_SequenceNumber_minusminus** (struct **DDS_SequenceNumber_t** *sn)

  Decreases the value of the input sequence number by one
- int **DDS_SequenceNumber_compare** (const struct **DDS_SequenceNumber_t** *sn1, const struct **DDS_SequenceNumber_t** *sn2)

  Compares two sequence numbers.

Variables

- const struct **DDS_SequenceNumber_t** **DDS_SEQUENCE_NUMBER_UNKNOWN**

  Unknown sequence number.
- const struct **DDS_SequenceNumber_t** **DDS_SEQUENCE_NUMBER_ZERO**

  Zero value for the sequence number.
- const struct **DDS_SequenceNumber_t** **DDS_SEQUENCE_NUMBER_MAX**

  Highest, most positive value for the sequence number.
- const struct **DDS_SequenceNumber_t** **DDS_AUTO_SEQUENCE_NUMBER**

  The sequence number is internally determined by RTI Connext.

5.130.1 Detailed Description

<<***extension***>> *(*p. *1014)* Sequence number type and defines.

5.130.2 Typedef Documentation

5.130.2.1 DDS_SequenceNumber_t

```
typedef struct  DDS_SequenceNumber_t  DDS_SequenceNumber_t
```

Type for *sequence* number representation.

Represents a 64-bit sequence number.

5.130.3 Function Documentation

5.130.3.1 DDS_SequenceNumber_subtract()

```
void DDS_SequenceNumber_subtract (
            struct  DDS_SequenceNumber_t * answer,
            const struct  DDS_SequenceNumber_t * sn1,
            const struct  DDS_SequenceNumber_t * sn2 )
```

Stores the value (sn1 - sn2) in answer

Parameters

answer	<<***out***>> *(*p. *1015)* Result sequence number. Cannot be NULL.
sn1	<<***in***>> *(*p. *1015)* First sequence number. Cannot be NULL.
sn2	<<***in***>> *(*p. *1015)* Second sequence number. Cannot be NULL.

5.130.3.2 DDS_SequenceNumber_add()

```
void DDS_SequenceNumber_add (
            struct  DDS_SequenceNumber_t * answer,
```

```
            const struct  DDS_SequenceNumber_t * sn1,
            const struct  DDS_SequenceNumber_t * sn2 )
```

Stores the value (sn1 + sn2) in answer

Parameters

answer	<<***out***>> *(*p. *1015)* Result sequence number. Cannot be NULL.
sn1	<<***in***>> *(*p. *1015)* First sequence number. Cannot be NULL.
sn2	<<***in***>> *(*p. *1015)* Second sequence number. Cannot be NULL.

5.130.3.3 DDS_SequenceNumber_plusplus()

```
void DDS_SequenceNumber_plusplus (
            struct  DDS_SequenceNumber_t * sn )
```

Increases the value of the input sequence number by one

Parameters

sn	<<***inout***>> *(*p. *1015)* Sequence number. Cannot be NULL.

5.130.3.4 DDS_SequenceNumber_minusminus()

```
void DDS_SequenceNumber_minusminus (
            struct  DDS_SequenceNumber_t * sn )
```

Decreases the value of the input sequence number by one

Parameters

sn	<<***inout***>> *(*p. *1015)* Sequence number. Cannot be NULL.

5.130.3.5 DDS_SequenceNumber_compare()

```
int DDS_SequenceNumber_compare (
            const struct  DDS_SequenceNumber_t * sn1,
            const struct  DDS_SequenceNumber_t * sn2 )
```

Compares two sequence numbers.

Parameters

sn1	<<***in***>> *(*p. *1015)* Sequence number to compare. Cannot be NULL.
sn2	<<***in***>> *(*p. *1015)* Sequence number to compare. Cannot be NULL.

Returns

If the two sequence numbers are equal, the function returns 0. If sn1 is greater than sn2 the function returns a positive number; otherwise, it returns a negative number.

5.130.4 Variable Documentation

5.130.4.1 DDS_SEQUENCE_NUMBER_UNKNOWN

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_UNKNOWN [extern]
```

Unknown sequence number.

5.130.4.2 DDS_SEQUENCE_NUMBER_ZERO

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_ZERO [extern]
```

Zero value for the sequence number.

5.130.4.3 DDS_SEQUENCE_NUMBER_MAX

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_MAX [extern]
```

Highest, most positive value for the sequence number.

5.130.4.4 DDS_AUTO_SEQUENCE_NUMBER

```
const struct DDS_SequenceNumber_t DDS_AUTO_SEQUENCE_NUMBER [extern]
```

The sequence number is internally determined by RTI Connext.

5.131 Exception Codes

<<***extension***>> *(*p. *1014)* Exception codes.

Enumerations

- enum **DDS_ExceptionCode_t** {
  DDS_NO_EXCEPTION_CODE ,
  DDS_USER_EXCEPTION_CODE ,
  DDS_SYSTEM_EXCEPTION_CODE ,
  DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE ,
  DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE ,
  DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE ,
  DDS_BADKIND_USER_EXCEPTION_CODE ,
  DDS_BOUNDS_USER_EXCEPTION_CODE ,
  DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE = 8 ,
  DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE = 9 ,
  DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE = 10 }

  Error codes used by the ***DDS_TypeCode*** *(*p. *2077) class.*

5.131.1 Detailed Description

<<***extension***>> *(*p. *1014)* Exception codes.

These exceptions are used for error handling by the **Type Code Support** (p. 227) API.

5.131.2 Enumeration Type Documentation

5.131.2.1 DDS_ExceptionCode_t

`enum` **`DDS_ExceptionCode_t`**

Error codes used by the **DDS_TypeCode** (p. 2077) class.

Exceptions are modeled via a special parameter passed to the operations.

Enumerator

DDS_NO_EXCEPTION_CODE	No failure occurred.
DDS_USER_EXCEPTION_CODE	User exception. This class is based on a similar class in CORBA.
DDS_SYSTEM_EXCEPTION_CODE	System exception. This class is based on a similar class in CORBA.

Enumerator

DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE	Exception thrown when a parameter passed to a call is considered illegal.
DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE	Exception thrown when there is not enough memory for a dynamic memory allocation.
DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_↩ CODE	Exception thrown when a malformed type code is found (for example, a type code with an invalid TCKind value).
DDS_BADKIND_USER_EXCEPTION_CODE	The exception BadKind is thrown when an inappropriate operation is invoked on a TypeCode object.
DDS_BOUNDS_USER_EXCEPTION_CODE	A user exception thrown when a parameter is not within the legal bounds.
DDS_IMMUTABLE_TYPECODE_SYSTEM_↩ EXCEPTION_CODE	An attempt was made to modify a **DDS_TypeCode** (p. 2077) that was received from a remote object. The built-in publication and subscription readers provide access to information about the remote **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) entities in the distributed system. Among other things, the data from these built-in readers contains the **DDS_TypeCode** (p. 2077) for these entities. Modifying this received **DDS_TypeCode** (p. 2077) is not permitted.
DDS_BAD_MEMBER_NAME_USER_EXCEPTION_↩ CODE	The specified **DDS_TypeCode** (p. 2077) member name is invalid. This failure can occur, for example, when querying a field by name when no such name is defined in the type. **See also** **DDS_BAD_MEMBER_ID_USER_EXCEPTION↩ _CODE** (p. 1222)
DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE	The specified **DDS_TypeCode** (p. 2077) member ID is invalid. This failure can occur, for example, when querying a field by ID when no such ID is defined in the type. **See also** **DDS_BAD_MEMBER_NAME_USER_↩ EXCEPTION_CODE** (p. 1222)

5.132 Return Codes

Types of return codes.

Enumerations

- enum **DDS_ReturnCode_t** {
  DDS_RETCODE_OK ,

DDS_RETCODE_ERROR ,
DDS_RETCODE_UNSUPPORTED ,
DDS_RETCODE_BAD_PARAMETER ,
DDS_RETCODE_PRECONDITION_NOT_MET ,
DDS_RETCODE_OUT_OF_RESOURCES ,
DDS_RETCODE_NOT_ENABLED ,
DDS_RETCODE_IMMUTABLE_POLICY ,
DDS_RETCODE_INCONSISTENT_POLICY ,
DDS_RETCODE_ALREADY_DELETED ,
DDS_RETCODE_TIMEOUT ,
DDS_RETCODE_NO_DATA ,
DDS_RETCODE_ILLEGAL_OPERATION ,
DDS_RETCODE_NOT_ALLOWED_BY_SECURITY }

Type for return codes.

5.132.1 Detailed Description

Types of return codes.

5.132.2 Standard Return Codes

Any operation with return type **DDS_ReturnCode_t** (p. 1223) may return **DDS_RETCODE_OK** (p. 1224) **DDS_↩ RETCODE_ERROR** (p. 1224) or **DDS_RETCODE_ILLEGAL_OPERATION** (p. 1224). Any operation that takes one or more input parameters may additionally return **DDS_RETCODE_BAD_PARAMETER** (p. 1224). Any operation on an object created from any of the factories may additionally return **DDS_RETCODE_ALREADY_DELETED** (p. 1224). Any operation that is stated as optional may additionally return **DDS_RETCODE_UNSUPPORTED** (p. 1224).

Thus, the standard return codes are:

- **DDS_RETCODE_ERROR** (p. 1224)
- **DDS_RETCODE_ILLEGAL_OPERATION** (p. 1224)
- **DDS_RETCODE_ALREADY_DELETED** (p. 1224)
- **DDS_RETCODE_BAD_PARAMETER** (p. 1224)
- **DDS_RETCODE_UNSUPPORTED** (p. 1224)

Operations that may return any of the additional return codes will state so explicitly.

5.132.3 Enumeration Type Documentation

5.132.3.1 DDS_ReturnCode_t

`enum` **DDS_ReturnCode_t**

Type for return codes.

Errors are modeled as operation return codes of this type.

Enumerator

DDS_RETCODE_OK	Successful return.
DDS_RETCODE_ERROR	Generic, unspecified error.
DDS_RETCODE_UNSUPPORTED	Unsupported operation. Only returned by operations that are unsupported.
DDS_RETCODE_BAD_PARAMETER	Illegal parameter value. The value of the parameter that is passed in has llegal value. Things that fall into this category include NULL parameters and parameter values that are out of range.
DDS_RETCODE_PRECONDITION_NOT_MET	A pre-condition for the operation was not met. The system is not in the expected state when the function is called, or the parameter itself is not in the expected state when the function is called.
DDS_RETCODE_OUT_OF_RESOURCES	RTI Connext ran out of the resources needed to complete the operation.
DDS_RETCODE_NOT_ENABLED	Operation invoked on a **DDS_Entity** (p. 1362) that is not yet enabled.
DDS_RETCODE_IMMUTABLE_POLICY	Application attempted to modify an immutable QoS policy.
DDS_RETCODE_INCONSISTENT_POLICY	Application specified a set of QoS policies that are not consistent with each other.
DDS_RETCODE_ALREADY_DELETED	The object target of this operation has already been deleted.
DDS_RETCODE_TIMEOUT	The operation timed out.
DDS_RETCODE_NO_DATA	Indicates a transient situation where the operation did not return any data but there is no inherent error.
DDS_RETCODE_ILLEGAL_OPERATION	The operation was called under improper circumstances. An operation was invoked on an inappropriate object or at an inappropriate time. This return code is similar to **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224), except that there is no precondition that could be changed to make the operation succeed.
DDS_RETCODE_NOT_ALLOWED_BY_SECURITY	An operation on the DDS API that fails because the security plugins do not allow it. An operation on the DDS API that fails because the security plugins do not allow it.

5.133 Status Kinds

Kinds of communication status.

Macros

- #define **DDS_STATUS_MASK_NONE**

  No bits are set.
- #define **DDS_STATUS_MASK_ALL**

  All bits are set.

Typedefs

- typedef **DDS_UnsignedLong DDS_StatusMask**

  A bit-mask (list) of concrete status types, i.e. ***DDS_StatusKind*** *(*p. *1229)[].*

Enumerations

- enum **DDS_StatusKind** {
  DDS_INCONSISTENT_TOPIC_STATUS ,
  DDS_OFFERED_DEADLINE_MISSED_STATUS ,
  DDS_REQUESTED_DEADLINE_MISSED_STATUS ,
  DDS_OFFERED_INCOMPATIBLE_QOS_STATUS ,

  DDS_DATA_READER_CACHE_STATUS ,
  DDS_DATA_READER_PROTOCOL_STATUS ,
  DDS_DATA_WRITER_DESTINATION_UNREACHABLE_STATUS = 0x00000001U << 30 ,
  DDS_DATA_WRITER_SAMPLE_REMOVED_STATUS }

  Type for status kinds.

5.133.1 Detailed Description

Kinds of communication status.

Entity:

DDS_Entity (p. 1362)

QoS:

All QoS Policies (p. 1240)

Listener:

DDS_Listener (p. 1819)

Each concrete **DDS_Entity** (p. 1362) is associated with a set of Status objects whose value represents the communication status of that entity. Each status value can be accessed with a corresponding function on the **DDS_Entity** (p. 1362).

When these status values change, the corresponding **DDS_StatusCondition** (p. 1373) objects are activated and the proper **DDS_Listener** (p. 1819) objects are invoked to asynchronously inform the application.

An application is notified of communication status by means of the **DDS_Listener** (p. 1819) or the **DDS_WaitSet** (p. 1373) / **DDS_Condition** (p. 1372) mechanism. The two mechanisms may be combined in the application (e.g., using **DDS_WaitSet** (p. 1373) (s) / **DDS_Condition** (p. 1372) (s) to access the data and **DDS_Listener** (p. 1819) (s) to be warned asynchronously of erroneous communication statuses).

It is likely that the application will choose one or the other mechanism for each particular communication status (not both). However, if both mechanisms are enabled, then the **DDS_Listener** (p. 1819) mechanism is used first and then the **DDS_WaitSet** (p. 1373) objects are signalled.

The statuses may be classified into:

- *read communication statuses*: i.e., those that are related to arrival of data, namely **DDS_DATA_ON_READERS↩ _STATUS** (p. 1232) and **DDS_DATA_AVAILABLE_STATUS** (p. 1232).

- *plain communication statuses*: i.e., all the others.

Read communication statuses are treated slightly differently than the others because they don't change independently. In other words, at least two changes will appear at the same time (**DDS_DATA_ON_READERS_STATUS** (p. 1232) and **DDS_DATA_AVAILABLE_STATUS** (p. 1232)) and even several of the last kind may be part of the set. This 'grouping' has to be communicated to the application.

For each plain communication status, there is a corresponding structure to hold the status value. These values contain the information related to the change of status, as well as information related to the statuses themselves (e.g., contains cumulative counts).

"Status Values"

5.133.2 Changes in Status

Associated with each one of an **DDS_Entity** (p. 1362)'s communication status is a logical `StatusChangedFlag`. This flag indicates whether that particular communication status has changed since the last time the status was read by the application. The way the status changes is slightly different for the Plain Communication Status and the Read Communication status.

"\p StatusChangedFlag indicates if status has changed"

5.133.2.1 Changes in plain communication status

For the plain communication status, the `StatusChangedFlag` flag is initially set to FALSE. It becomes TRUE whenever the plain communication status changes and it is reset to **DDS_BOOLEAN_FALSE** (p. 1203) each time the application accesses the plain communication status via the proper `get_<plain communication status>()` operation on the **DDS_Entity** (p. 1362).

The communication status is also reset to FALSE whenever the associated listener operation is called as the listener implicitly accesses the status which is passed as a parameter to the operation. The fact that the status is reset prior to calling the listener means that if the application calls the get_<plain communication status> from inside the listener it will see the status already reset.

An exception to this rule is when the associated listener is the 'nil' listener. The 'nil' listener is treated as a NOOP and the act of calling the 'nil' listener does not reset the communication status.

For example, the value of the `StatusChangedFlag` associated with the **DDS_REQUESTED_DEADLINE_↩ MISSED_STATUS** (p. 1231) will become TRUE each time new deadline occurs (which increases **DDS_Requested↩ DeadlineMissedStatus::total_count** (p. 1951)). The value changes to FALSE when the application accesses the status via the corresponding **DDS_DataReader_get_requested_deadline_missed_status** (p. 683) method on the proper Entity

"Changes in \p StatusChangedFlag for plain communication status"

5.133.2.2 Changes in read communication status

For the read communication status, the `StatusChangedFlag` flag is initially set to FALSE. The `Status↩ ChangedFlag` becomes TRUE when either a data-sample arrives or else the **DDS_ViewStateKind** (p. 713), **DDS↩ _SampleStateKind** (p. 711), or **DDS_InstanceStateKind** (p. 715) of any existing sample changes for any reason other than a call to **FooDataReader_read** (p. 628), **FooDataReader_take** (p. 629) or their variants. Specifically any of the following events will cause the `StatusChangedFlag` to become TRUE:

- The arrival of new data.
- A change in the **DDS_InstanceStateKind** (p. 715) of a contained instance. This can be caused by either:
  - The arrival of the notification that an instance has been disposed by:
    - the **DDS_DataWriter** (p. 488) that owns it if **OWNERSHIP** (p. 1303) QoS kind= **DDS_EXCLUSIVE_↩ OWNERSHIP_QOS** (p. 1304)
    - or by any **DDS_DataWriter** (p. 488) if **OWNERSHIP** (p. 1303) QoS kind= **DDS_SHARED_↩ OWNERSHIP_QOS** (p. 1304)
  - The loss of liveliness of the **DDS_DataWriter** (p. 488) of an instance for which there is no other **DDS_↩ DataWriter** (p. 488).
  - The arrival of the notification that an instance has been unregistered by the only **DDS_DataWriter** (p. 488) that is known to be writing the instance.

Depending on the kind of `StatusChangedFlag`, the flag transitions to FALSE again as follows:

- The **DDS_DATA_AVAILABLE_STATUS** (p. 1232) `StatusChangedFlag` becomes FALSE when either the corresponding listener operation (on_data_available) is called or the read or take operation (or their variants) is called on the associated **DDS_DataReader** (p. 618).

- The **DDS_DATA_ON_READERS_STATUS** (p. 1232) `StatusChangedFlag` becomes FALSE when any of the following events occurs:
  - The corresponding listener operation (on_data_on_readers) is called.
  - The on_data_available listener operation is called on any **DDS_DataReader** (p. 618) belonging to the **DDS_Subscriber** (p. 575).
  - The read or take operation (or their variants) is called on any **DDS_DataReader** (p. 618) belonging to the **DDS_Subscriber** (p. 575).

"Changes in \p StatusChangedFlag for read communication status"

DDS_Listener (p. 1819)

DDS_WaitSet (p. 1373), **DDS_Condition** (p. 1372)

5.133.3 Macro Definition Documentation

5.133.3.1 DDS_STATUS_MASK_NONE

```
#define DDS_STATUS_MASK_NONE
```

No bits are set.

Examples

HelloWorld_publisher.c, and **HelloWorld_subscriber.c**.

5.133.3.2 DDS_STATUS_MASK_ALL

```
#define DDS_STATUS_MASK_ALL
```

All bits are set.

Examples

HelloWorld_subscriber.c.

5.133.4 Typedef Documentation

5.133.4.1 DDS_StatusMask

```
typedef  DDS_UnsignedLong  DDS_StatusMask
```

A bit-mask (list) of concrete status types, i.e. **DDS_StatusKind** (p. 1229)[].

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS_StatusKind** (p. 1229) values.

Bits in the mask correspond to different statuses. You can choose which changes in status will trigger a callback by setting the corresponding status bits in this bit-mask and installing callbacks for each of those statuses.

The bits that are true indicate that the listener will be called back for changes in the corresponding status.

For example:
```
DDS_StatusMask mask = DDS_REQUESTED_DEADLINE_MISSED_STATUS |
                  DDS_DATA_AVAILABLE_STATUS;
datareader->set_listener(listener, mask);
```

or
```
DDS_StatusMask mask = DDS_REQUESTED_DEADLINE_MISSED_STATUS |
                   DDS_DATA_AVAILABLE_STATUS;
datareader = subscriber->create_datareader(topic,
                                DDS_DATAREADER_QOS_DEFAULT,
                                 listener, mask);
```

5.133.5 Enumeration Type Documentation

5.133.5.1 DDS_StatusKind

```
enum  DDS_StatusKind
```

Type for *status* kinds.

Each concrete **DDS_Entity** (p. 1362) is associated with a set of `*Status` objects whose values represent the communication status of that **DDS_Entity** (p. 1362).

The communication statuses whose changes can be communicated to the application depend on the **DDS_Entity** (p. 1362).

Each status value can be accessed with a corresponding function on the **DDS_Entity** (p. 1362). The changes on these status values cause activation of the corresponding **DDS_StatusCondition** (p. 1373) objects and trigger invocation of the proper **DDS_Listener** (p. 1819) objects to asynchronously inform the application. Note that not all statuses will activate the **DDS_StatusCondition** (p. 1373) or have a corresponding listener callback. Refer to the documentation of the individual statuses for that information.

DDS_Entity (p. 1362), **DDS_StatusCondition** (p. 1373), **DDS_Listener** (p. 1819)

Enumerator

DDS_INCONSISTENT_TOPIC_STATUS	Another topic exists with the same name but different characteristics. **Entity:** **DDS_Topic** (p. 174) **Status:** **DDS_InconsistentTopicStatus** (p. 1811) **Listener:** **DDS_TopicListener** (p. 2047)
DDS_OFFERED_DEADLINE_MISSED_STATUS	The deadline that the **DDS_DataWriter** (p. 488) has committed through its **DDS_DeadlineQosPolicy** (p. 1685) was not respected for a specific instance. **Entity:** **DDS_DataWriter** (p. 488) **QoS:** **DEADLINE** (p. 1274) **Status:** **DDS_OfferedDeadlineMissedStatus** (p. 1864) **Listener:** **DDS_DataWriterListener** (p. 1644)

Enumerator

DDS_REQUESTED_DEADLINE_MISSED_STATUS	The deadline that the **DDS_DataReader** (p. 618) was expecting through its **DDS_DeadlineQosPolicy** (p. 1685) was not respected for a specific instance. **Entity:** **DDS_DataReader** (p. 618) **QoS:** **DEADLINE** (p. 1274) **Status:** **DDS_RequestedDeadlineMissedStatus** (p. 1951) **Listener:** **DDS_DataReaderListener** (p. 1593)
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS	A QosPolicy value was incompatible with what was requested. **Entity:** **DDS_DataWriter** (p. 488) **Status:** **DDS_OfferedIncompatibleQosStatus** (p. 1865) **Listener:** **DDS_DataWriterListener** (p. 1644)
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS	A QosPolicy value was incompatible with what is offered. **Entity:** **DDS_DataReader** (p. 618) **Status:** **DDS_RequestedIncompatibleQosStatus** (p. 1952) **Listener:** **DDS_DataReaderListener** (p. 1593)

Enumerator

DDS_SAMPLE_LOST_STATUS	A sample has been lost (i.e., was never received). **Entity:** **DDS_DataReader** (p. 618) **Status:** **DDS_SampleLostStatus** (p. 2001) **Listener:** **DDS_DataReaderListener** (p. 1593)
DDS_SAMPLE_REJECTED_STATUS	A (received) sample has been rejected. **Entity:** **DDS_DataReader** (p. 618) **QoS:** **RESOURCE_LIMITS** (p. 1327) **Status:** **DDS_SampleRejectedStatus** (p. 2002) **Listener:** **DDS_DataReaderListener** (p. 1593)
DDS_DATA_ON_READERS_STATUS	New data is available. **Entity:** **DDS_Subscriber** (p. 575) **Listener:** **DDS_SubscriberListener** (p. 2014)
DDS_DATA_AVAILABLE_STATUS	One or more new data samples have been received. **Entity:** **DDS_DataReader** (p. 618) **Listener:** **DDS_DataReaderListener** (p. 1593)

Enumerator

DDS_LIVELINESS_LOST_STATUS	The liveliness that the **DDS_DataWriter** (p. 488) has committed to through its **DDS_LivelinessQosPolicy** (p. 1826) was not respected, thus **DDS_DataReader** (p. 618) entities will consider the **DDS_DataWriter** (p. 488) as no longer alive. **Entity:** **DDS_DataWriter** (p. 488) **QoS:** **LIVELINESS** (p. 1298) **Status:** **DDS_LivelinessLostStatus** (p. 1825) **Listener:** **DDS_DataWriterListener** (p. 1644)
DDS_LIVELINESS_CHANGED_STATUS	The liveliness of one or more **DDS_DataWriter** (p. 488) that were writing instances read through the **DDS_DataReader** (p. 618) has changed. Some **DDS_DataWriter** (p. 488) have become alive or not_alive. **Entity:** **DDS_DataReader** (p. 618) **QoS:** **LIVELINESS** (p. 1298) **Status:** **DDS_LivelinessChangedStatus** (p. 1823) **Listener:** **DDS_DataReaderListener** (p. 1593)

Enumerator

DDS_PUBLICATION_MATCHED_STATUS	The **DDS_DataWriter** (p. 488) has found **DDS_DataReader** (p. 618) that matches the **DDS_Topic** (p. 174) and has compatible QoS. **Entity:** **DDS_DataWriter** (p. 488) **Status:** **DDS_PublicationMatchedStatus** (p. 1919) **Listener:** **DDS_DataWriterListener** (p. 1644)
DDS_SUBSCRIPTION_MATCHED_STATUS	The **DDS_DataReader** (p. 618) has found **DDS_DataWriter** (p. 488) that matches the **DDS_Topic** (p. 174) and has compatible QoS. **Entity:** **DDS_DataReader** (p. 618) **Status:** **DDS_SubscriptionMatchedStatus** (p. 2028) **Listener:** **DDS_DataReaderListener** (p. 1593)
DDS_DATA_WRITER_EMPTY_VIRTUAL_WRITER_↩ STATUS	The status kind for the status when a data writer does not have samples for a virtual writer for which before it had samples.
DDS_INVALID_LOCAL_ADVANCE_NOTICE_STATUS	<<***extension***>> *(p. 1014)* The local **DDS_DomainParticipant** (p. 76) has or is about to have an invalid identity or permissions credential. Enables a **DDS_DomainParticipant** (p. 76) callback that is called when the local **DDS_DomainParticipant** (p. 76) has or is about to have an invalid identity or permissions credential. Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information. **Entity:** **DDS_DomainParticipant** (p. 76) **Listener:** **DDS_DomainParticipantListener** (p. 1726)

Enumerator

DDS_SERVICE_REQUEST_ACCEPTED_STATUS	<<***extension***>> *(p. 1014)* A **DDS_DataWriter** (p. 488) has been issued a **DDS_ServiceRequest** (p. 2006) Enables a **DDS_DataWriter** (p. 488) callback that is called when a **DDS_ServiceRequest** (p. 2006) has been accepted and dispatched to the DataWriter. **Entity:** **DDS_DataWriter** (p. 488) **Listener:** **DDS_DataWriterListener** (p. 1644)
DDS_DATA_WRITER_APPLICATION_↩ ACKNOWLEDGMENT_STATUS	<<***extension***>> *(p. 1014)* A **DDS_DataWriter** (p. 488) has received an application-level acknowledgment for a sample Enables a **DDS_DataWriter** (p. 488) callback that is called when an application-level acknowledgment from a **DDS_DataReader** (p. 618) is received. The callback is called for each sample that is application-level acknowledged. Changes to this status do not trigger a **DDS_StatusCondition** (p. 1373). **Entity:** **DDS_DataWriter** (p. 488) **Listener:** **DDS_DataWriterListener** (p. 1644)
DDS_DATA_WRITER_INSTANCE_REPLACED_↩ STATUS	<<***extension***>> *(p. 1014)* A **DDS_DataWriter** (p. 488) instance has been replaced Enables a **DDS_DataWriter** (p. 488) callback that is called when an instance in the writer queue is replaced. **Entity:** **DDS_DataWriter** (p. 488) **Listener:** **DDS_DataWriterListener** (p. 1644)

Enumerator

DDS_RELIABLE_WRITER_CACHE_CHANGED_↩ STATUS	<<***extension***>> *(p. 1014)* The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point. This status is considered changed at the following times: the cache is empty (i.e., contains no unacknowledged samples), the cache is full (i.e., the sample count has reached the value specified in **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956)), or the number of samples has reached a high (see **DDS_RtpsReliableWriterProtocol_t::high_↩ watermark** (p. 1967)) or low (see **DDS_RtpsReliableWriterProtocol_t::low_watermark** (p. 1966)) watermark. **Entity:** **DDS_DataWriter** (p. 488) **Status:** **DDS_ReliableWriterCacheChangedStatus** (p. 1947) **Listener:** **DDS_DataWriterListener** (p. 1644)
DDS_RELIABLE_READER_ACTIVITY_CHANGED_↩ STATUS	<<***extension***>> *(p. 1014)* One or more reliable readers has become active or inactive. A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see **DDS_RtpsReliableWriterProtocol_t** (p. 1965) and **DDS_ReliableReaderActivityChangedStatus** (p. 1945). **See also** **DDS_RtpsReliableWriterProtocol_t** (p. 1965) **DDS_ReliableReaderActivityChangedStatus** (p. 1945)
DDS_DATA_WRITER_CACHE_STATUS	<<***extension***>> *(p. 1014)* The status of the writer's cache. Changes to this status do not trigger a **DDS_StatusCondition** (p. 1373).
DDS_DATA_WRITER_PROTOCOL_STATUS	<<***extension***>> *(p. 1014)* The status of a writer's internal protocol related metrics The status of a writer's internal protocol-related metrics, such as the number of samples pushed, pulled, and filtered and the status of wire protocol traffic. Changes to this status information do not trigger a **DDS_StatusCondition** (p. 1373).

Enumerator

DDS_DATA_READER_CACHE_STATUS	<<***extension***>> *(*p. *1014)* The status of the reader's cache. Changes to this status do not trigger a **DDS_StatusCondition** (p. 1373).
DDS_DATA_READER_PROTOCOL_STATUS	<<***extension***>> *(*p. *1014)* The status of a reader's internal protocol related metrics The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic. Changes to this status do not trigger a **DDS_StatusCondition** (p. 1373).
DDS_DATA_WRITER_SAMPLE_REMOVED_STATUS	<<***extension***>> *(*p. *1014)* A **DDS_DataWriter** (p. 488) has removed a sample from its queue. Enables a **DDS_DataWriter** (p. 488) callback that is called when a sample is removed from its queue. **Entity:** **DDS_DataWriter** (p. 488) **Listener:** **DDS_DataWriterListener** (p. 1644)

5.134 Thread Settings

The properties of a thread of execution. Consult `Platform Notes` for additional platform specific details.

Data Structures

- struct **DDS_ThreadSettings_t**
  The properties of a thread of execution.

Macros

- #define **DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT**
  The mask of default thread options.

Typedefs

- typedef **DDS_UnsignedLong DDS_ThreadSettingsKindMask**
  A mask of which each bit is taken from ***DDS_ThreadSettingsKind*** *(*p. *1239).*

Enumerations

- enum **DDS_ThreadSettingsKind** {
  DDS_THREAD_SETTINGS_FLOATING_POINT ,
  DDS_THREAD_SETTINGS_STDIO ,
  DDS_THREAD_SETTINGS_REALTIME_PRIORITY ,
  DDS_THREAD_SETTINGS_PRIORITY_ENFORCE ,
  DDS_THREAD_SETTINGS_CANCEL_ASYNCHRONOUS }

  A collection of flags used to configure threads of execution.
- enum **DDS_ThreadSettingsCpuRotationKind** {
  DDS_THREAD_SETTINGS_CPU_NO_ROTATION ,
  DDS_THREAD_SETTINGS_CPU_RR_ROTATION }

  *Determines how **DDS_ThreadSettings_t::cpu_list** (p. 2036) affects processor affinity for thread-related QoS policies that apply to multiple threads.*

5.134.1 Detailed Description

The properties of a thread of execution. Consult `Platform Notes` for additional platform specific details.

5.134.2 Macro Definition Documentation

5.134.2.1 DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT

```
#define DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT
```

The mask of default thread options.

5.134.3 Typedef Documentation

5.134.3.1 DDS_ThreadSettingsKindMask

```
typedef DDS_UnsignedLong DDS_ThreadSettingsKindMask
```

A mask of which each bit is taken from **DDS_ThreadSettingsKind** (p. 1239).

See also

DDS_ThreadSettings_t (p. 2035)

5.134.4 Enumeration Type Documentation

5.134.4.1 DDS_ThreadSettingsKind

enum **DDS_ThreadSettingsKind**

A collection of flags used to configure threads of execution.

Not all of these options may be relevant for all operating systems. Consult `Platform Notes` for additional details.

See also

DDS_ThreadSettingsKindMask (p. 1238)

Enumerator

DDS_THREAD_SETTINGS_FLOATING_POINT	Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.
DDS_THREAD_SETTINGS_STDIO	Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.
DDS_THREAD_SETTINGS_REALTIME_PRIORITY	The thread will be scheduled on a FIFO basis.
DDS_THREAD_SETTINGS_PRIORITY_ENFORCE	Strictly enforce this thread's priority.
DDS_THREAD_SETTINGS_CANCEL_↩ ASYNCHRONOUS	Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

5.134.4.2 DDS_ThreadSettingsCpuRotationKind

enum **DDS_ThreadSettingsCpuRotationKind**

Determines how **DDS_ThreadSettings_t::cpu_list** (p. 2036) affects processor affinity for thread-related QoS policies that apply to multiple threads.

5.134.5 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the **DDS_EventQosPolicy** (p. 1796), **DDS_↩ DatabaseQosPolicy** (p. 1581), and **DDS_AsynchronousPublisherQosPolicy** (p. 1539)). However, the thread settings in the **DDS_ReceiverPoolQosPolicy** (p. 1938) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

Controlling CPU Core Affinity is only relevant to the **DDS_ReceiverPoolQosPolicy** (p. 1938). It is ignored within other QoS policies that include **DDS_ThreadSettings_t** (p. 2035).

If **DDS_ThreadSettings_t::cpu_list** (p. 2036) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that **DDS_ThreadSettings_t::cpu_list** (p. 2036) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If **DDS_ThreadSettings_t::cpu_rotation** (p. 2036) is **DDS_THREAD_SETTINGS_CPU↩_NO_ROTATION** (p. 1240), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If **DDS_ThreadSettings_t::cpu_rotation** (p. 2036) is **DDS_THREAD_SETTINGS_CPU_RR_ROTATION** (p. 1240), each thread will be assigned in round-robin fashion to one of the processors in **DDS_ThreadSettings_t::cpu_list** (p. 2036); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems. Refer to the Platform Notes for further information.

Enumerator

DDS_THREAD_SETTINGS_CPU_NO_ROTATION	Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
DDS_THREAD_SETTINGS_CPU_RR_ROTATION	Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

5.135 QoS

Quality of Service (QoS) policies.

Modules

- **All QoS Policies**

  All Quality of Service (QoS) policies.
- **QoS by Category**

  Quality of Service (QoS) organized into categories.

5.135.1 Detailed Description

Quality of Service (QoS) policies.

5.136 All QoS Policies

All Quality of Service (QoS) policies.

Modules

- **ASYNCHRONOUS_PUBLISHER**

  *<<**extension**>> (p. 796) Specifies the asynchronous publishing settings of the **DDS_Publisher** (p. 446) instances.*
- **AVAILABILITY**

  *<<**extension**>> (p. 796) Configures the availability of data.*
- **BATCH**

  *<<**extension**>> (p. 796) Batch QoS policy used to enable batching in **DDS_DataWriter** (p. 488) instances.*
- **DATABASE**

  *<<**extension**>> (p. 796) Various threads and resource limits settings used by RTI Connext to control its internal database.*
- **DATA_READER_PROTOCOL**

  *<<**extension**>> (p. 796) Specifies the DataReader-specific protocol QoS.*
- **DATA_READER_RESOURCE_LIMITS**

  *<<**extension**>> (p. 796) Various settings that configure how DataReaders allocate and use physical memory for internal resources.*
- **DATA_REPRESENTATION**

  *<<**spec**>> (p. 791) A list of data representations and compression methods supported by a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618).*
- **DATA_TAG**

  *<<**spec**>> (p. 791) Stores (name, value) pairs that can be used to determine access permissions.*
- **DATA_WRITER_PROTOCOL**

  *<<**extension**>> (p. 796) Along with **DDS_WireProtocolQosPolicy** (p. 2099) and **DDS_DataReaderProtocolQos**↩ **Policy** (p. 1596), this QoS policy configures the DDS on-the-network protocol (RTPS).*
- **DATA_WRITER_RESOURCE_LIMITS**

  *<<**extension**>> (p. 796) Various settings that configure how a **DDS_DataWriter** (p. 488) allocates and uses physical memory for internal resources.*
- **DATA_WRITER_TRANSFER_MODE**

  *<<**extension**>> (p. 796) Specifies the DataWriter transfer mode QoS.*
- **DEADLINE**

  *<<**spec**>> (p. 791) Expresses the maximum duration (deadline) within which an instance is expected to be updated.*
- **DESTINATION_ORDER**

  *<<**spec**>> (p. 791) Controls the criteria used to determine the logical order among changes made by **DDS_Publisher** (p. 446) entities to the same instance of data (i.e., matching **DDS_Topic** (p. 174) and key).*
- **DISCOVERY**

  *<<**extension**>> (p. 796) Specifies the attributes required to discover participants in the domain.*
- **DISCOVERY_CONFIG**

  *<<**extension**>> (p. 796) Specifies the discovery configuration QoS.*
- **DOMAIN_PARTICIPANT_RESOURCE_LIMITS**

  *<<**extension**>> (p. 796) Various settings that configure how a **DDS_DomainParticipant** (p. 76) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.*
- **DURABILITY**

  *<<**spec**>> (p. 791) This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **DDS_DataReader** (p. 618) entities that join the network later.*
- **DURABILITY_SERVICE**

  *<<**spec**>> (p. 791) Various settings to configure the external RTI Persistence Service used by RTI Connext for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1762) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290).*
- **ENTITY_FACTORY**

*<<**spec**>> (p. 791) A QoS policy for all **DDS_Entity** (p. 1362) types that can act as factories for one or more other **DDS_Entity** (p. 1362) types.*

- **ENTITY_NAME**

  *<<**extension**>> (p. 796) Assigns a name to a **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). Except for **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.*

- **EVENT**

  *<<**extension**>> (p. 796) Configures the internal thread in a DomainParticipant that handles timed events.*

- **HISTORY**

  *<<**spec**>> (p. 791) Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.*

- **GROUP_DATA**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.*

- **LATENCY_BUDGET**

  *<<**spec**>> (p. 791) Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.*

- **LIFESPAN**

  *<<**spec**>> (p. 791) Specifies how long the data written by the **DDS_DataWriter** (p. 488) is considered valid.*

- **LIVELINESS**

  *<<**spec**>> (p. 791) Specifies and configures the mechanism that allows **DDS_DataReader** (p. 618) entities to detect when **DDS_DataWriter** (p. 488) entities become disconnected or "dead."*

- **LOCATORFILTER**

  *<<**extension**>> (p. 796) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1909).*

- **LOGGING**

  *<<**extension**>> (p. 796) Configures the RTI Connext logging facility.*

- **MONITORING**

  *<<**extension**>> (p. 796) Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.*

- **MULTICHANNEL**

  *<<**extension**>> (p. 796) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.*

- **OWNERSHIP**

  *<<**spec**>> (p. 791) Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 488) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

- **OWNERSHIP_STRENGTH**

  *<<**spec**>> (p. 791) Specifies the value of the strength used to arbitrate among multiple **DDS_DataWriter** (p. 488) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 174) + key).*

- **PARTITION**

  *<<**spec**>> (p. 791) Set of strings that introduces logical partitions in **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), or **DDS_Subscriber** (p. 575) entities.*

- **PRESENTATION**

  *<<**spec**>> (p. 791) Specifies how the samples representing changes to data instances are presented to a subscribing application.*

- **PROFILE**

  *<<**extension**>> (p. 796) Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.*

- **PROPERTY**

  *<<**extension**>> (p. 796) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.*

- **PUBLISH_MODE**

  *<<**extension**>> (p. 796) Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its own thread to send data, instead of the user thread.*
- **READER_DATA_LIFECYCLE**

  *<<**spec**>> (p. 791) Controls how a DataReader manages the lifecycle of the data that it has received.*
- **RECEIVER_POOL**

  *<<**extension**>> (p. 796) Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).*
- **RELIABILITY**

  *<<**spec**>> (p. 791) Indicates the level of reliability offered/requested by RTI Connext.*
- **RESOURCE_LIMITS**

  *<<**spec**>> (p. 791) Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.*
- **SERVICE**

  *<<**extension**>> (p. 796) Service QoS policy is used to indicate what kind of service or tool is associated with the DDS entity.*
- **SYSTEM_RESOURCE_LIMITS**

  *<<**extension**>> (p. 796) Configures DomainParticipant-independent resources used by RTI Connext.*
- **TIME_BASED_FILTER**

  *<<**spec**>> (p. 791) Filter that allows a **DDS_DataReader** (p. 618) to specify that it is interested only in (potentially) a subset of the values of the data.*
- **TOPIC_DATA**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.*
- **TOPIC_QUERY_DISPATCH**

  *<<**extension**>> (p. 796) Configures the ability of a **DDS_DataWriter** (p. 488) to publish historical samples*
- **TRANSPORT_BUILTIN**

  *<<**extension**>> (p. 796) Specifies which built-in transports are used.*
- **TRANSPORT_MULTICAST**

  *<<**extension**>> (p. 796) Specifies the multicast address on which a **DDS_DataReader** (p. 618) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDS_DomainParticipant** (p. 76) level) transports with which to receive the multicast data.*
- **TRANSPORT_MULTICAST_MAPPING**

  *<<**extension**>> (p. 796) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.*
- **TRANSPORT_PRIORITY**

  *<<**spec**>> (p. 791) This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.*
- **TRANSPORT_SELECTION**

  *<<**extension**>> (p. 796) Specifies the physical transports that a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) may use to send or receive data.*
- **TRANSPORT_UNICAST**

  *<<**extension**>> (p. 796) Specifies a subset of transports and a port number that can be used by an Entity to receive data.*
- **TYPE_CONSISTENCY_ENFORCEMENT**

  *<<**spec**>> (p. 791) Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.*
- **TYPESUPPORT**

  ***[DEPRECATED]** (p. **968**) <<**extension**>> (p. 796) Allows you to attach application-specific values to a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.*

- **USER_DATA**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.*
- **WRITER_DATA_LIFECYCLE**

  *<<**spec**>> (p. 791) Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.*
- **WIRE_PROTOCOL**

  *<<**extension**>> (p. 796) Specifies the wire protocol related attributes for the **DDS_DomainParticipant** (p. 76).*
- **Extended Qos Support**

  *<<**extension**>> (p. 796) Types and defines used in extended QoS policies.*

Data Structures

- struct **DDS_QosPrintFormat**

  A collection of attributes used to configure how a QoS appears when printed.
- struct **DDS_QosPolicyCount**

  *Type to hold a counter for a **DDS_QosPolicyId_t** (p. 1248).*
- struct **DDS_QosPolicyCountSeq**

  *Declares IDL `sequence` < **DDS_QosPolicyCount** (p. 1929) >*

Macros

- #define **DDS_QosPrintFormat_INITIALIZER**

  *Static initializer for **DDS_QosPrintFormat** (p. 1930).*
- #define **DDS_QOS_POLICY_COUNT**

  *Number of QoS policies in **DDS_QosPolicyId_t** (p. 1248).*

Type to identify `QosPolicies`.

5.136.1 Detailed Description

All Quality of Service (QoS) policies.

Data Distribution Service (DDS) relies on the use of QoS. A QoS is a set of characteristics that controls some aspect of the behavior of DDS. A QoS is comprised of individual QoS policies (objects conceptually deriving from an *abstract* `QosPolicy` class).

"Supported QoS policies"

The QosPolicy provides the basic mechanism for an application to specify quality of service parameters. It has an attribute name that is used to uniquely identify each `QosPolicy`.

QosPolicy implementation is comprised of a name, an ID, and a type. The type of a `QosPolicy` value may be atomic, such as an integer or float, or compound (a structure). Compound types are used whenever multiple parameters must be set coherently to define a consistent value for a QosPolicy.

QoS (i.e., a list of `QosPolicy` objects) may be associated with all **DDS_Entity** (p. 1362) objects in the system such as **DDS_Topic** (p. 174), **DDS_DataWriter** (p. 488), **DDS_DataReader** (p. 618), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), and **DDS_DomainParticipant** (p. 76).

5.136.2 Specifying QoS on entities

QosPolicies can be set programmatically when an **DDS_Entity** (p. 1362) is created, or modified with the **DDS_Entity** (p. 1362)'s **set_qos (abstract)** (p. 1363) function.

QosPolicies can also be configured from XML resources (files, strings). With this approach, you can change the QoS without recompiling the application. For more information, see **Configuring QoS Profiles with XML** (p. 973).

To customize a **DDS_Entity** (p. 1362)'s QoS before creating the entity, the correct pattern is:

- First, initialize a QoS object with the appropriate INITIALIZER constant.
- Call the relevant get_<entity>_default_qos() method.
- Modify the QoS values as desired.
- Finally, create the entity.

Each `QosPolicy` is treated independently from the others. This approach has the advantage of being very extensible. However, there may be cases where several policies are in conflict. Consistency checking is performed each time the policies are modified via the **set_qos (abstract)** (p. 1363) operation, or when the **DDS_Entity** (p. 1362) is created.

When a policy is changed after being set to a given value, it is not required that the new value be applied instantaneously; RTI Connext is allowed to apply it after a transition phase. In addition, some `QosPolicy` have immutable semantics, meaning that they can only be specified either at **DDS_Entity** (p. 1362) creation time or else prior to calling the **DDS_Entity_enable** (p. 1365) operation on the entity.

Each **DDS_Entity** (p. 1362) can be configured with a list of `QosPolicy` objects. However, not all QosPolicies are supported by each **DDS_Entity** (p. 1362). For instance, a **DDS_DomainParticipant** (p. 76) supports a different set of QosPolicies than a **DDS_Topic** (p. 174) or a **DDS_Publisher** (p. 446).

Additional properties that are not exposed through the formal QoS policies can also be set for an **DDS_Entity** (p. 1362) via the **DDS_PropertyQosPolicy** (p. 1905). These properties are described in the `Property Reference Guide`.

5.136.3 QoS compatibility

In several cases, for communications to occur properly (or efficiently), a QosPolicy on the publisher side must be compatible with a corresponding policy on the subscriber side. For example, if a **DDS_Subscriber** (p. 575) requests to receive data reliably while the corresponding **DDS_Publisher** (p. 446) defines a best-effort policy, communication will not happen as requested.

To address this issue and maintain the desirable decoupling of publication and subscription as much as possible, the QosPolicy specification follows the **subscriber-requested, publisher-offered pattern**.

In this pattern, the subscriber side can specify a "requested" value for a particular `QosPolicy`. The publisher side specifes an "offered" value for that `QosPolicy`. RTI Connext will then determine whether the value requested by the subscriber side is compatible with what is offered by the publisher side. If the two policies are compatible, then communication will be established. If the two policies are not compatible, RTI Connext will not establish communications between the two **DDS_Entity** (p. 1362) objects and will record this fact by means of the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 1231) on the publisher end and **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 1231) on the subscriber end. The application can detect this fact by means of a **DDS_Listener** (p. 1819) or a **DDS_Condition** (p. 1372).

The following **properties** are defined on a QosPolicy.

- **RxO (**p. **1247) property**
  The QosPolicy objects that need to be set in a compatible manner between the **publisher** and **subscriber** end are indicated by the setting of the **RxO** (p. 1247) property:
  - **RxO** (p. 1247) = **YES**
    indicates that the policy can be set both at the publishing and subscribing ends and the values must be set in a compatible manner. In this case the compatible values are explicitly defined.
  - **RxO** (p. 1247) = **NO**
    indicates that the policy can be set both at the publishing and subscribing ends but the two settings are independent. That is, all combinations of values are compatible.
  - **RxO** (p. 1247) = **N/A**
    indicates that the policy can only be specified at either the publishing or the subscribing end, but not at both ends. So compatibility does not apply.
- **Changeable (**p. **1247)property**
  Determines whether a QosPolicy can be changed.
  - **NO (**p. **1247)** -- policy can only be specified at **DDS_Entity** (p. 1362) creation time.
  - **UNTIL ENABLE (**p. **1247)** -- policy can only be changed before the **DDS_Entity** (p. 1362) is enabled.
  - **YES (**p. **1247)** -- policy can be changed at any time.

5.136.4 Macro Definition Documentation

5.136.4.1 DDS_QosPrintFormat_INITIALIZER

```
#define DDS_QosPrintFormat_INITIALIZER
```

Static initializer for **DDS_QosPrintFormat** (p. 1930).

Use this initializer to ensure that new objects do not have uninitialized contents.
```
struct DDS_QosPrintFormat format = DDS_QosPrintFormat_INITIALIZER;
```

See also

DDS_QosPrintFormat (p. 1930)

5.136.4.2 DDS_QOS_POLICY_COUNT

```
#define DDS_QOS_POLICY_COUNT
```

Number of QoS policies in **DDS_QosPolicyId_t** (p. 1248).

5.136.5 Enumeration Type Documentation

5.136.5.1 DDS_QosPolicyId_t

```
enum DDS_QosPolicyId_t
```

Type to identify `QosPolicies`.

Enumerator

DDS_INVALID_QOS_POLICY_ID	Identifier for an invalid QoS policy.
DDS_USERDATA_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_UserDataQosPolicy** (p. 2092)
DDS_DURABILITY_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_DurabilityQosPolicy** (p. 1762)
DDS_PRESENTATION_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_PresentationQosPolicy** (p. 1894)
DDS_DEADLINE_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_DeadlineQosPolicy** (p. 1685)
DDS_LATENCYBUDGET_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_LatencyBudgetQosPolicy** (p. 1816)
DDS_OWNERSHIP_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_OwnershipQosPolicy** (p. 1867)

Enumerator

DDS_OWNERSHIPSTRENGTH_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_OwnershipStrengthQosPolicy** (p. 1872)
DDS_LIVELINESS_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_LivelinessQosPolicy** (p. 1826)
DDS_TIMEBASEDFILTER_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_TimeBasedFilterQosPolicy** (p. 2038)
DDS_PARTITION_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_PartitionQosPolicy** (p. 1884)
DDS_RELIABILITY_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_ReliabilityQosPolicy** (p. 1940)
DDS_DESTINATIONORDER_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_DestinationOrderQosPolicy** (p. 1688)
DDS_HISTORY_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_HistoryQosPolicy** (p. 1808)
DDS_RESOURCELIMITS_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_ResourceLimitsQosPolicy** (p. 1953)
DDS_ENTITYFACTORY_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_EntityFactoryQosPolicy** (p. 1791)
DDS_WRITERDATALIFECYCLE_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_WriterDataLifecycleQosPolicy** (p. 2112)
DDS_READERDATALIFECYCLE_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_ReaderDataLifecycleQosPolicy** (p. 1934)
DDS_TOPICDATA_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_TopicDataQosPolicy** (p. 2046)
DDS_GROUPDATA_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_GroupDataQosPolicy** (p. 1806)
DDS_TRANSPORTPRIORITY_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_TransportPriorityQosPolicy** (p. 2068)
DDS_LIFESPAN_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_LifespanQosPolicy** (p. 1818)
DDS_DURABILITYSERVICE_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_DurabilityServiceQosPolicy** (p. 1767)
DDS_DATA_REPRESENTATION_QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_DataRepresentationQosPolicy** (p. 1639)
DDS_TYPE_CONSISTENCY_ENFORCEMENT_↩ QOS_POLICY_ID	<<***spec***>> *(p. 791)* Identifier for **DDS_TypeConsistencyEnforcementQosPolicy** (p. 2082)
DDS_DATATAG_QOS_POLICY_ID	Identifier for **DDS_DataTagQosPolicy** (p. 1266).
DDS_WIREPROTOCOL_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_WireProtocolQosPolicy** (p. 2099)
DDS_DISCOVERY_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DiscoveryQosPolicy** (p. 1717)
DDS_DATAREADERRESOURCELIMITS_QOS_↩ POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619)
DDS_DATAWRITERRESOURCELIMITS_QOS_↩ POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DataWriterResourceLimitsQosPolicy** (p. 1674)

Enumerator

DDS_DATAREADERPROTOCOL_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DataReaderProtocolQosPolicy** (p. 1596)
DDS_DATAWRITERPROTOCOL_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DataWriterProtocolQosPolicy** (p. 1649)
DDS_DOMAINPARTICIPANTRESOURCELIMITS_↩ QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 1733)
DDS_EVENT_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_EventQosPolicy** (p. 1796)
DDS_DATABASE_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DatabaseQosPolicy** (p. 1581)
DDS_RECEIVERPOOL_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_ReceiverPoolQosPolicy** (p. 1938)
DDS_DISCOVERYCONFIG_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DiscoveryConfigQosPolicy** (p. 1691)
DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_SystemResourceLimitsQosPolicy** (p. 2030)
DDS_TRANSPORTSELECTION_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TransportSelectionQosPolicy** (p. 2070)
DDS_TRANSPORTUNICAST_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TransportUnicastQosPolicy** (p. 2071)
DDS_TRANSPORTMULTICAST_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TransportMulticastQosPolicy** (p. 2064)
DDS_TRANSPORTBUILTIN_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TransportBuiltinQosPolicy** (p. 2057)
DDS_TYPESUPPORT_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TypeSupportQosPolicy** (p. 2087)
DDS_PROPERTY_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_PropertyQosPolicy** (p. 1905)
DDS_PUBLISHMODE_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_PublishModeQosPolicy** (p. 1924)
DDS_ASYNCHRONOUSPUBLISHER_QOS_↩ POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_AsynchronousPublisherQosPolicy** (p. 1539)
DDS_ENTITYNAME_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_EntityNameQosPolicy** (p. 1793)
DDS_BATCH_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_BatchQosPolicy** (p. 1552)
DDS_PROFILE_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_ProfileQosPolicy** (p. 1902)
DDS_LOCATORFILTER_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_LocatorFilterQosPolicy** (p. 1832)
DDS_MULTICHANNEL_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_MultiChannelQosPolicy** (p. 1860)
DDS_AVAILABILITY_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_AvailabilityQosPolicy** (p. 1547)
DDS_TRANSPORTMULTICASTMAPPING_QOS_↩ POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TransportMulticastMappingQosPolicy** (p. 2062)

Enumerator

DDS_LOGGING_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_LoggingQosPolicy** (p. 1834)
DDS_TOPICQUERYDISPATCH_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_TopicQueryDispatchQosPolicy** (p. 2053)
DDS_DATAWRITERTRANSFERMODE_QOS_↩ POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_DataWriterTransferModeQosPolicy** (p. 1684)
DDS_MONITORING_QOS_POLICY_ID	<<***extension***>> *(p. 796)* Identifier for **DDS_MonitoringQosPolicy** (p. 1856)

5.137 QoS by Category

Quality of Service (QoS) organized into categories.

Modules

- **Basic QoS**

  QoS that are considered basic and fundamental to RTI Connext.
- **DDS Specification QoS**

  QoS that are defined in one of the OMG DDS Specifications.
- **DDS Extension QoS**

  QoS that are RTI extensions to the DDS standard.
- **Functional Categories**

  *These categories help you to discover which QoS may be relevant or related to a desired functionality or feature. For example, if you are interested in **Sending Large Data** (p. 873), then looking at any QoS in that category will be helpful.*
- **QoS Mutability**

  Some QoS are mutable after an entity is enabled, and others are not.
- **Other QoS Attributes**

  *These attributes are characteristics of the QoS – for example if they are **mutable** (p. 952) or **immutable** (p. 916), or if they **apply per-instance** (p. 958).*
- **Deprecated QoS**

  Deprecated QoS.

5.137.1 Detailed Description

Quality of Service (QoS) organized into categories.

The QoS have been grouped into a number of different categories.

These categories can help you to discover which QoS may be relevant or related to a desired functionality or feature. For example, if you are interested in **Sending Large Data** (p. 873), then looking at any QoS in that category will be helpful. The different functional categories are listed on **Functional Categories** (p. 835).

Some categories are not necessarily related to achieving a specific functionality, but are characteristics of the QoS – for example if they are **mutable** (p. 952) or **immutable** (p. 916), or if they **apply per-instance** (p. 958). These categories are listed under **QoS Mutability** (p. 916) and **Other QoS Attributes** (p. 958).

5.138 ASYNCHRONOUS_PUBLISHER

<<***extension***>> *(p. 796)* Specifies the asynchronous publishing settings of the **DDS_Publisher** (p. 446) instances.

Data Structures

- struct **DDS_AsynchronousPublisherQosPolicy**
  <<***extension***>> *(p. 796) Configures the mechanism that sends user data in an external middleware thread.*

Variables

- const char *const **DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME**
  *Stringified human-readable name for **DDS_AsynchronousPublisherQosPolicy** (p. 1539).*

5.138.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the asynchronous publishing settings of the **DDS_Publisher** (p. 446) instances.

5.138.2 Variable Documentation

5.138.2.1 DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME

```
const char* const DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_AsynchronousPublisherQosPolicy** (p. 1539).

5.139 AVAILABILITY

<<***extension***>> *(p. 796)* Configures the availability of data.

Data Structures

- struct **DDS_EndpointGroup_t**
  Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.
- struct **DDS_EndpointGroupSeq**
  *A sequence of **DDS_EndpointGroup_t** (p. 1787).*
- struct **DDS_AvailabilityQosPolicy**
  <<***extension***>> *(p. 796) Configures the availability of data.*

Variables

- const char ∗const **DDS_AVAILABILITY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_AvailabilityQosPolicy** (p. 1547).*

5.139.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the availability of data.

5.139.2 Variable Documentation

5.139.2.1 DDS_AVAILABILITY_QOS_POLICY_NAME

```
const char* const DDS_AVAILABILITY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_AvailabilityQosPolicy** (p. 1547).

5.140 BATCH

<<***extension***>> *(p. 796)* Batch QoS policy used to enable batching in **DDS_DataWriter** (p. 488) instances.

Data Structures

- struct **DDS_BatchQosPolicy**

  <<***extension***>> *(p. 796) Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.*

Variables

- const char ∗const **DDS_BATCH_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_BatchQosPolicy** (p. 1552).*

5.140.1 Detailed Description

<<***extension***>> *(p. 796)* Batch QoS policy used to enable batching in **DDS_DataWriter** (p. 488) instances.

5.140.2 Variable Documentation

5.140.2.1 DDS_BATCH_QOS_POLICY_NAME

```
const char* const DDS_BATCH_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_BatchQosPolicy** (p. 1552).

5.141 DATABASE

<<***extension***>> *(p. 796)* Various threads and resource limits settings used by RTI Connext to control its internal database.

Data Structures

- struct **DDS_DatabaseQosPolicy**

  <<***extension***>> (p. *796) Various threads and resource limits settings used by RTI Connext to control its internal database.*

Variables

- const char ∗const **DDS_DATABASE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DatabaseQosPolicy** (p. 1581).*

5.141.1 Detailed Description

<<***extension***>> *(p. 796)* Various threads and resource limits settings used by RTI Connext to control its internal database.

5.141.2 Variable Documentation

5.141.2.1 DDS_DATABASE_QOS_POLICY_NAME

```
const char* const DDS_DATABASE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DatabaseQosPolicy** (p. 1581).

5.142 DATA_READER_PROTOCOL

<<***extension***>> *(p. 796)* Specifies the DataReader-specific protocol QoS.

Data Structures

- struct **DDS_DataReaderProtocolQosPolicy**

  <<***extension***>> *(p. 796) Along with **DDS_WireProtocolQosPolicy** (p. 2099) and **DDS_DataWriterProtocolQosPolicy** (p. 1649), this QoS policy configures the DDS on-the-network protocol (RTPS).*

Variables

- const char ∗const **DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DataReaderProtocolQosPolicy** (p. 1596).*

5.142.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the DataReader-specific protocol QoS.

5.142.2 Variable Documentation

5.142.2.1 DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME

```
const char* const DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DataReaderProtocolQosPolicy** (p. 1596).

5.143 DATA_READER_RESOURCE_LIMITS

<<***extension***>> *(p. 796)* Various settings that configure how DataReaders allocate and use physical memory for internal resources.

Data Structures

- struct **DDS_DataReaderResourceLimitsInstanceReplacementSettings**

  Instance replacement kind applied to each instance state.

- struct **DDS_DataReaderResourceLimitsQosPolicy**

  <<***extension***>> *(p. 796) Various settings that configure how a **DDS_DataReader** (p. 618) allocates and uses physical memory for internal resources.*

Enumerations

- enum **DDS_DataReaderInstanceRemovalKind** {
  DDS_NO_INSTANCE_REMOVAL = PRES_NO_INSTANCE_REMOVAL ,
  DDS_EMPTY_INSTANCE_REMOVAL = PRES_EMPTY_INSTANCE_REMOVAL ,
  DDS_FULLY_PROCESSED_INSTANCE_REMOVAL = PRES_FULLY_PROCESSED_INSTANCE_REMOVAL ,
  DDS_ANY_INSTANCE_REMOVAL = PRES_ANY_INSTANCE_REMOVAL }

  *Sets the kinds of instances that can be replaced when instance resource limits (**DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956)) are reached.*

Variables

- const char ∗const **DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619).*
- const **DDS_Long** **DDS_AUTO_MAX_TOTAL_INSTANCES**

  *<<**extension**>> (p. 796) This value is used to make **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 1629) equal to **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956).*

5.143.1 Detailed Description

<<***extension***>> *(p. 796)* Various settings that configure how DataReaders allocate and use physical memory for internal resources.

5.143.2 Enumeration Type Documentation

5.143.2.1 DDS_DataReaderInstanceRemovalKind

enum **DDS_DataReaderInstanceRemovalKind**

Sets the kinds of instances that can be replaced when instance resource limits (**DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956)) are reached.

See also

DDS_DataReaderResourceLimitsQosPolicy::instance_replacement (p. 1635)

Enumerator

DDS_NO_INSTANCE_REMOVAL	No instance can be removed. If an instance resource is required because **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956) is reached, this setting will disallow instances from being replaced. Samples for new instances will be dropped and reported as lost with reason **DDS_LOST_BY_INSTANCES_LIMIT** (p. 621).
DDS_EMPTY_INSTANCE_REMOVAL	Only empty instances can be removed. Instances can be replaced only if they are empty. An instance is considered empty when all samples have been taken or removed from the DataReader queue due to the **DDS_LifespanQosPolicy** (p. 1818) or sample purging due to the **DDS_ReaderDataLifecycleQosPolicy** (p. 1934), and there are no outstanding loans on any of the instance's samples.
DDS_FULLY_PROCESSED_INSTANCE_REMOVAL	Only fully-processed instances can be removed. An instance is considered fully processed if every sample for the instance has been processed by the application. A sample is considered processed by the application depending on the **DDS_ReliabilityQosPolicy::kind** (p. 1943): • **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) (depends on the **DDS_ReliabilityQosPolicy↩ AcknowledgmentModeKind** (p. 1325)): – **DDS_PROTOCOL_↩ ACKNOWLEDGMENT_MODE** (p. 1325) or **DDS_APPLICATION_AUTO_↩ ACKNOWLEDGMENT_MODE** (p. 1325): The sample is considered processed when it has been read or taken by the application and return_loan has been called. – **DDS_APPLICATION_EXPLICIT_↩ ACKNOWLEDGMENT_MODE** (p. 1326): The sample is considered processed when the subscribing application has explicitly acknowledged the DDS sample, the AppAckConf has been received, and the application has called return_loan. • **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325): All samples are considered processed when they have been read or taken by the application and return_loan has been called.
DDS_ANY_INSTANCE_REMOVAL	Any instance can be removed. Instances can be replaced regardless of whether the subscribing application has processed all of the samples. Samples that have not been processed will be removed.

5.143.3 Variable Documentation

5.143.3.1 DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619).

5.143.3.2 DDS_AUTO_MAX_TOTAL_INSTANCES

```
const  DDS_Long DDS_AUTO_MAX_TOTAL_INSTANCES  [extern]
```

<<***extension***>> *(p. 796)* This value is used to make **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 1629) equal to **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956).

5.144 DATA_REPRESENTATION

<<***spec***>> *(p. 791)* A list of data representations and compression methods supported by a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618).

Modules

- **Compression Settings**

  <<***extension***>> *(p. 796) Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.*

Data Structures

- struct **DDS_DataRepresentationIdSeq**

  Declares IDL `sequence` *<* ***DDS_DataRepresentationId_t*** *(p. 1259) >*
- struct **DDS_DataRepresentationQosPolicy**

  <<***spec***>> *(p. 791) This QoS policy contains a list of representation identifiers and compression settings used by* ***DDS_DataWriter*** *(p. 488) and* ***DDS_DataReader*** *(p. 618) entities to negotiate which data representation and compression settings to use.*

Typedefs

- typedef **DDS_Short DDS_DataRepresentationId_t**

  A two-byte signed integer that identifies a data representation.

Variables

- const **DDS_DataRepresentationId_t DDS_XCDR_DATA_REPRESENTATION**

  Corresponds to the Extended Common Data Representation encoding version 1.
- const **DDS_DataRepresentationId_t DDS_XML_DATA_REPRESENTATION**

  Corresponds to the XML Data Representation (unsupported).
- const **DDS_DataRepresentationId_t DDS_XCDR2_DATA_REPRESENTATION**

  Corresponds to the Extended Common Data Representation encoding version 2.
- const **DDS_DataRepresentationId_t DDS_AUTO_DATA_REPRESENTATION**

  Representation is automatically chosen based on the type.
- const char *const **DDS_DATA_REPRESENTATION_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DataRepresentationQosPolicy** (p. 1639).*

5.144.1 Detailed Description

<<***spec***>> *(p. 791)* A list of data representations and compression methods supported by a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618).

5.144.2 Typedef Documentation

5.144.2.1 DDS_DataRepresentationId_t

```
typedef DDS_Short DDS_DataRepresentationId_t
```

A two-byte signed integer that identifies a data representation.

5.144.3 Variable Documentation

5.144.3.1 DDS_XCDR_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XCDR_DATA_REPRESENTATION [extern]
```

Corresponds to the Extended Common Data Representation encoding version 1.

5.144.3.2 DDS_XML_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XML_DATA_REPRESENTATION [extern]
```

Corresponds to the XML Data Representation (unsupported).

Note

This value is currently not supported.

5.144.3.3 DDS_XCDR2_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XCDR2_DATA_REPRESENTATION [extern]
```

Corresponds to the Extended Common Data Representation encoding version 2.

5.144.3.4 DDS_AUTO_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_AUTO_DATA_REPRESENTATION [extern]
```

Representation is automatically chosen based on the type.

For plain language binding, if the allowed_data_representation annotation is not specified or if it contains the value XCDR, RTI Connext translates this field to **DDS_XCDR_DATA_REPRESENTATION** (p. 1259). Otherwise, it translates this field to **DDS_XCDR2_DATA_REPRESENTATION** (p. 1260).

For the **FlatData language binding** (p. 208), RTI Connext translates this field to **DDS_XCDR2_DATA_↩ REPRESENTATION** (p. 1260).

Examples

HelloWorldPlugin.c.

5.144.3.5 DDS_DATA_REPRESENTATION_QOS_POLICY_NAME

```
const char* const DDS_DATA_REPRESENTATION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataRepresentationQosPolicy** (p. 1639).

5.145 Compression Settings

<<***extension***>> *(*p. *796)* Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.

Data Structures

- struct **DDS_CompressionSettings_t**

  <<***extension***>> *(*p. *796) Settings related to compressing user data.*

Macros

- #define **DDS_COMPRESSION_ID_MASK_NONE** ((**DDS_CompressionIdMask**) (0))

  DDS_CompressionIdMask *(*p. *1264) used to disable user-data compression for an endpoint.*

Typedefs

- typedef **DDS_UnsignedLong DDS_CompressionId_t**

  A four-byte signed integer that identifies a single compression algorithm.
- typedef **DDS_UnsignedLong DDS_CompressionIdMask**

  A four-byte signed integer that identifies a mask of the compression IDs that the algorithms enabled.

Variables

- const **DDS_CompressionId_t DDS_COMPRESSION_ID_ZLIB**

  Corresponds to the ID of the compression algorithm ZLIB. This is the only built-in compression algorithm that is supported when batching is enabled.
- const **DDS_CompressionId_t DDS_COMPRESSION_ID_BZIP2**

  Corresponds to the ID of the compression algorithm BZIP2.
- const **DDS_CompressionId_t DDS_COMPRESSION_ID_LZ4**

  Corresponds to the ID of the compression algorithm LZ4.

5.145.1 Detailed Description

<<***extension***>> *(p. 796)* Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.

5.145.2 Macro Definition Documentation

5.145.2.1 DDS_COMPRESSION_ID_MASK_NONE

```
#define DDS_COMPRESSION_ID_MASK_NONE (( DDS_CompressionIdMask) (0))
```

DDS_CompressionIdMask (p. 1264) used to disable user-data compression for an endpoint.

5.145.2.2 DDS_COMPRESSION_ID_MASK_ALL

```
#define DDS_COMPRESSION_ID_MASK_ALL
```

Value:

```
((DDS_CompressionIdMask) \
        (DDS_COMPRESSION_ID_ZLIB_BIT | DDS_COMPRESSION_ID_BZIP2_BIT \
                | DDS_COMPRESSION_ID_LZ4_BIT))
```

DDS_CompressionIdMask (p. 1264) mask with all the suported built-in compression algorithms enabled.

5.145.2.3 DDS_COMPRESSION_LEVEL_BEST_COMPRESSION

```
#define DDS_COMPRESSION_LEVEL_BEST_COMPRESSION (10)
```

The best compression ratio possible for a compression algorithm.

See also

DDS_CompressionSettings_t::writer_compression_level (p. 1569)

5.145.2.4 DDS_COMPRESSION_LEVEL_BEST_SPEED

```
#define DDS_COMPRESSION_LEVEL_BEST_SPEED (1)
```

The best compression speed possible for a compression algorithm.

See also

DDS_CompressionSettings_t::writer_compression_level (p. 1569)

5.145.2.5 DDS_COMPRESSION_LEVEL_DEFAULT

```
#define DDS_COMPRESSION_LEVEL_DEFAULT  DDS_COMPRESSION_LEVEL_BEST_COMPRESSION
```

Default level of compression.

See also

DDS_CompressionSettings_t::writer_compression_level (p. 1569)

5.145.2.6 DDS_COMPRESSION_THRESHOLD_DEFAULT

```
#define DDS_COMPRESSION_THRESHOLD_DEFAULT 8192
```

Default threshold from which a serialized sample will be eligible to be compressed.

See also

DDS_CompressionSettings_t::writer_compression_threshold (p. 1569)

This value has been decided after some performance tests, it's a prudent value that will ensure, in most cases with all of the algorithms, that we are going to compress the sample.

5.145.2.7 DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT

```
#define DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT  DDS_COMPRESSION_ID_MASK_NONE
```

DDS_CompressionIdMask (p. 1264) mask with the default value for publication.

See also

DDS_CompressionSettings_t::compression_ids (p. 1568)

DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT (p. 1263)

5.145.2.8 DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT

```
#define DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT
```

Value:

```
(DDS_COMPRESSION_ID_ZLIB_BIT | DDS_COMPRESSION_ID_BZIP2_BIT \
    | DDS_COMPRESSION_ID_LZ4_BIT)
```

DDS_CompressionIdMask (p. 1264) mask with the default value for subscription.

See also

DDS_CompressionSettings_t::compression_ids (p. 1568)

DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT (p. 1263)

5.145.3 Typedef Documentation

5.145.3.1 DDS_CompressionId_t

```
typedef DDS_UnsignedLong DDS_CompressionId_t
```

A four-byte signed integer that identifies a single compression algorithm.

5.145.3.2 DDS_CompressionIdMask

```
typedef DDS_UnsignedLong DDS_CompressionIdMask
```

A four-byte signed integer that identifies a mask of the compression IDs that the algorithms enabled.

5.145.4 Variable Documentation

5.145.4.1 DDS_COMPRESSION_ID_ZLIB

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_ZLIB [extern]
```

Corresponds to the ID of the compression algorithm ZLIB. This is the only built-in compression algorithm that is supported when batching is enabled.

5.145.4.2 DDS_COMPRESSION_ID_BZIP2

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_BZIP2 [extern]
```

Corresponds to the ID of the compression algorithm BZIP2.

5.145.4.3 DDS_COMPRESSION_ID_LZ4

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_LZ4 [extern]
```

Corresponds to the ID of the compression algorithm LZ4.

5.146 DATA_TAG

<<***spec***>> *(*p. *791)* Stores (name, value) pairs that can be used to determine access permissions.

Data Structures

- struct **DDS_Tag**

  Tags are name/value pair objects.
- struct **DDS_TagSeq**

  Declares IDL `sequence` *<* ***DDS_Tag*** *(*p. *2032)>*
- struct **DDS_DataTags**

  Definition of ***DDS_DataTagQosPolicy*** *(*p. *1266).*

Typedefs

- typedef struct **DDS_DataTags** **DDS_DataTagQosPolicy**

  *<<**spec**>> (*p. *791) Stores (name, value) pairs that can be used to determine access permissions.*

Functions

- struct **DDS_Tag** ∗ **DDS_DataTagQosPolicyHelper_lookup_tag** (const **DDS_DataTagQosPolicy** ∗policy, const char ∗name)

  Searches by tag name for a tag in the input policy.
- **DDS_ReturnCode_t** **DDS_DataTagQosPolicyHelper_assert_tag** (**DDS_DataTagQosPolicy** ∗policy, const char ∗name, const char ∗value)

  Asserts the tag identified by name in the input policy.
- **DDS_ReturnCode_t** **DDS_DataTagQosPolicyHelper_add_tag** (**DDS_DataTagQosPolicy** ∗policy, const char ∗name, const char ∗value)

  Adds a new tag to the input policy.
- **DDS_ReturnCode_t** **DDS_DataTagQosPolicyHelper_remove_tag** (**DDS_DataTagQosPolicy** ∗policy, const char ∗name)

  Removes a tag from the input policy.
- **DDS_Long** **DDS_DataTagQosPolicyHelper_get_number_of_tags** (const **DDS_DataTagQosPolicy** ∗policy)

  Gets the number of data tags in the input policy.

Variables

- const char ∗const **DDS_DATATAG_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DataTagQosPolicy** (p. 1266).*

5.146.1 Detailed Description

<<***spec***>> *(p. 791)* Stores (name, value) pairs that can be used to determine access permissions.

The **DDS_DataTagQosPolicy** (p. 1266) can be used to associate a set of tags in the form of (name, value) pairs with a **DDS_DataReader** (p. 618) or **DDS_DataWriter** (p. 488). This is similar to the **DDS_PropertyQosPolicy** (p. 1905), except you cannot select whether or not a particular pair should be propagated (included in the built-in topic). Data tags are always propagated. The Access Control plugin may use the tags to determine publish and subscribe permissions.

5.146.2 Typedef Documentation

5.146.2.1 DDS_DataTagQosPolicy

`typedef struct` **`DDS_DataTags`** **`DDS_DataTagQosPolicy`**

<<***spec***>> *(p. 791)* Stores (name, value) pairs that can be used to determine access permissions.

Entity:

DDS_DataReader (p. 618) **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = N/A;
Changeable (p. 1247) = **NO** (p. 1247)

5.146.3 Usage

The DATA_TAG QoS policy can be used to associate a set of tags in the form of (name, value) pairs with a **DDS_Data↩ Reader** (p. 618) or **DDS_DataWriter** (p. 488). This is similar to the **DDS_PropertyQosPolicy** (p. 1905), except for the following differences:

- Data tags are always propagated. You cannot select whether or not a particular pair should be propagated.
- Data tags are not exposed to API functions, such as **DDS_DataWriter_get_matched_subscription_data** (p. 543), that receive **DDS_PublicationBuiltinTopicData** (p. 1909) or **DDS_SubscriptionBuiltinTopicData** (p. 2018) as a parameter.
- Connext passes data tags to the Access Control Security Plugin, which may use them to decide whether to allow or deny the corresponding entities.

There are helper functions to facilitate working with data tags. See the **DATA_TAG** (p. 1265) page.

5.146.4 Function Documentation

5.146.4.1 DDS_DataTagQosPolicyHelper_lookup_tag()

```
struct  DDS_Tag * DDS_DataTagQosPolicyHelper_lookup_tag (
             const  DDS_DataTagQosPolicy * policy,
             const char * name )
```

Searches by tag name for a tag in the input policy.

Precondition

policy, name and value cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Tag name.

Returns

The function returns the first tag with the given name. If such a tag does not exist, the function returns NULL.

5.146.4.2 DDS_DataTagQosPolicyHelper_assert_tag()

```
DDS_ReturnCode_t DDS_DataTagQosPolicyHelper_assert_tag (
              DDS_DataTagQosPolicy * policy,
             const char * name,
             const char * value )
```

Asserts the tag identified by name in the input policy.

If the tag already exists, this function replaces its current value with the new one.

If the tag identified by name does not exist, this function adds it to the tag set.

This function increases the maximum number of elements of the policy sequence by 10 when this number is not enough to store the new tag.

Precondition

policy, name and value cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Tag name.
value	<<***in***>> *(*p. *1015)* Tag value.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224)

5.146.4.3 DDS_DataTagQosPolicyHelper_add_tag()

```
DDS_ReturnCode_t DDS_DataTagQosPolicyHelper_add_tag (
             DDS_DataTagQosPolicy * policy,
            const char * name,
            const char * value )
```

Adds a new tag to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connext.

If the maximum number of elements of the policy sequence is not enough to store the new tag, this function will increase it by 10.

If the tag already exists, the function will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

Precondition

policy, name and value cannot be NULL.

The tag is not in the policy.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Tag name.
value	<<***in***>> *(*p. *1015)* Tag value.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224), **DDS↩ _RETCODE_OUT_OF_RESOURCES** (p. 1224)

5.146.4.4 DDS_DataTagQosPolicyHelper_remove_tag()

```
DDS_ReturnCode_t DDS_DataTagQosPolicyHelper_remove_tag (
             DDS_DataTagQosPolicy * policy,
            const char * name )
```

Removes a tag from the input policy.

If the tag does not exist, the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

Precondition

policy and name cannot be NULL.

The tag is in the policy.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Tag name.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224)

5.146.4.5 DDS_DataTagQosPolicyHelper_get_number_of_tags()

```
DDS_Long DDS_DataTagQosPolicyHelper_get_number_of_tags (
            const  DDS_DataTagQosPolicy * policy )
```

Gets the number of data tags in the input policy.

Precondition

policy cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.

Returns

Number of data tags.

5.146.5 Variable Documentation

5.146.5.1 DDS_DATATAG_QOS_POLICY_NAME

```
const char* const DDS_DATATAG_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DataTagQosPolicy** (p. 1266).

5.147 DATA_WRITER_PROTOCOL

<<***extension***>> *(p. 796)* Along with **DDS_WireProtocolQosPolicy** (p. 2099) and **DDS_DataReaderProtocolQos↩ Policy** (p. 1596), this QoS policy configures the DDS on-the-network protocol (RTPS).

Data Structures

- struct **DDS_DataWriterProtocolQosPolicy**
  <<***extension***>> *(p. 796) Protocol that applies only to **DDS_DataWriter** (p. 488) instances.*

Variables

- const char *const **DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME**
  *Stringified human-readable name for **DDS_DataWriterProtocolQosPolicy** (p. 1649).*

5.147.1 Detailed Description

<<***extension***>> *(p. 796)* Along with **DDS_WireProtocolQosPolicy** (p. 2099) and **DDS_DataReaderProtocolQos↩ Policy** (p. 1596), this QoS policy configures the DDS on-the-network protocol (RTPS).

5.147.2 Variable Documentation

5.147.2.1 DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME

```
const char* const DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DataWriterProtocolQosPolicy** (p. 1649).

5.148 DATA_WRITER_RESOURCE_LIMITS

*<<**extension**>> (p. 796)* Various settings that configure how a **DDS_DataWriter** (p. 488) allocates and uses physical memory for internal resources.

Data Structures

- struct **DDS_DataWriterResourceLimitsQosPolicy**

  *<<**extension**>> (p. 796) Various settings that configure how a **DDS_DataWriter** (p. 488) allocates and uses physical memory for internal resources.*

Enumerations

- enum **DDS_DataWriterResourceLimitsInstanceReplacementKind** {
  DDS_UNREGISTERED_INSTANCE_REPLACEMENT ,
  DDS_ALIVE_INSTANCE_REPLACEMENT ,
  DDS_DISPOSED_INSTANCE_REPLACEMENT ,
  DDS_ALIVE_THEN_DISPOSED_INSTANCE_REPLACEMENT ,
  DDS_DISPOSED_THEN_ALIVE_INSTANCE_REPLACEMENT ,
  DDS_ALIVE_OR_DISPOSED_INSTANCE_REPLACEMENT }

  Sets the kinds of instances that can be replaced when instance resource limits are reached.

Variables

- const char ∗const **DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DataWriterResourceLimitsQosPolicy** (p. 1674).*

5.148.1 Detailed Description

*<<**extension**>> (p. 796)* Various settings that configure how a **DDS_DataWriter** (p. 488) allocates and uses physical memory for internal resources.

5.148.2 Enumeration Type Documentation

5.148.2.1 DDS_DataWriterResourceLimitsInstanceReplacementKind

enum **DDS_DataWriterResourceLimitsInstanceReplacementKind**

Sets the kinds of instances that can be replaced when instance resource limits are reached.

When **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956) is reached, a **DDS_DataWriter** (p. 488) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kind specified by **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 1678).

Only instances whose states match the specified kinds are eligible to be replaced. In addition, an instance must have had all of its samples fully acknowledged for it to be considered replaceable.

For all kinds, a **DDS_DataWriter** (p. 488) will replace the oldest instance satisfying that kind. For example, when the kind is **DDS_UNREGISTERED_INSTANCE_REPLACEMENT** (p. 1272), a **DDS_DataWriter** (p. 488) will remove the oldest, fully acknowledged, unregistered instance, if such an instance exists.

If no replaceable instance exists, the invoked function will either return with an appropriate out-of-resources return code, or in the case of a write, it may first block to wait for an instance to be acknowledged. Otherwise, the **DDS_DataWriter** (p. 488) will replace the old instance with the new instance, and invoke, if available, the **DDS_DataWriterListener::on_instance_replaced** (p. 1647) to notify the user about an instance being replaced.

A **DDS_DataWriter** (p. 488) checks for replaceable instances in the following order, stopping once a replaceable instance is found:

- If **DDS_DataWriterResourceLimitsQosPolicy::replace_empty_instances** (p. 1678) is **DDS_BOOLEAN_TRUE** (p. 1203), a **DDS_DataWriter** (p. 488) first tries replacing instances that have no samples. These empty instances can be unregistered, disposed, or alive.
- Next, a **DDS_DataWriter** (p. 488) tries replacing unregistered instances. Since an unregistered instance indicates that the **DDS_DataWriter** (p. 488) is done modifying it, unregistered instances are replaced before instances of any other state (alive, disposed). This is the same as the **DDS_UNREGISTERED_INSTANCE_REPLACEMENT** (p. 1272) kind.
- Then, a **DDS_DataWriter** (p. 488) tries replacing what is specified by **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 1678). With unregistered instances already checked, this leaves alive and disposed instances. When both alive and disposed instances may be replaced, the kind specifies whether the particular order matters (e.g., DISPOSED_THEN_ALIVE, ALIVE_THEN_DISPOSED) or not (ALIVE_OR_DISPOSED).

QoS:

DDS_DataWriterResourceLimitsQosPolicy (p. 1674)

Enumerator

DDS_UNREGISTERED_INSTANCE_REPLACEMENT	Allows a **DDS_DataWriter** (p. 488) to reclaim unregistered acknowledged instances. By default, all instance replacement kinds first attempt to reclaim an unregistered, acknowledged instance. Used in **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 1678) **[default]**

Enumerator

DDS_ALIVE_INSTANCE_REPLACEMENT	Allows a **DDS_DataWriter** (p. 488) to reclaim alive, acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 488) to reclaim an alive, acknowledged instance, where an alive instance is a registered, non-disposed instance. The least recently registered or written alive instance will be reclaimed.
DDS_DISPOSED_INSTANCE_REPLACEMENT	Allows a **DDS_DataWriter** (p. 488) to reclaim disposed acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 488) to reclaim a disposed, acknowledged instance. The least recently disposed instance will be reclaimed.
DDS_ALIVE_THEN_DISPOSED_INSTANCE_↩ REPLACEMENT	Allows a **DDS_DataWriter** (p. 488) first to reclaim an alive, acknowledged instance, and then, if necessary, a disposed, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 488) to first try reclaiming an alive, acknowledged instance. If no instance is reclaimable, then it tries reclaiming a disposed, acknowledged instance. The least recently used (i.e., registered, written, or disposed) instance will be reclaimed.
DDS_DISPOSED_THEN_ALIVE_INSTANCE_↩ REPLACEMENT	Allows a **DDS_DataWriter** (p. 488) first to reclaim a disposed, acknowledged instance, and then, if necessary, an alive, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 488) to first try reclaiming a disposed, acknowledged instance. If no instance is reclaimable, then it tries reclaiming an alive, acknowledged instance. The least recently used (i.e., disposed, registered, or written) instance will be reclaimed.
DDS_ALIVE_OR_DISPOSED_INSTANCE_↩ REPLACEMENT	Allows a **DDS_DataWriter** (p. 488) to reclaim a either an alive acknowledged instance or a disposed acknowledged instance. When an unregistered acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 488) to reclaim either an alive, acknowledged instance or a disposed, acknowledged instance. If both instance kinds are available to reclaim, the **DDS_DataWriter** (p. 488) will reclaim the least recently used (i.e. disposed, registered, or written) instance.

5.148.3 Variable Documentation

5.148.3.1 DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DataWriterResourceLimitsQosPolicy** (p. 1674).

5.149 DATA_WRITER_TRANSFER_MODE

<<***extension***>> *(p. 796)* Specifies the DataWriter transfer mode QoS.

Data Structures

- struct **DDS_DataWriterShmemRefTransferModeSettings**
  Settings related to transferring data using shared memory references.
- struct **DDS_DataWriterTransferModeQosPolicy**
  <<***extension***>> *(p. 796) Qos related to transferring data*

Variables

- const char *const **DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME**
  *Stringified human-readable name for **DDS_DataWriterTransferModeQosPolicy** (p. 1684).*

5.149.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the DataWriter transfer mode QoS.

5.149.2 Variable Documentation

5.149.2.1 DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME

```
const char* const DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DataWriterTransferModeQosPolicy** (p. 1684).

5.150 DEADLINE

<<***spec***>> *(p. 791)* Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Data Structures

- struct **DDS_DeadlineQosPolicy**

  *<<**spec**>> (p. 791) Expresses the maximum duration (deadline) within which an instance is expected to be updated.*

Variables

- const char *const **DDS_DEADLINE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DeadlineQosPolicy** (p. 1685).*

5.150.1 Detailed Description

<<**spec**>> *(p. 791)* Expresses the maximum duration (deadline) within which an instance is expected to be updated.

5.150.2 Variable Documentation

5.150.2.1 DDS_DEADLINE_QOS_POLICY_NAME

```
const char* const DDS_DEADLINE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DeadlineQosPolicy** (p. 1685).

5.151 DESTINATION_ORDER

<<**spec**>> *(p. 791)* Controls the criteria used to determine the logical order among changes made by **DDS_Publisher** (p. 446) entities to the same instance of data (i.e., matching **DDS_Topic** (p. 174) and key).

Data Structures

- struct **DDS_DestinationOrderQosPolicy**

  *<<**spec**>> (p. 791) Controls how the middleware will deal with data sent by multiple **DDS_DataWriter** (p. 488) entities for the same instance of data (i.e., same **DDS_Topic** (p. 174) and key).*

Enumerations

- enum **DDS_DestinationOrderQosPolicyKind** {
  DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS ,
  DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS }

  Kinds of destination order.
- enum **DDS_DestinationOrderQosPolicyScopeKind** {
  DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS ,
  DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS }

  Scope of source destination order.

Variables

- const char ∗const **DDS_DESTINATIONORDER_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DestinationOrderQosPolicy** (p. 1688).*

5.151.1 Detailed Description

<<***spec***>> *(p. 791)* Controls the criteria used to determine the logical order among changes made by **DDS_Publisher** (p. 446) entities to the same instance of data (i.e., matching **DDS_Topic** (p. 174) and key).

5.151.2 Enumeration Type Documentation

5.151.2.1 DDS_DestinationOrderQosPolicyKind

`enum` **DDS_DestinationOrderQosPolicyKind**

Kinds of destination order.

QoS:

DDS_DestinationOrderQosPolicy (p. 1688)

Enumerator

DDS_BY_RECEPTION_TIMESTAMP_↩ DESTINATIONORDER_QOS	**[default]** Indicates that data is ordered based on the reception time at each **DDS_Subscriber** (p. 575). Since each subscriber may receive the data at different times there is no guarantee that the changes will be seen in the same order. Consequently, it is possible for each subscriber to end up with a different final value for the data.
DDS_BY_SOURCE_TIMESTAMP_↩ DESTINATIONORDER_QOS	Indicates that data is ordered based on a time-stamp placed at the source (by RTI Connext or by the application). In any case this guarantees a consistent final value for the data in all subscribers. Note: If Batching is needed along with **DDS_BY_↩ SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276) and **DDS_INSTANCE_SCOPE_↩ DESTINATIONORDER_QOS** (p. 1277), then the **DDS_BatchQosPolicy::source_timestamp_↩ resolution** (p. 1554) and **DDS_BatchQosPolicy::thread_safe_write** (p. 1555) setting of **DDS_BatchQosPolicy** (p. 1552) should be set to **DDS_DURATION_ZERO** (p. 1211) and **DDS_BOOLEAN_TRUE** (p. 1203) respectively.

5.151.2.2 DDS_DestinationOrderQosPolicyScopeKind

`enum` **`DDS_DestinationOrderQosPolicyScopeKind`**

Scope of source destination order.

QoS:

DDS_DestinationOrderQosPolicy (p. 1688)

Enumerator

DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS	**[default]** Indicates that data is ordered on a per instance basis if used along with **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same instance. The tolerance check is also applied per instance.
DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS	Indicates that data is ordered on a per topic basis if used along with **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same topic. The tolerance check is also applied per topic.

5.151.3 Variable Documentation

5.151.3.1 DDS_DESTINATIONORDER_QOS_POLICY_NAME

```
const char* const DDS_DESTINATIONORDER_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DestinationOrderQosPolicy** (p. 1688).

5.152 DISCOVERY

*<<**extension**>> (p. 796)* Specifies the attributes required to discover participants in the domain.

Modules

- **NDDS_DISCOVERY_PEERS**

  *Environment variable or a file that specifies the default values of **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719) contained in the **DDS_DomainParticipantQos::discovery** (p. 1731) qos policy.*

Data Structures

- struct **DDS_DiscoveryQosPolicy**

  *<<**extension**>> (p. 796) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.*

Variables

- const char *const **DDS_DISCOVERY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DiscoveryQosPolicy** (p. 1717).*

5.152.1 Detailed Description

<<**extension**>> *(p. 796)* Specifies the attributes required to discover participants in the domain.

5.152.2 Variable Documentation

5.152.2.1 DDS_DISCOVERY_QOS_POLICY_NAME

```
const char* const DDS_DISCOVERY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DiscoveryQosPolicy** (p. 1717).

5.153 DISCOVERY_CONFIG

<<**extension**>> *(p. 796)* Specifies the discovery configuration QoS.

Data Structures

- struct **DDS_BuiltinTopicReaderResourceLimits_t**

  *<<**extension**>> (p. 796) Built-in topic reader's resource limits.*
- struct **DDS_DiscoveryConfigQosPolicy**

  Settings for discovery configuration.

Macros

- #define **DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE**

  No bits are set.
- #define **DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT**

  *The default value of **DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins** (p. 1703).*
- #define **DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE**

  *No bits are set, indicating that all channels that can be disabled, are disabled. Not all builtin channels can be disabled by the user. Only builtin channels represented by **DDS_DiscoveryConfigBuiltinChannelKind** (p. 1283) are able to be enabled or disabled by the user.*
- #define **DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT**

  *The default value of **DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels** (p. 1703).*
- #define **DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL**

  All bits are set, indicating that all channels are enabled.

Typedefs

- typedef **DDS_Long DDS_DiscoveryConfigBuiltinPluginKindMask**

  A bit-mask (list) of built-in discovery plugins.
- typedef **DDS_UnsignedLong DDS_DiscoveryConfigBuiltinChannelKindMask**

  A bit-mask (list) of built-in channels.

Enumerations

- enum **DDS_DiscoveryConfigBuiltinPluginKind** {
  DDS_DISCOVERYCONFIG_BUILTIN_SPDP ,
  DDS_DISCOVERYCONFIG_BUILTIN_SEDP ,
  DDS_DISCOVERYCONFIG_BUILTIN_SDP ,
  DDS_DISCOVERYCONFIG_BUILTIN_EDS = 0x0001 << 2 ,
  DDS_DISCOVERYCONFIG_BUILTIN_DPSE ,
  DDS_DISCOVERYCONFIG_BUILTIN_SPDP2 ,
  DDS_DISCOVERYCONFIG_BUILTIN_SDP2 }

  Built-in discovery plugins that can be used.
- enum **DDS_DiscoveryConfigBuiltinChannelKind** {
  DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL ,
  DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_REQUEST_CHANNEL ,
  DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_REPLY_CHANNEL ,
  DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL }

  Built-in channels that can be enabled.
- enum **DDS_RemoteParticipantPurgeKind** {
  DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE ,
  DDS_NO_REMOTE_PARTICIPANT_PURGE }

  Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

Variables

- const char *const **DDS_DISCOVERYCONFIG_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DiscoveryConfigQosPolicy** (p. 1691).*

5.153.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the discovery configuration QoS.

5.153.2 Macro Definition Documentation

5.153.2.1 DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE

```
#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE
```

No bits are set.

See also

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 1281)

5.153.2.2 DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT

```
#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT
```

The default value of **DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins** (p. 1703).

See also

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 1281)

5.153.2.3 DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE
```

No bits are set, indicating that all channels that can be disabled, are disabled. Not all builtin channels can be disabled by the user. Only builtin channels represented by **DDS_DiscoveryConfigBuiltinChannelKind** (p. 1283) are able to be enabled or disabled by the user.

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 1281)

5.153.2.4 DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT
```

The default value of **DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels** (p. 1703).

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 1281)

5.153.2.5 DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL
```

All bits are set, indicating that all channels are enabled.

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 1281)

5.153.3 Typedef Documentation

5.153.3.1 DDS_DiscoveryConfigBuiltinPluginKindMask

```
typedef DDS_Long DDS_DiscoveryConfigBuiltinPluginKindMask
```

A bit-mask (list) of built-in discovery plugins.

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS_DiscoveryConfigBuiltinPlugin↩ Kind** (p. 1282) values.

QoS:

DDS_DiscoveryConfigQosPolicy (p. 1691)

5.153.3.2 DDS_DiscoveryConfigBuiltinChannelKindMask

```
typedef DDS_UnsignedLong DDS_DiscoveryConfigBuiltinChannelKindMask
```

A bit-mask (list) of built-in channels.

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS_DiscoveryConfigBuiltin↩ ChannelKind** (p. 1283) values.

QoS:

DDS_DiscoveryConfigQosPolicy (p. 1691)

5.153.4 Enumeration Type Documentation

5.153.4.1 DDS_DiscoveryConfigBuiltinPluginKind

```
enum DDS_DiscoveryConfigBuiltinPluginKind
```

Built-in discovery plugins that can be used.

See also

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 1281)

Enumerator

DDS_DISCOVERYCONFIG_BUILTIN_SPDP	Simple Participant Discovery Protocol. Enables the first phase of the Simple Discovery Protocol (SDP), in which DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant declaration messages, also known as participant DATA submessages or participant announcements.
DDS_DISCOVERYCONFIG_BUILTIN_SEDP	Simple Endpoint Discovery Protocol. Enables the second phase of the Simple Discovery Protocol (SDP), in which the information (GUID, QoS, etc.) about your application's DataReaders and DataWriters is exchanged by sending publication/subscription declarations in DATA messages, also known as publication DATAs and subscription DATAs.
DDS_DISCOVERYCONFIG_BUILTIN_SDP	**[default]** Simple discovery plugin. It is equivalent to SPDP + SEDP.

Enumerator

DDS_DISCOVERYCONFIG_BUILTIN_DPSE	Dynamic Participant discovery, Static Endpoint discovery. Enables static endpoint discovery for a DomainParticipant. In this type of discovery, information from remote endpoints is extracted from a local DDS-XML file instead of being received over the network, reducing the number of exchanged packets and consequently reducing bandwidth consumption used for discovery. Using this value in **DDS_DiscoveryConfigBuiltinPluginKindMask** (p. 1281) requires the 'librtilbedisc' library (included in the RTI Connext Professional bundles) to be reachable (PATH, LD_LIBRARY_PATH or DYLD_LIBRARY_PATH).
DDS_DISCOVERYCONFIG_BUILTIN_SPDP2	Simple Participant Discovery Protocol 2.0 (SPDP2) Enables the Simple Participant Discovery Protocol 2.0, in which a DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant bootstrap messages. These bootstrap messages contain only a subset of the information in the Simple Participant Discovery Protocol (SPDP) participant announcements that is required to match two participants and bootstrap the system. The DomainParticpant's full configuration is then sent reliably with participant configuration announcements. Two DomainParticipants that use SPDP2 will maintain liveliness using liveliness participant messages.
DDS_DISCOVERYCONFIG_BUILTIN_SDP2	Simple discovery plugin 2.0. It is equivalent to SPDP2 + SEDP.

5.153.4.2 DDS_DiscoveryConfigBuiltinChannelKind

`enum` **`DDS_DiscoveryConfigBuiltinChannelKind`**

Built-in channels that can be enabled.

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 1281)

Enumerator

DDS_DISCOVERYCONFIG_SERVICE_REQUEST_↩ CHANNEL	**[default]** Built-in ServiceRequest channel. Enables the ServiceRequest channel, which is required by the TopicQuery and locator reachability features. Disabling the ServiceRequest channel reduces resource consumption including network bandwidth, CPU utilization, and memory.
DDS_DISCOVERYCONFIG_TYPE_LOOKUP_↩ SERVICE_CHANNEL	**[default]** Built-in Type Lookup Service channel. Enables both the Type Lookup Service Request channel and Type Lookup Service Reply channel.

5.153.4.3 DDS_RemoteParticipantPurgeKind

enum **DDS_RemoteParticipantPurgeKind**

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also

DDS_DiscoveryConfigQosPolicy::remote_participant_purge_kind (p. 1695)

Enumerator

DDS_LIVELINESS_BASED_REMOTE_↩ PARTICIPANT_PURGE	**[default]** Maintain knowledge of the remote participant for as long as it maintains its liveliness contract. A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered. The liveliness contract a participant promises to its peers – its "liveliness lease duration" – is specified in its **DDS_DiscoveryConfigQosPolicy::participant_↩ liveliness_lease_duration** (p. 1694) QoS field. It maintains that contract by writing data to those other participants with a writer that has a **DDS_LivelinessQosPolicyKind** (p. 1298) of **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 1299) or **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_↩ QOS** (p. 1299) and by asserting itself (at the **DDS_DiscoveryConfigQosPolicy::participant_↩ liveliness_assert_period** (p. 1694)) over the Simple Discovery Protocol.

Enumerator

DDS_NO_REMOTE_PARTICIPANT_PURGE	Never "forget" a remote participant with which discovery communication has been lost. If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely. This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.

5.153.5 Variable Documentation

5.153.5.1 DDS_DISCOVERYCONFIG_QOS_POLICY_NAME

```
const char* const DDS_DISCOVERYCONFIG_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DiscoveryConfigQosPolicy** (p. 1691).

5.154 DOMAIN_PARTICIPANT_RESOURCE_LIMITS

<<***extension***>> *(p. 796)* Various settings that configure how a **DDS_DomainParticipant** (p. 76) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Data Structures

- struct **DDS_AllocationSettings_t**

  Resource allocation settings.
- struct **DDS_DomainParticipantResourceLimitsQosPolicy**

  <<***extension***>> *(p. 796) Various settings that configure how a **DDS_DomainParticipant** (p. 76) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.*

Enumerations

- enum **DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind** { **DDS_NO_REPLACEMENT_IGNORED_ENTITY_REPLACEMENT** , **DDS_NOT_ALIVE_FIRST_IGNORED_ENTITY_REPLACEMENT** }

  Available replacement policies for the ignored entities.

Variables

- const **DDS_Long DDS_AUTO_COUNT**

  A special value indicating a quantity that is derived from another QoS value.
- const char ∗const **DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 1733).*

5.154.1 Detailed Description

<<***extension***>> *(p. 796)* Various settings that configure how a **DDS_DomainParticipant** (p. 76) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

5.154.2 Enumeration Type Documentation

5.154.2.1 DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind

enum **DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind**

Available replacement policies for the ignored entities.

QoS:

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)

Enumerator

DDS_NO_REPLACEMENT_IGNORED_ENTITY_↩ REPLACEMENT	Default value for ignored_entity_replacement_kind, no replacement is done, the ignore will fail if the ignored_entity table is full.
DDS_NOT_ALIVE_FIRST_IGNORED_ENTITY_↩ REPLACEMENT	If the ignored_entity table is full and if there is at least one ignored participant in the table, the participant record that has been not updated for the longest time will be replaced. Note that if the table is full and there are no participant records to replace, the ignore will fail.

5.154.3 Variable Documentation

5.154.3.1 DDS_AUTO_COUNT

```
const  DDS_Long DDS_AUTO_COUNT  [extern]
```

A special value indicating a quantity that is derived from another QoS value.

5.154.3.2 DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 1733).

5.155 DURABILITY

*<<**spec**>> (p. 791)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **DDS_DataReader** (p. 618) entities that join the network later.

Data Structures

- struct **DDS_PersistentStorageSettings**

  Configures durable writer history and durable reader state.
- struct **DDS_DurabilityQosPolicy**

  *<<**spec**>> (p. 791) This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **DDS_DataReader** (p. 618) entities that join the network later.*

Enumerations

- enum **DDS_PersistentJournalKind** {
  DDS_DELETE_PERSISTENT_JOURNAL ,
  DDS_TRUNCATE_PERSISTENT_JOURNAL ,
  DDS_PERSIST_PERSISTENT_JOURNAL ,
  DDS_MEMORY_PERSISTENT_JOURNAL ,
  DDS_WAL_PERSISTENT_JOURNAL ,
  DDS_OFF_PERSISTENT_JOURNAL }

  Sets the journal mode of the persistent storage.
- enum **DDS_PersistentSynchronizationKind** {
  DDS_NORMAL_PERSISTENT_SYNCHRONIZATION ,
  DDS_FULL_PERSISTENT_SYNCHRONIZATION ,
  DDS_OFF_PERSISTENT_SYNCHRONIZATION }

  Determines the level of synchronization with the physical disk.
- enum **DDS_DurabilityQosPolicyKind** {
  DDS_VOLATILE_DURABILITY_QOS ,
  DDS_TRANSIENT_LOCAL_DURABILITY_QOS ,
  DDS_TRANSIENT_DURABILITY_QOS ,
  DDS_PERSISTENT_DURABILITY_QOS }

  Kinds of durability.

Variables

- const char ∗const **DDS_DURABILITY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DurabilityQosPolicy** (p. 1762).*
- const **DDS_Long** **DDS_AUTO_WRITER_DEPTH**

  *A special value used as the default value for **DDS_DurabilityQosPolicy::writer_depth** (p. 1765).*

5.155.1 Detailed Description

<<***spec***>> *(p. 791)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **DDS_DataReader** (p. 618) entities that join the network later.

5.155.2 Enumeration Type Documentation

5.155.2.1 DDS_PersistentJournalKind

enum **DDS_PersistentJournalKind**

Sets the journal mode of the persistent storage.

The rollback journal is used in SQLite to store the state of the persistent storage before a transaction is committed.

QoS:

DDS_DurabilityQosPolicy (p. 1762)

Enumerator

DDS_DELETE_PERSISTENT_JOURNAL	Deletes the rollback journal at the conclusion of each transaction.
DDS_TRUNCATE_PERSISTENT_JOURNAL	Commits transactions by truncating the rollback journal to zero-length instead of deleting it.
DDS_PERSIST_PERSISTENT_JOURNAL	Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.
DDS_MEMORY_PERSISTENT_JOURNAL	Stores the rollback journal in volatile RAM. This saves disk I/O.
DDS_WAL_PERSISTENT_JOURNAL	Uses a write-ahead log instead of a rollback journal to implement transactions.
DDS_OFF_PERSISTENT_JOURNAL	Completely disables the rollback journal. If the application crashes in the middle of a transaction when the OFF journaling mode is set, the persistent storage will very likely be corrupted.

5.155.2.2 DDS_PersistentSynchronizationKind

enum **DDS_PersistentSynchronizationKind**

Determines the level of synchronization with the physical disk.

QoS:

DDS_DurabilityQosPolicy (p. 1762)

Enumerator

DDS_NORMAL_PERSISTENT_SYNCHRONIZATION	Data (e.g., new sample) is written to disk at critical moments.
DDS_FULL_PERSISTENT_SYNCHRONIZATION	Data (e.g., new sample) is written to physical disk immediately.
DDS_OFF_PERSISTENT_SYNCHRONIZATION	No synchronization is enforced. Data will be written to physical disk when the operating system flushes its buffers.

5.155.2.3 DDS_DurabilityQosPolicyKind

enum **DDS_DurabilityQosPolicyKind**

Kinds of durability.

QoS:

DDS_DurabilityQosPolicy (p. 1762)

Enumerator

DDS_VOLATILE_DURABILITY_QOS	**[default]** RTI Connext does not need to keep any samples of data instances on behalf of any **DDS_DataReader** (p. 618) that is unknown by the **DDS_DataWriter** (p. 488) at the time the instance is written. In other words, RTI Connext will only attempt to provide the data to existing subscribers. This option does not require RTI Persistence Service.

Enumerator

DDS_TRANSIENT_LOCAL_DURABILITY_QOS	RTI Connext will attempt to keep some samples so that they can be delivered to any potential late-joining **DDS_DataReader** (p. 618). Which particular samples are kept depends on other QoS such as **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimitsQosPolicy** (p. 1953). RTI Connext is only required to keep the data in memory of the **DDS_DataWriter** (p. 488) that wrote the data. Data is not required to survive the **DDS_DataWriter** (p. 488). For this setting to be effective, you must also set the **DDS_ReliabilityQosPolicy::kind** (p. 1943) to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325). This option does not require RTI Persistence Service.
DDS_TRANSIENT_DURABILITY_QOS	RTI Connext will attempt to keep some samples so that they can be delivered to any potential late-joining **DDS_DataReader** (p. 618). Which particular samples are kept depends on other QoS such as **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimitsQosPolicy** (p. 1953). RTI Connext is only required to keep the data in memory and not in permanent storage. Data is not tied to the lifecycle of the **DDS_DataWriter** (p. 488). Data will survive the **DDS_DataWriter** (p. 488). This option requires RTI Persistence Service.
DDS_PERSISTENT_DURABILITY_QOS	Data is kept on permanent storage, so that they can outlive a system session. This option requires RTI Persistence Service.

5.155.3 Variable Documentation

5.155.3.1 DDS_DURABILITY_QOS_POLICY_NAME

```
const char* const DDS_DURABILITY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DurabilityQosPolicy** (p. 1762).

5.155.3.2 DDS_AUTO_WRITER_DEPTH

```
const  DDS_Long DDS_AUTO_WRITER_DEPTH  [extern]
```

A special value used as the default value for **DDS_DurabilityQosPolicy::writer_depth** (p. 1765).

This values resolves to the following:

- **DDS_HistoryQosPolicy::depth** (p. 1810) if the history kind is **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295).
- **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956) in the **DDS_ResourceLimitsQos↩ Policy** (p. 1953) if the history kind is **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295).

5.156 DURABILITY_SERVICE

<<***spec***>> *(p. 791)* Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1762) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290).

Data Structures

- struct **DDS_DurabilityServiceQosPolicy**

  <<***spec***>> *(p. 791) Various settings to configure the external RTI Persistence Service used by RTI Connext for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1762) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290).*

Variables

- const char ∗const **DDS_DURABILITYSERVICE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_DurabilityServiceQosPolicy** (p. 1767).*

5.156.1 Detailed Description

<<***spec***>> *(p. 791)* Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1762) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290).

5.156.2 Variable Documentation

5.156.2.1 DDS_DURABILITYSERVICE_QOS_POLICY_NAME

```
const char* const DDS_DURABILITYSERVICE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_DurabilityServiceQosPolicy** (p. 1767).

5.157 ENTITY_FACTORY

<<***spec***>> *(p. 791)* A QoS policy for all **DDS_Entity** (p. 1362) types that can act as factories for one or more other **DDS_Entity** (p. 1362) types.

Data Structures

- struct **DDS_EntityFactoryQosPolicy**

  *<<**spec**>> (p. 791) A QoS policy for all **DDS_Entity** (p. 1362) types that can act as factories for one or more other **DDS_Entity** (p. 1362) types.*

Variables

- const char *const **DDS_ENTITYFACTORY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_EntityFactoryQosPolicy** (p. 1791).*

5.157.1 Detailed Description

*<<**spec**>> (p. 791)* A QoS policy for all **DDS_Entity** (p. 1362) types that can act as factories for one or more other **DDS_Entity** (p. 1362) types.

5.157.2 Variable Documentation

5.157.2.1 DDS_ENTITYFACTORY_QOS_POLICY_NAME

```
const char* const DDS_ENTITYFACTORY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_EntityFactoryQosPolicy** (p. 1791).

5.158 ENTITY_NAME

*<<**extension**>> (p. 796)* Assigns a name to a **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). Except for **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

Data Structures

- struct **DDS_EntityNameQosPolicy**

  *<<**extension**>> (p. 796) Assigns a name and a role name to a **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). Except for **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.*

Variables

- const char ∗const **DDS_ENTITYNAME_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_EntityNameQosPolicy** (p. 1793).*

5.158.1 Detailed Description

<<***extension***>> *(p. 796)* Assigns a name to a **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). Except for **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

5.158.2 Variable Documentation

5.158.2.1 DDS_ENTITYNAME_QOS_POLICY_NAME

```
const char* const DDS_ENTITYNAME_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_EntityNameQosPolicy** (p. 1793).

5.159 EVENT

<<***extension***>> *(p. 796)* Configures the internal thread in a DomainParticipant that handles timed events.

Data Structures

- struct **DDS_EventQosPolicy**

  <<***extension***>> *(p. 796) Settings for event.*

Variables

- const char ∗const **DDS_EVENT_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_EventQosPolicy** (p. 1796).*

5.159.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the internal thread in a DomainParticipant that handles timed events.

5.159.2 Variable Documentation

5.159.2.1 DDS_EVENT_QOS_POLICY_NAME

```
const char* const DDS_EVENT_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_EventQosPolicy** (p. 1796).

5.160 HISTORY

<<***spec***>> *(p. 791)* Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Data Structures

- struct **DDS_HistoryQosPolicy**

  <<***spec***>> (p. *791) Specifies the behavior of RTI Connext in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.*

Enumerations

- enum **DDS_HistoryQosPolicyKind** {
  DDS_KEEP_LAST_HISTORY_QOS ,
  DDS_KEEP_ALL_HISTORY_QOS }

  Kinds of history.

Variables

- const char ∗const **DDS_HISTORY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_HistoryQosPolicy** (p. 1808).*

5.160.1 Detailed Description

<<***spec***>> *(p. 791)* Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

5.160.2 Enumeration Type Documentation

5.160.2.1 DDS_HistoryQosPolicyKind

```
enum DDS_HistoryQosPolicyKind
```

Kinds of history.

QoS:

DDS_HistoryQosPolicy (p. 1808)

Enumerator

DDS_KEEP_LAST_HISTORY_QOS	**[default]** Keep the last `depth` samples. On the publishing side, RTI Connext will only attempt to keep the most recent `depth` samples of each instance of data (identified by its key) managed by the **DDS_DataWriter** (p. 488). Invalid samples representing a disposal or unregistration of an instance count towards the depth and may replace other DDS samples currently in the DataWriter queue for the same instance. On the subscribing side, the **DDS_DataReader** (p. 618) will only attempt to keep the most recent `depth` samples received for each instance (identified by its key) until the application takes them via the **DDS_DataReader** (p. 618) 's **take()** operation. Invalid samples representing a disposal or unregistration of an instance do not count towards the history depth and will not replace other DDS samples currently in the DataReader queue for the same instance.
DDS_KEEP_ALL_HISTORY_QOS	Keep *all* the samples. On the publishing side, RTI Connext will attempt to keep all samples (representing each value written) of each instance of data (identified by its key) managed by the **DDS_DataWriter** (p. 488) until they can be delivered to all subscribers. On the subscribing side, RTI Connext will attempt to keep all samples of each instance of data (identified by its key) managed by the **DDS_DataReader** (p. 618). These samples are kept until the application takes them from RTI Connext via the **take()** operation.

5.160.3 Variable Documentation

5.160.3.1 DDS_HISTORY_QOS_POLICY_NAME

```
const char* const DDS_HISTORY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_HistoryQosPolicy** (p. 1808).

5.161 GROUP_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Data Structures

- struct **DDS_GroupDataQosPolicy**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.*

Variables

- const char *const **DDS_GROUPDATA_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_GroupDataQosPolicy** (p. 1806).*

5.161.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

5.161.2 Variable Documentation

5.161.2.1 DDS_GROUPDATA_QOS_POLICY_NAME

```
const char* const DDS_GROUPDATA_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_GroupDataQosPolicy** (p. 1806).

5.162 LATENCY_BUDGET

<<***spec***>> *(p. 791)* Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Data Structures

- struct **DDS_LatencyBudgetQosPolicy**

  *<<**spec**>> (p. 791) Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.*

Variables

- const char *const **DDS_LATENCYBUDGET_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_LatencyBudgetQosPolicy** (p. 1816).*

5.162.1 Detailed Description

<<***spec***>> *(p. 791)* Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

5.162.2 Variable Documentation

5.162.2.1 DDS_LATENCYBUDGET_QOS_POLICY_NAME

```
const char* const DDS_LATENCYBUDGET_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_LatencyBudgetQosPolicy** (p. 1816).

5.163 LIFESPAN

<<***spec***>> *(p. 791)* Specifies how long the data written by the **DDS_DataWriter** (p. 488) is considered valid.

Data Structures

- struct **DDS_LifespanQosPolicy**
  <<***spec***>> *(p. 791) Specifies how long the data written by the **DDS_DataWriter** (p. 488) is considered valid.*

Variables

- const char *const **DDS_LIFESPAN_QOS_POLICY_NAME**
  *Stringified human-readable name for **DDS_LifespanQosPolicy** (p. 1818).*

5.163.1 Detailed Description

<<***spec***>> *(p. 791)* Specifies how long the data written by the **DDS_DataWriter** (p. 488) is considered valid.

5.163.2 Variable Documentation

5.163.2.1 DDS_LIFESPAN_QOS_POLICY_NAME

```
const char* const DDS_LIFESPAN_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_LifespanQosPolicy** (p. 1818).

5.164 LIVELINESS

<<***spec***>> *(p. 791)* Specifies and configures the mechanism that allows **DDS_DataReader** (p. 618) entities to detect when **DDS_DataWriter** (p. 488) entities become disconnected or "dead."

Data Structures

- struct **DDS_LivelinessQosPolicy**

  *Specifies and configures the mechanism that allows **DDS_DataReader** (p. 618) entities to detect when **DDS_DataWriter** (p. 488) entities become disconnected or "dead.".*

Enumerations

- enum **DDS_LivelinessQosPolicyKind** {
  DDS_AUTOMATIC_LIVELINESS_QOS ,
  DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS ,
  DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS }

  Kinds of liveliness.

Variables

- const char ∗const **DDS_LIVELINESS_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_LivelinessQosPolicy** (p. 1826).*

5.164.1 Detailed Description

<<***spec***>> *(p. 791)* Specifies and configures the mechanism that allows **DDS_DataReader** (p. 618) entities to detect when **DDS_DataWriter** (p. 488) entities become disconnected or "dead."

5.164.2 Enumeration Type Documentation

5.164.2.1 DDS_LivelinessQosPolicyKind

`enum` **`DDS_LivelinessQosPolicyKind`**

Kinds of liveliness.

QoS:

DDS_LivelinessQosPolicy (p. 1826)

Enumerator

DDS_AUTOMATIC_LIVELINESS_QOS	**[default]** The infrastructure will automatically signal liveliness for the **DDS_DataWriter** (p. 488) (s) at least as often as required by the **DDS_DataWriter** (p. 488) (S) `lease_duration`. A **DDS_DataWriter** (p. 488) with this setting does not need to take any specific action in order to be considered 'alive.' The **DDS_DataWriter** (p. 488) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.
DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS	RTI Connext will assume that as long as at least one **DDS_DataWriter** (p. 488) belonging to the **DDS_DomainParticipant** (p. 76) (or the **DDS_DomainParticipant** (p. 76) itself) has asserted its liveliness, then the other DataWriters belonging to that same **DDS_DomainParticipant** (p. 76) are also alive. The user application takes responsibility to signal liveliness to RTI Connext either by calling **DDS_DomainParticipant_assert_liveliness** (p. 135), or by calling **DDS_DataWriter_assert_liveliness** (p. 541), or **FooDataWriter_write** (p. 499) on any **DDS_DataWriter** (p. 488) belonging to the **DDS_DomainParticipant** (p. 76).
DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS	RTI Connext will only assume liveliness of the **DDS_DataWriter** (p. 488) if the application has asserted liveliness of that **DDS_DataWriter** (p. 488) itself. The user application takes responsibility to signal liveliness to RTI Connext using the **DDS_DataWriter_assert_liveliness** (p. 541) function, or by writing some data.

5.164.3 Variable Documentation

5.164.3.1 DDS_LIVELINESS_QOS_POLICY_NAME

```
const char* const DDS_LIVELINESS_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_LivelinessQosPolicy** (p. 1826).

5.165 LOCATORFILTER

<<***extension***>> *(p. 796)* The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1909).

Data Structures

- struct **DDS_LocatorFilter_t**

  *<<**extension**>> (p. 796) Specifies the configuration of an individual channel within a MultiChannel DataWriter.*
- struct **DDS_LocatorFilterSeq**

  *Declares IDL `sequence<` **DDS_LocatorFilter_t** (p. 1831) `>`.*
- struct **DDS_LocatorFilterQosPolicy**

  *<<**extension**>> (p. 796) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1909).*

Variables

- const char *const **DDS_LOCATORFILTER_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_LocatorFilterQosPolicy** (p. 1832).*

5.165.1 Detailed Description

<<**extension**>> *(p. 796)* The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1909).

5.165.2 Variable Documentation

5.165.2.1 DDS_LOCATORFILTER_QOS_POLICY_NAME

```
const char* const DDS_LOCATORFILTER_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_LocatorFilterQosPolicy** (p. 1832).

5.166 LOGGING

<<**extension**>> *(p. 796)* Configures the RTI Connext logging facility.

Data Structures

- struct **DDS_LoggingQosPolicy**

  *<<**extension**>> (p. 796) Configures the RTI Connext logging facility.*

5.166.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the RTI Connext logging facility.

5.167 MONITORING

<<***extension***>> *(p. 796)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

Data Structures

- struct **DDS_MonitoringDedicatedParticipantSettings**

  <<***extension***>> *(p. 796) Configures the use of a dedicated **DDS_DomainParticipant** (p. 76) to distribute the RTI Connext application telemetry data.*
- struct **DDS_MonitoringEventDistributionSettings**

  <<***extension***>> *(p. 796) Configures the distribution of event metrics.*
- struct **DDS_MonitoringPeriodicDistributionSettings**

  <<***extension***>> *(p. 796) Configures the distribution of periodic metrics.*
- struct **DDS_MonitoringLoggingDistributionSettings**

  <<***extension***>> *(p. 796) Configures the distribution of log messages.*
- struct **DDS_MonitoringDistributionSettings**

  <<***extension***>> *(p. 796) Configures the distribution of telemetry data.*
- struct **DDS_MonitoringMetricSelection**

  <<***extension***>> *(p. 796) This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.*
- struct **DDS_MonitoringMetricSelectionSeq**

  *Declares IDL `sequence` < **DDS_MonitoringMetricSelection** (p. 1852) >*
- struct **DDS_MonitoringLoggingForwardingSettings**

  <<***extension***>> *(p. 796) Configures the forwarding levels of log messages for the different **NDDS_Config_LogFacility** (p. 1448).*
- struct **DDS_MonitoringTelemetryData**

  <<***extension***>> *(p. 796) Configures the telemetry data that will be distributed.*
- struct **DDS_MonitoringQosPolicy**

  <<***extension***>> *(p. 796) Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.*

Variables

- const char *const **DDS_MONITORING_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_MonitoringQosPolicy** (p. 1856).*

5.167.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

5.167.2 Variable Documentation

5.167.2.1 DDS_MONITORING_QOS_POLICY_NAME

```
const char* const DDS_MONITORING_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_MonitoringQosPolicy** (p. 1856).

5.168 MULTICHANNEL

<<***extension***>> *(p. 796)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Data Structures

- struct **DDS_ChannelSettings_t**

  <<***extension***>> *(p. 796) Type used to configure the properties of a channel.*
- struct **DDS_ChannelSettingsSeq**

  Declares IDL `sequence`*<* ***DDS_ChannelSettings_t*** *(p. 1564) >*
- struct **DDS_MultiChannelQosPolicy**

  <<***extension***>> *(p. 796) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.*

Variables

- const char ∗const **DDS_MULTICHANNEL_QOS_POLICY_NAME**

  Stringified human-readable name for ***DDS_MultiChannelQosPolicy*** *(p. 1860).*

5.168.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

5.168.2 Variable Documentation

5.168.2.1 DDS_MULTICHANNEL_QOS_POLICY_NAME

```
const char* const DDS_MULTICHANNEL_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_MultiChannelQosPolicy** (p. 1860).

5.169 OWNERSHIP

<<***spec***>> *(p. 791)* Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 488) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Data Structures

- struct **DDS_OwnershipQosPolicy**

  <<***spec***>> *(p. 791) Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 488) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

Enumerations

- enum **DDS_OwnershipQosPolicyKind** {
  DDS_SHARED_OWNERSHIP_QOS ,
  DDS_EXCLUSIVE_OWNERSHIP_QOS }

  Kinds of ownership.

Variables

- const char ∗const **DDS_OWNERSHIP_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_OwnershipQosPolicy** (p. 1867).*

5.169.1 Detailed Description

<<***spec***>> *(p. 791)* Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 488) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

5.169.2 Enumeration Type Documentation

5.169.2.1 DDS_OwnershipQosPolicyKind

```
enum  DDS_OwnershipQosPolicyKind
```

Kinds of ownership.

QoS:

DDS_OwnershipQosPolicy (p. 1867)

Enumerator

DDS_SHARED_OWNERSHIP_QOS	**[default]** Indicates shared ownership for each instance. Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances. This is the **default** behavior if the **OWNERSHIP** (p. 1303) policy is not specified or supported.
DDS_EXCLUSIVE_OWNERSHIP_QOS	Indicates each instance can only be owned by one **DDS_DataWriter** (p. 488), but the owner of an instance can change dynamically. The selection of the owner is controlled by the setting of the **OWNERSHIP_STRENGTH** (p. 1304) policy. The owner is always set to be the highest-strength **DDS_DataWriter** (p. 488) object among the ones currently active (as determined by the **LIVELINESS** (p. 1298)).

5.169.3 Variable Documentation

5.169.3.1 DDS_OWNERSHIP_QOS_POLICY_NAME

```
const char* const DDS_OWNERSHIP_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_OwnershipQosPolicy** (p. 1867).

5.170 OWNERSHIP_STRENGTH

<<***spec***>> *(p. 791)* Specifies the value of the strength used to arbitrate among multiple **DDS_DataWriter** (p. 488) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 174) + key).

Data Structures

- struct **DDS_OwnershipStrengthQosPolicy**

  *Specifies the value of the strength used to arbitrate among multiple **DDS_DataWriter** (p. 488) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 174) + key).*

Variables

- const char *const **DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_OwnershipStrengthQosPolicy** (p. 1872).*

5.170.1 Detailed Description

<<***spec***>> *(*p. *791)* Specifies the value of the strength used to arbitrate among multiple **DDS_DataWriter** (p. 488) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 174) + key).

5.170.2 Variable Documentation

5.170.2.1 DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME

```
const char* const DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_OwnershipStrengthQosPolicy** (p. 1872).

5.171 PARTITION

<<***spec***>> *(*p. *791)* Set of strings that introduces logical partitions in **DDS_DomainParticipant** (p. 76), **DDS_↩ Publisher** (p. 446), or **DDS_Subscriber** (p. 575) entities.

Data Structures

- struct **DDS_PartitionQosPolicy**

  <<***spec***>> *(*p. *791) Set of strings that introduces logical partitions in **DDS_DomainParticipant** (*p. *76), **DDS_Publisher** (*p. *446), or **DDS_Subscriber** (*p. *575) entities.*

Variables

- const char ∗const **DDS_PARTITION_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_PartitionQosPolicy** (*p. *1884).*

5.171.1 Detailed Description

<<***spec***>> *(*p. *791)* Set of strings that introduces logical partitions in **DDS_DomainParticipant** (p. 76), **DDS_↩ Publisher** (p. 446), or **DDS_Subscriber** (p. 575) entities.

5.171.2 Variable Documentation

5.171.2.1 DDS_PARTITION_QOS_POLICY_NAME

```
const char* const DDS_PARTITION_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_PartitionQosPolicy** (p. 1884).

5.172 PRESENTATION

<<***spec***>> *(p. 791)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

Data Structures

- struct **DDS_PresentationQosPolicy**

  <<***spec***>> *(p. 791) Specifies how the samples representing changes to data instances are presented to a subscribing application.*

Enumerations

- enum **DDS_PresentationQosPolicyAccessScopeKind** {
  DDS_INSTANCE_PRESENTATION_QOS ,
  DDS_TOPIC_PRESENTATION_QOS ,
  DDS_GROUP_PRESENTATION_QOS ,
  DDS_HIGHEST_OFFERED_PRESENTATION_QOS }

  Kinds of presentation "access scope".

Variables

- const char ∗const **DDS_PRESENTATION_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_PresentationQosPolicy** (p. 1894).*

5.172.1 Detailed Description

<<***spec***>> *(p. 791)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

5.172.2 Enumeration Type Documentation

5.172.2.1 DDS_PresentationQosPolicyAccessScopeKind

```
enum DDS_PresentationQosPolicyAccessScopeKind
```

Kinds of presentation "access scope".

Access scope determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

QoS:

DDS_PresentationQosPolicy (p. 1894)

Enumerator

DDS_INSTANCE_PRESENTATION_QOS	**[default]** Scope spans only a single instance. Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.
DDS_TOPIC_PRESENTATION_QOS	Scope spans all instances within the same **DDS_DataWriter** (p. 488), but not across instances in different **DDS_DataWriter** (p. 488) entities.
DDS_GROUP_PRESENTATION_QOS	Scope spans all instances belonging to **DDS_DataWriter** (p. 488) entities within the same **DDS_Publisher** (p. 446).
DDS_HIGHEST_OFFERED_PRESENTATION_QOS	This value only applies to a **DDS_Subscriber** (p. 575). The **DDS_Subscriber** (p. 575) will use the access scope specified by each remote **DDS_Publisher** (p. 446).

5.172.3 Variable Documentation

5.172.3.1 DDS_PRESENTATION_QOS_POLICY_NAME

```
const char* const DDS_PRESENTATION_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_PresentationQosPolicy** (p. 1894).

5.173 PROFILE

<<***extension***>> *(p. 796)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

Data Structures

- struct **DDS_ProfileQosPolicy**

  <<***extension***>> *(p. 796) Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.*

Variables

- const char *const **DDS_PROFILE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_ProfileQosPolicy** (p. 1902).*

5.173.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

5.173.2 Variable Documentation

5.173.2.1 DDS_PROFILE_QOS_POLICY_NAME

```
const char* const DDS_PROFILE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_ProfileQosPolicy** (p. 1902).

5.174 PROPERTY

<<***extension***>> *(p. 796)* Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Data Structures

- struct **DDS_Property_t**

  Properties are name/value pairs objects.
- struct **DDS_PropertySeq**

  Declares IDL `sequence` *<* ***DDS_Property_t*** *(p. 1904) >*
- struct **DDS_PropertyQosPolicy**

  <<***extension***>> *(p. 796) Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.*

Typedefs

- typedef struct **DDS_PropertyQosPolicy DDS_PropertyQosPolicy**

  <<***extension***>> *(p. 796) Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.*
- typedef enum **DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyMutability**

  Determines if, and when, the value of a property can change.

Enumerations

- enum **DDS_PropertyQosPolicyMutability** {
  DDS_PROPERTY_QOS_MUTABLE ,
  DDS_PROPERTY_QOS_MUTABLE_UNTIL_ENABLE ,
  DDS_PROPERTY_QOS_IMMUTABLE }

  Determines if, and when, the value of a property can change.

Functions

- **DDS_Long DDS_PropertyQosPolicyHelper_get_number_of_properties** (const struct **DDS_PropertyQos↩ Policy** ∗policy)

  Gets the number of properties in the input policy.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_property** (struct **DDS_PropertyQosPolicy** ∗policy, const char ∗name, const char ∗value, **DDS_Boolean** propagate)

  Asserts the property identified by name in the input policy.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_property** (struct **DDS_PropertyQosPolicy** ∗policy, const char ∗name, const char ∗value, **DDS_Boolean** propagate)

  Adds a new property to the input policy.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_pointer_property** (struct **DDS_Property↩ QosPolicy** ∗policy, const char ∗name, const void ∗pointer)

  Asserts the property identified by name in the input policy. Used when the property to store is a pointer.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_pointer_property** (struct **DDS_PropertyQos↩ Policy** ∗policy, const char ∗name, const void ∗pointer)

  Adds a new property to the input policy. Used when the property to store is a pointer.
- struct **DDS_Property_t** ∗ **DDS_PropertyQosPolicyHelper_lookup_property** (const struct **DDS_Property↩ QosPolicy** ∗policy, const char ∗name)

  Searches for a property in the input policy given its name.
- struct **DDS_Property_t** ∗ **DDS_PropertyQosPolicyHelper_lookup_property_with_prefix** (const struct **DDS_PropertyQosPolicy** ∗policy, const char ∗prefix, const char ∗name)

  Searches for a property in the input policy given its prefix and name.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_remove_property** (struct **DDS_PropertyQosPolicy** ∗policy, const char ∗name)

  Removes a property from the input policy.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties** (const struct **DDS_PropertyQos↩ Policy** ∗policy, struct **DDS_PropertySeq** ∗properties, const char ∗name_prefix)

  Retrieves a list of properties whose names match the input prefix.
- **DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties_into_policy** (const struct **DDS_↩ PropertyQosPolicy** ∗policy, struct **DDS_PropertyQosPolicy** ∗outPolicy, const char ∗name_prefix)

  This function gets the properties from a policy with a given prefix and sets them into the properties of the output policy.
- **DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyHelper_get_property_mutability** (const char ∗name, const struct **DDS_PropertyQosPolicy** ∗policy)

  Returns the mutability type of a property.

Variables

- const char ∗const **DDS_PROPERTY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_PropertyQosPolicy** (p. 1905).*

5.174.1 Detailed Description

<<***extension***>> *(p. 796)* Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

RTI Connext will automatically set some system properties in the **DDS_PropertyQosPolicy** (p. 1905) associated with a **DDS_DomainParticipantQos** (p. 1729). See **System Properties** (p. 972) for additional details.

5.174.2 Typedef Documentation

5.174.2.1 DDS_PropertyQosPolicy

`typedef struct` **`DDS_PropertyQosPolicy`** **`DDS_PropertyQosPolicy`**

<<***extension***>> *(p. 796)* Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

DDS_DomainParticipant (p. 76) **DDS_DataReader** (p. 618) **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = N/A;
Changeable (p. 1247) = **YES** (p. 1247)

See also

DDS_DomainParticipant_get_builtin_subscriber (p. 128)

5.174.3 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488), or **DDS_DomainParticipant** (p. 76). This is similar to the **DDS_UserDataQosPolicy** (p. 2092), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the `Property Reference Guide`.

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 780)
- Durable Reader State, see **Configuring Durable Reader State** (p. 782)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 1046), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 1062), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 1040)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 728)
- **Clock Selection** (p. 25)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Connext to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **DDS_UserDataQosPolicy** (p. 2092) or **DDS_Group↩ DataQosPolicy** (p. 1806)).

5.174.3.1 Reasons for Using the PropertyQosPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connext capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 1308) page.

5.174.3.2 DDS_PropertyQosPolicyMutability

`typedef enum` **`DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyMutability`**

Determines if, and when, the value of a property can change.

5.174.4 Enumeration Type Documentation

5.174.4.1 DDS_PropertyQosPolicyMutability

`enum` **`DDS_PropertyQosPolicyMutability`**

Determines if, and when, the value of a property can change.

Enumerator

DDS_PROPERTY_QOS_MUTABLE	The property is mutable: it can be changed at any time.
DDS_PROPERTY_QOS_MUTABLE_UNTIL_ENABLE	The property can only be changed before enabling the entity.
DDS_PROPERTY_QOS_IMMUTABLE	The property is immutable: it can only be specified when creating the entity.

5.174.5 Function Documentation

5.174.5.1 DDS_PropertyQosPolicyHelper_get_number_of_properties()

```
DDS_Long DDS_PropertyQosPolicyHelper_get_number_of_properties (
            const struct  DDS_PropertyQosPolicy * policy )
```

Gets the number of properties in the input policy.

Precondition

policy cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.

Returns

Number of properties.

5.174.5.2 DDS_PropertyQosPolicyHelper_assert_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_property (
            struct  DDS_PropertyQosPolicy * policy,
            const char * name,
            const char * value,
             DDS_Boolean propagate )
```

Asserts the property identified by name in the input policy.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

Precondition

policy, name and value cannot be NULL.

Parameters

policy	<<***in***>> *(p. 1015)* Input policy.
name	<<***in***>> *(p. 1015)* Property name.
value	<<***in***>> *(p. 1015)* Property value.
propagate	<<***in***>> *(p. 1015)* Indicates if the property will be propagated on discovery.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224)

5.174.5.3 DDS_PropertyQosPolicyHelper_add_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_property (
            struct  DDS_PropertyQosPolicy * policy,
            const char * name,
            const char * value,
             DDS_Boolean propagate )
```

Adds a new property to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connext.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

Precondition

policy, name and value cannot be NULL.

The property is not in the policy.

Parameters

policy	<<***in***>> *(p. 1015)* Input policy.
name	<<***in***>> *(p. 1015)* Property name.
value	<<***in***>> *(p. 1015)* Property value.
propagate	<<***in***>> *(p. 1015)* Indicates if the property will be propagated on discovery.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224), **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224)

5.174.5.4 DDS_PropertyQosPolicyHelper_assert_pointer_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_pointer_property (
            struct  DDS_PropertyQosPolicy * policy,
            const char * name,
            const void * pointer )
```

Asserts the property identified by name in the input policy. Used when the property to store is a pointer.

This is a function similar to **DDS_PropertyQosPolicyHelper_assert_property** (p. 1312). However, instead of passing a stringified version of the pointer, this function receives a pointer as the value.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

The properties asserted by this function will not be propagated on discovery.

Precondition

policy and name cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Property name.
pointer	<<***in***>> *(*p. *1015)* The pointer to store in the property.

Returns

One of the **Standard Return Codes** (p. 1223) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224).

5.174.5.5 DDS_PropertyQosPolicyHelper_add_pointer_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_pointer_property (
            struct  DDS_PropertyQosPolicy * policy,
```

```
            const char * name,
            const void * pointer )
```

Adds a new property to the input policy. Used when the property to store is a pointer.

This is a function similar to **DDS_PropertyQosPolicyHelper_add_property** (p. 1313). However, instead of passing a stringified version of the pointer, this function receives a pointer as the value.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connext.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

The properties added by this function will not be propagated on discovery.

Precondition

policy and name cannot be NULL.

The property is not in the policy.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Property name.
pointer	<<***in***>> *(*p. *1015)* The pointer to store in the property.

Returns

One of the **Standard Return Codes** (p. 1223) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224) or **DDS_↩ RETCODE_PRECONDITION_NOT_MET** (p. 1224)

5.174.5.6 DDS_PropertyQosPolicyHelper_lookup_property()

```
struct  DDS_Property_t * DDS_PropertyQosPolicyHelper_lookup_property (
            const struct  DDS_PropertyQosPolicy * policy,
            const char * name )
```

Searches for a property in the input policy given its name.

Precondition

policy, name and value cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Property name.

Returns

The function returns the first property with the given name. If such a property does not exist, the function returns NULL.

5.174.5.7 DDS_PropertyQosPolicyHelper_lookup_property_with_prefix()

```
struct  DDS_Property_t * DDS_PropertyQosPolicyHelper_lookup_property_with_prefix (
             const struct  DDS_PropertyQosPolicy * policy,
             const char * prefix,
             const char * name )
```

Searches for a property in the input policy given its prefix and name.

Precondition

policy, name and value cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
prefix	<<***in***>> *(*p. *1015)* Property name prefix.
name	<<***in***>> *(*p. *1015)* Property name.

Returns

The function returns the first property with the given prefix and name. If such a property does not exist, the function returns NULL.

5.174.5.8 DDS_PropertyQosPolicyHelper_remove_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_remove_property (
             struct  DDS_PropertyQosPolicy * policy,
             const char * name )
```

Removes a property from the input policy.

If the property does not exist, the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

Precondition

policy and name cannot be NULL.

The property is in the policy.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
name	<<***in***>> *(*p. *1015)* Property name.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224)

5.174.5.9 DDS_PropertyQosPolicyHelper_get_properties()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties (
            const struct  DDS_PropertyQosPolicy * policy,
            struct  DDS_PropertySeq * properties,
            const char * name_prefix )
```

Retrieves a list of properties whose names match the input prefix.

If the properties sequence doesn't own its buffer, and its maximum is less than the total number of properties matching the input prefix, it will be filled up to its maximum and fail with an error of **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224).

Precondition

policy, properties and name_prefix cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
properties	<<***inout***>> *(*p. *1015)* A **DDS_PropertySeq** (p. 1907) object where the set or list of properties will be returned.
name_prefix	Name prefix.

Returns

One of the **Standard Return Codes** (p. 1223), **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224)

5.174.5.10 DDS_PropertyQosPolicyHelper_get_properties_into_policy()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties_into_policy (
            const struct  DDS_PropertyQosPolicy * policy,
            struct  DDS_PropertyQosPolicy * outPolicy,
            const char * name_prefix )
```

This function gets the properties from a policy with a given prefix and sets them into the properties of the output policy.

Precondition

inProperties, outProperties and name_prefix cannot be NULL.

Parameters

policy	<<***in***>> *(*p. *1015)* Input policy.
outPolicy	<<***out***>> *(*p. *1015)* Output policy where the properties with the given prefix will be stored. The structure must be initialized.
name_prefix	<<***in***>> *(*p. *1015)* Name prefix.

Returns

DDS_RETCODE_OK if success, DDS_RETCODE_ERROR otherwise.

5.174.5.11 DDS_PropertyQosPolicyHelper_get_property_mutability()

```
DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyHelper_get_property_mutability (
            const char * name,
            const struct  DDS_PropertyQosPolicy * policy )
```

Returns the mutability type of a property.

If the property does not exist, **DDS_PROPERTY_QOS_MUTABLE** (p. 1312) is returned. Otherwise, it returns the mutability type of the specified property. See **DDS_PropertyQosPolicyMutability** (p. 1311) for more information of the different mutability types.

Parameters

name	<<***in***>> *(*p. *1015)*. The name of the property for which we want to know the mutability type.
policy	<<***in***>> *(*p. *1015)*. These are the properties in which we are going to look for the property with the provided name.

Returns

The mutability type of the input property.

5.174.6 Variable Documentation

5.174.6.1 DDS_PROPERTY_QOS_POLICY_NAME

```
const char* const DDS_PROPERTY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_PropertyQosPolicy** (p. 1905).

5.175 PUBLISH_MODE

<<***extension***>> *(p. 796)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

Data Structures

- struct **DDS_PublishModeQosPolicy**

  <<***extension***>> *(p. 796) Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its own thread to send data, instead of the user thread.*

Macros

- #define **DDS_PUBLICATION_PRIORITY_UNDEFINED**

  *Initializer value for **DDS_PublishModeQosPolicy::priority** (p. 1928) and/or **DDS_ChannelSettings_t::priority** (p. 1565).*
- #define **DDS_PUBLICATION_PRIORITY_AUTOMATIC**

  *Constant value for **DDS_PublishModeQosPolicy::priority** (p. 1928) and/or **DDS_ChannelSettings_t::priority** (p. 1565).*

Enumerations

- enum **DDS_PublishModeQosPolicyKind** {
  DDS_SYNCHRONOUS_PUBLISH_MODE_QOS ,
  DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS }

  Kinds of publishing mode.

Variables

- const char ∗const **DDS_PUBLISHMODE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_PublishModeQosPolicy** (p. 1924).*

5.175.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

5.175.2 Macro Definition Documentation

5.175.2.1 DDS_PUBLICATION_PRIORITY_UNDEFINED

```
#define DDS_PUBLICATION_PRIORITY_UNDEFINED
```

Initializer value for **DDS_PublishModeQosPolicy::priority** (p. 1928) and/or **DDS_ChannelSettings_t::priority** (p. 1565).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the lowest possible value. For muilti-channel data writers, if either the data writer or channel priority is NOT set to this value, then the publication priority of the entity will be set to the defined value.

5.175.2.2 DDS_PUBLICATION_PRIORITY_AUTOMATIC

```
#define DDS_PUBLICATION_PRIORITY_AUTOMATIC
```

Constant value for **DDS_PublishModeQosPolicy::priority** (p. 1928) and/or **DDS_ChannelSettings_t::priority** (p. 1565).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the largest priority value of any sample currently queued for publication by the data writer or data writer channel.

5.175.3 Enumeration Type Documentation

5.175.3.1 DDS_PublishModeQosPolicyKind

```
enum DDS_PublishModeQosPolicyKind
```

Kinds of publishing mode.

QoS:

DDS_PublishModeQosPolicy (p. 1924)

Enumerator

DDS_SYNCHRONOUS_PUBLISH_MODE_QOS	Indicates to send data synchronously. If **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 1651) is **DDS_BOOLEAN_TRUE** (p. 1203), data is sent immediately in the context of **FooDataWriter_write** (p. 499). As data is sent immediately in the context of the user thread, no flow control is applied. **See also** **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 1651) **[default]** for **DDS_DataWriter** (p. 488)
DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS	Indicates to send data asynchronously. Configures the **DDS_DataWriter** (p. 488) to delegate the task of data transmission to a separate publishing thread. The **FooDataWriter_write** (p. 499) call does not send the data, but instead schedules the data to be sent later by its associated **DDS_Publisher** (p. 446). Each **DDS_Publisher** (p. 446) uses its dedicated publishing thread (**DDS_PublisherQos::asynchronous_publisher** (p. 1924)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated **DDS_FlowController** (p. 562) determines when the publishing thread is allowed to send the data. **DDS_DataWriter_wait_for_asynchronous_publishing** (p. 547) and **DDS_Publisher_wait_for_asynchronous_publishing** (p. 471) enable you to determine when the data has actually been sent. **See also** **DDS_FlowController** (p. 562) **DDS_HistoryQosPolicy** (p. 1808) **DDS_DataWriter_wait_for_asynchronous_↩ publishing** (p. 547) **DDS_Publisher_wait_for_asynchronous_↩ publishing** (p. 471) **NDDS_Transport_Property_t::gather_send_↩ buffer_count_max** (p. 2131)

5.175.4 Variable Documentation

5.175.4.1 DDS_PUBLISHMODE_QOS_POLICY_NAME

```
const char* const DDS_PUBLISHMODE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_PublishModeQosPolicy** (p. 1924).

5.176 READER_DATA_LIFECYCLE

<<***spec***>> *(p. 791)* Controls how a DataReader manages the lifecycle of the data that it has received.

Data Structures

- struct **DDS_ReaderDataLifecycleQosPolicy**
  <<***spec***>> *(p. 791) Controls how a DataReader manages the lifecycle of the data that it has received.*

Variables

- const char *const **DDS_READERDATALIFECYCLE_QOS_POLICY_NAME**
  *Stringified human-readable name for **DDS_ReaderDataLifecycleQosPolicy** (p. 1934).*

5.176.1 Detailed Description

<<***spec***>> *(p. 791)* Controls how a DataReader manages the lifecycle of the data that it has received.

5.176.2 Variable Documentation

5.176.2.1 DDS_READERDATALIFECYCLE_QOS_POLICY_NAME

```
const char* const DDS_READERDATALIFECYCLE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_ReaderDataLifecycleQosPolicy** (p. 1934).

5.177 RECEIVER_POOL

<<***extension***>> *(p. 796)* Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

Data Structures

- struct **DDS_ReceiverPoolQosPolicy**

  *<<**extension**>> (p. 796) Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).*

Variables

- const **DDS_Long DDS_LENGTH_AUTO**

  A special value indicating that the actual value will be automatically resolved.
- const char *const **DDS_RECEIVERPOOL_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_ReceiverPoolQosPolicy** (p. 1938).*

5.177.1 Detailed Description

*<<**extension**>> (p. 796)* Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

5.177.2 Variable Documentation

5.177.2.1 DDS_LENGTH_AUTO

```
const DDS_Long DDS_LENGTH_AUTO [extern]
```

A special value indicating that the actual value will be automatically resolved.

5.177.2.2 DDS_RECEIVERPOOL_QOS_POLICY_NAME

```
const char* const DDS_RECEIVERPOOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ReceiverPoolQosPolicy** (p. 1938).

5.178 RELIABILITY

*<<**spec**>> (p. 791)* Indicates the level of reliability offered/requested by RTI Connext.

Data Structures

- struct **DDS_ReliabilityQosPolicy**

  <<***extension***>> (p. *796*) <<***spec***>> (p. *791*) *Indicates the level of reliability offered/requested by RTI Connext.*

Enumerations

- enum **DDS_ReliabilityQosPolicyKind** {
  DDS_BEST_EFFORT_RELIABILITY_QOS ,
  DDS_RELIABLE_RELIABILITY_QOS }

  Kinds of reliability.
- enum **DDS_ReliabilityQosPolicyAcknowledgmentModeKind** {
  DDS_PROTOCOL_ACKNOWLEDGMENT_MODE ,
  DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE ,
  DDS_APPLICATION_ORDERED_ACKNOWLEDGMENT_MODE ,
  DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE }

  <<***extension***>> (p. *796*) *Kinds of acknowledgment.*
- enum **DDS_InstanceStateConsistencyKind** {
  DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY ,
  DDS_RECOVER_INSTANCE_STATE_CONSISTENCY }

  <<***extension***>> (p. *796*) *Whether instance state consistency is enabled.*

Variables

- const char ∗const **DDS_RELIABILITY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_ReliabilityQosPolicy*** (p. *1940*).

5.178.1 Detailed Description

<<***spec***>> (p. *791*) Indicates the level of reliability offered/requested by RTI Connext.

5.178.2 Enumeration Type Documentation

5.178.2.1 DDS_ReliabilityQosPolicyKind

`enum` **`DDS_ReliabilityQosPolicyKind`**

Kinds of reliability.

QoS:

DDS_ReliabilityQosPolicy (p. 1940)

Enumerator

DDS_BEST_EFFORT_RELIABILITY_QOS	Indicates that it is acceptable to not retry propagation of any samples. Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples. **[default]** for **DDS_DataReader** (p. 618) and **DDS_Topic** (p. 174)
DDS_RELIABLE_RELIABILITY_QOS	Specifies RTI Connext will attempt to deliver all samples in its history. Missed samples may be retried. In steady-state (no modifications communicated via the **DDS_DataWriter** (p. 488)), RTI Connext guarantees that all samples in the **DDS_DataWriter** (p. 488) history will eventually be delivered to all the **DDS_DataReader** (p. 618) objects (subject to timeouts that indicate loss of communication with a particular **DDS_Subscriber** (p. 575)). Outside steady state, the **HISTORY** (p. 1294) and **RESOURCE_LIMITS** (p. 1327) policies will determine how samples become part of the history and whether samples can be discarded from it. **[default]** for **DDS_DataWriter** (p. 488)

5.178.2.2 DDS_ReliabilityQosPolicyAcknowledgmentModeKind

`enum` **`DDS_ReliabilityQosPolicyAcknowledgmentModeKind`**

<<***extension***>> *(p. 796)* Kinds of acknowledgment.

QoS:

DDS_ReliabilityQosPolicy (p. 1940)

Enumerator

DDS_PROTOCOL_ACKNOWLEDGMENT_MODE	Samples are acknowledged by RTPS protocol. Samples are acknowledged according to the Real-Time Publish-Subscribe (RTPS) interoperability protocol.
DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_↩ MODE	Samples are acknowledged automatically after a subscribing application has accessed them. A sample received by a **FooDataReader** (p. 2119) is acknowledged after the subscribing application accesses it, either through calling **FooDataReader_take** (p. 629) or **FooDataReader_read** (p. 628) on the DDS sample. If the read or take operation loans the samples, the acknowledgment is done after **FooDataReader_return_loan** (p. 649) is called. Otherwise, for read or take operations that make a copy, acknowledgment is done after the read or take operations are executed.

Enumerator

DDS_APPLICATION_EXPLICIT_↩ ACKNOWLEDGMENT_MODE	Samples are acknowledged after the subscribing application explicitly calls acknowledge on the samples. Samples received by a **DDS_DataReader** (p. 618) are explicitly acknowledged by the subscribing application, after it calls either **DDS_DataReader_acknowledge_all** (p. 678) or **DDS_DataReader_acknowledge_sample** (p. 678).

5.178.2.3 DDS_InstanceStateConsistencyKind

enum **DDS_InstanceStateConsistencyKind**

<<***extension***>> *(p. 796)* Whether instance state consistency is enabled.

QoS:

DDS_ReliabilityQosPolicy (p. 1940)

Enumerator

DDS_NO_RECOVER_INSTANCE_STATE_↩ CONSISTENCY	Instance state is not restored on a DataReader after reconnecting with a DataWriter until the DataWriter sends a new sample. When DataReaders rediscover DataWriters, they will not request updated instance state data. DataWriters always provide instance state data alongside each sample update regardless of this setting.
DDS_RECOVER_INSTANCE_STATE_CONSISTENCY	Instance state is restored on the DataReader after it reconnects with a DataWriter that has regained liveliness, even before the DataWriter sends a new sample. When DataReaders rediscover DataWriters, they will request updated instance state data. DataWriters will respond to requests for updated instance state data and publish updates on a builtin channel. DataWriters still provide instance state data alongside each sample update regardless of this setting. The following limitation applies to using RECOVER_INSTANCE_STATE_CONSISTENCY: If the **DDS_DestinationOrderQosPolicyKind** (p. 1276) is set to **DDS_BY_SOURCE_TIMESTAMP_**↩ **DESTINATIONORDER_QOS** (p. 1276), RECOVER_INSTANCE_STATE_CONSISTENCY can only be used if scope is set to **DDS_INSTANCE_**↩ **SCOPE_DESTINATIONORDER_QOS** (p. 1277) (the default).

5.178.3 Variable Documentation

5.178.3.1 DDS_RELIABILITY_QOS_POLICY_NAME

```
const char* const DDS_RELIABILITY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_ReliabilityQosPolicy** (p. 1940).

5.179 RESOURCE_LIMITS

*<<**spec**>> (p. 791)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Data Structures

- struct **DDS_ResourceLimitsQosPolicy**

  *<<**spec**>> (p. 791) Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.*

Variables

- const char *const **DDS_RESOURCELIMITS_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_ResourceLimitsQosPolicy** (p. 1953).*
- const **DDS_Long** **DDS_LENGTH_UNLIMITED**

  A special value indicating an unlimited quantity.

5.179.1 Detailed Description

*<<**spec**>> (p. 791)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

5.179.2 Variable Documentation

5.179.2.1 DDS_RESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_RESOURCELIMITS_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_ResourceLimitsQosPolicy** (p. 1953).

5.179.2.2 DDS_LENGTH_UNLIMITED

```
const  DDS_Long DDS_LENGTH_UNLIMITED  [extern]
```

A special value indicating an unlimited quantity.

Examples

HelloWorld_subscriber.c.

5.180 SERVICE

<<***extension***>> *(p. 796)* Service QoS policy is used to indicate what kind of service or tool is associated with the DDS entity.

Data Structures

- struct **DDS_ServiceQosPolicy**
  <<***extension***>> *(p. 796) Service or tool associated with a DDS entity.*

Enumerations

- enum **DDS_ServiceQosPolicyKind** {
  DDS_NO_SERVICE_QOS ,
  DDS_PERSISTENCE_SERVICE_QOS ,
  DDS_QUEUING_SERVICE_QOS ,
  DDS_ROUTING_SERVICE_QOS ,
  DDS_RECORDING_SERVICE_QOS ,
  DDS_REPLAY_SERVICE_QOS ,
  DDS_DATABASE_INTEGRATION_SERVICE_QOS ,
  DDS_WEB_INTEGRATION_SERVICE_QOS ,
  DDS_OBSERVABILITY_COLLECTOR_SERVICE_QOS ,
  DDS_ADMIN_CONSOLE_SERVICE_QOS }
  Kinds of service.

Variables

- const char ∗const **DDS_SERVICE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_ServiceQosPolicy** (p. 2005).*

5.180.1 Detailed Description

<<***extension***>> *(p. 796)* Service QoS policy is used to indicate what kind of service or tool is associated with the DDS entity.

5.180.2 Enumeration Type Documentation

5.180.2.1 DDS_ServiceQosPolicyKind

enum **DDS_ServiceQosPolicyKind**

Kinds of service.

QoS:

DDS_ServiceQosPolicy (p. 2005)

Enumerator

DDS_NO_SERVICE_QOS	There is no service associated with the entity.
DDS_PERSISTENCE_SERVICE_QOS	The entity is an entity created by RTI Persistence Service.
DDS_QUEUING_SERVICE_QOS	The entity is an entity created by RTI Queuing Service.
DDS_ROUTING_SERVICE_QOS	The entity is an entity created by RTI Routing Service.
DDS_RECORDING_SERVICE_QOS	The entity is an entity created by RTI Recording Service.
DDS_REPLAY_SERVICE_QOS	The entity is an entity created by RTI Replay Service.
DDS_DATABASE_INTEGRATION_SERVICE_QOS	The entity is an entity created by RTI Database Integration Service.
DDS_WEB_INTEGRATION_SERVICE_QOS	The entity is an entity created by RTI Web Integration Service.
DDS_OBSERVABILITY_COLLECTOR_SERVICE_QOS	The entity is an entity created by RTI Observability Collector Service.
DDS_ADMIN_CONSOLE_SERVICE_QOS	The entity is an entity created by RTI Admin Console.

5.180.3 Variable Documentation

5.180.3.1 DDS_SERVICE_QOS_POLICY_NAME

```
const char* const DDS_SERVICE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_ServiceQosPolicy** (p. 2005).

5.181 SYSTEM_RESOURCE_LIMITS

<<***extension***>> *(p. 796)* Configures DomainParticipant-independent resources used by RTI Connext.

Data Structures

- struct **DDS_SystemResourceLimitsQosPolicy**

  <<***extension***>> *(p. 796) Configures **DDS_DomainParticipant** (p. 76)-independent resources used by RTI Connext. Mainly used to change the maximum number of **DDS_DomainParticipant** (p. 76) entities that can be created within a single process (address space).*

Variables

- const char *const **DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_SystemResourceLimitsQosPolicy** (p. 2030).*

5.181.1 Detailed Description

<<***extension***>> *(p. 796)* Configures DomainParticipant-independent resources used by RTI Connext.

5.181.2 Variable Documentation

5.181.2.1 DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_SystemResourceLimitsQosPolicy** (p. 2030).

5.182 TIME_BASED_FILTER

<<***spec***>> *(p. 791)* Filter that allows a **DDS_DataReader** (p. 618) to specify that it is interested only in (potentially) a subset of the values of the data.

Data Structures

- struct **DDS_TimeBasedFilterQosPolicy**

  <<***spec***>> *(p. 791) Filter that allows a **DDS_DataReader** (p. 618) to specify that it is interested only in (potentially) a subset of the values of the data.*

Variables

- const char ∗const **DDS_TIMEBASEDFILTER_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TimeBasedFilterQosPolicy** (p. 2038).*

5.182.1 Detailed Description

<<***spec***>> *(p. 791)* Filter that allows a **DDS_DataReader** (p. 618) to specify that it is interested only in (potentially) a subset of the values of the data.

5.182.2 Variable Documentation

5.182.2.1 DDS_TIMEBASEDFILTER_QOS_POLICY_NAME

```
const char* const DDS_TIMEBASEDFILTER_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TimeBasedFilterQosPolicy** (p. 2038).

5.183 TOPIC_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Data Structures

- struct **DDS_TopicDataQosPolicy**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.*

Variables

- const char ∗const **DDS_TOPICDATA_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TopicDataQosPolicy** (p. 2046).*

5.183.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

5.183.2 Variable Documentation

5.183.2.1 DDS_TOPICDATA_QOS_POLICY_NAME

```
const char* const DDS_TOPICDATA_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TopicDataQosPolicy** (p. 2046).

5.184 TOPIC_QUERY_DISPATCH

<<***extension***>> *(p. 796)* Configures the ability of a **DDS_DataWriter** (p. 488) to publish historical samples

Data Structures

- struct **DDS_TopicQueryDispatchQosPolicy**

  <<***extension***>> *(p. 796) Configures the ability of a **DDS_DataWriter** (p. 488) to publish samples in response to a **DDS_TopicQuery** (p. 708)*

Variables

- const char ∗const **DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TopicQueryDispatchQosPolicy** (p. 2053).*

5.184.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the ability of a **DDS_DataWriter** (p. 488) to publish historical samples

5.184.2 Variable Documentation

5.184.2.1 DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME

```
const char* const DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TopicQueryDispatchQosPolicy** (p. 2053).

5.185 TRANSPORT_BUILTIN

<<***extension***>> *(p. 796)* Specifies which built-in transports are used.

Data Structures

- struct **DDS_TransportBuiltinQosPolicy**
  <<***extension***>> *(p. 796) Specifies which built-in transports are used.*

Macros

- #define **DDS_TRANSPORTBUILTIN_MASK_NONE**
  *None of the built-in transports will be registered automatically when the **DDS_DomainParticipant** (p. 76) is enabled.*
- #define **DDS_TRANSPORTBUILTIN_MASK_DEFAULT**
  *The default value of **DDS_TransportBuiltinQosPolicy::mask** (p. 2058).*
- #define **DDS_TRANSPORTBUILTIN_MASK_ALL**
  *All the available built-in transports are registered automatically when the **DDS_DomainParticipant** (p. 76) is enabled.*

Typedefs

- typedef **DDS_Long** **DDS_TransportBuiltinKindMask**
  *A mask of **DDS_TransportBuiltinKind** (p. 1335) bits.*

Enumerations

- enum **DDS_TransportBuiltinKind** {
  DDS_TRANSPORTBUILTIN_UDPv4 ,
  DDS_TRANSPORTBUILTIN_SHMEM ,
  DDS_TRANSPORTBUILTIN_INTRA = 0x00000001 << 2 ,
  DDS_TRANSPORTBUILTIN_UDPv6 ,
  DDS_TRANSPORTBUILTIN_UDPv4_WAN }
  Built-in transport kind.

Variables

- const char ∗const **DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TransportBuiltinQosPolicy** (p. 2057).*
- const char ∗const **DDS_TRANSPORTBUILTIN_SHMEM_ALIAS**

  Alias name for the shared memory built-in transport: "builtin.shmem".
- const char ∗const **DDS_TRANSPORTBUILTIN_UDPv4_ALIAS**

  Alias name for the UDPv4 built-in transport: "builtin.udpv4".
- const char ∗const **DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS**

  Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".
- const char ∗const **DDS_TRANSPORTBUILTIN_UDPv6_ALIAS**

  Alias name for the UDPv6 built-in transport: "builtin.udpv6".

5.185.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies which built-in transports are used.

See also

Changing the automatically registered built-in transports (p. 994)

5.185.2 Macro Definition Documentation

5.185.2.1 DDS_TRANSPORTBUILTIN_MASK_NONE

```
#define DDS_TRANSPORTBUILTIN_MASK_NONE
```

None of the built-in transports will be registered automatically when the **DDS_DomainParticipant** (p. 76) is enabled.

The user must explictly register transports using **NDDS_Transport_Support_register_transport** (p. 731).

See also

DDS_TransportBuiltinKindMask (p. 1335)

5.185.2.2 DDS_TRANSPORTBUILTIN_MASK_DEFAULT

```
#define DDS_TRANSPORTBUILTIN_MASK_DEFAULT
```

The default value of **DDS_TransportBuiltinQosPolicy::mask** (p. 2058).

The set of builtin transport plugins that will be automatically registered with the participant by default. The user can register additional transports using **NDDS_Transport_Support_register_transport** (p. 731).

[default] [UDPv4|Shmem]

See also

DDS_TransportBuiltinKindMask (p. 1335)

5.185.2.3 DDS_TRANSPORTBUILTIN_MASK_ALL

```
#define DDS_TRANSPORTBUILTIN_MASK_ALL
```

All the available built-in transports are registered automatically when the **DDS_DomainParticipant** (p. 76) is enabled.

See also

DDS_TransportBuiltinKindMask (p. 1335)

5.185.3 Typedef Documentation

5.185.3.1 DDS_TransportBuiltinKindMask

```
typedef DDS_Long DDS_TransportBuiltinKindMask
```

A mask of **DDS_TransportBuiltinKind** (p. 1335) bits.

QoS:

DDS_TransportBuiltinQosPolicy (p. 2057)

5.185.4 Enumeration Type Documentation

5.185.4.1 DDS_TransportBuiltinKind

```
enum DDS_TransportBuiltinKind
```

Built-in transport kind.

See also

DDS_TransportBuiltinKindMask (p. 1335)

Enumerator

DDS_TRANSPORTBUILTIN_UDPv4	Built-in UDPv4 transport, ::**UDPv4 Transport** (p. 1043).
DDS_TRANSPORTBUILTIN_SHMEM	Built-in shared memory transport, ::**Shared Memory Transport** (p. 1037).
DDS_TRANSPORTBUILTIN_UDPv6	Built-in UDPv6 transport, ::**UDPv6 Transport** (p. 1060).
DDS_TRANSPORTBUILTIN_UDPv4_WAN	Built-in UDPv4 asymmetric transport, ::**Real-Time WAN Transport** (p. 1053).

5.185.5 Variable Documentation

5.185.5.1 DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TransportBuiltinQosPolicy** (p. 2057).

5.185.5.2 DDS_TRANSPORTBUILTIN_SHMEM_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_SHMEM_ALIAS  [extern]
```

Alias name for the shared memory built-in transport: "builtin.shmem".

5.185.5.3 DDS_TRANSPORTBUILTIN_UDPv4_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv4_ALIAS  [extern]
```

Alias name for the UDPv4 built-in transport: "builtin.udpv4".

5.185.5.4 DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS  [extern]
```

Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".

5.185.5.5 DDS_TRANSPORTBUILTIN_UDPv6_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv6_ALIAS  [extern]
```

Alias name for the UDPv6 built-in transport: "builtin.udpv6".

5.186 TRANSPORT_MULTICAST

<<***extension***>> *(p. 796)* Specifies the multicast address on which a **DDS_DataReader** (p. 618) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDS_DomainParticipant** (p. 76) level) transports with which to receive the multicast data.

Modules

- **Multicast Settings**

  <<***extension***>> *(p. 796) Multicast communication settings.*
- **Multicast Mapping**

  <<***extension***>> *(p. 796) Multicast communication mapping.*

Data Structures

- struct **DDS_TransportMulticastQosPolicy**

  <<***extension***>> *(p. 796) Specifies the multicast address on which a **DDS_DataReader** (p. 618) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS_DomainParticipant** (p. 76) level) transports with which to receive the multicast data.*

Enumerations

- enum **DDS_TransportMulticastQosPolicyKind** {
  DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS ,
  DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS }

  Transport Multicast Policy Kind.

Variables

- const char ∗const **DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TransportMulticastQosPolicy** (p. 2064).*

5.186.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the multicast address on which a **DDS_DataReader** (p. 618) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDS_DomainParticipant** (p. 76) level) transports with which to receive the multicast data.

5.186.2 Enumeration Type Documentation

5.186.2.1 DDS_TransportMulticastQosPolicyKind

enum **DDS_TransportMulticastQosPolicyKind**

Transport Multicast Policy Kind.

See also

DDS_TransportMulticastQosPolicy (p. 2064)

Enumerator

DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS	Selects the multicast address automatically. NOTE: This setting is required when using the **DDS_TransportMulticastMappingQosPolicy** (p. 2062).
DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_↩ QOS	Selects a unicast-only mode.

5.186.3 Variable Documentation

5.186.3.1 DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME

const char* const DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME [extern]

Stringified human-readable name for **DDS_TransportMulticastQosPolicy** (p. 2064).

5.187 TRANSPORT_MULTICAST_MAPPING

<<***extension***>> *(p. 796)* Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

Data Structures

- struct **DDS_TransportMulticastMappingQosPolicy**

  <<***extension***>> *(p. 796) Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.*

Variables

- const char ∗const **DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TransportMulticastMappingQosPolicy** (p. 2062).*

5.187.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

5.187.2 Variable Documentation

5.187.2.1 DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TransportMulticastMappingQosPolicy** (p. 2062).

5.188 TRANSPORT_PRIORITY

<<***spec***>> *(p. 791)* This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

Data Structures

- struct **DDS_TransportPriorityQosPolicy**

  *<<**spec**>> (p. 791) This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.*

Variables

- const char ∗const **DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TransportPriorityQosPolicy** (p. 2068).*

5.188.1 Detailed Description

<<***spec***>> *(p. 791)* This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

5.188.2 Variable Documentation

5.188.2.1 DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TransportPriorityQosPolicy** (p. 2068).

5.189 TRANSPORT_SELECTION

<<***extension***>> *(p. 796)* Specifies the physical transports that a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) may use to send or receive data.

Data Structures

- struct **DDS_TransportSelectionQosPolicy**

  <<***extension***>> *(p. 796) Specifies the physical transports a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) may use to send or receive data.*

Variables

- const char *const **DDS_TRANSPORTSELECTION_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TransportSelectionQosPolicy** (p. 2070).*

5.189.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the physical transports that a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) may use to send or receive data.

5.189.2 Variable Documentation

5.189.2.1 DDS_TRANSPORTSELECTION_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTSELECTION_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TransportSelectionQosPolicy** (p. 2070).

5.190 TRANSPORT_UNICAST

*<<**extension**>> (p. 796)* Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Modules

- **Unicast Settings**

  *<<**extension**>> (p. 796) Unicast communication settings.*

Data Structures

- struct **DDS_TransportUnicastQosPolicy**

  *<<**extension**>> (p. 796) Specifies a subset of transports and a port number that can be used by an Entity to receive data.*

Variables

- const char *const **DDS_TRANSPORTUNICAST_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TransportUnicastQosPolicy** (p. 2071).*

5.190.1 Detailed Description

*<<**extension**>> (p. 796)* Specifies a subset of transports and a port number that can be used by an Entity to receive data.

5.190.2 Variable Documentation

5.190.2.1 DDS_TRANSPORTUNICAST_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTUNICAST_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TransportUnicastQosPolicy** (p. 2071).

5.191 TYPE_CONSISTENCY_ENFORCEMENT

*<<**spec**>> (p. 791)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Data Structures

- struct **DDS_TypeConsistencyEnforcementQosPolicy**

  *<<**spec**>> (p. 791) Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.*

Enumerations

- enum **DDS_TypeConsistencyKind** {
  DDS_DISALLOW_TYPE_COERCION ,
  DDS_ALLOW_TYPE_COERCION ,
  DDS_AUTO_TYPE_COERCION }

  Kinds of type consistency.

Variables

- const char *const **DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TypeConsistencyEnforcementQosPolicy** (p. 2082).*

5.191.1 Detailed Description

*<<**spec**>> (p. 791)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

5.191.2 Enumeration Type Documentation

5.191.2.1 DDS_TypeConsistencyKind

`enum` **`DDS_TypeConsistencyKind`**

Kinds of type consistency.

QoS:

DDS_TypeConsistencyEnforcementQosPolicy (p. 2082)

Enumerator

DDS_DISALLOW_TYPE_COERCION	The DataWriter and the DataReader must support the same data type in order for them to communicate. This is the degree of type consistency enforcement required by the OMG DDS Specification prior to the OMG Extensible and Dynamic Topic Types for DDS Specification.

DDS_ALLOW_TYPE_COERCION	The DataWriter and the DataReader need not support the same data type in order for them to communicate as long as the DataReader's type is assignable from the DataWriter's type. For example, the following two extensible types will be assignable to each other since MyDerivedType contains all the members of MyBaseType (member_1) plus some additional elements (member_2).
	`struct MyBaseType { long member_1; };`
	`struct MyDerivedType: MyBaseType { long member_2; };`
	Even if MyDerivedType was not explicitly inheriting from MyBaseType the types would still be assignable. For example:
	`struct MyBaseType { long member_1; };`
	`struct MyDerivedType { long member_1; long member_2; };`
	For additional information on type assignability refer to the OMG Extensible and Dynamic Topic Types for DDS Specification.

DDS_AUTO_TYPE_COERCION	This AUTO value will be applied as **DDS_DISALLOW_TYPE_COERCION** (p. 1343) when the data type is annotated with @transfer_mode(SHMEM_REF) and the @language_binding is PLAIN (default) while using C, Traditional C++, or Modern C++ APIs. In all other cases, this AUTO value will be applied as **DDS_ALLOW_TYPE_COERCION** (p. 1343). **[default]**

5.191.3 Variable Documentation

5.191.3.1 DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME

```
const char* const DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TypeConsistencyEnforcementQosPolicy** (p. 2082).

5.192 TYPESUPPORT

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Allows you to attach application-specific values to a **DDS_Data↩ Writer** (p. 488) or **DDS_DataReader** (p. 618), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Data Structures

- struct **DDS_TypeSupportQosPolicy**

  [DEPRECATED] *(p. **968**)* *<<**extension**>> (p. 796) Allows you to attach application-specific values to a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.*

Enumerations

- enum **DDS_CdrPaddingKind** {
  DDS_ZERO_CDR_PADDING ,
  DDS_NOT_SET_CDR_PADDING ,
  DDS_AUTO_CDR_PADDING }

  The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

Variables

- const char *const **DDS_TYPESUPPORT_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_TypeSupportQosPolicy** (p. 2087).*

5.192.1 Detailed Description

[DEPRECATED] (p. **968**) *<<**extension**>> (p. 796)* Allows you to attach application-specific values to a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

5.192.2 Enumeration Type Documentation

5.192.2.1 DDS_CdrPaddingKind

enum **DDS_CdrPaddingKind**

The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

Enumerator

DDS_ZERO_CDR_PADDING	Padding bytes will be set to zeros during CDR serialization.
DDS_NOT_SET_CDR_PADDING	Padding bytes will not be set to any value during CDR serialization.
DDS_AUTO_CDR_PADDING	When set on a **DDS_DomainParticipant** (p. 76) the default behavior is **DDS_NOT_SET_CDR_PADDING** (p. 1344). When set on a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) the behavior is to inherit the value from the **DDS_DomainParticipant** (p. 76).

5.192.3 Variable Documentation

5.192.3.1 DDS_TYPESUPPORT_QOS_POLICY_NAME

```
const char* const DDS_TYPESUPPORT_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_TypeSupportQosPolicy** (p. 2087).

5.193 USER_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Data Structures

- struct **DDS_UserDataQosPolicy**
  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.*

Variables

- const char *const **DDS_USERDATA_QOS_POLICY_NAME**
  *Stringified human-readable name for **DDS_UserDataQosPolicy** (p. 2092).*

5.193.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

5.193.2 Variable Documentation

5.193.2.1 DDS_USERDATA_QOS_POLICY_NAME

```
const char* const DDS_USERDATA_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_UserDataQosPolicy** (p. 2092).

5.194 WRITER_DATA_LIFECYCLE

<<***spec***>> *(p. 791)* Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

Data Structures

- struct **DDS_WriterDataLifecycleQosPolicy**

  <<***spec***>> *(p. 791) Controls how a **DDS_DataWriter** (p. 488) handles the lifecycle of the instances (keys) that it is registered to manage.*

Variables

- const char ∗const **DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_WriterDataLifecycleQosPolicy** (p. 2112).*

5.194.1 Detailed Description

<<***spec***>> *(p. 791)* Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

5.194.2 Variable Documentation

5.194.2.1 DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME

```
const char* const DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME  [extern]
```

Stringified human-readable name for **DDS_WriterDataLifecycleQosPolicy** (p. 2112).

5.195 WIRE_PROTOCOL

<<***extension***>> *(p. 796)* Specifies the wire protocol related attributes for the **DDS_DomainParticipant** (p. 76).

Data Structures

- struct **DDS_RtpsWellKnownPorts_t**

  <<***extension***>> *(p. 796) RTPS well-known port mapping configuration.*
- struct **DDS_WireProtocolQosPolicy**

  <<***extension***>> *(p. 796) Specifies the wire-protocol-related attributes for the **DDS_DomainParticipant** (p. 76).*

Macros

- #define **DDS_RTPS_RESERVED_PORT_MASK_DEFAULT**

  *The default value of **DDS_WireProtocolQosPolicy::rtps_reserved_port_mask** (p. 2105).*
- #define **DDS_RTPS_RESERVED_PORT_MASK_NONE**

  No bits are set.
- #define **DDS_RTPS_RESERVED_PORT_MASK_ALL**

  All bits are set.

Typedefs

- typedef **DDS_Long DDS_RtpsReservedPortKindMask**

  *A mask of **DDS_RtpsReservedPortKind** (p. 1349) bits.*

Enumerations

- enum **DDS_RtpsReservedPortKind** {
  DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST = 0x0001 << 0 ,
  DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST = 0x0001 << 1 ,
  DDS_RTPS_RESERVED_PORT_USER_UNICAST = 0x0001 << 2 ,
  DDS_RTPS_RESERVED_PORT_USER_MULTICAST = 0x0001 << 3 }

  RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.
- enum **DDS_WireProtocolQosPolicyAutoKind** {
  DDS_RTPS_AUTO_ID_FROM_IP = 0 ,
  DDS_RTPS_AUTO_ID_FROM_MAC = 1 ,
  DDS_RTPS_AUTO_ID_FROM_UUID = 2 }

  Mechanism to automatically calculate the GUID prefix.

Variables

- const struct **DDS_RtpsWellKnownPorts_t DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_↩ KNOWN_PORTS**

  Assign to use well-known port mappings which are compatible with previous versions of the RTI Connext middleware.
- const struct **DDS_RtpsWellKnownPorts_t DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS**

  Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.
- const char *const **DDS_WIREPROTOCOL_QOS_POLICY_NAME**

  *Stringified human-readable name for **DDS_WireProtocolQosPolicy** (p. 2099).*

5.195.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the wire protocol related attributes for the **DDS_DomainParticipant** (p. 76).

5.195.2 Macro Definition Documentation

5.195.2.1 DDS_RTPS_RESERVED_PORT_MASK_DEFAULT

```
#define DDS_RTPS_RESERVED_PORT_MASK_DEFAULT
```

Value:

```
((DDS_RtpsReservedPortKindMask) DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST \
 | DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST | DDS_RTPS_RESERVED_PORT_USER_UNICAST)
```

The default value of **DDS_WireProtocolQosPolicy::rtps_reserved_port_mask** (p. 2105).

Most of the ports that may be needed by DDS will be reserved by the transport when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **DDS_RtpsWellKnownPorts_t** (p. 1983) will be detected at this time and the enable operation will fail.

This setting will avoid reserving the **usertraffic** multicast port, which is not actually used unless there are DataReaders that enable multicast but fail to specify a port.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

DDS_RtpsReservedPortKindMask (p. 1349)

5.195.2.2 DDS_RTPS_RESERVED_PORT_MASK_NONE

```
#define DDS_RTPS_RESERVED_PORT_MASK_NONE
```

No bits are set.

None of the ports that are needed by DDS will be allocated until they are specifically required. With this value set, automatic participant Id selection will be based on selecting a port for discovery (metatraffic) unicast traffic on a single transport.

See also

DDS_RtpsReservedPortKindMask (p. 1349)

5.195.2.3 DDS_RTPS_RESERVED_PORT_MASK_ALL

```
#define DDS_RTPS_RESERVED_PORT_MASK_ALL
```

All bits are set.

All of the ports that may be needed by DDS will be reserved when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **DDS_RtpsWellKnownPorts_t** (p. 1983) will be detected at this time, and the enable operation will fail.

Note that this will also reserve the **usertraffic** multicast port which is not actually used unless there are DataReaders that enable multicast but fail to specify a port. To avoid unnecesary resource usage for these ports, use RTPS_↩ RESERVED_PORT_MASK_DEFAULT.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

DDS_RtpsReservedPortKindMask (p. 1349)

5.195.3 Typedef Documentation

5.195.3.1 DDS_RtpsReservedPortKindMask

```
typedef DDS_Long DDS_RtpsReservedPortKindMask
```

A mask of **DDS_RtpsReservedPortKind** (p. 1349) bits.

QoS:

DDS_WireProtocolQosPolicy (p. 2099)

5.195.4 Enumeration Type Documentation

5.195.4.1 DDS_RtpsReservedPortKind

```
enum DDS_RtpsReservedPortKind
```

RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.

See also

DDS_WireProtocolQosPolicy::rtps_reserved_port_mask (p. 2105)

Enumerator

DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST	Select the **metatraffic** unicast port.
DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST	Select the **metatraffic** multicast port.
DDS_RTPS_RESERVED_PORT_USER_UNICAST	Select the **usertraffic** unicast port.
DDS_RTPS_RESERVED_PORT_USER_MULTICAST	Select the **usertraffic** multicast port.

5.195.4.2 DDS_WireProtocolQosPolicyAutoKind

`enum` **`DDS_WireProtocolQosPolicyAutoKind`**

Mechanism to automatically calculate the GUID prefix.

See also

DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 2106)

Enumerator

DDS_RTPS_AUTO_ID_FROM_IP	Builds the GUID prefix using the IPv4 address and process ID. Uses the IPv4 address of the first up-and-running interface of the host machine and the process ID to build the GUID prefix.
DDS_RTPS_AUTO_ID_FROM_MAC	Builds the GUID prefix using the MAC address and process ID. Uses the first 32 bits of the MAC address assigned to the first up-and-running interface and the process ID to build the GUID prefix. Note to Android Users: DDS_RTPS_AUTO_ID_FROM_MAC is not supported in recent versions of Android (6.0 and later).
DDS_RTPS_AUTO_ID_FROM_UUID	Builds the GUID prefix by selecting the UUID-based algorithm (default). This method of generating the GUID prefix does not require having a network interface and is friendly to IP mobility scenarios in which an RTI Connext application may start in a node that does not have a physical network interface enabled.

5.195.5 Variable Documentation

5.195.5.1 DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS

`const struct` **`DDS_RtpsWellKnownPorts_t`** `DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS [extern]`

Assign to use well-known port mappings which are compatible with previous versions of the RTI Connext middleware.

Assign **DDS_WireProtocolQosPolicy::rtps_well_known_ports** (p. 2105) to this value to remain compatible with previous versions of the RTI Connext middleware that used fixed port mappings.

The following are the `rtps_well_known_ports` values for **DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_↩ WELL_KNOWN_PORTS** (p. 1350):

`port_base` = 7400
`domain_id_gain` = 10
`participant_id_gain` = 1000
`builtin_multicast_port_offset` = 2
`builtin_unicast_port_offset` = 0
`user_multicast_port_offset` = 1
`user_unicast_port_offset` = 3

These settings are *not* compliant with OMG's DDS Interoperability Wire Protocol. To comply with the specification, please use **DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS** (p. 1351).

See also

DDS_WireProtocolQosPolicy::rtps_well_known_ports (p. 2105)

DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS (p. 1351)

5.195.5.2 DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS

`const struct` **DDS_RtpsWellKnownPorts_t** `DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS [extern]`

Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

Assign **DDS_WireProtocolQosPolicy::rtps_well_known_ports** (p. 2105) to this value to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

The following are the `rtps_well_known_ports` values for **DDS_INTEROPERABLE_RTPS_WELL_KNOWN_↩ PORTS** (p. 1351):

`port_base` = 7400
`domain_id_gain` = 250
`participant_id_gain` = 2
`builtin_multicast_port_offset` = 0
`builtin_unicast_port_offset` = 10
`user_multicast_port_offset` = 1
`user_unicast_port_offset` = 11

Assuming a maximum port number of 65535 (UDPv4), the above settings enable the use of about 230 domains with up to 120 Participants per node per domain.

These settings are *not* backwards compatible with previous versions of the RTI Connext middleware that used fixed port mappings. For backwards compability, please use **DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN↩ _PORTS** (p. 1350).

5.199.1 Detailed Description

<<***extension***>> *(p. 796)* Multicast communication mapping.

5.200 NDDS_DISCOVERY_PEERS

Environment variable or a file that specifies the default values of **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719) contained in the **DDS_Domain↩ ParticipantQos::discovery** (p. 1731) qos policy.

Environment variable or a file that specifies the default values of **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719) contained in the **DDS_Domain↩ ParticipantQos::discovery** (p. 1731) qos policy.

The default value of the **DDS_DomainParticipantQos** (p. 1729) is obtained by calling **DDS_DomainParticipant↩ Factory_get_default_participant_qos()** (p. 40).

NDDS_DISCOVERY_PEERS specifies the default value of the **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719) fields, when the default participant QoS policies have not been explictly set by the user (i.e., **DDS_DomainParticipantFactory_set_default_participant_qos()** (p. 38) has never been called or was called using **DDS_PARTICIPANT_QOS_DEFAULT** (p. 64)).

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **DDS_DiscoveryQos↩ Policy::multicast_receive_addresses** (p. 1719) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **DDS_↩ DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719), starting at element 0. They will be stored in the order in which they appear in NDDS_DISCOVERY_PEERS.

Note: IPv4 multicast addresses must have a prefix. Therefore, when using the UDPv6 transport: if there are any IPv4 multicast addresses in the peers list, make sure they have "udpv4://" in front of them (such as udpv4://239.255.0.1).

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **DDS_↩ DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719).

NDDS_DISCOVERY_PEERS provides a mechanism to dynamically switch the discovery configuration of an RTI Connext application without recompilation. The application programmer is free to not use the default values; instead use values supplied by other means.

NDDS_DISCOVERY_PEERS can be specified either in an environment variable as comma (',') separated "peer descriptors" (see **Peer Descriptor Format** (p. 1355)) or in a file. These formats are described below.

5.200.1 Peer Descriptor Format

A **peer descriptor** string specifies a range of participants at a given `locator`. Peer descriptor strings are used in the **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) field and the **DDS_DomainParticipant_add_peer()** (p. 148) operation.

The anatomy of a `peer` descriptor is illustrated below using a UDPv4 transport and a custom "StarFabric" transport example.

A peer descriptor consists of:

optional **Participant ID Limit**. If a simple integer is specified, it indicates the maximum participant ID to be contacted by the RTI Connext discovery mechanism at the given locator. If that integer is enclosed in square brackets (e.g.: [2]) *only* that Participant ID will be used. You can also specify a range in the form of [a-b]: in this case only the Participant IDs in that specific range are contacted. If omitted, a default value of 4 is implied: participant IDs 0,1,2,3, and 4 will be contacted.

- **Locator**. See **Locator Format** (p. 1355).

These are separated by the '@' character. The separator may be omitted if a participant ID limit is not explictly specified.

Note that the "participant ID limit" only applies to unicast locators; it is ignored for multicast locators (and therefore should be omitted for multicast peer descriptors).

5.200.1.1 Locator Format

A **locator** string specifies a transport and an address in string format. Locators are used to form peer descriptors. A locator is equivalent to a peer descriptor with the default maximum participant ID.

A locator consists of:

optional **Transport name** (**alias** or class). This identifies the set of transport plugins (**Transport Aliases** (p. 722)) that may be used to parse the `address` portion of the locator. Note that a transport class name is an implicit alias that is used to refer to all the transport plugin instances of that class.

optional **Address**. See **Address Format** (p. 1356).

These are separated by the "//:" string. The separator is specified if and only if a transport name is specified.

If a transport name is specified, the address may be omitted; in that case, all the unicast addresses (across all transport plugin instances) associated with the transport class are implied. Thus, a locator string may specify several addresses.

If an address is specified, the transport name and the separator string may be omitted; in that case all the available transport plugins (for the **DDS_Entity** (p. 1362)) may be used to parse the address string.

5.200.1.2 Address Format

An **address** string specifies a transport-independent network address that qualifies a **transport-dependent** address string. Addresses are used to form locators. Addresses are also used in **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719), and **DDS_TransportMulticastSettings_t::receive_address** (p. 2067) fields. An address is equivalent to a locator in which the transport name and separator are omitted.

An address consists of:

optional **Network Address**. An address in IPv4 or IPv6 string notation. If omitted, the network address of the transport is implied (**Transport Network Address** (p. 725)).

optional **Transport Address**. A string that is passed to the transport for processing. The transport maps this string into **NDDS_Transport_Property_t::address_bit_count** (p. 2130) bits. If omitted the network address is used as the fully qualified address.

These are separated by the '#' character. If a separator is specified, it must be followed by a non-empty string which is passed to the transport plugin. If the separator is omitted, it is treated as a transport address with an implicit network address (of the transport plugin). The implicit network address is the address used when registering the transport: e.g, the UDPv4 implicit network address is 0.0.0.0.0.0.0.0.0.0.0.0.

The bits resulting from the transport address string are combined with the network address. The least or most significant **NDDS_Transport_Property_t::address_bit_count** (p. 2130) bits of the network address are ignored and replaced with the transport address. The sign of the **NDDS_Transport_Property_t::address_bit_count** (p. 2130) value determines whether the most significant bits (negative sign) or least significant bits (positive sign) are ignored (**Transport Network Address** (p. 725)).

You can use a hostname instead of a transport address. If a hostname is used, the transport will attempt to resolve the hostname upon enabling the DomainParticipant. Changes to the hostname resolution will only be detected if the DNS tracker is enabled (it is enabled by default); see `Using DNS Tracker to Keep Peer List Updated`, in the Core Libraries User's Manual. For example:

```
<domain_participant_qos>

    <discovery>

        <initial_peers>

            <element>udpv4://myhostname</element>

        </initial_peers>

    </discovery>

</domain_participant_qos>
```

In this example, the DomainParticipant will attempt to resolve "myhostname" using the UDPv4 transport.

5.200.2 NDDS_DISCOVERY_PEERS Environment Variable Format

NDDS_DISCOVERY_PEERS can be specified via an environment variable of the same name, consisting of a sequence of peer descriptors separated by the comma (',') character.

Examples

Multicast (maximum participant ID is irrelevant)

- 239.255.0.1

Default maximum participant ID on localhost

- localhost

Default maximum participant ID on host 192.168.1.1 (IPv4)

- 192.168.1.1

Default maximum participant ID on host FAA0::0 (IPv6)

- FAA0::1

Default maximum participant ID on host himalaya accessed using the "udpv4" transport plugin(s) (IPv4)

- udpv4://himalaya

Default maximum participant ID on localhost using the "udpv4" transport plugin(s) registered at network address FAA0::0

- udpv4://FAA0::0#localhost

Default maximum participant ID on host 0/0/R (StarFabric)

- 0/0/R
- #0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s)

- starfabric://0/0/R
- starfabric://#0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s) registered at network address FAA0::0

- starfabric://FBB0::0#0/0/R

Default maximum participant ID on all unicast addresses accessed via the "starfabric" (StarFabric) transport plugin(s)

- starfabric://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s) registered at network address FCC0::0

- shmem://FCC0::0

Default maximum participant ID on hosts himalaya and gangotri

- himalaya,gangotri

Maximum participant ID of 1 on hosts himalaya and gangotri

- 1@himalaya,1@gangotri

Combinations of above

- 239.255.0.1,localhost,192.168.1.1,0/0/R
- FAA0::1,FAA0::0#localhost,FBB0::0#0/0/R
- udpv4://himalaya,udpv4://FAA0::0#localhost,#0/0/R
- starfabric://0/0/R,starfabric://FBB0::0#0/0/R,shmem://
- starfabric://,shmem://FCC0::0,1@himalaya,1@gangotri

5.200.3 NDDS_DISCOVERY_PEERS File Format

NDDS_DISCOVERY_PEERS can be specified via a file of the same name in the program's current working directory. A NDDS_DISCOVERY_PEERS file would contain a sequence of peer descriptors separated by whitespace or the comma (',') character. The file may also contain comments starting with a semicolon (';') character till the end of the line.

Example:

```
;; NDDS_DISCOVERY_PEERS - Discovery Configuration File
;;
;;
;; NOTE:
;;   1. This file must be in the current working directory, i.e.
;;      in the folder from which the application is launched.
;;
;;   2. This file takes precedence over the environment variable NDDS_DISCOVERY_PEERS
;;
;; Multicast
```

```
239.255.0.1                 ; The default dds discovery multicast address
;; Unicast
localhost,192.168.1.1       ; A comma can be used a separator
FAA0::1  FAA0::0#localhost  ; Whitespace can be used as a separator
1@himalaya                  ; Maximum participant ID of 1 on 'himalaya'
1@gangotri
;; UDPv4
udpv4://himalaya            ; 'himalaya' via 'udpv4' transport plugin(s)
udpv4://FAA0::0#localhost   ; 'localhost' via 'updv4' transport
                            ;  plugin registered at network address FAA0::0
;; Shared Memory
shmem://                    ; All 'shmem' transport plugin(s)
builtin.shmem://            ; The builtin 'shmem' transport plugin
shmem://FCC0::0             ; Shared memory transport plugin registered
                            ;                at network address FCC0::0
;; StarFabric
0/0/R                       ; StarFabric node 0/0/R
starfabric://0/0/R          ; 0/0/R accessed via 'starfabric'
                            ;             transport plugin(s)
starfabric://FBB0::0#0/0/R  ; StarFabric transport plugin registered
                            ;             at network address FBB0::0
starfabric://               ; All 'starfabric' transport plugin(s)
```

5.200.4 NDDS_DISCOVERY_PEERS Precedence

If the current working directory from which the RTI Connext application is launched contains a file called NDDS_↩ DISCOVERY_PEERS, and an environment variable named NDDS_DISCOVERY_PEERS is also defined, the file takes precedence; the environment variable is ignored.

5.200.5 NDDS_DISCOVERY_PEERS Default Value

If NDDS_DISCOVERY_PEERS is not specified (either as a file in the current working directory, or as an environment variable), it implicitly defaults to the following.

```
;; Multicast (only on platforms which allow UDPv4 multicast out of the box)
;;
;; This allows any dds applications anywhere on the local network to
```

```
;; discover each other over UDPv4.
builtin.udpv4://239.255.0.1  ; dds's default discovery multicast address
                             ; This is also the default multicast receive address
;; Unicast - UDPv4 (on all platforms)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over UDP/IPv4.
builtin.udpv4://127.0.0.1
;; Unicast - Shared Memory (only on platforms that support shared memory)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over shared memory.
builtin.shmem://
```

5.200.6 Builtin Transport Class Names

The class names for the builtin transport plugins are:

- `shmem` - ::**Shared Memory Transport** (p. 1037)
- `udpv4` - ::**UDPv4 Transport** (p. 1043)
- `udpv6` - ::**UDPv6 Transport** (p. 1060)

These may be used as the transport names in the **Locator Format** (p. 1355).

5.200.7 NDDS_DISCOVERY_PEERS and Local Host Communication

Suppose you want to communicate with other RTI Connext applications on the same host and you are setting NDDS↩ _DISCOVERY_PEERS explicitly (generally in order to use unicast discovery with applications on other hosts).

If the local host platform does not support the shared memory transport, then you can include the name of the local host in the NDDS_DISCOVERY_PEERS list.

If the local host platform supports the shared memory transport, then you can do one of the following:

- Include "shmem://" in the NDDS_DISCOVERY_PEERS list. This will cause shared memory to be used for discovery and data traffic for applications on the same host.

or:

- Include the name of the local host in the NDDS_DISCOVERY_PEERS list and disable the shared memory transport in the **DDS_TransportBuiltinQosPolicy** (p. 2057) of the **DDS_DomainParticipant** (p. 76). This will cause UDP loopback to be used for discovery and data traffic for applications on the same host.

(To check if your platform supports shared memory, see the `Platform Notes`.)

5.201.1 Detailed Description

DDS_Entity (p. 1362), **DDS_Listener** (p. 1819) and related items.

DDS_Entity (p. 1362) subtypes are created and destroyed by factory objects. With the exception of **DDS_Domain↩ Participant** (p. 76), whose factory is **DDS_DomainParticipantFactory** (p. 32), all **DDS_Entity** (p. 1362) factory objects are themselves **DDS_Entity** (p. 1362) subtypes as well.

Important: all **DDS_Entity** (p. 1362) delete operations are inherently thread-unsafe. The user must take extreme care that a given **DDS_Entity** (p. 1362) is not destroyed in one thread while being used concurrently (including being deleted concurrently) in another thread. An operation's effect in the presence of the concurrent deletion of the operation's target **DDS_Entity** (p. 1362) is undefined.

5.201.2 Macro Definition Documentation

5.201.2.1 DDS_Listener_INITIALIZER

```
#define DDS_Listener_INITIALIZER
```

Initialize the **DDS_Listener::listener_data** (p. 1822) pointer to NULL.

5.201.3 Typedef Documentation

5.201.3.1 DDS_Entity

```
typedef struct DDS_EntityImpl  DDS_Entity
```

<<***interface***>> *(*p. *1015)* Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

All operations except for set_qos(), get_qos(), set_listener(), get_listener() and enable(), may return the value **DDS_RETCODE_NOT_ENABLED** (p. 1224).

QoS:

All QoS Policies (p. 1240)

Status:

Status Kinds (p. 1224)

Listener:

DDS_Listener (p. 1819)

5.201.4 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Connext.

5.201.4.1 set_qos (abstract)

This operation sets the QoS policies of the **DDS_Entity** (p. 1362). Each of the derived entity classes provides this operation: **DDS_Entity** (p. 1362) classes (**DDS_DomainParticipant** (p. 76), **DDS_Topic** (p. 174), **DDS_Publisher** (p. 446), **DDS_DataWriter** (p. 488), **DDS_Subscriber** (p. 575), and **DDS_DataReader** (p. 618)) so that the policies that are meaningful to each **DDS_Entity** (p. 1362) can be set. For example, see **DDS_DomainParticipant_set_qos** (p. 151).

Precondition

Certain policies are immutable (see **All QoS Policies** (p. 1240)): they can only be set at **DDS_Entity** (p. 1362) creation time or before the entity is enabled. If `set_qos()` is invoked after the **DDS_Entity** (p. 1362) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return **DDS_RETCODE_IMMUTABLE_POLICY** (p. 1224).

Certain values of QoS policies can be incompatible with the settings of the other policies. The `set_qos()` operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the set_qos operation will fail and return **DDS_RETCODE_UNSUPPORTED** (p. 1224).

Postcondition

The existing set of policies is only changed if the `set_qos()` operation succeeds. This is indicated by a return code of **DDS_RETCODE_OK** (p. 1224). In all other cases, none of the policies are modified.

Each derived **DDS_Entity** (p. 1362) class (**DDS_DomainParticipant** (p. 76), **DDS_Topic** (p. 174), **DDS_Publisher** (p. 446), **DDS_DataWriter** (p. 488), **DDS_Subscriber** (p. 575), **DDS_DataReader** (p. 618)) has a corresponding special value of the QoS (**DDS_PARTICIPANT_QOS_DEFAULT** (p. 64), **DDS_PUBLISHER_QOS_DEFAULT** (p. 160), **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 161), **DDS_TOPIC_QOS_DEFAULT** (p. 159), **DDS_DATAWRITER_QOS_↩ DEFAULT** (p. 473), **DDS_DATAREADER_QOS_DEFAULT** (p. 603)). This special value may be used as a parameter to the `set_qos` operation to indicate that the QoS of the **DDS_Entity** (p. 1362) should be changed to match the current default QoS set in the **DDS_Entity** (p. 1362)'s factory. The operation set_qos cannot modify the immutable QoS, so a successful return of the operation indicates that the mutable QoS for the Entity has been modified to match the current default for the **DDS_Entity** (p. 1362)'s factory.

The set of policies specified in the `qos` parameter are applied on top of the existing QoS, replacing the values of any policies previously set.

Possible error codes returned in addition to **Standard Return Codes** (p. 1223) : **DDS_RETCODE_IMMUTABLE_↩ POLICY** (p. 1224), **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224), **DDS_RETCODE_NOT_ALLOWED_BY_↩ SECURITY** (p. 1224).

5.201.4.2 get_qos (abstract)

This operation allows access to the existing set of QoS policies for the **DDS_Entity** (p. 1362). This operation must be provided by each of the derived **DDS_Entity** (p. 1362) classes (**DDS_DomainParticipant** (p. 76), **DDS_Topic** (p. 174), **DDS_Publisher** (p. 446), **DDS_DataWriter** (p. 488), **DDS_Subscriber** (p. 575), and **DDS_DataReader** (p. 618)), so that the policies that are meaningful to each **DDS_Entity** (p. 1362) can be retrieved. For example, see **DDS_Domain↩ Participant_get_qos** (p. 152)

Possible error codes are **Standard Return Codes** (p. 1223).

5.201.4.3 set_listener (abstract)

This operation installs a **DDS_Listener** (p. 1819) on the **DDS_Entity** (p. 1362). The listener will only be invoked on the changes of communication status indicated by the specified `mask`.

This operation must be provided by each of the derived **DDS_Entity** (p. 1362) classes (**DDS_DomainParticipant** (p. 76), **DDS_Topic** (p. 174), **DDS_Publisher** (p. 446), **DDS_DataWriter** (p. 488), **DDS_Subscriber** (p. 575), and **DDS_Data↩ Reader** (p. 618)), so that the listener is of the concrete type suitable to the particular **DDS_Entity** (p. 1362).

There are two components involved when setting up listeners: the listener itself and the mask. Both of these can be NULL.

Listeners for some Entities derive from the Connext DDS Listeners for related Entities. This means that the derived Listener has all of the methods of its parent class. You can install Listeners at all levels of the object hierarchy. At the top is the DomainParticipantListener; only one can be installed in a DomainParticipant. Then every Subscriber and Publisher can have their own Listener. Finally, each Topic, DataReader and DataWriter can have their own listeners. All are optional.

Suppose, however, that an Entity does not install a Listener, or installs a Listener that does not have particular communication status selected in the bitmask. In this case, if/when that particular status changes for that Entity, the corresponding Listener for that Entity's parent is called. Status changes are "propagated" from child Entity to parent Entity until a Listener is found that is registered for that status. Connext DDS will give up and drop the status-change event only if no Listeners have been installed in the object hierarchy to be called back for the specific status.

The following table describes the effect of different combinations of Listeners and Status Bit Masks considering the hierarchical processing.

Table 5.945 Effect of Different Combinations of Listeners and Status Bit Masks

	No Bits Set in Mask	Some/All Bits Set in Mask
Listener is Specified	Connext DDS finds the next most relevant listener for the changed status	For the statuses that are enabled in the mask, the most relevant listener will be called. The 'statusChangedFlag' for the relevant status is reset
Listener is NULL	Connext DDS behaves as if the listener is not installed and finds the next most relevant listener for that status	Connext DDS behaves as if the listener is installed, but the callback is doing nothing. This is called a "nil" listener

Postcondition

Only one listener can be attached to each **DDS_Entity** (p. 1362). If a listener was already set, the operation `set_listener()` will replace it with the new one. Consequently, if the value NULL is passed for the listener parameter to the set_listener operation, any existing listener will be removed.

5.201.4.4 get_listener (abstract)

This operation allows access to the existing **DDS_Listener** (p. 1819) attached to the **DDS_Entity** (p. 1362).

This operation must be provided by each of the derived **DDS_Entity** (p. 1362) classes (**DDS_DomainParticipant** (p. 76), **DDS_Topic** (p. 174), **DDS_Publisher** (p. 446), **DDS_DataWriter** (p. 488), **DDS_Subscriber** (p. 575), and **DDS_DataReader** (p. 618)) so that the listener is of the concrete type suitable to the particular **DDS_Entity** (p. 1362).

If no listener is installed on the **DDS_Entity** (p. 1362), this operation will return NULL.

5.201.4.5 DDS_DomainEntity

```
typedef struct DDS_DomainEntityImpl  DDS_DomainEntity
```

<<***interface***>> *(*p. *1015)* Abstract base class for all DDS entities except for the **DDS_DomainParticipant** (p. 76).

Its sole purpose is to *conceptually* express that **DDS_DomainParticipant** (p. 76) is a special kind of **DDS_Entity** (p. 1362) that acts as a container of all other **DDS_Entity** (p. 1362) but itself cannot contain other **DDS_DomainParticipant** (p. 76).

5.201.5 Function Documentation

5.201.5.1 DDS_Entity_enable()

```
DDS_ReturnCode_t DDS_Entity_enable (
            DDS_Entity * self )
```

Enables the **DDS_Entity** (p. 1362).

This operation enables the Entity. Entity objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 1291) QoS policy on the corresponding factory for the **DDS_Entity** (p. 1362).

By default, **ENTITY_FACTORY** (p. 1291) is set so that it is not necessary to explicitly call **DDS_Entity_enable** (p. 1365) on newly created entities.

The **DDS_Entity_enable** (p. 1365) operation is idempotent. Calling enable on an already enabled Entity returns OK and has no effect.

If a **DDS_Entity** (p. 1362) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **DDS_Entity_get_statuscondition** (p. 1367)
- 'factory' operations
- **DDS_Entity_get_status_changes** (p. 1367) and other get status operations (although the status of a disabled entity never changes)
- 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **DDS_RETCODE_NOT_ENABLED** (p. 1224).

It is legal to delete an **DDS_Entity** (p. 1362) that has not been enabled by calling the proper operation on its factory .

Entities created from a factory Entity that is disabled are created disabled, regardless of the setting of the **DDS_Entity↩ FactoryQosPolicy** (p. 1791).

Calling enable on an Entity whose factory Entity is not enabled will fail and return **DDS_RETCODE_PRECONDITION↩ _NOT_MET** (p. 1224).

If **DDS_EntityFactoryQosPolicy::autoenable_created_entities** (p. 1792) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **DDS_Publisher** (p. 446) will enable all its contained **DDS_DataWriter** (p. 488) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value` == FALSE.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.

Returns

One of the **Standard Return Codes** (p. 1223), **Standard Return Codes** (p. 1223) or **DDS_RETCODE_↩ PRECONDITION_NOT_MET** (p. 1224).

5.201.5.2 DDS_Entity_get_statuscondition()

```
DDS_StatusCondition * DDS_Entity_get_statuscondition (
            DDS_Entity * self )
```

Allows access to the **DDS_StatusCondition** (p. 1373) associated with the **DDS_Entity** (p. 1362).

The returned condition can then be added to a **DDS_WaitSet** (p. 1373) so that the application can wait for specific status changes that affect the **DDS_Entity** (p. 1362).

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

the status condition associated with this entity.

5.201.5.3 DDS_Entity_get_status_changes()

```
DDS_StatusMask DDS_Entity_get_status_changes (
            DDS_Entity * self )
```

Retrieves the list of communication statuses in the **DDS_Entity** (p. 1362) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the get_∗_status() function.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the get_status_changes operation will be empty.

The list of statuses returned by the get_status_changes operation refers to the status that are triggered on the Entity itself and does not include statuses that apply to contained entities.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

list of communication statuses in the **DDS_Entity** (p. 1362) that are triggered.

See also

Status Kinds (p. 1224)

5.201.5.4 DDS_Entity_get_instance_handle()

```
DDS_InstanceHandle_t DDS_Entity_get_instance_handle (
            const  DDS_Entity * self )
```

Allows access to the **DDS_InstanceHandle_t** (p. 213) associated with the **DDS_Entity** (p. 1362).

This operation returns the **DDS_InstanceHandle_t** (p. 213) that represents the **DDS_Entity** (p. 1362).

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

the instance handle associated with this entity.

5.201.5.5 DDS_Entity_get_entity_kind()

```
DDS_EntityKind_t DDS_Entity_get_entity_kind (
              DDS_Entity * self )
```

Allows access to the **DDS_InstanceHandle_t** (p. 213) associated with the **DDS_Entity** (p. 1362).

This operation returns the **DDS_InstanceHandle_t** (p. 213) that represents the **DDS_Entity** (p. 1362).

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

the instance handle associated with this entity.

5.202 Conditions and WaitSets

DDS_Condition (p. 1372) and **DDS_WaitSet** (p. 1373) and related items.

Modules

- **AsyncWaitSet**

  *<<**extension**>> (p. 1014) A specialization of **DDS_WaitSet** (p. 1373) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDS_Condition** (p. 1372).*

Data Structures

- struct **DDS_ConditionSeq**

  *Instantiates **FooSeq** (p. 2120) < **DDS_Condition** (p. 1372) >*
- struct **DDS_ConditionHandler**

  *<<**extension**>> (p. 1014) <<**interface**>> (p. 1015) Handler called by the **DDS_Condition_dispatch** (p. 1377).*
- struct **DDS_WaitSetProperty_t**

  *<<**extension**>> (p. 1014) Specifies the **DDS_WaitSet** (p. 1373) behavior for multiple trigger events.*

Macros

- #define **DDS_ConditionHandler_INITIALIZER**

  *<<**experimental**>> (p. 1014) <<**extension**>> (p. 1014) Initializer for new **DDS_ConditionHandler** (p. 1570).*
- #define **DDS_WaitSetProperty_t_INITIALIZER**

  *<<**extension**>> (p. 1014) Initializer for new property instances.*

Typedefs

- typedef struct DDS_ConditionImpl **DDS_Condition**

  *<<**interface**>> (p. 1015) Root class for all the conditions that may be attached to a **DDS_WaitSet** (p. 1373).*
- typedef void(* **DDS_ConditionHandler_OnConditionTriggeredCallback**) (void *handler_data, **DDS_↩ Condition** *condition)

  *Prototype of a **DDS_ConditionHandler** (p. 1570) on_condition_triggered function.*
- typedef struct DDS_GuardConditionImpl **DDS_GuardCondition**

  *<<**interface**>> (p. 1015) A specific **DDS_Condition** (p. 1372) whose `trigger_value` is completely under the control of the application.*
- typedef struct DDS_StatusConditionImpl **DDS_StatusCondition**

  *<<**interface**>> (p. 1015) A specific **DDS_Condition** (p. 1372) that is associated with each **DDS_Entity** (p. 1362).*
- typedef struct DDS_WaitSetImpl **DDS_WaitSet**

  *<<**interface**>> (p. 1015) Allows an application to wait until one or more of the attached **DDS_Condition** (p. 1372) objects has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 1203) or else until the timeout expires.*

Functions

- **DDS_Boolean DDS_Condition_get_trigger_value** (**DDS_Condition** ∗self)

  Retrieve the `trigger_value`*.*
- **DDS_ReturnCode_t DDS_Condition_set_handler** (**DDS_Condition** ∗self, const struct **DDS_Condition↩ Handler** ∗handler)

  *<<**extension**>> (*p. *1014) Registers a **DDS_ConditionHandler** (*p. *1570) in this **DDS_Condition** (*p. *1372).*
- struct **DDS_ConditionHandler DDS_Condition_get_handler** (**DDS_Condition** ∗self)

  *<<**extension**>> (*p. *1014) Returns the registered **DDS_ConditionHandler** (*p. *1570).*
- void **DDS_Condition_dispatch** (**DDS_Condition** ∗self)

  *<<**extension**>> (*p. *1014) Calls **DDS_ConditionHandler::on_condition_triggered** (*p. *1571) of the registered **DDS↩ _ConditionHandler** (*p. *1570).*
- **DDS_Condition** ∗ **DDS_GuardCondition_as_condition** (**DDS_GuardCondition** ∗guardCondition)

  *Access a **DDS_GuardCondition** (*p. *1372)'s supertype instance.*
- **DDS_GuardCondition** ∗ **DDS_GuardCondition_new** (void)

  No argument constructor.
- **DDS_ReturnCode_t DDS_GuardCondition_delete** (**DDS_GuardCondition** ∗self)

  Destructor.
- **DDS_ReturnCode_t DDS_GuardCondition_set_trigger_value** (**DDS_GuardCondition** ∗self, **DDS_Boolean** value)

  Set the guard condition trigger value.
- **DDS_Condition** ∗ **DDS_StatusCondition_as_condition** (**DDS_StatusCondition** ∗statusCondition)

  *Access a **DDS_StatusCondition** (*p. *1373)'s supertype instance.*
- **DDS_StatusMask DDS_StatusCondition_get_enabled_statuses** (**DDS_StatusCondition** ∗self)

  *Get the list of statuses enabled on an **DDS_Entity** (*p. *1362).*
- **DDS_ReturnCode_t DDS_StatusCondition_set_enabled_statuses** (**DDS_StatusCondition** ∗self, **DDS_↩ StatusMask** mask)

  This operation defines the list of communication statuses that determine the `trigger_value` *of the **DDS_Status↩ Condition** (*p. *1373).*
- **DDS_Entity** ∗ **DDS_StatusCondition_get_entity** (**DDS_StatusCondition** ∗self)

  *Get the **DDS_Entity** (*p. *1362) associated with the **DDS_StatusCondition** (*p. *1373).*
- **DDS_WaitSet** ∗ **DDS_WaitSet_new** (void)

  Default no-argument constructor.
- **DDS_WaitSet** ∗ **DDS_WaitSet_new_ex** (const struct **DDS_WaitSetProperty_t** ∗prop)

  *<<**extension**>> (*p. *1014) Constructor for a **DDS_WaitSet** (*p. *1373) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first*
- **DDS_ReturnCode_t DDS_WaitSet_delete** (**DDS_WaitSet** ∗self)

  Destructor.
- **DDS_ReturnCode_t DDS_WaitSet_set_property** (**DDS_WaitSet** ∗self, const struct **DDS_WaitSetProperty↩ _t** ∗prop)

  *<<**extension**>> (*p. *1014) Sets the **DDS_WaitSetProperty_t** (*p. *2097), to configure the associated **DDS_WaitSet** (*p. *1373) to return after one or more trigger events have occurred.*
- **DDS_ReturnCode_t DDS_WaitSet_get_property** (**DDS_WaitSet** ∗self, struct **DDS_WaitSetProperty_↩ t** ∗prop)

  *<<**extension**>> (*p. *1014) Retrieves the **DDS_WaitSetProperty_t** (*p. *2097) configuration of the associated **DDS_↩ WaitSet** (*p. *1373).*
- **DDS_ReturnCode_t DDS_WaitSet_wait** (**DDS_WaitSet** ∗self, struct **DDS_ConditionSeq** ∗active_conditions, const struct **DDS_Duration_t** ∗timeout)

  Allows an application thread to wait for the occurrence of certain conditions.

- **DDS_ReturnCode_t DDS_WaitSet_attach_condition** (**DDS_WaitSet** ∗self, **DDS_Condition** ∗cond)

  *Attaches a **DDS_Condition** (p. 1372) to the **DDS_WaitSet** (p. 1373).*
- **DDS_ReturnCode_t DDS_WaitSet_detach_condition** (**DDS_WaitSet** ∗self, **DDS_Condition** ∗cond)

  *Detaches a **DDS_Condition** (p. 1372) from the **DDS_WaitSet** (p. 1373).*
- **DDS_ReturnCode_t DDS_WaitSet_get_conditions** (**DDS_WaitSet** ∗self, struct **DDS_ConditionSeq** ∗attached_conditions)

  *Retrieves the list of attached **DDS_Condition** (p. 1372) (s).*

5.202.1 Detailed Description

DDS_Condition (p. 1372) and **DDS_WaitSet** (p. 1373) and related items.

5.202.2 Macro Definition Documentation

5.202.2.1 DDS_ConditionHandler_INITIALIZER

```
#define DDS_ConditionHandler_INITIALIZER
```

<<***experimental***>> *(p. 1014)* <<***extension***>> *(p. 1014)* Initializer for new **DDS_ConditionHandler** (p. 1570).

No memory is allocated. New **DDS_ConditionHandler** (p. 1570) instances stored in the stack should be initialized with this value before they are passed to any functions.

See also

DDS_ConditionHandler (p. 1570)

5.202.2.2 DDS_WaitSetProperty_t_INITIALIZER

```
#define DDS_WaitSetProperty_t_INITIALIZER
```

Value:

```
   {  \
   1, DDS_DURATION_INFINITE_VALUE \
}
```

<<***extension***>> *(p. 1014)* Initializer for new property instances.

Default property specifies `max_event_count` = 1 and `max_event_delay` = `DDS_DURATION_INFINITE`

5.202.3 Typedef Documentation

5.202.3.1 DDS_Condition

```
typedef struct DDS_ConditionImpl DDS_Condition
```

<<***interface***>> *(p. 1015)* Root class for all the conditions that may be attached to a **DDS_WaitSet** (p. 1373).

This basic class is specialised in three classes:

DDS_GuardCondition (p. 1372), **DDS_StatusCondition** (p. 1373), and **DDS_ReadCondition** (p. 695).

A **DDS_Condition** (p. 1372) has a `trigger_value` that can be **DDS_BOOLEAN_TRUE** (p. 1203) or **DDS_BOOLEAN_FALSE** (p. 1203) and is set automatically by RTI Connext.

See also

DDS_WaitSet (p. 1373)

5.202.3.2 DDS_ConditionHandler_OnConditionTriggeredCallback

```
typedef void(* DDS_ConditionHandler_OnConditionTriggeredCallback) (void *handler_data, DDS_Condition *condition)
```

Prototype of a **DDS_ConditionHandler** (p. 1570) on_condition_triggered function.

Parameters

handler_data	<<***in***>> *(p. 1015)* Data associated with the handler when the handler is set.
condition	st_in associated **DDS_Condition** (p. 1372) on which the **DDS_Condition_dispatch** (p. 1377) is called.

5.202.3.3 DDS_GuardCondition

```
typedef struct DDS_GuardConditionImpl DDS_GuardCondition
```

<<***interface***>> *(p. 1015)* A specific **DDS_Condition** (p. 1372) whose `trigger_value` is completely under the control of the application.

The **DDS_GuardCondition** (p. 1372) provides a way for an application to manually wake up a **DDS_WaitSet** (p. 1373). This is accomplished by attaching the **DDS_GuardCondition** (p. 1372) to the **DDS_WaitSet** (p. 1373) and then setting the `trigger_value` by means of the **DDS_GuardCondition_set_trigger_value** (p. 1380) operation.

See also

DDS_WaitSet (p. 1373)

5.202.3.4 DDS_StatusCondition

`typedef struct DDS_StatusConditionImpl` **`DDS_StatusCondition`**

<<***interface***>> *(*p. *1015)* A specific **DDS_Condition** (p. 1372) that is associated with each **DDS_Entity** (p. 1362).

The `trigger_value` of the **DDS_StatusCondition** (p. 1373) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of `enabled_statuses` on the **DDS_Status↩ Condition** (p. 1373).

Status Kinds (p. 1224)

DDS_WaitSet (p. 1373), **DDS_Condition** (p. 1372)

DDS_Listener (p. 1819)

5.202.3.5 DDS_WaitSet

`typedef struct DDS_WaitSetImpl DDS_WaitSet`

<<***interface***>> *(*p. *1015)* Allows an application to wait until one or more of the attached **DDS_Condition** (p. 1372) objects has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 1203) or else until the timeout expires.

5.202.4 Usage

DDS_Condition (p. 1372) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

This mechanism is wait-based. Its general use pattern is as follows:

- The application indicates which relevant information it wants to get by creating **DDS_Condition** (p. 1372) objects (**DDS_StatusCondition** (p. 1373), **DDS_ReadCondition** (p. 695) or **DDS_QueryCondition** (p. 700)) and attaching them to a **DDS_WaitSet** (p. 1373).

- It then waits on that **DDS_WaitSet** (p. 1373) until the `trigger_value` of one or several **DDS_Condition** (p. 1372) objects become **DDS_BOOLEAN_TRUE** (p. 1203).

- It then uses the result of the wait (i.e., active_conditions, the list of **DDS_Condition** (p. 1372) objects with `trigger_value` == **DDS_BOOLEAN_TRUE** (p. 1203)) to actually get the information:
  - by calling **DDS_Entity_get_status_changes** (p. 1367) and then `get_<communication_status>()` on the relevant **DDS_Entity** (p. 1362), if the condition is a **DDS_StatusCondition** (p. 1373) and the status changes, refer to plain communication status;
  - by calling **DDS_Entity_get_status_changes** (p. 1367) and then **DDS_Subscriber_get_datareaders** (p. 591) on the relevant **DDS_Subscriber** (p. 575) (and then **FooDataReader_read()** (p. 628) or **Foo↩ DataReader_take** (p. 629) on the returned **DDS_DataReader** (p. 618) objects), if the condition is a **DDS↩ _StatusCondition** (p. 1373) and the status changes refers to **DDS_DATA_ON_READERS_STATUS** (p. 1232);
  - by calling **DDS_Entity_get_status_changes** (p. 1367) and then **FooDataReader_read()** (p. 628) or **Foo↩ DataReader_take** (p. 629) on the relevant **DDS_DataReader** (p. 618), if the condition is a **DDS_Status↩ Condition** (p. 1373) and the status changes refers to **DDS_DATA_AVAILABLE_STATUS** (p. 1232);
  - by calling directly **FooDataReader_read_w_condition** (p. 633) or **FooDataReader_take_w_condition** (p. 635) on a **DDS_DataReader** (p. 618) with the **DDS_Condition** (p. 1372) as a parameter if it is a **DDS_↩ ReadCondition** (p. 695) or a **DDS_QueryCondition** (p. 700).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **DDS_Condition** (p. 1372) objects), **DDS_Condition** (p. 1372) objects are meant to embed all that is needed to react properly when enabled. In particular, **DDS_Entity** (p. 1362)-related conditions are related to exactly one **DDS↩ _Entity** (p. 1362) and cannot be shared.

The blocking behavior of the **DDS_WaitSet** (p. 1373) is illustrated below.

The result of a **DDS_WaitSet_wait** (p. 1383) operation depends on the state of the **DDS_WaitSet** (p. 1373), which in turn depends on whether at least one attached **DDS_Condition** (p. 1372) has a `trigger_value` of **DDS_BOOLEAN↩ _TRUE** (p. 1203). If the wait operation is called on **DDS_WaitSet** (p. 1373) with state BLOCKED, it will block the calling thread. If wait is called on a **DDS_WaitSet** (p. 1373) with state UNBLOCKED, it will return immediately. In addition, when the **DDS_WaitSet** (p. 1373) transitions from BLOCKED to UNBLOCKED it wakes up any threads that had called wait on it.

A key aspect of the Condition and WaitSet mechanism is the setting of the `trigger_value` of each **DDS_Condition** (p. 1372).

The **DDS_WaitSet** (p. 1373) cannot be used after calling **DDS_DomainParticipantFactory_finalize_instance** (p. 38).

5.202.5 Trigger State of a ::DDS_StatusCondition

The `trigger_value` of a **DDS_StatusCondition** (p. 1373) is the boolean OR of the ChangedStatusFlag of all the communication statuses (see **Status Kinds** (p. 1224)) to which it is sensitive. That is, `trigger_value` == **DDS_↩ BOOLEAN_FALSE** (p. 1203) only if all the values of the ChangedStatusFlags are **DDS_BOOLEAN_FALSE** (p. 1203).

The sensitivity of the **DDS_StatusCondition** (p. 1373) to a particular communication status is controlled by the list of `enabled_statuses` set on the condition by means of the **DDS_StatusCondition_set_enabled_statuses** (p. 1381) operation.

Once the `trigger_value` of a StatusCondition becomes true, it remains true until the status that changed is reset. To reset a status, call the related get_*_status() operation. Or, in the case of the data available status, call read(), take(), or one of their variants. Therefore, if you are using a **DDS_StatusCondition** (p. 1373) on a **DDS_WaitSet** (p. 1373) to be notified of events, your thread will wake up when one of the statuses associated with the StatusCondition becomes true. If you do not reset the status, the StatusCondition `trigger_value` remains true and your WaitSet will not block again; it will immediately wake up when you call **DDS_WaitSet_wait** (p. 1383).

5.202.6 Trigger State of a ::DDS_ReadCondition

Similar to the **DDS_StatusCondition** (p. 1373), a **DDS_ReadCondition** (p. 695) also has a `trigger_value` that determines whether the attached **DDS_WaitSet** (p. 1373) is BLOCKED or UNBLOCKED. However, unlike the **DDS_StatusCondition** (p. 1373), the `trigger_value` of the **DDS_ReadCondition** (p. 695) is tied to the presence of *at least a sample* managed by RTI Connext with **DDS_SampleStateKind** (p. 711) and **DDS_ViewStateKind** (p. 713) matching those of the **DDS_ReadCondition** (p. 695). Furthermore, for the **DDS_QueryCondition** (p. 700) to have a `trigger_value` == **DDS_BOOLEAN_TRUE** (p. 1203), the data associated with the sample must be such that the `query_expression` evaluates to **DDS_BOOLEAN_TRUE** (p. 1203).

The fact that the trigger_value of a **DDS_ReadCondition** (p. 695) depends on the presence of samples on the associated **DDS_DataReader** (p. 618) implies that a single take operation can potentially change the `trigger_value` of several **DDS_ReadCondition** (p. 695) or **DDS_QueryCondition** (p. 700) conditions. For example, if all samples are taken, any **DDS_ReadCondition** (p. 695) and **DDS_QueryCondition** (p. 700) conditions associated with the **DDS_DataReader** (p. 618) that had their `trigger_value==TRUE` before will see the `trigger_value` change to FALSE. Note that this does not guarantee that **DDS_WaitSet** (p. 1373) objects that were separately attached to those conditions will not be woken up. Once we have `trigger_value==TRUE` on a condition, it may wake up the attached **DDS_WaitSet** (p. 1373), the condition transitioning to `trigger_value==FALSE` does not necessarily 'unwakeup' the WaitSet as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a **DDS_WaitSet** (p. 1373) may return from the wait with a list of conditions, some of which are not no longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate **DDS_WaitSet** (p. 1373) objects and taking data associated with the same **DDS_DataReader** (p. 618) entity.

To elaborate further, consider the following example: A **DDS_ReadCondition** (p. 695) that has a `sample_state_mask` = {**DDS_NOT_READ_SAMPLE_STATE** (p. 712)} will have `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 1203) whenever a new sample arrives and will transition to **DDS_BOOLEAN_FALSE** (p. 1203) as soon as all the newly-arrived samples are either read (so their sample state changes to READ) or taken (so they are no longer managed by RTI Connext). However if the same **DDS_ReadCondition** (p. 695) had a `sample_state_mask` = { **DDS_READ_SAMPLE_STATE** (p. 712), **DDS_NOT_READ_SAMPLE_STATE** (p. 712) }, then the `trigger_value` would only become **DDS_BOOLEAN_FALSE** (p. 1203) once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to READ), which overlaps the mask on the **DDS_ReadCondition** (p. 695).

5.202.7 Trigger State of a ::DDS_GuardCondition

The `trigger_value` of a **DDS_GuardCondition** (p. 1372) is completely controlled by the application via the operation **DDS_GuardCondition_set_trigger_value** (p. 1380).

DDS_Listener (p. 1819)

5.202.8 Function Documentation

5.202.8.1 DDS_Condition_get_trigger_value()

```
DDS_Boolean DDS_Condition_get_trigger_value (
            DDS_Condition * self )
```

Retrieve the `trigger_value`.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

the trigger value.

5.202.8.2 DDS_Condition_set_handler()

```
DDS_ReturnCode_t DDS_Condition_set_handler (
            DDS_Condition * self,
           const struct  DDS_ConditionHandler * handler )
```

<<***extension***>> *(p. 1014)* Registers a **DDS_ConditionHandler** (p. 1570) in this **DDS_Condition** (p. 1372).

This operation replaces any existing registered handler. If there is any resources associated with an existing registered handler that need to be released, you may first call **DDS_Condition_get_handler** (p. 1377) to retrieve the handler.

MT Safety:

It is not safe to call **DDS_Condition_set_handler** (p. 1377), **DDS_Condition_get_handler** (p. 1377) or **DDS_↩ Condition_dispatch** (p. 1377) concurrently.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
handler	The **DDS_ConditionHandler** (p. 1570) to be called by **DDS_Condition_dispatch** (p. 1377). If this parameter is null, an no-op handler implemenation will be set.

5.202.8.3 DDS_Condition_get_handler()

```
struct  DDS_ConditionHandler DDS_Condition_get_handler (
            DDS_Condition * self )
```

<<***extension***>> *(p. 1014)* Returns the registered **DDS_ConditionHandler** (p. 1570).

If no **DDS_ConditionHandler** (p. 1570) is registered, this operation returns a no-op **DDS_ConditionHandler** (p. 1570) implementation.

5.202.8.4 DDS_Condition_dispatch()

```
void DDS_Condition_dispatch (
            DDS_Condition * self )
```

<<***extension***>> *(p. 1014)* Calls **DDS_ConditionHandler::on_condition_triggered** (p. 1571) of the registered **DDS_ConditionHandler** (p. 1570).

If the trigger value is true, calling this operation will call the registered **DDS_ConditionHandler** (p. 1570).

If no **DDS_ConditionHandler** (p. 1570) is registered, this operation is a no-op.

5.202.8.5 DDS_GuardCondition_as_condition()

```
DDS_Condition * DDS_GuardCondition_as_condition (
            DDS_GuardCondition * guardCondition )
```

Access a **DDS_GuardCondition** (p. 1372)'s supertype instance.

Parameters

guardCondition	<<***in***>> *(p. 1015)* Cannot be NULL.

5.202.8.6 DDS_GuardCondition_new()

```
DDS_GuardCondition * DDS_GuardCondition_new (
            void  )
```

No argument constructor.

Construct a new guard condition on the heap.

Returns

A new condition with trigger value **DDS_BOOLEAN_FALSE** (p. 1203), or NULL if a condition could not be allocated.

See also

DDS_GuardCondition_delete (p. 1378)

5.202.8.7 DDS_GuardCondition_delete()

```
DDS_ReturnCode_t DDS_GuardCondition_delete (
            DDS_GuardCondition * self )
```

Destructor.

Releases the resources associated with this object.

Deleting a NULL condition is safe and has no effect.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

5.202.8.8 DDS_GuardCondition_set_trigger_value()

```
DDS_ReturnCode_t DDS_GuardCondition_set_trigger_value (
            DDS_GuardCondition * self,
            DDS_Boolean value )
```

Set the guard condition trigger value.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
value	<<***in***>> *(*p. *1015)* the new trigger value.

5.202.8.9 DDS_StatusCondition_as_condition()

```
DDS_Condition * DDS_StatusCondition_as_condition (
            DDS_StatusCondition * statusCondition )
```

Access a **DDS_StatusCondition** (p. 1373)'s supertype instance.

Parameters

statusCondition	<<***in***>> *(*p. *1015)* Cannot be NULL.

5.202.8.10 DDS_StatusCondition_get_enabled_statuses()

```
DDS_StatusMask DDS_StatusCondition_get_enabled_statuses (
            DDS_StatusCondition * self )
```

Get the list of statuses enabled on an **DDS_Entity** (p. 1362).

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

Returns

list of enabled statuses.

5.202.8.11 DDS_StatusCondition_set_enabled_statuses()

```
DDS_ReturnCode_t DDS_StatusCondition_set_enabled_statuses (
            DDS_StatusCondition * self,
            DDS_StatusMask mask )
```

This operation defines the list of communication statuses that determine the `trigger_value` of the **DDS_Status↩ Condition** (p. 1373).

This operation may change the `trigger_value` of the **DDS_StatusCondition** (p. 1373).

DDS_WaitSet (p. 1373) objects' behavior depends on the changes of the `trigger_value` of their attached conditions. Therefore, any **DDS_WaitSet** (p. 1373) to which the **DDS_StatusCondition** (p. 1373) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
mask	<<***in***>> *(*p. *1015)* the list of enables statuses (see **Status Kinds** (p. 1224))

Returns

One of the **Standard Return Codes** (p. 1223)

5.202.8.12 DDS_StatusCondition_get_entity()

```
DDS_Entity * DDS_StatusCondition_get_entity (
            DDS_StatusCondition * self )
```

Get the **DDS_Entity** (p. 1362) associated with the **DDS_StatusCondition** (p. 1373).

There is exactly one **DDS_Entity** (p. 1362) assocated with each **DDS_StatusCondition** (p. 1373).

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

Returns

DDS_Entity (p. 1362) associated with the **DDS_StatusCondition** (p. 1373).

5.202.8.13 DDS_WaitSet_new()

```
DDS_WaitSet * DDS_WaitSet_new (
            void  )
```

Default no-argument constructor.

Construct a new **DDS_WaitSet** (p. 1373).

Returns

A new **DDS_WaitSet** (p. 1373) or NULL if one could not be allocated.

5.202.8.14 DDS_WaitSet_new_ex()

```
DDS_WaitSet * DDS_WaitSet_new_ex (
            const struct  DDS_WaitSetProperty_t * prop )
```

<<***extension***>> *(p. 1014)* Constructor for a **DDS_WaitSet** (p. 1373) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first

Constructs a new **DDS_WaitSet** (p. 1373).

Returns

A new **DDS_WaitSet** (p. 1373) or NULL if one could not be allocated.

5.202.8.15 DDS_WaitSet_delete()

```
DDS_ReturnCode_t DDS_WaitSet_delete (
             DDS_WaitSet * self )
```

Destructor.

Releases the resources asociated with this **DDS_WaitSet** (p. 1373).

Freeing a null pointer is safe and does nothing.

MT Safety:

UNSAFE. It is not safe to delete a **DDS_WaitSet** (p. 1373) while another thread is calling an API that uses the entity. For instance, a thread must not delete a WaitSet while another thread is blocked with **DDS_WaitSet_wait** (p. 1383). To properly handle this scenario, you can use a **DDS_GuardCondition** (p. 1372) to wake up the WaitSet and then wait for the finalization of the thread.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

5.202.8.16 DDS_WaitSet_set_property()

```
DDS_ReturnCode_t DDS_WaitSet_set_property (
             DDS_WaitSet * self,
            const struct  DDS_WaitSetProperty_t * prop )
```

<<***extension***>> *(*p. *1014)* Sets the **DDS_WaitSetProperty_t** (p. 2097), to configure the associated **DDS_WaitSet** (p. 1373) to return after one or more trigger events have occurred.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
prop	<<***in***>> *(*p. *1015)*

Returns

One of the **Standard Return Codes** (p. 1223)

5.202.8.17 DDS_WaitSet_get_property()

```
DDS_ReturnCode_t DDS_WaitSet_get_property (
             DDS_WaitSet * self,
            struct  DDS_WaitSetProperty_t * prop )
```

<<***extension***>> *(*p. *1014)* Retrieves the **DDS_WaitSetProperty_t** (p. 2097) configuration of the associated **DDS_↩ WaitSet** (p. 1373).

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
prop	<<***out***>> *(*p. *1015)*

Returns

One of the **Standard Return Codes** (p. 1223)

5.202.8.18 DDS_WaitSet_wait()

```
DDS_ReturnCode_t DDS_WaitSet_wait (
             DDS_WaitSet * self,
            struct  DDS_ConditionSeq * active_conditions,
            const struct  DDS_Duration_t * timeout )
```

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **DDS_WaitSet** (p. 1373) have a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 1203), the wait operation will block, suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a `trigger_value` of **DDS_↩ BOOLEAN_TRUE** (p. 1203) (i.e., the conditions that unblocked the wait).

The wait operation takes a `timeout` argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached **DDS_Condition** (p. 1372) objects are **DDS_BOOLEAN_TRUE** (p. 1203), wait fails with **DDS_RETCODE_TIMEOUT** (p. 1224). In this case, the resulting list of conditions will be empty. If a negative duration is passed, wait fails with **DDS_RETCODE_BAD_PARAMETER** (p. 1224).

Note: The resolution of the `timeout` period is constrained by the resolution of the system clock.

When the **DDS_WaitSet** (p. 1373) is configured to wait for more than one trigger event and the timeout is exceeded before that number is reached, this function returns normally as long as at least one trigger event has occurred.

It is not allowable for more than one application thread to be waiting on the same **DDS_WaitSet** (p. 1373). If the wait operation is invoked on a **DDS_WaitSet** (p. 1373) that already has a thread blocking on it, the operation will return immediately with the value **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

Parameters

active_conditions	<<***inout***>> *(p. 1015)* a valid non-NULL **DDS_ConditionSeq** (p. 1571) object. Note that RTI Connext will not allocate a new object if `active_conditions` is NULL; the function will return **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).
self	<<***in***>> *(p. 1015)* Cannot be NULL.
timeout	<<***in***>> *(p. 1015)* a wait timeout

Returns

One of the **Standard Return Codes** (p. 1223) or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224) or **DDS_RETCODE_TIMEOUT** (p. 1224).

5.202.8.19 DDS_WaitSet_attach_condition()

```
DDS_ReturnCode_t DDS_WaitSet_attach_condition (
             DDS_WaitSet * self,
             DDS_Condition * cond )
```

Attaches a **DDS_Condition** (p. 1372) to the **DDS_WaitSet** (p. 1373).

It is possible to attach a **DDS_Condition** (p. 1372) on a **DDS_WaitSet** (p. 1373) that is currently being waited upon (via the wait operation). In this case, if the **DDS_Condition** (p. 1372) has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 1203), then attaching the condition will unblock the **DDS_WaitSet** (p. 1373).

If the same **DDS_Condition** (p. 1372) is attached multiple times, only the first attachment has any effect. Subsequent attempts to attach the same **DDS_Condition** (p. 1372) are silently ignored. As a result, the **DDS_Condition** (p. 1372) is only considered attached once and must only be detached once.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
cond	*<<**in**>> (p. 1015)* Condition to be attached.

Returns

One of the **Standard Return Codes** (p. 1223), or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224).

5.202.8.20 DDS_WaitSet_detach_condition()

```
DDS_ReturnCode_t DDS_WaitSet_detach_condition (
            DDS_WaitSet * self,
            DDS_Condition * cond )
```

Detaches a **DDS_Condition** (p. 1372) from the **DDS_WaitSet** (p. 1373).

It is possible to detach a **DDS_Condition** (p. 1372) on a **DDS_WaitSet** (p. 1373) that is currently being waited upon (via the wait operation). If the **DDS_Condition** (p. 1372) was not attached to the **DDS_WaitSet** (p. 1373), the operation will return **DDS_RETCODE_BAD_PARAMETER** (p. 1224).

If the same **DDS_Condition** (p. 1372) had been previously attached multiple times, only a single detach is required; the **DDS_Condition** (p. 1372) is considered attached only once.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
cond	*<<**in**>> (p. 1015)* Condition to be detached.

Returns

One of the **Standard Return Codes** (p. 1223), or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224).

5.202.8.21 DDS_WaitSet_get_conditions()

```
DDS_ReturnCode_t DDS_WaitSet_get_conditions (
            DDS_WaitSet * self,
          struct  DDS_ConditionSeq * attached_conditions )
```

Retrieves the list of attached **DDS_Condition** (p. 1372) (s).

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
attached_conditions	*<<**inout**>> (p. 1015)* a **DDS_ConditionSeq** (p. 1571) object where the list of attached conditions will be returned

Returns

One of the **Standard Return Codes** (p. 1223), or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 1224).

5.203 Cookie

*<<**extension**>> (p. 1014)* Unique identifier for a written data sample

Data Structures

- struct **DDS_Cookie_t**

  *<<**extension**>> (p. 1014) Sequence of bytes.*
- struct **DDS_CookieSeq**

  *Declares IDL `sequence` < **DDS_Cookie_t** (p. 1580) > .*

Functions

- **DDS_Boolean DDS_Cookie_from_pointer** (struct **DDS_Cookie_t** *self, const void *pointer)

  Stores a pointer in a cookie.
- void * **DDS_Cookie_to_pointer** (const struct **DDS_Cookie_t** *self)

  Returns the pointer previously stored in the cookie.

5.203.1 Detailed Description

*<<**extension**>> (p. 1014)* Unique identifier for a written data sample

5.203.2 Function Documentation

5.203.2.1 DDS_Cookie_from_pointer()

```
DDS_Boolean DDS_Cookie_from_pointer (
            struct  DDS_Cookie_t * self,
            const void * pointer )
```

Stores a pointer in a cookie.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
pointer	<<***in***>> *(*p. *1015)* The pointer to be stored in the cookie. Can be NULL.

Returns

DDS_BOOLEAN_TRUE if the cookie was successfully filled with the pointer, DDS_BOOLEAN_FALSE otherwise.

5.203.2.2 DDS_Cookie_to_pointer()

```
void * DDS_Cookie_to_pointer (
            const struct  DDS_Cookie_t * self )
```

Returns the pointer previously stored in the cookie.

Precondition

The cookie's value was filled with a pointer; otherwise, the value returned may not be a valid memory address.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

Returns

The pointer stored in the cookie.

5.204 Sample Flags

<<***extension***>> *(*p. *1014)* Flags for samples.

Typedefs

- typedef enum **DDS_SampleFlagBits** **DDS_SampleFlagBits**

  Type to identify the sample flags reserved by RTI.
- typedef **DDS_Long** **DDS_SampleFlag**

  A set of flags that can be associated with a sample.

Enumerations

- enum **DDS_SampleFlagBits** {
  DDS_REDELIVERED_SAMPLE ,
  DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE ,
  DDS_REPLICATE_SAMPLE ,
  DDS_LAST_SHARED_READER_QUEUE_SAMPLE ,
  DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE ,
  DDS_INCOMPLETE_SNAPSHOT_TOPIC_QUERY ,
  DDS_WRITER_REMOVED_BATCH_SAMPLE = PRES_WRITER_REMOVED_BATCH_SAMPLE ,
  DDS_DISCOVERY_SERVICE_SAMPLE = PRES_DISCOVERY_SERVICE_SAMPLE }

  Type to identify the sample flags reserved by RTI.

5.204.1 Detailed Description

<<***extension***>> *(*p. *1014)* Flags for samples.

5.204.2 Typedef Documentation

5.204.2.1 DDS_SampleFlagBits

`typedef enum` **`DDS_SampleFlagBits DDS_SampleFlagBits`**

Type to identify the sample flags reserved by RTI.

5.204.2.2 DDS_SampleFlag

`typedef` **`DDS_Long DDS_SampleFlag`**

A set of flags that can be associated with a sample.

- Least-significant bits [0-7] are reserved by RTI
- Least-significant bits [8-15] are application specific
- Least-significant bits [16-31] are invalid and cannot be used

5.204.3 Enumeration Type Documentation

5.204.3.1 DDS_SampleFlagBits

enum **DDS_SampleFlagBits**

Type to identify the sample flags reserved by RTI.

Enumerator

DDS_REDELIVERED_SAMPLE	Indicates that a sample has been redelivered by RTI Queuing Service.
DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE	Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connext Repliers sending multiple responses for a request.
DDS_REPLICATE_SAMPLE	Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.
DDS_LAST_SHARED_READER_QUEUE_SAMPLE	Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.
DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE	Indicates that a sample for a TopicQuery will be followed by more samples. This flag only applies to samples that have been published as a response to a **DDS_TopicQuery** (p. 708). When this bit is not set and **DDS_SampleInfo::topic_query_guid** (p. 2000) is different from **DDS_GUID_UNKNOWN** (p. 1215), this sample is the last sample for that TopicQuery coming from the DataWriter identified by **DDS_SampleInfo::source_guid** (p. 1999).
DDS_INCOMPLETE_SNAPSHOT_TOPIC_QUERY	Indicates that some of the samples that were published as part of a snapshot TopicQuery were lost. This flag is set in the last sample of the snapshot.
DDS_WRITER_REMOVED_BATCH_SAMPLE	This flag will be set if the sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed. A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295) **DDS_HistoryQosPolicy** (p. 1808) QoS or because the duration in **DDS_LifespanQosPolicy** (p. 1818) was reached. If the DataReader sets the property "dds.data_reader.↩ accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.
DDS_DISCOVERY_SERVICE_SAMPLE	This flag will be set if the sample was sent by Cloud Discovery Service. The samples sent by Cloud Discovery Service are participant announcement samples on the ParticipantBuiltinTopic.

5.205 WriteParams

*<<**extension**>> (p. 1014)*

Data Structures

- struct **DDS_SampleIdentity_t**

  Type definition for a Sample Identity.
- struct **DDS_AckResponseData_t**

  Data payload of an application-level acknowledgment.
- struct **DDS_WriteParams_t**

  *<<**extension**>> (p. 1014) Input parameters for writing with **FooDataWriter_write_w_params** (p. 504), **FooData↩ Writer_dispose_w_params** (p. 507), **FooDataWriter_register_instance_w_params** (p. 496), **FooDataWriter_↩ unregister_instance_w_params** (p. 499)*

Functions

- **DDS_Boolean DDS_SampleIdentity_equals** (const struct **DDS_SampleIdentity_t** *self, const struct **DDS↩ _SampleIdentity_t** *other)

  Compares this sample identity with another sample identity for equality.
- void **DDS_WriteParams_reset** (struct **DDS_WriteParams_t** *self)

  Resets all the fields to their default values.

Variables

- struct **DDS_GUID_t DDS_SampleIdentity_t::writer_guid**

  16-byte identifier identifying the virtual GUID.
- struct **DDS_SequenceNumber_t DDS_SampleIdentity_t::sequence_number**

  monotonically increasing 64-bit integer that identifies the sample in the data source.
- const struct **DDS_SampleIdentity_t DDS_AUTO_SAMPLE_IDENTITY**

  The AUTO sample identity.
- const struct **DDS_SampleIdentity_t DDS_UNKNOWN_SAMPLE_IDENTITY**

  An invalid or unknown sample identity.
- const struct **DDS_WriteParams_t DDS_WRITEPARAMS_DEFAULT**

  *Initializer for **DDS_WriteParams_t** (p. 2107).*

5.205.1 Detailed Description

*<<**extension**>> (p. 1014)*

5.205.2 Function Documentation

5.205.2.1 DDS_SampleIdentity_equals()

```
DDS_Boolean DDS_SampleIdentity_equals (
            const struct  DDS_SampleIdentity_t * self,
            const struct  DDS_SampleIdentity_t * other )
```

Compares this sample identity with another sample identity for equality.

Parameters

self	<<***in***>> *(p. 1015)* This sample identity.
other	<<***in***>> *(p. 1015)* The other sample identity to be compared with this sample identity.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the two sample identities have equal values, or **DDS_BOOLEAN_FALSE** (p. 1203) otherwise.

5.205.2.2 DDS_WriteParams_reset()

```
void DDS_WriteParams_reset (
            struct  DDS_WriteParams_t * self )
```

Resets all the fields to their default values.

This operation is useful to reset all the fields to their automatic value when **DDS_WriteParams_t::replace_auto** (p. 2108) is enabled and the same params instance is used in multiple calls to **FooDataWriter_write_w_params** (p. 504)

5.205.3 Variable Documentation

5.205.3.1 writer_guid

```
struct  DDS_GUID_t DDS_SampleIdentity_t::writer_guid
```

16-byte identifier identifying the virtual GUID.

5.205.3.2 sequence_number

```
struct  DDS_SequenceNumber_t DDS_SampleIdentity_t::sequence_number
```

monotonically increasing 64-bit integer that identifies the sample in the data source.

5.205.3.3 DDS_AUTO_SAMPLE_IDENTITY

```
const struct DDS_SampleIdentity_t DDS_AUTO_SAMPLE_IDENTITY [extern]
```

The AUTO sample identity.

Special **DDS_AUTO_SAMPLE_IDENTITY** (p. 1392) value {**DDS_GUID_AUTO** (p. 1215), **DDS_AUTO_SEQUENCE_↩ NUMBER** (p. 1220)}

5.205.3.4 DDS_UNKNOWN_SAMPLE_IDENTITY

```
const struct DDS_SampleIdentity_t DDS_UNKNOWN_SAMPLE_IDENTITY [extern]
```

An invalid or unknown sample identity.

Special **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 1393) value {**DDS_GUID_UNKNOWN** (p. 1215), **DDS_↩ SEQUENCE_NUMBER_UNKNOWN** (p. 1220)}

5.205.3.5 DDS_WRITEPARAMS_DEFAULT

```
const struct DDS_WriteParams_t DDS_WRITEPARAMS_DEFAULT [extern]
```

Initializer for **DDS_WriteParams_t** (p. 2107).

5.206 Heap Support in C

<<***extension***>> *(p. 1014)* Heap allocation and free routines in C

Functions

- void * **DDS_Heap_calloc** (size_t numElem, size_t size)

  Peforms the logical equivalent of calloc().
- void * **DDS_Heap_malloc** (size_t size)

  Peforms the logical equivalent of malloc().
- void **DDS_Heap_free** (void *ptr)

  Performs the logical equivalent of free().

5.206.1 Detailed Description

<<***extension***>> *(p. 1014)* Heap allocation and free routines in C

The functions in this class ensure consistent cross-platform implementations for memory allocation (**DDS_Heap_↩ malloc()** (p. 1394) and **DDS_Heap_calloc()** (p. 1394)) and deletion (**DDS_Heap_free()** (p. 1394)).

Applications need to use these routines to reserve memory that the middleware will release or to free memory that the middleware has allocated.

For example, to allocate an optional member in a sample use **DDS_Heap_malloc()** (p. 1394)/ **DDS_Heap_calloc()** (p. 1394); to release an optional member previously reserved by **FooTypeSupport_create_data_w_params()** (p. 215), use **DDS_Heap_free()** (p. 1394).

5.206.2 Function Documentation

5.206.2.1 DDS_Heap_calloc()

```
void * DDS_Heap_calloc (
            size_t numElem,
            size_t size )
```

Peforms the logical equivalent of calloc().

Allocates unused space for an array with `numElem` elements each of whose size in bytes is `size`. The memory will be initialized to zeros.

Parameters

numElem	<<***in***>> *(*p. *1015)* The number of elements in the array to be allocated
size	<<***in***>> *(*p. *1015)* The size in bytes of each element in the array

Returns

If insufficient memory is available, this function will return NULL. Otherwise, upon success it returns a pointer to the allocated space.

5.206.2.2 DDS_Heap_malloc()

```
void * DDS_Heap_malloc (
            size_t size )
```

Peforms the logical equivalent of malloc().

Allocates unused space for an object of the specified `size`. The memory will be initialized to zeros.

Parameters

size	<<***in***>> *(*p. *1015)* The size in bytes of the object to be allocated

Returns

If insufficient memory is available, this function will return NULL. Otherwise, upon success it returns a pointer to the allocated space.

5.206.2.3 DDS_Heap_free()

```
void DDS_Heap_free (
            void * ptr )
```

Performs the logical equivalent of free().

Deallocates the space pointed to by `ptr` and made available for further allocation.

Parameters

ptr	<<***in***>> *(*p. *1015)* A pointer to the space to be deallocated

5.207 Builtin Qos Profiles

<<***extension***>> *(*p. *1014)* QoS libraries, profiles, and snippets that are automatically built into RTI Connext.

Variables

- const char ∗const **DDS_BUILTIN_QOS_LIB**

  A library of non-experimental QoS profiles.
- const char ∗const **DDS_PROFILE_BASELINE_ROOT**

  The root baseline QoS values from which all other Baseline.X.X.X profiles inherit.
- const char ∗const **DDS_PROFILE_BASELINE**

  The most up-to-date QoS default values.
- const char ∗const **DDS_PROFILE_BASELINE_5_0_0**

  The QoS default values for version 5.0.0.
- const char ∗const **DDS_PROFILE_BASELINE_5_1_0**

  The QoS default values for version 5.1.0.
- const char ∗const **DDS_PROFILE_BASELINE_5_2_0**

  The QoS default values for version 5.2.0.
- const char ∗const **DDS_PROFILE_BASELINE_5_3_0**

  The QoS default values for version 5.3.0.
- const char ∗const **DDS_PROFILE_BASELINE_6_0_0**

  The QoS default values for version 6.0.0.
- const char ∗const **DDS_PROFILE_BASELINE_6_1_0**

  The QoS default values for version 6.1.0.
- const char ∗const **DDS_PROFILE_BASELINE_7_0_0**

  The QoS default values for version 7.0.0.
- const char ∗const **DDS_PROFILE_BASELINE_7_1_0**

  The QoS default values for version 7.1.0.
- const char ∗const **DDS_PROFILE_GENERIC_COMMON**

  A common Participant base profile.
- const char ∗const **DDS_PROFILE_GENERIC_MONITORING_COMMON**

Enables RTI Monitoring Library.

- const char *const **DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY**

  Sets the values necessary to communicate with RTI Connext Micro.
- const char *const **DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9**

  Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.
- const char *const **DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3**

  Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and ealier.
- const char *const **DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY**

  Sets the values necessary to interoperate with other DDS vendors.
- const char *const **DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY**

  Sets the values necessary to interoperate with RTI Connext 5.1.0 using the UDPv6 and/or SHMEM transports.
- const char *const **DDS_BUILTIN_QOS_LIB_EXP**

  A library of experimental QoS profiles.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE**

  Enables strict reliability.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE**

  Enables keep-last reliability.
- const char *const **DDS_PROFILE_GENERIC_BEST_EFFORT**

  Enables best-effort reliability kind.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT**

  A profile that can be used to achieve high throughput.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY**

  A profile that can be used to achieve low latency.
- const char *const **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA**

  A common Participant base profile to facilitate sending large data.
- const char *const **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING**

  Configures Participants for large data and monitoring.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA**

  Configures endpoints for sending large data with strict reliability.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA**

  Configures endpoints for sending large data with keep-last reliability.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW**

  Configures strictly reliable communication for large data with a fast flow controller.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW**

  Configures strictly reliable communication for large data with a medium flow controller.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW**

  Configures strictly reliable communication for large data with a slow flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW**

  Configures keep-last reliable communication for large data with a fast flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW**

  Configures keep-last reliable communication for large data with a medium flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW**

  Configures keep-last reliable communication for large data with a slow flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL**

  Persists the samples of a DataWriter as long as the entity exists.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT**

  Persists samples using RTI Persistence Service.

- const char ∗const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT**

  Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- const char ∗const **DDS_PROFILE_GENERIC_AUTO_TUNING**

  Enables the Turbo Mode batching and Auto Throttle experimental features.
- const char ∗const **DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT**

  Uses a set of QoS which reduces the memory footprint of the application.
- const char ∗const **DDS_PROFILE_GENERIC_SECURITY**

  Loads the DDS Secure builtin plugins.
- const char ∗const **DDS_PROFILE_GENERIC_MONITORING2**

  The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.
- const char ∗const **DDS_PROFILE_GENERIC_MONITORING2_WAN**

  The QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use to communicate over WAN with a Collector Service.
- const char ∗const **DDS_PROFILE_PATTERN_RPC**

  This profile contains the default RPC and Request-Reply QoS settings.
- const char ∗const **DDS_PROFILE_PATTERN_PERIODIC_DATA**

  Used for applications that expect periodic data.
- const char ∗const **DDS_PROFILE_PATTERN_STREAMING**

  Used for applications that stream data.
- const char ∗const **DDS_PROFILE_PATTERN_RELIABLE_STREAMING**

  Used for applications that stream data and require reliable communication.
- const char ∗const **DDS_PROFILE_PATTERN_EVENT**

  Used for applications that handle events.
- const char ∗const **DDS_PROFILE_PATTERN_ALARM_EVENT**

  Used for applications that handle alarm events.
- const char ∗const **DDS_PROFILE_PATTERN_STATUS**

  Used for applications whose samples represent statuses.
- const char ∗const **DDS_PROFILE_PATTERN_ALARM_STATUS**

  Used for applications in which samples represent alarm statuses.
- const char ∗const **DDS_PROFILE_PATTERN_LAST_VALUE_CACHE**

  Used for applications that only need the last published value.
- const char ∗const **DDS_BUILTIN_QOS_SNIPPET_LIB**

  A library of QoS Snippets.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON**

  QoS Snippet that configures the reliability protocol with a common configuration.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL**

  QoS Snippet that configures the reliability protocol for KEEP_ALL.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST**

  QoS Snippet that configures the reliability protocol for KEEP_LAST.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE**

  QoS Snippet that configures the reliability protocol for sending data at a high rate.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY**

  QoS Snippet that configures the reliability protocol for sending data at low latency.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA**

  QoS Snippet that configures the reliability protocol for large data.
- const char ∗const **DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC**

  Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

- const char *const **DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON**

  QoS Snippet that optimizes discovery with a common configuration.
- const char *const **DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT**

  QoS Snippet that optimizes the Participant QoS to send less discovery information.
- const char *const **DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST**

  QoS Snippet that optimizes the Endpoint Discovery to be faster.
- const char *const **DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS**

  QoS Snippet that increases the Participant default buffer that shmem and udpv4 use.
- const char *const **DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE**

  QoS Snippet that sets RELIABILITY QoS to RELIABLE.
- const char *const **DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT**

  QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.
- const char *const **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1**

  QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.
- const char *const **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL**

  QoS Snippet that sets HISTORY QosPolicy to KEEP_ALL kind.
- const char *const **DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS**

  QoS Snippet that sets PUBLISH_MODE QosPolicy to ASYNCHRONOUS kind.
- const char *const **DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL**

  QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT_LOCAL kind.
- const char *const **DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT**

  QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT kind.
- const char *const **DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT**

  QoS Snippet that sets DURABILITY QosPolicy to PERSISTENT kind.
- const char *const **DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE**

  QoS Snippet that sets BATCH QosPolicy to true.
- const char *const **DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS**

  QoS Snippet that configures and set a FlowController of 838 Mbps.
- const char *const **DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS**

  QoS Snippet that configures and sets a FlowController of 209 Mbps.
- const char *const **DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS**

  QoS Snippet that configures and sets a FlowController of 52 Mbps.
- const char *const **DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE**

  QoS Snippet that enables auto_throttle and turbo_mode to true.
- const char *const **DDS_SNIPPET_FEATURE_MONITORING_ENABLE**

  QoS Snippet that enables the use of the RTI Monitoring Library.
- const char *const **DDS_SNIPPET_FEATURE_MONITORING2_ENABLE**

  QoS Snippet that enables the use of the RTI Monitoring Library 2.0.
- const char *const **DDS_SNIPPET_FEATURE_SECURITY_ENABLE**

  QoS Snippet that enables security using the Builtin Security Plugins.
- const char *const **DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE**

  QoS Snippet that enables Topic Query.
- const char *const **DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V1_ENABLE**

  QoS Snippet that enables TypeObject V1 propagation.
- const char *const **DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V1_DISABLE**

  QoS Snippet that disables TypeObject V1 propagation.
- const char *const **DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V2_ENABLE**

QoS Snippet that enables TypeObject V2 propagation.

- const char *const **DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V2_DISABLE**

  QoS Snippet that disables TypeObject V2 propagation.
- const char *const **DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT**

  QoS Snippet that configures a TCP LAN Client over DDS.
- const char *const **DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT**

  QoS Snippet that configures a symmetric WAN TCP Client over DDS.
- const char *const **DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER**

  QoS Snippet that an asymmetric WAN TCP Server over DDS.
- const char *const **DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT**

  QoS Snippet that configures an asymmetric WAN TCP Client over DDS.
- const char *const **DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION**

  QoS Snippet that configures RTI Connext and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.
- const char *const **DDS_SNIPPET_TRANSPORT_UDP_WAN**

  QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).
- const char *const **DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3**

  QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connext Micro 2.4.3.
- const char *const **DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE**

  QoS Snippet that configures RTI Connext to interoperate with other DDS vendors.
- const char *const **DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE**

  QoS Snippet that configures RTI Connext to interoperate with RTI Connext 5.1.0 and below for UDPv6 and SHMEM transports.

5.207.1 Detailed Description

<<***extension***>> *(*p. *1014)* QoS libraries, profiles, and snippets that are automatically built into RTI Connext.

The built-in profiles can be accessed in QoS XML configuration files and by using any of the APIs that accept library and profiles names by using the constants or string versions as documented on this page.

The built-in profiles are provided as a way to quickly and easily configure RTI Connext applications with a set of QoS values aimed at achieving a specific behavior.

There are three built-in QoS libraries:

- BuiltinQosLib: A library containing built-in QoS Profiles.

- BuiltinQosLibExp: A library containing experimental QoS Profiles. Experimental QoS Profiles are new QoS Profiles that have been tested internally but have not gone through an extensive validation period. Therefore, some of the settings may change in future releases based on customer and internal feedback. After validation, experimental QoS Profiles will be moved into the non-experimental library.

- BuiltinQosSnippetLib: A library containing QoS Snippets that are ready to use as elements for the QoS Profile composition pattern. For further information about this pattern visit the following article: `https↩ ://community.rti.com/best-practices/qos-profile-inheritance-and-composition-guidance`

There are three types of profiles:

- Baseline.X.X.X: These profiles represent the QoS defaults for /ndds version X.X.X. To access the defaults for the latest RTI Connext version, use the BuiltinQosLib::Baseline profile.
- Generic.X: These profiles allow you to easily configure different features and communication use-cases with RTI Connext. For example, there is a Generic.StrictReliable profile for use when your application has a requirement for no data loss.
- Pattern.X: These profiles inherit from the Generic.X profiles and allow you to configure various domain-specific communication use cases. For example, there is a Pattern.Alarm profile that can be used to manage the generation and consumption of alarm events.

There are several types of QoS Snippets. These are the current QoS Snippets available:

- Optimization.X: these QoS Snippets optimize one or more parameters related to the X QoS Policy or a specific use-case.
- QosPolicy.X.Y: these QoS Snippets set a specific QoS Policy X to the value Y.
- Feature.X: these QoS Snippets set all the needed QoS values to enable/modify a specific feature.
- Transport.X: these QoS Snippets set a specific transport defined by X. This transport may have specific scenarios that are also specified in the name.
- Compatibility.X: these QoS Snippets change the specific QoS policies to ensure compatibility with specific products or versions specified by X.

These QoS Profiles can be used as base profiles in XML configuration, then QoS Snippets can modify specific aspects of this base QoS Profile, and finally files and values can be modified to fit a specific system's needs. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.Common">

   <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">

     <base_name>

       <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>

     </base_name>

     <!-- Override and add values -->

   </domain_participant_qos>

</qos_profile>
```

The QoS Profiles can also be used in any APIs that call for a QoS library and profile name, for example, the create_*↩ _with_profile() APIs. To create a **DDS_DataWriter** (p. 488) configured to send large data asynchronously:

```
writer = DDS_DomainParticipant_create_datawriter_with_profile(

                 participant, topic,

                 ::DDS_BUILTIN_QOS_LIB,

                 ::DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW,

                 NULL, ::DDS_STATUS_MASK_NONE);
```

All the built-in QoS Profiles and QoS Snippets are documented in the BaselineRoot.documentationONLY.xml and BuiltinProfiles.documentationONLY.xml files that are included in the NDDSHOME/xml directory of the RTI Connext installation.

- BaselineRoot.documentationONLY.xml contains the root baseline QoS profile that corresponds to the default values of RTI Connext 5.0.0.
- BuiltinProfiles.documentationONLY.xml contains the rest of the built-in Qos Profiles and QoS Snippets.

5.207.2 Variable Documentation

5.207.2.1 DDS_BUILTIN_QOS_LIB

```
const char* const DDS_BUILTIN_QOS_LIB  [extern]
```

A library of non-experimental QoS profiles.

String-version: "BuiltinQosLib"

5.207.2.2 DDS_PROFILE_BASELINE_ROOT

```
const char* const DDS_PROFILE_BASELINE_ROOT  [extern]
```

The root baseline QoS values from which all other Baseline.X.X.X profiles inherit.

This profile contains the root baseline QoS values from which all other Baseline.X.X.X profiles inherit. These values correspond to the default values for RTI Connext 5.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.Root"

5.207.2.3 DDS_PROFILE_BASELINE

```
const char* const DDS_PROFILE_BASELINE  [extern]
```

The most up-to-date QoS default values.

You can use this profile if you want your application to pick up and use any new QoS default settings each time a new RTI Connext version is released – without changing your application code.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline"

5.207.2.4 DDS_PROFILE_BASELINE_5_0_0

```
const char* const DDS_PROFILE_BASELINE_5_0_0  [extern]
```

The QoS default values for version 5.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.5.0.0"

5.207.2.5 DDS_PROFILE_BASELINE_5_1_0

```
const char* const DDS_PROFILE_BASELINE_5_1_0  [extern]
```

The QoS default values for version 5.1.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.5.1.0"

5.207.2.6 DDS_PROFILE_BASELINE_5_2_0

```
const char* const DDS_PROFILE_BASELINE_5_2_0  [extern]
```

The QoS default values for version 5.2.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.5.2.0"

5.207.2.7 DDS_PROFILE_BASELINE_5_3_0

```
const char* const DDS_PROFILE_BASELINE_5_3_0  [extern]
```

The QoS default values for version 5.3.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.5.3.0"

5.207.2.8 DDS_PROFILE_BASELINE_6_0_0

```
const char* const DDS_PROFILE_BASELINE_6_0_0  [extern]
```

The QoS default values for version 6.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.6.0.0"

5.207.2.9 DDS_PROFILE_BASELINE_6_1_0

```
const char* const DDS_PROFILE_BASELINE_6_1_0  [extern]
```

The QoS default values for version 6.1.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.6.1.0"

5.207.2.10 DDS_PROFILE_BASELINE_7_0_0

```
const char* const DDS_PROFILE_BASELINE_7_0_0  [extern]
```

The QoS default values for version 7.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.7.0.0"

5.207.2.11 DDS_PROFILE_BASELINE_7_1_0

```
const char* const DDS_PROFILE_BASELINE_7_1_0  [extern]
```

The QoS default values for version 7.1.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Baseline.7.1.0"

5.207.2.12 DDS_PROFILE_GENERIC_COMMON

```
const char* const DDS_PROFILE_GENERIC_COMMON  [extern]
```

A common Participant base profile.

All Generic.X and Pattern.X profiles inherit from this profile.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.Common"

5.207.2.13 DDS_PROFILE_GENERIC_MONITORING_COMMON

```
const char* const DDS_PROFILE_GENERIC_MONITORING_COMMON  [extern]
```

Enables RTI Monitoring Library.

Generic Base participant QoS Profile that enables RTI Monitoring Library.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Monitoring.Common", apply the QoS Snippet "BuiltinQos↩ SnippetLib::Feature.Monitoring.Enable" via composition. For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>

    </base_name>

</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">

    <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">

</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.Monitoring.Common"

5.207.2.14 DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY  [extern]
```

Sets the values necessary to communicate with RTI Connext Micro.

This profile will always represent the QoS values required for interoperability between the most recent version of RTI Connext Micro at the time of release of the most recent version of RTI Connext.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.ConnextMicroCompatibility"

5.207.2.15 DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9  [extern]
```

Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.

At the time of the release of RTI Connext 5.3.0 it was not necessary to set any QoS values in order to interoperate with RTI Connext Micro. This applies to RTI Connext Micro versions 2.4.4 and later. The most recent version of RTI Connext Micro at the time of release of RTI Connext 5.3.0 was 2.4.9. There is no guarantee that this profile will interoperate with versions of RTI Connext Micro after 2.4.9.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.ConnextMicroCompatibility.2.4.9"

5.207.2.16 DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3  [extern]
```

Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and ealier.

RTI Connext Micro versions 2.4.3 and earlier only supported the **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 1299) LivelinessQos kind. In order to be compatible with these versions of RTI Connext Micro, the **DDS_DataReader** (p. 618) and **DDS_DataWriter** (p. 488) must have their Liveliness kind changed to this value because the default kind in RTI Connext is **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 1299).

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.ConnextMicroCompatibility.2.4.3"

5.207.2.17 DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY  [extern]
```

Sets the values necessary to interoperate with other DDS vendors.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.OtherDDSVendorCompatibility"

5.207.2.18 DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY  [extern]
```

Sets the values necessary to interoperate with RTI Connext 5.1.0 using the UDPv6 and/or SHMEM transports.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.510TransportCompatibility"

5.207.2.19 DDS_BUILTIN_QOS_LIB_EXP

```
const char* const DDS_BUILTIN_QOS_LIB_EXP  [extern]
```

A library of experimental QoS profiles.

Experimental profiles are new profiles that have been tested internally but have not gone through an extensive validation period. Therefore some of the settings may change in future releases based on customer and internal feedback. After validation, experimental profiles will be moved into the non-experimental library.

QoS Profiles in this library are deprecated. They have been moved to "BuiltinQosLib". You should use the QoS Profiles from "BuiltinQosLib" instead of the ones in "BuiltinQosLibExp". The experimental profiles are still defined here to avoid backward compatibility issues.

String-version: "BuiltinQosLibExp"

5.207.2.20 DDS_PROFILE_GENERIC_STRICT_RELIABLE

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE  [extern]
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) for **DDS_ReliabilityQosPolicy** (p. 1940) with a **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295) for the **DDS_HistoryQosPolicyKind** (p. 1294).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable"

5.207.2.21 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE  [extern]
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable"

5.207.2.22 DDS_PROFILE_GENERIC_BEST_EFFORT

```
const char* const DDS_PROFILE_GENERIC_BEST_EFFORT  [extern]
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.BestEffort"

5.207.2.23 DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT  [extern]
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 1405) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 1405) QoS Profile..

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable.HighThroughput"

5.207.2.24 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY  [extern]
```

A profile that can be used to achieve low latency.

This QoS Profile extends the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 1405) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 1405) QoS Profile.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable.LowLatency"

5.207.2.25 DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA

```
const char* const DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA  [extern]
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.Participant.LargeData"

5.207.2.26 DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING

```
const char* const DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING  [extern]
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **DDS_SNIPPET_FEATURE_MONITORING_ENABLE** (p. 1426)

Enable Large Data optimizations

- **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA** (p. 1418)
- **DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC** (p. 1419) In Library↩ : **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA (p. 1406)

DDS_PROFILE_GENERIC_MONITORING_COMMON (p. 1403)

5.207.2.27 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA [extern]
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA** (p. 1406) QoS Profile to handle sending large samples reliably. This QoS Profile optimizes memory usage per sample within RTI Connext. You can use this QoS Profile directly, which doesn't perform any flow control, or you can use one of the three QoS Profiles below (Generic.StrictReliable.LargeData.∗Flow), which use this QoS Profile as a common base QoS Profile, but additionally enable asynchronous publication. Each of these three QoS Profiles uses one of the three flow controllers defined in **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA** (p. 1406) in order to throttle application data flow.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable.LargeData"

5.207.2.28 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA [extern]
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 1405) QoS Profile, but also adds QoS Snippets to handle sending large samples reliably. You can use this QoS Profile directly, which doesn't perform any flow control, or you can use one of the three QoS Profiles below (Generic.KeepLastReliable.LargeData.∗Flow), which use this QoS Profile as a common base QoS Profile, but additionally enable asynchronous publication. Each of these three QoS Profiles uses one of the three flow controllers defined in **DDS_PROFILE_GENERIC_PARTICIPANT↩ _LARGE_DATA** (p. 1406) in order to throttle application data flow.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.LargeData"

5.207.2.29 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW [extern]
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps ($\sim$ 100 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable.LargeData.FastFlow"

5.207.2.30 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW  [extern]
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps ($\sim$ 25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

5.207.2.31 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW  [extern]
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec ($\sim$ 6.25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

5.207.2.32 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW  [extern]
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps ($\sim$ 100 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

5.207.2.33 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW  [extern]
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps ($\sim$ 25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

5.207.2.34 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW  [extern]
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec ($\sim$ 6.25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

5.207.2.35 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL  [extern]
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 1405) profile, but persists the samples of a **DDS_DataWriter** (p. 488) as long as the entity exists in order to deliver them to late-joining DataReaders.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.TransientLocal"

5.207.2.36 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT  [extern]
```

Persists samples using RTI Persistence Service.

This profile extends the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 1405) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.Transient"

5.207.2.37 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT  [extern]
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 1405) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining DataReaders.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.KeepLastReliable.Persistent"

5.207.2.38 DDS_PROFILE_GENERIC_AUTO_TUNING

```
const char* const DDS_PROFILE_GENERIC_AUTO_TUNING  [extern]
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.AutoTuning"

5.207.2.39 DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT

```
const char* const DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT  [extern]
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Generic.MinimalMemoryFootprint"

5.207.2.40 DDS_PROFILE_GENERIC_SECURITY

```
const char* const DDS_PROFILE_GENERIC_SECURITY  [extern]
```

Loads the DDS Secure builtin plugins.

Generic Base Participant Profile that enables the builtin DDS Security Plugins.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Security", apply the QoS Snippet "BuiltinQosSnippetLib::↩ Feature.Security.Enable" via composition. For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosSnippetLib::Feature.Security.Enable</element>

    </base_name>

</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">

    <domain_participant_qos base_name="BuiltinQosLib::Generic.Security">

</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401)

String-version: "Generic.Security"

5.207.2.41 DDS_PROFILE_GENERIC_MONITORING2

```
const char* const DDS_PROFILE_GENERIC_MONITORING2  [extern]
```

The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.

This profile inherits from **DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT** (p. 1411).

The following DomainParticipant QoS policy of this profile cannot be modified and it is overwritten by the RTI Monitoring Library 2.0:

- Discovery Config Built-in Channel Kind.

The following DataWriter and DataReader QoS policies of this profile cannot be modified and they are overwritten by the RTI Monitoring Library 2.0:

- Reliability Kind.
- Durability Kind.
- History Kind.
- Publish Mode Kind.
- Protocol -> RTPS Reliable Writer -> Max Heartbeat Retries.

This profile uses Topic Filters to select the DataWriter and DataReader QoS depending on the Observability Distribution Topic.

You should be using this profile or a profile inheriting from it when you configure the distribution of telemetry data using the <distribution_settings> tag under <monitoring> for the <participant_factory_qos>.

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet **DDS_SNIPPET_FEATURE_MONITORING2_ENABLE** (p. 1427).

String-version: "Generic.Monitoring2"

See also

RTI_MONITORING_PERIODIC_TOPIC_NAME (p. 1438)

RTI_MONITORING_EVENT_TOPIC_NAME (p. 1438)

RTI_MONITORING_LOGGING_TOPIC_NAME (p. 1438)

5.207.2.42 DDS_PROFILE_GENERIC_MONITORING2_WAN

```
const char* const DDS_PROFILE_GENERIC_MONITORING2_WAN  [extern]
```

The QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use to communicate over WAN with a Collector Service.

This profile inherits from **DDS_PROFILE_GENERIC_MONITORING2** (p. 1411).

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet **DDS_SNIPPET_FEATURE_MONITORING2_ENABLE** (p. 1427).

String-version: "Generic.Monitoring2.WAN"

See also

DDS_PROFILE_GENERIC_MONITORING2 (p. 1411)

5.207.2.43 DDS_PROFILE_PATTERN_RPC

```
const char* const DDS_PROFILE_PATTERN_RPC  [extern]
```

This profile contains the default RPC and Request-Reply QoS settings.

This profile contains the QoS that is used to create the DataReaders and DataWriters in a Requester, a Replier, a Client or a Service.

Use this profile as the base profile if you need to customize the QoS settings of any of these entities.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Pattern.RPC"

5.207.2.44 DDS_PROFILE_PATTERN_PERIODIC_DATA

```
const char* const DDS_PROFILE_PATTERN_PERIODIC_DATA  [extern]
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.PeriodicData"

5.207.2.45 DDS_PROFILE_PATTERN_STREAMING

```
const char* const DDS_PROFILE_PATTERN_STREAMING  [extern]
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **DDS_↩ PROFILE_PATTERN_PERIODIC_DATA** (p. 1413) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.Streaming"

5.207.2.46 DDS_PROFILE_PATTERN_RELIABLE_STREAMING

```
const char* const DDS_PROFILE_PATTERN_RELIABLE_STREAMING  [extern]
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 1405) QoS Profile and the following QoS Snippets:

- **DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE** (p. 1421)
- **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1** (p. 1422)
- **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST** (p. 1417)

This QoS Snippet also increases the **DDS_HistoryQosPolicy::depth** (p. 1810) to reduce the probability of losing samples.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.ReliableStreaming"

5.207.2.47 DDS_PROFILE_PATTERN_EVENT

```
const char* const DDS_PROFILE_PATTERN_EVENT  [extern]
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE** (p. 1421)
- **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL** (p. 1422)
- **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL** (p. 1416)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) is broken. This is why this profile sets the **DDS↩ _LivelinessQosPolicy** (p. 1826). If the **DDS_DataWriter** (p. 488) does not assert its liveliness in a timely manner, the **DDS_DataReader** (p. 618) will report 'loss of liveliness' to the application.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.Event"

5.207.2.48 DDS_PROFILE_PATTERN_ALARM_EVENT

```
const char* const DDS_PROFILE_PATTERN_ALARM_EVENT  [extern]
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **DDS_PROFILE_PATTERN_EVENT** (p. 1414).

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.AlarmEvent"

5.207.2.49 DDS_PROFILE_PATTERN_STATUS

```
const char* const DDS_PROFILE_PATTERN_STATUS  [extern]
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **DDS_PROFILE_PATTERN_PERIODIC_DATA** (p. 1413) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **DDS_PROFILE_PATTERN_PERIODIC_DATA** (p. 1413) QoS Profile and publish the data at a fixed rate or it could use the **DDS_PROFILE_PATTERN_STATUS** (p. 1415) QoS Profile and only publish the temperature when it changes more than 1 degree.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.Status"

5.207.2.50 DDS_PROFILE_PATTERN_ALARM_STATUS

```
const char* const DDS_PROFILE_PATTERN_ALARM_STATUS  [extern]
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from **DDS_PROFILE_PATTERN_STATUS** (p. 1415).

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.AlarmStatus"

5.207.2.51 DDS_PROFILE_PATTERN_LAST_VALUE_CACHE

```
const char* const DDS_PROFILE_PATTERN_LAST_VALUE_CACHE  [extern]
```

Used for applications that only need the last published value.

With this QoS Profile, a **DDS_DataWriter** (p. 488) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL** (p. 1410) because the use case requires delivery to late-joiners.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 1401) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 1405)

String-version: "Pattern.LastValueCache"

5.207.2.52 DDS_BUILTIN_QOS_SNIPPET_LIB

```
const char* const DDS_BUILTIN_QOS_SNIPPET_LIB  [extern]
```

A library of QoS Snippets.

String-version: "BuiltinQosSnippetLib"

5.207.2.53 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON  [extern]
```

QoS Snippet that configures the reliability protocol with a common configuration.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet defines parameters common to a set of "alternative" QoS Snippets that configure the reliability protocol.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599)

This QoS Snippet configures the reliability protocol parameters for more aggressive (faster) heartbeats so that sample loss is detected and repaired faster.

This QoS Snippet also sets the **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1971), which works in combination with the heartbeat rate to determine when the **DDS_DataWriter** (p. 488) considers a **DDS_DataReader** (p. 618) non-responsive. This QoS Snippet configures the **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653) parameters so that the **DDS_DataWriter** (p. 488) considers the **DDS_DataReader** (p. 618) to be "inactive" after 500 unresponded heartbeats.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.ReliabilityProtocol.Common"

5.207.2.54 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL  [extern]
```

QoS Snippet that configures the reliability protocol for KEEP_ALL.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDS_DataWriter** (p. 488) reliable protocol parameters for a reliable **DDS_DataWriter** (p. 488) with **DDS_HistoryQosPolicyKind** (p. 1294) set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295).

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599)

Note that this QoS Snippet does not configure the **DDS_ReliabilityQosPolicy** (p. 1940) or **DDS_HistoryQosPolicy** (p. 1808) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.ReliabilityProtocol.KeepAll"

5.207.2.55 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST  [extern]
```

QoS Snippet that configures the reliability protocol for KEEP_LAST.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDS_DataWriter** (p. 488) reliable protocol parameters for a reliable **DDS_DataWriter** (p. 488) with **DDS_HistoryQosPolicyKind** (p. 1294) set to **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295).

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599)

Note that this QoS Snippet does not configure the **DDS_ReliabilityQosPolicy** (p. 1940) or **DDS_HistoryQosPolicy** (p. 1808) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.ReliabilityProtocol.KeepLast"

5.207.2.56 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE  [extern]
```

QoS Snippet that configures the reliability protocol for sending data at a high rate.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDS_DataWriter** (p. 488) reliable protocol parameters for a reliable **DDS_DataWriter** (p. 488) that is writing messages at high rates, especially in situations where throughput is favored over latency.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599)

This QoS Snippet sets a fast rate of heartbeats so that errors are detected and repaired more swiftly.

Note that to get the highest thoughout you may need to apply additional changes to the final QoS Profile. See the QoS Profile **DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT** (p. 1406) for further information.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.ReliabilityProtocol.HighRate"

5.207.2.57 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY  [extern]
```

QoS Snippet that configures the reliability protocol for sending data at low latency.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet modifies the Reliable Protocol parameters to accomplish low latency.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599)

Note that to get the lowest latency you may need to apply additional changes to the final QoS Profile. See the QoS Profile **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY** (p. 1406) for further information.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.ReliabilityProtocol.LowLatency"

5.207.2.58 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA [extern]
```

QoS Snippet that configures the reliability protocol for large data.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

Modifies the Reliable Protocol parameters and Resource Limits to work better with Large Data.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599)

Note that, to send large data, it is recommended to apply additional changes that configure the data caches, transport buffers, etc. See, for example, **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA** (p. 1408), and derivatives for fully functional Large Data QoS Profiles.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.ReliabilityProtocol.LargeData"

5.207.2.59 DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC

```
const char* const DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC [extern]
```

Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataWriterQos** (p. 1666) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.data_writer.history.↩ memory_manager.*"
- **DDS_DataReaderQos** (p. 1611) => **DDS_ResourceLimitsQosPolicy** (p. 1953)
- **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619)
- **DDS_DataReaderQos** (p. 1611) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.data_reader.history.↩ memory_manager.*"

This configuration is needed to handle data that contains unbounded sequences or strings. This QoS Snippet is also recommended if samples can have very different sizes and the bigger samples can be very large.

If dynamic memory allocation is not used for the larger samples, then all samples are allocated to their maximum size which can consume a lot of resources.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.DataCache.LargeData.DynamicMemAlloc"

5.207.2.60 DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON  [extern]
```

QoS Snippet that optimizes discovery with a common configuration.

Optimizes the **DDS_DomainParticipantQos** (p. 1729) to detect faster discovery changes. This QoS Snippet increases the speed moderately so that it fits the normal scenarios.

Modified QoS Parameters:

- **DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration** (p. 1694)
- **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 1694)
- **DDS_DiscoveryConfigQosPolicy::max_liveliness_loss_detection_period** (p. 1695)
- **DDS_DiscoveryConfigQosPolicy::initial_participant_announcements** (p. 1696)
- **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700)
- **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.Discovery.Common"

5.207.2.61 DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT  [extern]
```

QoS Snippet that optimizes the Participant QoS to send less discovery information.

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 1729) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.participant.inter_↩ participant.∗"
- **DDS_DomainParticipantQos** (p. 1729) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.sys_info.∗"

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.Discovery.Participant.Compact"

5.207.2.62 DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST  [extern]
```

QoS Snippet that optimizes the Endpoint Discovery to be faster.

This is useful when using security, to prevent a noticeable delay.

Modified QoS Parameters:

- **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700)
- **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.Discovery.Endpoint.Fast"

5.207.2.63 DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS

```
const char* const DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS  [extern]
```

QoS Snippet that increases the Participant default buffer that shmem and udpv4 use.

This is useful when using Large Data

Modified QoS Parameters:

- **DDS_ReceiverPoolQosPolicy** (p. 1938)
- **DDS_TransportBuiltinQosPolicy** (p. 2057)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Optimization.Transport.LargeBuffers"

5.207.2.64 DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE

```
const char* const DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE  [extern]
```

QoS Snippet that sets RELIABILITY QoS to RELIABLE.

This also configures a blocking time in case the **DDS_DataWriter** (p. 488) writes faster than the DataReaders can accommodate.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_ReliabilityQosPolicy** (p. 1940)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ReliabilityQosPolicy** (p. 1940)

Note that by itself enabling reliability does not ensure that every sample written is delivered to the DataReaders. This is because the **DDS_DataWriter** (p. 488) and/or **DDS_DataReader** (p. 618) can be configured to override samples in its cache based on the configuration of the **DDS_HistoryQosPolicy** (p. 1808) QoS policy.

To ensure delivery of every sample (at the expense of potentially blocking the **DDS_DataWriter** (p. 488)), use the QoS Profile **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 1405) or one of the derived QoS Profiles.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.Reliability.Reliable"

5.207.2.65 DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT

```
const char* const DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT  [extern]
```

QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_ReliabilityQosPolicy** (p. 1940)
- **DDS_DataReaderQos** (p. 1611) => **DDS_ReliabilityQosPolicy** (p. 1940)

With best-effort, there are no resources spent to confirm delivery of samples nor repairs of any samples that may be lost.

Best-effort communication reduces jitter; therefore, the delay between sending data and receiving it is more deterministic for the samples that are actually received. Best-effort is good for periodic data where it may be better to get the next value than to wait for the previous one to be repaired.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.Reliability.BestEffort"

5.207.2.66 DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1

```
const char* const DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1  [extern]
```

QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_HistoryQosPolicy** (p. 1808)
- **DDS_DataReaderQos** (p. 1611) => **DDS_HistoryQosPolicy** (p. 1808)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.History.KeepLast_1"

5.207.2.67 DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL

```
const char* const DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL  [extern]
```

QoS Snippet that sets HISTORY QosPolicy to KEEP_ALL kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_HistoryQosPolicy** (p. 1808)
- **DDS_DataReaderQos** (p. 1611) => **DDS_HistoryQosPolicy** (p. 1808)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.History.KeepAll"

5.207.2.68 DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS

```
const char* const DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS [extern]
```

QoS Snippet that sets PUBLISH_MODE QosPolicy to ASYNCHRONOUS kind.

Modified QoS Parameters:

- **DDS_PublishModeQosPolicy** (p. 1924)

Asynchronous Publish mode decouples the application thread that calls the **DDS_DataWriter** (p. 488) "write" operation from the thread used to send the data on the network. See https://community.rti.↩ com/glossary/asynchronous-writer

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.PublishMode.Asynchronous"

5.207.2.69 DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL [extern]
```

QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT_LOCAL kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_DurabilityQosPolicy** (p. 1762)
- **DDS_DataReaderQos** (p. 1611) => **DDS_DurabilityQosPolicy** (p. 1762)

DataWriters will store and send previously published DDS samples for delivery to newly discovered DataReaders as long as the **DDS_DataWriter** (p. 488) still exists. For this setting to be effective, you must also set the **DDS_Reliability**↩ **QosPolicyKind** (p. 1324) to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) (not Best Effort). Which particular DDS samples are kept depends on other QoS settings such as **DDS_HistoryQosPolicy** (p. 1808) and **DDS_Resource**↩ **LimitsQosPolicy** (p. 1953).

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.Durability.TransientLocal"

5.207.2.70 DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT  [extern]
```

QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_DurabilityQosPolicy** (p. 1762)
- **DDS_DataReaderQos** (p. 1611) => **DDS_DurabilityQosPolicy** (p. 1762)

RTI Connext will store previously published DDS samples in memory using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimitsQosPolicy** (p. 1953) of the Persistence Service DataWriters. These QosPolicies can be configured in the Persistence Service configuration file or through the **DDS_DurabilityQosPolicyKind** (p. 1289) of the DataWriters configured with **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290).

You need a Persistence Service instance running to use this behavior.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.Durability.Transient"

5.207.2.71 DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT  [extern]
```

QoS Snippet that sets DURABILITY QosPolicy to PERSISTENT kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 1666) => **DDS_DurabilityQosPolicy** (p. 1762)
- **DDS_DataReaderQos** (p. 1611) => **DDS_DurabilityQosPolicy** (p. 1762)

RTI Connext will store previously published DDS samples in permanent storage, like a disk, using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimitsQosPolicy** (p. 1953) in the Persistence Service DataWriters. These QosPolicies can be configured in the Persistence Service configuration file or through the **DDS_DurabilityQosPolicyKind** (p. 1289) of the DataWriters configured with **DDS_PERSISTENT↩ _DURABILITY_QOS** (p. 1290).

You need a Persistence Service instance running to use this behavior.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.Durability.Persistent"

5.207.2.72 DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE

```
const char* const DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE  [extern]
```

QoS Snippet that sets BATCH QosPolicy to true.

Modified QoS Parameters:

- **DDS_BatchQosPolicy** (p. 1552)

This QoS Snippet specifies and configures the mechanism that allows RTI Connext to collect multiple user data DDS samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "QosPolicy.Batching.Enable"

5.207.2.73 DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS  [extern]
```

QoS Snippet that configures and set a FlowController of 838 Mbps.

Defines a **DDS_FlowController** (p. 562) and configures the **DDS_DataWriterQos** (p. 1666) with it.

This is a **DDS_FlowController** (p. 562) of 838 Mbps ($\sim$ 100 MB/sec)

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 1729) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.flow_controller.↩ token_bucket.*"
- **DDS_PublishModeQosPolicy** (p. 1924)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.FlowController.838Mbps"

5.207.2.74 DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS  [extern]
```

QoS Snippet that configures and sets a FlowController of 209 Mbps.

Defines a **DDS_FlowController** (p. 562) and configures the **DDS_DataWriterQos** (p. 1666) with it.

This is a **DDS_FlowController** (p. 562) of 209 Mbps ($\sim$ 25 MB/sec)

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 1729) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.flow_controller.↩ token_bucket.*"
- **DDS_PublishModeQosPolicy** (p. 1924)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.FlowController.209Mbps"

5.207.2.75 DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS  [extern]
```

QoS Snippet that configures and sets a FlowController of 52 Mbps.

Defines a **DDS_FlowController** (p. 562) and configures the **DDS_DataWriterQos** (p. 1666) with it.

This is a **DDS_FlowController** (p. 562) of 52 Mbps ($\sim$ 6.25 MB/sec)

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 1729) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.flow_controller.↩ token_bucket.∗"
- **DDS_PublishModeQosPolicy** (p. 1924)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.FlowController.52Mbps"

5.207.2.76 DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE  [extern]
```

QoS Snippet that enables auto_throttle and turbo_mode to true.

Sets the **DDS_DomainParticipantQos** (p. 1729) properties to enable auto_throttle and turbo_mode to true.

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 1729) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.domain_↩ participant.auto_throttle"
- **DDS_DataWriterQos** (p. 1666) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.data_writer.auto_throttle.↩ enable"
- **DDS_DataWriterQos** (p. 1666) => **DDS_PropertyQosPolicy** (p. 1905) named "dds.data_writer.enable_turbo↩ _mode"

The domain_participant.auto_throttle configures the **DDS_DomainParticipant** (p. 76) to gather internal measurements (during **DDS_DomainParticipant** (p. 76) creation) that are required for the Auto Throttle feature. This allows DataWriters belonging to this **DDS_DomainParticipant** (p. 76) to use the Auto Throttle feature.

The turbo_mode adjusts the batch max_data_bytes based on how frequently the **DDS_DataWriter** (p. 488) writes data.

Data_writer.auto_throttle enables automatic throttling in the **DDS_DataWriter** (p. 488) so it can automatically adjust the writing rate and the send window size; this minimizes the need for repairing DDS samples and improves latency.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.AutoTuning.Enable"

5.207.2.77 DDS_SNIPPET_FEATURE_MONITORING_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_MONITORING_ENABLE  [extern]
```

QoS Snippet that enables the use of the RTI Monitoring Library.

To enable the use of RTI Monitoring Library apply this QoS Snippet to the QoS Profile used to create your **DDS_↩ DomainParticipant** (p. 76). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.Monitoring.Enable</element>

    </base_name>

</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.Monitoring.Enable"

5.207.2.78 DDS_SNIPPET_FEATURE_MONITORING2_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_MONITORING2_ENABLE  [extern]
```

QoS Snippet that enables the use of the RTI Monitoring Library 2.0.

QoS Snippet to enable the use of the RTI Monitoring Library 2.0 with a dedicated DomainParticipant publishing telemetry data from your application in domain ID 2. All metrics are enabled for all resources in this profile.

To enable the use of RTI Monitoring Library 2.0, apply this QoS Snippet to the QoS Profile used to create your Domain↩ ParticipantFactory. For example:

```
<qos_profile name="MyProfile" is_default_participant_factory_profile="true">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring2.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.Monitoring2.Enable"

5.207.2.79 DDS_SNIPPET_FEATURE_SECURITY_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_SECURITY_ENABLE  [extern]
```

QoS Snippet that enables security using the Builtin Security Plugins.

To enable the use of the Builtin DDS Security Library apply this QoS Snippet to the QoS Profile used to create your **DDS_DomainParticipant** (p. 76). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.Security.Enable</element>

    </base_name>

</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.Security.Enable"

5.207.2.80 DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE  [extern]
```

QoS Snippet that enables Topic Query.

To enable the use of the RTI Connext **DDS_TopicQuery** (p. 708) feature, apply this QoS Snippet to the QoS Profile used to create your **DDS_DataWriter** (p. 488). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TopicQuery.Enable</element>

    </base_name>

</qos_profile>
```

For more information on Topic Query see the "Topic Queries" chapter in the `User's Manual`.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Feature.TopicQuery.Enable"

5.207.2.81 DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V1_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V1_ENABLE  [extern]
```

QoS Snippet that enables TypeObject V1 propagation.

To enable TypeObject V1 propagation apply this QoS Snippet to the QoS Profile used to create your **DDS_Domain↩ Participant** (p. 76). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V1.Enable</element>

    </base_name>

</qos_profile>
```

5.207.2.82 DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V1_DISABLE

```
const char* const DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V1_DISABLE  [extern]
```

QoS Snippet that disables TypeObject V1 propagation.

To disable TypeObject V1 propagation apply this QoS Snippet to the QoS Profile used to create your **DDS_Domain↩ Participant** (p. 76). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V1.Disable</element>

    </base_name>

</qos_profile>
```

5.207.2.83 DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V2_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V2_ENABLE  [extern]
```

QoS Snippet that enables TypeObject V2 propagation.

To enable TypeObject V2 propagation apply this QoS Snippet to the QoS Profile used to create your **DDS_Domain↩ Participant** (p. 76). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V2.Enable</element>

    </base_name>

</qos_profile>
```

5.207.2.84 DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V2_DISABLE

```
const char* const DDS_SNIPPET_FEATURE_TYPE_SUPPORT_V2_DISABLE  [extern]
```

QoS Snippet that disables TypeObject V2 propagation.

To disable TypeObject V2 propagation apply this QoS Snippet to the QoS Profile used to create your **DDS_Domain↩ Participant** (p. 76). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V2.Disable</element>

    </base_name>

</qos_profile>
```

5.207.2.85 DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT  [extern]
```

QoS Snippet that configures a TCP LAN Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the initial_peers and the property dds.transport.TCPv4.tcp1.server_bind_port are incorrect (just sample strings). Therefore, they must be modified:

- initial_peers: should point to the remote client IP and port.
- server_bind_port: is the port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **DDS_Entity** (p. 1362). These new values will overwrite the current invalid values.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Transport.TCP.LAN.Client"

5.207.2.86 DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT  [extern]
```

QoS Snippet that configures a symmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties dds.transport.TCPv4.tcp1.public_address and dds.transport.TCPv4.tcp1.server_bind_port are incorrect (just sample strings). Also the initial_peers information is not correct. Therefore, the following must be modified:

- initial_peers: should point to the remote client IP and port.
- public_address: public IP address where this application can be reached.
- server_bind_port: port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **DDS_Entity** (p. 1362). These new values will overwrite the current invalid values.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Transport.TCP.WAN.Symmetric.Client"

5.207.2.87 DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER  [extern]
```

QoS Snippet that an asymmetric WAN TCP Server over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties dds.transport.TCPv4.tcp1.public_address and dds.transport.TCPv4.tcp1.server_bind_port are incorrect (just sample strings). Therefore, they must be modified to the corresponding public_address and port↩ _number. This modification should be done in the QoS Profile that will be used to create the **DDS_Entity** (p. 1362). These new values will overwrite the current invalid values.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Transport.TCP.WAN.Asymmetric.Server"

5.207.2.88 DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT  [extern]
```

QoS Snippet that configures an asymmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The value of discovery.initial_peers and public_ip have to match the values set on the Server side (**DDS_SNIPPET↩ _TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER** (p. 1430)). This modification should be done in the QoS Profile that will be used to create the **DDS_Entity** (p. 1362). This new value will overwrite the current invalid value.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Transport.TCP.WAN.Asymmetric.Client"

5.207.2.89 DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION

```
const char* const DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION  [extern]
```

QoS Snippet that configures RTI Connext and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

For WAN communications and, in general, for communications in third party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

This snippet provides a way to avoid IP fragmentation in Connext applications using the built-in UDP transports. Instead, Connext will be responsible for fragmentation, which is done at the RTPS level.

Among other changes, this configuration changes the transport MTU (message_size_max) to be 1400 bytes. Notice that this change will affect other transports such as SHMEM since Connext chooses the minimum transport MTU across all enabled transports to determine the maximum size of outgoing RTPS messages.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Transport.UDP.AvoidIPFragmentation"

5.207.2.90 DDS_SNIPPET_TRANSPORT_UDP_WAN

```
const char* const DDS_SNIPPET_TRANSPORT_UDP_WAN  [extern]
```

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).

The snippet disables all the other built-in transports and avoids the use of IP fragmentation.

For WAN communications and, in general, for communications in third-party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Transport.UDP.WAN"

5.207.2.91 DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3

```
const char* const DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3  [extern]
```

QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connext Micro 2.4.3.

QoS Snippet that sets the **DDS_DataReaderQos** (p. 1611) and **DDS_DataWriterQos** (p. 1666) **DDS_LivelinessQos↩PolicyKind** (p. 1298) to **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 1299) It also disables the built-in shared memory transport.

Modified QoS Parameters:

- **DDS_DataReaderQos** (p. 1611) => **DDS_LivelinessQosPolicy** (p. 1826)
- **DDS_DataWriterQos** (p. 1666) => **DDS_LivelinessQosPolicy** (p. 1826)
- **DDS_TransportBuiltinQosPolicy** (p. 2057)

RTI Connext Micro versions 2.4.3 and earlier only supported **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 1299) **DDS_LivelinessQosPolicyKind** (p. 1298). In order to be compatible with RTI Connext Micro 2.4.3, the **DDS_Data↩Reader** (p. 618) and **DDS_DataWriter** (p. 488) must have their **DDS_LivelinessQosPolicyKind** (p. 1298) changed to this value because the default kind in RTI Connext is **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 1299).

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Compatibility.ConnextMicro.Version243"

5.207.2.92 DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE

```
const char* const DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE  [extern]
```

QoS Snippet that configures RTI Connext to interoperate with other DDS vendors.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Compatibility.OtherDDSVendor.Enable"

5.207.2.93 DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE

```
const char* const DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE  [extern]
```

QoS Snippet that configures RTI Connext to interoperate with RTI Connext 5.1.0 and below for UDPv6 and SHMEM transports.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 1416)

String-version: "Compatibility.510Transport.Enable"

5.208 DomainParticipantConfigParams

<<***extension***>> *(p. 1014)* **DDS_DomainParticipantConfigParams_t** (p. 1721)

Data Structures

- struct **DDS_DomainParticipantConfigParams_t**

  <<***extension***>> *(p. 1014) Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.*

Macros

- #define **DDS_DomainParticipantConfigParams_t_INITIALIZER**

  <<***extension***>> *(p. 1014) Initializer for new* ***DDS_DomainParticipantConfigParams_t*** *(p. 1721).*

Variables

- const int **DDS_DOMAIN_ID_USE_XML_CONFIG**

  <<***extension***>> *(p. 1014) Special value to be used with* ***DDS_DomainParticipantConfigParams_t*** *(p. 1721) to indicate that a participant is created using the domain ID specified in the participant configuration.*
- const char * **DDS_ENTITY_NAME_USE_XML_CONFIG**

  <<***extension***>> *(p. 1014) Special value to be used with* ***DDS_DomainParticipantConfigParams_t*** *(p. 1721) to indicate that a participant created is with an autogenerated entity name.*
- const char * **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG**

  <<***extension***>> *(p. 1014) Special value to be used with* ***DDS_DomainParticipantConfigParams_t*** *(p. 1721) to indicate that entities are created from the QoS profile specified in the participant configuration.*

5.208.1 Detailed Description

<<***extension***>> *(*p. *1014)* **DDS_DomainParticipantConfigParams_t** (p. 1721)

5.208.2 Macro Definition Documentation

5.208.2.1 DDS_DomainParticipantConfigParams_t_INITIALIZER

```
#define DDS_DomainParticipantConfigParams_t_INITIALIZER
```

<<***extension***>> *(*p. *1014)* Initializer for new **DDS_DomainParticipantConfigParams_t** (p. 1721).

No memory is allocated. New **DDS_DomainParticipantConfigParams_t** (p. 1721) instances stored in the stack should be initialized with this value before they are passed to any functions. .

5.208.3 Variable Documentation

5.208.3.1 DDS_DOMAIN_ID_USE_XML_CONFIG

```
const int DDS_DOMAIN_ID_USE_XML_CONFIG  [extern]
```

<<***extension***>> *(*p. *1014)* Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 1721) to indicate that a participant is created using the domain ID specified in the participant configuration.

This variable contains a constant sentinel value that is compared when creating the entities from configuration.

5.208.3.2 DDS_ENTITY_NAME_USE_XML_CONFIG

```
const char* DDS_ENTITY_NAME_USE_XML_CONFIG  [extern]
```

<<***extension***>> *(*p. *1014)* Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 1721) to indicate that a participant created is with an autogenerated entity name.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

5.208.3.3 DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG

```
const char* DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG  [extern]
```

<<***extension***>> *(p. 1014)* Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 1721) to indicate that entities are created from the QoS profile specified in the participant configuration.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

5.209 User-managed Threads

User-managed thread infrastructure.

Data Structures

- struct **DDS_ThreadFactory**

  <<***extension***>> *(p. 1014)* <<***interface***>> *(p. 1015) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the* ***DDS_ThreadFactory_OnSpawned↩ Function*** *(p. 1435) that specifies the operation to run in the new thread.*

Macros

- #define **DDS_ThreadFactory_INITIALIZER**

  <<***extension***>> *(p. 1014) Initializer for new* ***DDS_ThreadFactory*** *(p. 2033).*

Typedefs

- typedef void *(* **DDS_ThreadFactory_OnSpawnedFunction**) (void *thread_param)

  Prototype of the function that must be called on a new thread created by a ***DDS_ThreadFactory*** *(p. 2033).*
- typedef void *(* **DDS_ThreadFactory_CreateThreadCallback**) (void *factory_data, const char *thread_name, const struct **DDS_ThreadSettings_t** *settings, **DDS_ThreadFactory_OnSpawnedFunction** on_spawned, void *threadParam)

  Prototype of a ***DDS_ThreadFactory*** *(p. 2033) create_thread function.*
- typedef void(* **DDS_ThreadFactory_DeleteThreadCallback**) (void *factory_data, void *thread)

  Prototype of a ***DDS_ThreadFactory*** *(p. 2033) delete_thread function.*

5.209.1 Detailed Description

User-managed thread infrastructure.

Core feature that allows users to provide the threads to RTI Connext.

"::DDS_ThreadFactory"

The model follows the abstract factory pattern. A **DDS_ThreadFactory** (p. 2033) instance can be set in the **DDS_↩ DomainParticipantFactory** (p. 32) so that **DDS_DomainParticipant** (p. 76) will use it for thread creation and deletion.

5.209.2 Macro Definition Documentation

5.209.2.1 DDS_ThreadFactory_INITIALIZER

```
#define DDS_ThreadFactory_INITIALIZER
```

<<***extension***>> *(p. 1014)* Initializer for new **DDS_ThreadFactory** (p. 2033).

No memory is allocated. New **DDS_ThreadFactory** (p. 2033) instances stored in the stack should be initialized with this value before they are passed to any functions.

5.209.3 Typedef Documentation

5.209.3.1 DDS_ThreadFactory_OnSpawnedFunction

```
typedef void *(* DDS_ThreadFactory_OnSpawnedFunction) (void *thread_param)
```

Prototype of the function that must be called on a new thread created by a **DDS_ThreadFactory** (p. 2033).

Parameters

thread_param	<<***in***>> *(p. 1015)* Single argument that this operation receives. It is the data this operation needs to perform.

5.209.3.2 DDS_ThreadFactory_CreateThreadCallback

```
typedef void *(* DDS_ThreadFactory_CreateThreadCallback) (void *factory_data, const char *thread↩
_name, const struct DDS_ThreadSettings_t *settings, DDS_ThreadFactory_OnSpawnedFunction on_↩
spawned, void *threadParam)
```

Prototype of a **DDS_ThreadFactory** (p. 2033) create_thread function.

Parameters

factory_data	<<***in***>> *(p. 1015)* Data associated with the factory when the factory is set.
thread_name	<<***in***>> *(p. 1015)* Name of the thread given by the middleware.
settings	<<***in***>> *(p. 1015)* Attributes of the new thread (i.e., priority, stack size, etc.). These attributes are specified in the QoS settings corresponding to each kind of thread (i.e., database, event, etc).

Parameters

on_spawned	<<***in***>> *(*p. *1015)* Function provided by the middleware to be called in the newly created thread.
threadParam	<<***in***>> *(*p. *1015)* Parameters provided by the middleware to be passed in the call to on_spawned.

Returns

An opaque pointer to the newly created thread. The same pointer will be provided to the **DDS_ThreadFactory**↩ **::delete_thread** (p. 2034) operation when deletion is requested.

5.209.3.3 DDS_ThreadFactory_DeleteThreadCallback

```
typedef void(* DDS_ThreadFactory_DeleteThreadCallback) (void *factory_data, void *thread)
```

Prototype of a **DDS_ThreadFactory** (p. 2033) delete_thread function.

Parameters

factory_data	<<***in***>> *(*p. *1015)* Data associated with the factory when the factory is set.
thread	<<***in***>> (p. *1015)* Thread to be deleted. The thread was previously created by the same **DDS_ThreadFactory** (p. 2033).

5.210 Monitoring Library 2.0

RTI Monitoring Library 2.0 public API.

Functions

- void **RTI_Monitoring_initialize** (void)

  Initializes Monitoring Library 2.0.

Variables

- const char ∗const **RTI_MONITORING_PERIODIC_TOPIC_NAME**

  The name of the Monitoring Topic used for periodic metrics distribution.
- const char ∗const **RTI_MONITORING_EVENT_TOPIC_NAME**

  The name of the Monitoring Topic used for event metrics distribution.
- const char ∗const **RTI_MONITORING_LOGGING_TOPIC_NAME**

  The name of the Monitoring Topic used for log messages distribution.

5.210.1 Detailed Description

RTI Monitoring Library 2.0 public API.

RTI Monitoring Library 2.0 is one component of the RTI Connext Observability Framework which allows collecting and distributing telemetry data (metrics and logs) associated with the observable resources created by an RTI Connext application.

In this release, the only Observable resources are the following entities: **DDS_DataWriter** (p. 488), **DDS_DataReader** (p. 618), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DomainParticipant** (p. 76), **DDS_Topic** (p. 174) and Application (a process running RTI Connext).

The library also accepts remote commands to change the set of distributed telemetry data at run-time.

The data distributed by RTI Monitoring Library 2.0 is sent to an RTI Observability Collector Service instance, which forwards the data to other RTI Observability Collector Service instances or stores the data in third-party observability backends such as Prometheus or Grafana Loki.

RTI Monitoring Library 2.0 is a separate library (rtimonitoring2), and applications can use it in three different modes:

- **Dynamically loaded:** This is the default mode, and it requires that the rtimonitoring2 shared library is in the library search path.
- **Dynamic linking:** The application is linked with the rtimonitoring2 shared library.
- **Static linking:** The application is linked with the rtimonitoring2 static library.

The last two modes require calling the API **RTI_Monitoring_initialize** (p. 1437) in your application before any other RTI Connext APIs. This API is defined in the header file `ndds/monitoring/monitoring_monitoringClass.h`.

Dynamic and static linking are only supported in C and C++ applications.

To enable use of RTI Monitoring Library 2.0 and configure its behavior, use the **DDS_MonitoringQosPolicy** (p. 1856) QoS policy on the **DDS_DomainParticipantFactory** (p. 32). This QoS policy can be configured programmatically or via XML.

5.210.2 Function Documentation

5.210.2.1 RTI_Monitoring_initialize()

```
void RTI_Monitoring_initialize (
             void  )
```

Initializes Monitoring Library 2.0.

This function must be called before calling any other RTI Connext API if the application links with RTI Monitoring Library 2.0 dynamically or statically.

5.210.3 Variable Documentation

5.210.3.1 RTI_MONITORING_PERIODIC_TOPIC_NAME

```
const char* const RTI_MONITORING_PERIODIC_TOPIC_NAME
```

The name of the Monitoring Topic used for periodic metrics distribution.

String version: "DCPSPeriodicStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

5.210.3.2 RTI_MONITORING_EVENT_TOPIC_NAME

```
const char* const RTI_MONITORING_EVENT_TOPIC_NAME
```

The name of the Monitoring Topic used for event metrics distribution.

String version: "DCPSEventStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

5.210.3.3 RTI_MONITORING_LOGGING_TOPIC_NAME

```
const char* const RTI_MONITORING_LOGGING_TOPIC_NAME
```

The name of the Monitoring Topic used for log messages distribution.

String version: "DCPSLoggingStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

5.211 Version

Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

Data Structures

- struct **NDDS_Config_LibraryVersion_t**

  The version of a single library shipped as part of an RTI Connext distribution.
- struct **NDDS_Config_Version_t**

  *<<**interface**>> (p. 1015) The version of an RTI Connext distribution.*

Functions

- const struct **DDS_ProductVersion_t** * **NDDS_Config_Version_get_product_version** (void)

  Get the RTI Connext product version.
- const struct **NDDS_Config_LibraryVersion_t** * **NDDS_Config_Version_get_api_version** (void)

  Get the version of the C API library.
- const struct **NDDS_Config_LibraryVersion_t** * **NDDS_Config_Version_get_core_version** (void)

  Get the version of the core library.
- const char * **NDDS_Config_Version_to_string** (void)

  Get this version in string form.

5.211.1 Detailed Description

Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

There are three ways to obtain version information: looking at the revision files, using Visual Studio or the command line, or programmatically at run time. This HTML documentation includes a reference for consulting the APIs that allow you to get version information programmatically. For more information see the RTI Connext DDS Core Libraries User's Manual.

The version information includes four fields:

- Major product version.
- Minor product version.
- Release letter for product version.
- Revision number of product.

5.211.2 Function Documentation

5.211.2.1 NDDS_Config_Version_get_product_version()

```
const struct  DDS_ProductVersion_t * NDDS_Config_Version_get_product_version (
            void  )
```

Get the RTI Connext product version.

5.211.2.2 NDDS_Config_Version_get_api_version()

```
const struct  NDDS_Config_LibraryVersion_t * NDDS_Config_Version_get_api_version (
            void  )
```

Get the version of the C API library.

5.211.2.3 NDDS_Config_Version_get_core_version()

```
const struct  NDDS_Config_LibraryVersion_t * NDDS_Config_Version_get_core_version (
            void  )
```

Get the version of the core library.

5.211.2.4 NDDS_Config_Version_to_string()

```
const char * NDDS_Config_Version_to_string (
            void  )
```

Get this version in string form.

Combine all of the constituent library versions into a single string.

The memory in which the string is stored in internal to this **NDDS_Config_Version_t** (p. 2126). The caller should not modify it.

5.212 Logging

Configure how much debugging information is reported during runtime and where it is logged.

Modules

- **Activity Context**

  Add contextual information to log messages.

Data Structures

- struct **NDDS_Config_Logger**

  *<<**interface**>> (p. 1015) The singleton type used to configure RTI Connext logging.*
- struct **NDDS_Config_LogMessage**

  A log message's input parameter to a logging device, including the text and additional information.
- struct **NDDS_Config_LoggerDevice**

  *<<**interface**>> (p. 1015) Logging device interface. Use for user-defined logging devices.*

Macros

- #define **NDDS_Config_LoggerDevice_INITIALIZER**

  Initializer for new Logger Device instances.

Typedefs

- typedef void(∗ **NDDS_Config_LoggerDeviceWriteFnc**) (struct **NDDS_Config_LoggerDevice** ∗device, const struct **NDDS_Config_LogMessage** ∗message)

  *Prototype of a **NDDS_Config_LoggerDevice*** (p. *2122*) *write function.*
- typedef void(∗ **NDDS_Config_LoggerDeviceCloseFnc**) (struct **NDDS_Config_LoggerDevice** ∗device)

  *Prototype of a **NDDS_Config_LoggerDevice*** (p. *2122*) *close function.*

Enumerations

- enum **NDDS_Config_LogVerbosity** {
  NDDS_CONFIG_LOG_VERBOSITY_SILENT ,
  NDDS_CONFIG_LOG_VERBOSITY_ERROR ,
  NDDS_CONFIG_LOG_VERBOSITY_WARNING ,
  NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL ,
  NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE ,
  NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL }

  The verbosities at which RTI Connext diagnostic information is logged.
- enum **NDDS_Config_LogLevel** {
  NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR ,
  NDDS_CONFIG_LOG_LEVEL_ERROR ,
  NDDS_CONFIG_LOG_LEVEL_WARNING ,
  NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL ,
  NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE ,
  NDDS_CONFIG_LOG_LEVEL_DEBUG }

  Level category assigned to RTI Connext log messages returned to an output device.
- enum **NDDS_Config_SyslogLevel** {
  NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY ,
  NDDS_CONFIG_SYSLOG_LEVEL_ALERT ,
  NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL ,
  NDDS_CONFIG_SYSLOG_LEVEL_ERROR ,
  NDDS_CONFIG_SYSLOG_LEVEL_WARNING ,
  NDDS_CONFIG_SYSLOG_LEVEL_NOTICE ,
  NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL ,
  NDDS_CONFIG_SYSLOG_LEVEL_DEBUG }

  Syslog level category assigned to RTI Connext log messages. See `Syslog Level and Verbosity Mapping`*, in the Core Libraries User's Manual, for more information.*
- enum **NDDS_Config_LogCategory** {
  NDDS_CONFIG_LOG_CATEGORY_PLATFORM ,
  NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION ,
  NDDS_CONFIG_LOG_CATEGORY_DATABASE ,
  NDDS_CONFIG_LOG_CATEGORY_ENTITIES ,
  NDDS_CONFIG_LOG_CATEGORY_API ,
  NDDS_CONFIG_LOG_CATEGORY_DISCOVERY ,
  NDDS_CONFIG_LOG_CATEGORY_SECURITY ,
  NDDS_CONFIG_LOG_CATEGORY_USER ,
  NDDS_CONFIG_LOG_CATEGORY_ALL }

Categories of logged messages.

- enum **NDDS_Config_LogPrintFormat** { }

  The format used to output RTI Connext diagnostic information.

- enum **NDDS_Config_LogFacility** {
  NDDS_CONFIG_LOG_FACILITY_USER ,
  NDDS_CONFIG_LOG_FACILITY_SECURITY_EVENT ,
  NDDS_CONFIG_LOG_FACILITY_SERVICE ,
  NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE }

  A number that identifies the source of a log message.

- enum **NDDS_Config_SyslogVerbosity** {
  NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_EMERGENCY ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_INFORMATIONAL ,
  NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG }

  *The Syslog verbosities at which RTI Connext diagnostic information is logged. These Syslog verbosities are mapped to **NDDS_Config_LogVerbosity** (p. 1445). See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.*

Functions

- **NDDS_Config_Logger** ∗ **NDDS_Config_Logger_get_instance** (void)

  Get the singleton instance of this type.

- **NDDS_Config_Logger** ∗ **NDDS_Config_Logger_get_instancel** (void)

  Get the singleton instance of this type.

- **NDDS_Config_LogVerbosity** **NDDS_Config_Logger_get_verbosity** (const **NDDS_Config_Logger** ∗self)

  Get the verbosity at which RTI Connext is currently logging diagnostic information.

- **NDDS_Config_LogVerbosity** **NDDS_Config_Logger_get_verbosity_by_category** (const **NDDS_Config_Logger** ∗self, **NDDS_Config_LogCategory** category)

  Get the verbosity at which RTI Connext is currently logging diagnostic information in the given category.

- void **NDDS_Config_Logger_set_verbosity** (**NDDS_Config_Logger** ∗self, **NDDS_Config_LogVerbosity** verbosity)

  Set the verbosity at which RTI Connext will log diagnostic information.

- void **NDDS_Config_Logger_set_verbosity_by_category** (**NDDS_Config_Logger** ∗self, **NDDS_Config_LogCategory** category, **NDDS_Config_LogVerbosity** verbosity)

  Set the verbosity at which RTI Connext will log diagnostic information in the given category.

- FILE ∗ **NDDS_Config_Logger_get_output_file** (**NDDS_Config_Logger** ∗self)

  Get the file to which the logged output is redirected.

- **DDS_Boolean** **NDDS_Config_Logger_set_output_file** (**NDDS_Config_Logger** ∗self, FILE ∗out)

  Set the file to which the logged output is redirected.

- **DDS_Boolean** **NDDS_Config_Logger_set_output_file_name** (**NDDS_Config_Logger** ∗self, const char ∗file_name)

  Set the name of the file to which the logged output is redirected.

- **DDS_Boolean** **NDDS_Config_Logger_set_output_file_set** (**NDDS_Config_Logger** ∗self, const char ∗file_preffix, const char ∗file_suffix, int max_capacity, int max_files)

Configure a set of files to redirect the logged output.

- **NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format** (const **NDDS_Config_Logger** *self)

  *Get the current message format for the log level **NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1446).*

- **NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format_by_log_level** (const **NDDS_Config_Logger** *self, **NDDS_Config_LogLevel** log_level)

  Get the current message format, by log level, that RTI Connext is using to log diagnostic information.

- **DDS_Boolean NDDS_Config_Logger_set_print_format** (**NDDS_Config_Logger** *self, **NDDS_Config_LogPrintFormat** print_format)

  *Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1446). When the **Activity Context** (p. 1457) is printed, the user can select the information that will be part of the **Activity Context** (p. 1457) by using the API **NDDS_Config_ActivityContext_set_attribute_mask** (p. 1461).*

- **DDS_Boolean NDDS_Config_Logger_set_print_format_by_log_level** (**NDDS_Config_Logger** *self, **NDDS_Config_LogPrintFormat** print_format, **NDDS_Config_LogLevel** log_level)

  *Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1446). When the **Activity Context** (p. 1457) is printed, the user can select the information that will be part of the **Activity Context** (p. 1457) by using the API **NDDS_Config_ActivityContext_set_attribute_mask** (p. 1461).*

- void **NDDS_Config_Logger_emergency** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY** (p. 1446) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_alert** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_ALERT** (p. 1446) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_critical** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_error** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_ERROR** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_warning** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_WARNING** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_notice** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_NOTICE** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_informational** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- void **NDDS_Config_Logger_debug** (**NDDS_Config_Logger** *self, const char *msg)

  *Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_DEBUG** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .*

- struct **NDDS_Config_LoggerDevice** * **NDDS_Config_Logger_get_output_device** (**NDDS_Config_Logger** *self)

  Return the user device registered with the logger.
- **DDS_Boolean NDDS_Config_Logger_set_output_device** (**NDDS_Config_Logger** *self, struct **NDDS_Config_LoggerDevice** *device)

  *Register a **NDDS_Config_LoggerDevice** (p. 2122).*

5.212.1 Detailed Description

Configure how much debugging information is reported during runtime and where it is logged.

5.212.2 Macro Definition Documentation

5.212.2.1 NDDS_Config_LoggerDevice_INITIALIZER

```
#define NDDS_Config_LoggerDevice_INITIALIZER
```

Initializer for new Logger Device instances.

5.212.3 Typedef Documentation

5.212.3.1 NDDS_Config_LoggerDeviceWriteFnc

```
typedef void(* NDDS_Config_LoggerDeviceWriteFnc) (struct NDDS_Config_LoggerDevice *device, const
struct NDDS_Config_LogMessage *message)
```

Prototype of a **NDDS_Config_LoggerDevice** (p. 2122) write function.

Write a log message to the input device.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **DDS_DomainParticipant_get_current_time** (p. 137), from any of the logging device operations.

Parameters

device	<<***in***>> *(p. 1015)* Logging device.
message	<<***in***>> *(p. 1015)* Message to log.

5.212.3.2 NDDS_Config_LoggerDeviceCloseFnc

```
typedef void(* NDDS_Config_LoggerDeviceCloseFnc) (struct NDDS_Config_LoggerDevice *device)
```

Prototype of a **NDDS_Config_LoggerDevice** (p. 2122) close function.

Close the input device.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **DDS_DomainParticipant_get↩ _current_time** (p. 137), from any of the logging device operations.

Parameters

device	<<***in***>> *(p. 1015)* Logging device.

5.212.4 Enumeration Type Documentation

5.212.4.1 NDDS_Config_LogVerbosity

```
enum NDDS_Config_LogVerbosity
```

The verbosities at which RTI Connext diagnostic information is logged.

Enumerator

NDDS_CONFIG_LOG_VERBOSITY_SILENT	No further output will be logged.
NDDS_CONFIG_LOG_VERBOSITY_ERROR	Only error and fatal error messages will be logged. An error indicates something wrong in the functioning of RTI Connext. The most common cause of errors is incorrect configuration.
NDDS_CONFIG_LOG_VERBOSITY_WARNING	Both error and warning messages will be logged. A warning indicates that RTI Connext is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL	Errors, warnings, and verbose information about the lifecycles of local RTI Connext objects will be logged.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_↩ REMOTE	Errors, warnings, and verbose information about the lifecycles of remote RTI Connext objects will be logged.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL	Errors, warnings, verbose information about the lifecycles of local and remote RTI Connext objects, and periodic information about RTI Connext threads will be logged.

5.212.4.2 NDDS_Config_LogLevel

enum **NDDS_Config_LogLevel**

Level category assigned to RTI Connext log messages returned to an output device.

Enumerator

NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR	The message describes a fatal error. A fatal error indicates an unrecoverable situation in the functioning of RTI Connext. Error messages with this log level usually indicate a violation of an internal invariant or a segfault, and may include the function call stack where the fatal error happened.
NDDS_CONFIG_LOG_LEVEL_ERROR	The message describes an error. An error indicates a non-fatal problem in the functioning of RTI Connext. Errors are usually recoverable and will not stop application execution, although they may prevent some features from working properly. The most common cause of non-fatal errors is incorrect configuration and incorrect arguments.
NDDS_CONFIG_LOG_LEVEL_WARNING	The message describes a warning. A warning indicates that RTI Connext is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL	The message contains information about the lifecycles of local RTI Connext objects will be logged.
NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE	The message contains information about the lifecycles of remote RTI Connext objects will be logged.
NDDS_CONFIG_LOG_LEVEL_DEBUG	The message contains debug information that might be relevant to your application.

5.212.4.3 NDDS_Config_SyslogLevel

enum **NDDS_Config_SyslogLevel**

Syslog level category assigned to RTI Connext log messages. See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

Enumerator

NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY	System is unusable. Maps to **NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1446).
NDDS_CONFIG_SYSLOG_LEVEL_ALERT	Should be corrected immediately. Maps to **NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1446).

Enumerator

NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL	Critical conditions. Maps to **NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1446).
NDDS_CONFIG_SYSLOG_LEVEL_ERROR	Error conditions. Maps to **NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1446).
NDDS_CONFIG_SYSLOG_LEVEL_WARNING	May indicate that an error will occur if action is not taken. Maps to **NDDS_CONFIG_LOG_LEVEL_WARNING** (p. 1446).
NDDS_CONFIG_SYSLOG_LEVEL_NOTICE	Events that are unusual, but not error conditions. Maps to **NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL** (p. 1446).
NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL	Normal operational messages that require no action. Maps to **NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL** (p. 1446).
NDDS_CONFIG_SYSLOG_LEVEL_DEBUG	Information useful to developers for debugging the application. Maps to **NDDS_CONFIG_LOG_LEVEL_DEBUG** (p. 1446).

5.212.4.4 NDDS_Config_LogCategory

enum **NDDS_Config_LogCategory**

Categories of logged messages.

The **NDDS_Config_Logger_get_verbosity_by_category** (p. 1451) and **NDDS_Config_Logger_set_verbosity_by_category** (p. 1451) can be used to specify different verbosities for different categories of messages.

Enumerator

NDDS_CONFIG_LOG_CATEGORY_PLATFORM	Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connext is running are in this category.
NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION	Log messages pertaining to data serialization and deserialization and network traffic are in this category.
NDDS_CONFIG_LOG_CATEGORY_DATABASE	Log messages pertaining to the internal database in which RTI Connext objects are stored are in this category.
NDDS_CONFIG_LOG_CATEGORY_ENTITIES	Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)
NDDS_CONFIG_LOG_CATEGORY_API	Log messages pertaining to the API layer of RTI Connext (such as function argument validation) are in this category.

Enumerator

NDDS_CONFIG_LOG_CATEGORY_DISCOVERY	Log messages pertaining to discovery are in this category.
NDDS_CONFIG_LOG_CATEGORY_SECURITY	Log messages pertaining to security are in this category. These messages include any messages logged by RTI Connext components even if they are not related to the Security Plugins.
NDDS_CONFIG_LOG_CATEGORY_USER	Log messages that are generated by the user using the following log APIs: **NDDS_Config_Logger_emergency** (p. 1454), **NDDS_Config_Logger_alert** (p. 1454), **NDDS_Config_Logger_critical** (p. 1454), **NDDS_Config_Logger_error** (p. 1455), **NDDS_Config_Logger_warning** (p. 1455), **NDDS_Config_Logger_notice** (p. 1455), **NDDS_Config_Logger_informational** (p. 1455), **NDDS_Config_Logger_debug** (p. 1456).
NDDS_CONFIG_LOG_CATEGORY_ALL	Log messages pertaining to all categories in RTI Connext.

5.212.4.5 NDDS_Config_LogPrintFormat

enum **NDDS_Config_LogPrintFormat**

The format used to output RTI Connext diagnostic information.

Enumerator

NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT	(default) Print message, method name, log level, **Activity Context** (p. 1457) (what was happening when the event occurred), and logging category.
NDDS_CONFIG_LOG_PRINT_FORMAT_↩ TIMESTAMPED	Print message, method name, log level, **Activity Context** (p. 1457), logging category, and timestamp.
NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE	Print message with all available context information (includes thread identifier, message location).
NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE↩ _TIMESTAMPED	Print message with all available context information, and timestamp.
NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG	Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.
NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL	Print only message number and message location.
NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL	Print all available fields.

5.212.4.6 NDDS_Config_LogFacility

enum **NDDS_Config_LogFacility**

A number that identifies the source of a log message.

In the Syslog Protocol, the Facility is a numerical code that represents the machine process that created a Syslog event. RTI Connext uses the facility to represent the source of a given log message.

Enumerator

NDDS_CONFIG_LOG_FACILITY_USER	A log message produced by the APIs that log user messages in **NDDS_Config_Logger** (p. 2122) (e.g, **NDDS_Config_Logger_emergency** (p. 1454)). Numerical code: 1
NDDS_CONFIG_LOG_FACILITY_SECURITY_EVENT	A security-related message logged by the RTI Security Plugins Logging Plugin. Numerical code: 10
NDDS_CONFIG_LOG_FACILITY_SERVICE	A log message produced by an Infrastructure Service, such as Routing Service. Infrastructure Services operate using the Core Libraries. The messages that the Core Libraries create are categorized under the MIDDLEWARE facility. Log messages that are directly generated by the Infrastructure Service itself are marked with the SERVICE facility. Numerical code: 22
NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE	A log message produced by RTI Connext Core Libraries. Numerical code: 23

5.212.4.7 NDDS_Config_SyslogVerbosity

enum **NDDS_Config_SyslogVerbosity**

The Syslog verbosities at which RTI Connext diagnostic information is logged. These Syslog verbosities are mapped to **NDDS_Config_LogVerbosity** (p. 1445). See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

Enumerator

NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT	No messages will be logged. (lowest verbosity) Equivalent to **NDDS_CONFIG_LOG_VERBOSITY_SILENT** (p. 1445).
NDDS_CONFIG_SYSLOG_VERBOSITY_↩ EMERGENCY	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1445) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency messages.)

Enumerator

NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT	Emergency, critical, and alert messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1445) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency, critical and alert messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1445) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency and critical messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1445) when interpreted by RTI Connext.
NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING	Emergency, critical, alert, error, and warning messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 1445) when interpreted by RTI Connext.
NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE	Emergency, critical, alert, error, warning, notice and informational messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_↩ VERBOSITY_STATUS_REMOTE** (p. 1445) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency, critical, alert, error, warning and notice messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_↩ INFORMATIONAL	Emergency, critical, alert, error, warning, notice, and informational messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_↩ VERBOSITY_STATUS_REMOTE** (p. 1445) when interpreted by RTI Connext.
NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG	All messages will be logged. This Syslog verbosity level is translated to **NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL** (p. 1445) when interpreted by RTI Connext.

5.212.5 Function Documentation

5.212.5.1 NDDS_Config_Logger_get_instance()

```
NDDS_Config_Logger * NDDS_Config_Logger_get_instance (
            void  )
```

Get the singleton instance of this type.

5.212.5.2 NDDS_Config_Logger_get_instanceI()

```
NDDS_Config_Logger * NDDS_Config_Logger_get_instanceI (
            void  )
```

Get the singleton instance of this type.

5.212.5.3 NDDS_Config_Logger_get_verbosity()

```
NDDS_Config_LogVerbosity NDDS_Config_Logger_get_verbosity (
            const  NDDS_Config_Logger * self )
```

Get the verbosity at which RTI Connext is currently logging diagnostic information.

The default verbosity if **NDDS_Config_Logger_set_verbosity** (p. 1451) is never called is **NDDS_CONFIG_LOG_↩ VERBOSITY_ERROR** (p. 1445).

If **NDDS_Config_Logger_set_verbosity_by_category** (p. 1451) has been used to set different verbosities for different categories of messages, this function will return the maximum verbosity of all categories.

5.212.5.4 NDDS_Config_Logger_get_verbosity_by_category()

```
NDDS_Config_LogVerbosity NDDS_Config_Logger_get_verbosity_by_category (
            const  NDDS_Config_Logger * self,
             NDDS_Config_LogCategory category )
```

Get the verbosity at which RTI Connext is currently logging diagnostic information in the given category.

The default verbosity if **NDDS_Config_Logger_set_verbosity** (p. 1451) and **NDDS_Config_Logger_set_verbosity↩ _by_category** (p. 1451) are never called is **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1445).

5.212.5.5 NDDS_Config_Logger_set_verbosity()

```
void NDDS_Config_Logger_set_verbosity (
             NDDS_Config_Logger * self,
             NDDS_Config_LogVerbosity verbosity )
```

Set the verbosity at which RTI Connext will log diagnostic information.

Note: Logging at high verbosities will be detrimental to your application's performance. Your default setting should typically remain at **NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 1445) or below. (The default verbosity if you never set it is **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1445).)

5.212.5.6 NDDS_Config_Logger_set_verbosity_by_category()

```
void NDDS_Config_Logger_set_verbosity_by_category (
              NDDS_Config_Logger * self,
              NDDS_Config_LogCategory category,
              NDDS_Config_LogVerbosity verbosity )
```

Set the verbosity at which RTI Connext will log diagnostic information in the given category.

5.212.5.7 NDDS_Config_Logger_get_output_file()

```
FILE * NDDS_Config_Logger_get_output_file (
              NDDS_Config_Logger * self )
```

Get the file to which the logged output is redirected.

If no output file has been registered through **NDDS_Config_Logger_set_output_file** (p. 1452), this function will return NULL. In this case, logged output will on most platforms go to standard out as if through printf.

5.212.5.8 NDDS_Config_Logger_set_output_file()

```
DDS_Boolean NDDS_Config_Logger_set_output_file (
              NDDS_Config_Logger * self,
             FILE * out )
```

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

For better performance when log messages are generated frequently, the log messages are not flushed into a file immediately after they are generated. In other words, while writing a log message, RTI Connext only calls the function fwrite() (see https://pubs.opengroup.org/onlinepubs/009695399/functions/fwrite.html); it does not call the function fflush() (see https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html). If your application requires a different flushing behavior, you may use **NDDS_Config_Logger_set_output_device** (p. 1456) to configure a custom logging device.

5.212.5.9 NDDS_Config_Logger_set_output_file_name()

```
DDS_Boolean NDDS_Config_Logger_set_output_file_name (
              NDDS_Config_Logger * self,
             const char * file_name )
```

Set the name of the file to which the logged output is redirected.

The name may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

See **NDDS_Config_Logger_set_output_file** (p. 1452) for the flushing behavior.

5.212.5.10 NDDS_Config_Logger_set_output_file_set()

```
DDS_Boolean NDDS_Config_Logger_set_output_file_set (
             NDDS_Config_Logger * self,
            const char * file_preffix,
            const char * file_suffix,
            int max_capacity,
            int max_files )
```

Configure a set of files to redirect the logged output.

The logged output will be redirected to a set of files whose names are configured with a prefix and a suffix. The maximum number of bytes configures how many bytes to write into a file before opening the next file. After reaching the maximum number of files, the first one is overwritten.

For example, if the prefix is '**Foo** (p. 2116)', the suffix is '.txt', the max number of bytes is 1GB, and the max number of files is 3, the logger will create (at most) these files: Foo1.txt, Foo2.txt, and Foo3.txt. It will write to Foo1.txt, and after writing 1GB, it will move on to Foo2.txt, then to Foo3.txt, then to Foo1.txt again, and so on.

To stop logging to these files and redirect the output to the platform-specific location, pass NULL, NULL, 0, 0.

See **NDDS_Config_Logger_set_output_file** (p. 1452) for the flushing behavior.

5.212.5.11 NDDS_Config_Logger_get_print_format()

```
NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format (
            const  NDDS_Config_Logger * self )
```

Get the current message format for the log level **NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1446).

Use **NDDS_Config_Logger_get_print_format_by_log_level** (p. 1453) to retrieve the format for other log levels.

If **NDDS_Config_Logger_set_print_format** (p. 1453) is never called, the default format is **NDDS_CONFIG_LOG_↩ PRINT_FORMAT_DEFAULT** (p. 1448).

5.212.5.12 NDDS_Config_Logger_get_print_format_by_log_level()

```
NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format_by_log_level (
            const  NDDS_Config_Logger * self,
             NDDS_Config_LogLevel log_level )
```

Get the current message format, by log level, that RTI Connext is using to log diagnostic information.

If **NDDS_Config_Logger_set_print_format** (p. 1453) is never called, the default format is **NDDS_CONFIG_LOG_↩ PRINT_FORMAT_DEFAULT** (p. 1448).

5.212.5.13 NDDS_Config_Logger_set_print_format()

```
DDS_Boolean NDDS_Config_Logger_set_print_format (
             NDDS_Config_Logger * self,
             NDDS_Config_LogPrintFormat print_format )
```

Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **NDDS_↩ CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1446). When the **Activity Context** (p. 1457) is printed, the user can select the information that will be part of the **Activity Context** (p. 1457) by using the API **NDDS_Config_ActivityContext_↩ set_attribute_mask** (p. 1461).

Set print mask for all the log levels, except for (RTI_LOG_LEVEL_FATAL_ERROR).

5.212.5.14 NDDS_Config_Logger_set_print_format_by_log_level()

```
DDS_Boolean NDDS_Config_Logger_set_print_format_by_log_level (
             NDDS_Config_Logger * self,
             NDDS_Config_LogPrintFormat print_format,
             NDDS_Config_LogLevel log_level )
```

Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **NDDS_↩ CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1446). When the **Activity Context** (p. 1457) is printed, the user can select the information that will be part of the **Activity Context** (p. 1457) by using the API **NDDS_Config_ActivityContext_↩ set_attribute_mask** (p. 1461).

5.212.5.15 NDDS_Config_Logger_emergency()

```
void NDDS_Config_Logger_emergency (
             NDDS_Config_Logger * self,
            const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY** (p. 1446) and **NDDS_CONFIG_LOG_↩ CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.16 NDDS_Config_Logger_alert()

```
void NDDS_Config_Logger_alert (
             NDDS_Config_Logger * self,
            const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_ALERT** (p. 1446) and **NDDS_CONFIG_LOG_CATEGORY_↩ USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.17 NDDS_Config_Logger_critical()

```
void NDDS_Config_Logger_critical (
              NDDS_Config_Logger * self,
             const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL** (p. 1447) and **NDDS_CONFIG_LOG_↩ CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.18 NDDS_Config_Logger_error()

```
void NDDS_Config_Logger_error (
              NDDS_Config_Logger * self,
             const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_ERROR** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY↩ _USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.19 NDDS_Config_Logger_warning()

```
void NDDS_Config_Logger_warning (
              NDDS_Config_Logger * self,
             const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_WARNING** (p. 1447) and **NDDS_CONFIG_LOG_↩ CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.20 NDDS_Config_Logger_notice()

```
void NDDS_Config_Logger_notice (
              NDDS_Config_Logger * self,
             const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_NOTICE** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY↩ _USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.21 NDDS_Config_Logger_informational()

```
void NDDS_Config_Logger_informational (
             NDDS_Config_Logger * self,
            const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL** (p. 1447) and **NDDS_CONFIG_LOG_↩ CATEGORY_USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.22 NDDS_Config_Logger_debug()

```
void NDDS_Config_Logger_debug (
             NDDS_Config_Logger * self,
            const char * msg )
```

Logs message with **NDDS_CONFIG_SYSLOG_LEVEL_DEBUG** (p. 1447) and **NDDS_CONFIG_LOG_CATEGORY↩ _USER** (p. 1448). **Note: DDS_DomainParticipantFactory_finalize_instance** (p. 38) needs to be called to finalize the Logger singleton. .

5.212.5.23 NDDS_Config_Logger_get_output_device()

```
struct  NDDS_Config_LoggerDevice * NDDS_Config_Logger_get_output_device (
             NDDS_Config_Logger * self )
```

Return the user device registered with the logger.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

Registered user device or NULL if no user device is registered.

5.212.5.24 NDDS_Config_Logger_set_output_device()

```
DDS_Boolean NDDS_Config_Logger_set_output_device (
             NDDS_Config_Logger * self,
            struct  NDDS_Config_LoggerDevice * device )
```

Register a **NDDS_Config_LoggerDevice** (p. 2122).

Register the specified logging device with the logger.

There can be at most only one device registered with the logger at any given time.

When a device is installed, the logger will stop sending the log messages to the standard output and to the file set with **NDDS_Config_Logger_set_output_file** (p. 1452).

To remove an existing device, use this function with NULL as the device parameter. After a device is removed the logger will continue sending log messages to the standard output and to the output file.

To replace an existing device with a new device, use this function providing the new device as the device parameter.

When a device is unregistered (by setting it to NULL), **NDDS_Config_LoggerDevice** (p. 2122) calls the function **NDDS_Config_LoggerDevice::close** (p. 2123).

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
device	<<***in***>> *(p. 1015)* Logging device.

5.213 Activity Context

Add contextual information to log messages.

Macros

- #define **NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT** RTI_OSAPI_ACTIVITY_↩ CONTEXT_ATTRIBUTE_MASK_DEFAULT

  Provide the default attributes of the resource of the Activity Context.
- #define **NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE** RTI_OSAPI_ACTIVITY_↩ CONTEXT_ATTRIBUTE_MASK_NONE

  Not provide any attribute of the resource of the Activity Context.
- #define **NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL** RTI_OSAPI_ACTIVITY_↩ CONTEXT_ATTRIBUTE_MASK_ALL

  Provide all the possibles attributes of the resource of the Activity Context.

Typedefs

- typedef **DDS_Long NDDS_Config_ActivityContextAttributeKindMask**

  *The attributes **NDDS_Config_ActivityContextAttributeKind** (p. 1459) used in the string representation of the Activity Context can be configured through this mask.*

Enumerations

- enum **NDDS_Config_ActivityContextAttributeKind** {
  NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_GUID_PREFIX ,
  NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_TOPIC ,
  NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_TYPE ,
  NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_ENTITY_KIND ,
  NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_DOMAIN_ID ,
  NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_ENTITY_NAME }

  *The resources of the **Activity Context** (p. 1457) can have multiple associated attributes. Those attributes provide extra information about the entity such as GUID prefix, Topic, data type, entity kind, entity name and domain ID. They are used to indicate what attributes of the resources are included in the activity context.*

Functions

- void **NDDS_Config_ActivityContext_set_attribute_mask** (**NDDS_Config_ActivityContextAttributeKind↩ Mask** attribute_mask)

  *Set the **NDDS_Config_ActivityContextAttributeKindMask** (p. 1459) of the Activity Context.*

5.213.1 Detailed Description

Add contextual information to log messages.

The Activity Context is a group of resources and activities associated with an action such as the creation of an entity.

- A resource is a abstraction of an entity. It can contain attributes such as Topic or domain ID.
- An activity is a general task that the resource is doing, such as "Getting QoS".

Logging context is one of the formats RTI Connext logging infrastructure supports. It is used by default in **NDDS↩ _CONFIG_LOG_PRINT_FORMAT_DEFAULT** (p. 1448). It provides information about resources and activities. The activity context is used in two places:

- Logging: activity context is one of the **NDDS_Config_LogPrintFormat** (p. 1448) DDS logging infrastructure supports. If that format is set every time RTI Connext logs a message, it will contain the contextual information.
- Heap monitoring: every time memory is allocated and heap monitoring is enabled, the string representation of the activity context will be associated with the allocation. This information will be available when taking the snapshot.

For example, in the creation of a DataWriter, the activity context will provide information about:

- Resource: the Publisher creating the DataWriter. Attributes of the publisher will be GUID, kind, name and domain ID.
- Activity: entity creation. It will have two parameters, the entity kind and the Topic. In the example below, these are "Writer" and "TestTopic".

The string representation of the above activity context would be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000088{Entity=Pu,Name=TestPublisher,Domain=1}|CREATE Writer WITH TOPIC
       TestTopic]
```

Another example could be when a DataWriter writes a sample. The activity context will provide information about:

- Resource: the DataWriter writing the sample. The attributes of the DataWriter will be GUID, name, kind, Topic, data type, and the domain ID.
- Activity will be "write a sample".

The string representation of the activity context will be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
```

5.213.2 Macro Definition Documentation

5.213.2.1 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT  RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE↩
_MASK_DEFAULT
```

Provide the default attributes of the resource of the Activity Context.

5.213.2.2 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE  RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE_↩
MASK_NONE
```

Not provide any attribute of the resource of the Activity Context.

5.213.2.3 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL  RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE_↩
MASK_ALL
```

Provide all the possibles attributes of the resource of the Activity Context.

5.213.3 Typedef Documentation

5.213.3.1 NDDS_Config_ActivityContextAttributeKindMask

```
typedef DDS_Long NDDS_Config_ActivityContextAttributeKindMask
```

The attributes **NDDS_Config_ActivityContextAttributeKind** (p. 1459) used in the string representation of the Activity Context can be configured through this mask.

This mask indicates what attributes of the resource are used when RTI Connext logs a message or when the Heap Monitoring utility saves statistics for a memory allocation.

5.213.4 Enumeration Type Documentation

5.213.4.1 NDDS_Config_ActivityContextAttributeKind

```
enum NDDS_Config_ActivityContextAttributeKind
```

The resources of the **Activity Context** (p. 1457) can have multiple associated attributes. Those attributes provide extra information about the entity such as GUID prefix, Topic, data type, entity kind, entity name and domain ID. They are used to indicate what attributes of the resources are included in the activity context.

Enumerator

NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_GUID_PREFIX	Provide the entity GUID prefix to the resource of the Activity Context. For example:
	• For the following string representation of the context:
	`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite`
	• The GUID prefix is 0X101A76B,0X79E5D71,0X50EE914. If the bit **NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_GUID_PREFIX** (p. 1460) is not set, the string representation will not show the GUID prefix:
	`[:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo`

NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_TOPIC	Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic". For example: • For the following string representation of the context: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite` • The Topic is "test." If the bit **NDDS_CONFIG_↩ ACTIVITY_CONTEXT_ATTRIBUTE_TOPIC** (p. 1460) is not set, the string representation will not show the Topic: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite`
NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_TYPE	Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type". For example: • For the following string representation of the context: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite` • The data type is "Foo." If the bit **NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_TYPE** (p. 1460) is not set, the string representation will not show the data type: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite`

Enumerator

NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_ENTITY_KIND	Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity". For example: • For the following string representation of the context: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite` • The entity kind is "Writer." If the bit **NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_ENTITY_KIND** (p. 1461) is not set, the string representation will not show the entity kind: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite`
NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_DOMAIN_ID	Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain". For example: • For the following string representation of the context: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite` • The domain ID is "1." If the bit **NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_DOMAIN_ID** (p. 1461) is not set, the string representation will not show the domain ID: `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite`

NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_ENTITY_NAME	Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name". For example:
	• For the following string representation of the context:
	`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite`
	• The entity name is "testDataWriterName." If the bit **NDDS_CONFIG_ACTIVITY_CONTEXT_↩ ATTRIBUTE_ENTITY_NAME** (p. 1461) is not set, the string representation will not show the entity name:
	`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Entity=DW,Topic=te`

5.213.5 Function Documentation

5.213.5.1 NDDS_Config_ActivityContext_set_attribute_mask()

```
void NDDS_Config_ActivityContext_set_attribute_mask (
            NDDS_Config_ActivityContextAttributeKindMask attribute_mask )
```

Set the **NDDS_Config_ActivityContextAttributeKindMask** (p. 1459) of the Activity Context.

5.214 Compliance Configuration

APIs to configure compliance with certain standard specifications.

Macros

- #define **NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_VENDOR**
  XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.
- #define **NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_DEFAULT**
  Default XTypes compliance mask.
- #define **NDDS_CONFIG_RPC_COMPLIANCE_MASK_VENDOR**
  This mask configures compliance with the OMG DDS-RPC specification.
- #define **NDDS_CONFIG_RPC_COMPLIANCE_MASK_DEFAULT**
  Default RPC compliance mask.

Typedefs

- typedef **DDS_UnsignedLong NDDS_Config_XTypesComplianceMask**
  XTypes compliance mask.
- typedef **DDS_UnsignedLong NDDS_Config_RpcComplianceMask**
  Mask to configure compliance with the OMG DDS-RPC specification.

Enumerations

- enum **NDDS_Config_XTypesComplianceMaskBits** {
  NDDS_CONFIG_XTYPES_DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT ,
  NDDS_CONFIG_XTYPES_ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT ,
  NDDS_CONFIG_XTYPES_PARAMETER_LENGTH_WITH_PADDING_BIT ,
  NDDS_CONFIG_XTYPES_ENCAPSULATION_OPTIONS_WITH_PADDING_BIT ,
  NDDS_CONFIG_XTYPES_ACCEPT_UNKNOWN_ENUM_VALUE_BIT ,
  NDDS_CONFIG_XTYPES_ACCEPT_UNKNOWN_DISCRIMINATOR_BIT ,
  NDDS_CONFIG_XTYPES_SELECT_DEFAULT_DISCRIMINATOR_BIT ,
  NDDS_CONFIG_XTYPES_SENTINEL_IN_EMPTY_UNION_BIT ,
  NDDS_CONFIG_XTYPES_INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT ,
  NDDS_CONFIG_XTYPES_JAVA_KEYHASH_750_BIT ,
  NDDS_CONFIG_XTYPES_PYTHON_INT8_730_BIT ,
  NDDS_CONFIG_XTYPES_MUST_UNDERSTAND_IN_KEY_AND_DISCRIMINATOR_BIT }
  *The bits for the **NDDS_Config_XTypesComplianceMask** (p. 1464) with different aspects of the Extended CDR encoding (XCDR and XCDR2).*
- enum **NDDS_Config_RpcComplianceMaskBits** { **NDDS_CONFIG_RPC_USE_STANDARD_RELATED_SAMPLE_PID_BIT** }
  *The bits for the **NDDS_Config_RpcComplianceMask** (p. 1465) with different aspects of RPC and Request Reply.*

Functions

- **NDDS_Config_XTypesComplianceMask NDDS_Config_get_xtypes_compliance_mask** (void)
  Gets the XTypes compliance mask value for the application.
- void **NDDS_Config_set_xtypes_compliance_mask** (**NDDS_Config_XTypesComplianceMask** mask)
  Sets the level of compliance of the application with the XTypes specification.
- **DDS_Boolean NDDS_Config_load_compliance_masks** (void)
  Load the compliance masks from the environment variables.
- **NDDS_Config_RpcComplianceMask NDDS_Config_get_rpc_compliance_mask** (void)
  Gets the RPC compliance mask value for the application.
- void **NDDS_Config_set_rpc_compliance_mask** (**NDDS_Config_RpcComplianceMask** mask)
  Sets the level of compliance of the application with the DDS RPC specification.

5.214.1 Detailed Description

APIs to configure compliance with certain standard specifications.

5.214.2 Macro Definition Documentation

5.214.2.1 NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_VENDOR

```
#define NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_VENDOR
```

XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.

The mask sets the following bits:

- **NDDS_CONFIG_XTYPES_DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT** (p. 1467)
- **NDDS_CONFIG_XTYPES_ENCAPSULATION_OPTIONS_WITH_PADDING_BIT** (p. 1468)
- **NDDS_CONFIG_XTYPES_ACCEPT_UNKNOWN_DISCRIMINATOR_BIT** (p. 1469)
- **NDDS_CONFIG_XTYPES_SENTINEL_IN_EMPTY_UNION_BIT** (p. 1470)
- **NDDS_CONFIG_XTYPES_INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 1471)

The HEX value for the mask is: 0x000001a9.

Warning

This mask will always include all known fixes to ensure full alignment with the XTypes specification. As a result, its contents may change between releases or patches. If you want to ensure that your application's behavior remains unaffected by future changes, you should specify the exact bits you are interested in.

5.214.2.2 NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_DEFAULT

```
#define NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_DEFAULT
```

Default XTypes compliance mask.

The mask sets the following bits:

- **NDDS_CONFIG_XTYPES_PARAMETER_LENGTH_WITH_PADDING_BIT** (p. 1467)
- **NDDS_CONFIG_XTYPES_ENCAPSULATION_OPTIONS_WITH_PADDING_BIT** (p. 1468)
- **NDDS_CONFIG_XTYPES_SENTINEL_IN_EMPTY_UNION_BIT** (p. 1470)
- **NDDS_CONFIG_XTYPES_INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 1471)

The HEX value for the mask is: 0x0000018C.

5.214.2.3 NDDS_CONFIG_RPC_COMPLIANCE_MASK_VENDOR

```
#define NDDS_CONFIG_RPC_COMPLIANCE_MASK_VENDOR
```

This mask configures compliance with the OMG DDS-RPC specification.

The mask sets the following bits:

- **NDDS_CONFIG_RPC_USE_STANDARD_RELATED_SAMPLE_PID_BIT** (p. 1473)

The HEX value for the mask is: 0x00000001.

5.214.2.4 NDDS_CONFIG_RPC_COMPLIANCE_MASK_DEFAULT

```
#define NDDS_CONFIG_RPC_COMPLIANCE_MASK_DEFAULT
```

Default RPC compliance mask.

The mask does not sets any bits.

The HEX value for the mask is: 0x00000000.

5.214.3 Typedef Documentation

5.214.3.1 NDDS_Config_XTypesComplianceMask

```
typedef DDS_UnsignedLong NDDS_Config_XTypesComplianceMask
```

XTypes compliance mask.

The **NDDS_Config_XTypesComplianceMask** (p. 1464) configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Applications that don't use the exact same XTypes compliance mask may not be interoperable.

By default, data serialization is not fully compliant with Extended CDR encoding. While this doesn't affect correctness, it may prevent interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**
- Calling the function **NDDS_Config_set_xtypes_compliance_mask** (p. 1474)

The environment variable will be automatically loaded when a **DDS_DomainParticipantFactory** (p. 32) is created. If you need to load it before that, use the function **NDDS_Config_load_compliance_masks** (p. 1475).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is **NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463).

To be fully compliant with the XTypes specification, set the mask to **NDDS_CONFIG_XTYPES_COMPLIANCE_↩ MASK_VENDOR** (p. 1463).

[default] NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_DEFAULT (p. 1463)

When changing the mask for an application is not desired, the property dds.xtypes.compliance_mask will change the mask at the DomainParticipant or DataWriter level. When set in the DomainParticipant, it configures the mask for all DataWriters in the participant. See `Extensible Types Compliance Mask` in the RTI Connext Core Libraries Extensible Types Guide.

5.214.3.2 NDDS_Config_RpcComplianceMask

```
typedef DDS_UnsignedLong NDDS_Config_RpcComplianceMask
```

Mask to configure compliance with the OMG DDS-RPC specification.

The **NDDS_Config_RpcComplianceMask** (p. 1465) configures different aspects of RPC communication.

By default, the PID_RELATED_SAMPLE_IDENTITY used in RPC is not compliant with DDS RPC specification. This issue only affect interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS_RPC_COMPLIANCE_MASK**

- Calling the function **NDDS_Config_set_rpc_compliance_mask** (p. 1475)

The environment variable will be automatically loaded when a **DDS_DomainParticipantFactory** (p. 32) is created. If you need to load it before that, use the function **NDDS_Config_load_compliance_masks** (p. 1475).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is **NDDS_CONFIG_RPC_COMPLIANCE_MASK_DEFAULT** (p. 1464).

To be fully compliant with the DDS RPC specification, set the mask to **NDDS_CONFIG_RPC_COMPLIANCE_MASK↩ _VENDOR** (p. 1464).

[default] NDDS_CONFIG_RPC_COMPLIANCE_MASK_DEFAULT (p. 1464)

If changing the the mask in an application is not desired, the property dds.rpc.compliance_mask will change the mask at Participant or DataWriter level. When set in the Participant it configures the mask for all DataWriters in the Participant. See Using RPC compliance mask in the RTI Connext Core Libraries Users Manual.

5.214.4 Enumeration Type Documentation

5.214.4.1 NDDS_Config_XTypesComplianceMaskBits

`enum` **`NDDS_Config_XTypesComplianceMaskBits`**

The bits for the **NDDS_Config_XTypesComplianceMask** (p. 1464) with different aspects of the Extended CDR encoding (XCDR and XCDR2).

See also

NDDS_Config_XTypesComplianceMask (p. 1464)

Enumerator

NDDS_CONFIG_XTYPES_DHEADER_IN_NON_↩ PRIMITIVE_COLLECTIONS_BIT	When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER. Value: 0x00000001 To be compatible with the XTypes specification, this bit must be set. This bit only applies to XCDR2 encoding. Limitation: For FlatData, the compliant encoding is applied to arrays and sequences of mutable types, but not final types . The serialization of final types containing arrays of non-primitive types in the FlatData language binding is not compliant with Extended CDR encoding version 2 in any case. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)
NDDS_CONFIG_XTYPES_ENUM_AS_PRIMITIVE_↩ IN_COLLECTIONS_BIT	When this bit is set, enums are considered primitive types in collection types. Value: 0x00000002 A DHEADER will not be added to collections of enums if **NDDS_CONFIG_XTYPES_DHEADER_IN_NON_↩ PRIMITIVE_COLLECTIONS_BIT** (p. 1467) is set. To be compatible with the XTypes specification, this bit must be unset. This bit only applies to XCDR2 encoding. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)
NDDS_CONFIG_XTYPES_PARAMETER_LENGTH↩ _WITH_PADDING_BIT	When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary. Value: 0x00000004 To be compatible with the XTypes specification, this bit must be unset. This bit only applies to XCDR encoding. This bit is set by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

Enumerator

NDDS_CONFIG_XTYPES_ENCAPSULATION_↩ OPTIONS_WITH_PADDING_BIT	When this bit is set, RTI Connext will set the padding bits in the options field of the encapsulation header of a serialized payload. Value: 0x00000008 When this bit is set RTI Connext will set the least significant two bits in the second byte of the options field to a value that encodes the number of padding bytes needed after the end of the serialized payload in order to reach the next 4-byte aligned offset. Specifically, the least significant two bits shall be set to binary 00 if no padding bits would be needed and binary 01, 10, or 11 if, respectively, there would be one, two, or three bytes of padding needed. These bits in the options field will be interpreted by a DataReader to determine where the serialized data exactly ended. To be compatible with the XTypes specification, this bit must be set. To be compatible with the following Micro versions this bit must be unset because those versions of Micro did not support padding bits and will discard any data with encapsulations options not set to 0. • RTI Connext Micro 3.x.y.z • RTI Connext Micro 2.4.15.1 • RTI Connext Micro 2.4.14.0 and 2.4.14.1 • RTI Connext Micro 2.4.13.1 through 2.4.13.5 • RTI Connext Micro 2.4.12.z This bit applies to both, XCDR and XCDR2 encodings. This bit is set by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)
NDDS_CONFIG_XTYPES_ACCEPT_UNKNOWN_↩ ENUM_VALUE_BIT	When this bit is set, samples containing an unknown enumerator can be successfully deserialized to the default enumeration value. Value: 0x00000010 To be compatible with the XTypes specification, this bit must be unset. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

Enumerator

NDDS_CONFIG_XTYPES_ACCEPT_UNKNOWN_↩ DISCRIMINATOR_BIT	When this bit is set, samples containing an unknown discriminator can be successfully deserialized, and the sample won't be dropped. Value: 0x00000020 When this bit is set, samples containing an unknown discriminator won't be dropped, and the discriminator value assigned to the sample will depend on whether or not the bit **NDDS_CONFIG_XTYPES_SELECT_↩ DEFAULT_DISCRIMINATOR_BIT** (p. 1469) is set. To be compatible with the XTypes specification, this bit must be set. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)
NDDS_CONFIG_XTYPES_SELECT_DEFAULT_↩ DISCRIMINATOR_BIT	When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value; if the bit is not set, the sample will preserve the discriminator value. Value: 0x00000040 When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value. If the default value selects a valid union member, that member will be initialized to the default value of its type. If the bit is not set, the sample will preserve the discriminator value. The bit **NDDS_CONFIG_XTYPES_INITIALIZE↩ _DISCRIMINATOR_TO_DEFAULT_BIT** (p. 1471) determines what the default discriminator value is. This bit is only relevant when the bit **NDDS_CONFIG_XTYPES_ACCEPT_UNKNOWN_↩ DISCRIMINATOR_BIT** (p. 1469) is set, and it is used to determine the value of the discriminator when the sample contains an unknown discriminator. To be compatible with the XTypes specification, this bit must be unset. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

Enumerator

NDDS_CONFIG_XTYPES_SENTINEL_IN_EMPTY_↩ UNION_BIT	When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value. Value: 0x00000080 When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value: 0x027f0000. This is the same sentinel value as the one used for samples of a mutable union that contain a known discriminator. This bit only applies to XCDR encoding, Dynamic Data, and language APIs other than Java. When using Java and not using Dynamic Data, the sentinel is always added. To be compatible with the XTypes specification and with Connext version 5.3.x, this bit must be set. This bit is set by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

Enumerator

NDDS_CONFIG_XTYPES_INITIALIZE_↩ DISCRIMINATOR_TO_DEFAULT_BIT	When this bit is set, the union discriminator will be initialized to the default value of its type. Value: 0x00000100 When this bit is set, the union discriminator will be initialized to the default value of its type. This means 0 for numeric discriminators, false for boolean discriminators, and the first literal of the enumeration for enumerated discriminators. As a result, a union may be initialized with a discriminator value that does not correspond to any of its members. The default value of the type can be modified by creating an alias type and using the **[default]** annotation to specify the desired default value. You can then use that alias type as the discriminator type, and the default discriminator value will be the one specified in the alias type. When this bit is unset, the discriminator will be set to select to a value that selects the default union member, if one is defined, or otherwise to the lowest value associated with any member. If you generated code (using Code Generator) with this bit configured one way using the -xTypesComplianceMask flag (for example, -xTypesComplianceMask 0x00000100) and then configure it the opposite way in the API (for example, unset at 0x00000000), you must regenerate code using Code Generator's -xTypesComplianceMask flag configured the same way as it is in the API (for example, -xTypesComplianceMask 0x00000000). Note that this bit is the only bit that Code Generator uses; therefore, you have to set it the same both in the API and in Code Generator. See information about Code Generator's -xTypesComplianceMask command-line option in `Command-Line Arguments for rtiddsgen`, in the RTI Code Generator User's Manual. This bit affects **NDDS_CONFIG_XTYPES_SELECT_↩ DEFAULT_DISCRIMINATOR_BIT** (p. 1469). (See that bit's description above.) To be compatible with the XTypes specification, this bit must be set. This bit is set by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

Enumerator

NDDS_CONFIG_XTYPES_JAVA_KEYHASH_750_BIT	When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions. Value: 0x00000200 When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions. This affects KeyHash calculation only when using XCDR encoding and the Java language API for mutable types and either of the following conditions is met: • The key is not a primitive type, and the maximum serialized size of a sample for the type exceeds 65KB. • At least one key member has a member ID greater than 16128. To be compatible with the XTypes specification, this bit must be unset. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)
NDDS_CONFIG_XTYPES_PYTHON_INT8_730_BIT	Set this bit to interoperate with Connext 7.3.0 Python applications that published or subscribed to types with int8 members. Value: 0x00000400 When this bit is set, the TypeCode generation for a Python type that contains an int8 member will match the one produced by the Python API in Connext 7.3.0. However, this behavior is not compliant with the XTypes specification, and Python types with int8 members won't interoperate with other APIs. When this bit is unset, the TypeCode generation for a Python type that contains an int8 member will be done according to the XTypes specification, allowing interoperability with all the APIs except Python in Connext 7.3.0. To be compatible with the XTypes specification, this bit must be unset. This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

Enumerator

NDDS_CONFIG_XTYPES_MUST_UNDERSTAND_↩ IN_KEY_AND_DISCRIMINATOR_BIT	When this bit is set, the parameter ID for members that are part of the key, or for the discriminator of a union, will have the parameter ID's FLAG_MUST_UNDERSTAND bit set when serialized using XCDR2. Value: 0x00000800 To be compatible with the XTypes specification, this bit must be set. This bit only applies when you are using XCDR2. (For XCDR, the parameter ID's FLAG_MUST_UNDERSTAND bit will never be set for key members and union discriminators, because doing so would change the key hash computation and disrupt communication with older versions of RTI Connext.) This bit is unset by default. See **NDDS_CONFIG_↩ XTYPES_COMPLIANCE_MASK_DEFAULT** (p. 1463)

5.214.4.2 NDDS_Config_RpcComplianceMaskBits

enum **NDDS_Config_RpcComplianceMaskBits**

The bits for the **NDDS_Config_RpcComplianceMask** (p. 1465) with different aspects of RPC and Request Reply.

Enumerator

NDDS_CONFIG_RPC_USE_STANDARD_RELATED↩ _SAMPLE_PID_BIT	This bit configures a standard value for PID_RELATED_SAMPLE_IDENTITY. Value: 0x00000001 Set this bit to be compliant with the OMG DDS-RPC specification. The PID_RELATED_SAMPLE_IDENTITY will be 0x0083 as is defined as is defined in the RPC over DDS OMG specification. See https://www.omg.org/spec/DDS-RPC Using **NDDS_CONFIG_RPC_USE_STANDARD_↩ RELATED_SAMPLE_PID_BIT** (p. 1473) will affect both RPC and Request-Reply communtications. The PID_RELATED_SAMPLE_IDENTITY is a parameter identifier (PID) used by the RTPS wire protocol and required for Request-Reply and RPC communications. By default, this PID takes a non-standard value that is compatible with previous versions of Connext. This bit is unset by default. See **NDDS_CONFIG_↩ RPC_COMPLIANCE_MASK_DEFAULT** (p. 1464)

5.214.5 Function Documentation

5.214.5.1 NDDS_Config_get_xtypes_compliance_mask()

```
NDDS_Config_XTypesComplianceMask NDDS_Config_get_xtypes_compliance_mask (
            void  )
```

Gets the XTypes compliance mask value for the application.

The **NDDS_Config_XTypesComplianceMask** (p. 1464) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Returns

The **NDDS_Config_XTypesComplianceMask** (p. 1464) value.

See also

NDDS_Config_XTypesComplianceMask (p. 1464)

NDDS_Config_get_xtypes_compliance_mask (p. 1474)

NDDS_Config_load_compliance_masks (p. 1475)

5.214.5.2 NDDS_Config_set_xtypes_compliance_mask()

```
void NDDS_Config_set_xtypes_compliance_mask (
             NDDS_Config_XTypesComplianceMask mask )
```

Sets the level of compliance of the application with the XTypes specification.

The **NDDS_Config_XTypesComplianceMask** (p. 1464) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Once you call this function the value of the mask will apply to all the entities created after the call. It won't apply to entities created before the call.

In general, applications should only set the mask once, before executing any other RTI Connext API. The mask can also be set using the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**.

Parameters

mask	<<***in***>> *(p. 1015)* Compliance mask.

See also

NDDS_Config_XTypesComplianceMask (p. 1464)

NDDS_Config_get_xtypes_compliance_mask (p. 1474)

NDDS_Config_load_compliance_masks (p. 1475)

5.214.5.3 NDDS_Config_load_compliance_masks()

```
DDS_Boolean NDDS_Config_load_compliance_masks (
            void  )
```

Load the compliance masks from the environment variables.

This function loads the XTypes and RPC compliance masks from the environment, which can be set using the environment variables **NDDS_XTYPES_COMPLIANCE_MASK** and **NDDS_RPC_COMPLIANCE_MASK**.

5.214.5.4 NDDS_Config_get_rpc_compliance_mask()

```
NDDS_Config_RpcComplianceMask NDDS_Config_get_rpc_compliance_mask (
            void  )
```

Gets the RPC compliance mask value for the application.

The **NDDS_Config_RpcComplianceMask** (p. 1465) configures different aspects of RPC communication.

Returns

The **NDDS_Config_RpcComplianceMask** (p. 1465) value.

See also

NDDS_Config_RpcComplianceMask (p. 1465)

NDDS_Config_get_rpc_compliance_mask (p. 1475)

NDDS_Config_load_compliance_masks (p. 1475)

5.214.5.5 NDDS_Config_set_rpc_compliance_mask()

```
void NDDS_Config_set_rpc_compliance_mask (
                NDDS_Config_RpcComplianceMask mask )
```

Sets the level of compliance of the application with the DDS RPC specification.

The **NDDS_Config_RpcComplianceMask** (p. 1465) configures different aspects of RPC communication.

Once you call this function the value of the mask will apply to all the entities created after the call. It won't apply to entities created before the call.

In general, applications should only set the mask once, before executing any other RTI Connext API. The mask can also be set using the environment variable **NDDS_RPC_COMPLIANCE_MASK**.

Parameters

mask	<<***in***>> *(*p. *1015)* Compliance mask.

5.215 Heap Monitoring

Monitor memory allocations done by the middleware on the native heap.

Data Structures

- struct **NDDS_Utility_HeapMonitoringParams_t**

  Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

Macros

- #define **NDDS_Utility_HeapMonitoringParams_INITIALIZER**

  *Static initializer for **NDDS_Utility_HeapMonitoringParams_t** (*p. *2171).*

Typedefs

- typedef struct **NDDS_Utility_HeapMonitoringParams_t** **NDDS_Utility_HeapMonitoringParams_t**

  Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

Enumerations

- enum **NDDS_Utility_HeapMonitoringSnapshotOutputFormat** {
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_STANDARD ,
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_COMPRESSED }

  Specify the format of the output of the snapshot. RTI Connext.
- enum **NDDS_Utility_HeapMonitoringSnapshotContentFormat** {
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_TOPIC ,
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_FUNCTION ,
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_ACTIVITY ,
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_DEFAULT ,
  NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_MINIMAL }

  Bitmap used to decide which information of the snapshot will be displayed.

Functions

- **DDS_Boolean NDDS_Utility_enable_heap_monitoring** (void)

  Starts monitoring the heap memory used by RTI Connext.
- **DDS_Boolean NDDS_Utility_enable_heap_monitoring_w_params** (const **NDDS_Utility_Heap↩ MonitoringParams_t** ∗params)

  Starts monitoring the heap memory used by RTI Connext.
- void **NDDS_Utility_disable_heap_monitoring** (void)

  Stops monitoring the heap memory used by RTI Connext.
- **DDS_Boolean NDDS_Utility_pause_heap_monitoring** (void)

  Pauses heap monitoring.
- **DDS_Boolean NDDS_Utility_resume_heap_monitoring** (void)

  Resumes heap monitoring.
- **DDS_Boolean NDDS_Utility_take_heap_snapshot** (const char ∗filename, **DDS_Boolean** print_details)

  Saves the current heap memory usage in a file.

5.215.1 Detailed Description

Monitor memory allocations done by the middleware on the native heap.

RTI Connext allows you to monitor the memory allocations done by the middleware on the native heap. This feature can be used to analyze and debug unexpected memory growth.

After NDDS_Utility_enable_heap_monitoring is called, you may invoke **NDDS_Utility_take_heap_snapshot** (p. 1481) to save the current heap memory usage to a file. By comparing two snapshots, you can tell if new memory has been allocated and, in many cases, where.

5.215.2 Macro Definition Documentation

5.215.2.1 NDDS_Utility_HeapMonitoringParams_INITIALIZER

```
#define NDDS_Utility_HeapMonitoringParams_INITIALIZER
```

Static initializer for **NDDS_Utility_HeapMonitoringParams_t** (p. 2171).

Use this initializer to ensure that new objects do not have uninitialized contents.
```
struct NDDS_Utility_HeapMonitoringParams_t param = NDDS_Utility_HeapMonitoringParams_INITIALIZER;
```

See also

NDDS_Utility_HeapMonitoringParams_t (p. 2171)

5.215.3 Typedef Documentation

5.215.3.1 NDDS_Utility_HeapMonitoringParams_t

```
typedef struct NDDS_Utility_HeapMonitoringParams_t NDDS_Utility_HeapMonitoringParams_t
```

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

5.215.4 Enumeration Type Documentation

5.215.4.1 NDDS_Utility_HeapMonitoringSnapshotOutputFormat

```
enum NDDS_Utility_HeapMonitoringSnapshotOutputFormat
```

Specify the format of the output of the snapshot. RTI Connext.

Enumerator

NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _OUTPUT_FORMAT_STANDARD	The output of the snapshot will be in plain text.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _OUTPUT_FORMAT_COMPRESSED	The output of the snapshot will be compressed using Zlib techonology. The file can be uncompressed using zlib-flate.

5.215.4.2 NDDS_Utility_HeapMonitoringSnapshotContentFormat

enum **NDDS_Utility_HeapMonitoringSnapshotContentFormat**

Bitmap used to decide which information of the snapshot will be displayed.

Enumerator

NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_BIT_TOPIC	Add the topic to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_BIT_FUNCTION	Add the function name to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_BIT_ACTIVITY	Add the activity context to the snapshot of heap monitoring. The user can select the information that will be part of the activity context by using the API **NDDS_Config_ActivityContext_set_attribute_mask** (p. 1461).
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_DEFAULT	Add all the optional attributes to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_MINIMAL	Not add any optional attribute to the snapshot of heap monitoring.

5.215.5 Function Documentation

5.215.5.1 NDDS_Utility_enable_heap_monitoring()

```
DDS_Boolean NDDS_Utility_enable_heap_monitoring (
            void  )
```

Starts monitoring the heap memory used by RTI Connext.

This function must be called before any other function in the RTI Connext library is called.

Once heap monitoring is enabled, you can take heap snapshots by using **NDDS_Utility_take_heap_snapshot** (p. 1481).

Use this function only for debugging purposes, since it may introduce a significant performance impact.

MT Safety:

UNSAFE. It is not safe to call this function while another thread may be simultaneously calling another heap-related function, including this one.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_disable_heap_monitoring (p. 1480)

5.215.5.2 NDDS_Utility_enable_heap_monitoring_w_params()

```
DDS_Boolean NDDS_Utility_enable_heap_monitoring_w_params (
            const  NDDS_Utility_HeapMonitoringParams_t * params )
```

Starts monitoring the heap memory used by RTI Connext.

Perfoms the same function as NDDS_Utility_enable_heap_monitoring except that it also provides the values in params. Those values will set the format used in the snapshot **NDDS_Utility_take_heap_snapshot** (p. 1481).

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_disable_heap_monitoring (p. 1480)

5.215.5.3 NDDS_Utility_disable_heap_monitoring()

```
void NDDS_Utility_disable_heap_monitoring (
            void  )
```

Stops monitoring the heap memory used by RTI Connext.

This function must be the last function called from RTI Connext.

See also

NDDS_Utility_enable_heap_monitoring (p. 1479)

5.215.5.4 NDDS_Utility_pause_heap_monitoring()

```
DDS_Boolean NDDS_Utility_pause_heap_monitoring (
            void  )
```

Pauses heap monitoring.

New memory allocations will not be monitored and they will not appear in the snapshot generated by **NDDS_Utility_↩ take_heap_snapshot** (p. 1481).

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_resume_heap_monitoring (p. 1480)

5.215.5.5 NDDS_Utility_resume_heap_monitoring()

```
DDS_Boolean NDDS_Utility_resume_heap_monitoring (
            void  )
```

Resumes heap monitoring.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_pause_heap_monitoring (p. 1480)

5.215.5.6 NDDS_Utility_take_heap_snapshot()

```
DDS_Boolean NDDS_Utility_take_heap_snapshot (
            const char * filename,
             DDS_Boolean print_details )
```

Saves the current heap memory usage in a file.

After NDDS_Utility_enable_heap_monitoring is called, you may invoke this function periodically to save the current heap memory usage to a file.

By comparing two snapshots, you can tell if new memory has been allocated and in many cases where. This is why this operation can be used to debug unexpected memory growth.

The format of a snapshot is as follows:

First, there is a memory usage summary like this:

```
<P>
                    Product Version: NDDSCORE_BUILD_6.0.0.0_20200316T123411Z_RTI_ENG

                    Process virtual memory: 2552352768

                    Process physical memory: 16187392

                    Current application heap usage: 10532131

                    Approximate total heap usage: 203331110

                    High watermark: 10532131

                    Alloc count: 17634

                    Free count: 3518
```

- Process virtual memory: The amount of virtual memory in bytes taken by the process. This memory includes RTI Connext and non-RTI Connext memory.
- Process virtual memory: The amount of physical memory in bytes taken by the process.

- Current application heap usage: The amount of heap memory in bytes used by the middleware. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connext memory, not memory living in the managed heap. This value does not include overhead memory allocations that are used by the Heap Monitoring utility. It therefore provides the heap usage that is used when Heap Monitoring is disabled and does not reflect the actual amount of memory that has been allocated by the middleware. That value is accounted for in 'Approximate total heap usage'.
- Approximate total heap usage: The amount of heap memory in bytes used by the middleware, including overhead allocations from the Heap Monitoring utility. When the Heap Monitoring utility is enabled, every allocation has an additional overhead number of bytes allocated so that the middleware can keep track of the meta-data that is output in the heap snapshots. This overhead is not accounted for in the 'Current application heap usage' summary field, but is included in this field. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connext memory, not memory living in the managed heap.
- High watermark: The maximum amount of heap usage by RTI Connext since NDDS_Utility_enable_heap_↩ monitoring was invoked.
- Alloc count: The number of invocations to malloc, realloc, or calloc operations done by RTI Connext.
- Free count: The number of invocations to the free operation done by RTI Connext.

After the previous summary, and only if you set the parameter print_details to **DDS_BOOLEAN_TRUE** (p. 1203), the function will print the details of every single outstanding heap allocation done by RTI Connext. For example:

```
<P>
                block_id, timestamp, block_size, alloc_method_name, type_name, pool_alloc, pool_buffer_size,
    pool_buffer_count, topic_name, function_name, activity_context

                23087, 1586943520, 16, RTIOsapiHeap_allocateArray, struct RTIEncapsulationInfo, MALLOC, 0,
    0, PRESServiceRequest, PRESWriterHistoryDriver_new,
    "0X101175A,0X76DD63D7,0X984377BC:0X1C1{Name=ShapeTypeParticipant,Domain=110}|CREATE
    Participant|ENABLE|:0X80000088{Entity=Pu,Domain=110}|CREATE Writer WITH TOPIC PRESServiceRequest"
```

- block_id: Block ID of the allocation. This number increases with every allocation.
- timestamp: Timestamp in UTC seconds corresponding to the time where the allocation was done.
- block_size: The number of bytes allocated.
- alloc_method_name: The allocation RTI Connext method name.
- type_name: The allocation typename.
- pool_alloc: Indicates if the heap allocation is a RTI Connext pool allocation (POOL) or a regular allocation (MALLOC).
- pool_buffer_size: For pool allocations, this number indicates the size of the elements in the pool in number of bytes. block_size is equal to (pool_buffer_size ∗ pool_buffer_count).
- pool_buffer_count: For pool allocations, this number indicates the number of buffers allocated for the pool. block↩ _size is equal to (pool_buffer_size ∗ pool_buffer_count).
- topic_name: The topic name associated with the allocation or 'n/a' if it is not available.
- function_name: function name associated with the allocation or 'n/a' if it is not available.
- activity_context: **Activity Context** (p. 1457)

Parameters

filename	*<<**in**>> (p. 1015).* Name of file in which to store the snapshot.
print_details	*<<**in**>> (p. 1015).* Indicates if the snapshot will contain only the memory usage summary or the details of the individual allocations.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

5.216 Network Capture

Save network traffic into a capture file for further analysis.

Data Structures

- struct **NDDS_Utility_NetworkCaptureParams_t**

  Input parameters for starting network capture.

Macros

- #define **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT**

  *Default mask for **NDDS_Utility_NetworkCaptureContentKind** (p. 1488): do not remove any content.*
- #define **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE**

  The RTPS frames in the capture file will be saved as they are.
- #define **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL**

  The RTPS frames in the capture file will not include user data (either plain or encrypted).
- #define **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT**

  *Default mask for **NDDS_Utility_NetworkCaptureTrafficKindMask** (p. 1487).*
- #define **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE**

  Do not capture any traffic.
- #define **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL**

  Capture all traffic (both inbound and outbound).

Typedefs

- typedef **DDS_Long** **NDDS_Utility_NetworkCaptureContentKindMask**

  Mask that indicates a combination of content types.
- typedef **DDS_Long** **NDDS_Utility_NetworkCaptureTrafficKindMask**

  Mask that indicates the traffic direction to capture.
- typedef struct **NDDS_Utility_NetworkCaptureParams_t** **NDDS_Utility_NetworkCaptureParams_t**

  Input parameters for starting network capture.

Enumerations

- enum **NDDS_Utility_NetworkCaptureContentKind** {
  NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_SERIALIZED_DATA ,
  NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_DATA }

  Bitmap used to specify a content type, i.e., a part of the RTPS frame.
- enum **NDDS_Utility_NetworkCaptureTrafficKind** {
  NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_OUT ,
  NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN }

  Bitmap used to specify whether we want to capture inbound or outbound traffic.

Functions

- **DDS_Boolean NDDS_Utility_enable_network_capture** (void)

  Enable Network Capture.
- **DDS_Boolean NDDS_Utility_disable_network_capture** (void)

  Disable Network Capture.
- **DDS_Boolean NDDS_Utility_set_default_network_capture_params** (const **NDDS_Utility_Network↩ CaptureParams_t** ∗params)

  Set the default Network Capture parameters.
- **DDS_Boolean NDDS_Utility_start_network_capture** (const char ∗filename)

  Start capturing traffic for all DomainParticipants, with the default parameters.
- **DDS_Boolean NDDS_Utility_start_network_capture_for_participant** (**DDS_DomainParticipant** ∗participant, const char ∗filename)

  Start capturing traffic for a DomainParticipant, with the default parameters.
- **DDS_Boolean NDDS_Utility_start_network_capture_w_params** (const char ∗filename, const **NDDS_↩ Utility_NetworkCaptureParams_t** ∗params)

  Start capturing traffic for all DomainParticipants, with the provided parameters.
- **DDS_Boolean NDDS_Utility_start_network_capture_w_params_for_participant** (**DDS_Domain↩ Participant** ∗participant, const char ∗filename, const **NDDS_Utility_NetworkCaptureParams_t** ∗params)

  Start capturing traffic for a DomainParticipant, with the provided parameters.
- **DDS_Boolean NDDS_Utility_stop_network_capture** (void)

  Stop capturing traffic for all participants.
- **DDS_Boolean NDDS_Utility_stop_network_capture_for_participant** (**DDS_DomainParticipant** ∗participant)

  Stop capturing traffic for a DomainParticipant.
- **DDS_Boolean NDDS_Utility_pause_network_capture** (void)

  Pause capturing traffic for all DomainParticipants.
- **DDS_Boolean NDDS_Utility_pause_network_capture_for_participant** (**DDS_DomainParticipant** ∗participant)

  Pause capturing traffic for a DomainParticipant.
- **DDS_Boolean NDDS_Utility_resume_network_capture** (void)

  Resume capturing traffic for all DomainParticipants.
- **DDS_Boolean NDDS_Utility_resume_network_capture_for_participant** (**DDS_DomainParticipant** ∗participant)

  Resume capturing traffic for a DomainParticipant.

Variables

- const **NDDS_Utility_NetworkCaptureParams_t NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_↩ DEFAULT**

  Default parameters used in Network Capture.

5.216.1 Detailed Description

Save network traffic into a capture file for further analysis.

RTI Connext allows you to capture the network traffic that one or more DomainParticipants send or receive. This feature can be used to analyze and debug communication problems between your DDS applications. When network capture is enabled, each DomainParticipant will generate a pcap-based file that can then be opened by a packet analyzer like Wireshark, provided the right dissectors are installed.

To some extent, network capture can be used as an alternative to existing pcap-based network capture software (such as Wireshark). This will be the case when you are only interested in analyzing the traffic a DomainParticipant sends/receives. In this scenario, network capture will actually have some advantages over using more general pcap-based network capture applications: RTI's network capture includes additional information such as security-related data; it also removes information that is not needed, such as user data, when you want to reduce the capture size. That said, RTI's network capture is not a replacement for other pcap-based network capture applications: it only captures the traffic exchanged by the DomainParticipants, but it does not capture any other traffic exchanged through the system network interfaces.

To capture network traffic NDDS_Utility_enable_network_capture must be invoked before creating any Domain↩ Participant. Similarly, NDDS_Utility_disable_network_capture must be called after deleting all participants. In between these calls, you may start, stop, pause or resume capturing traffic for one or all participants.

5.216.2 Capturing

Shared Memory Traffic

Every RTPS frame in network capture has a source and a destination associated with it. In the case of shared memory traffic, a process identifier and a port determine the source and destination endpoints.

Access to the process identifier (PID) of the source for inbound traffic requires changes in the shared memory segments. These changes would break shared memory compatibility with previous versions of RTI Connext. For this reason, by default, network capture will not populate the value of the source PID for inbound shared memory traffic.

If interoperability with previous versions of RTI Connext is not necessary, you can generate capture files containing the source PID for inbound traffic. To do so, configure the value of the *'dds.transport.minimum_compatibility_version'* property to 6.1.0. (See **DDS_PropertyQosPolicy** (p. 1905)).

```
<domain_participant_qos>
    <property>
        <value>
            <element>
                <name>dds.transport.minimum_compatibility_version</name>
                <value>6.1.0</value>
                <propagate>false</propagate>
            </element>
        </value>
    </property>
</domain_participant_qos>
```

This property is never propagated, so it must be consistently configured throughout the whole system.

Note: Changing the value of this property affects the type of shared memory segments that RTI Connext uses. For that reason, you may see the following warning, resulting from leftover shared memory segments:

```
[0xC733A001,0xB248F671,0xAEC4A0C1:0x000001C1{Domain=200}|CREATE DP|ENABLE]
       NDDS_Transport_Shmem_is_segment_compatible:incompatible shared memory protocol detected.

Current version 4.0 not compatible with 2.0.
```

The leftover shared memory segments can be removed using the `ipcrm` command. See `https://community.rti.com/kb/what-are-possible-solutions-common-shared-memory-issues` for more information.

5.216.3 Macro Definition Documentation

5.216.3.1 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT
```

Default mask for **NDDS_Utility_NetworkCaptureContentKind** (p. 1488): do not remove any content.

It is equivalent to **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE** (p. 1486).

[default] Do not remove any content.

5.216.3.2 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE
```

The RTPS frames in the capture file will be saved as they are.

5.216.3.3 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL
```

The RTPS frames in the capture file will not include user data (either plain or encrypted).

Its value is the result of setting the bits for removing user data and removing encrypted data: (**NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_SERIALIZED_DATA** (p. 1488)) | **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_DATA** (p. 1488))

5.216.3.4 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT
```

Default mask for **NDDS_Utility_NetworkCaptureTrafficKindMask** (p. 1487).

It is equivalent to **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL** (p. 1487).

[default] Capture all traffic: inbound and outbound.

5.216.3.5 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE
```

Do not capture any traffic.

5.216.3.6 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL
```

Capture all traffic (both inbound and outbound).

The value is equal to setting both the input and output bits of the mask: (**NDDS_UTILITY_NETWORK_CAPTURE_↩ TRAFFIC_OUT** (p. 1489) | **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN** (p. 1489)).

5.216.4 Typedef Documentation

5.216.4.1 NDDS_Utility_NetworkCaptureContentKindMask

```
typedef DDS_Long NDDS_Utility_NetworkCaptureContentKindMask
```

Mask that indicates a combination of content types.

The masks are based on a combination (or only one) of the **NDDS_Utility_NetworkCaptureContentKind** (p. 1488) bitmaps.

See also

NDDS_Utility_NetworkCaptureContentKind (p. 1488)

5.216.4.2 NDDS_Utility_NetworkCaptureTrafficKindMask

```
typedef DDS_Long NDDS_Utility_NetworkCaptureTrafficKindMask
```

Mask that indicates the traffic direction to capture.

The masks are based on a combination (or only one) of the **NDDS_Utility_NetworkCaptureTrafficKind** (p. 1488) bitmaps.

See also

NDDS_Utility_NetworkCaptureTrafficKind (p. 1488)

5.216.4.3 NDDS_Utility_NetworkCaptureParams_t

```
typedef struct NDDS_Utility_NetworkCaptureParams_t NDDS_Utility_NetworkCaptureParams_t
```

Input parameters for starting network capture.

5.216.5 Enumeration Type Documentation

5.216.5.1 NDDS_Utility_NetworkCaptureContentKind

```
enum NDDS_Utility_NetworkCaptureContentKind
```

Bitmap used to specify a content type, i.e., a part of the RTPS frame.

Several values can be combined. Read **NDDS_Utility_NetworkCaptureContentKindMask** (p. 1487) for typical combinations.

Enumerator

NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_SERIALIZED_DATA	The serialized data coming from a user.
NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_DATA	The encrypted user data.

5.216.5.2 NDDS_Utility_NetworkCaptureTrafficKind

```
enum NDDS_Utility_NetworkCaptureTrafficKind
```

Bitmap used to specify whether we want to capture inbound or outbound traffic.

Several values can be combined. Read **NDDS_Utility_NetworkCaptureTrafficKindMask** (p. 1487) for typical combinations.

Enumerator

NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_OUT	Do not capture outbound traffic.
NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN	Do not capture inbound traffic.

5.216.6 Function Documentation

5.216.6.1 NDDS_Utility_enable_network_capture()

```
DDS_Boolean NDDS_Utility_enable_network_capture (
            void  )
```

Enable Network Capture.

This function must be called before any other Network Capture function. It must also be called before creating the participants for which we want to capture traffic.

Use this function only for debugging purposes, since it may introduce a significant performance impact.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

MT Safety:

UNSAFE. It is not safe to call this function while another thread may be simultaneously calling another Network Caputre related function, including this one.

See also

NDDS_Utility_disable_network_capture (p. 1489)

5.216.6.2 NDDS_Utility_disable_network_capture()

```
DDS_Boolean NDDS_Utility_disable_network_capture (
            void  )
```

Disable Network Capture.

This function must be the last Network Capture function to be called. It must also be called after deleting the participants for which we captured traffic. Disabling Network Capture without stopping it first is not ok!

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

MT Safety:

UNSAFE. It is not safe to call this function while another thread may be simultaneously calling another Network Capture related function, including this one.

See also

NDDS_Utility_enable_network_capture (p. 1489)

5.216.6.3 NDDS_Utility_set_default_network_capture_params()

```
DDS_Boolean NDDS_Utility_set_default_network_capture_params (
            const  NDDS_Utility_NetworkCaptureParams_t * params )
```

Set the default Network Capture parameters.

The default parameters are used when Network Capture is started without parameters, i.e., NDDS_Utility_start_↩ network_capture.

Precondition

This function requires first enabling Network Capture. See NDDS_Utility_enable_network_capture.

Parameters

params	*<<**in**>> (p. 1015).* Configuration parameters that we want to set as defaults.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_start_network_capture (p. 1491)

5.216.6.4 NDDS_Utility_start_network_capture()

```
DDS_Boolean NDDS_Utility_start_network_capture (
            const char * filename )
```

Start capturing traffic for all DomainParticipants, with the default parameters.

Precondition

This function requires first enabling Network Capture. See NDDS_Utility_enable_network_capture.

Parameters

filename	*<<**in**>> (p. 1015).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_stop_network_capture (p. 1493)

5.216.6.5 NDDS_Utility_start_network_capture_for_participant()

```
DDS_Boolean NDDS_Utility_start_network_capture_for_participant (
             DDS_DomainParticipant * participant,
            const char * filename )
```

Start capturing traffic for a DomainParticipant, with the default parameters.

Precondition

This function requires first enabling Network Capture. See NDDS_Utility_enable_network_capture.

Parameters

participant	<<***in***>> *(p. 1015).* DomainParticipant for which we want to capture traffic.
filename	<<***in***>> *(p. 1015).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_stop_network_capture_for_participant (p. 1494)

NDDS_Utility_enable_network_capture (p. 1489)

5.216.6.6 NDDS_Utility_start_network_capture_w_params()

```
DDS_Boolean NDDS_Utility_start_network_capture_w_params (
            const char * filename,
            const  NDDS_Utility_NetworkCaptureParams_t * params )
```

Start capturing traffic for all DomainParticipants, with the provided parameters.

Precondition

This function requires first enabling Network Capture. See NDDS_Utility_enable_network_capture.

Perfoms the same function as NDDS_Utility_start_network_capture except that it uses the provided parameters, instead of the default ones.

Parameters

filename	<<***in***>> *(p. 1015).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Parameters

params	<<***in***>> *(p. 1015).* Configuration parameters for the capture.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_stop_network_capture (p. 1493)

NDDS_Utility_start_network_capture_w_params_for_participant (p. 1493)

5.216.6.7 NDDS_Utility_start_network_capture_w_params_for_participant()

```
DDS_Boolean NDDS_Utility_start_network_capture_w_params_for_participant (
             DDS_DomainParticipant * participant,
            const char * filename,
            const  NDDS_Utility_NetworkCaptureParams_t * params )
```

Start capturing traffic for a DomainParticipant, with the provided parameters.

Precondition

This function requires enabling first Network Capture. See NDDS_Utility_enable_network_capture.

Parameters

participant	<<***in***>> *(p. 1015).* DomainParticipant for which we want to capture traffic.
filename	<<***in***>> *(p. 1015).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Parameters

params	<<***in***>> *(p. 1015).* Parameters for configuring the capture.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_stop_network_capture_for_participant (p. 1494)

NDDS_Utility_start_network_capture_for_participant (p. 1491)

5.216.6.8 NDDS_Utility_stop_network_capture()

```
DDS_Boolean NDDS_Utility_stop_network_capture (
            void  )
```

Stop capturing traffic for all participants.

Precondition

This function requires enabling first Network Capture. See NDDS_Utility_enable_network_capture.

This function can (and must) be called after NDDS_Utility_start_network_capture, not NDDS_Utility_start_network_↩ capture_for_participant. That is, if we start capturing traffic globally (for all DomainParticipants), we must stop capturing traffic also globally. It is not possible to start capturing traffic for a participant but stop it globally.

It is possible to start capturing globally and then stop capturing for a participant, as long as we eventually stop capturing traffic globally.

We must stop capturing for a participant before deleting it.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

NDDS_Utility_start_network_capture (p. 1491)

NDDS_Utility_stop_network_capture_for_participant (p. 1494)

```
DDS_Boolean NDDS_Utility_stop_network_capture_for_participant (
             DDS_DomainParticipant * participant )
```

Stop capturing traffic for a DomainParticipant.

Precondition

This function requires first enabling Network Capture. See NDDS_Utility_enable_network_capture.

Parameters

participant	<<***in***>> *(p. 1015).* DomainParticipant for which we want to stop capturing traffic.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

See also

5.216.7 Variable Documentation

5.216.7.1 NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT

```
const NDDS_Utility_NetworkCaptureParams_t NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT [extern]
```

Default parameters used in Network Capture.

The default parameters can be used as initilizers to ensure that new objects do not have uninitialized contents.

Initialization of a **NDDS_Utility_NetworkCaptureParams_t** (p. 2172) type can be done either by assigning to the default parameters:

```
struct NDDS_Utility_NetworkCaptureParams_t params = NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT;
```

Or equivalently, by using its initializer function:

```
struct NDDS_Utility_NetworkCaptureParams_t params;

NDDS_Utility_NetworkCaptureParams_t_initialize(&params);
```

In either case, do not forget to finalize the parameters when you don't need them any more:

```
NDDS_Utility_NetworkCaptureParams_t_finalize(&params);
```

The values that are used by default for the parameters can be found in the description of each of the members in **NDDS_Utility_NetworkCaptureParams_t** (p. 2172).

5.217 Other Utilities

Other Utilities, such as **NDDS_Utility_spin** (p. 1499).

Functions

- **DDS_Boolean NDDS_LM_unload_activation_library** (void)
  Unloads the Activation Library (rti_activation) if it was previously loaded.
- void **NDDS_Config_enable_automatic_tss_cleanup** (**DDS_Boolean** enable)
  Enable automatic thread-specific storage (TSS) cleanup on platforms that support it.
- void **NDDS_Utility_sleep** (const struct **DDS_Duration_t** *durationIn)
  Block the calling thread for the specified duration.
- void **NDDS_Utility_spin** (**DDS_UnsignedLongLong** spinCount)
  Performs the spin operation as many times as indicated.
- **DDS_UnsignedLongLong NDDS_Utility_get_spin_per_microsecond** (void)
  Returns the number of spin operations to perform to wait 1 microsecond.

5.217.1 Detailed Description

Other Utilities, such as **NDDS_Utility_spin** (p. 1499).

5.217.2 Function Documentation

5.217.2.1 NDDS_LM_unload_activation_library()

```
DDS_Boolean NDDS_LM_unload_activation_library (
            void  )
```

Unloads the Activation Library (rti_activation) if it was previously loaded.

This function should be called just before your process finishes. See the License Management section in the `Installation Guide` for additional details.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if successful. Otherwise, **DDS_BOOLEAN_FALSE** (p. 1203)

5.217.2.2 NDDS_Config_enable_automatic_tss_cleanup()

```
void NDDS_Config_enable_automatic_tss_cleanup (
             DDS_Boolean enable )
```

Enable automatic thread-specific storage (TSS) cleanup on platforms that support it.

This API must be called before any other RTI Connext API.

Setting it to one value and then setting it to the opposite value after any RTI Connext API has been called may result in undefined behavior.

See also

DDS_DomainParticipantFactory_unregister_thread (p. 57)

5.217.2.3 NDDS_Utility_sleep()

```
void NDDS_Utility_sleep (
            const struct  DDS_Duration_t * durationIn )
```

Block the calling thread for the specified duration.

Note that the achievable resolution of sleep is OS-dependent. That is, do not assume that you can sleep for 1 nanosecond just because you can specify a 1-nanosecond sleep duration via the API. The sleep resolution on most operating systems is usually 10 ms or greater.

Parameters

durationIn	<<***in***>> *(p. 1015)* Sleep duration. Cannot be NULL.

MT Safety:

safe

Examples

HelloWorld_publisher.c, and **HelloWorld_subscriber.c**.

5.217.2.4 NDDS_Utility_spin()

```
void NDDS_Utility_spin (
             DDS_UnsignedLongLong spinCount )
```

Performs the spin operation as many times as indicated.

Spinning is the action of performing useless operations in a for loop in order to actively wait some time without yielding the CPU. Given that the resolution of sleep is in the order of ms, you can use this utility to wait times in the order of microseconds. To properly use this functionality, it is useful to measure previously the number of spin operations needed to wait the equivalent to microsecond (using the utility get_spin_per_microsecond) and then compute the corresponding spin count desired.

Parameters

spinCount	<<***in***>> *(p. 1015)* Number of spin operations to perform.

5.217.2.5 NDDS_Utility_get_spin_per_microsecond()

```
DDS_UnsignedLongLong NDDS_Utility_get_spin_per_microsecond (
```

```
        void  )
```

Returns the number of spin operations to perform to wait 1 microsecond.

This utility can be used to measure how many spin operations must be performed to wait 1 microsecond. Since the time that it takes the CPU to perform 1 spin operation depends on the CPU frequency, it is recommended to use this utility before using spin().

Returns

Number of spin operations to wait 1 microsecond.

NDDS_Utility_spin (p. 1499)

5.218 Octet Buffer Support

<<***extension***>> *(p. 1014)* Octet buffer creation, cloning, and deletion.

Functions

- unsigned char * **DDS_OctetBuffer_alloc** (unsigned int size)

  Create a new empty OctetBuffer that can hold up to `size` *octets.*
- unsigned char * **DDS_OctetBuffer_dup** (const unsigned char *buffer, unsigned int size)

  Clone an OctetBuffer.
- void **DDS_OctetBuffer_free** (unsigned char *buffer)

  Delete an OctetBuffer.

5.218.1 Detailed Description

<<***extension***>> *(p. 1014)* Octet buffer creation, cloning, and deletion.

The functions in this class ensure consistent cross-platform implementations for OctetBuffer creation (**DDS_OctetBuffer_alloc()** (p. 1501)), deletion (**DDS_OctetBuffer_free()** (p. 1502)), and cloning (**DDS_OctetBuffer_dup()** (p. 1502)) that preserve the mutable value type semantics. These are to be viewed as functions that define an `Octet Buffer` class whose data is represented by a `'unsigned` char*'.

5.218.2 Conventions

The following conventions govern the memory management of OctetBuffers in RTI Connext.

- The DDS implementation ensures that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the `OctetBuffer` class functions.
  - Value types containing OctetBuffers have ownership of the contained OctetBuffer. Thus, when a value type is deleted, the contained octet buffer field is also deleted.
- The user must ensure that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the OctetBuffer class functions.

The representation of an OctetBuffer in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a OctetBuffer. RTI Connext must therefore make some assumptions when a user requests that a OctetBuffer be copied into. The following rules apply when RTI Connext is copying into an OctetBuffer.

- If the 'unsigned char*' is NULL, RTI Connext will allocate a new OctetBuffer on behalf of the user. *To avoid leaking memory, you must ensure that the OctetBuffer will be freed (see **Usage** (p. 1501) below) in C. For C++, the destructor of the valuetype containing the OctetBuffer will free it automatically.*.
- If the 'unsigned char*' is not NULL, RTI Connext will assume that you are managing the OctetBuffer's memory yourself and have allocated enough memory to store the OctetBuffer to be copied. *RTI Connext will copy into your memory; to avoid memory corruption, be sure to allocate enough of it.* Also, *do not pass structures containing junk pointers into RTI Connext*; you are likely to crash.

5.218.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating OctetBuffers.

```
Always use
     DDS_OctetBuffer_alloc() to create,
     DDS_OctetBuffer_dup() to clone,
     DDS_OctetBuffer_free() to delete
 a 'unsigned char*' that is passed back and forth between
 user code and the DDS C/C++ APIs.
```

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS_OctetBuffer_alloc()** (p. 1501), with matching occurrences of **DDS_OctetBuffer_free()** (p. 1502) in the code.
- Finalize value types containing OctetBuffer. In C++ the destructor accomplishes this automatically. in C, explicit "destructor" functions are provided.

5.218.4 Function Documentation

5.218.4.1 DDS_OctetBuffer_alloc()

```
unsigned char * DDS_OctetBuffer_alloc (
            unsigned int size )
```

Create a new empty OctetBuffer that can hold up to `size` octets.

An OctetBuffer created by this function must be deleted using **DDS_OctetBuffer_free()** (p. 1502).

This function will allocate enough memory to hold an OctetBuffer of `size` octets.

Parameters

size	<<***in***>> *(p. 1015)* Size of the buffer.

Returns

A newly created non-NULL OctetBuffer upon success or NULL upon failure.

5.218.4.2 DDS_OctetBuffer_dup()

```
unsigned char * DDS_OctetBuffer_dup (
            const unsigned char * buffer,
            unsigned int size )
```

Clone an OctetBuffer.

```
An OctetBuffer created by this function must be deleted using
DDS_OctetBuffer_free()
```

Parameters

buffer	<<***in***>> *(p. 1015)* The OctetBuffer to duplicate.
size	<<***in***>> *(p. 1015)* Size of the OctetBuffer to duplicate.

Returns

If `src` == NULL or size <0, this function always returns NULL. Otherwise, upon success it returns a newly created OctetBuffer whose value is `src`; upon failure it returns NULL.

5.218.4.3 DDS_OctetBuffer_free()

```
void DDS_OctetBuffer_free (
            unsigned char * buffer )
```

Delete an OctetBuffer.

Precondition

`buffer` must be either NULL, or must have been created using **DDS_OctetBuffer_alloc()** (p. 1501), **DDS_↩ OctetBuffer_dup()** (p. 1502)

Parameters

buffer	*<<**in**>> (p. 1015)* The buffer to delete.

5.219 SampleProcessor

*<<**experimental**>> (p. 1014) <<**extension**>> (p. 1014)* Utility to concurrently read and process the data samples received by **DDS_DataReader** (p. 618).

Data Structures

- struct **DDS_SampleHandler**

  *<<**experimental**>> (p. 1014) <<**extension**>> (p. 1014) <<**interface**>> (p. 1015) Handler called by a sample dispatcher, such as **DDS_SampleProcessor** (p. 1505).*

Macros

- #define **DDS_SampleHandler_INITIALIZER**

  *<<**experimental**>> (p. 1014) <<**extension**>> (p. 1014) Initializer for new **DDS_SampleHandler** (p. 1988).*

Typedefs

- typedef struct DDS_SampleProcessorImpl **DDS_SampleProcessor**

  *<<**extension**>> (p. 1014) <<**interface**>> (p. 1015) A class for reading the samples in **DDS_DataReader** (p. 618)'s cache concurrently. This class allows associating a **DDS_SampleHandler** (p. 1988) with a **DDS_DataReader** (p. 618) and notify it for each sample individually.*

Functions

- **DDS_ReturnCode_t DDS_SampleProcessor_attach_reader** (**DDS_SampleProcessor** ∗self, **DDS_Data↩ Reader** ∗reader, const struct **DDS_SampleHandler** ∗handler)

  *Attaches the specified **DDS_DataReader** (p. 618) with an associated sample handler to this **DDS_SampleProcessor** (p. 1505).*
- **DDS_ReturnCode_t DDS_SampleProcessor_detach_reader** (**DDS_SampleProcessor** ∗self, **DDS_Data↩ Reader** ∗reader)

  *Detaches the specified **DDS_DataReader** (p. 618) from this **DDS_SampleProcessor** (p. 1505).*
- **DDS_ReturnCode_t DDS_SampleProcessor_lookup_sample_handler** (**DDS_SampleProcessor** ∗self, struct **DDS_SampleHandler** ∗handler_out, **DDS_DataReader** ∗reader)

  *Finds the associated **DDS_SampleHandler** (p. 1988) of the specified attached **DDS_DataReader** (p. 618).*
- **DDS_ReturnCode_t DDS_SampleProcessor_get_datareaders** (**DDS_SampleProcessor** ∗self, struct **DDS_DataReaderSeq** ∗attached_readers)

  *Retrieves the list of attached **DDS_DataReader** (p. 618) (s).*
- **DDS_ReturnCode_t DDS_SampleProcessor_delete** (**DDS_SampleProcessor** ∗self)

  *Deletes a **DDS_SampleProcessor** (p. 1505).*
- **DDS_SampleProcessor** ∗ **DDS_SampleProcessor_new** (const struct **DDS_AsyncWaitSetProperty_↩ t** ∗aws_property)

  *Single-argument constructor that allows creating a a **DDS_SampleProcessor** (p. 1505) with the configuration of the underlying **DDS_AsyncWaitSet** (p. 1072).*
- **DDS_SampleProcessor** ∗ **DDS_SampleProcessor_new_with_aws** (**DDS_AsyncWaitSet** ∗aws)

  *Constructor that allows specifying an externally created **DDS_AsyncWaitSet** (p. 1072).*

5.219.1 Detailed Description

<<***experimental***>> *(p. 1014)* <<***extension***>> *(p. 1014)* Utility to concurrently read and process the data samples received by **DDS_DataReader** (p. 618).

5.219.2 Macro Definition Documentation

5.219.2.1 DDS_SampleHandler_INITIALIZER

```
#define DDS_SampleHandler_INITIALIZER
```

<<***experimental***>> *(p. 1014)* <<***extension***>> *(p. 1014)* Initializer for new **DDS_SampleHandler** (p. 1988).

No memory is allocated. New **DDS_SampleHandler** (p. 1988) instances stored in the stack should be initialized with this value before they are passed to any functions.

See also

DDS_SampleHandler (p. 1988)

5.219.3 Typedef Documentation

5.219.3.1 DDS_SampleProcessor

```
typedef struct DDS_SampleProcessorImpl  DDS_SampleProcessor
```

<<***extension***>> *(*p. *1014)* <<***interface***>> *(*p. *1015)* A class for reading the samples in **DDS_DataReader** (p. 618)'s cache concurrently. This class allows associating a **DDS_SampleHandler** (p. 1988) with a **DDS_DataReader** (p. 618) and notify it for each sample individually.

A **DDS_SampleProcessor** (p. 1505) relies on an underlying **DDS_AsyncWaitSet** (p. 1072) to read and dispatch the data from the DataReaders. It internally creates a **DDS_ReadCondition** (p. 695) for each attached DataReader, an associates a custom handler that contains state to read samples and notify the corresponding handler .

The SampleProcessor uses this ReadCondition to wait for data and then calls **FooDataReader_take_w_condition** (p. 635) to take all the available data.

Notifications to any handler may be concurrent if the thread pool size set in **DDS_AsyncWaitSetProperty_t::thread_pool_size** (p. 1545) is greater than 1. The same or different handlers may be called in parallel. The SampleProcessor cycles through all attached DataReaders dispatching a sample at a time with the next available thread. This mechanism guarantees concurrent dispatching of the samples accross all DataReaders.

The **DDS_SampleProcessor** (p. 1505) internally creates and uses a **DDS_ReadCondition** (p. 695) for each attached **DDS_DataReader** (p. 618) to read the data. It's recommended to perform all the reading of the **DDS_DataReader** (p. 618)'s samples through the **DDS_SampleProcessor** (p. 1505) and avoid reading through other mechanisms in different parts of your applications. Similarly, your application must be careful to not modify the **DDS_ReadCondition** (p. 695) associated with an attached **DDS_DataReader** (p. 618).

In general, avoid or beware of using the following operations in combination with a **DDS_SampleProcessor** (p. 1505):

- read or take operation (and any of its overloads) of a **DDS_DataReader** (p. 618) from any part of your application, including a **DDS_DataReaderListener** (p. 1593) or a handler .
- Delete all the **DDS_DataReader** (p. 618)'s **DDS_ReadCondition** (p. 695) by calling **DDS_DataReader_delete_contained_entities** (p. 675)
- Perform actions based on the **DDS_StatusCondition** (p. 1373) with the **DDS_DATA_AVAILABLE_STATUS** (p. 1232) enabled (for example through a **DDS_AsyncWaitSet** (p. 1072)).

On the other hand, you can externally provide the underlying **DDS_SampleProcessor** (p. 1505)'s **DDS_AsyncWaitSet** (p. 1072) if you want to access additional capabilities of the **DDS_AsyncWaitSet** (p. 1072) and use it to attach other **DDS_Condition** (p. 1372) to handle other aspects of your application.

5.219.4 SampleProcessor Thread Safety

Similar to the **DDS_AsyncWaitSet** (p. 1072), the **DDS_SampleProcessor** (p. 1505) provides a thread-safe interface. All the operations of this class can be called concurrently from multiple threads.

Because the **DDS_SampleProcessor** (p. 1505) relies on an **DDS_AsyncWaitSet** (p. 1072) to dispatch the samples the same threading concepts apply. This means that operations on a **DDS_SampleProcessor** (p. 1505) may require synchronizing with the thread pool for safety. **DDS_SampleProcessor** (p. 1505) also relies on the asynchrnous completion pattern to effectively interact with the underlying thread pool.

For instance to detach a **DDS_DataReader** (p. 618), the **DDS_SampleProcessor** (p. 1505) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token on which the **DDS_SampleProcessor** (p. 1505) waits and blocks until it completes.

Due to the concurrent processing nature of operations on a **DDS_SampleProcessor** (p. 1505) as well as the sample handling, it's important to keep in mind the following aspects:

- The handler operation can be called concurrently for each sample. Therefore, handler implementations may need to apply thread synchronization strategies to protect shared resources.
- Calling a **DDS_SampleProcessor** (p. 1505) operation that requires internal synchronization (e.g., **DDS_SampleProcessor_attach_reader** (p. 1506)) from a handler notification will result in a error.

Note that the interface of the **DDS_SampleProcessor** (p. 1505) is similar to that of the **DDS_AsyncWaitSet** (p. 1072) but reduced and simplified. As noted above, if more advanced use and control of the thread pool is required, you can always create the **DDS_AsyncWaitSet** (p. 1072) externally when calling **DDS_SampleProcessor_new_with_aws** (p. 1510).

MT Safety:

Safe.

DDS_AsyncWaitSet (p. 1072)

DDS_Condition (p. 1372)

DDS_AsyncWaitSetProperty_t (p. 1544)

DDS_DataReader (p. 618)

5.219.5 Function Documentation

5.219.5.1 DDS_SampleProcessor_attach_reader()

```
DDS_ReturnCode_t DDS_SampleProcessor_attach_reader (
            DDS_SampleProcessor * self,
            DDS_DataReader * reader,
           const struct  DDS_SampleHandler * handler )
```

Attaches the specified **DDS_DataReader** (p. 618) with an associated sample handler to this **DDS_SampleProcessor** (p. 1505).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **DDS_DataReader** (p. 618) is attached and notifications to the handler may occur.

If this operation is called multiple times for an already attached **DDS_DataReader** (p. 618), it will result in no-op and return sucessfully, ignoring the specified handler. So if the handler is different, it will not be updated.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
reader	<<***in***>> *(p. 1015)* **DDS_DataReader** (p. 618) to be attached.
handler	<<***in***>> *(p. 1015)* handler to be notified on dispatching of the `reader` samples.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_SampleProcessor_detach_reader (p. 1507)

5.219.5.2 DDS_SampleProcessor_detach_reader()

```
DDS_ReturnCode_t DDS_SampleProcessor_detach_reader (
            DDS_SampleProcessor * self,
            DDS_DataReader * reader )
```

Detaches the specified **DDS_DataReader** (p. 618) from this **DDS_SampleProcessor** (p. 1505).

Once the **DDS_DataReader** (p. 618) is detached, it is guaranteed that the **DDS_SampleProcessor** (p. 1505) will no longer process it so it is safe for your application to release any resources associated with the detached **DDS_Data↩ Reader** (p. 618).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **DDS_DataReader** (p. 618) is detached.

DDS_DataReader (p. 618) may be detached at any time independently of the state of the **DDS_SampleProcessor** (p. 1505).

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
reader	*<<**in**>> (p. 1015)* **DDS_DataReader** (p. 618) to be detached.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_SampleProcessor_attach_reader (p. 1506)

5.219.5.3 DDS_SampleProcessor_lookup_sample_handler()

```
DDS_ReturnCode_t DDS_SampleProcessor_lookup_sample_handler (
            DDS_SampleProcessor * self,
           struct  DDS_SampleHandler * handler_out,
            DDS_DataReader * reader )
```

Finds the associated **DDS_SampleHandler** (p. 1988) of the specified attached **DDS_DataReader** (p. 618).

The operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 1224). if the specified reader is not currently attached.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
handler_out	*<<**inout**>> (p. 1015)* a **DDS_SampleHandler** (p. 1988) object that contains the found associated handler.
reader	**DDS_DataReader** (p. 618) The attached reader for which the associated **DDS_SampleHandler** (p. 1988) is retrieved.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_SampleProcessor_attach_reader (p. 1506)

DDS_SampleProcessor_detach_reader (p. 1507)

5.219.5.4 DDS_SampleProcessor_get_datareaders()

```
DDS_ReturnCode_t DDS_SampleProcessor_get_datareaders (
            DDS_SampleProcessor * self,
          struct  DDS_DataReaderSeq * attached_readers )
```

Retrieves the list of attached **DDS_DataReader** (p. 618) (s).

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
attached_readers	*<<**inout**>> (p. 1015)* a **DDS_DataReaderSeq** (p. 1638) object where the list of attached readers will be returned.

Returns

One of the **Standard Return Codes** (p. 1223)

See also

DDS_SampleProcessor_attach_reader (p. 1506)

DDS_SampleProcessor_detach_reader (p. 1507)

5.219.5.5 DDS_SampleProcessor_delete()

```
DDS_ReturnCode_t DDS_SampleProcessor_delete (
            DDS_SampleProcessor * self )
```

Deletes a **DDS_SampleProcessor** (p. 1505).

This will delete the underlying **DDS_AsyncWaitSet** (p. 1072) only if it owns it. That is, if the **DDS_AsyncWaitSet** (p. 1072) was not provided externally.

The deletion will fail if there are outstanding **DDS_AsyncWaitSetCompletionToken** (p. 1075) that have not been deleted.

Any outstanding **DDS_SampleProcessor** (p. 1505) must be deleted before finalizing the **DDS_DomainParticipant↩ Factory** (p. 32). Otherwise undefined behavior may occur.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.

See also

DDS_SampleProcessor_new (p. 1510)

5.219.5.6 DDS_SampleProcessor_new()

```
DDS_SampleProcessor * DDS_SampleProcessor_new (
            const struct  DDS_AsyncWaitSetProperty_t * aws_property )
```

Single-argument constructor that allows creating a a **DDS_SampleProcessor** (p. 1505) with the configuration of the underlying **DDS_AsyncWaitSet** (p. 1072).

You can provide **DDS_ASYNC_WAITSET_PROPERTY_DEFAULT** (p. 1092) as `property` to create the underlying **DDS_AsyncWaitSet** (p. 1072) with default behavior.

This constructor creates **DDS_AsyncWaitSet** (p. 1072) with no listener installed and will call **DDS_AsyncWaitSet_start** (p. 1084) rigt after its creation.

Parameters

aws_property	*<<**in**>> (p. 1015)* configuration of the underlying **DDS_AsyncWaitSet** (p. 1072).

Returns

A new **DDS_SampleProcessor** (p. 1505) or NULL if one could not be allocated.

See also

DDS_SampleProcessor_new_with_aws (p. 1510)

5.219.5.7 DDS_SampleProcessor_new_with_aws()

```
DDS_SampleProcessor * DDS_SampleProcessor_new_with_aws (
             DDS_AsyncWaitSet * aws )
```

Constructor that allows specifying an externally created **DDS_AsyncWaitSet** (p. 1072).

Creates a new **DDS_SampleProcessor** (p. 1505) with the specified **DDS_AsyncWaitSet** (p. 1072).

Tnis constructor flavor decouples the lifecycle of the **DDS_SampleProcessor** (p. 1505) from the **DDS_AsyncWait↩ Set** (p. 1072). It allows the application to have more control on the **DDS_AsyncWaitSet** (p. 1072), such as to install an **DDS_AsyncWaitSetListener** (p. 1543), a custom **DDS_ThreadFactory** (p. 2033), and controlling when it starts or stops.

Note that this constructor will not call **DDS_AsyncWaitSet_start** (p. 1084), so it's the caller responsiblity to start and stop it. You can provide the external **DDS_AsyncWaitSet_start** (p. 1084) in either started or stopped state.

Parameters

aws	<<***in***>> *(*p. *1015)* the externally created **DDS_AsyncWaitSet** (p. 1072).

Returns

A new **DDS_SampleProcessor** (p. 1505) or NULL if one could not be allocated.

See also

DDS_SampleProcessor_new (p. 1510)

5.220 Sequence Support

The **FooSeq** (p. 2120) interface allows you to work with variable-length collections of homogeneous data.

Modules

- **Built-in Sequences**

  Defines sequences of primitive data type. .

Data Structures

- struct **FooSeq**

  <<***interface***>> *(*p. *1015)* <<***generic***>> *(*p. *1015) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as* ***Foo*** *(*p. *2116).*

Macros

- #define **DDS_SEQUENCE_INITIALIZER**

  An initializer for new sequence instances.

Functions

- **DDS_Boolean FooSeq_initialize** (struct **FooSeq** *self)

  Initialize sequence instances.
- **DDS_Long FooSeq_get_maximum** (const struct **FooSeq** *self)

  Get the current maximum number of elements that can be stored in this sequence.
- **DDS_Boolean FooSeq_set_maximum** (struct **FooSeq** *self, **DDS_Long** new_max)

  Resize this sequence to a new desired maximum.
- **DDS_Long FooSeq_get_length** (const struct **FooSeq** *self)

  Get the logical length of this sequence.
- **DDS_Boolean FooSeq_set_length** (struct **FooSeq** *self, **DDS_Long** new_length)

  Set the sequence to the desired length, and resize the sequence if necessary.
- **DDS_Boolean FooSeq_ensure_length** (struct **FooSeq** *self, **DDS_Long** length, **DDS_Long** max)

  Set the sequence to the desired length, and resize the sequence if necessary.
- **Foo FooSeq_get** (const struct **FooSeq** *self, **DDS_Long** i)

  Get the `i-th` element for a `const` sequence.
- **Foo** * **FooSeq_get_reference** (const struct **FooSeq** *self, **DDS_Long** i)

  Get the pointer to the `i-th` element of this sequence.
- **DDS_Boolean FooSeq_copy_no_alloc** (struct **FooSeq** *self, const struct **FooSeq** *src_seq)

  Copy elements from another sequence, only if the destination sequence has enough capacity.
- **FooSeq** * **FooSeq_copy** (struct **FooSeq** *self, const struct **FooSeq** *src_seq)

  Copy elements from another sequence, resizing the sequence if necessary.
- **DDS_Boolean FooSeq_from_array** (struct **FooSeq** *self, const **Foo** array[ ], **DDS_Long** length)

  Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.
- **DDS_Boolean FooSeq_to_array** (struct **FooSeq** *self, **Foo** array[ ], **DDS_Long** length)

  Copy elements to an array of elements. The original contents of the array (if any) are replaced.
- **DDS_Boolean FooSeq_loan_contiguous** (struct **FooSeq** *self, **Foo** *buffer, **DDS_Long** new_length, **DDS_Long** new_max)

  Loan a contiguous buffer to this sequence.
- **DDS_Boolean FooSeq_loan_discontiguous** (struct **FooSeq** *self, **Foo** **buffer, **DDS_Long** new_length, **DDS_Long** new_max)

  Loan a discontiguous buffer to this sequence.
- **DDS_Boolean FooSeq_unloan** (struct **FooSeq** *self)

  Return the loaned buffer in the sequence and set the maximum to 0.
- **Foo** * **FooSeq_get_contiguous_buffer** (const struct **FooSeq** *self)

  Return the contiguous buffer of the sequence.
- **Foo** ** **FooSeq_get_discontiguous_buffer** (const struct **FooSeq** *self)

  Return the discontiguous buffer of the sequence.
- **DDS_Boolean FooSeq_has_ownership** (const struct **FooSeq** *self)

  Return the value of the owned flag.
- **DDS_Boolean FooSeq_finalize** (struct **FooSeq** *self)

  Deallocate this sequence's buffer.

5.220.1 Detailed Description

The **FooSeq** (p. 2120) interface allows you to work with variable-length collections of homogeneous data.

This interface is instantiated for each concrete element type in order to provide compile-time type safety to applications. The **Built-in Sequences** (p. 719) are pre-defined instantiations for the primitive data types.

When you use the rtiddsgen code generation tool, it will automatically generate concrete sequence instantiations for each of your own custom types.

5.220.2 Macro Definition Documentation

5.220.2.1 DDS_SEQUENCE_INITIALIZER

```
#define DDS_SEQUENCE_INITIALIZER
```

An initializer for new sequence instances.

This constant will initialize a new sequence to a valid empty state. C language users should assign it to uninitialized sequence instances before using them, at the time they are declared, or use **FooSeq_initialize** (p. 1513) as an alternative function to initialize new sequences.

Examples

HelloWorld_subscriber.c.

5.220.3 Function Documentation

5.220.3.1 FooSeq_initialize()

```
DDS_Boolean FooSeq_initialize (
            struct  FooSeq * self )
```

Initialize sequence instances.

Use this function to initialize new sequences to a valid empty state. C users should initialize sequences before using them.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

See also

DDS_SEQUENCE_INITIALIZER (p. 1513)

5.220.3.2 FooSeq_get_maximum()

```
DDS_Long FooSeq_get_maximum (
            const struct  FooSeq * self )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

`maximum` can only be changed with the **FooSeq_set_maximum** (p. 1514) operation.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

the current maximum of the sequence.

See also

FooSeq_get_length (p. 1515)

5.220.3.3 FooSeq_set_maximum()

```
DDS_Boolean FooSeq_set_maximum (
            struct  FooSeq * self,
             DDS_Long new_max )
```

Resize this sequence to a new desired maximum.

This operation does nothing if the new desired maximum matches the current maximum.

If this sequence owns its buffer and the new maximum is not equal to the old maximum, then the existing buffer will be freed and re-allocated.

Precondition

owned == **DDS_BOOLEAN_TRUE** (p. 1203)

`new_max` <= maximum size for IDL bounded sequences.

Postcondition

owned == **DDS_BOOLEAN_TRUE** (p. 1203)

length == MINIMUM(original length, new_max)

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
new_max	Must be >= 0.

Returns

DDS_BOOLEAN_TRUE (p. 1203) on success, **DDS_BOOLEAN_FALSE** (p. 1203) if the preconditions are not met. In that case the sequence is not modified.

5.220.3.4 FooSeq_get_length()

```
DDS_Long FooSeq_get_length (
            const struct  FooSeq * self )
```

Get the logical length of this sequence.

Get the length that was last set, or zero if the length has never been set.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.

Returns

the length of the sequence

5.220.3.5 FooSeq_set_length()

```
DDS_Boolean FooSeq_set_length (
            struct  FooSeq * self,
             DDS_Long new_length )
```

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the desired length, then sequence is not resized.

Otherwise, if this sequence owns its buffer, the sequence is resized to the new length by freeing and re-allocating the buffer. However, if the sequence does not own its buffer, this operation will fail.

For sequences that are part of a type declared in IDL, the length must not exceed the maximum established for the sequence in the IDL.

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
new_length	the new desired length. This value must be non-negative. Must be >= 0.

Returns

DDS_BOOLEAN_TRUE (p. 1203) on success or **DDS_BOOLEAN_FALSE** (p. 1203) on failure

5.220.3.6 FooSeq_ensure_length()

```
DDS_Boolean FooSeq_ensure_length (
            struct  FooSeq * self,
             DDS_Long length,
             DDS_Long max )
```

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the new length, then the sequence is not resized.

Otherwise, if this sequence owns its buffer, the sequence is resized to the new maximum by freeing and re-allocating the buffer, and the length is set to the new length. However, if the sequence does not own its buffer, this operation will fail.

This function allows user to avoid unnecessary buffer re-allocation.

Precondition

`length` <= `max`

`max` <= maximum size for IDL bounded sequences

owned == **DDS_BOOLEAN_TRUE** (p. 1203) if sequence needs to be resized

Postcondition

length == `length`

maximum == `max` if resized

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
length	<<***in***>> *(p. 1015)* The new length that should be set. Must be >= 0.
max	<<***in***>> *(p. 1015)* If sequence need to be resized, this is the maximum that should be set. `max` >= `length`

Returns

DDS_BOOLEAN_TRUE (p. 1203) on success, **DDS_BOOLEAN_FALSE** (p. 1203) if the preconditions are not met. In that case the sequence is not modified.

5.220.3.7 FooSeq_get()

```
Foo FooSeq_get (
            const struct  FooSeq * self,
             DDS_Long i )
```

Get the `i-th` element for a `const` sequence.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
i	index of element to access, must be >= 0 and less than **FooSeq_get_length** (p. 1515)

Returns

the `i-th` element

5.220.3.8 FooSeq_get_reference()

```
Foo * FooSeq_get_reference (
            const struct  FooSeq * self,
             DDS_Long i )
```

Get the pointer to the `i-th` element of this sequence.

This operation can used to modify the elements of the sequence in place.

```
struct DDS_LongSeq my_seq = DDS_SEQUENCE_INITIALIZER;

DDS_Long* first_element = NULL;

DDS_LongSeq_ensure_length(1, 1);

first_element = DDS_LongSeq_get_reference(&my_seq, 0);

*first_element = 5;
```

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
i	index of element to access, must be >= 0 and less than **FooSeq_get_length** (p. 1515)

Returns

a pointer to the `i-th` element

5.220.3.9 FooSeq_copy_no_alloc()

```
DDS_Boolean FooSeq_copy_no_alloc (
            struct  FooSeq * self,
            const struct  FooSeq * src_seq )
```

Copy elements from another sequence, only if the destination sequence has enough capacity.

Fill the elements in this sequence by copying the corresponding elements in `src_seq`. The original contents in this sequence are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Precondition

this::maximum >= src_seq::length

this::owned == **DDS_BOOLEAN_TRUE** (p. 1203)

Postcondition

this::length == src_seq::length

this[i] == src_seq[i] for 0 <= i < target_seq::length

this::owned == **DDS_BOOLEAN_TRUE** (p. 1203)

Parameters

self	<<***in***>> *(*p. *1015)* Cannot be NULL.
src_seq	<<***in***>> *(*p. *1015)* the sequence from which to copy

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the sequence was successfully copied; **DDS_BOOLEAN_FALSE** (p. 1203) otherwise.

Note

If the pre-conditions are not met, the operator will print a message to stdout and leave this sequence unchanged.

See also

FooSeq_copy (p. 1519)

5.220.3.10 FooSeq_copy()

```
FooSeq * FooSeq_copy (
            struct  FooSeq * self,
            const struct  FooSeq * src_seq )
```

Copy elements from another sequence, resizing the sequence if necessary.

This function invokes **FooSeq_copy_no_alloc** (p. 1518) after ensuring that the sequence has enough capacity to hold the elements to be copied.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
src_seq	<<***in***>> *(p. 1015)* the sequence from which to copy

Returns

`self`, this sequence

See also

FooSeq_copy_no_alloc (p. 1518)

5.220.3.11 FooSeq_from_array()

```
DDS_Boolean FooSeq_from_array (
            struct  FooSeq * self,
            const  Foo array[],
             DDS_Long length )
```

Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.

Fill the elements in this sequence by copying the corresponding elements in `array`. The original contents in this sequence are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Precondition

this::owned == **DDS_BOOLEAN_TRUE** (p. 1203)

Postcondition

this::length == `length`

this[i] == array[i] for 0 <= i < `length`

this::owned == **DDS_BOOLEAN_TRUE** (p. 1203)

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
array	*<<**in**>> (p. 1015)* The array of elements to be copy elements from
length	*<<**in**>> (p. 1015)* The length of the array.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the array was successfully copied; **DDS_BOOLEAN_FALSE** (p. 1203) otherwise.

Note

If the pre-conditions are not met, the function will print a message to stdout and leave this sequence unchanged.

5.220.3.12 FooSeq_to_array()

```
DDS_Boolean FooSeq_to_array (
            struct  FooSeq * self,
             Foo array[],
             DDS_Long length )
```

Copy elements to an array of elements. The original contents of the array (if any) are replaced.

Copy the elements of this sequence to the corresponding elements in the array. The original contents of the array are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.
array	*<<**in**>> (p. 1015)* The array of elements to be filled with elements from this sequence
length	*<<**in**>> (p. 1015)* The number of elements to be copied.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the elements of the sequence were successfully copied; **DDS_BOOLEAN_FALSE** (p. 1203) otherwise.

5.220.3.13 FooSeq_loan_contiguous()

```
DDS_Boolean FooSeq_loan_contiguous (
            struct  FooSeq * self,
             Foo * buffer,
             DDS_Long new_length,
             DDS_Long new_max )
```

Loan a contiguous buffer to this sequence.

This operation changes the `owned` flag of the sequence to **DDS_BOOLEAN_FALSE** (p. 1203) and also sets the underlying buffer used by the sequence. See the `User's Manual` for more information about sequences and memory ownership.

Use this function if you want to manage the memory used by the sequence yourself. You must provide an array of elements and integers indicating how many elements are allocated in that array (i.e. the maximum) and how many elements are valid (i.e. the length). The sequence will subsequently use the memory you provide and will not permit it to be freed by a call to **FooSeq_set_maximum** (p. 1514).

Once you have loaned a buffer to a sequence, make sure that you don't free it before calling **FooSeq_unloan** (p. 1522): the next time you access the sequence, you will be accessing freed memory!

You can use this function to wrap stack memory with a sequence interface, thereby avoiding dynamic memory allocation. Create a **FooSeq** (p. 2120) and an array of type **Foo** (p. 2116) and then loan the array to the sequence:

```
struct ::Foo fooArray[10];

struct ::FooSeq fooSeq = ::DDS_SEQUENCE_INITIALIZER;

::FooSeq_loan_contiguous(&fooSeq, fooArray, 0, 10);
```

By default, a sequence you create owns its memory unless you explicitly loan memory of your own to it. In a very few cases, RTI Connext will return a sequence to you that has a loan; those cases are documented as such. For example, if you call **FooDataReader_read** (p. 628) or **FooDataReader_take** (p. 629) and pass in sequences with no loan and no memory allocated, RTI Connext will loan memory to your sequences which must be unloaned with **FooDataReader_return_loan** (p. 649). See the documentation of those functions for more information.

Precondition

FooSeq_get_maximum (p. 1514) == 0; i.e. the sequence has no memory allocated to it.

FooSeq_has_ownership (p. 1524) == **DDS_BOOLEAN_TRUE** (p. 1203); i.e. the sequence does not already have an outstanding loan

Postcondition

The sequence will store its elements in the buffer provided.

FooSeq_has_ownership (p. 1524) == **DDS_BOOLEAN_FALSE** (p. 1203)

FooSeq_get_length (p. 1515) == new_length

FooSeq_get_maximum (p. 1514) == new_max

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
buffer	The new buffer that the sequence will use. Must point to enough memory to hold new_max elements of type **Foo** (p. 2116). It may be NULL if new_max == 0.
new_length	The desired new length for the sequence. It must be the case that that 0 <= new_length <= new_max.
new_max	The allocated number of elements that could fit in the loaned buffer.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if `buffer` is successfully loaned to this sequence or **DDS_BOOLEAN_FALSE** (p. 1203) otherwise. Failure only occurs due to failing to meet the pre-conditions. Upon failure the sequence remains unmodified.

See also

FooSeq_unloan (p. 1522) , **FooSeq_loan_discontiguous** (p. 1522)

5.220.3.14 FooSeq_loan_discontiguous()

```
DDS_Boolean FooSeq_loan_discontiguous (
            struct  FooSeq * self,
             Foo ** buffer,
             DDS_Long new_length,
             DDS_Long new_max )
```

Loan a discontiguous buffer to this sequence.

This function is exactly like **FooSeq_loan_contiguous** (p. 1521) except that the buffer loaned is an array of **Foo** (p. 2116) pointers, not an array of **Foo** (p. 2116).

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.
buffer	The new buffer that the sequence will use. Must point to enough memory to hold new_max elements of type Foo*. It may be NULL if new_max == 0.
new_length	The desired new length for the sequence. It must be the case that that 0 <= new_length <= new_max.
new_max	The allocated number of elements that could fit in the loaned buffer.

See also

FooSeq_unloan (p. 1522), **FooSeq_loan_contiguous** (p. 1521)

5.220.3.15 FooSeq_unloan()

```
DDS_Boolean FooSeq_unloan (
            struct  FooSeq * self )
```

Return the loaned buffer in the sequence and set the maximum to 0.

This function affects only the state of this sequence; it does not change the contents of the buffer in any way.

Only the user who originally loaned a buffer should return that loan, as the user may have dependencies on that memory known only to them. Unloaning someone else's buffer may cause unspecified problems. For example, suppose a sequence is loaning memory from a custom memory pool. A user of the sequence likely has no way to release the memory back into the pool, so unloaning the sequence buffer would result in a resource leak. If the user were to then re-loan a different buffer, the original creator of the sequence would have no way to discover, when freeing the sequence, that the loan no longer referred to its own memory and would thus not free the user's memory properly, exacerbating the situation and leading to undefined behavior.

Precondition

owned == **DDS_BOOLEAN_FALSE** (p. 1203)

Postcondition

owned == **DDS_BOOLEAN_TRUE** (p. 1203)

maximum == 0

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if the preconditions were met. Otherwise **DDS_BOOLEAN_FALSE** (p. 1203). The function only fails if the pre-conditions are not met, in which case it leaves the sequence unmodified.

See also

FooSeq_loan_contiguous (p. 1521), **FooSeq_loan_discontiguous** (p. 1522), **FooSeq_set_maximum** (p. 1514)

5.220.3.16 FooSeq_get_contiguous_buffer()

```
Foo * FooSeq_get_contiguous_buffer (
            const struct  FooSeq * self )
```

Return the contiguous buffer of the sequence.

Get the underlying buffer where contiguous elements of the sequence are stored. The size of the buffer matches the maximum of the sequence, but only the elements up to the **FooSeq_get_length** (p. 1515) of the sequence are valid.

This function provides almost no encapsulation of the sequence's underlying implementation. Certain operations, such as **FooSeq_set_maximum** (p. 1514), may render the buffer invalid. In light of these caveats, this operation should be used with care.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

buffer that stores contiguous elements in sequence.

5.220.3.17 FooSeq_get_discontiguous_buffer()

```
Foo ** FooSeq_get_discontiguous_buffer (
            const struct  FooSeq * self )
```

Return the discontiguous buffer of the sequence.

This operation returns the underlying buffer where discontiguous elements of the sequence are stored. The size of the buffer matches the maximum of this sequence, but only the elements up to the **FooSeq_get_length** (p. 1515) of the sequence are valid.

The same caveats apply to this function as to **FooSeq_get_contiguous_buffer** (p. 1523).

The sequence will dereference pointers in the discontiguous buffer to provide access to its elements by value in C and by reference in C++. If you access the discontiguous buffer directly by means of this function, do not store any NULL values into it, as acessing those values will result in a segmentation fault.

Parameters

self	<<***in***>> *(p. 1015)* Cannot be NULL.

Returns

buffer that stores discontiguous elements in sequence.

5.220.3.18 FooSeq_has_ownership()

```
DDS_Boolean FooSeq_has_ownership (
            const struct  FooSeq * self )
```

Return the value of the owned flag.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 1203) if sequence owns the underlying buffer, or **DDS_BOOLEAN_FALSE** (p. 1203) if it has an outstanding loan.

5.220.3.19 FooSeq_finalize()

```
DDS_Boolean FooSeq_finalize (
            struct  FooSeq * self )
```

Deallocate this sequence's buffer.

Note that this function deletes this sequence's *buffer*, not this sequence itself. To avoid memory leaks, it should be called even on sequences declared on the stack. And after it has been called on a sequence located in dynamic memory, it is still necessary to call free().

Precondition

(owned == **DDS_BOOLEAN_TRUE** (p. 1203)). If this precondition is not met, no memory will be freed and an error will be logged.

Parameters

self	*<<**in**>> (p. 1015)* Cannot be NULL.

Postcondition

maximum == 0 and the underlying buffer is freed.

FooSeq_get_maximum (p. 1514), **FooSeq_unloan** (p. 1522)

5.221 String Support

<<***extension***>> *(*p. *1014)* String creation, cloning, assignment, and deletion.

Functions

- char * **DDS_String_alloc** (size_t length)

  Create a new empty string that can hold up to `length` *characters.*
- char * **DDS_String_dup** (const char *str)

  Clone a string. Creates a new string that duplicates the value of `string`*.*
- char * **DDS_String_replace** (char **string_ptr, const char *new_value)

  Assign a new value to a string. Replaces the string pointed to by `string_ptr`*, with a string whose value is* `new_value`*.*
- void **DDS_String_free** (char *str)

  Delete a string.
- **DDS_Wchar** * **DDS_Wstring_alloc** (**DDS_UnsignedLong** length)

  Create a new empty string that can hold up to `length` *wide characters.*
- **DDS_UnsignedLong** **DDS_Wstring_length** (const **DDS_Wchar** *str)

  Get the number of wide characters in the given string.
- **DDS_Wchar** * **DDS_Wstring_copy** (**DDS_Wchar** *dst, const **DDS_Wchar** *src)

  Copy the source string over the destination string reallocating the space if it's necessary.
- **DDS_Wchar** * **DDS_Wstring_copy_and_widen** (**DDS_Wchar** *dst, const char *src)

  Copy the source string over the destination string, widening each character.
- **DDS_Wchar** * **DDS_Wstring_dup** (const **DDS_Wchar** *str)

  Clone a string of wide characters. Creates a new string that duplicates the value of `string`*.*
- **DDS_Wchar** * **DDS_Wstring_dup_and_widen** (const char *str)

  Clone a string of characters as a string of wide characters.
- void **DDS_Wstring_free** (**DDS_Wchar** *str)

  Delete a string.

5.221.1 Detailed Description

<<***extension***>> *(*p. *1014)* String creation, cloning, assignment, and deletion.

The functions in this class ensure consistent cross-platform implementations for string creation (**DDS_String_alloc()** (p. 1528)), deletion (**DDS_String_free()** (p. 1529)), and cloning (**DDS_String_dup()** (p. 1528)) that preserve the mutable value type semantics. These are to be viewed as functions that define a `string` class whose data is represented by a `'char*'`.

5.221.2 String Conventions

The following conventions govern the memory management of strings in RTI Connext.

- The DDS implementation ensures that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the `string` class functions.
  - Value types containing strings have ownership of the contained string. Thus, when a value type is deleted, the contained string field is also deleted.
  - **DDS_StringSeq** (p. 2010) is a value type that contains strings; it owns the memory for the contained strings. When a **DDS_StringSeq** (p. 2010) is assigned or deleted, the contained strings are also assigned or deleted respectively.
- The user must ensure that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the String class functions.

The representation of a string in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a string. RTI Connext must therefore make some assumptions when a user requests that a string be copied into. The following rules apply when RTI Connext is copying into a string or string sequence:

- If the 'char∗' is NULL, RTI Connext will log a warning and allocate a new string on behalf of the user. *To avoid leaking memory, you must ensure that the string will be freed (see **Usage** (p. 1527) below).*
- If the 'char∗' is not NULL, RTI Connext will assume that you are managing the string's memory yourself and have allocated enough memory to store the string to be copied. *RTI Connext will copy into your memory; to avoid memory corruption, be sure to allocate enough of it.* Also, *do not pass structures containing junk pointers into RTI Connext*; you are likely to crash.

5.221.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating strings.

```
Always use
     DDS_String_alloc() to create,
     DDS_String_dup() to clone,
     DDS_String_free() to delete
 a string 'char*' that is passed back and forth between
 user code and the DDS C/C++ APIs.
```

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS_String_alloc()** (p. 1528), **DDS_String_dup()** (p. 1528), with matching occurrences of **DDS_String_free()** (p. 1529) in the code.
- Finalize value types containing strings. In C++ the destructor accomplishes this automatically. in C, explicit "destructor" functions are provided; these functions are typically called "finalize."

Note

When dealing with the **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1926) and **DDS_Multi↩ ChannelQosPolicy::filter_name** (p. 1861) fields, we advise taking a look at the sample code for how to properly assign new values and free the old ones.

DDS_StringSeq (p. 2010)

5.221.4 Function Documentation

5.221.4.1 DDS_String_alloc()

```
char * DDS_String_alloc (
            size_t length )
```

Create a new empty string that can hold up to `length` characters.

A string created by this function must be deleted using **DDS_String_free()** (p. 1529).

This function will allocate enough memory to hold a string of `length` characters, **plus** one additional byte to hold the NULL terminating character.

Parameters

length	<<***in***>> *(p. 1015)* Capacity of the string.

Returns

A newly created non-NULL string upon success or NULL upon failure.

Examples

HelloWorld.c.

5.221.4.2 DDS_String_dup()

```
char * DDS_String_dup (
            const char * str )
```

Clone a string. Creates a new string that duplicates the value of `string`.

A string created by this function must be deleted using **DDS_String_free()** (p. 1529)

Parameters

str	<<***in***>> *(p. 1015)* The string to duplicate.

Returns

If `string` == NULL, this function always returns NULL. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns NULL.

5.221.4.3 DDS_String_replace()

```
char * DDS_String_replace (
            char ** string_ptr,
            const char * new_value )
```

Assign a new value to a string. Replaces the string pointed to by `string_ptr`, with a string whose value is `new_value`.

A string created by this function must be deleted using **DDS_String_free()** (p. 1529).

This function is most commonly used when manipulating string sequences, **DDS_StringSeq** (p. 2010).

Precondition

`string_ptr` be a non-NULL pointer. *string_ptr must be either NULL, or a string created using **DDS_String_alloc()** (p. 1528) or **DDS_String_dup()** (p. 1528), or **DDS_String_replace()** (p. 1529).

Parameters

string_ptr	<<***inout***>> *(p. 1015)* Pointer to the string to replace.
new_value	<<***in***>> *(p. 1015)* The value of the replacement string.

Returns

If `new_value` = NULL, this function always returns NULL. Otherwise, upon success it returns *string_ptr whose value is `new_value`; upon failure it returns NULL.

Postcondition

If `new_value` = NULL, *string_ptr == NULL. Otherwise, upon success `string_ptr` contains a pointer to a string whose value is `new_value`; upon failure, `string_ptr` is left unchanged.

5.221.4.4 DDS_String_free()

```
void DDS_String_free (
            char * str )
```

Delete a string.

Precondition

`string` must be either NULL, or must have been created using **DDS_String_alloc()** (p. 1528), **DDS_String_↩ dup()** (p. 1528)

Parameters

str	<<***in***>> *(p. 1015)* The string to delete.

Examples

HelloWorld.c.

5.221.4.5 DDS_Wstring_alloc()

```
DDS_Wchar * DDS_Wstring_alloc (
            DDS_UnsignedLong length )
```

Create a new empty string that can hold up to `length` wide characters.

A string created by this function must be deleted using **DDS_Wstring_free()** (p. 1532)

This function will allocate enough memory to hold a string of `length` characters, **plus** one additional wide character to hold the NULL terminator.

Parameters

length	<<***in***>> *(p. 1015)* Capacity of the string.

Returns

A newly created non-NULL string upon success or NULL upon failure.

5.221.4.6 DDS_Wstring_length()

```
DDS_UnsignedLong DDS_Wstring_length (
            const  DDS_Wchar * str )
```

Get the number of wide characters in the given string.

The result does not count the terminating zero character.

Parameters

str	<<***in***>> *(*p. *1015)* A non-NULL string.

Returns

The number of wide characters in the string.

5.221.4.7 DDS_Wstring_copy()

```
DDS_Wchar * DDS_Wstring_copy (
             DDS_Wchar * dst,
            const  DDS_Wchar * src )
```

Copy the source string over the destination string reallocating the space if it's necessary.

Parameters

dst	
src	

Returns

`dst`

5.221.4.8 DDS_Wstring_copy_and_widen()

```
DDS_Wchar * DDS_Wstring_copy_and_widen (
             DDS_Wchar * dst,
            const char * src )
```

Copy the source string over the destination string, widening each character.

Parameters

dst	<<***in***>> *(*p. *1015)* A non-NULL string to be overwritten by `src`.
src	<<***in***>> *(*p. *1015)* A non-NULL string to be copied over `dst`

Returns

dst

5.221.4.9 DDS_Wstring_dup()

```
DDS_Wchar * DDS_Wstring_dup (
            const  DDS_Wchar * str )
```

Clone a string of wide characters. Creates a new string that duplicates the value of `string`.

A string created by this function must be deleted using **DDS_Wstring_free()** (p. 1532).

Parameters

str	<<***in***>> *(p. 1015)* The string to duplicate.

Returns

If `string` == NULL, this function always returns NULL. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns NULL.

5.221.4.10 DDS_Wstring_dup_and_widen()

```
DDS_Wchar * DDS_Wstring_dup_and_widen (
            const char * str )
```

Clone a string of characters as a string of wide characters.

A string created by this function must be deleted using **DDS_Wstring_free()** (p. 1532)

Parameters

str	<<***in***>> *(p. 1015)* The string to duplicate.

Returns

If `string` == NULL, this function always returns NULL. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns NULL.

5.221.4.11 DDS_Wstring_free()

```
void DDS_Wstring_free (
            DDS_Wchar * str )
```

Delete a string.

Precondition

`string` must either NULL, or must have been created using **DDS_Wstring_alloc()** (p. 1530), **DDS_Wstring_dup()** (p. 1532), or DDS_Wstring_replace()

Parameters

str	<<***in***>> *(p. 1015)* The string to delete.

Chapter 6

Data Structure Documentation

6.1 DDS_AcknowledgmentInfo Struct Reference

Information about an application-level acknowledged sample.

Data Fields

- **DDS_InstanceHandle_t subscription_handle**

  *Subscription handle of the acknowledging **DDS_DataReader** (p. 618).*
- struct **DDS_SampleIdentity_t sample_identity**

  Identity of the sample being acknowledged.
- **DDS_Boolean valid_response_data**

  Flag indicating validity of the user response data in the acknowledgment.
- struct **DDS_AckResponseData_t response_data**

  User data payload of application-level acknowledgment message.

6.1.1 Detailed Description

Information about an application-level acknowledged sample.

When acknowledging a sample, the reader provides the writer with information about the sample being acknowledged. The AcknowledgmentInfo structure provides the identity and cookie of the sample being acknowledged, as well as user data payload provided by the reader.

6.1.2 Field Documentation

6.1.2.1 subscription_handle

DDS_InstanceHandle_t DDS_AcknowledgmentInfo::subscription_handle

Subscription handle of the acknowledging **DDS_DataReader** (p. 618).

6.1.2.2 sample_identity

struct **DDS_SampleIdentity_t** DDS_AcknowledgmentInfo::sample_identity

Identity of the sample being acknowledged.

See also

DDS_SampleIdentity_t (p. 1989)

6.1.2.3 valid_response_data

DDS_Boolean DDS_AcknowledgmentInfo::valid_response_data

Flag indicating validity of the user response data in the acknowledgment.

This flag is true when the **DDS_RtpsReliableReaderProtocol_t::min_app_ack_response_keep_duration** (p. 1963) has not yet elapsed for the acknowledgment's response data.

The flag is false when that duration has elapsed for the response data.

6.1.2.4 response_data

struct **DDS_AckResponseData_t** DDS_AcknowledgmentInfo::response_data

User data payload of application-level acknowledgment message.

Response data set by **DDS_DataReader** (p. 618) when sample was acknowledged.

6.2 DDS_AckResponseData_t Struct Reference

Data payload of an application-level acknowledgment.

Data Fields

- struct **DDS_OctetSeq value**
  a sequence of octets

6.2.1 Detailed Description

Data payload of an application-level acknowledgment.

6.2.2 Field Documentation

6.2.2.1 value

`struct` **`DDS_OctetSeq`** `DDS_AckResponseData_t::value`

a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0, **DDS_DataReaderResourceLimitsQosPolicy::max_app_ack_response_length** (p. 1633)],

6.3 DDS_AllocationSettings_t Struct Reference

Resource allocation settings.

Data Fields

- **DDS_Long initial_count**
  The initial count of resources.
- **DDS_Long max_count**
  The maximum count of resources.
- **DDS_Long incremental_count**
  The incremental count of resources.

6.3.1 Detailed Description

Resource allocation settings.

QoS:

DDS_DomainParticipantResourceLimitsQosPolicy (p. 1733)

6.3.2 Field Documentation

6.3.2.1 initial_count

DDS_Long DDS_AllocationSettings_t::initial_count

The initial count of resources.

The initial resources to be allocated.

[default] It depends on the case.

[range] [0, 1 million], <= max_count

6.3.2.2 max_count

DDS_Long DDS_AllocationSettings_t::max_count

The maximum count of resources.

The maximum resources to be allocated.

[default] Depends on the case.

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_count

6.3.2.3 incremental_count

DDS_Long DDS_AllocationSettings_t::incremental_count

The incremental count of resources.

The resource to be allocated when more resources are needed.

[default] Depends on the case.

[range] -1 (Double the amount of extra memory allocated each time memory is needed) or [1,1 million] (or = 0 only if initial_count == max_count)

6.4 DDS_AnnotationParameterValue Struct Reference

Annotation parameter value.

6.4.1 Detailed Description

Annotation parameter value.

This structure is use to represent an annotation parameter value. For example, the value of the annotation **[default]** for an aggregation type member.

6.5 DDS_AsynchronousPublisherQosPolicy Struct Reference

*<<**extension**>> (p. 796)* Configures the mechanism that sends user data in an external middleware thread.

Data Fields

- **DDS_Boolean disable_asynchronous_write**
  *[DEPRECATED] (p. **968**) <<**extension**>> (p. 796) Disable asynchronous publishing.*
- struct **DDS_ThreadSettings_t thread**
  *<<**extension**>> (p. 796) Settings of the publishing thread.*
- **DDS_Boolean disable_asynchronous_batch**
  *[DEPRECATED] (p. **968**) <<**extension**>> (p. 796) Disable asynchronous batch flushing.*
- struct **DDS_ThreadSettings_t asynchronous_batch_thread**
  *<<**extension**>> (p. 796) Settings of the batch flushing thread.*
- **DDS_Boolean disable_topic_query_publication**
  *[DEPRECATED] (p. **968**) <<**extension**>> (p. 796) Disable topic query publication.*
- struct **DDS_ThreadSettings_t topic_query_publication_thread**
  *<<**extension**>> (p. 796) Settings of the **DDS_TopicQuery** (p. 708) publication thread.*

6.5.1 Detailed Description

*<<**extension**>> (p. 796)* Configures the mechanism that sends user data in an external middleware thread.

Specifies the asynchronous publishing and asynchronous batch flushing settings of the **DDS_Publisher** (p. 446) instances.

The QoS policy specifies whether asynchronous publishing and asynchronous batch flushing are enabled for the **DDS_DataWriter** (p. 488) entities belonging to this **DDS_Publisher** (p. 446). If so, the publisher will spawn up to two threads, one for asynchronous publishing and one for asynchronous batch flushing.

This policy also configures the settings of the **DDS_TopicQuery** (p. 708) publication thread. The publisher will spawn this thread only if one or more DataWriters enable TopicQueries.

See also

DDS_BatchQosPolicy (p. 1552).

DDS_PublishModeQosPolicy (p. 1924).

Entity:

DDS_Publisher (p. 446)

Properties:

RxO (p. 1247) = N/A

Changeable (p. 1247) = **NO** (p. 1247)

6.5.2 Usage

You can use this QoS policy to reduce the amount of time your application thread spends sending data.

The asynchronous *publisher* thread is shared by all **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321) **DDS_DataWriter** (p. 488) instances that belong to this publisher and handles their data transmission chores.

The asynchronous *batch flushing* thread is shared by all **DDS_DataWriter** (p. 488) instances with batching enabled that belong to this publisher.

This QoS policy also allows you to adjust the settings of the asynchronous publishing and the asynchronous batch flushing threads. To use different threads for two different **DDS_DataWriter** (p. 488) entities, the instances must belong to different **DDS_Publisher** (p. 446) instances.

A **DDS_Publisher** (p. 446) must have asynchronous publishing enabled for its **DDS_DataWriter** (p. 488) instances to write asynchronously.

A **DDS_Publisher** (p. 446) must have asynchronous batch flushing enabled in order to flush the batches of its **DDS_DataWriter** (p. 488) instances asynchronously. However, no asynchronous batch flushing thread will be started until the first **DDS_DataWriter** (p. 488) instance with batching enabled is created from this **DDS_Publisher** (p. 446).

6.5.3 Field Documentation

6.5.3.1 disable_asynchronous_write

```
DDS_Boolean DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_write
```

[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Disable asynchronous publishing.

If set to **DDS_BOOLEAN_TRUE** (p. 1203), any **DDS_DataWriter** (p. 488) created with **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224).

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Flow Control** (p. 865), **Concurrency** (p. 841)

6.5.3.2 thread

```
struct DDS_ThreadSettings_t DDS_AsynchronousPublisherQosPolicy::thread
```

<<***extension***>> *(p. 796)* Settings of the publishing thread.

6.6 DDS_AsyncWaitSetListener Struct Reference

<<***interface***>> *(*p. *1015)* Listener for receiving event notifications related to the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

Data Fields

- void * **listener_data**

  A place for listener implementors to keep a pointer to data that may be needed by their listener.
- **DDS_AsyncWaitSetListener_OnThreadSpawnedCallback on_thread_spawned**

  *Handles the spawning of each thread comprising the thread pool of the **DDS_AsyncWaitSet** (*p. *1072).*
- **DDS_AsyncWaitSetListener_OnThreadDeletedCallback on_thread_deleted**

  *Handles the deletion of each thread comprising the thread pool of the **DDS_AsyncWaitSet** (*p. *1072).*
- **DDS_AsyncWaitSetListener_OnWaitTimeoutCallback on_wait_timeout**

  *Handles the wait timeout generated by the leader thread of the **DDS_AsyncWaitSet** (*p. *1072).*

6.6.1 Detailed Description

<<***interface***>> *(p. 1015)* Listener for receiving event notifications related to the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

6.6.2 Field Documentation

6.6.2.1 listener_data

```
void* DDS_AsyncWaitSetListener::listener_data
```

A place for listener implementors to keep a pointer to data that may be needed by their listener.

6.6.2.2 on_thread_spawned

DDS_AsyncWaitSetListener_OnThreadSpawnedCallback DDS_AsyncWaitSetListener::on_thread_spawned

Handles the spawning of each thread comprising the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

6.6.2.3 on_thread_deleted

DDS_AsyncWaitSetListener_OnThreadDeletedCallback DDS_AsyncWaitSetListener::on_thread_deleted

Handles the deletion of each thread comprising the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

6.6.2.4 on_wait_timeout

DDS_AsyncWaitSetListener_OnWaitTimeoutCallback DDS_AsyncWaitSetListener::on_wait_timeout

Handles the wait timeout generated by the leader thread of the **DDS_AsyncWaitSet** (p. 1072).

6.7 DDS_AsyncWaitSetProperty_t Struct Reference

Specifies the **DDS_AsyncWaitSet** (p. 1072) behavior.

Data Fields

- struct **DDS_WaitSetProperty_t waitset_property**

  *Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **DDS_WaitSet** (p. 1373).*
- **DDS_UnsignedLong thread_pool_size**

  *Number of threads that comprise the thread pool of the **DDS_AsyncWaitSet** (p. 1072).*
- struct **DDS_ThreadSettings_t thread_settings**

  ***DDS_ThreadSettings_t** (p. 2035) for each thread comprising the thread pool of the **DDS_AsyncWaitSet** (p. 1072).*
- char * **thread_name_prefix**

  *Prefix used to compose the name of each thread that comprises the thread pool of the **DDS_AsyncWaitSet** (p. 1072).*
- struct **DDS_Duration_t wait_timeout**

  Asynchronous wait timeout.
- **DDS_Long level**

  *Specifies the level of an **DDS_AsyncWaitSet** (p. 1072).*

6.7.1 Detailed Description

Specifies the **DDS_AsyncWaitSet** (p. 1072) behavior.

This property allows configuring the behavior of the asynchronous wait and the **DDS_Condition** (p. 1372) dispatch, as well as the parameters of the thread pool.

See also

DDS_WaitSetProperty_t (p. 2097)

DDS_ThreadSettings_t (p. 2035)

6.7.2 Field Documentation

6.7.2.1 waitset_property

`struct` **`DDS_WaitSetProperty_t`** `DDS_AsyncWaitSetProperty_t::waitset_property`

Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **DDS_WaitSet** (p. 1373).

[default] DDS_WaitSetProperty_t_INITIALIZER (p. 1371)

See also

DDS_WaitSetProperty_t (p. 2097)

6.7.2.2 thread_pool_size

```
DDS_UnsignedLong DDS_AsyncWaitSetProperty_t::thread_pool_size
```

Number of threads that comprise the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

Size must be equal to or greater than one.

[default] 1

6.7.2.3 thread_settings

```
struct DDS_ThreadSettings_t DDS_AsyncWaitSetProperty_t::thread_settings
```

DDS_ThreadSettings_t (p. 2035) for each thread comprising the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

Each thread within the pool is created with the same settings.

[default] Default thread settings values.

See also

DDS_ThreadSettings_t (p. 2035)

6.7.2.4 thread_name_prefix

```
char* DDS_AsyncWaitSetProperty_t::thread_name_prefix
```

Prefix used to compose the name of each thread that comprises the thread pool of the **DDS_AsyncWaitSet** (p. 1072).

The composed name has the form:

`thread_name_prefix##[index]AWs` where [index] is an integer that identifies the thread relative to the **DDS↩ _AsyncWaitSet** (p. 1072).

If NULL, the default prefix will be used.

[default] NULL (use default prefix)

6.7.2.5 wait_timeout

```
struct DDS_Duration_t DDS_AsyncWaitSetProperty_t::wait_timeout
```

Asynchronous wait timeout.

Specifies the maximum amount of time the leader thread of the **DDS_AsyncWaitSet** (p. 1072) waits for an attached **DDS_Condition** (p. 1372) to trigger before it wakes up.

Duration must be a value greater than zero.

See also

DDS_WaitSet_wait (p. 1383)

[default] DDS_DURATION_INFINITE (p. 1210)

6.7.2.6 level

```
DDS_Long DDS_AsyncWaitSetProperty_t::level
```

Specifies the level of an **DDS_AsyncWaitSet** (p. 1072).

The level prevents an application to deadlock when it uses multiple **DDS_AsyncWaitSet** (p. 1072) instances that call operations on each other from the context of one of their thread pool's thread.

Inside the context of one of these threads, the application can synchronize only with other **DDS_AsyncWaitSet** (p. 1072) of bigger level.

[default] 1

6.8 DDS_AvailabilityQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Configures the availability of data.

Data Fields

- **DDS_Boolean enable_required_subscriptions**

  <<***extension***>> *(p. 796) Enables support for required subscriptions in a* ***DDS_DataWriter*** *(p. 488)*
- struct **DDS_Duration_t max_data_availability_waiting_time**

  <<***extension***>> *(p. 796) Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.*
- struct **DDS_Duration_t max_endpoint_availability_waiting_time**

  <<***extension***>> *(p. 796) Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).*
- struct **DDS_EndpointGroupSeq required_matched_endpoint_groups**

  <<***extension***>> *(p. 796) A sequence of endpoint groups.*

6.8.1 Detailed Description

<<***extension***>> *(*p. *796)* Configures the availability of data.

Entity:

DDS_DataReader (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **YES** (p. 1247) (only on a **DDS_DataWriter** (p. 488) except for the member **DDS_↩ AvailabilityQosPolicy::enable_required_subscriptions** (p. 1550))

6.8.2 Usage

This QoS policy is used in the context of two features:

- Collaborative DataWriters
- Required Subscriptions

Collaborative DataWriters

The Collaborative DataWriters feature allows having multiple DataWriters publishing samples from a common logical data source. The DataReaders will combine the samples coming from the DataWriters in order to reconstruct the correct order at the source.

This QoS policy allows you to configure the ordering and combination process in the DataReader and can be used to support two different use cases:

- **Ordered delivery of samples in high-availability scenarios** One example of this is RTI Persistence Service. When a late-joining DataReader configured with **DDS_DurabilityQosPolicy** (p. 1762) set to **DDS_↩ PERSISTENT_DURABILITY_QOS** (p. 1290) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290) joins a DDS domain, it will start receiving historical samples from multiple DataWriters. For example, if the original DataWriter is still alive, the newly created DataReader will receive samples from the original DataWriter and one or more RTI Persistence Service DataWriters (PRSTDataWriters). This policy can be used to configure the sample ordering process on the DataReader.

- **Ordered delivery of samples in load-balanced scenarios** Multiple instances of the same application can work together to process and deliver samples. When the samples arrive through different data-paths out of order, the DataReader will be able to reconstruct the order at the destination. An example of this is when multiple instances of RTI Persistence Service are used to persist the data. Persisting data to a database on disk can be a bottleneck for throughput. You can improve scalability and performance by dividing the workload across different instances of RTI Persistence Service that use different databases. For example, samples larger than 10 are persisted by Persistence Service 1, samples less than or equal to 10 are persisted by Persistence Service 2.

- **Ordered delivery of samples with Group Ordered Access** This policy can also be used to configure the sample ordering process when the Subscriber is configured with **DDS_PresentationQosPolicy** (p. 1894) access_scope set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307). In this case, the Subscriber must deliver in order the samples published by a group of DataWriters that belong to the same Publisher and have access_scope set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307).

Each sample published in a DDS domain for a given logical data source is uniquely identified by a pair (virtual GUID, virtual sequence number). Samples from the same data source (same virtual GUID) can be published by different DataWriters. A DataReader will deliver a sample (VGUIDn, VSNm) to the application if one of the following conditions is satisfied:

- (VGUIDn, VSNm-1) has already been delivered to the application.
- All the known DataWriters publishing VGUIDn have announced that they do not have (VGUIDn, VSNm-1).
- None of the known DataWriters publishing GUIDn have announced potential availability of (VGUIDn, VSNm-1) and both timeouts in this QoS policy have expired.

A DataWriter announces potential availability of samples by using virtual heartbeats (HBs).

When **DDS_PresentationQosPolicy::access_scope** (p. 1897) is set to **DDS_TOPIC_PRESENTATION_QOS** (p. 1307) or **DDS_INSTANCE_PRESENTATION_QOS** (p. 1307), the virtual HB contains information about the samples contained in the **DDS_DataWriter** (p. 488) history.

When **DDS_PresentationQosPolicy::access_scope** (p. 1897) is set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307), the virtual HB contains information about all DataWriters in the **DDS_Publisher** (p. 446).

The frequency at which virtual HBs are sent is controlled by the protocol parameters **DDS_RtpsReliableWriter↩ Protocol_t::virtual_heartbeat_period** (p. 1970) and **DDS_RtpsReliableWriterProtocol_t::samples_per_virtual_↩ heartbeat** (p. 1970).

Required Subscriptions

In the context of Required Subscriptions, this QoS policy can be used to configure a set of Required Subscriptions on a **DDS_DataWriter** (p. 488).

Required subscriptions are preconfigured, named subscriptions that may leave and subsequently rejoin the network from time to time, at the same or different physical locations. Any time a required subscription is disconnected, any samples that would have been delivered to it are stored for delivery if and when the subscription rejoins the network.

6.8.3 Consistency

For a DataWriter, the setting of **AVAILABILITY** (p. 1252) must be set consistenly with that of the **RELIABILITY** (p. 1323) and **DURABILITY** (p. 1287).

If **DDS_AvailabilityQosPolicy::enable_required_subscriptions** (p. 1550) is set to **DDS_BOOLEAN_TRUE** (p. 1203), **DDS_ReliabilityQosPolicy::kind** (p. 1943) must be set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325), **DDS_↩ DurabilityQosPolicy** (p. 1762) must be set to a value different than **DDS_VOLATILE_DURABILITY_QOS** (p. 1289), and **DDS_DurabilityQosPolicy::writer_depth** (p. 1765) must be set to either **DDS_AUTO_WRITER_DEPTH** (p. 1290) or **DDS_LENGTH_UNLIMITED** (p. 1328).

6.8.4 Field Documentation

6.8.4.1 enable_required_subscriptions

```
DDS_Boolean DDS_AvailabilityQosPolicy::enable_required_subscriptions
```

<<***extension***>> *(*p. *796)* Enables support for required subscriptions in a **DDS_DataWriter** (p. 488)

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Durability** (p. 861), **Data Availability** (p. 844)

6.8.4.2 max_data_availability_waiting_time

```
struct DDS_Duration_t DDS_AvailabilityQosPolicy::max_data_availability_waiting_time
```

<<***extension***>> *(*p. *796)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.

Collaborative DataWriters

A sample identified by (VGUIDn, VSNm) will be delivered to the application if this timeout expires for the sample and the following two conditions are satisfied:

- None of the known DataWriters publishing VGUIDn have announced potential availability of (VGUIDn, VSNm-1).
- The DataWriters for all the endpoint groups specified in **required_matched_endpoint_groups** (p. 1551) have been discovered or **max_endpoint_availability_waiting_time** (p. 1550) has expired.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] DDS_DURATION_AUTO (p. 1211) (**DDS_DURATION_INFINITE** (p. 1210) for **DDS_GROUP_PRESENTATION_QOS** (p. 1307). Otherwise, 0 seconds)

[range] [0, **DDS_DURATION_INFINITE** (p. 1210)], **DDS_DURATION_AUTO** (p. 1211)

Categories

Mutable (p. 952), **Reliability** (p. 897), **Durability** (p. 861), **Data Availability** (p. 844)

6.8.4.3 max_endpoint_availability_waiting_time

`struct` **`DDS_Duration_t`** `DDS_AvailabilityQosPolicy::max_endpoint_availability_waiting_time`

<<***extension***>> *(p. 796)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).

Collaborative DataWriters

The set of endpoint groups that are required to provide samples for a data source can be configured using **required_matched_endpoint_groups** (p. 1551).

A non-consecutive sample identified by (VGUIDn, VSNm) cannot be delivered to the application unless DataWriters for all the endpoint groups in **required_matched_endpoint_groups** (p. 1551) are discovered or this timeout expires.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] DDS_DURATION_AUTO (p. 1211) (**DDS_DURATION_INFINITE** (p. 1210) for **DDS_GROUP_PRESENTATION_QOS** (p. 1307). Otherwise, 0 seconds)

[range] [0, **DDS_DURATION_INFINITE** (p. 1210)], **DDS_DURATION_AUTO** (p. 1211)

Categories

Mutable (p. 952), **Reliability** (p. 897), **Durability** (p. 861), **Data Availability** (p. 844)

6.8.4.4 required_matched_endpoint_groups

`struct` **`DDS_EndpointGroupSeq`** `DDS_AvailabilityQosPolicy::required_matched_endpoint_groups`

<<***extension***>> *(p. 796)* A sequence of endpoint groups.

Collaborative DataWriters

In the context of Collaborative DataWriters, it specifies the set of endpoint groups that are expected to provide samples for the same data source.

The quorum count in a group represents the number of DataWriters that must be discovered for that group before the DataReader is allowed to provide non consecutive samples to the application.

A DataWriter becomes a member of an endpoint group by configuring the role_name in **DDS_DataWriterQos::publication_name** (p. 1673).

Required Subscriptions

In the context of Required Subscriptions, it specifies the set of Required Subscriptions on a **DDS_DataWriter** (p. 488).

Each Required Subscription is specified by a name and a quorum count.

The quorum count represents the number of DataReaders that have to acknowledge the sample before it can be considered fully acknowledged for that Required Subscription.

A DataReader is associated with a Required Subscription by configuring the role_name in **DDS_DataReaderQos::subscription_name** (p. 1617).

[default] Empty sequence

Categories

Mutable (p. 952), **Reliability** (p. 897), **Durability** (p. 861), **Data Availability** (p. 844)

6.9 DDS_BatchQosPolicy Struct Reference

*<<**extension**>> (p. 796)* Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

Data Fields

- **DDS_Boolean enable**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) Specifies whether or not batching is enabled.*
- **DDS_Long max_data_bytes**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) The maximum cumulative length of all serialized samples in a batch.*
- **DDS_Long max_samples**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) The maximum number of samples in a batch.*
- struct **DDS_Duration_t max_flush_delay**

  *<<**extension**>> (p. 796) The maximum flush delay.*
- struct **DDS_Duration_t source_timestamp_resolution**

  *<<**extension**>> (p. 796) Batch source timestamp resolution.*
- **DDS_Boolean thread_safe_write**

  *<<**extension**>> (p. 796) Determines whether or not the write operation is thread safe.*

6.9.1 Detailed Description

*<<**extension**>> (p. 796)* Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

This QoS policy configures the ability of the middleware to collect multiple user data samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

This QoS policy can be used to dramatically increase effective throughput for small data samples. Usually, throughput for small samples (size $<$ 2048 bytes) is limited by CPU capacity and not by network bandwidth. Batching many smaller samples to be sent in a single large packet will increase network utilization, and thus throughput, in terms of samples per second.

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.9.2 Field Documentation

6.9.2.1 enable

```
DDS_Boolean DDS_BatchQosPolicy::enable
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Specifies whether or not batching is enabled.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Batching** (p. 840), **Throughput** (p. 910)

6.9.2.2 max_data_bytes

```
DDS_Long DDS_BatchQosPolicy::max_data_bytes
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The maximum cumulative length of all serialized samples in a batch.

A batch is flushed automatically when this maximum is reached.

max_data_bytes does not include the meta data associated with the batch samples. Each sample has at least 8 bytes of meta data containing information such as the timestamp and sequence number. The meta data can be as large as 52 bytes for keyed topics and 20 bytes for unkeyed topics.

Note: Batches must contain whole samples. If a new batch is started and its initial sample causes the serialized size to exceed max_data_bytes, RTI Connext will send the sample in a single batch.

[default] 1024

[range] [1,**DDS_LENGTH_UNLIMITED** (p. 1328)]

6.9.3 Consistency

The setting of **DDS_BatchQosPolicy::max_data_bytes** (p. 1553) must be consistent with **DDS_BatchQosPolicy**↩ **::max_samples** (p. 1553). For these two values to be consistent, they cannot be both **DDS_LENGTH_UNLIMITED** (p. 1328).

Categories

Immutable (p. 916), **Batching** (p. 840), **Throughput** (p. 910)

6.9.3.1 max_samples

```
DDS_Long DDS_BatchQosPolicy::max_samples
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The maximum number of samples in a batch.

A batch is flushed automatically when this maximum is reached.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1,**DDS_LENGTH_UNLIMITED** (p. 1328)]

6.9.4 Consistency

The setting of **DDS_BatchQosPolicy::max_samples** (p. 1553) must be consistent with **DDS_BatchQosPolicy::max_data_bytes** (p. 1553). For these two values to be consistent, they cannot be both **DDS_LENGTH_UNLIMITED** (p. 1328).

Categories

Immutable (p. 916), **Batching** (p. 840), **Throughput** (p. 910)

6.9.4.1 max_flush_delay

```
struct DDS_Duration_t DDS_BatchQosPolicy::max_flush_delay
```

<<***extension***>> *(p. 796)* The maximum flush delay.

A batch is flushed automatically after the delay specified by this parameter.

The delay is measured from the time the first sample in the batch is written by the application.

[default] DDS_DURATION_INFINITE (p. 1210)

[range] [0,**DDS_DURATION_INFINITE** (p. 1210)]

6.9.5 Consistency

The setting of **DDS_BatchQosPolicy::max_flush_delay** (p. 1554) must be consistent with **DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_batch** (p. 1541) and **DDS_BatchQosPolicy::thread_safe_write** (p. 1555). If the delay is different than **DDS_DURATION_INFINITE** (p. 1210), **DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_batch** (p. 1541) must be set to **DDS_BOOLEAN_FALSE** (p. 1203) and **DDS_BatchQosPolicy::thread_safe_write** (p. 1555) must be set to **DDS_BOOLEAN_TRUE** (p. 1203).

Categories

Immutable (p. 916), **Batching** (p. 840), **Throughput** (p. 910)

6.9.5.1 source_timestamp_resolution

```
struct DDS_Duration_t DDS_BatchQosPolicy::source_timestamp_resolution
```

<<***extension***>> *(p. 796)* Batch source timestamp resolution.

The value of this field determines how the source timestamp is associated with the samples in a batch.

A sample written with timestamp 't' inherits the source timestamp 't2' associated with the previous sample unless ('t' - 't2') > source_timestamp_resolution.

If source_timestamp_resolution is set to **DDS_DURATION_INFINITE** (p. 1210), every sample in the batch will share the source timestamp associated with the first sample.

If source_timestamp_resolution is set to zero, every sample in the batch will contain its own source timestamp corresponding to the moment when the sample was written.

The performance of the batching process is better when source_timestamp_resolution is set to **DDS_DURATION_INFINITE** (p. 1210).

[default] DDS_DURATION_INFINITE (p. 1210)

[range] [0,**DDS_DURATION_INFINITE** (p. 1210)]

6.9.6 Consistency

The setting of **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 1554) must be consistent with **DDS_BatchQosPolicy::thread_safe_write** (p. 1555). If **DDS_BatchQosPolicy::thread_safe_write** (p. 1555) is set to **DDS_BOOLEAN_FALSE** (p. 1203), **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 1554) must be set to **DDS_DURATION_INFINITE** (p. 1210).

Categories

Immutable (p. 916), **Batching** (p. 840), **Throughput** (p. 910), **Data Availability** (p. 844)

6.9.6.1 thread_safe_write

```
DDS_Boolean DDS_BatchQosPolicy::thread_safe_write
```

<<***extension***>> *(p. 796)* Determines whether or not the write operation is thread safe.

If this parameter is set to **DDS_BOOLEAN_TRUE** (p. 1203), multiple threads can call write on the **DDS_DataWriter** (p. 488) concurrently.

[default] DDS_BOOLEAN_TRUE (p. 1203)

6.9.7 Consistency

The setting of **DDS_BatchQosPolicy::thread_safe_write** (p. 1555) must be consistent with **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 1554). If **DDS_BatchQosPolicy::thread_safe_write** (p. 1555) is set to **DDS_BOOLEAN_FALSE** (p. 1203), **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 1554) must be set to **DDS_DURATION_INFINITE** (p. 1210).

6.12.1 Detailed Description

*<<**extension**>> (p. 796)* Built-in topic reader's resource limits.

Defines the resources that can be used for a built-in-topic data reader.

A built-in topic data reader subscribes reliably to built-in topics containing declarations of new entities or updates to existing entities in the domain. Keys are used to differentiate among entities of the same type. RTI Connext assigns a unique key to each entity in a domain.

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

QoS:

DDS_DiscoveryConfigQosPolicy (p. 1691)

6.12.2 Field Documentation

6.12.2.1 initial_samples

```
DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_samples
```

*<<**extension**>> (p. 796)* Initial number of samples.

This should be a value between 1 and initial number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently.

[default] 64

[range] [1, 1 million], <= max_samples

Categories

Immutable (p. 916), **Sample Memory Management** (p. 904), **Middleware Memory Management** (p. 880), **Durability** (p. 861)

6.12.2.2 max_samples

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_samples

<<***extension***>> *(p. 796)* Maximum number of samples.

This should be a value between 1 and max number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently. Also, it should not be less than initial_samples.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_samples

Categories

Immutable (p. 916), **Sample Memory Management** (p. 904), **Middleware Memory Management** (p. 880), **Durability** (p. 861)

6.12.2.3 initial_infos

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_infos

<<***extension***>> *(p. 796)* Initial number of sample infos.

The initial number of info units that a built-in topic **DDS_DataReader** (p. 618) can have. Info units are used to store **DDS_SampleInfo** (p. 1990).

[default] 64

[range] [1, 1 million] <= max_infos

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.12.2.4 max_infos

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_infos

<<***extension***>> *(p. 796)* Maximum number of sample infos.

The maximum number of info units that a built-in topic **DDS_DataReader** (p. 618) can use to store **DDS_SampleInfo** (p. 1990).

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_infos

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.12.2.5 initial_outstanding_reads

```
DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_outstanding_reads
```

<<***extension***>> *(p. 796)* The initial number of outstanding reads that have not called finish yet on the same built-in topic **DDS_DataReader** (p. 618).

Must be less than or equal to max_outstanding_reads.

[default] 2

[range] [1, 1024]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Data Availability** (p. 844)

6.12.2.6 max_outstanding_reads

```
DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_outstanding_reads
```

<<***extension***>> *(p. 796)* The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDS_DataReader** (p. 618).

Must be greater than or equal to initial_outstanding_reads.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1024] or **DDS_LENGTH_UNLIMITED** (p. 1328)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Data Availability** (p. 844)

6.12.2.7 max_samples_per_read

```
DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_samples_per_read
```

<<***extension***>> *(p. 796)* Maximum number of samples that can be read/taken on a same built-in topic **DDS_Data↩ Reader** (p. 618).

[default] 1024

[range] [1, 65536]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Data Availability** (p. 844)

6.12.2.8 disable_fragmentation_support

```
DDS_Boolean DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support
```

[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Determines whether the built-in topic **DDS_DataReader** (p. 618) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.12.2.9 max_fragmented_samples

```
DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_fragmented_samples
```

<<***extension***>> *(p. 796)* The maximum number of samples for which the built-in topic **DDS_DataReader** (p. 618) may store fragments at a given point in time.

At any given time, a built-in topic **DDS_DataReader** (p. 618) may store fragments for up to `max_fragmented_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different built-in topic **DDS_DataWriter** (p. 488) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS_BuiltinTopicReaderResourceLimits_t::max_samples** (p. 1558).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 1560) is **DDS_BOOLEAN_FALSE** (p. 1203).

[default] 1024

[range] [1, 1 million]

6.12.2.10 initial_fragmented_samples

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_fragmented_samples

<<***extension***>> *(p. 796)* The initial number of samples for which a built-in topic **DDS_DataReader** (p. 618) may store fragments.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 1560) is **DDS_↩ BOOLEAN_FALSE** (p. 1203).

[default] 4

[range] [1,1024], <= max_fragmented_samples

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.12.2.11 max_fragmented_samples_per_remote_writer

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_fragmented_samples_per_remote_writer

<<***extension***>> *(p. 796)* The maximum number of samples per remote writer for which a built-in topic **DDS_Data↩ Reader** (p. 618) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 1560) is **DDS_↩ BOOLEAN_FALSE** (p. 1203).

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.12.2.12 max_fragments_per_sample

```
DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_fragments_per_sample
```

<<***extension***>> *(p. 796)* Maximum number of fragments for a single sample.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 1560) is **DDS_BOOLEAN_FALSE** (p. 1203).

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.12.2.13 dynamically_allocate_fragmented_samples

```
DDS_Boolean DDS_BuiltinTopicReaderResourceLimits_t::dynamically_allocate_fragmented_samples
```

<<***extension***>> *(p. 796)* Determines whether the built-in topic **DDS_DataReader** (p. 618) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to **DDS_BOOLEAN_FALSE** (p. 1203), the middleware will allocate memory upfront for storing fragments for up to **DDS_DataReaderResourceLimitsQosPolicy::initial_fragmented_samples** (p. 1627) samples. This memory may grow up to **DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples** (p. 1626) if needed.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 1626) is **DDS_BOOLEAN_FALSE** (p. 1203).

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.13 DDS_ChannelSettings_t Struct Reference

<<***extension***>> *(p. 796)* Type used to configure the properties of a channel.

Data Fields

- struct **DDS_TransportMulticastSettingsSeq multicast_settings**

  <<***extension***>> *(p. 796) A sequence of* ***DDS_TransportMulticastSettings_t*** *(p. 2066) used to configure the multicast addresses associated with a channel.*
- char * **filter_expression**

  <<***extension***>> *(p. 796) A logical expression used to determine the data that will be published in the channel.*
- **DDS_Long priority**

  <<***extension***>> *(p. 796) Publication priority*

6.13.1 Detailed Description

<<***extension***>> *(p. 796)* Type used to configure the properties of a channel.

QoS:

DDS_MultiChannelQosPolicy (p. 1860)

6.13.2 Field Documentation

6.13.2.1 multicast_settings

`struct` **`DDS_TransportMulticastSettingsSeq`** `DDS_ChannelSettings_t::multicast_settings`

<<***extension***>> *(p. 796)* A sequence of **DDS_TransportMulticastSettings_t** (p. 2066) used to configure the multicast addresses associated with a channel.

The sequence cannot be empty.

The maximum number of multicast locators in a channel is limited to 16 (a locator is defined by a transport alias, a multicast address and a port). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_DomainParticipantQos** (p. 1729).

[default] Empty sequence (invalid value)

Categories

Immutable (p. 916), **Transports** (p. 911), **Content Filtering** (p. 843)

6.13.2.2 filter_expression

```
char* DDS_ChannelSettings_t::filter_expression
```

<<***extension***>> *(p. 796)* A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS_MultiChannelQosPolicy::filter_name** (p. 1861)

Important: This value must be an allocated string with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528). It should not be assigned to a string constant.

The filter expression length (including NULL-terminated character) cannot be greater than **DDS_DomainParticipant↩ ResourceLimitsQosPolicy::channel_filter_expression_max_length** (p. 1755).

See also

Queries and Filters Syntax (p. 739)

[default] NULL (invalid value)

Categories

Immutable (p. 916), **Content Filtering** (p. 843)

6.13.2.3 priority

```
DDS_Long DDS_ChannelSettings_t::priority
```

<<***extension***>> *(p. 796)* Publication priority

A positive integer value designating the relative priority of the channel, used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**DDS_ASYNCHRONOUS_PUBLISH_MODE↩ _QOS** (p. 1321)) with **DDS_FlowControllerProperty_t::scheduling_policy** (p. 1802) set to **DDS_HPF_FLOW_↩ CONTROLLER_SCHED_POLICY** (p. 564).

Larger numbers have higher priority.

If the publication priority of the channel is any value other than **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), then the channel's priority will take precedence over the data writer's priority.

If the publication priority of the channel is set to **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), then the channel's priority will be set to the value of the data writer's priority.

If the publicaton priority of both the data writer and the channel are **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), the channel will be assigned the lowest priority value.

If the publication priority of the channel is **DDS_PUBLICATION_PRIORITY_AUTOMATIC** (p. 1320), then the channel will be assigned the priority of the largest publication priority of all samples in the channel. The publication priority of each sample can be set in the **DDS_WriteParams_t** (p. 2107) of the **FooDataWriter_write_w_params** (p. 504) function.

[default] DDS_PUBLICATION_PRIORITY_UNDEFINED (p. 1320)

Categories

Immutable (p. 916), **Transports** (p. 911), **Data Availability** (p. 844)

6.14 DDS_ChannelSettingsSeq Struct Reference

Declares IDL sequence< **DDS_ChannelSettings_t** (p. 1564) >

6.14.1 Detailed Description

Declares IDL sequence< **DDS_ChannelSettings_t** (p. 1564) >

A sequence of **DDS_ChannelSettings_t** (p. 1564) used to configure the channels' properties. If the length of the sequence is zero, the **DDS_MultiChannelQosPolicy** (p. 1860) has no effect.

Instantiates:

6.16 DDS_CoherentSetInfo_t Struct Reference

<<***extension***>> *(*p. *1014)* Type definition for a coherent set info.

Data Fields

- **DDS_GUID_t group_guid**

  The coherent set group GUID.
- **DDS_SequenceNumber_t coherent_set_sequence_number**

  *Sequence number that identifies a sample as part of a **DDS_DataWriter** (p. 488) coherent set.*
- **DDS_SequenceNumber_t group_coherent_set_sequence_number**

  Sequence number that identifies a sample as part of a group coherent set.
- **DDS_Boolean incomplete_coherent_set**

  Indicates if a sample is part of an incomplete coherent set.

6.16.1 Detailed Description

<<***extension***>> *(p. 1014)* Type definition for a coherent set info.

A CoherentSetInfo provides information about the coherent set associated with a sample.

6.16.2 Field Documentation

6.16.2.1 group_guid

DDS_GUID_t DDS_CoherentSetInfo_t::group_guid

The coherent set group GUID.

This GUID identifies the **DDS_DataWriter** (p. 488) or the group of DataWriters publishing the coherent set, depending on the value of **DDS_PresentationQosPolicy::access_scope** (p. 1897) in the **DDS_Subscriber** (p. 575).

6.16.2.2 coherent_set_sequence_number

DDS_SequenceNumber_t DDS_CoherentSetInfo_t::coherent_set_sequence_number

Sequence number that identifies a sample as part of a **DDS_DataWriter** (p. 488) coherent set.

When **DDS_PresentationQosPolicy::access_scope** (p. 1897) in the **DDS_Subscriber** (p. 575) is set to **DDS_↩ INSTANCE_PRESENTATION_QOS** (p. 1307) or **DDS_TOPIC_PRESENTATION_QOS** (p. 1307), the coherent set associated with a sample is identified by the pair (group_guid, coherent_set_sequence_number).

6.16.2.3 group_coherent_set_sequence_number

```
DDS_SequenceNumber_t DDS_CoherentSetInfo_t::group_coherent_set_sequence_number
```

Sequence number that identifies a sample as part of a group coherent set.

When **DDS_PresentationQosPolicy::access_scope** (p. 1897) in the **DDS_Subscriber** (p. 575) is set to **DDS_↩ GROUP_PRESENTATION_QOS** (p. 1307), the coherent set associated with a sample is identified by the pair (group↩ _guid, group_coherent_set_sequence_number).

6.16.2.4 incomplete_coherent_set

```
DDS_Boolean DDS_CoherentSetInfo_t::incomplete_coherent_set
```

Indicates if a sample is part of an incomplete coherent set.

6.17 DDS_CompressionSettings_t Struct Reference

*<<**extension**>> (p. 796)* Settings related to compressing user data.

Data Fields

- **DDS_CompressionIdMask compression_ids**
  *<<**extension**>> (p. 796) Mask that represents the compression algorithms enabled.*
- **DDS_UnsignedLong writer_compression_level**
  *<<**extension**>> (p. 796) The level of compression to use when compressing data.*
- **DDS_Long writer_compression_threshold**
  *<<**extension**>> (p. 796) The threshold, in bytes, above which a serialized sample will be eligible to be compressed.*

6.17.1 Detailed Description

*<<**extension**>> (p. 796)* Settings related to compressing user data.

QoS:

DDS_DataRepresentationQosPolicy (p. 1639)

6.17.2 Field Documentation

6.17.2.1 compression_ids

DDS_CompressionIdMask DDS_CompressionSettings_t::compression_ids

<<***extension***>> *(p. 796)* Mask that represents the compression algorithms enabled.

A bitmap that represents the compression algorithm IDs (**DDS_CompressionIdMask** (p. 1264)) that are supported by the endpoint. The **DDS_DataWriter** (p. 488) creation will fail if more than one algorithm is provided.

If a **DDS_DataWriter** (p. 488) inherits multiple compression IDs from a **DDS_Topic** (p. 174), only the least significant bit enabled will be inherited. This forces the following order of preference: **DDS_COMPRESSION_ID_ZLIB** (p. 1264), **DDS_COMPRESSION_ID_BZIP2** (p. 1264), **DDS_COMPRESSION_ID_LZ4** (p. 1265).

Interactions with Security and Batching: Currently, the only algorithm that is supported when compression and batching are enabled on the same **DDS_DataWriter** (p. 488) is **DDS_COMPRESSION_ID_ZLIB** (p. 1264).

The combination of compression, batching, and data protection is supported. First, compression is applied to the entire batch. Then, data protection is applied to the compressed batch.

Note: When **DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose** (p. 1652) is enabled and a dispose message is sent, the serialized key is not compressed.

[default] For **DDS_Topic** (p. 174), **DDS_DataWriter** (p. 488) a **DDS_CompressionIdMask** (p. 1264) mask set to **DDS_COMPRESSION_ID_MASK_NONE** (p. 1262)

[default] For **DDS_DataReader** (p. 618) a **DDS_CompressionIdMask** (p. 1264) mask set to **DDS_COMPRESSION_ID_MASK_ALL** (p. 1262).

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Sending Large Data** (p. 873)

6.17.2.2 writer_compression_level

DDS_UnsignedLong DDS_CompressionSettings_t::writer_compression_level

<<***extension***>> *(p. 796)* The level of compression to use when compressing data.

Compression algorithms typically allow you to choose a level with which to compress the data. Each level has trade-offs between the resulting compression ratio and the speed of compression.

[range] [0, 10]

The value 1 represents the fastest compression time and the lowest compression ratio. The value 10 represents the slowest compression time but the highest compression ratio.

A value of 0 disables compression.

[default] DDS_COMPRESSION_LEVEL_BEST_COMPRESSION (p. 1262)

Note

Only available for a **DDS_DataWriter** (p. 488) and **DDS_Topic** (p. 174).

Categories

Immutable (p. 916), **Sending Large Data** (p. 873)

6.17.2.3 writer_compression_threshold

```
DDS_Long DDS_CompressionSettings_t::writer_compression_threshold
```

<<***extension***>> *(p. 796)* The threshold, in bytes, above which a serialized sample will be eligible to be compressed.

Any sample with a serialized size greater than or equal to the threshold will be eligible to be compressed. All samples with an eligible serialized size will be compressed. Only if the compressed size is smaller than the serialized size will the sample be stored and sent compressed on the wire.

For batching we check the maximum serialized size of the batch, calculated as serialized_sample_max_size * **DDS_BatchQosPolicy::max_samples** (p. 1553)

[range] [0, 2147483647] or **DDS_LENGTH_UNLIMITED** (p. 1328)

Setting the threshold to **DDS_LENGTH_UNLIMITED** (p. 1328) disables the compression.

[default] DDS_COMPRESSION_THRESHOLD_DEFAULT (p. 1263) (8192)

Note

Only available for a **DDS_DataWriter** (p. 488) and **DDS_Topic** (p. 174).

Categories

Immutable (p. 916), **Sending Large Data** (p. 873)

6.18 DDS_ConditionHandler Struct Reference

<<***extension***>> *(p. 1014)* <<***interface***>> *(p. 1015)* Handler called by the **DDS_Condition_dispatch** (p. 1377).

Data Fields

- void * **handler_data**

  A place for handler implementors to keep a pointer to data that may be needed by their handler.
- **DDS_ConditionHandler_OnConditionTriggeredCallback on_condition_triggered**

  *Handles the dispatch of a **DDS_Condition** (p. 1372).*

6.18.1 Detailed Description

<<***extension***>> *(p. 1014)* <<***interface***>> *(p. 1015)* Handler called by the **DDS_Condition_dispatch** (p. 1377).

Direct known implementations: **DDS_DataReaderStatusConditionHandler** (p. 1077)

6.18.2 Field Documentation

6.18.2.1 handler_data

```
void* DDS_ConditionHandler::handler_data
```

A place for handler implementors to keep a pointer to data that may be needed by their handler.

6.18.2.2 on_condition_triggered

```
DDS_ConditionHandler_OnConditionTriggeredCallback DDS_ConditionHandler::on_condition_triggered
```

Handles the dispatch of a **DDS_Condition** (p. 1372).

This callback is called by **DDS_Condition_dispatch** (p. 1377).

6.19 DDS_ConditionSeq Struct Reference

6.20 DDS_ContentFilter Struct Reference

<<***interface***>> *(p. 1015)* Interface to be used by a custom filter of a **DDS_ContentFilteredTopic** (p. 176)

Data Fields

- **DDS_ContentFilterCompileFunction compile**

  Compile an instance of the content filter according to the filter expression and parameters of the given data type.
- **DDS_ContentFilterWriterCompileFunction writer_compile**

  *A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **DDS_DataReader** (p. 618).*
- **DDS_ContentFilterEvaluateFunction evaluate**

  Evaluate whether the sample is passing the filter or not according to the sample content.
- **DDS_ContentFilterWriterEvaluateFunction writer_evaluate**

  A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.
- **DDS_ContentFilterFinalizeFunction finalize**

  A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.
- **DDS_ContentFilterWriterFinalizeFunction writer_finalize**

  A writer-side filtering API to clean up a previously compiled instance of the content filter.
- **DDS_ContentFilterWriterAttachFunction writer_attach**

  A writer-side filtering API to create some state that can facilitate filtering on the writer side.
- **DDS_ContentFilterWriterDetachFunction writer_detach**

  *A writer-side filtering API to clean up a previously created state using **DDS_ContentFilter::writer_attach** (p. 1577).*
- **DDS_ContentFilterWriterReturnLoanFunction writer_return_loan**

  *A writer-side filtering API to return the loan on the list of DataReaders returned by **DDS_ContentFilter::writer_evaluate** (p. 1576).*
- void * **filter_data**

  A place for filter implementors to keep a pointer to data that may be needed by their filter.

6.20.1 Detailed Description

<<***interface***>> *(p. 1015)* Interface to be used by a custom filter of a **DDS_ContentFilteredTopic** (p. 176)

Entity:

DDS_ContentFilteredTopic (p. 176)

This interface can be implemented by an application-provided class and then registered with the **DDS_DomainParticipant** (p. 76) such that samples can be filtered for a **DDS_ContentFilteredTopic** (p. 176) with the given filter name.

Note: the API for using a custom content filter is subject to change in a future release.

See also

DDS_ContentFilteredTopic (p. 176)

DDS_DomainParticipant_register_contentfilter (p. 119)

6.20.2 Field Documentation

6.20.2.1 compile

DDS_ContentFilterCompileFunction DDS_ContentFilter::compile

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This function is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **DDS_ContentFilteredTopic** (p. 176) with the matching filter name is created, or when a **DDS_DataReader** (p. 618) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

new_compile_data	*<<**out**>> (p. 1015)* User specified opaque pointer of this instance of the content filter. This value is then passed to the **DDS_ContentFilter::evaluate** (p. 1574) and **DDS_ContentFilter::finalize** (p. 1576) functions for this instance of the content filter. Can be set to NULL .
expression	*<<**in**>> (p. 1015)* An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Connext and **must** not be freed. If you want to manipulate this string, you **must** first make a copy of it.
parameters	*<<**in**>> (p. 1015)* A string sequence with the expression parameters the **DDS_ContentFilteredTopic** (p. 176) was created with. The string sequence is **equal** (but **not** identical) to the string sequence passed to **DDS_DomainParticipant_create_contentfilteredtopic** (p. 117). Note that the sequence passed to the compile function is **owned** by RTI Connext and **must not** be referenced outside the compile function.
type_code	*<<**in**>> (p. 1015)* A pointer to the type code for the related **DDS_Topic** (p. 174) of the **DDS_ContentFilteredTopic** (p. 176). A type_code is a description of a type in terms of which types it contains (int32, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
type_class_name	*<<**in**>> (p. 1015)* Fully qualified class name of the related **DDS_Topic** (p. 174).
old_compile_data	*<<**in**>> (p. 1015)* The previous new_compile_data value from a previous call to this instance of a content filter. If the compile function is called more than once for an instance of a **DDS_ContentFilteredTopic** (p. 176), e.g., if the expression parameters are changed, then the new_compile_data value returned by the previous invocation is passed in the old_compile_data parameter (which can be NULL). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing previously allocated resources.

Returns

One of the **Standard Return Codes** (p. 1223)

6.20.2.2 writer_compile

DDS_ContentFilterWriterCompileFunction DDS_ContentFilter::writer_compile

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **DDS_DataReader** (p. 618).

This function is called when the **DDS_DataWriter** (p. 488) discovers a **DDS_DataReader** (p. 618) with a **DDS_ContentFilteredTopic** (p. 176) or when a **DDS_DataWriter** (p. 488) is notified of a change in a DataReader's filter parameter for the locally registered content filter instance.

It is possible for multiple threads to be calling into this function at the same time.

Parameters

writer_filter_data	<<***in***>> *(*p. *1015)* A pointer to the state created using **DDS_ContentFilter::writer_attach** (p. 1577) .
prop	<<***out***>> *(*p. *1015)* A pointer to **DDS_ExpressionProperty** (p. 1798) that allows you to indicate to RTI Connext if a filter expression can be optimized.
expression	<<***in***>> *(*p. *1015)* An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Connext and **must** not be freed. If you want to manipulate this string, you **must** first make a copy of it.
parameters	<<***in***>> *(*p. *1015)* A string sequence with the expression parameters with which the **DDS_ContentFilteredTopic** (p. 176) was created. The string sequence is **equal** (but **not** identical) to the string sequence passed to **DDS_DomainParticipant_create_contentfilteredtopic** (p. 117). Note that the sequence passed to the compile function is **owned** by RTI Connext and **must not** be referenced outside the compile function.
type_code	<<***in***>> *(*p. *1015)* A pointer to the type code for the related **DDS_Topic** (p. 174) of the **DDS_ContentFilteredTopic** (p. 176). A type_code is a description of a type in terms of which types it contains (int32, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
type_class_name	<<***in***>> *(*p. *1015)* Fully qualified class name of the related **DDS_Topic** (p. 174).
cookie	<<***in***>> *(*p. *1015)* **DDS_Cookie_t** (p. 1580) to uniquely identify **DDS_DataReader** (p. 618) for which **DDS_ContentFilter::writer_compile** (p. 1573) was called.

Returns

One of the **Standard Return Codes** (p. 1223)

6.20.2.3 evaluate

DDS_ContentFilterEvaluateFunction DDS_ContentFilter::evaluate

Evaluate whether the sample is passing the filter or not according to the sample content.

This function is called when a sample for a locally created **DDS_DataReader** (p. 618) associated with the filter is received, or when a sample for a discovered **DDS_DataReader** (p. 618) assocated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

compile_data	*<<**in**>> (p. 1015)* The last return value of the **DDS_ContentFilter::compile** (p. 1572) function for this instance of the content filter. Can be NULL .
sample	*<<**in**>> (p. 1015)* Pointer to a deserialized sample to be filtered
meta_data	*<<**in**>> (p. 1015)* Pointer to meta data associated with the sample.

Returns

The function must return 0 if the sample should be filtered out, non zero otherwise

6.20.2.4 writer_evaluate

DDS_ContentFilterWriterEvaluateFunction DDS_ContentFilter::writer_evaluate

A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.

This function is called every time a **DDS_DataWriter** (p. 488) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **DDS_DataWriter** (p. 488) is performing writer-side filtering and return the list of **DDS_Cookie_t** (p. 1580) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

Parameters

writer_filter_data	*<<**in**>> (p. 1015)* A pointer to the state created using **DDS_ContentFilter::writer_attach** (p. 1577) .
sample	*<<**in**>> (p. 1015)* Pointer to a deserialized sample to be filtered.
meta_data	*<<**in**>> (p. 1015)* Pointer to meta data associated with the sample.

Returns

The function returns **DDS_CookieSeq** (p. 1581) which identifies the set of DataReaders whose filters pass the sample.

6.20.2.5 finalize

DDS_ContentFilterFinalizeFunction DDS_ContentFilter::finalize

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

This function is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local **DDS_ContentFilteredTopic** (p. 176) with the matching filter name is deleted, or when a **DDS_DataReader** (p. 618) with a matching filter name is removed due to discovery.

This function is also called on all instances of the discovered **DDS_DataReader** (p. 618) with a matching filter name if the filter is unregistered with **DDS_DomainParticipant_unregister_contentfilter** (p. 120).

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

compile_data	*<<**in**>> (p. 1015)* The last return value of the **DDS_ContentFilter::compile** (p. 1572) function for this instance of the content filter. Can be NULL

6.20.2.6 writer_finalize

DDS_ContentFilterWriterFinalizeFunction DDS_ContentFilter::writer_finalize

A writer-side filtering API to clean up a previously compiled instance of the content filter.

This function is called to notify the filter implementation that the **DDS_DataWriter** (p. 488) is no longer matching with a **DDS_DataReader** (p. 618) for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the **DDS_DataReader** (p. 618).

It is possible for multiple threads to be calling into this function at the same time.

Parameters

writer_filter_data	*<<**in**>> (p. 1015)* A pointer to the state created using **DDS_ContentFilter::writer_attach** (p. 1577).
cookie	**DDS_Cookie_t** (p. 1580) to uniquely identify **DDS_DataReader** (p. 618) for which **DDS_ContentFilter::writer_finalize** (p. 1577) was called.

6.20.2.7 writer_attach

DDS_ContentFilterWriterAttachFunction DDS_ContentFilter::writer_attach

A writer-side filtering API to create some state that can facilitate filtering on the writer side.

This function is called to create some state required to perform filtering on the writer side using writer-side filtering APIs. This function will be called for every **DDS_DataWriter** (p. 488); it will be called only the first time the **DDS_Data↩ Writer** (p. 488) matches a **DDS_DataReader** (p. 618) using the specified filter. This function will not be called for any subsequent DataReaders that match the DataWriter and are using the same filter.

Parameters

writer_filter_data	<<***out***>> *(*p. *1015)* A user-specified opaque pointer to some state created on the **DDS_DataWriter** (p. 488) that will help perform writer-side filtering efficiently.

6.20.2.8 writer_detach

DDS_ContentFilterWriterDetachFunction DDS_ContentFilter::writer_detach

A writer-side filtering API to clean up a previously created state using **DDS_ContentFilter::writer_attach** (p. 1577).

This function is called to delete any state created using the **DDS_ContentFilter::writer_attach** (p. 1577) function. This function will be called when the **DDS_DataWriter** (p. 488) is deleted.

Parameters

writer_filter_data	<<***in***>> *(*p. *1015)* A pointer to the state created using **DDS_ContentFilter::writer_attach** (p. 1577).

6.20.2.9 writer_return_loan

DDS_ContentFilterWriterReturnLoanFunction DDS_ContentFilter::writer_return_loan

A writer-side filtering API to return the loan on the list of DataReaders returned by **DDS_ContentFilter::writer_evaluate** (p. 1576).

This function is called to return the loan on **DDS_CookieSeq** (p. 1581) returned by **DDS_ContentFilter::writer_↩ return_loan** (p. 1578). It is possible for multiple threads to be calling into this function at the same time.

Parameters

writer_filter_data	<<***in***>> *(*p. *1015)* A pointer to the state created using **DDS_ContentFilter::writer_attach** (p. 1577).
cookies	<<***in***>> *(*p. *1015)* **DDS_CookieSeq** (p. 1581) for which the **DDS_ContentFilter::writer_return_loan** (p. 1578) was invoked.

6.20.2.10 filter_data

void* DDS_ContentFilter::filter_data

A place for filter implementors to keep a pointer to data that may be needed by their filter.

6.21 DDS_ContentFilterProperty_t Struct Reference

<<***extension***>> *(*p. *1014)* Type used to provide all the required information to enable content filtering.

Data Fields

- char * **content_filter_topic_name**

  Name of the Content-filtered Topic associated with the Reader.
- char * **related_topic_name**

  Name of the Topic related to the Content-filtered Topic.
- char * **filter_class_name**

  Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).
- char * **filter_expression**

  The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.
- struct **DDS_StringSeq expression_parameters**

  Defines the value for each parameter in the filter expression.

6.21.1 Detailed Description

<<***extension***>> *(*p. *1014)* Type used to provide all the required information to enable content filtering.

6.21.2 Field Documentation

6.21.2.1 content_filter_topic_name

```
char* DDS_ContentFilterProperty_t::content_filter_topic_name
```

Name of the Content-filtered Topic associated with the Reader.

6.21.2.2 related_topic_name

```
char* DDS_ContentFilterProperty_t::related_topic_name
```

Name of the Topic related to the Content-filtered Topic.

6.21.2.3 filter_class_name

```
char* DDS_ContentFilterProperty_t::filter_class_name
```

Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).

6.21.2.4 filter_expression

```
char* DDS_ContentFilterProperty_t::filter_expression
```

The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.

6.21.2.5 expression_parameters

```
struct DDS_StringSeq DDS_ContentFilterProperty_t::expression_parameters
```

Defines the value for each parameter in the filter expression.

6.22 DDS_Cookie_t Struct Reference

- **DDS_Long initial_weak_references**
  <<***extension***>> *(p. 796) The initial number of weak references.*

6.24.1 Detailed Description

<<***extension***>> *(p. 796)* Various threads and resource limits settings used by RTI Connext to control its internal database.

RTI uses an internal in-memory "database" to store information about entities created locally as well as remote entities found during the discovery process. This database uses a background thread to garbage-collect records related to deleted entities. When the **DDS_DomainParticipant** (p. 76) that maintains this database is deleted, it shuts down this thread.

The Database QoS policy is used to configure how RTI Connext manages its database, including how often it cleans up, the priority of the database thread, and limits on resources that may be allocated by the database.

You may be interested in modifying the **DDS_DatabaseQosPolicy::shutdown_timeout** (p. 1583) and **DDS_DatabaseQosPolicy::shutdown_cleanup_period** (p. 1583) parameters to decrease the time it takes to delete a **DDS_DomainParticipant** (p. 76) when your application is shutting down.

The **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 1733) controls the memory allocation for elements stored in the database.

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) **NO** (p. 1247)

6.24.2 Field Documentation

6.24.2.1 thread

`struct` **`DDS_ThreadSettings_t`** `DDS_DatabaseQosPolicy::thread`

<<***extension***>> *(p. 796)* Database thread settings.

There is only one database thread: the clean-up thread.

[default] Priority: LOW.
The actual value depends on your architecture:

For Windows: -3
For Linux: OS default priority
For a complete list of platform specific values, please refer to `Platform Notes`.

[default] Stack Size: The actual value depends on your architecture:

For Windows: OS default stack size
For Linux: OS default stack size
For a complete list of platform specific values, please refer to `Platform Notes`.

[default] Mask: **DDS_THREAD_SETTINGS_STDIO** (p. 1239)

Categories

Immutable (p. 916), **Concurrency** (p. 841)

6.24.2.2 shutdown_timeout

`struct` **`DDS_Duration_t`** `DDS_DatabaseQosPolicy::shutdown_timeout`

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* The maximum wait time during a shutdown.

The domain participant will exit after the timeout, even if the database has not been fully cleaned up.

[default] 15 seconds

[range] [0,**DDS_DURATION_INFINITE** (p. 1210)]

Categories

Immutable (p. 916)

6.24.2.3 cleanup_period

`struct` **`DDS_Duration_t`** `DDS_DatabaseQosPolicy::cleanup_period`

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* The period at which the database thread wakes up to remove deleted records.

[default] 61 seconds

[range] [0,1 year]

Categories

Immutable (p. 916)

6.24.2.4 shutdown_cleanup_period

`struct` **DDS_Duration_t** DDS_DatabaseQosPolicy::shutdown_cleanup_period

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* The clean-up period used during database shut-down.

If you would like to shorten the time taken for a DomainParticipant to shutdown, you can decrease this value.

It is recommended to set this value to something other than 0 if running in an RTOS environment, to avoid CPU starvation.

[default] 10 milliseconds

[range] [0,1 year]

Categories

Immutable (p. 916)

6.24.2.5 initial_records

DDS_Long DDS_DatabaseQosPolicy::initial_records

<<***extension***>> *(*p. *796)* The initial number of total records.

[default] 1024

[range] [1,10 million]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.24.2.6 max_skiplist_level

DDS_Long DDS_DatabaseQosPolicy::max_skiplist_level

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* The maximum level of the skiplist.

The skiplist is used to keep records in the database. Usually, the search time is log2(N), where N is the total number of records in one skiplist. However, once N exceeds 2^n, where n is the maximum skiplist level, the search time will become more and more linear. Therefore, the maximum level should be set such that 2^n is larger than the maximum(N among all skiplists). Usually, the maximum N is the maximum number of remote and local writers or readers.

[default] 7

[range] [1,31]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.24.2.7 max_weak_references

```
DDS_Long DDS_DatabaseQosPolicy::max_weak_references
```

<<***extension***>> *(p. 796)* The maximum number of weak references.

A weak reference is an internal data structure that refers to a record within RTI Connext' internal database. This field configures the maximum number of such references that RTI Connext may create.

The actual number of weak references is permitted to grow from an initial value (indicated by **DDS_DatabaseQos↩ Policy::initial_weak_references** (p. 1585)) to this maximum. To prevent RTI Connext from allocating any weak references after the system has reached a steady state, set the initial and maximum values equal to one another. To indicate that the number of weak references should continue to grow as needed indefinitely, set this field to **DDS_LENGTH_↩ UNLIMITED** (p. 1328). Be aware that although a single weak reference occupies very little memory, allocating a very large number of them can have a significant impact on your overall memory usage.

Tuning this value precisely is difficult without intimate knowledge of the structure of RTI Connext' database; doing so is an advanced feature not required by most applications. The default value has been chosen to be sufficient for reasonably large systems. If you believe you may need to modify this value, please consult with RTI support personnel for assistance.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_weak_references

```

<<***extension***>> *(p. 796)* The initial number of weak references.

See **DDS_DatabaseQosPolicy::max_weak_references** (p. 1584) for more information about what a weak reference is.

If the QoS set contains an initial_weak_references value that is too small to ever grow to **DDS_DatabaseQosPolicy↩ ::max_weak_references** (p. 1584) using RTI Connext' internal algorithm, this value will be adjusted upwards as necessary. Subsequent accesses of this value will reveal the actual initial value used.

Changing the value of this field is an advanced feature; it is recommended that you consult with RTI support personnel before doing so.

[default] 2049, which is the minimum initial value imposed by RTI Connext when the maximum is unlimited. If a lower value is specified, it will simply be increased to 2049 automatically.

[range] [1, 100 million], <= max_weak_references

6.25 DDS_DataReaderCacheStatus Struct Reference

<<***extension***>> *(*p. *1014)* The status of the reader's cache.

Data Fields

- **DDS_LongLong sample_count_peak**

  The highest number of samples in the reader's queue over the lifetime of the reader.
- **DDS_LongLong sample_count**

  The number of samples in the reader's queue.
- **DDS_LongLong old_source_timestamp_dropped_sample_count**

  The number of samples dropped as a result of receiving a sample older than the last one, using ***DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS*** *(*p. *1276).*
- **DDS_LongLong tolerance_source_timestamp_dropped_sample_count**

  The number of samples dropped as a result of receiving a sample in the future, using ***DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS*** *(*p. *1276).*
- **DDS_LongLong ownership_dropped_sample_count**

  The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.
- **DDS_LongLong content_filter_dropped_sample_count**

  The number of user samples filtered by the DataReader due to Content-Filtered Topics.
- **DDS_LongLong time_based_filter_dropped_sample_count**

  The number of user samples filtered by the DataReader due to ***DDS_TimeBasedFilterQosPolicy*** *(*p. *2038).*
- **DDS_LongLong expired_dropped_sample_count**

  The number of samples expired by the DataReader due to ***DDS_LifespanQosPolicy*** *(*p. *1818) or the autopurge sample delays.*
- **DDS_LongLong virtual_duplicate_dropped_sample_count**

  The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.
- **DDS_LongLong replaced_dropped_sample_count**

  The number of samples replaced by the DataReader due to ***DDS_KEEP_LAST_HISTORY_QOS*** *(*p. *1295) replacement.*
- **DDS_LongLong writer_removed_batch_sample_dropped_sample_count**

  The number of batch samples received by the DataReader that were marked as removed by the DataWriter.
- **DDS_LongLong total_samples_dropped_by_instance_replacement**

  The number of samples with sample state ***DDS_NOT_READ_SAMPLE_STATE*** *(*p. *712) that were dropped when removing an instance due to instance replacement. See* ***DDS_DataReaderResourceLimitsQosPolicy::instance_replacement*** *(*p. *1635) for more details about when instances are replaced.*
- **DDS_LongLong alive_instance_count**

  The number of instances in the DataReader's queue with an instance state equal to ***DDS_ALIVE_INSTANCE_STATE*** *(*p. *716).*
- **DDS_LongLong alive_instance_count_peak**

  The highest value of ***DDS_DataReaderCacheStatus::alive_instance_count*** *(*p. *1590) over the lifetime of the DataReader.*
- **DDS_LongLong no_writers_instance_count**

  The number of instances in the DataReader's queue with an instance state equal to ***DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE*** *(*p. *716).*
- **DDS_LongLong no_writers_instance_count_peak**

*The highest value of **DDS_DataReaderCacheStatus::no_writers_instance_count** (p. 1591) over the lifetime of the DataReader.*

- **DDS_LongLong disposed_instance_count**

  *The number of instances in the DataReader's queue with an instance state equal to **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716).*

- **DDS_LongLong disposed_instance_count_peak**

  *The highest value of **DDS_DataReaderCacheStatus::disposed_instance_count** (p. 1591) over the lifetime of the DataReader.*

- **DDS_LongLong detached_instance_count**

  The number of minimal instance states currently being maintained in the DataReader's queue.

- **DDS_LongLong detached_instance_count_peak**

  *The highest value of **DDS_DataReaderCacheStatus::detached_instance_count** (p. 1592) over the lifetime of the DataReader.*

- **DDS_LongLong compressed_sample_count**

  The number of received samples compressed by a DataWriter.

6.25.1 Detailed Description

<<***extension***>> *(p. 1014)* The status of the reader's cache.

Entity:

DDS_DataReader (p. 618)

6.25.2 Field Documentation

6.25.2.1 sample_count_peak

```
DDS_LongLong DDS_DataReaderCacheStatus::sample_count_peak
```

The highest number of samples in the reader's queue over the lifetime of the reader.

6.25.2.2 sample_count

```
DDS_LongLong DDS_DataReaderCacheStatus::sample_count
```

The number of samples in the reader's queue.

includes samples that may not yet be available to be read or taken by the user, due to samples being received out of order or **PRESENTATION** (p. 1306)

6.25.2.3 old_source_timestamp_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::old_source_timestamp_dropped_sample_count

The number of samples dropped as a result of receiving a sample older than the last one, using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276).

When the DataReader is using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276):

- If the DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped.
- If the DataReader receives a sample for an instance with a source timestamp that is equal to the last source timestamp received for the instance and the writer has a higher virtual GUID, the sample is dropped.

6.25.2.4 tolerance_source_timestamp_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::tolerance_source_timestamp_dropped_sample_count

The number of samples dropped as a result of receiving a sample in the future, using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276).

When the DataReader is using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276): the DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than the source_timestamp_tolerance. Otherwise, the sample is dropped.

6.25.2.5 ownership_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::ownership_dropped_sample_count

The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.

When using Exclusive Ownership, the DataReader receives data from multiple DataWriters. Each instance can only be owned by one DataWriter.

If other DataWriters write samples on this instance, the samples will be dropped.

6.25.2.6 content_filter_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::content_filter_dropped_sample_count

The number of user samples filtered by the DataReader due to Content-Filtered Topics.

When using a content filter on the DataReader side, if the sample received by the DataReader does not pass the filter, it will be dropped.

6.25.2.7 time_based_filter_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count

The number of user samples filtered by the DataReader due to **DDS_TimeBasedFilterQosPolicy** (p. 2038).

When using **TIME_BASED_FILTER** (p. 1331) on the DataReader side, if the sample received by the DataReader does not pass the minimum_separation filter, it will be dropped.

6.25.2.8 expired_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::expired_dropped_sample_count

The number of samples expired by the DataReader due to **DDS_LifespanQosPolicy** (p. 1818) or the autopurge sample delays.

- **DDS_LifespanQosPolicy** (p. 1818)
  When a sample expires due to **DDS_LifespanQosPolicy** (p. 1818), the data is removed from the DataReader caches. This sample will be considered dropped if its **DDS_SampleStateKind** (p. 711) was **DDS_NOT_READ↩ _SAMPLE_STATE** (p. 712).
- **DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay** (p. 1936)
  When a sample expires due to **DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay** (p. 1936), this sample will be considered dropped if its **DDS_SampleStateKind** (p. 711) was **DDS_NOT_READ↩ _SAMPLE_STATE** (p. 712).
- **DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay** (p. 1936)
  When a sample expires due to **DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay** (p. 1936), this sample will be considered dropped if its **DDS_SampleStateKind** (p. 711) was **DDS_NOT_READ↩ _SAMPLE_STATE** (p. 712).

6.25.2.9 virtual_duplicate_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::virtual_duplicate_dropped_sample_count

The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

When two DataWriters with the same logical data source publish a sample with the same sequence_number, one sample will be dropped and the other will be received by the DataReader.

This can happen when multiple writers are writing on behalf of the same original DataWriter: for example, in systems with redundant Routing Services or when a DataReader is receiving samples both directly from the original DataWriter and from an instance of Persistence Service.

6.25.2.10 replaced_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::replaced_dropped_sample_count

The number of samples replaced by the DataReader due to **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295) replacement.

When the number of samples for an instance in the queue reaches the **DDS_HistoryQosPolicy::depth** (p. 1810) value, a new sample for the instance will replace the oldest sample for the instance in the queue.

The new sample will be accepted and the old sample will be dropped.

This counter will only be updated if the replaced sample's **DDS_SampleStateKind** (p. 711) was **DDS_NOT_READ_↩ SAMPLE_STATE** (p. 712).

6.25.2.11 writer_removed_batch_sample_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::writer_removed_batch_sample_dropped_sample_count

The number of batch samples received by the DataReader that were marked as removed by the DataWriter.

When the DataReader receives a batch, the batch can contain samples marked as removed by the DataWriter. Examples of removed samples in a batch could be because of sample replacement due to **DDS_KEEP_LAST_HISTORY_↩ QOS** (p. 1295) **DDS_HistoryQosPolicy** (p. 1808) QoS on the DataWriter or because the duration in **DDS_Lifespan↩ QosPolicy** (p. 1818) was reached. By default, any sample marked as removed from a batch is dropped (unless you set the dds.data_reader.accept_writer_removed_batch_samples property in the **DDS_PropertyQosPolicy** (p. 1905) to true). Note: Historical data with removed batch samples written before the DataReader joined the DDS domain will also be included in the count.

6.25.2.12 total_samples_dropped_by_instance_replacement

DDS_LongLong DDS_DataReaderCacheStatus::total_samples_dropped_by_instance_replacement

The number of samples with sample state **DDS_NOT_READ_SAMPLE_STATE** (p. 712) that were dropped when removing an instance due to instance replacement. See **DDS_DataReaderResourceLimitsQosPolicy::instance_↩ replacement** (p. 1635) for more details about when instances are replaced.

6.25.2.13 alive_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::alive_instance_count

The number of instances in the DataReader's queue with an instance state equal to **DDS_ALIVE_INSTANCE_STATE** (p. 716).

6.25.2.14 alive_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::alive_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::alive_instance_count** (p. 1590) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::alive_instance_count (p. 1590)

6.25.2.15 no_writers_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::no_writers_instance_count

The number of instances in the DataReader's queue with an instance state equal to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716).

6.25.2.16 no_writers_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::no_writers_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::no_writers_instance_count** (p. 1591) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::no_writers_instance_count (p. 1591)

6.25.2.17 disposed_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::disposed_instance_count

The number of instances in the DataReader's queue with an instance state equal to **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716).

6.25.2.18 disposed_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::disposed_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::disposed_instance_count** (p. 1591) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::disposed_instance_count (p. 1591)

6.25.2.19 detached_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::detached_instance_count

The number of minimal instance states currently being maintained in the DataReader's queue.

If **DDS_DataReaderResourceLimitsQosPolicy::keep_minimum_state_for_instances** (p. 1633) is true, the Data↩ Reader will keep up to a maximum of **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 1629) detached instances in its queue. For a more in-depth description of detached instances, refer to **DDS_DataReader↩ ResourceLimitsQosPolicy::max_total_instances** (p. 1629).

6.25.2.20 detached_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::detached_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::detached_instance_count** (p. 1592) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::detached_instance_count (p. 1592)

6.25.2.21 compressed_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::compressed_sample_count

The number of received samples compressed by a DataWriter.

These include data, dispose, and unregister samples sent by a DataWriter.

6.26 DDS_DataReaderListener Struct Reference

<<***interface***>> *(*p. *1015)* **DDS_Listener** (p. 1819) for reader status.

Data Fields

- struct **DDS_Listener as_listener**
  *The superclass instance of this **DDS_DataReaderListener** (*p. *1593).*
- **DDS_DataReaderListener_RequestedDeadlineMissedCallback on_requested_deadline_missed**
  *Handles the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (*p. *1231) communication status.*
- **DDS_DataReaderListener_RequestedIncompatibleQosCallback on_requested_incompatible_qos**
  *Handles the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (*p. *1231) communication status.*
- **DDS_DataReaderListener_SampleRejectedCallback on_sample_rejected**
  *Handles the **DDS_SAMPLE_REJECTED_STATUS** (*p. *1232) communication status.*
- **DDS_DataReaderListener_LivelinessChangedCallback on_liveliness_changed**
  *Handles the **DDS_LIVELINESS_CHANGED_STATUS** (*p. *1233) communication status.*
- **DDS_DataReaderListener_DataAvailableCallback on_data_available**
  *Handle the **DDS_DATA_AVAILABLE_STATUS** (*p. *1232) communication status.*
- **DDS_DataReaderListener_SubscriptionMatchedCallback on_subscription_matched**
  *Handles the **DDS_SUBSCRIPTION_MATCHED_STATUS** (*p. *1234) communication status.*
- **DDS_DataReaderListener_SampleLostCallback on_sample_lost**
  *Handles the **DDS_SAMPLE_LOST_STATUS** (*p. *1232) communication status.*

6.26.1 Detailed Description

<<***interface***>> *(*p. *1015)* **DDS_Listener** (p. 1819) for reader status.

Entity:

DDS_DataReader (p. 618)

Status:

DDS_DATA_AVAILABLE_STATUS (p. 1232);
DDS_LIVELINESS_CHANGED_STATUS (p. 1233), **DDS_LivelinessChangedStatus** (p. 1823);
DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 1231), **DDS_RequestedDeadlineMissedStatus** (p. 1951);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_RequestedIncompatibleQosStatus** (p. 1952);
DDS_SAMPLE_LOST_STATUS (p. 1232), **DDS_SampleLostStatus** (p. 2001);
DDS_SAMPLE_REJECTED_STATUS (p. 1232), **DDS_SampleRejectedStatus** (p. 2002);
DDS_SUBSCRIPTION_MATCHED_STATUS (p. 1234), **DDS_SubscriptionMatchedStatus** (p. 2028);

Status Kinds (p. 1224)

Operations Allowed in Listener Callbacks (p. 1821)

Examples

HelloWorld_subscriber.c.

6.26.2 Field Documentation

6.26.2.1 as_listener

`struct` **DDS_Listener** DDS_DataReaderListener::as_listener

The superclass instance of this **DDS_DataReaderListener** (p. 1593).

6.26.2.2 on_requested_deadline_missed

DDS_DataReaderListener_RequestedDeadlineMissedCallback DDS_DataReaderListener::on_requested_↩deadline_missed

Handles the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 1231) communication status.

Examples

HelloWorld_subscriber.c.

6.26.2.3 on_requested_incompatible_qos

DDS_DataReaderListener_RequestedIncompatibleQosCallback DDS_DataReaderListener::on_requested_↩incompatible_qos

Handles the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 1231) communication status.

Examples

HelloWorld_subscriber.c.

6.26.2.4 on_sample_rejected

DDS_DataReaderListener_SampleRejectedCallback DDS_DataReaderListener::on_sample_rejected

Handles the **DDS_SAMPLE_REJECTED_STATUS** (p. 1232) communication status.

Examples

HelloWorld_subscriber.c.

6.26.2.5 on_liveliness_changed

DDS_DataReaderListener_LivelinessChangedCallback DDS_DataReaderListener::on_liveliness_changed

Handles the **DDS_LIVELINESS_CHANGED_STATUS** (p. 1233) communication status.

Examples

HelloWorld_subscriber.c.

6.26.2.6 on_data_available

DDS_DataReaderListener_DataAvailableCallback DDS_DataReaderListener::on_data_available

Handle the **DDS_DATA_AVAILABLE_STATUS** (p. 1232) communication status.

Examples

HelloWorld_subscriber.c.

6.26.2.7 on_subscription_matched

DDS_DataReaderListener_SubscriptionMatchedCallback DDS_DataReaderListener::on_subscription_↩
matched

Handles the **DDS_SUBSCRIPTION_MATCHED_STATUS** (p. 1234) communication status.

Examples

HelloWorld_subscriber.c.

6.26.2.8 on_sample_lost

DDS_DataReaderListener_SampleLostCallback DDS_DataReaderListener::on_sample_lost

Handles the **DDS_SAMPLE_LOST_STATUS** (p. 1232) communication status.

Examples

HelloWorld_subscriber.c.

6.27 DDS_DataReaderProtocolQosPolicy Struct Reference

<<***extension***>> *(*p. *796)* Along with **DDS_WireProtocolQosPolicy** (p. 2099) and **DDS_DataWriterProtocolQos↩ Policy** (p. 1649), this QoS policy configures the DDS on-the-network protocol (RTPS).

Data Fields

- struct **DDS_GUID_t virtual_guid**

  <<***extension***>> *(*p. *796) The virtual GUID (Global Unique Identifier).*

This parameter only has effect if the reader is configured with* ***DDS_RELIABLE_↩ RELIABILITY_QOS*** *(*p. *1325)* ***DDS_ReliabilityQosPolicyKind*** *(*p. *1324).*

6.27.1 Detailed Description

<<***extension***>> *(*p. *796)* Along with **DDS_WireProtocolQosPolicy** (p. 2099) and **DDS_DataWriterProtocolQos↩ Policy** (p. 1649), this QoS policy configures the DDS on-the-network protocol (RTPS).

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **DDS_DataReaderProtocolQosPolicy** (p. 1596) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **DDS_ReliabilityQosPolicy** (p. 1940) for more information on the per-Data↩ Reader/DataWriter reliability configuration. **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimitsQosPolicy** (p. 1953) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DataReader (p. 618)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.27.2 Field Documentation

6.27.2.1 virtual_guid

`struct` **DDS_GUID_t** `DDS_DataReaderProtocolQosPolicy::virtual_guid`

<<***extension***>> *(p. 796)* The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDS_DataReader** (p. 618).

The association between a **DDS_DataReader** (p. 618) and its persisted state is done using the virtual GUID.

[default] DDS_GUID_AUTO (p. 1215)

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960)

6.27.2.2 rtps_object_id

DDS_UnsignedLong `DDS_DataReaderProtocolQosPolicy::rtps_object_id`

<<***extension***>> *(p. 796)* The RTPS Object ID.

This value is used to determine the RTPS object ID of a data reader according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connext will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data reader.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connext. In those cases, the recomendation is not to use automatic object ID assigment.

[default] DDS_RTPS_AUTO_ID (p. **??**)

[range] [0,0x00ffffff]

Categories

Immutable (p. 916)

6.27.2.3 expects_inline_qos

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::expects_inline_qos
```

[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* Specifies whether this DataReader expects inline QoS with every sample.

RTI Connext DataWriters do not match with DataReaders that set this field to **DDS_BOOLEAN_TRUE** (p. 1203) (because RTI Connext DataWriters do not support sending inline QoS), but here is how the field is meant to be used:

In RTI Connext, a **DDS_DataReader** (p. 618) nominally relies on Discovery to propagate QoS on a matched **DDS_DataWriter** (p. 488).

Alternatively, a **DDS_DataReader** (p. 618) may get information on a matched **DDS_DataWriter** (p. 488) through QoS sent inline with a sample.

Asserting **DDS_DataReaderProtocolQosPolicy::expects_inline_qos** (p. 1597) indicates to a matching **DDS_DataWriter** (p. 488) that this **DDS_DataReader** (p. 618) expects to receive inline QoS with every sample. The complete set of inline QoS that a **DDS_DataWriter** (p. 488) may send inline is specified by the Real-Time Publish-Subscribe (RTPS) Wire Interoperability Protocol.

Because RTI Connext **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) cache Discovery information, inline QoS are largely redundant and thus unecessary. Only for other stateless implementations whose **DDS_DataReader** (p. 618) does not cache Discovery information is inline QoS necessary.

Also note that inline QoS are additional wire-payload that consume additional bandwidth and serialization and deserialization time.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960)

6.27.2.4 disable_positive_acks

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::disable_positive_acks
```

<<***extension***>> *(p. 796)* Whether the reader sends positive acknowledgements to writers.

If set to **DDS_BOOLEAN_TRUE** (p. 1203), the reader does not send positive acknowledgments (ACKs) in response to Heartbeat messages. The reader will send negative acknowledgements (NACKs) when a Heartbeat advertises samples that it has not received.

Otherwise, if set to **DDS_BOOLEAN_FALSE** (p. 1203) (the default), the reader will send ACKs to writers that expect ACKs (**DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 1651) = **DDS_BOOLEAN_FALSE** (p. 1203)) and it will not send ACKs to writers that disable ACKs (**DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 1651) = **DDS_BOOLEAN_TRUE** (p. 1203))

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960), **Reliability** (p. 897)

6.27.2.5 propagate_dispose_of_unregistered_instances

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances
```

<<***extension***>> *(p. 796)* Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716) state without being in the **DDS_ALIVE_INSTANCE_STATE** (p. 716) state.

This field only applies to keyed readers.

When the field is set to **DDS_BOOLEAN_TRUE** (p. 1203), the DataReader will receive dispose notifications even if the instance is not alive.

To guarantee the key availability through the usage of the API **FooDataReader_get_key_value** (p. 650), this option should be used in combination with setting **DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose** (p. 1652) on the DataWriter to **DDS_BOOLEAN_TRUE** (p. 1203).

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869)

6.27.2.6 propagate_unregister_of_disposed_instances

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::propagate_unregister_of_disposed_instances
```

<<***extension***>> *(p. 796)* Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716) state directly from the **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716).

This field only applies to keyed readers.

When the field is set to **DDS_BOOLEAN_TRUE** (p. 1203), the DataReader will receive unregister notifications even if the instance is not alive.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869)

6.27.2.7 rtps_reliable_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader
```

<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **DDS_DataReader** (p. 618). This parameter only has effect if the reader is configured with **DDS_RELIABLE_↩ RELIABILITY_QOS** (p. 1325) **DDS_ReliabilityQosPolicyKind** (p. 1324).

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1959)

[default] See **DDS_RtpsReliableReaderProtocol_t** (p. 1959)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.28 DDS_DataReaderProtocolStatus Struct Reference

<<***extension***>> *(p. 1014)* The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Data Fields

- **DDS_LongLong received_sample_count**

  The number of samples received by a DataReader.
- **DDS_LongLong received_sample_count_change**

  *The change in **DDS_DataReaderProtocolStatus::received_sample_count** (p. 1602) since the last time the status was read.*
- **DDS_LongLong received_sample_bytes**

  The number of bytes received by a DataReader.
- **DDS_LongLong received_sample_bytes_change**

  *The change in **DDS_DataReaderProtocolStatus::received_sample_bytes** (p. 1603) since the last time the status was read.*
- **DDS_LongLong duplicate_sample_count**

  The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.
- **DDS_LongLong duplicate_sample_count_change**

  *The change in **DDS_DataReaderProtocolStatus::duplicate_sample_count** (p. 1604) since the last time the status was read.*
- **DDS_LongLong duplicate_sample_bytes**

  The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.
- **DDS_LongLong duplicate_sample_bytes_change**

  The change in ***DDS_DataReaderProtocolStatus::sent_nack_bytes*** *(p. 1607) since the last time the status was read.*

- **DDS_LongLong received_gap_count**

  The number of GAPs received from remote DataWriter to this DataReader.

- **DDS_LongLong received_gap_count_change**

  The change in ***DDS_DataReaderProtocolStatus::received_gap_count*** *(p. 1607) since the last time the status was read.*

- **DDS_LongLong received_gap_bytes**

  The number of bytes of GAPs received from remote DataWriter to this DataReader.

- **DDS_LongLong received_gap_bytes_change**

  The change in ***DDS_DataReaderProtocolStatus::received_gap_bytes*** *(p. 1608) since the last time the status was read.*

- **DDS_LongLong rejected_sample_count**

  The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

- **DDS_LongLong rejected_sample_count_change**

  The change in ***DDS_DataReaderProtocolStatus::rejected_sample_count*** *(p. 1608) since the last time the status was read.*

- struct **DDS_SequenceNumber_t first_available_sample_sequence_number**

Sequence number of the first available sample in a matched DataWriters reliability queue.

- struct **DDS_SequenceNumber_t last_available_sample_sequence_number**

  Sequence number of the last available sample in a matched Datawriter's reliability queue.
- struct **DDS_SequenceNumber_t last_committed_sample_sequence_number**

  Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.
- **DDS_Long uncommitted_sample_count**

  Number of received samples that are not yet available to be read or taken, due to being received out of order.
- **DDS_LongLong out_of_range_rejected_sample_count**

  The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.
- **DDS_LongLong received_fragment_count**

  The number of DATA_FRAG messages that have been received by this DataReader.
- **DDS_LongLong dropped_fragment_count**

  The number of DATA_FRAG messages that have been dropped by a DataReader.
- **DDS_LongLong reassembled_sample_count**

  The number of fragmented samples that have been reassembled by a DataReader.
- **DDS_LongLong sent_nack_fragment_count**

  The number of NACK fragments that have been sent from a DataReader to a DataWriter.
- **DDS_LongLong sent_nack_fragment_bytes**

  The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

6.28.1 Detailed Description

<<***extension***>> *(*p. *1014)* The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Entity:

DDS_DataReader (p. 618)

6.28.2 Field Documentation

6.28.2.1 received_sample_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_count
```

The number of samples received by a DataReader.

Depending on how the **DDS_DataReaderProtocolStatus** (p. 1600) was obtained this may count samples coming from a specific DataWriter or from all the DataWriters that are matched with the DataReader.

If the **DDS_DataReaderProtocolStatus** (p. 1600) is obtained using the **DDS_DataReader_get_datareader_protocol_status** (p. 687) operation then it will count samples from any DataWriter. If the DataReaderProtocolStatus is obtained using the **DDS_DataReader_get_matched_publication_datareader_protocol_status** (p. 687) then it will count the samples for the DataWriter specified as a parameter to the function.

Duplicate samples arriving from the DataWriter(s) (e.g. via multiple network paths) are detected prior to increasing this counter. The duplicate samples are counted by **DDS_DataReaderProtocolStatus::duplicate_sample_count** (p. 1604).

If the DataReader has specified a ContentFilter the received samples that do not pass the filter are part of this counter. The filtered samples are counted by **DDS_DataReaderProtocolStatus::filtered_sample_count** (p. 1604).

Samples rejected because they do not fit on the DataReader Queue are also part of this counter.

Note the received_sample_count counts samples received from all DataWriters and it does not necessarily match the number of samples accepted into the DataReader Queue. This is because:

- Samples can also be inserted into the DataReader Queue by lifecycle events that are locally detected like an instance becoming not alive as a result of DataWriters leaving the network.
- Samples can be filtered out due to ContentFilter or TimeFilter
- Samples can be rejected because there is no space in DataReader Queue

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

6.28.2.2 received_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_count_change

The change in **DDS_DataReaderProtocolStatus::received_sample_count** (p. 1602) since the last time the status was read.

See also

DDS_DataReaderProtocolStatus::received_sample_count (p. 1602)

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

6.28.2.3 received_sample_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_bytes

The number of bytes received by a DataReader.

See also

DDS_DataReaderProtocolStatus::received_sample_count (p. 1602)

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

6.28.2.4 received_sample_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_bytes_change

The change in **DDS_DataReaderProtocolStatus::received_sample_bytes** (p. 1603) since the last time the status was read.

See also

DDS_DataReaderProtocolStatus::received_sample_count_change (p. 1603)

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

6.28.2.5 duplicate_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_count

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

6.28.2.6 duplicate_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_count_change

The change in **DDS_DataReaderProtocolStatus::duplicate_sample_count** (p. 1604) since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

6.28.2.7 duplicate_sample_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_bytes

The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

6.28.2.8 duplicate_sample_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_bytes_change

The change in **DDS_DataReaderProtocolStatus::duplicate_sample_bytes** (p. 1604) since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

6.28.2.9 filtered_sample_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_count
```

[DEPRECATED]. See: **DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 1588) **DDS_DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 1588)

6.28.2.10 filtered_sample_count_change

```
DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_count_change
```

[DEPRECATED]. See: **DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 1588) **DDS_DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 1588)

6.28.2.11 filtered_sample_bytes

```
DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_bytes
```

[DEPRECATED]. See: **DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 1588) **DDS_DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 1588)

6.28.2.12 filtered_sample_bytes_change

```
DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_bytes_change
```

[DEPRECATED]. See: **DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 1588) **DDS_DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 1588)

6.28.2.13 received_heartbeat_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_count
```

The number of Heartbeats from a remote DataWriter received by a local DataReader.

6.28.2.14 received_heartbeat_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_count_change

The change in **DDS_DataReaderProtocolStatus::received_heartbeat_count** (p. 1605) since the last time the status was read.

6.28.2.15 received_heartbeat_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_bytes

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

6.28.2.16 received_heartbeat_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_bytes_change

The change in **DDS_DataReaderProtocolStatus::received_heartbeat_bytes** (p. 1606) since the last time the status was read.

6.28.2.17 sent_ack_count

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_count

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

6.28.2.18 sent_ack_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_count_change

The change in **DDS_DataReaderProtocolStatus::sent_ack_count** (p. 1606) since the last time the status was read.

6.28.2.19 sent_ack_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_bytes

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

6.28.2.20 sent_ack_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_bytes_change

The change in **DDS_DataReaderProtocolStatus::sent_ack_bytes** (p. 1606) since the last time the status was read.

6.28.2.21 sent_nack_count

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_count

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

6.28.2.22 sent_nack_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_count_change

The change in **DDS_DataReaderProtocolStatus::sent_nack_count** (p. 1607) since the last time the status was read.

6.28.2.23 sent_nack_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_bytes

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

6.28.2.24 sent_nack_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_bytes_change

The change in **DDS_DataReaderProtocolStatus::sent_nack_bytes** (p. 1607) since the last time the status was read.

6.28.2.25 received_gap_count

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_count

The number of GAPs received from remote DataWriter to this DataReader.

6.28.2.26 received_gap_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_count_change

The change in **DDS_DataReaderProtocolStatus::received_gap_count** (p. 1607) since the last time the status was read.

6.28.2.27 received_gap_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_bytes

The number of bytes of GAPs received from remote DataWriter to this DataReader.

6.28.2.28 received_gap_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_bytes_change

The change in **DDS_DataReaderProtocolStatus::received_gap_bytes** (p. 1608) since the last time the status was read.

6.28.2.29 rejected_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::rejected_sample_count

The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

Samples rejected by a reliable DataReader will be NACKed, and they will have to be resent by the DataWriter if they are still available in the DataWriter queue.

This counter will always be 0 when using **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325).

6.28.2.30 rejected_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::rejected_sample_count_change

The change in **DDS_DataReaderProtocolStatus::rejected_sample_count** (p. 1608) since the last time the status was read.

This counter will always be 0 when using **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325).

6.28.2.31 first_available_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataReaderProtocolStatus::first_available_sample_sequence_number

Sequence number of the first available sample in a matched DataWriters reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

6.28.2.32 last_available_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataReaderProtocolStatus::last_available_sample_sequence_number

Sequence number of the last available sample in a matched Datawriter's reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

6.28.2.33 last_committed_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataReaderProtocolStatus::last_committed_sample_sequence_number

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.

Applicable only when retrieving matched DataWriter statuses.

For best-effort DataReaders, this is the sequence number of the latest sample received.

For reliable DataReaders, this is the sequence number of the latest sample that is available to be read or taken from the DataReader's queue.

6.28.2.34 uncommitted_sample_count

DDS_Long DDS_DataReaderProtocolStatus::uncommitted_sample_count

Number of received samples that are not yet available to be read or taken, due to being received out of order.

Applicable only when retrieving matched DataWriter statuses.

6.28.2.35 out_of_range_rejected_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::out_of_range_rejected_sample_count

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

When using **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325); if the DataReader received samples out-of-order, they are stored internally until the missing samples are received. The number of out-of-order samples that the DataReader can keep is set by **DDS_RtpsReliableReaderProtocol_t::receive_window_size** (p. 1962). When the received window is full any out-of-order sample received will be dropped.

6.28.2.36 received_fragment_count

DDS_LongLong DDS_DataReaderProtocolStatus::received_fragment_count

The number of DATA_FRAG messages that have been received by this DataReader.

This statistic is incremented upon the receipt of each DATA_FRAG message. Fragments from duplicate samples do not count towards this statistic. Applicable only when data is fragmented.

6.28.2.37 dropped_fragment_count

DDS_LongLong DDS_DataReaderProtocolStatus::dropped_fragment_count

The number of DATA_FRAG messages that have been dropped by a DataReader.

This statistic does not include malformed fragments. Applicable only when data is fragmented.

6.28.2.38 reassembled_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::reassembled_sample_count

The number of fragmented samples that have been reassembled by a DataReader.

This statistic is incremented when all of the fragments which are required to reassemble an entire sample have been received. Applicable only when data is fragmented.

6.28.2.39 sent_nack_fragment_count

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_fragment_count

The number of NACK fragments that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

6.28.2.40 sent_nack_fragment_bytes

```
DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_fragment_bytes
```

The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

6.29.2 Field Documentation

6.29.2.1 durability

`struct` **`DDS_DurabilityQosPolicy`** `DDS_DataReaderQos::durability`

Durability policy, **DURABILITY** (p. 1287).

6.29.2.2 deadline

`struct` **`DDS_DeadlineQosPolicy`** `DDS_DataReaderQos::deadline`

<<***basic***>> *(p. 784)* Deadline policy, **DEADLINE** (p. 1274).

6.29.2.3 latency_budget

`struct` **`DDS_LatencyBudgetQosPolicy`** `DDS_DataReaderQos::latency_budget`

Latency budget policy, **LATENCY_BUDGET** (p. 1296).

6.29.2.4 liveliness

`struct` **DDS_LivelinessQosPolicy** DDS_DataReaderQos::liveliness

Liveliness policy, **LIVELINESS** (p. 1298).

6.29.2.5 reliability

`struct` **DDS_ReliabilityQosPolicy** DDS_DataReaderQos::reliability

Reliability policy, **RELIABILITY** (p. 1323).

6.29.2.6 destination_order

`struct` **DDS_DestinationOrderQosPolicy** DDS_DataReaderQos::destination_order

Destination order policy, **DESTINATION_ORDER** (p. 1275).

6.29.2.7 history

`struct` **DDS_HistoryQosPolicy** DDS_DataReaderQos::history

<<***basic***>> *(p. 784)* History policy, **HISTORY** (p. 1294).

6.29.2.8 resource_limits

`struct` **DDS_ResourceLimitsQosPolicy** DDS_DataReaderQos::resource_limits

Resource limits policy, **RESOURCE_LIMITS** (p. 1327).

6.29.2.9 user_data

`struct` **DDS_UserDataQosPolicy** DDS_DataReaderQos::user_data

User data policy, **USER_DATA** (p. 1345).

6.29.2.10 ownership

`struct` **DDS_OwnershipQosPolicy** `DDS_DataReaderQos::ownership`

<<***basic***>> *(p. 784)* Ownership policy, **OWNERSHIP** (p. 1303).

6.29.2.11 time_based_filter

`struct` **DDS_TimeBasedFilterQosPolicy** `DDS_DataReaderQos::time_based_filter`

<<***basic***>> *(p. 784)* Time-based filter policy, **TIME_BASED_FILTER** (p. 1331)

6.29.2.12 reader_data_lifecycle

`struct` **DDS_ReaderDataLifecycleQosPolicy** `DDS_DataReaderQos::reader_data_lifecycle`

Reader data lifecycle policy, **READER_DATA_LIFECYCLE** (p. 1322).

6.29.2.13 representation

`struct` **DDS_DataRepresentationQosPolicy** `DDS_DataReaderQos::representation`

Data representation policy, **DATA_REPRESENTATION** (p. 1258).

6.29.2.14 type_consistency

`struct` **DDS_TypeConsistencyEnforcementQosPolicy** `DDS_DataReaderQos::type_consistency`

Type consistency enforcement policy, **TYPE_CONSISTENCY_ENFORCEMENT** (p. 1341).

6.29.2.15 data_tags

DDS_DataTagQosPolicy `DDS_DataReaderQos::data_tags`

DataTag policy, **DATA_TAG** (p. 1265).

6.29.2.16 reader_resource_limits

`struct` **DDS_DataReaderResourceLimitsQosPolicy** DDS_DataReaderQos::reader_resource_limits

<<***extension***>> *(p. 1014)* **DDS_DataReader** (p. 618) resource limits policy, **DATA_READER_RESOURCE_LIMITS** (p. 1255). This policy is an extension to the DDS standard.

6.29.2.17 protocol

`struct` **DDS_DataReaderProtocolQosPolicy** DDS_DataReaderQos::protocol

<<***extension***>> *(p. 1014)* **DDS_DataReader** (p. 618) protocol policy, **DATA_READER_PROTOCOL** (p. 1255)

6.29.2.18 transport_selection

`struct` **DDS_TransportSelectionQosPolicy** DDS_DataReaderQos::transport_selection

<<***extension***>> *(p. 1014)* Transport selection policy, **TRANSPORT_SELECTION** (p. 1340).

Specifies the transports available for use by the **DDS_DataReader** (p. 618).

6.29.2.19 unicast

`struct` **DDS_TransportUnicastQosPolicy** DDS_DataReaderQos::unicast

<<***extension***>> *(p. 1014)* Unicast transport policy, **TRANSPORT_UNICAST** (p. 1341).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDS_DataWriter** (p. 488) entities in the domain.

6.29.2.20 multicast

`struct` **DDS_TransportMulticastQosPolicy** DDS_DataReaderQos::multicast

<<***extension***>> *(p. 1014)* Multicast transport policy, **TRANSPORT_MULTICAST** (p. 1337).

Specifies the multicast group addresses and ports on which **messages** can be received.

The multicast addresses are used to receive messages from **DDS_DataWriter** (p. 488) entities in the domain.

6.29.2.21 property

`struct` **DDS_PropertyQosPolicy** DDS_DataReaderQos::property

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 1014)* Property policy, **PROPERTY** (p. 1308). See also `Property Reference Guide`.

6.29.2.22 service

`struct` **DDS_ServiceQosPolicy** DDS_DataReaderQos::service

<<***extension***>> *(p. 1014)* Service policy, **SERVICE** (p. 1328).

6.29.2.23 availability

`struct` **DDS_AvailabilityQosPolicy** DDS_DataReaderQos::availability

<<***extension***>> *(p. 1014)* Availability policy, **AVAILABILITY** (p. 1252).

6.29.2.24 subscription_name

`struct` **DDS_EntityNameQosPolicy** DDS_DataReaderQos::subscription_name

<<***extension***>> *(p. 1014)* EntityName policy, **ENTITY_NAME** (p. 1292).

6.29.2.25 transport_priority

`struct` **DDS_TransportPriorityQosPolicy** DDS_DataReaderQos::transport_priority

Transport priority policy, **TRANSPORT_PRIORITY** (p. 1339).

6.29.2.26 type_support

`struct` **DDS_TypeSupportQosPolicy** DDS_DataReaderQos::type_support

<<***extension***>> *(p. 1014)* type support data, **TYPESUPPORT** (p. 1343).

Optional value that is passed to a type plugin's on_endpoint_attached and deserialization functions.

6.30 DDS_DataReaderResourceLimitsInstanceReplacementSettings Struct Reference

Instance replacement kind applied to each instance state.

Data Fields

- **DDS_DataReaderInstanceRemovalKind alive_instance_removal**
  *Removal kind applied to alive (**DDS_ALIVE_INSTANCE_STATE** (p. 716)) instances.*
- **DDS_DataReaderInstanceRemovalKind disposed_instance_removal**
  *Removal kind applied to disposed (**DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716)) instances.*
- **DDS_DataReaderInstanceRemovalKind no_writers_instance_removal**
  *Removal kind applied to fully-unregistered (**DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716)) instances.*

6.30.1 Detailed Description

Instance replacement kind applied to each instance state.

[default]

- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::alive_instance_removal** (p. 1618) = **DDS_NO_INSTANCE_REMOVAL** (p. 1257)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::disposed_instance_removal** (p. 1618) = **DDS_EMPTY_INSTANCE_REMOVAL** (p. 1257)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_writers_instance_removal** (p. 1619) = **DDS_EMPTY_INSTANCE_REMOVAL** (p. 1257)

  *<<**extension**>> (p. 796) Maximum duration for which the **DDS_DataReader** (p. 618) will maintain information regarding a **DDS_DataWriter** (p. 488) once the **DDS_DataWriter** (p. 488) has become not alive.*
- **DDS_Boolean lazily_allocate_batch_resources**

  *<<**extension**>> (p. 796) Determines whether the **DDS_DataReader** (p. 618) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.*

6.31.1 Detailed Description

*<<**extension**>> (p. 796)* Various settings that configure how a **DDS_DataReader** (p. 618) allocates and uses physical memory for internal resources.

DataReaders must allocate internal structures to handle the maximum number of DataWriters that may connect to it, whether or not a **DDS_DataReader** (p. 618) handles data fragmentation and how many data fragments that it may handle (for data samples larger than the MTU of the underlying network transport), how many simultaneous outstanding loans of internal memory holding data samples can be provided to user code, as well as others.

Most of these internal structures start at an initial size and, by default, will grow as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDS_DataReader** (p. 618). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **DDS_DataReader** (p. 618).

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DataReader (p. 618)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.31.2 Field Documentation

6.31.2.1 max_remote_writers

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers
```

<<***extension***>> *(p. 796)* The maximum number of remote writers from which a **DDS_DataReader** (p. 618) may read, including all instances.

[default] DDS_LENGTH_UNLIMITED (p. 1328)
[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_remote_writers, >= max_remote_writers_↩ per_instance

For unkeyed types, this value has to be equal to max_remote_writers_per_instance if max_remote_writers_per_instance is not equal to **DDS_LENGTH_UNLIMITED** (p. 1328).

Note: For efficiency, set `max_remote_writers` >= **DDS_DataReaderResourceLimitsQosPolicy::max_↩ remote_writers_per_instance** (p. 1622).

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.2 max_remote_writers_per_instance

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance
```

<<***extension***>> *(p. 796)* The maximum number of remote writers from which a **DDS_DataReader** (p. 618) may read a single instance.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1024] or **DDS_LENGTH_UNLIMITED** (p. 1328), <= max_remote_writers or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers if it is not **DDS_LENGTH_UNLIMITED** (p. 1328).

Note: For efficiency, set `max_remote_writers_per_instance` <= **DDS_DataReaderResourceLimitsQos↩ Policy::max_remote_writers** (p. 1621)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.3 max_samples_per_remote_writer

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_remote_writer
```

<<***extension***>> *(p. 796)* The maximum number of out-of-order samples from a given remote **DDS_DataWriter** (p. 488) that a **DDS_DataReader** (p. 618) may store when maintaining a reliable connection to the **DDS_DataWriter** (p. 488).

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), <= **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.4 max_infos

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_infos
```

<<***extension***>> *(p. 796)* The maximum number of info units that a **DDS_DataReader** (p. 618) can use to store **DDS_SampleInfo** (p. 1990).

When read/take is called on a DataReader, the DataReader passes a sequence of data samples and an associated sample info sequence. The sample info sequence contains additional information for each data sample.

max_infos determines the resources allocated for storing sample info. This memory is loaned to the application when passing a sample info sequence.

Note that sample info is a snapshot, generated when read/take is called.

max_infos should not be less than max_samples.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_infos

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.10 max_samples_per_read

`DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_read`

<<***extension***>> *(p. 796)* The maximum number of data samples that the application can receive from the middleware in a single call to **FooDataReader_read** (p. 628) or **FooDataReader_take** (p. 629). If more data exists in the middleware, the application will need to issue multiple read/take calls.

When reading data using listeners, the expected number of samples available for delivery in a single `take` call is typically small: usually just one, in the case of unbatched data, or the number of samples in a single batch, in the case of batched data. (See **DDS_BatchQosPolicy** (p. 1552) for more information about this feature.) When polling for data or using a **DDS_WaitSet** (p. 1373), however, multiple samples (or batches) could be retrieved at once, depending on the data rate.

A larger value for this parameter makes the API simpler to use at the expense of some additional memory consumption.

[default] 1024

[range] [1,65536]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.11 disable_fragmentation_support

`DDS_Boolean DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support`

[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Determines whether the **DDS_DataReader** (p. 618) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

6.31.2.12 max_fragmented_samples

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples

<<***extension***>> *(p. 796)* The maximum number of samples for which the **DDS_DataReader** (p. 618) may store fragments at a given point in time.

At any given time, a **DDS_DataReader** (p. 618) may store fragments for up to `max_fragmented_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different **DDS_DataWriter** (p. 488) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 1626) is **DDS_↩ BOOLEAN_FALSE** (p. 1203).

[default] 1024

[range] [1, 1 million]

Categories

Immutable (p. 916), **Sample Memory Management** (p. 904), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.31.2.13 initial_fragmented_samples

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_fragmented_samples

<<***extension***>> *(p. 796)* The initial number of samples for which a **DDS_DataReader** (p. 618) may store fragments.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 1626) is **DDS_↩ BOOLEAN_FALSE** (p. 1203).

[default] 4

[range] [1,1024], <= max_fragmented_samples

6.31.2.16 dynamically_allocate_fragmented_samples

```
DDS_Boolean DDS_DataReaderResourceLimitsQosPolicy::dynamically_allocate_fragmented_samples
```

<<***extension***>> *(p. 796)* Determines whether the **DDS_DataReader** (p. 618) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to **DDS_BOOLEAN_FALSE** (p. 1203), the middleware will allocate memory upfront for storing fragments for up to **DDS_DataReaderResourceLimitsQosPolicy::initial_fragmented_samples** (p. 1627) samples. This memory may grow up to **DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples** (p. 1626) if needed.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 1626) is **DDS_BOOLEAN_FALSE** (p. 1203).

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Sample Memory Management** (p. 904), **Middleware Memory Management** (p. 880), **Fragmentation** (p. 867), **Sending Large Data** (p. 873)

6.31.2.17 max_total_instances

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_total_instances
```

<<***extension***>> *(p. 796)* Maximum number of instances for which a DataReader will keep state.

The maximum number of instances actively managed by a DataReader is determined by **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956).

These instances have associated DataWriters or samples in the DataReader's queue and are visible to the user through operations such as **FooDataReader_take** (p. 629), **FooDataReader_read** (p. 628), and **FooDataReader_get_key_value** (p. 650).

The features Durable Reader State, MultiChannel DataWriters and RTI Persistence Service require RTI Connext to keep some internal state even for instances without DataWriters or samples in the DataReader's queue. The additional state is used to filter duplicate samples that could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or samples, is determined by max_total_instances.

When a new instance is received, RTI Connext will check the resource limit **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956). If the limit is exceeded, RTI Connext will drop the sample with the reason LOST_BY_INSTANCES_LIMIT. If the limit is not exceeded, RTI Connext will check max_total_instances. If max_total_instances is exceeded, RTI Connext will replace an existing instance without DataWriters and samples with the new one. The application could receive duplicate samples for the replaced instance if it becomes alive again.

The max_total_instances limit is not used if **DDS_DataReaderResourceLimitsQosPolicy::keep_minimum_state_for_instances** (p. 1633) is false, and in that case should be left at the default value.

[default] DDS_AUTO_MAX_TOTAL_INSTANCES (p. 1258)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328) or **DDS_AUTO_MAX_TOTAL_INSTANCES** (p. 1258), >= **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Instance Lifecycle** (p. 869)

6.31.2.18 max_remote_virtual_writers

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_virtual_writers
```

<<***extension***>> *(p. 796)* The maximum number of remote virtual writers from which a **DDS_DataReader** (p. 618) may read, including all instances.

When **DDS_PresentationQosPolicy::access_scope** (p. 1897) is set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307), this value determines the maximum number of DataWriter groups that can be managed by the **DDS_Subscriber** (p. 575) containing this **DDS_DataReader** (p. 618).

Since the **DDS_Subscriber** (p. 575) may contain more than one **DDS_DataReader** (p. 618), only the setting of the first applies.

[default] DDS_LENGTH_UNLIMITED (p. 1328)
[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_remote_virtual_writers, >= max_remote_virtual_writers_per_instance

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.19 initial_remote_virtual_writers

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_remote_virtual_writers
```

<<***extension***>> *(p. 796)* The initial number of remote virtual writers from which a **DDS_DataReader** (p. 618) may read, including all instances.

[default] 2
[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), <= max_remote_virtual_writers

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.20 max_remote_virtual_writers_per_instance

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_virtual_writers_per_instance
```

<<***extension***>> *(p. 796)* The maximum number of virtual remote writers that can be associated with an instance.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1024] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_remote_virtual_writers_per_instance

For unkeyed types, this value is ignored.

The features of Durable Reader State and MultiChannel DataWriters, and RTI Persistence Service require RTI Connext to keep some internal state per virtual writer and instance that is used to filter duplicate samples. These duplicate samples could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

Once an association between a remote virtual writer and an instance is established, it is permanent – it will not disappear even if the physical writer incarnating the virtual writer is destroyed.

If max_remote_virtual_writers_per_instance is exceeded for an instance, RTI Connext will not associate this instance with new virtual writers. Duplicates samples from these virtual writers will not be filtered on the reader.

If you are not using Durable Reader State, MultiChannel DataWriters or RTI Persistence Service in your system, you can set this property to 1 to optimize resources.

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.21 initial_remote_virtual_writers_per_instance

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_remote_virtual_writers_per_instance
```

<<***extension***>> *(p. 796)* The initial number of virtual remote writers per instance.

[default] 2

[range] [1, 1024], <= max_remote_virtual_writers_per_instance

For unkeyed types, this value is ignored.

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.22 max_remote_writers_per_sample

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_sample
```

<<***extension***>> *(p. 796)* The maximum number of remote writers allowed to write the same sample.

One scenario in which two DataWriters may write the same sample is Persistence Service. The DataReader may receive the same sample coming from the original DataWriter and from a Persistence Service DataWriter. **[default]** 3

[range] [1, 1024]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.31.2.23 max_query_condition_filters

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_query_condition_filters

<<***extension***>> *(p. 796)* The maximum number of query condition filters a reader is allowed.

[default] 4

[range] [0, 32]

This value determines the maximum number of unique query condition content filters that a reader may create.

Each query condition content filter is comprised of both its `query_expression` and `query_parameters`. Two query conditions that have the same `query_expression` will require unique query condition filters if their `query_paramters` differ. Query conditions that differ only in their state masks will share the same query condition filter.

6.31.2.29 instance_replacement

`struct` **`DDS_DataReaderResourceLimitsInstanceReplacementSettings`** `DDS_DataReaderResourceLimitsQos↩ Policy::instance_replacement`

<<***extension***>> *(p. 796)* Sets the kind of instances allowed to be replaced for each instance state (**DDS_Instance↩ StateKind** (p. 715)) when a DataReader reaches **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956).

When **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956) is reached, a **DDS_DataReader** (p. 618) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kinds specified by this field.

A DataReader can choose what kinds of instances can be replaced for each **DDS_InstanceStateKind** (p. 715) separately. This means, for example, that a DataReader can choose to not allow replacing alive (**DDS_ALIVE_INSTANCE↩ _STATE** (p. 716)) instances but allow replacement of empty disposed (**DDS_NOT_ALIVE_DISPOSED_INSTANCE_↩ STATE** (p. 716)) instances.

Only instances whose states match the specified kinds are eligible to be replaced. In addition, there must be no outstanding loans on any of the samples belonging to the instance for it to be considered for replacement.

For all kinds, a **DDS_DataReader** (p. 618) will replace the least-recently-updated instance satisfying that kind. An instance is considered 'updated' when a valid sample or dispose sample is received and accepted for that instance. When using **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 1304), only samples that are received from the owner of the instance will cause the instance to be considered updated. An instance is not considered updated when an unregister sample is received because the unregister message simply indicates that there is one less writer that has updates for the instance, not that the instance itself was updated.

If no replaceable instance exists, the sample for the new instance will be considered lost with lost reason **DDS_LOST↩ _BY_INSTANCES_LIMIT** (p. 621) and the instance will not be asserted into the DataReader queue.

[default]

- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::alive_instance_removal** (p. 1618) = **DDS_NO_INSTANCE_REMOVAL** (p. 1257)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::disposed_instance_removal** (p. 1618) = **DDS_EMPTY_INSTANCE_REMOVAL** (p. 1257)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_writers_instance_removal** (p. 1619) = **DDS_EMPTY_INSTANCE_REMOVAL** (p. 1257)

See also

DDS_DataReaderResourceLimitsInstanceReplacementSettings (p. 1618)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Instance Lifecycle** (p. 869)

6.31.2.30 autopurge_remote_not_alive_writer_delay

`struct DDS_Duration_t DDS_DataReaderResourceLimitsQosPolicy::autopurge_remote_not_alive_writer_delay`

<<***extension***>> *(p. 796)* Maximum duration for which the **DDS_DataReader** (p. 618) will maintain information regarding a **DDS_DataWriter** (p. 488) once the **DDS_DataWriter** (p. 488) has become not alive.

After this time elapses, the **DDS_DataReader** (p. 618) will purge all internal information regarding the not alive **DDS_DataWriter** (p. 488).

See also

DDS_LivelinessQosPolicy (p. 1826) for more information on when a **DDS_DataWriter** (p. 488) is considered not alive.

When set to **DDS_DURATION_AUTO** (p. 1211), this parameter is set to 10 times the value of **DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration** (p. 1694).

This QoS only applies when the **DDS_DataReader** (p. 618) is using **DDS_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1326) for the **DDS_ReliabilityQosPolicy::instance_state_consistency_kind** (p. 1944) QoS. When using **DDS_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1326), a **DDS_DataReader** (p. 618) keeps state about all **DDS_DataWriter** (p. 488) entities and the instances they were writing in order to be able to transition those instances back to their correct state if liveliness with the **DDS_DataWriter** (p. 488) is recovered. This can cause unbounded memory growth if that state is never purged and **DDS_DataWriter** (p. 488) entities continuously come and go in a system. This QoS avoids that unbounded memory growth by setting a time at which that state will be purged.

This QoS should be set such that it is longer than the longest period of time for which a **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) are expected to be disconnected and then reconnected in your system.

An alternative to using this QoS to purge the state is to set the **DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers** (p. 1621) QoS to a finite value. If that QoS is set to a finite value and the number of alive + not alive **DDS_DataWriter** (p. 488) entities reaches the limit when a new **DDS_DataWriter** (p. 488) is discovered, the oldest not alive **DDS_DataWriter** (p. 488) will be replaced.

[default] DDS_DURATION_AUTO (p. 1211)

[range] $>$ 0 or **DDS_DURATION_AUTO** (p. 1211)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Instance Lifecycle** (p. 869), **Liveliness** (p. 876)

6.31.2.31 lazily_allocate_batch_resources

```
DDS_Boolean DDS_DataReaderResourceLimitsQosPolicy::lazily_allocate_batch_resources
```

<<***extension***>> *(p. 796)* Determines whether the **DDS_DataReader** (p. 618) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.

By default, the middleware does not allocate memory up front to manage the batches of samples received, but instead allocates memory from the heap upon receiving the first batch of samples.

Lazily allocating batching resources helps reduce memory consumption when batches are not used, but it may introduce some latency when receiving the first batch of samples, since memory needs to be allocated from the heap. If you know that your application will be using batches, you may set this value to **DDS_BOOLEAN_FALSE** (p. 1203) if you are concerned about that latency.

[default] DDS_BOOLEAN_TRUE (p. 1203)

6.34 DDS_DataRepresentationQosPolicy Struct Reference

*<<**spec**>> (p. 791)* This QoS policy contains a list of representation identifiers and compression settings used by **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) entities to negotiate which data representation and compression settings to use.

Data Fields

- struct **DDS_DataRepresentationIdSeq value**

  *<<**spec**>> (p. 791) Sequence of representation identifiers.*
- struct **DDS_CompressionSettings_t compression_settings**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) Structure that contains the compression settings.*

6.34.1 Detailed Description

*<<**spec**>> (p. 791)* This QoS policy contains a list of representation identifiers and compression settings used by **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) entities to negotiate which data representation and compression settings to use.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

See also

DATA_REPRESENTATION (p. 1258)

This policy has request-offer semantics for both representation and compression. For representation, a **DDS_DataWriter** (p. 488) may only offer a single representation. Attempting to put multiple representations in a **DDS_DataWriter** (p. 488) will result in **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224). A **DDS_DataWriter** (p. 488) will use its offered policy to communicate with its matched **DDS_DataReader** (p. 618) entities. A **DDS_DataReader** (p. 618) requests one or more representations. If a **DDS_DataWriter** (p. 488) offers a representation that is contained within the sequence of the **DDS_DataReader** (p. 618), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When representations are specified in the **DDS_TopicQos** (p. 2048), **DDS_Publisher_copy_from_topic_qos** (p. 465) copies the first element of the sequence, and **DDS_Subscriber_copy_from_topic_qos** (p. 594) copies the whole sequence.

For Compression, only the **DDS_CompressionSettings_t::compression_ids** (p. 1568) is propagated and a **DDS_↩ DataWriter** (p. 488) may only offer a single compression id. Attempting to put multiple compression_ids in a **DDS_↩ DataWriter** (p. 488) will result in **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224).

A **DDS_DataWriter** (p. 488) will use its offered compression algorithm to compress data that it sends to its matched **DDS_DataReader** (p. 618) entities. A **DDS_DataReader** (p. 618) requests zero or more compression algorithms. If a **DDS_DataWriter** (p. 488) offers a representation that is contained within the algorithms requested by the **DDS_Data↩ Reader** (p. 618), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When compression IDs are specified in the **DDS_TopicQos** (p. 2048), **DDS_Publisher_copy_from_topic_qos** (p. 465) copies a single compression ID (see **DDS_CompressionSettings_t::compression_ids** (p. 1568)), and **DDS_↩ Subscriber_copy_from_topic_qos** (p. 594) copies all of the compression_ids.

6.34.2 Field Documentation

6.34.2.1 value

`struct` **`DDS_DataRepresentationIdSeq`** `DDS_DataRepresentationQosPolicy::value`

<<***spec***>> *(p. 791)* Sequence of representation identifiers.

[default] For **DDS_Topic** (p. 174), **DDS_DataWriter** (p. 488), and **DDS_DataReader** (p. 618), a list with one element: **DDS_AUTO_DATA_REPRESENTATION** (p. 1260).

Note

An empty sequence is equivalent to a list with one element: **DDS_XCDR_DATA_REPRESENTATION** (p. 1259).

6.36 DDS_DataWriterCacheStatus Struct Reference

<<***extension***>> *(*p. *1014)* The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.

Data Fields

- **DDS_LongLong sample_count_peak**

  The highest value of ***DDS_DataWriterCacheStatus::sample_count*** *(*p. *1643) over the lifetime of the DataWriter.*
- **DDS_LongLong sample_count**

  The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.
- **DDS_LongLong alive_instance_count**

  The number of instances currently in the DataWriter's queue that have an instance_state equal to ***DDS_ALIVE_INSTANCE_STATE*** *(*p. *716).*
- **DDS_LongLong alive_instance_count_peak**

  The highest value of ***DDS_DataWriterCacheStatus::alive_instance_count*** *(*p. *1643) over the lifetime of the DataWriter.*
- **DDS_LongLong disposed_instance_count**

  The number of instances currently in the DataWriter's queue that have an instance_state equal to ***DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE*** *(*p. *716) (due to, for example, being disposed via the* ***FooDataWriter_dispose*** *(*p. *505) operation).*
- **DDS_LongLong disposed_instance_count_peak**

  The highest value of ***DDS_DataWriterCacheStatus::disposed_instance_count*** *(*p. *1643) over the lifetime of the DataWriter.*
- **DDS_LongLong unregistered_instance_count**

  The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the ***FooDataWriter_unregister_instance*** *(*p. *496) operation.*
- **DDS_LongLong unregistered_instance_count_peak**

  The highest value of ***DDS_DataWriterCacheStatus::unregistered_instance_count*** *(*p. *1644) over the lifetime of the DataWriter.*

6.36.1 Detailed Description

<<***extension***>> *(p. 1014)* The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.

Entity:

DDS_DataWriter (p. 488)

6.36.2 Field Documentation

6.36.2.1 sample_count_peak

```
DDS_LongLong DDS_DataWriterCacheStatus::sample_count_peak
```

The highest value of **DDS_DataWriterCacheStatus::sample_count** (p. 1643) over the lifetime of the DataWriter.

6.36.2.2 sample_count

```
DDS_LongLong DDS_DataWriterCacheStatus::sample_count
```

The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.

6.36.2.3 alive_instance_count

```
DDS_LongLong DDS_DataWriterCacheStatus::alive_instance_count
```

The number of instances currently in the DataWriter's queue that have an instance_state equal to **DDS_ALIVE_INSTANCE_STATE** (p. 716).

6.36.2.4 alive_instance_count_peak

```
DDS_LongLong DDS_DataWriterCacheStatus::alive_instance_count_peak
```

The highest value of **DDS_DataWriterCacheStatus::alive_instance_count** (p. 1643) over the lifetime of the DataWriter.

6.36.2.5 disposed_instance_count

DDS_LongLong DDS_DataWriterCacheStatus::disposed_instance_count

The number of instances currently in the DataWriter's queue that have an instance_state equal to **DDS_NOT_ALIVE_↩ DISPOSED_INSTANCE_STATE** (p. 716) (due to, for example, being disposed via the **FooDataWriter_dispose** (p. 505) operation).

6.36.2.6 disposed_instance_count_peak

DDS_LongLong DDS_DataWriterCacheStatus::disposed_instance_count_peak

The highest value of **DDS_DataWriterCacheStatus::disposed_instance_count** (p. 1643) over the lifetime of the DataWriter.

6.36.2.7 unregistered_instance_count

DDS_LongLong DDS_DataWriterCacheStatus::unregistered_instance_count

The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the **Foo↩ DataWriter_unregister_instance** (p. 496) operation.

6.36.2.8 unregistered_instance_count_peak

DDS_LongLong DDS_DataWriterCacheStatus::unregistered_instance_count_peak

The highest value of **DDS_DataWriterCacheStatus::unregistered_instance_count** (p. 1644) over the lifetime of the DataWriter.

6.37 DDS_DataWriterListener Struct Reference

<<***interface***>> *(p. 1015)* **DDS_Listener** (p. 1819) for writer status.

Data Fields

- struct **DDS_Listener as_listener**

  *The superclass instance of this **DDS_DataWriterListener** (p. 1644).*
- **DDS_DataWriterListener_OfferedDeadlineMissedCallback on_offered_deadline_missed**

  *Handles the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 1230) status.*
- **DDS_DataWriterListener_OfferedIncompatibleQosCallback on_offered_incompatible_qos**

  *Handles the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 1231) status.*
- **DDS_DataWriterListener_LivelinessLostCallback on_liveliness_lost**

  *Handles the **DDS_LIVELINESS_LOST_STATUS** (p. 1233) status.*

DDS_Listener (p. 1819)

Status Kinds (p. 1224)

Operations Allowed in Listener Callbacks (p. 1821)

6.37.2 Field Documentation

6.37.2.1 as_listener

struct **DDS_Listener** DDS_DataWriterListener::as_listener

The superclass instance of this **DDS_DataWriterListener** (p. 1644).

6.37.2.2 on_offered_deadline_missed

DDS_DataWriterListener_OfferedDeadlineMissedCallback DDS_DataWriterListener::on_offered_deadline_missed

Handles the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 1230) status.

This callback is called when the deadline that the **DDS_DataWriter** (p. 488) has committed through its **DEADLINE** (p. 1274) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **DDS_DataWriter** (p. 488) failed to provide data for an instance.

6.37.2.3 on_offered_incompatible_qos

DDS_DataWriterListener_OfferedIncompatibleQosCallback DDS_DataWriterListener::on_offered_incompatible_qos

Handles the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 1231) status.

This callback is called when the **DDS_DataWriterQos** (p. 1666) of the **DDS_DataWriter** (p. 488) was incompatible with what was requested by a **DDS_DataReader** (p. 618). This callback is called when a **DDS_DataWriter** (p. 488) has discovered a **DDS_DataReader** (p. 618) for the same **DDS_Topic** (p. 174) and common partition, but with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 488).

6.37.2.4 on_liveliness_lost

DDS_DataWriterListener_LivelinessLostCallback DDS_DataWriterListener::on_liveliness_lost

Handles the **DDS_LIVELINESS_LOST_STATUS** (p. 1233) status.

This callback is called when the liveliness that the **DDS_DataWriter** (p. 488) has committed through its **LIVELINESS** (p. 1298) qos policy was not respected; this **DDS_DataReader** (p. 618) entities will consider the **DDS_DataWriter** (p. 488) as no longer "alive/active". This callback will not be called when an already not alive **DDS_DataWriter** (p. 488) simply remains not alive for another liveliness period.

6.37.2.5 on_publication_matched

DDS_DataWriterListener_PublicationMatchedCallback DDS_DataWriterListener::on_publication_matched

Handles the **DDS_PUBLICATION_MATCHED_STATUS** (p. 1234) status.

This callback is called when the **DDS_DataWriter** (p. 488) has found a **DDS_DataReader** (p. 618) that matches the **DDS_Topic** (p. 174), has a common partition and compatible QoS, or has ceased to be matched with a **DDS_Data↩ Reader** (p. 618) that was previously considered to be matched.

6.37.2.6 on_reliable_writer_cache_changed

DDS_DataWriterListener_ReliableWriterCacheChangedCallback DDS_DataWriterListener::on_reliable_↩ writer_cache_changed

<<***extension***>> *(*p. *1014)* A change has occurred in the writer's cache of unacknowledged samples.

This listener callback is triggered when:

- The cache is empty (contains no unacknowledged samples).
- The cache is full (the number of unacknowledged samples has reached the value specified in **DDS_Resource↩ LimitsQosPolicy::max_samples** (p. 1956)).
- The number of unacknowledged samples has reached **DDS_RtpsReliableWriterProtocol_t::high_watermark** (p. 1967) or **DDS_RtpsReliableWriterProtocol_t::low_watermark** (p. 1966).

6.37.2.7 on_reliable_reader_activity_changed

DDS_DataWriterListener_ReliableReaderActivityChangedCallback DDS_DataWriterListener::on_reliable↩ _reader_activity_changed

<<***extension***>> *(*p. *1014)* A matched reliable reader has become active or become inactive.

6.37.2.8 on_sample_removed

DDS_DataWriterListener_SampleRemovedCallback DDS_DataWriterListener::on_sample_removed

<<***extension***>> *(*p. *1014)* Called when a sample is removed from the DataWriter queue.

This callback is called only if the sample was written with a **DDS_Cookie_t** (p. 1580) with **FooDataWriter_write_w↩ _params** (p. 504), or if this writer uses **Zero Copy** (p. 209) transfer over shared memory" or **FlatData Topic-Types** (p. 208) "FlatData language binding".

See also

FooDataWriter_get_loan (p. 511)

6.37.2.9 on_instance_replaced

DDS_DataWriterListener_InstanceReplacedCallback DDS_DataWriterListener::on_instance_replaced

<<***extension***>> *(p. 1014)* Notifies when an instance is replaced in DataWriter queue.

This callback is called when an instance is replaced by the **DDS_DataWriter** (p. 488) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance using the **FooDataWriter_get_key_value** (p. 508) API.

Because this callback can be called within the context of an in-progress write, dispose, or unregister call, most APIs on the DataWriter must not be used. The only DataWriter APIs that are safe to call within this callback are:

- **FooDataWriter_get_key_value** (p. 508)
- **FooDataWriter_narrow** (p. 493)
- **FooDataWriter_as_datawriter** (p. 493)
- **FooDataWriter_create_data** (p. 509)
- **FooDataWriter_create_data_w_params** (p. 510)
- **FooDataWriter_delete_data** (p. 510)
- **FooDataWriter_delete_data_w_params** (p. 511)
- **DDS_DataWriter_as_entity** (p. 540)
- **DDS_DataWriter_get_matched_subscriptions** (p. 542)
- **DDS_DataWriter_is_matched_subscription_active** (p. 543)
- **DDS_DataWriter_get_matched_subscription_participant_data** (p. 545)
- **DDS_DataWriter_get_topic** (p. 545)
- **DDS_DataWriter_get_publisher** (p. 546)
- **DDS_DataWriter_is_sample_app_acknowledged** (p. 547)

6.37.2.10 on_application_acknowledgment

DDS_DataWriterListener_OnApplicationAcknowledgmentCallback DDS_DataWriterListener::on_application↩
_acknowledgment

<<***extension***>> *(p. 1014)* Called when a sample is application-acknowledged

Applicable only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1943) = **DDS_APPLICATION_AUTO↩
_ACKNOWLEDGMENT_MODE** (p. 1325) or **DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 1326)

Called when a sample is application-level acknowledged. Provides identities of the sample and the acknowledging **DDS_DataReader** (p. 618). Also provides user-specified response data sent from the **DDS_DataReader** (p. 618) by the acknowledgment message.

6.37.2.11 on_service_request_accepted

DDS_DataWriterListener_ServiceRequestAcceptedCallback DDS_DataWriterListener::on_service_request_accepted

<<***extension***>> *(*p. *1014)* Called when a **DDS_ServiceRequest** (p. 2006) for the **DDS_TopicQuery** (p. 708) service is dispatched to this **DDS_DataWriter** (p. 488) for processing.

See also

Topic Queries (p. 704)

- struct **DDS_SequenceNumber_t initial_virtual_sequence_number**

  <<***extension***>> *(*p. *796) Determines, the initial virtual sequence number for this DataWriter.*

6.38.1 Detailed Description

<<***extension***>> *(*p. *796)* Protocol that applies only to **DDS_DataWriter** (p. 488) instances.

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **DDS_DataWriterProtocolQosPolicy** (p. 1649) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **DDS_ReliabilityQosPolicy** (p. 1940) for more information on the per-DataReader/DataWriter reliability configuration. **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimitsQosPolicy** (p. 1953) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.38.2 Field Documentation

6.38.2.1 virtual_guid

`struct DDS_GUID_t DDS_DataWriterProtocolQosPolicy::virtual_guid`

<<***extension***>> *(*p. *796)* The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDS_DataWriter** (p. 488).

RTI Connext uses the virtual GUID to associate a persisted writer history to a specific **DDS_DataWriter** (p. 488).

The RTI Connext Persistence Service uses the virtual GUID to send samples on behalf of the original **DDS_DataWriter** (p. 488).

[default] DDS_GUID_AUTO (p. 1215)

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960), **Data Availability** (p. 844)

6.38.2.2 rtps_object_id

```
DDS_UnsignedLong DDS_DataWriterProtocolQosPolicy::rtps_object_id
```

<<***extension***>> *(*p. *796)* The RTPS Object ID.

This value is used to determine the RTPS object ID of a data writer according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connext will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data writer.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connext. In those cases, the recomendation is not to use automatic object ID assigment.

[default] DDS_RTPS_AUTO_ID (p. **??**)

[range] [0,0x00ffffff]

Categories

Immutable (p. 916)

6.38.2.3 push_on_write

```
DDS_Boolean DDS_DataWriterProtocolQosPolicy::push_on_write
```

<<***extension***>> *(*p. *796)* Whether to push sample out when write is called.

If set to **DDS_BOOLEAN_TRUE** (p. 1203) (the default), the writer will send a sample every time write is called. Otherwise, the sample is put into the queue waiting for a NACK from remote reader(s) to be sent out.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Data Availability** (p. 844)

6.38.2.4 disable_positive_acks

DDS_Boolean DDS_DataWriterProtocolQosPolicy::disable_positive_acks

<<***extension***>> *(p. 796)* Controls whether or not the writer expects positive acknowledgements from matching readers.

If set to **DDS_BOOLEAN_TRUE** (p. 1203), the writer does not expect readers to send send positive acknowledgments to the writer. Consequently, instead of keeping a sample queued until all readers have positively acknowledged it, the writer will keep a sample for at least **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration** (p. 1975), after which the sample is logically considered as positively acknowledged.

If set to **DDS_BOOLEAN_FALSE** (p. 1203) (the default), the writer expects to receive positive acknowledgements from its acknowledging readers (**DDS_DataReaderProtocolQosPolicy::disable_positive_acks** (p. 1598) = **DDS_BOOLEAN_FALSE** (p. 1203)) and it applies the keep-duration to its non-acknowledging readers (**DDS_DataReaderProtocolQosPolicy::disable_positive_acks** (p. 1598) = **DDS_BOOLEAN_TRUE** (p. 1203)).

A writer with both acknowledging and non-acknowledging readers keeps a sample queued until acknowledgements have been received from all acknowledging readers and the keep-duration has elapsed for non-acknowledging readers.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960), **Reliability** (p. 897)

6.38.2.5 disable_inline_keyhash

DDS_Boolean DDS_DataWriterProtocolQosPolicy::disable_inline_keyhash

<<***extension***>> *(p. 796)* Controls whether or not a keyhash is propagated on the wire with each sample.

This field only applies to keyed writers.

With each key, RTI Connext associates an internal 16-byte representation, called a keyhash.

When this field is **DDS_BOOLEAN_FALSE** (p. 1203), the keyhash is sent on the wire with every data instance.

When this field is **DDS_BOOLEAN_TRUE** (p. 1203), the keyhash is not sent on the wire and the readers must compute the value using the received data.

If the *reader* is CPU bound, sending the keyhash on the wire may increase performance, because the reader does not have to get the keyhash from the data.

If the *writer* is CPU bound, sending the keyhash on the wire may decrease performance, because it requires more bandwidth (16 more bytes per sample).

Note: Setting disable_inline_keyhash to **DDS_BOOLEAN_TRUE** (p. 1203) is not compatible with using RTI Real-Time Connect or RTI Recorder.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869)

6.38.2.6 serialize_key_with_dispose

```
DDS_Boolean DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose
```

<<***extension***>> *(p. 796)* Controls whether or not the serialized key is propagated on the wire with dispose samples.

This field only applies to keyed writers.

We recommend setting this field to **DDS_BOOLEAN_TRUE** (p. 1203) if there are DataReaders where **DDS_Data↩ ReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances** (p. 1598) is also **DDS_BOOLEAN_↩ TRUE** (p. 1203).

When setting serialize_key_with_dispose to FALSE, only a key hash is included in the dispose meta-sample sent by a DataWriter for a dispose action. If a dispose meta-sample only includes the key hash, then DataReaders must have previously received an actual data sample for the instance being disposed, in order for a DataReader to map a key hash/instance handle to actual key values.

If an actual data sample was never received for an instance and serialize_key_with_dispose is set to FALSE, then the DataReader application will not be able to determine the value of the key that was disposed, since **FooDataReader_↩ get_key_value** (p. 650) will not be able to map an instance handle to actual key values.

By setting serialize_key_with_dispose to TRUE, the values of the key members of a data type will be sent in the dispose meta-sample for a dispose action by the DataWriter. This allows the DataReader to map an instance handle to the values of the key members even when receiving a dispose meta-sample without previously having received a data sample for the instance.

Important: When this field is **DDS_BOOLEAN_TRUE** (p. 1203), batching will not be compatible with RTI Connext 4.3e, 4.4b, or 4.4c. The **DDS_DataReader** (p. 618) entities will receive incorrect data and/or encounter deserialization errors.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869)

6.38.2.7 propagate_app_ack_with_no_response

```
DDS_Boolean DDS_DataWriterProtocolQosPolicy::propagate_app_ack_with_no_response
```

<<***extension***>> *(p. 796)* Controls whether or not a **DDS_DataWriter** (p. 488) receives **DDS_DataWriterListener↩ ::on_application_acknowledgment** (p. 1648) notifications with an empty or invalid response.

When this field is set to **DDS_BOOLEAN_FALSE** (p. 1203), the callback **DDS_DataWriterListener::on_application↩ _acknowledgment** (p. 1648) will not be invoked if the sample being acknowledged has an empty or invalid response.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Application Acknowledgement** (p. 836), **Durability** (p. 861)

6.38.2.8 rtps_reliable_writer

`struct` **`DDS_RtpsReliableWriterProtocol_t`** `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer`

<<***extension***>> *(p. 796)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **DDS_DataWriter** (p. 488). This parameter only has effect if both the writer and the matching reader are configured with **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) **DDS_ReliabilityQosPolicyKind** (p. 1324).

For details, refer to the **DDS_RtpsReliableWriterProtocol_t** (p. 1965)

[default] [default] See **DDS_RtpsReliableWriterProtocol_t** (p. 1965)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.38.2.9 initial_virtual_sequence_number

`struct` **`DDS_SequenceNumber_t`** `DDS_DataWriterProtocolQosPolicy::initial_virtual_sequence_number`

<<***extension***>> *(p. 796)* Determines, the initial virtual sequence number for this DataWriter.

By default, the virtual sequence number of the first sample published by a DataWriter will be 1 for DataWriters that do not use durable writer history. For durable writers, the default virtual sequence number will be the last sequence number they published in a previous execution, plus one. So, when a non-durable DataWriter is restarted and must continue communicating with the same DataReaders, its samples start over with sequence number 1. Durable DataWriters start over where the last sequence number left off, plus one.

This QoS setting allows overwriting the default initial virtual sequence number.

Normally, this parameter is not expected to be modified; however, in some scenarios when continuing communication after restarting, applications may require the DataWriter's virtual sequence number to start at something other than the value described above. An example would be to enable non-durable DataWriters to start at the last sequence number published, plus one, similar to the durable DataWriter. This property enables you to make such a configuration, if desired.

The virtual sequence number can be overwritten as well on a per sample basis by updating **DDS_WriteParams_t**↩ **::identity** (p. 2108) in the **FooDataWriter_write_w_params** (p. 504).

[default] DDS_AUTO_SEQUENCE_NUMBER (p. 1220)

Categories

Immutable (p. 916)

6.39 DDS_DataWriterProtocolStatus Struct Reference

<<***extension***>> *(p. 1014)* The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Data Fields

- **DDS_LongLong pushed_sample_count**

  The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.
- **DDS_LongLong pushed_sample_count_change**

  *The change in **DDS_DataWriterProtocolStatus::pushed_sample_count** (p. 1657) since the last time the status was read.*
- **DDS_LongLong pushed_sample_bytes**

  The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.
- **DDS_LongLong pushed_sample_bytes_change**

  *The change in **DDS_DataWriterProtocolStatus::pushed_sample_bytes** (p. 1657) since the last time the status was read.*
- **DDS_LongLong filtered_sample_count**

  ***[Not supported.]** The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.*
- **DDS_LongLong filtered_sample_count_change**

  ***[Not supported.]** The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.*
- **DDS_LongLong filtered_sample_bytes**

  ***[Not supported.]** The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.*
- **DDS_LongLong filtered_sample_bytes_change**

  ***[Not supported.]** The incremental change in the number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.*
- **DDS_LongLong sent_heartbeat_count**

  The number of Heartbeats sent between a local DataWriter and matching remote DataReader.
- **DDS_LongLong sent_heartbeat_count_change**

  *The change in **DDS_DataWriterProtocolStatus::sent_heartbeat_count** (p. 1658) since the last time the status was read.*
- **DDS_LongLong sent_heartbeat_bytes**

  The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.
- **DDS_LongLong sent_heartbeat_bytes_change**

  *The change in **DDS_DataWriterProtocolStatus::sent_heartbeat_bytes** (p. 1659) since the last time the status was read.*
- **DDS_LongLong pulled_sample_count**

  The number of user samples pulled from local DataWriter by matching DataReaders.
- **DDS_LongLong pulled_sample_count_change**

  *The change in **DDS_DataWriterProtocolStatus::pulled_sample_count** (p. 1659) since the last time the status was read.*
- **DDS_LongLong pulled_sample_bytes**

  The number of bytes of user samples pulled from local DataWriter by matching DataReaders.
- **DDS_LongLong pulled_sample_bytes_change**

  *The change in **DDS_DataWriterProtocolStatus::pulled_sample_bytes** (p. 1660) since the last time the status was read.*
- **DDS_LongLong received_ack_count**

  The number of ACKs from a remote DataReader received by a local DataWriter.
- **DDS_LongLong received_ack_count_change**

  *The change in **DDS_DataWriterProtocolStatus::received_ack_count** (p. 1660) since the last time the status was read.*
- **DDS_LongLong received_ack_bytes**

  The number of bytes of ACKs from a remote DataReader received by a local DataWriter.
- **DDS_LongLong received_ack_bytes_change**

  *The change in **DDS_DataWriterProtocolStatus::received_ack_bytes** (p. 1661) since the last time the status was read.*
- **DDS_LongLong received_nack_count**

The number of NACKs from a remote DataReader received by a local DataWriter.

- **DDS_LongLong received_nack_count_change**

  *The change in **DDS_DataWriterProtocolStatus::received_nack_count** (p. 1661) since the last time the status was read.*
- **DDS_LongLong received_nack_bytes**

  The number of bytes of NACKs from a remote DataReader received by a local DataWriter.
- **DDS_LongLong received_nack_bytes_change**

  *The change in **DDS_DataWriterProtocolStatus::received_nack_bytes** (p. 1661) since the last time the status was read.*
- **DDS_LongLong sent_gap_count**

  The number of GAPs sent from local DataWriter to matching remote DataReaders.
- **DDS_LongLong sent_gap_count_change**

  *The change in **DDS_DataWriterProtocolStatus::sent_gap_count** (p. 1662) since the last time the status was read.*
- **DDS_LongLong sent_gap_bytes**

  The number of bytes of GAPs sent from local DataWriter to matching remote DataReaders.
- **DDS_LongLong sent_gap_bytes_change**

  *The change in **DDS_DataWriterProtocolStatus::sent_gap_bytes** (p. 1662) since the last time the status was read.*
- **DDS_LongLong rejected_sample_count**

  [Not supported.]
- **DDS_LongLong rejected_sample_count_change**

  [Not supported.]
- **DDS_Long send_window_size**

  Current maximum number of outstanding samples allowed in the DataWriter's queue.
- struct **DDS_SequenceNumber_t first_available_sample_sequence_number**

  The sequence number of the first available sample currently queued in the local DataWriter.
- struct **DDS_SequenceNumber_t last_available_sample_sequence_number**

  The sequence number of the last available sample currently queued in the local DataWriter.
- struct **DDS_SequenceNumber_t first_unacknowledged_sample_sequence_number**

  The sequence number of the first unacknowledged sample currently queued in the local DataWriter.
- struct **DDS_SequenceNumber_t first_available_sample_virtual_sequence_number**

  The virtual sequence number of the first available sample currently queued in the local DataWriter.
- struct **DDS_SequenceNumber_t last_available_sample_virtual_sequence_number**

  The virtual sequence number of the last available sample currently queued in the local DataWriter.
- struct **DDS_SequenceNumber_t first_unacknowledged_sample_virtual_sequence_number**

  The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.
- **DDS_InstanceHandle_t first_unacknowledged_sample_subscription_handle**

  The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.
- struct **DDS_SequenceNumber_t first_unelapsed_keep_duration_sample_sequence_number**

  The sequence number of the first sample whose keep duration has not yet elapsed.
- **DDS_LongLong pushed_fragment_count**

  The number of DATA_FRAG messages that have been pushed by this DataWriter.
- **DDS_LongLong pushed_fragment_bytes**

  The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.
- **DDS_LongLong pulled_fragment_count**

  The number of DATA_FRAG messages that have been pulled from this DataWriter.
- **DDS_LongLong pulled_fragment_bytes**

  The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.
- **DDS_LongLong received_nack_fragment_count**

  The number of NACK_FRAG messages that have been received by this DataWriter.
- **DDS_LongLong received_nack_fragment_bytes**

  The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

6.39.1 Detailed Description

<<***extension***>> *(p. 1014)* The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Entity:

DDS_DataWriter (p. 488)

6.39.2 Field Documentation

6.39.2.1 pushed_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_count

The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count is the number of sends done internally, and it may be greater than the number of user writes.

For large data, counts whole samples, not fragments. The fragment count is tracked in the **DDS_DataWriterProtocol↩ Status::pushed_fragment_count** (p. 1665) statistic.

6.39.2.2 pushed_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_count_change

The change in **DDS_DataWriterProtocolStatus::pushed_sample_count** (p. 1657) since the last time the status was read.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing.

For large data, counts whole samples, not fragments.

6.39.2.3 pushed_sample_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes

The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count of bytes corresponds to the number of sends done internally, and it may be greater than the number of user writes.

When data fragmentation is used, this statistic is incremented as fragments are written.

6.39.2.4 pushed_sample_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes_change

The change in **DDS_DataWriterProtocolStatus::pushed_sample_bytes** (p. 1657) since the last time the status was read.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing.

When data fragmentation is used, this statistic is incremented as fragments are written.

6.39.2.5 filtered_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_count

[Not supported.] The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

6.39.2.6 filtered_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_count_change

[Not supported.] The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

6.39.2.7 filtered_sample_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes

[Not supported.] The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-↩ Filtered Topics.

6.39.2.8 filtered_sample_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes_change

[Not supported.] The incremental change in the number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

6.39.2.9 sent_heartbeat_count

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

6.39.2.10 sent_heartbeat_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count_change

The change in **DDS_DataWriterProtocolStatus::sent_heartbeat_count** (p. 1658) since the last time the status was read.

6.39.2.11 sent_heartbeat_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes

The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

6.39.2.12 sent_heartbeat_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes_change

The change in **DDS_DataWriterProtocolStatus::sent_heartbeat_bytes** (p. 1659) since the last time the status was read.

6.39.2.13 pulled_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count

The number of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 1651) is **DDS_BOOLEAN_FALSE** (p. 1203).

When data fragmentation is used, this statistic is incremented as fragments are written.

6.39.2.14 pulled_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count_change

The change in **DDS_DataWriterProtocolStatus::pulled_sample_count** (p. 1659) since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 1651) is **DDS_BOOLEAN_FALSE** (p. 1203).

For large data, counts whole samples, not fragments.

6.39.2.15 pulled_sample_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes

The number of bytes of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 1651) is **DDS_BOOLEAN_FALSE** (p. 1203).

When data fragmentation is used, this statistic is incremented as fragments are written.

6.39.2.16 pulled_sample_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes_change

The change in **DDS_DataWriterProtocolStatus::pulled_sample_bytes** (p. 1660) since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 1651) is **DDS_BOOLEAN_FALSE** (p. 1203).

For large data, counts bytes of whole samples, not fragments.

6.39.2.17 received_ack_count

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_count

The number of ACKs from a remote DataReader received by a local DataWriter.

6.39.2.18 received_ack_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_count_change

The change in **DDS_DataWriterProtocolStatus::received_ack_count** (p. 1660) since the last time the status was read.

6.39.2.19 received_ack_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_bytes

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

6.39.2.20 received_ack_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_bytes_change

The change in **DDS_DataWriterProtocolStatus::received_ack_bytes** (p. 1661) since the last time the status was read.

6.39.2.21 received_nack_count

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_count

The number of NACKs from a remote DataReader received by a local DataWriter.

6.39.2.22 received_nack_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_count_change

The change in **DDS_DataWriterProtocolStatus::received_nack_count** (p. 1661) since the last time the status was read.

6.39.2.23 received_nack_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_bytes

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

6.39.2.24 received_nack_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_bytes_change

The change in **DDS_DataWriterProtocolStatus::received_nack_bytes** (p. 1661) since the last time the status was read.

6.39.2.25 sent_gap_count

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_count

The number of GAPs sent from local DataWriter to matching remote DataReaders.

6.39.2.26 sent_gap_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_count_change

The change in **DDS_DataWriterProtocolStatus::sent_gap_count** (p. 1662) since the last time the status was read.

6.39.2.27 sent_gap_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_bytes

The number of bytes of GAPs sent from local DataWriter to matching remote DataReaders.

6.39.2.28 sent_gap_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_bytes_change

The change in **DDS_DataWriterProtocolStatus::sent_gap_bytes** (p. 1662) since the last time the status was read.

6.39.2.29 rejected_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::rejected_sample_count

[Not supported.]

6.39.2.30 rejected_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::rejected_sample_count_change

[Not supported.]

6.39.2.31 send_window_size

DDS_Long DDS_DataWriterProtocolStatus::send_window_size

Current maximum number of outstanding samples allowed in the DataWriter's queue.

Spans the range from **DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1978) to **DDS_Rtps↩ ReliableWriterProtocol_t::max_send_window_size** (p. 1978).

6.39.2.32 first_available_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::first_available_sample_sequence_number

The sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

6.39.2.33 last_available_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::last_available_sample_sequence_number

The sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

6.39.2.34 first_unacknowledged_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::first_unacknowledged_sample_sequence_↩number

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

6.39.2.35 first_available_sample_virtual_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::first_available_sample_virtual_sequence↩_number

The virtual sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

6.39.2.36 last_available_sample_virtual_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::last_available_sample_virtual_sequence↩_number

The virtual sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

6.39.2.37 first_unacknowledged_sample_virtual_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::first_unacknowledged_sample_virtual_↩sequence_number

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

6.39.2.38 first_unacknowledged_sample_subscription_handle

DDS_InstanceHandle_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_subscription_↩handle

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

Applies only for local DataWriter status.

6.39.2.39 first_unelapsed_keep_duration_sample_sequence_number

struct **DDS_SequenceNumber_t** DDS_DataWriterProtocolStatus::first_unelapsed_keep_duration_sample_↩ sequence_number

The sequence number of the first sample whose keep duration has not yet elapsed.

Applicable only when **DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 1651) is set.

Sequence number of the first sample kept in the DataWriter's queue whose keep_duration (applied when **DDS_Data↩ WriterProtocolQosPolicy::disable_positive_acks** (p. 1651) is set) has not yet elapsed.

Applies only for local DataWriter status.

6.39.2.40 pushed_fragment_count

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_fragment_count

The number of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

6.39.2.41 pushed_fragment_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_fragment_bytes

The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

6.39.2.42 pulled_fragment_count

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_fragment_count

The number of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

6.39.2.43 pulled_fragment_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_fragment_bytes

The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

6.39.2.44 received_nack_fragment_count

```
DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_fragment_count
```

The number of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

6.39.2.45 received_nack_fragment_bytes

```
DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_fragment_bytes
```

The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

6.40 DDS_DataWriterQos Struct Reference

QoS policies supported by a **DDS_DataWriter** (p. 488) entity.

6.40.1 Detailed Description

QoS policies supported by a **DDS_DataWriter** (p. 488) entity.

You must set certain members in a consistent manner:

- **DDS_DataWriterQos::history** (p. 1669) .depth <= **DDS_DataWriterQos::resource_limits** (p. 1670) .max_samples_per_instance
- **DDS_DataWriterQos::resource_limits** (p. 1670) .max_samples_per_instance <= **DDS_DataWriterQos::resource_limits** (p. 1670) .max_samples
- **DDS_DataWriterQos::resource_limits** (p. 1670) .initial_samples <= **DDS_DataWriterQos::resource_limits** (p. 1670) .max_samples
- **DDS_DataWriterQos::resource_limits** (p. 1670) .initial_instances <= **DDS_DataWriterQos::resource_limits** (p. 1670) .max_instances
- length of **DDS_DataWriterQos::user_data** (p. 1670) .value <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .writer_user_data_max_length

If any of the above are not true, **DDS_DataWriter_set_qos** (p. 553) and **DDS_DataWriter_set_qos_with_profile** (p. 554) and **DDS_Publisher_set_default_datawriter_qos** (p. 453) and **DDS_Publisher_set_default_datawriter_qos_with_profile** (p. 453) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224) and **DDS_Publisher_create_datawriter** (p. 456) and **DDS_Publisher_create_datawriter_with_profile** (p. 457) and will return NULL.

Entity:

DDS_DataWriter (p. 488)

6.40.2 Field Documentation

6.40.2.1 durability

`struct` **`DDS_DurabilityQosPolicy`** `DDS_DataWriterQos::durability`

Durability policy, **DURABILITY** (p. 1287).

6.40.2.2 durability_service

`struct` **DDS_DurabilityServiceQosPolicy** `DDS_DataWriterQos::durability_service`

DurabilityService policy, **DURABILITY_SERVICE** (p. 1291).

6.40.2.3 deadline

`struct` **DDS_DeadlineQosPolicy** `DDS_DataWriterQos::deadline`

<<***basic***>> *(p. 784)* Deadline policy, **DEADLINE** (p. 1274).

6.40.2.4 latency_budget

`struct` **DDS_LatencyBudgetQosPolicy** `DDS_DataWriterQos::latency_budget`

Latency budget policy, **LATENCY_BUDGET** (p. 1296).

6.40.2.5 liveliness

`struct` **DDS_LivelinessQosPolicy** `DDS_DataWriterQos::liveliness`

Liveliness policy, **LIVELINESS** (p. 1298).

6.40.2.6 reliability

`struct` **DDS_ReliabilityQosPolicy** `DDS_DataWriterQos::reliability`

Reliability policy, **RELIABILITY** (p. 1323).

6.40.2.7 destination_order

`struct` **DDS_DestinationOrderQosPolicy** `DDS_DataWriterQos::destination_order`

Destination order policy, **DESTINATION_ORDER** (p. 1275).

6.40.2.8 history

struct **DDS_HistoryQosPolicy** DDS_DataWriterQos::history

<<***basic***>> *(p. 784)* History policy, **HISTORY** (p. 1294).

6.40.2.9 resource_limits

struct **DDS_ResourceLimitsQosPolicy** DDS_DataWriterQos::resource_limits

Resource limits policy, **RESOURCE_LIMITS** (p. 1327).

6.40.2.10 transport_priority

struct **DDS_TransportPriorityQosPolicy** DDS_DataWriterQos::transport_priority

Transport priority policy, **TRANSPORT_PRIORITY** (p. 1339).

6.40.2.11 lifespan

struct **DDS_LifespanQosPolicy** DDS_DataWriterQos::lifespan

<<***basic***>> *(p. 784)* Lifespan policy, **LIFESPAN** (p. 1297).

6.40.2.12 user_data

struct **DDS_UserDataQosPolicy** DDS_DataWriterQos::user_data

User data policy, **USER_DATA** (p. 1345).

6.40.2.13 ownership

struct **DDS_OwnershipQosPolicy** DDS_DataWriterQos::ownership

<<***basic***>> *(p. 784)* Ownership policy, **OWNERSHIP** (p. 1303).

6.40.2.14 ownership_strength

struct **DDS_OwnershipStrengthQosPolicy** DDS_DataWriterQos::ownership_strength

<<***basic***>> *(*p. *784)* Ownership strength policy, **OWNERSHIP_STRENGTH** (p. 1304).

6.40.2.15 writer_data_lifecycle

struct **DDS_WriterDataLifecycleQosPolicy** DDS_DataWriterQos::writer_data_lifecycle

Writer data lifecycle policy, **WRITER_DATA_LIFECYCLE** (p. 1346).

6.40.2.16 representation

struct **DDS_DataRepresentationQosPolicy** DDS_DataWriterQos::representation

Data representation policy, **DATA_REPRESENTATION** (p. 1258).

6.40.2.17 data_tags

DDS_DataTagQosPolicy DDS_DataWriterQos::data_tags

DataTag policy, **DATA_TAG** (p. 1265).

6.40.2.18 writer_resource_limits

struct **DDS_DataWriterResourceLimitsQosPolicy** DDS_DataWriterQos::writer_resource_limits

<<***extension***>> *(*p. *1014)* Writer resource limits policy, **DATA_WRITER_RESOURCE_LIMITS** (p. 1271).

6.40.2.19 protocol

struct **DDS_DataWriterProtocolQosPolicy** DDS_DataWriterQos::protocol

<<***extension***>> *(*p. *1014)* **DDS_DataWriter** (p. 488) protocol policy, **DATA_WRITER_PROTOCOL** (p. 1270)

6.40.2.20 transport_selection

struct **DDS_TransportSelectionQosPolicy** DDS_DataWriterQos::transport_selection

<<***extension***>> *(*p. *1014)* Transport plugin selection policy, **TRANSPORT_SELECTION** (p. 1340).

Specifies the transports available for use by the **DDS_DataWriter** (p. 488).

6.40.2.21 unicast

struct **DDS_TransportUnicastQosPolicy** DDS_DataWriterQos::unicast

<<***extension***>> *(*p. *1014)* Unicast transport policy, **TRANSPORT_UNICAST** (p. 1341).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDS_DataReader** (p. 618) entities in the domain.

6.40.2.22 publish_mode

struct **DDS_PublishModeQosPolicy** DDS_DataWriterQos::publish_mode

<<***extension***>> *(*p. *1014)* Publish mode policy, **PUBLISH_MODE** (p. 1319).

Determines whether the **DDS_DataWriter** (p. 488) publishes data synchronously or asynchronously and how.

6.40.2.23 property

struct **DDS_PropertyQosPolicy** DDS_DataWriterQos::property

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *1014)* Property policy, **PROPERTY** (p. 1308). See also `Property Reference Guide`.

6.40.2.24 service

struct **DDS_ServiceQosPolicy** DDS_DataWriterQos::service

<<***extension***>> *(*p. *1014)* Service policy, **SERVICE** (p. 1328).

6.40.2.25 batch

`struct` **DDS_BatchQosPolicy** DDS_DataWriterQos::batch

<<***extension***>> *(p. 1014)* Batch policy, **BATCH** (p. 1253).

6.40.2.26 multi_channel

`struct` **DDS_MultiChannelQosPolicy** DDS_DataWriterQos::multi_channel

<<***extension***>> *(p. 1014)* Multi channel policy, **MULTICHANNEL** (p. 1302).

6.40.2.27 availability

`struct` **DDS_AvailabilityQosPolicy** DDS_DataWriterQos::availability

<<***extension***>> *(p. 1014)* Availability policy, **AVAILABILITY** (p. 1252).

6.40.2.28 publication_name

`struct` **DDS_EntityNameQosPolicy** DDS_DataWriterQos::publication_name

<<***extension***>> *(p. 1014)* EntityName policy, **ENTITY_NAME** (p. 1292).

6.40.2.29 topic_query_dispatch

`struct` **DDS_TopicQueryDispatchQosPolicy** DDS_DataWriterQos::topic_query_dispatch

<<***extension***>> *(p. 1014)* Topic Query dispatch policy, **TOPIC_QUERY_DISPATCH** (p. 1332).

6.40.2.30 transfer_mode

`struct` **DDS_DataWriterTransferModeQosPolicy** DDS_DataWriterQos::transfer_mode

<<***extension***>> *(p. 1014)* TransferMode policy, **DATA_WRITER_TRANSFER_MODE** (p. 1274).

6.40.2.31 type_support

```
struct DDS_TypeSupportQosPolicy DDS_DataWriterQos::type_support
```

<<***extension***>> *(*p. *1014)* Type support data, **TYPESUPPORT** (p. 1343).

Optional value that is passed to a type plugin's on_endpoint_attached and serialization functions.

6.41 DDS_DataWriterResourceLimitsQosPolicy Struct Reference

<<***extension***>> *(*p. *796)* Various settings that configure how a **DDS_DataWriter** (p. 488) allocates and uses physical memory for internal resources.

6.41.1 Detailed Description

*<<**extension**>> (p. 796)* Various settings that configure how a **DDS_DataWriter** (p. 488) allocates and uses physical memory for internal resources.

DataWriters must allocate internal structures to handle the simultaneously blocking of threads trying to call **FooData↩ Writer_write** (p. 499) on the same **DDS_DataWriter** (p. 488), for the storage used to batch small samples, and for content-based filters specified by DataReaders.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDS_DataWriter** (p. 488). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **DDS_DataWriter** (p. 488).

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.41.2 Field Documentation

6.41.2.1 initial_concurrent_blocking_threads

`DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_concurrent_blocking_threads`

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* The initial number of threads that are allowed to concurrently block on write call on the same **DDS_DataWriter** (p. 488).

This value only applies if **DDS_HistoryQosPolicy** (p. 1808) has its kind set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295) and **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1943) is $>$ 0.

[default] 1

[range] [1, 10000], <= max_concurrent_blocking_threads

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Concurrency** (p. 841)

6.41.2.2 max_concurrent_blocking_threads

`DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_concurrent_blocking_threads`

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* The maximum number of threads that are allowed to concurrently block on write call on the same **DDS_DataWriter** (p. 488).

This value only applies if **DDS_HistoryQosPolicy** (p. 1808) has its kind set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295) and **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1943) is $>$ 0.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 10000] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_concurrent_blocking_threads

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Concurrency** (p. 841)

6.41.2.3 max_remote_reader_filters

```
DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_remote_reader_filters
```

<<***extension***>> *(p. 796)* The maximum number of remote DataReaders for which the **DDS_DataWriter** (p. 488) will perform content-based filtering.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [0, (2^31)-2] or **DDS_LENGTH_UNLIMITED** (p. 1328).

0: The **DDS_DataWriter** (p. 488) will not perform filtering for any **DDS_DataReader** (p. 618).

1 to (2^31)-2: The DataWriter will filter for up to the specified number of DataReaders. In addition, the Datawriter will store the result of the filtering per sample per DataReader.

DDS_LENGTH_UNLIMITED (p. 1328): The DataWriter will filter for up to (2^31)-2 DataReaders. However, in this case, the DataWriter will not store the filtering result per sample per DataReader. Thus, if a sample is resent (such as due to a loss of reliable communication), the sample will be filtered again.

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Content Filtering** (p. 843)

6.41.2.4 initial_batches

```
DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_batches
```

<<***extension***>> *(p. 796)* Represents the initial number of batches a **DDS_DataWriter** (p. 488) will manage.

[default] 8

[range] [1,100 million]

See also

DDS_BatchQosPolicy (p. 1552)

Categories

Immutable (p. 916), **Sample Memory Management** (p. 904), **Middleware Memory Management** (p. 880), **Batching** (p. 840)

6.41.2.5 max_batches

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_batches

<<***extension***>> *(p. 796)* Represents the maximum number of batches a **DDS_DataWriter** (p. 488) will manage.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

When batching is enabled, the maximum number of samples that a **DDS_DataWriter** (p. 488) can store is limited by this value and **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956).

[range] [1,100 million] or **DDS_LENGTH_UNLIMITED** (p. 1328) >= **DDS_RtpsReliableWriterProtocol_t**↩ **::heartbeats_per_max_samples** (p. 1972) if batching is enabled

See also

DDS_BatchQosPolicy (p. 1552)

Categories

Immutable (p. 916), **Sample Memory Management** (p. 904), **Middleware Memory Management** (p. 880), **Batching** (p. 840)

6.41.2.6 instance_replacement

DDS_DataWriterResourceLimitsInstanceReplacementKind DDS_DataWriterResourceLimitsQosPolicy::instance↩ _replacement

<<***extension***>> *(p. 796)* Sets the kinds of instances allowed to be replaced when instance resource limits are reached.

When a **DDS_DataWriter** (p. 488)'s number of active instances is greater than **DDS_ResourceLimitsQosPolicy**↩ **::max_instances** (p. 1956), it will try to make room by replacing an existing instance. This field specifies the kinds of instances allowed to be replaced.

If a replaceable instance is not available, either an out-of-resources exception will be returned, or the writer may block if the instance reclamation was done when writing.

[default] DDS_UNREGISTERED_INSTANCE_REPLACEMENT (p. 1272)

See also

DDS_DataWriterResourceLimitsInstanceReplacementKind (p. 1271)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Instance Lifecycle** (p. 869)

6.41.2.7 replace_empty_instances

```
DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::replace_empty_instances
```

<<***extension***>> *(*p. *796)* Whether or not to replace empty instances during instance replacement

When a **DDS_DataWriter** (p. 488) has more active instances than allowed by **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956), it tries to make room by replacing an existing instance. This field configures whether empty instances (i.e. instances with no samples) may be replaced. If set **DDS_BOOLEAN_TRUE** (p. 1203), then a **DDS_DataWriter** (p. 488) will first try reclaiming empty instances, before trying to replace whatever is specified by **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 1678).

[default] DDS_BOOLEAN_FALSE (p. 1203)

See also

DDS_DataWriterResourceLimitsInstanceReplacementKind (p. 1271)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Instance Lifecycle** (p. 869)

6.41.2.8 autoregister_instances

```
DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::autoregister_instances
```

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Whether or not to automatically register new instances

[default] DDS_BOOLEAN_FALSE (p. 1203)

When set to true, it is possible to write with a non-NIL handle of an instance that is not registered: the write operation will succeed and the instance will be registered. Otherwise, that write operation would fail.

6.42 DDS_DataWriterShmemRefTransferModeSettings Struct Reference

Settings related to transferring data using shared memory references.

Data Fields

- **DDS_Boolean enable_data_consistency_check**

  Controls if samples can be checked for consistency.

6.42.1 Detailed Description

Settings related to transferring data using shared memory references.

It is used to configure a **DDS_DataWriter** (p. 488) using **Zero Copy transfer over shared memory** (p. 209).

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

QoS:

DDS_DataWriterTransferModeQosPolicy (p. 1684)

6.42.2 Field Documentation

6.42.2.1 enable_data_consistency_check

```
DDS_Boolean DDS_DataWriterShmemRefTransferModeSettings::enable_data_consistency_check
```

Controls if samples can be checked for consistency.

When this setting is true, the **DDS_DataWriter** (p. 488) sends an incrementing sequence number as an inline QoS with every sample. This sequence number allows a **DDS_DataReader** (p. 618) to use the **FooDataReader_is_data_consistent** (p. 652) API to detect if the **DDS_DataWriter** (p. 488) overwrote the sample before the **DDS_DataReader** (p. 618) could complete processing the sample.

[default] DDS_BOOLEAN_TRUE (p. 1203)

6.44 DDS_DeadlineQosPolicy Struct Reference

<<***spec***>> *(*p. *791)* Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Data Fields

- struct **DDS_Duration_t period**
  <<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791) Duration of the deadline period.*

6.44.1 Detailed Description

<<***spec***>> *(p. 791)* Expresses the maximum duration (deadline) within which an instance is expected to be updated.

A **DDS_DataReader** (p. 618) expects a new sample updating the value of each instance at least once every `period`. That is, `period` specifies the maximum expected elapsed time between arriving data samples.

A **DDS_DataWriter** (p. 488) indicates that the application commits to write a new value (using the **DDS_DataWriter** (p. 488)) for each instance managed by the **DDS_DataWriter** (p. 488) at least once every `period`.

This QoS can be used during system integration to ensure that applications have been coded to meet design specifications.

It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions to prevent total system failure when data is not received in time. For topics on which data is not expected to be periodic, `period` should be set to an infinite value.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 1230), **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 1231), **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **YES** (p. 1247)

6.44.2 Usage

This policy is useful for cases where a **DDS_Topic** (p. 174) is expected to have each instance updated periodically. On the publishing side this setting establishes a contract that the application must meet. On the subscribing side the setting establishes a minimum requirement for the remote publishers that are expected to supply the data values.

When RTI Connext 'matches' a **DDS_DataWriter** (p. 488) and a **DDS_DataReader** (p. 618) it checks whether the settings are compatible (i.e., *offered deadline* <= *requested deadline*); if they are not, the two entities are informed (via the **DDS_Listener** (p. 1819) or **DDS_Condition** (p. 1372) mechanism) of the incompatibility of the QoS settings and communication will not occur.

Assuming that the reader and writer ends have compatible settings, the fulfilment of this contract is monitored by RTI Connext and the application is informed of any violations by means of the proper **DDS_Listener** (p. 1819) or **DDS_Condition** (p. 1372).

6.44.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered period <= requested period* holds.

6.44.4 Consistency

The setting of the **DEADLINE** (p. 1274) policy must be set consistently with that of the **TIME_BASED_FILTER** (p. 1331).

For these two policies to be consistent the settings must be such that *deadline period >= minimum_separation*.

An attempt to set these policies in an inconsistent manner will result in **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224) in **set_qos (abstract)** (p. 1363), or the **DDS_Entity** (p. 1362) will not be created.

For a **DDS_DataReader** (p. 618), the **DEADLINE** (p. 1274) policy and **DDS_TimeBasedFilterQosPolicy** (p. 2038) may interact such that even though the **DDS_DataWriter** (p. 488) is writing samples fast enough to fulfill its commitment to its own deadline, the **DDS_DataReader** (p. 618) may see violations of its deadline. This happens because RTI Connext will drop any samples received within the **DDS_TimeBasedFilterQosPolicy::minimum_separation** (p. 2040). To avoid triggering the **DDS_DataReader** (p. 618)'s deadline, even though the matched **DDS_DataWriter** (p. 488) is meeting its own deadline, set the two QoS parameters so that:

reader deadline >= reader minimum_separation + writer deadline

See **DDS_TimeBasedFilterQosPolicy** (p. 2038) for more information about the interactions between deadlines and time-based filters.

*<<**spec**>> (p. 791)* Controls how the middleware will deal with data sent by multiple **DDS_DataWriter** (p. 488) entities for the same instance of data (i.e., same **DDS_Topic** (p. 174) and key).

Data Fields

- **DDS_DestinationOrderQosPolicyKind kind**

  *<<**basic**>> (p. 784) <<**spec**>> (p. 791) Specifies the desired kind of destination order.*
- **DDS_DestinationOrderQosPolicyScopeKind scope**

  *<<**spec**>> (p. 791) Specifies the desired scope of the source destination order.*
- struct **DDS_Duration_t source_timestamp_tolerance**

  *<<**extension**>> (p. 796) Allowed tolerance between source timestamps of consecutive samples.*

6.45.1 Detailed Description

*<<**spec**>> (p. 791)* Controls how the middleware will deal with data sent by multiple **DDS_DataWriter** (p. 488) entities for the same instance of data (i.e., same **DDS_Topic** (p. 174) and key).

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_↩STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.45.2 Usage

When multiple DataWriters send data for the same topic, the order in which data from different DataWriters are received by the applications of different DataReaders may be different. So different DataReaders may not receive the same "last" value when DataWriters stop sending data.

This QoS policy controls how each subscriber resolves the final value of a data instance that is written by multiple **DDS_DataWriter** (p. 488) entities (which may be associated with different **DDS_Publisher** (p. 446) entities) running on different nodes.

This QoS can be used to create systems that have the property of "eventual consistency." Thus intermediate states across multiple applications may be inconsistent, but when DataWriters stop sending changes to the same topic, all applications will end up having the same state.

This QoS policy can be set for both DataWriters and DataReaders.

For the DataReader:

The default setting, **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276), indicates that (assuming the **OWNERSHIP_STRENGTH** (p. 1304) policy allows it) the latest received value for the instance should be the one whose value is kept. That is, data will be delivered by a **DDS_DataReader** (p. 618) in the order in which it was *received* (which may lead to inconsistent final values).

For **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276), if the scope is set to **DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS** (p. 1277) (default), within each instance, the sample's source timestamp shall be used to determine the most recent information. This is the only setting that, in the case of concurrent same-strength DataWriters updating the same instance, ensures that all DataReaders end up with the same final value for the instance. If a DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped. The SAMPLE_REJECTED status or the SAMPLE_LOST status will not be updated.

If scope is set to **DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS** (p. 1277), the ordering is enforced per topic across all instances.

In addition, a DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than source_timestamp_tolerance. Otherwise, the DDS sample is dropped. The SAMPLE_REJECTED status or the SAMPLE_LOST status will not be updated.

For the DataWriter:

For the default setting, **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276), the DataWriter will not enforce source timestamp ordering when writing samples using the **FooDataWriter_write_w_params** (p. 504) or **FooDataWriter_write_w_timestamp** (p. 503) API. The source timestamp of a new sample can be older than the source timestamp of the previous samples.

When using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276), If scope is set to **DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS** (p. 1277) (default), when writing a sample, the sample's timestamp must not be older than the timestamp of the previously written DDS sample for the same instance. If, however, the timestamp is older than the timestamp of the previously written DDS sample—but the difference is less than the source_timestamp_tolerance—the DDS sample will use the previously written DDS sample's timestamp as its timestamp. Otherwise, if the difference is greater than the tolerance, the write will fail with retcode **DDS_RETCODE_BAD_PARAMETER** (p. 1224).

If scope is set to **DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS** (p. 1277), a new sample timestamp must not be older than the timestamp of the previously written DDS sample, across all instances. (The ordering is enforced across all instances.)

6.45.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind* >= *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_DestinationOrderQosPolicy::kind** (p. 1690) are considered ordered such that **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276) < **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276)

6.45.4 Field Documentation

6.45.4.1 kind

DDS_DestinationOrderQosPolicyKind DDS_DestinationOrderQosPolicy::kind

<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* Specifies the desired kind of destination order.

[default] DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS (p. 1276),

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Applied Per-Instance** (p. 958), **Sample Ordering** (p. 908)

6.45.4.2 scope

DDS_DestinationOrderQosPolicyScopeKind DDS_DestinationOrderQosPolicy::scope

<<***spec***>> *(p. 791)* Specifies the desired scope of the source destination order.

Indicates if tolerance check and the current sample's timestamp is computed based on instance or topic basis.
[default] DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS (p. 1277)

Categories

Immutable (p. 916), **Applied Per-Instance** (p. 958), **Sample Ordering** (p. 908)

6.45.4.3 source_timestamp_tolerance

struct **DDS_Duration_t** DDS_DestinationOrderQosPolicy::source_timestamp_tolerance

<<***extension***>> *(p. 796)* Allowed tolerance between source timestamps of consecutive samples.

When a **DDS_DataWriter** (p. 488) sets **DDS_DestinationOrderQosPolicyKind** (p. 1276) to **DDS_BY_SOURCE_↩ TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276), when writing a sample, its timestamp must not be less than the timestamp of the previously written sample. However, if it is less than the timestamp of the previously written sample but the difference is less than this tolerance, the sample will use the previously written sample's timestamp as its timestamp. Otherwise, if the difference is greater than this tolerance, the write will fail.

When a **DDS_DataReader** (p. 618) sets **DDS_DestinationOrderQosPolicyKind** (p. 1276) to **DDS_BY_SOURCE_↩ TIMESTAMP_DESTINATIONORDER_QOS** (p. 1276), the **DDS_DataReader** (p. 618) will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than this tolerance. Otherwise, the sample is dropped.

[default] 100 milliseconds for **DDS_DataWriter** (p. 488), 30 seconds for **DDS_DataReader** (p. 618)

Categories

Immutable (p. 916), **Applied Per-Instance** (p. 958), **Sample Ordering** (p. 908)

6.46.1 Detailed Description

Settings for discovery configuration.

*<<**extension**>> (p. 796)* This QoS policy controls the amount of delay in discovering entities in the system and the amount of discovery traffic in the network.

The amount of network traffic required by the discovery process can vary widely, based on how your application has chosen to configure the middleware's network addressing (e.g., unicast vs. multicast, multicast TTL, etc.), the size of the system, whether all applications are started at the same time or whether start times are staggered, and other factors. Your application can use this policy to make tradeoffs between discovery completion time and network bandwidth utilization. In addition, you can introduce random back-off periods into the discovery process to decrease the probability of network contention when many applications start simultaneously.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.46.2 Field Documentation

6.46.2.1 participant_liveliness_lease_duration

`struct` **`DDS_Duration_t`** `DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration`

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The liveliness lease duration for the participant.

This is the same as the expiration time of the DomainParticipant as defined in the RTPS protocol.

If the participant has not refreshed its own liveliness to other participants at least once within this period, it may be considered as stale by other participants in the network.

Should be strictly greater than **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 1694).

[default] 100 seconds

[range] [1 nanosec,1 year], > participant_liveliness_assert_period

Categories

Immutable (p. 916), **Discovery** (p. 854), **Liveliness** (p. 876), **Discovery Metadata** (p. 960)

6.46.2.2 participant_liveliness_assert_period

`struct` **`DDS_Duration_t`** `DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period`

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The period to assert liveliness for the participant.

The period at which the participant will refresh its liveliness to all the peers.

Should be strictly less than **DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration** (p. 1694).

[default] 30 seconds

[range] [1 nanosec,1 year], < participant_liveliness_lease_duration

Categories

Immutable (p. 916), **Discovery** (p. 854), **Liveliness** (p. 876)

6.46.2.3 participant_announcement_period

`struct` **DDS_Duration_t** DDS_DiscoveryConfigQosPolicy::participant_announcement_period

*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).

The **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) list **DDS_DomainParticipant_add_peer** (p. 148) API are used to configure a set of potential peers that a DomainParticipant may discover. The **DDS_DiscoveryConfigQosPolicy::participant_announcement_period** (p. 1694) configures how frequently a DomainParticipant will announce itself to the subset of the configured potential peers that it has not matched with yet. Once a DomainParticipant matches with a DomainParticipant at one of configured potential peer locators, it will no longer announce itself to that locator at this period unless liveliness is lost.

This QoS policy is only supported when using the Simple Participant Discovery Protocol 2.0 (SPDP2). Setting this value when using the Simple Participant Discovery Protocol (SPDP) or other participant discovery protocols is not supported and will result in an error.

[default] DDS_DURATION_AUTO (p. 1211) (Takes the value of **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 1694))

[range] [1 nanosec,1 year]

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.46.2.4 remote_participant_purge_kind

DDS_RemoteParticipantPurgeKind DDS_DiscoveryConfigQosPolicy::remote_participant_purge_kind

[DEPRECATED] (p. 968) *<<**extension**>> (p. 796)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

Most users will not need to change this value from its default, **DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE** (p. 1284). However, **DDS_NO_REMOTE_PARTICIPANT_PURGE** (p. 1285) may be a good choice if the following conditions apply:

1. Discovery communication with a remote participant may be lost while data communication remains intact. Such will not typically be the case if discovery takes place over the Simple Discovery Protocol, but may be the case if the RTI Enterprise Discovery Service is used.
2. Extensive and prolonged lack of discovery communication between participants is not expected to be common, either because participant loss itself is expected to be rare, or because participants may be lost sporadically but will typically return again.
3. Maintaining inter-participant liveliness is problematic, perhaps because a participant has no writers with the appropriate **DDS_LivelinessQosPolicyKind** (p. 1298).

[default] DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE (p. 1284)

Categories

Immutable (p. 916), **Discovery** (p. 854), **Liveliness** (p. 876)

6.46.2.5 max_liveliness_loss_detection_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::max_liveliness_loss_detection_period
```

[DEPRECATED] (p. **968**) <<***extension***>> *(p. 796)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

Notification of the loss of liveliness of a remote entity may come more quickly than this duration, depending on the liveliness contract between the local and remote entities and the capabilities of the discovery mechanism in use. For example, a **DDS_DataReader** (p. 618) will learn of the loss of liveliness of a matched **DDS_DataWriter** (p. 488) within the reader's offered liveliness lease duration.

Shortening this duration will increase the responsiveness of entities to communication failures. However, it will also increase the CPU usage of the application, as the liveliness of remote entities will be examined more frequently.

[default] 60 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 916), **Discovery** (p. 854), **Liveliness** (p. 876)

6.46.2.6 initial_participant_announcements

```
DDS_Long DDS_DiscoveryConfigQosPolicy::initial_participant_announcements
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The number of initial announcements sent when a participant is first enabled.

[default] 5

[range] [1,1 million]

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.46.2.7 new_remote_participant_announcements

DDS_Long DDS_DiscoveryConfigQosPolicy::new_remote_participant_announcements

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The number of participant announcements sent when a remote participant is newly discovered.

These announcements are only sent to the newly discovered remote participant, they are not also broadcast to the initial_peers list.

[default] 2

[range] [0,1 million]

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.46.2.8 min_initial_participant_announcement_period

struct **DDS_Duration_t** DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between this and **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 1697) is introduced in between initial announcements when a new remote participant is discovered.

The setting of **DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period** (p. 1697) must be consistent with **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 1697). For these two values to be consistent, they must verify that:

DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 1697) <= **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 1697).

[default] 10 milliseconds

[range] [1 nanosec,1 year]

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.46.2.9 max_initial_participant_announcement_period

`struct` **`DDS_Duration_t`** `DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period`

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between **DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period** (p. 1697) and this is introduced in between initial announcements when a new remote participant is discovered.

The setting of **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 1697) must be consistent with **DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period** (p. 1697). For these two values to be consistent, they must verify that:

DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 1697) <= **DDS_Discovery↩ ConfigQosPolicy::max_initial_participant_announcement_period** (p. 1697).

DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration (p. 1710)

Categories

Immutable (p. 916), **Transports** (p. 911)

6.46.2.34 locator_reachability_lease_duration

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration
```

<<***extension***>> *(p. 796)* The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

For the purpose of this explanation, we will use 'local' to refer to the DomainParticipant in which we configure locator_reachability_lease_duration and 'remote' to refer to the other DomainParticipants communicating with the local DomainParticipant.

This setting configures a timeout announced to the remote DomainParticipants. This timeout is used by the remote DomainParticipants as the maximum period by which a remote locator must be asserted by the local DomainParticipant (through a REACHABILITY PING message) before considering this locator as "unreachable" from the local DomainParticipant.

When a remote DomainParticipant detects that one of its locators is not reachable from the local DomainParticipant, it will notify the local DomainParticipant of this event. From that moment on, and until notified otherwise, the local DomainParticipant will not send RTPS messages to remote DomainParticipants using this locator.

If this value is set to **DDS_DURATION_INFINITE** (p. 1210), the local DomainParticipant will send RTPS messages to a remote DomainParticipant on the locators announced by the remote DomainParticipant, regardless of whether or not the remote DomainParticipant can be reached using these locators.

[default] DDS_DURATION_INFINITE (p. 1210)

[range] [1 nanosec,1 year] or **DDS_DURATION_INFINITE** (p. 1210)

6.46.2.35 locator_reachability_change_detection_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_change_detection_period
```

<<***extension***>> *(p. 796)* Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.

This setting determines the maximum period at which this DomainParticipant will check to see if its locators are reachable from other DomainParticipants according to the other DomainParticipants' **DDS_DiscoveryConfigQosPolicy↩ ::locator_reachability_lease_duration** (p. 1710) value.

If **DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration** (p. 1710) is **DDS_DURATION_INFINITE** (p. 1210) this parameter is ignored. The DomainParticipant will not schedule an event to see if its locators are reachable from other DomainParticipants.

[default] 60 seconds

[range] [1 nanosec,1 year]

6.46.2.40 dns_tracker_polling_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period
```

<<***extension***>> *(p. 796)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

RTI Connext allows the use of hostnames instead of IP addresses when configuring initial peers for specific transports (e.g.: UDPv4 and UDPv6). The DNS tracker keeps the IP addresses of these hostnames updated. The DNS tracker builds a list of hostnames from the initial peers of a DomainParticipant, queries the DNS for those hostnames, and updates the resolved IP addresses when the IP addresses change. The frequency of these queries is defined by the DNS tracker polling period.

RTI Connext keeps information regarding the hostnames of peers if they are part of the **DDS_DiscoveryQosPolicy**↩**::initial_peers** (p. 1719). The information regarding peers added through the **DDS_DomainParticipant_add_peer** (p. 148) operation is kept only if the DNS tracker has been enabled before adding a peer.

The DNS tracker is useful in situations where the IP address of an as-yet undiscovered peer may change. For example, if the **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) of a participant is set to "hostname1" and the IP address associated with "hostname1" changes after the participant is created, the participant has no way of knowing about that change unless it queries the DNS again.

When two participants have already discovered each other, any IP address change is communicated directly between the participants and there is no need for the DNS tracker. In other words, they do not wait for the DNS tracker polling period to update the IP address–the change is communicated immediately between the participants so that communication can continue uninterrupted.

The value should be (but is not required to be) set to a value that is less than the **DDS_DiscoveryConfig↩ QosPolicy::participant_liveliness_assert_period** (p. 1694) (if using SPDP) or **DDS_DiscoveryConfigQosPolicy↩ ::participant_liveliness_assert_period** (p. 1694) (is using SPDP2) so that multiple participant announcements are not sent to an outdated IP address.

When the period is set to **DDS_DURATION_INFINITE** (p. 1210), the tracker is disabled.

[default] 20 seconds

[range] [1 second,1 year], **DDS_DURATION_INFINITE** (p. 1210)

6.46.2.46 request_types_filter

```
DDS_String DDS_DiscoveryConfigQosPolicy::request_types_filter
```

<<***extension***>> *(*p. *796)* Topic name pattern for requesting all types via Type Lookup Service.

When using TypeObject v2 (enabled via **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283)), this field configures a topic name pattern. Any remote endpoint whose topic name matches this pattern will have all of its types requested by the Type Lookup Service, even if no matching local endpoint exists.

By default, the Type Lookup Service only requests unknown types when a matching local endpoint exists. This setting allows you to proactively retrieve type information for remote endpoints matching specific topic names, which can be useful for applications where types are discovered on the wire (such as those using Dynamic Data).

This is a regex string, so you can use regex syntax to match multiple topic names (including wildcards).

If this is NULL or an empty string, the middleware will only request types for remote endpoints that have a matching local endpoint.

If you are using **DDS_DynamicData** (p. 1771) and relying on discovering types on the wire, you should set this to a value that matches the topic names of your remote endpoints to ensure that you receive type information for those endpoints.

[default] NULL

6.47.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.47.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

NDDS_DISCOVERY_PEERS (p. 1354)

DDS_DiscoveryConfigQosPolicy (p. 1691)

6.47.3 Field Documentation

6.47.3.1 enabled_transports

`struct` **`DDS_StringSeq`** `DDS_DiscoveryQosPolicy::enabled_transports`

<<***extension***>> *(p. 796)* The transports available for use by the Discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **DDS_DataReader** (p. 618) and **DDS_DataWriter** (p. 488)).

Also determines the unicast addresses on which the Discovery mechanism will listen for meta-traffic. These along with the `domain_id` and `participant_id` determine the unicast locators on which the Discovery mechanism can receive meta-data.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1527). In particular, be careful to avoid a situation in which RTI Connext allocates a string on your behalf and you then reuse that string in such a way that RTI Connext believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 1333). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence. All the transports available to the DomainParticipant are available for use by the Discovery mechanism.

[range] Sequence of non-null,non-empty strings.

Categories

Immutable (p. 916), **Transports** (p. 911), **Discovery** (p. 854)

6.47.3.2 initial_peers

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::initial_peers
```

*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

As part of the participant discovery phase, the **DDS_DomainParticipant** (p. 76) will announce itself to the domain by sending participant DATA messages. The initial_peers specifies the initial list of peers that will be contacted. A remote **DDS_DomainParticipant** (p. 76) is discovered by receiving participant announcements from a remote peer. When the new remote **DDS_DomainParticipant** (p. 76) has been added to the participant's database, the endpoint discovery phase commences and information about the DataWriters and DataReaders is exchanged.

Each element of this list must be a peer descriptor in the proper format (see **Peer Descriptor Format** (p. 1355)).

[default] builtin.udpv4://239.255.0.1, builtin.udpv4://127.0.0.1, builtin.shmem:// (See also **NDDS_DISCOVERY_PEERS** (p. 1354))

[range] Sequence of arbitrary length.

See also

Peer Descriptor Format (p. 1355)

Categories

Immutable (p. 916), **Transports** (p. 911), **Discovery Isolation** (p. 860), **Discovery** (p. 854)

6.47.3.3 multicast_receive_addresses

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::multicast_receive_addresses
```

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the DomainParticipant.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. 1356)).

The `domain_id` determines the multicast port on which the Discovery mechanism can receive meta-data.

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **DDS_DiscoveryQos↩ Policy::multicast_receive_addresses** (p. 1719) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **DDS_↩ DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719), starting at element 0. They will be stored in the order they appear NDDS_DISCOVERY_PEERS.

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **DDS_↩ DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719).

[default] builtin.udpv4://239.255.0.1 (See also **NDDS_DISCOVERY_PEERS** (p. 1354))

[range] Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also

Address Format (p. 1356)

6.47.3.4 metatraffic_transport_priority

```
DDS_Long DDS_DiscoveryQosPolicy::metatraffic_transport_priority
```

<<***extension***>> *(*p. *796)* The transport priority to use for the Discovery meta-traffic.

The discovery metatraffic will be sent by the built-in **DDS_DataWriter** (p. 488) using this transport priority.

[default] 0

[range] [0, MAX_UINT]

Categories

Immutable (p. 916), **Transports** (p. 911), **Concurrency** (p. 841), **Discovery** (p. 854)

6.47.3.5 accept_unknown_peers

```
DDS_Boolean DDS_DiscoveryQosPolicy::accept_unknown_peers
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Whether to accept a new participant that is not in the initial peers list.

If **DDS_BOOLEAN_FALSE** (p. 1203), the participant will only communicate with those in the initial peers list and those added via **DDS_DomainParticipant_add_peer()** (p. 148).

If **DDS_BOOLEAN_TRUE** (p. 1203), the participant will also communicate with all discovered remote participants.

Note: If accept_unknown_peers is **DDS_BOOLEAN_FALSE** (p. 1203) and shared memory is disabled, applications on the same node will *not* communicate if only 'localhost' is specified in the peers list. If shared memory is disabled or 'shmem://' is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS_DISCOVERY_PEERS** (p. 1354).

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Transports** (p. 911), **Discovery Isolation** (p. 860), **Discovery** (p. 854)

6.47.3.6 enable_endpoint_discovery

```
DDS_Boolean DDS_DiscoveryQosPolicy::enable_endpoint_discovery
```

[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Whether to automatically enable endpoint discovery for all the remote participants.

If **DDS_BOOLEAN_TRUE** (p. 1203), endpoint discovery will automatically occur for every discovered remote participant.

If **DDS_BOOLEAN_FALSE** (p. 1203), endpoint discovery will be initially disabled and manual activation is required for each discovered participant by calling **DDS_DomainParticipant_resume_endpoint_discovery** (p. 140).

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Transports** (p. 911), **Discovery Isolation** (p. 860), **Discovery** (p. 854)

6.48 DDS_DomainParticipantConfigParams_t Struct Reference

<<***extension***>> *(p. 1014)* Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

Data Fields

- int **domain_id**

  *Domain ID from which the **DDS_DomainParticipant** (p. 76) is created.*
- char * **participant_name**

  *Name assigned to the **DDS_DomainParticipant** (p. 76).*
- char * **participant_qos_library_name**

  *QoS library name containing the QoS profile from which the **DDS_DomainParticipant** (p. 76) is created.*
- char * **participant_qos_profile_name**

  *QoS profile name from which the **DDS_DomainParticipant** (p. 76) is created.*
- char * **domain_entity_qos_library_name**

  *QoS library name containing the QoS profile from which the all the **DDS_DomainEntity** (p. 1365) defined under the participant configuration are created.*
- char * **domain_entity_qos_profile_name**

  *QoS profile name from which the all the **DDS_DomainEntity** (p. 1365) defined under the participant configuration are created.*

6.48.1 Detailed Description

<<***extension***>> *(p. 1014)* Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

6.48.2 Field Documentation

6.48.2.1 domain_id

```
int DDS_DomainParticipantConfigParams_t::domain_id
```

Domain ID from which the **DDS_DomainParticipant** (p. 76) is created.

Allows overriding the domain ID defined in the configuration for the participant to be created. If the special value **DDS_DOMAIN_ID_USE_XML_CONFIG** (p. 1433) is specified then the ID in the configuration will be used.

6.48.2.2 participant_name

```
char* DDS_DomainParticipantConfigParams_t::participant_name
```

Name assigned to the **DDS_DomainParticipant** (p. 76).

This is the name the name that will be set in the **DDS_DomainParticipantQos::participant_name** (p. 1732). It allows overriding the participant name that is generated automatically.

When this member is lexicographically equal to the special value **DDS_ENTITY_NAME_USE_XML_CONFIG** (p. 1433) then an automatically generated name will be assigned.

6.48.2.3 participant_qos_library_name

```
char* DDS_DomainParticipantConfigParams_t::participant_qos_library_name
```

QoS library name containing the QoS profile from which the **DDS_DomainParticipant** (p. 76) is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **DDS_DomainParticipant** (p. 76).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1433) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **DDS_DomainParticipantConfigParams_t::participant_qos_profile_name** (p. 1723) will be ignored.

6.48.2.4 participant_qos_profile_name

```
char* DDS_DomainParticipantConfigParams_t::participant_qos_profile_name
```

QoS profile name from which the **DDS_DomainParticipant** (p. 76) is created.

Allows overriding the QoS defined in the configuration for the participant to be created.This value only affects to the **DDS_DomainParticipant** (p. 76).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1433) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **DDS_DomainParticipantConfigParams_t::participant_qos_library_name** (p. 1722) will be ignored.

6.48.2.5 domain_entity_qos_library_name

```
char* DDS_DomainParticipantConfigParams_t::domain_entity_qos_library_name
```

QoS library name containing the QoS profile from which the all the **DDS_DomainEntity** (p. 1365) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **DDS_DomainEntity** (p. 1365).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1433) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **DDS_DomainParticipantConfigParams_t::domain_entity_qos_profile_name** (p. 1723) will be ignored.

6.48.2.6 domain_entity_qos_profile_name

```
char* DDS_DomainParticipantConfigParams_t::domain_entity_qos_profile_name
```

QoS profile name from which the all the **DDS_DomainEntity** (p. 1365) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **DDS_DomainEntity** (p. 1365).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1433) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **DDS_DomainParticipantConfigParams_t::domain_entity_qos_library_name** (p. 1723) will be ignored.

6.49 DDS_DomainParticipantFactoryQos Struct Reference

QoS policies supported by a **DDS_DomainParticipantFactory** (p. 32).

Data Fields

- struct **DDS_EntityFactoryQosPolicy entity_factory**

  *Entity factory policy, **ENTITY_FACTORY** (p. 1291).*
- struct **DDS_SystemResourceLimitsQosPolicy resource_limits**

  *<<**extension**>> (p. 1014) System resource limits, **SYSTEM_RESOURCE_LIMITS** (p. 1330).*
- struct **DDS_ProfileQosPolicy profile**

  *<<**extension**>> (p. 1014) Qos profile policy, **PROFILE** (p. 1307).*
- struct **DDS_LoggingQosPolicy logging**

  *<<**extension**>> (p. 1014) Logging qos policy, **LOGGING** (p. 1300).*
- struct **DDS_MonitoringQosPolicy monitoring**

  *<<**extension**>> (p. 1014) Monitoring qos policy, **MONITORING** (p. 1301).*

6.49.1 Detailed Description

QoS policies supported by a **DDS_DomainParticipantFactory** (p. 32).

Entity:

DDS_DomainParticipantFactory (p. 32)

See also

All QoS Policies (p. 1240) and allowed ranges within each Qos.

6.49.2 Field Documentation

6.49.2.1 entity_factory

struct **DDS_EntityFactoryQosPolicy** DDS_DomainParticipantFactoryQos::entity_factory

Entity factory policy, **ENTITY_FACTORY** (p. 1291).

6.49.2.2 resource_limits

struct **DDS_SystemResourceLimitsQosPolicy** DDS_DomainParticipantFactoryQos::resource_limits

<<***extension***>> *(p. 1014)* System resource limits, **SYSTEM_RESOURCE_LIMITS** (p. 1330).

Note: This QoS policy cannot be configured from XML configuration files.

6.49.2.3 profile

struct **DDS_ProfileQosPolicy** DDS_DomainParticipantFactoryQos::profile

<<***extension***>> *(p. 1014)* Qos profile policy, **PROFILE** (p. 1307).

Note: This QoS policy cannot be configured from XML configuration files.

6.49.2.4 logging

struct **DDS_LoggingQosPolicy** DDS_DomainParticipantFactoryQos::logging

<<***extension***>> *(p. 1014)* Logging qos policy, **LOGGING** (p. 1300).

6.49.2.5 monitoring

struct **DDS_MonitoringQosPolicy** DDS_DomainParticipantFactoryQos::monitoring

<<***extension***>> *(p. 1014)* Monitoring qos policy, **MONITORING** (p. 1301).

This QoS policy is used to collect and emit telemetry data of a Connext application using RTI Monitoring Library 2.0.

6.50 DDS_DomainParticipantListener Struct Reference

<<***interface***>> *(*p. *1015)* Listener for participant status.

Data Fields

- struct **DDS_Listener as_listener**

  A superclass instance of this ***DDS_DomainParticipantListener*** *(*p. *1726).*
- struct **DDS_TopicListener as_topiclistener**

  A superclass instance of this ***DDS_DomainParticipantListener*** *(*p. *1726).*
- struct **DDS_PublisherListener as_publisherlistener**

  A superclass instance of this ***DDS_DomainParticipantListener*** *(*p. *1726).*
- struct **DDS_SubscriberListener as_subscriberlistener**

  A superclass instance of this ***DDS_DomainParticipantListener*** *(*p. *1726).*
- **DDS_DomainParticipantListener_InvalidLocalAdvanceNoticeStatusCallback on_invalid_local_status_advance_notice**

  Notifies the user that one of the local ***DDS_DomainParticipant*** *(*p. *76) trusted artifacts (identity or permissions) is about to expire.*

6.50.1 Detailed Description

<<***interface***>> *(*p. *1015)* Listener for participant status.

Entity:

DDS_DomainParticipant (p. 76)

Status:

Status Kinds (p. 1224)

This is the interface that can be implemented by an application-provided class and then registered with the **DDS_DomainParticipant** (p. 76) such that the application can be notified by RTI Connext of relevant status changes.

The **DDS_DomainParticipantListener** (p. 1726) interface extends all other Listener interfaces and has no additional operation beyond the ones defined by the more general listeners.

The purpose of the **DDS_DomainParticipantListener** (p. 1726) is to be the listener of last resort that is notified of all status changes not captured by more specific listeners attached to the **DDS_DomainEntity** (p. 1365) objects. When a relevant status change occurs, RTI Connext will first attempt to notify the listener attached to the concerned **DDS_DomainEntity** (p. 1365) if one is installed. Otherwise, RTI Connext will notify the Listener attached to the **DDS_DomainParticipant** (p. 76).

Important: Because a **DDS_DomainParticipantListener** (p. 1726) may receive callbacks pertaining to many different entities, it is possible for the same listener to receive multiple callbacks simultaneously in different threads. (Such is not the case for listeners of other types.) It is therefore critical that users of this listener provide their own protection for any thread-unsafe activities undertaken in a **DDS_DomainParticipantListener** (p. 1726) callback.

Note: Due to a thread-safety issue, the destruction of a DomainParticipantListener from an enabled DomainParticipant should be avoided – even if the DomainParticipantListener has been removed from the DomainParticipant. (This limitation does not affect the Java API.)

DDS_Listener (p. 1819)

DDS_DomainParticipant_set_listener (p. 153)

6.50.2 Field Documentation

6.50.2.1 as_listener

struct **DDS_Listener** DDS_DomainParticipantListener::as_listener

A superclass instance of this **DDS_DomainParticipantListener** (p. 1726).

6.50.2.2 as_topiclistener

struct **DDS_TopicListener** DDS_DomainParticipantListener::as_topiclistener

A superclass instance of this **DDS_DomainParticipantListener** (p. 1726).

6.50.2.3 as_publisherlistener

struct **DDS_PublisherListener** DDS_DomainParticipantListener::as_publisherlistener

A superclass instance of this **DDS_DomainParticipantListener** (p. 1726).

6.50.2.4 as_subscriberlistener

struct **DDS_SubscriberListener** DDS_DomainParticipantListener::as_subscriberlistener

A superclass instance of this **DDS_DomainParticipantListener** (p. 1726).

6.50.2.5 on_invalid_local_status_advance_notice

DDS_DomainParticipantListener_InvalidLocalAdvanceNoticeStatusCallback DDS_DomainParticipant↩
Listener::on_invalid_local_status_advance_notice

Notifies the user that one of the local **DDS_DomainParticipant** (p. 76) trusted artifacts (identity or permissions) is about to expire.

6.51 DDS_DomainParticipantProtocolStatus Struct Reference

<<***extension***>> *(p. 1014)* The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Data Fields

- **DDS_LongLong corrupted_rtps_message_count**

  The number of corrupted RTPS messages detected by the domain participant.
- **DDS_LongLong corrupted_rtps_message_count_change**

  The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.
- struct **DDS_Time_t last_corrupted_message_timestamp**

  The timestamp when the last corrupted RTPS message was detected by the domain participant.

6.51.1 Detailed Description

<<***extension***>> *(p. 1014)* The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Entity:

DDS_DomainParticipant (p. 76) The corrupted messages are detected by validating the received CRC. The participant protocol status can be obtained by enabling **DDS_WireProtocolQosPolicy::compute_crc** (p. 2106) and **DDS_WireProtocolQosPolicy::check_crc** (p. 2106) at the publishing and subscribing application respectively.

6.51.2 Field Documentation

6.51.2.1 corrupted_rtps_message_count

```
DDS_LongLong DDS_DomainParticipantProtocolStatus::corrupted_rtps_message_count
```

The number of corrupted RTPS messages detected by the domain participant.

Counts the corrupted RTPS messages received by the participant. It includes messages belonging to discovery and user traffic.

6.51.2.2 corrupted_rtps_message_count_change

```
DDS_LongLong DDS_DomainParticipantProtocolStatus::corrupted_rtps_message_count_change
```

The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.

6.51.2.3 last_corrupted_message_timestamp

```
struct DDS_Time_t DDS_DomainParticipantProtocolStatus::last_corrupted_message_timestamp
```

The timestamp when the last corrupted RTPS message was detected by the domain participant.

6.52 DDS_DomainParticipantQos Struct Reference

- struct **DDS_TypeSupportQosPolicy type_support**
  *<<**extension**>> (p. 1014) Type support data, **TYPESUPPORT** (p. 1343).*

6.52.1 Detailed Description

QoS policies supported by a **DDS_DomainParticipant** (p. 76) entity.

Certain members must be set in a consistent manner:

Length of **DDS_DomainParticipantQos::user_data** (p. 1730) .value <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .participant_user_data_max_length

For **DDS_DomainParticipantQos::discovery_config** (p. 1732) .publication_writer high_watermark <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .local_writer_allocation .max_count heartbeats_per_max_samples <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .local_writer_allocation.max_count

For **DDS_DomainParticipantQos::discovery_config** (p. 1732) .suscription_writer high_watermark <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .local_reader_allocation.max_count heartbeats_per_max_samples <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .local_reader_allocation.max_count

If any of the above are not true, **DDS_DomainParticipant_set_qos** (p. 151) and **DDS_DomainParticipant_set_qos_with_profile** (p. 151) and **DDS_DomainParticipantFactory_set_default_participant_qos** (p. 38) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224), and **DDS_DomainParticipantFactory_create_participant** (p. 41) will fail.

Entity:

DDS_DomainParticipant (p. 76)

6.53.1 Detailed Description

*<<**extension**>> (p. 796)* Various settings that configure how a **DDS_DomainParticipant** (p. 76) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as DataWriters/DataReaders), as well as parameters used by the internal database to size the hash tables it uses.

By default, a **DDS_DomainParticipant** (p. 76) is allowed to dynamically allocate memory as needed as users create local Entities such as **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) or as the participant discovers new applications to store their information. By setting fixed values for the maximum parameters in this QosPolicy, you can bound the memory that can be allocated by a DomainParticipant. In addition, by setting the initial values to the maximum values, you can reduce the amount of memory allocated by DomainParticipants after the initialization period. Notice that memory can still be allocated dynamically after the initialization period. For example, when a new local **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) is created, the initial memory required for its queue is allocated dynamically.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the **DDS_PartitionQosPolicy** (p. 1884), the maximum length of data store in the **DDS_UserDataQosPolicy** (p. 2092) and **DDS_GroupDataQosPolicy** (p. 1806), and many others can be changed from their defaults using this QoS policy. However, it is important that all DomainParticipants that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one **DDS_DomainParticipant** (p. 76) to another, a **DDS_DomainParticipant** (p. 76) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 1751).

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.53.2.41 type_code_max_serialized_length

```
DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::type_code_max_serialized_length
```

[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Maximum size of serialized string for type code.

This parameter is an alternative to **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 1751) for limiting the size of the type code that a **DDS_DomainParticipant** (p. 76) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in large type codes. So it is common for users to set this parameter to a large value, if used (by default, it is set to 0). However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter.

Note: TypeObject v2 is now the standard, and default, method of exchanging type information in RTI Connext. It is recommended to keep **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) in **DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels** (p. 1703) enabled in DomainParticipants requiring type information.

[default] 0

[range] [0,0xffff]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Type System** (p. 914)

6.53.2.42 type_object_max_serialized_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length

<<***extension***>> *(p. 796)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.

Type codes contain complete information about a data structure, including all member names; as a result, complex data structures can produce large type codes. This parameter limits the size of the resulting TypeObject v1 that a DomainParticipant is able to propagate.

If this parameter is set to a value between 1 and 0x7fffffff, the DomainParticipant will propagate TypeObject v1 for types that don't exceed the specified size. The desired size for a given **DDS_TypeCode** (p. 2077) can be obtained using **DDS_TypeCode_get_type_object_serialized_size** (p. 278). If **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) is also enabled, both TypeObject v1 and TypeObject v2 will be propagated (TypeObject v2s are not subject to this size limit).

If set to **DDS_LENGTH_AUTO** (p. 1323), the DomainParticipant will not propagate TypeObject v1. If **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) is also enabled, only TypeObject v2 will be propagated.

If explicitly set to 0, the DomainParticipant won't propagate any TypeObject (neither TypeObject v1 nor TypeObject v2), regardless of whether **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) is enabled.

Note: TypeObject v2 is now the standard, and default, method of exchanging type information in RTI Connext. It is recommended to enable **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) in **DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels** (p. 1703) in DomainParticipants requiring type validation.

[default] DDS_LENGTH_AUTO (p. 1323)

[range] [0,0x7fffffff], or **DDS_LENGTH_AUTO** (p. 1323)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Type System** (p. 914)

6.53.2.43 serialized_type_object_dynamic_allocation_threshold

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::serialized_type_object_dynamic_allocation_threshold

<<***extension***>> *(p. 796)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.

Above this threshold, the memory for a TypeObject v1 is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

The effective threshold value used by the middleware is determined as follows:

- If **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 1751) is **DDS_LENGTH_AUTO** (p. 1323) or 0, the effective threshold is 0 (no pre-allocated buffers).

- If this threshold is set to **DDS_LENGTH_AUTO** (p. 1323) and **DDS_DomainParticipantResourceLimits↩ QosPolicy::type_object_max_serialized_length** (p. 1751) is set to a specific value, the effective threshold is min(type_object_max_serialized_length, 8192).
- If the specified threshold exceeds type_object_max_serialized_length, it is automatically capped and adjusted down to match the maximum serialized length.

If **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) is also enabled, this threshold does not affect memory allocation of TypeObject v2s.

[default] DDS_LENGTH_AUTO (p. 1323)

[range] [0,0x7fffffff], or **DDS_LENGTH_AUTO** (p. 1323)

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880), **Type System** (p. 914)

6.53.2.44 type_object_max_deserialized_length

```
DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_deserialized_length
```

<<***extension***>> *(p. 796)* The maximum number of bytes that a deserialized TypeObject v1 can consume.

This parameter limits the size of the TypeObject v1 that a DomainParticipant is able to store.

Setting this field to 0 disables the ability of a DomainParticipant to receive TypeObject v1.

If **DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283) is also enabled, the Domain↩ Participant will always send/receive TypeObject v2 (deserialized TypeObject v2s are not subject to this size limit), but will only receive TypeObject v1 if this parameter is set to a value greater than 0.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [0,0x7fffffff] or **DDS_LENGTH_UNLIMITED** (p. 1328)

Categories

6.56.1 Detailed Description

<<***spec***>> *(p. 791)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **DDS_DataReader** (p. 618) entities that join the network later.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_↩ STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

See also

DURABILITY_SERVICE (p. 1291)

6.56.2 Usage

It is possible for a **DDS_DataWriter** (p. 488) to start publishing data before all (or any) **DDS_DataReader** (p. 618) entities have joined the network.

Moreover, a **DDS_DataReader** (p. 618) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **DDS_DataReader** (p. 618) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Connext will maintain internally. That is, RTI Connext may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 1287) policy is set to **DDS_VOLATILE_DURABILITY_QOS** (p. 1289).

6.56.2.1 Transient and Persistent Durability

For the purpose of implementing the DURABILITY QoS kind TRANSIENT or PERSISTENT, RTI Connext behaves *as if* for each Topic that has **DDS_DurabilityQosPolicy::kind** (p. 1765) of **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290) or **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290) there is a corresponding "built-in" **DDS_DataReader** (p. 618) and **DDS_DataWriter** (p. 488) configured with the same DURABILITY kind. In other words, it is *as if* somewhere in the system, independent of the original **DDS_DataWriter** (p. 488), there is a built-in durable **DDS_DataReader** (p. 618) subscribing to that Topic and a built-in durable DataWriter re-publishing it as needed for the new subscribers that join the system. This functionality is provided by the *RTI Persistence Service*.

The Persistence Service can configure itself based on the QoS of your application's **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) entities. For each transient or persistent **DDS_Topic** (p. 174), the built-in fictitious Persistence Service **DDS_DataReader** (p. 618) and **DDS_DataWriter** (p. 488) have their QoS configured from the QoS of your application's **DDS_DataWriter** (p. 488) and **DDS_DataReader** (p. 618) entities that communicate on that **DDS_Topic** (p. 174).

For a given **DDS_Topic** (p. 174), the usual request/offered semantics apply to the matching between any **DDS_DataWriter** (p. 488) in the domain that writes the **DDS_Topic** (p. 174) and the built-in transient/persistent **DDS_DataReader** (p. 618) for that **DDS_Topic** (p. 174); similarly for the built-in transient/persistent **DDS_DataWriter** (p. 488) for a **DDS_Topic** (p. 174) and any **DDS_DataReader** (p. 618) for the **DDS_Topic** (p. 174). As a consequence, a **DDS_DataWriter** (p. 488) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **DDS_DataReader** (p. 618) that has an incompatible QoS will not get data from it.

Incompatibilities between local **DDS_DataReader** (p. 618) and **DDS_DataWriter** (p. 488) entities and the corresponding fictitious built-in transient/persistent entities cause the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 1231) and **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 1231) to change and the corresponding Listener invocations and/or signaling of **DDS_Condition** (p. 1372) objects as they would with your application's own entities.

The value of **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 1768) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (instance_state = NOT_ALIVE_DISPOSED),

and

1. All samples for the disposed instance have been acknowledged, including the dispose sample itself,

and

1. A time interval longer that **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 1768) has elapsed since the moment RTI Connext detected that the previous two conditions were met. (Note: Only values of zero or **DDS_DURATION_INFINITE** (p. 1210) are currently supported for the service_cleanup_delay)

The utility of **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 1768) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the service_cleanup_delay will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

6.56.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind >= requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that **DDS_VOLATILE_DURABILITY_QOS** (p. 1289) < **DDS_TRANSIENT_LOCAL_DURABILITY_QOS** (p. 1290) < **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290) < **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290).

6.56.4 Field Documentation

6.56.4.1 kind

DDS_DurabilityQosPolicyKind DDS_DurabilityQosPolicy::kind

<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* The kind of durability.

[default] DDS_VOLATILE_DURABILITY_QOS (p. 1289)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Durability** (p. 861), **Data Availability** (p. 844)

6.56.4.2 direct_communication

DDS_Boolean DDS_DurabilityQosPolicy::direct_communication

<<***extension***>> *(p. 796)* Indicates whether or not a TRANSIENT or PERSISTENT **DDS_DataReader** (p. 618) should receive samples directly from a TRANSIENT or PERSISTENT **DDS_DataWriter** (p. 488)

When direct_communication is set to **DDS_BOOLEAN_TRUE** (p. 1203), a TRANSIENT or PERSISTENT **DDS_DataReader** (p. 618) will receive samples from both the original **DDS_DataWriter** (p. 488) configured with TRANSIENT or PERSISTENT durability and the **DDS_DataWriter** (p. 488) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **DDS_DataWriter** (p. 488) and the persistence service, the middleware will discard the duplicate.

When direct_communication is set to **DDS_BOOLEAN_FALSE** (p. 1203), a TRANSIENT or PERSISTENT **DDS_DataReader** (p. 618) will only receive samples from the **DDS_DataWriter** (p. 488) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960), **Durability** (p. 861), **Data Availability** (p. 844)

6.56.4.3 writer_depth

`DDS_Long DDS_DurabilityQosPolicy::writer_depth`

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Indicates the number of samples per instance that a durable **DDS_DataWriter** (p. 488) will send to a late-joining **DDS_DataReader** (p. 618).

The default value, **DDS_AUTO_WRITER_DEPTH** (p. 1290), makes this parameter equal to the following:

- **DDS_HistoryQosPolicy::depth** (p. 1810) if the history kind is **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295).
- **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956) in the **DDS_ResourceLimitsQosPolicy** (p. 1953) if the history kind is **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295).

The `writer_depth` must be <= **DDS_HistoryQosPolicy::depth** (p. 1810).

`writer_depth` applies only to non-volatile DataWriters (those for which the kind is TRANSIENT_LOCAL, TRANSIENT, or PERSISTENT).

When **DDS_BatchQosPolicy::enable** (p. 1552) is set to true, `writer_depth` acts as a minimum number of samples per instance that will be sent to late joiners, as opposed to the maximum. As long as a batch contains a single sample that falls within the `writer_depth` for the instance to which it belongs, then the entire batch will be sent. This means that batches sent to late-joining DataReaders may contain more samples per instance than is specified by the `writer_depth` QoS setting.

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the `writer_depth`, not the **DDS_HistoryQosPolicy::depth** (p. 1810).

Setting `writer_depth` on the DataReader side will be ignored.

[default] DDS_AUTO_WRITER_DEPTH (p. 1290)

Categories

Immutable (p. 916), **Durability** (p. 861), **Applied Per-Instance** (p. 958), **Data Availability** (p. 844)

6.56.4.4 storage_settings

`struct DDS_PersistentStorageSettings DDS_DurabilityQosPolicy::storage_settings`

<<***extension***>> *(p. 796)* Configures durable writer history and durable reader state.

By default, durable writer history and durable reader state are disabled. This means that a DataWriter will not persist its historical cache and a DataReader will not persist its state.

To enable durable writer history and durable reader state set **DDS_PersistentStorageSettings::enable** (p. 1889) to **DDS_BOOLEAN_TRUE** (p. 1203).

Categories

Immutable (p. 916), **Durability** (p. 861), **Data Availability** (p. 844)

6.57 DDS_DurabilityServiceQosPolicy Struct Reference

DURABILITY (p. 1287)

HISTORY (p. 1294)

RESOURCE_LIMITS (p. 1327)

6.57.2 Usage

When a DataWriter's **DDS_DurabilityQosPolicy::kind** (p. 1765) is **DDS_PERSISTENT_DURABILITY_QOS** (p. 1290) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 1290), an external service, the *RTI Persistence Service*, is used to store and possibly forward the data sent by the **DDS_DataWriter** (p. 488) to **DDS_DataReader** (p. 618) objects that are created *after* the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **DDS_DataWriter** (p. 488), such as how much data to store. For example, it configures the **DURABILITY** (p. 1287), **HISTORY** (p. 1294), and the **RESOURCE_LIMITS** (p. 1327) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

6.57.3 Field Documentation

6.57.3.1 service_cleanup_delay

`struct` **`DDS_Duration_t`** `DDS_DurabilityServiceQosPolicy::service_cleanup_delay`

<<***spec***>> *(p. 791)* Controls when the service is able to remove all information regarding a data instances.

When the service cleanup delay is set to 0, disposed instances will be completely removed from the service. Only values of 0 and **DDS_DURATION_INFINITE** (p. 1210) are currently supported.

6.59 DDS_DynamicData Struct Reference

A sample of any complex data type, which can be inspected and manipulated reflectively.

6.59.1 Detailed Description

A sample of any complex data type, which can be inspected and manipulated reflectively.

Objects of type **DDS_DynamicData** (p. 1771) represent corresponding objects of the type identified by their **DDS_TypeCode** (p. 2077). Because the definition of these types may not have existed at compile time on the system on which the application is running, you will interact with the data using an API of reflective getters and setters.

For example, if you had access to your data types at compile time, you could do this:
```
theValue = theObject.theField;
```

Instead, you will do something like this:
```
theValue = get(theObject, "theField");
```

DDS_DynamicData (p. 1771) objects can represent any complex data type, including those of type kinds **DDS_TK_ARRAY** (p. 242), **DDS_TK_SEQUENCE** (p. 242), **DDS_TK_STRUCT** (p. 242), **DDS_TK_UNION** (p. 242), and **DDS_TK_VALUE** (p. 242). They cannot represent objects of basic types (e.g., integers and strings). Since those type definitions always exist on every system, you can examine their objects directly.

6.59.2 Member Names and IDs

The members of a data type can be identified in one of two ways: by their name or by their numeric ID. The former is often more transparent to human users; the latter is typically faster.

You define the name and ID of a type member when you add that member to that type. If you define your type in IDL or XML, the name will be the field name that appears in the type definition; the ID will be the one-based index of the field in declaration order. For example, in the following IDL structure, the ID of `theLong` is 2.

```
struct MyNestedType {
    char theChar;
    octet theOctetArray[10];
    long long theMultidimensionalArray[4][6][12];
    sequence<long> myArrayOfSeq[8];
};

struct MyType {
    short theShort;
    long theLong;
    MyNestedType theNestedType;
};
```

6.59.2.1 Getting and Setting Union Discriminator Values

For unions (**DDS_TK_UNION** (p. 242)), the ID of a member is the discriminator value corresponding to that member. To access the current discriminator of a union, use the **DDS_DynamicData_get_discriminator** (p. 337) operation. Once you know the value of the discriminator, you can use it in the proper get/set_xxx() operations to access and set the member's value. Here is an example of accessing the discriminator and then using it to get a member value:

```
DynamicDataMemberId discriminatorValue = myDynamicData.get_discriminator();
DDS_Long myMemberValue = myDynamicData.get_long(NULL, discriminatorValue);
```

To get information, like the **DDS_TCKind** (p. 242), about the member that the discriminator value selects, use the **DDS_DynamicData_get_member_info** (p. 349) API, passing in NULL for the name and the discriminator for the member ID. If the discriminator value does not select any member in the union, **DDS_DynamicData_get_member_info** (p. 349) will return **DDS_RETCODE_NO_DATA** (p. 1224).

The discriminator value is automatically set as a side-effect of setting a member using one of the set_xxx() operations. For example, given the following IDL Union:

```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

Setting member "x" using the **DDS_DynamicData_set_long** (p. 396) API, passing either "x" as the name or 1 as the member ID, will set the discriminator value to 1. When members can be selected by multiple case values, like "y" in our example, if the memeber is set by name, the first case label is chosen as the discriminator. For example, if member "y" is set by name, the discriminator value will be set to 2. To set the discriminator to a different value you can either set the member by ID, passing in the desired discriminator value, or use the **DDS_DynamicData_set_discriminator** (p. 336) API.

Note: In past releases, accessing the discriminator value required passing in index 0 to the **DDS_DynamicData_get_member_info_by_index** (p. 350) operation and then looking at the populated info.member_id. That functionality has been deprecated and replaced with the **DDS_DynamicData_get_discriminator** (p. 337) operation.

6.59.2.2 Hierarchical Member Names

It is possible to refer to a nested member in a type without first having to use the **DDS_DynamicData_bind_complex_member** (p. 344) API. You can do this by using a hierarchical name. A hierarchical member name is a concatenation of member names separated by the '.' character. The hierarchical name describes the complete path from a top-level type to the nested member. For example, in the above type, any DynamicData API that receives a member name will accept "theNestedType.theChar" to refer to the char member in MyNestedType:

```
char myChar = myDynamicData.get_char("theNestedType.theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

In order to access the value of `theChar` without using a hierarchical name, you would have to first bind to theNestedType and then get the value:

```
myDynamicData.bind_complex_member(myBoundData, "theNestedType", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

DDS_Char myChar = myBoundData.get_char("theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

As you can see, using a hierarchical member name removes the need to call the **DDS_DynamicData_bind_complex_member** (p. 344) and **DDS_DynamicData_unbind_complex_member** (p. 346) APIs, and allows for access to nested members at any depth directly from the top-level type.

The member name can also contain indexes to address members in arrays and sequences. For example, to set the third member in the array `theOctetArray`, you can pass in "theNestedType.theOctetArray[2]" as the member name to the **DDS_DynamicData_set_octet** (p. 402) API. The index values when used as part of the member name are 0-based.

For multi-dimensional arrays, the indexes for each dimension should be listed comma-separated in between brackets. For example, to address a member of `theMultidimensionalArray`, the member name should be something like "theNestedType.theMultidimensionalArray[3,2,5]".

In complex types with arrays and sequences that contain other arrays and sequences, the hierarchical name may include multiple index values, one right after another. For example, in MyNestedType, `myArrayOfSeq` is an array of sequences. In order to set the third member of the sequence in the fourth member of the array, the member name would be "myNestedType.myArrayOfSeq[3][2]".

6.59.3 Arrays and Sequences

The "members" of array and sequence types, unlike those of structure and union types, don't have names or explicit member IDs. However, they may nevertheless be accessed by "ID": the ID is one more than the index. (The first element has ID 1, the second 2, etc.)

Multi-dimensional arrays are effectively flattened by this pattern. For example, for an array `theArray`[4][5], accessing ID 7 is equivalent to index 6, or the second element of the second group of 5.

To determine the length of a collection-typed member of a structure or union, you have two choices:

1. Get the length along with the data: call the appropriate array accessor (see **Getters and Setters** (p. 1774)) and check the resulting length.
2. Get the length without getting the data itself: call **DDS_DynamicData_get_member_info** (p. 349) and check the resulting **DDS_DynamicDataMemberInfo::element_count** (p. 1782).

6.59.4 Available Functionality

The Dynamic Data API is large when measured by the number of methods it contains. But each method falls into one of a very small number of categories. You will find it easier to navigate this documentation if you understand these categories.

6.59.4.1 Lifecycle and Utility Methods

Managing the lifecycle of **DDS_DynamicData** (p. 1771) objects is simple. You have two choices:

1. Usually, you will go through a **DDS_DynamicDataTypeSupport** (p. 328) factory object, which will ensure that the type and property information for the new **DDS_DynamicData** (p. 1771) object corresponds to a registered type in your system.
2. In certain advanced cases, such as when you're navigating a nested structure, you will want to have a **DDS_↩ DynamicData** (p. 1771) object that is not bound up front to any particular type, or you will want to initialize the object in a custom way. In that case, you can call the constructor directly.

Table 6.10 Lifecycle

DDS_DynamicDataTypeSupport (p. 328)	DDS_DynamicData (p. 1771)
DDS_DynamicDataTypeSupport_create_data (p. 438)	**DDS_DynamicData_new** (p. 329)
DDS_DynamicDataTypeSupport_initialize_data (p. 439)	**DDS_DynamicData_initialize** (p. 329)
DDS_DynamicDataTypeSupport_finalize_data (p. 439)	**DDS_DynamicData_finalize** (p. 330)
DDS_DynamicDataTypeSupport_delete_data (p. 438)	**DDS_DynamicData_delete** (p. 331)

You can also copy **DDS_DynamicData** (p. 1771) objects:

- **DDS_DynamicData_copy** (p. 331)

You can test them for equality:

- **DDS_DynamicData_equal** (p. 331)

And you can print their contents:

- **DDS_DynamicData_print** (p. 338)
- **DDS_DynamicDataTypeSupport_print_data** (p. 438)

6.59.4.2 Getters and Setters

Most methods get or set the value of some field. These methods are named according to the type of the field they access.

The names of types vary across languages. The programming API for each language reflects that programming language. However, if your chosen language does not use the same names as the language that you used to define your types (e.g., IDL), or if you need to interoperate among programming languages, you will need to understand these differences. They are explained the following table. (Note: for modern C++, see the RTI Connext Modern C++ API reference.)

Table 6.11 Type Names Across Languages

Type	IDL	C, Traditional C++	Java	Ada
16-bit integer	short	DDS_Short	short	Standard.DDS.↩ Short
32-bit integer	long	DDS_Long	int	Standard.DDS.Long
64-bit integer	long long	DDS_LongLong	long	Standard.DDS.↩ Long_Long
Unsigned 16-bit integer	unsigned short	DDS_Unsigned↩ Short	short	Standard.DDS.↩ Unsigned_Short
Unsigned 32-bit integer	unsigned long	DDS_Unsigned↩ Long	int	Standard.DDS.Long
Unsigned 64-bit integer	unsigned long long	DDS_Unsigned↩ LongLong	long	Standard.DDS.↩ Unsigned_Long_↩ Long
float	float	DDS_Float	float	Standard.DDS.Float
double	double	DDS_Double	double	Standard.DDS.↩ Double
long double	long double	DDS_LongDouble	N/A (see CORE-14091 known issue)	Standard.DDS.↩ Long_Double
character	char	DDS_Char	char	Standard.DDS.Char
wide character	wchar	DDS_Wchar	char	Standard.DDS.↩ Wchar
octet	octet	DDS_Octet	byte	Standard.DDS.Octet
boolean	boolean	DDS_Boolean	boolean	Standard.DDS.↩ Boolean
string	string	DDS_Char∗	String	Standard.DDS.↩ String
wstring	wstring	DDS_Wchar∗	String	Standard.DDS.↩ Wide_String

When working with a **DDS_DynamicData** (p. 1771) object representing an array or sequence, calling one of the "get" methods below for an index that is out of bounds will result in **DDS_RETCODE_NO_DATA** (p. 1224). Calling "set" for an index that is past the end of a sequence will cause that sequence to automatically lengthen (filling with default contents).

When working with a **DDS_DynamicData** (p. 1771) object whose type contains optional members, calling one of the "get" methods below on an unset optional member or any member that is part of an unset complex optional member will result in **DDS_RETCODE_NO_DATA** (p. 1224).

Table 6.12 Basic Types

Get	Set
DDS_DynamicData_get_long (p. 353)	**DDS_DynamicData_set_long** (p. 396)
DDS_DynamicData_get_ulong (p. 355)	**DDS_DynamicData_set_ulong** (p. 398)
DDS_DynamicData_get_short (p. 354)	**DDS_DynamicData_set_short** (p. 397)
DDS_DynamicData_get_ushort (p. 356)	**DDS_DynamicData_set_ushort** (p. 399)
DDS_DynamicData_get_longlong (p. 360)	**DDS_DynamicData_set_longlong** (p. 403)
DDS_DynamicData_get_ulonglong (p. 361)	**DDS_DynamicData_set_ulonglong** (p. 404)
DDS_DynamicData_get_float (p. 356)	**DDS_DynamicData_set_float** (p. 399)
DDS_DynamicData_get_double (p. 357)	**DDS_DynamicData_set_double** (p. 400)

Get	Set
DDS_DynamicData_get_longdouble (p. 362)	**DDS_DynamicData_set_longdouble** (p. 404)
DDS_DynamicData_get_boolean (p. 358)	**DDS_DynamicData_set_boolean** (p. 401)
DDS_DynamicData_get_octet (p. 360)	**DDS_DynamicData_set_octet** (p. 402)
DDS_DynamicData_get_char (p. 359)	**DDS_DynamicData_set_char** (p. 401)
DDS_DynamicData_get_wchar (p. 363)	**DDS_DynamicData_set_wchar** (p. 405)
DDS_DynamicData_get_string (p. 365)	**DDS_DynamicData_set_string** (p. 407)
DDS_DynamicData_get_wstring (p. 366)	**DDS_DynamicData_set_wstring** (p. 408)

Table 6.13 Structures, Arrays, and Other Complex Types

Get	Set
DDS_DynamicData_get_complex_member (p. 367)	**DDS_DynamicData_set_complex_member** (p. 409)

Table 6.14 Arrays of Basic Types

Get	Set
DDS_DynamicData_get_long_array (p. 368)	**DDS_DynamicData_set_long_array** (p. 410)
DDS_DynamicData_get_ulong_array (p. 370)	**DDS_DynamicData_set_ulong_array** (p. 412)
DDS_DynamicData_get_short_array (p. 369)	**DDS_DynamicData_set_short_array** (p. 411)
DDS_DynamicData_get_ushort_array (p. 371)	**DDS_DynamicData_set_ushort_array** (p. 413)
DDS_DynamicData_get_longlong_array (p. 377)	**DDS_DynamicData_set_longlong_array** (p. 418)
DDS_DynamicData_get_ulonglong_array (p. 378)	**DDS_DynamicData_set_ulonglong_array** (p. 419)
DDS_DynamicData_get_float_array (p. 372)	**DDS_DynamicData_set_float_array** (p. 414)
DDS_DynamicData_get_double_array (p. 373)	**DDS_DynamicData_set_double_array** (p. 415)
DDS_DynamicData_get_longdouble_array (p. 379)	**DDS_DynamicData_set_longdouble_array** (p. 420)
DDS_DynamicData_get_boolean_array (p. 374)	**DDS_DynamicData_set_boolean** (p. 401)
DDS_DynamicData_get_octet_array (p. 376)	**DDS_DynamicData_set_octet_array** (p. 418)
DDS_DynamicData_get_char_array (p. 375)	**DDS_DynamicData_set_char_array** (p. 417)
DDS_DynamicData_get_wchar_array (p. 380)	**DDS_DynamicData_set_wchar_array** (p. 421)

Table 6.15 Sequences of Basic Types

Get	Set
DDS_DynamicData_get_long_seq (p. 383)	**DDS_DynamicData_set_long_seq** (p. 424)
DDS_DynamicData_get_ulong_seq (p. 385)	**DDS_DynamicData_set_ulong_seq** (p. 425)
DDS_DynamicData_get_short_seq (p. 384)	**DDS_DynamicData_set_short_seq** (p. 424)
DDS_DynamicData_get_ushort_seq (p. 386)	**DDS_DynamicData_set_ushort_seq** (p. 426)

Get	Set
DDS_DynamicData_get_longlong_seq (p. 391)	**DDS_DynamicData_set_longlong_seq** (p. 430)
DDS_DynamicData_get_ulonglong_seq (p. 392)	**DDS_DynamicData_set_ulonglong_seq** (p. 431)
DDS_DynamicData_get_float_seq (p. 387)	**DDS_DynamicData_set_float_seq** (p. 427)
DDS_DynamicData_get_double_seq (p. 388)	**DDS_DynamicData_set_double_seq** (p. 427)
DDS_DynamicData_get_longdouble_seq (p. 393)	**DDS_DynamicData_set_longdouble_seq** (p. 432)
DDS_DynamicData_get_boolean_seq (p. 389)	**DDS_DynamicData_set_boolean_seq** (p. 428)
DDS_DynamicData_get_octet_seq (p. 390)	**DDS_DynamicData_set_octet_seq** (p. 430)
DDS_DynamicData_get_char_seq (p. 389)	**DDS_DynamicData_set_char_seq** (p. 429)
DDS_DynamicData_get_wchar_seq (p. 394)	**DDS_DynamicData_set_wchar_seq** (p. 433)

In addition to getting or setting a field, you can "clear" its value; that is, set it to a default zero value.

- **DDS_DynamicData_clear_all_members** (p. 332)
- **DDS_DynamicData_clear_optional_member** (p. 332)

6.59.4.3 Query and Iteration

Not all components of your application will have static knowledge of all of the fields of your type. Sometimes, you will want to query meta-data about the fields that appear in a given data sample.

- **DDS_DynamicData_get_type** (p. 346)
- **DDS_DynamicData_get_type_kind** (p. 347)
- **DDS_DynamicData_get_member_type** (p. 351)
- **DDS_DynamicData_get_member_info** (p. 349)
- **DDS_DynamicData_get_member_count** (p. 347)
- **DDS_DynamicData_get_member_info_by_index** (p. 350)
- **DDS_DynamicData_member_exists** (p. 347)
- **DDS_DynamicData_member_exists_in_type** (p. 348)
- **DDS_DynamicData_is_member_key** (p. 352)

6.59.4.4 Type/Object Association

Sometimes, you may want to change the association between a data object and its type. This is not something you can do with a typical object, but with **DDS_DynamicData** (p. 1771) objects, it is a powerful capability. It allows you to, for example, examine nested structures without copying them by using a "bound" **DDS_DynamicData** (p. 1771) object as a view into an enclosing **DDS_DynamicData** (p. 1771) object.

- **DDS_DynamicData_bind_type** (p. 342)
- **DDS_DynamicData_unbind_type** (p. 343)
- **DDS_DynamicData_bind_complex_member** (p. 344)
- **DDS_DynamicData_unbind_complex_member** (p. 346)

6.59.4.5 Performance Considerations

By default, a DynamicData object stores its content in an implementation-specific representation that allows getting and setting its fields by name or ID.

When a sample is received, the CDR-formatted data is deserialized into this buffer.

When a sample is published, the data is serialized into CDR from the buffer and sent to the network.

However, there are scenarios where DynamicData is used for purposes that don't involve manipulating the object's content directly. Two common examples are:

- Recording/Replaying: Storing samples in persistent storage for later analysis or replay.
- Bridging: Transferring samples from one domain to another by transmitting samples received with a DynamicDataReader to another domain using a DynamicDataWriter.

RTI provides dedicated services, namely RTI Recording Service and RTI Routing Service, to address these use cases. However, in certain situations, you might be unable to utilize these services.

For scenarios where inspecting or modifying the content of DynamicData fields is unnecessary, DynamicData offers a high-performance method to configure a DataReader to avoid deserializing incoming samples into the internal representation. Additionally, the DynamicData API provides a method to link a CDR-formatted serialization buffer directly with a DynamicData object, facilitating direct transmission without converting the data from the internal representation to CDR.

To skip the deserialization of a DynamicData object on the DataReader side, you can set the field **DDS_DynamicDataTypeSerializationProperty_t::skip_deserialization** (p. 1786) to **DDS_BOOLEAN_TRUE** (p. 1203).

Once a sample is received, you can access the serialized buffer directly by using the **DDS_DynamicData_get_cdr_buffer** (p. 334). This buffer can be stored in persistent storage in a Recording/Replaying use case.

To link a serialization buffer directly with a DynamicData object, you can use the **DDS_DynamicData_set_cdr_buffer** (p. 334) method. This method allows you to set the buffer that will be used to serialize the DynamicData object when it is published.

MT Safety:

UNSAFE. In general, using a single **DDS_DynamicData** (p. 1771) object concurrently from multiple threads is *unsafe*.

Examples

HelloWorldPlugin.c.

6.60 DDS_DynamicDataInfo Struct Reference

A descriptor for a **DDS_DynamicData** (p. 1771) object.

Data Fields

- **DDS_Long member_count**

  *The number of data members in this **DDS_DynamicData** (p. 1771) sample.*
- **DDS_Long stored_size**

  *The number of bytes currently used to store the data of this **DDS_DynamicData** (p. 1771) sample.*

6.60.1 Detailed Description

A descriptor for a **DDS_DynamicData** (p. 1771) object.

See also

DDS_DynamicData_get_info (p. 342)

6.60.2 Field Documentation

6.60.2.1 member_count

```
DDS_Long DDS_DynamicDataInfo::member_count
```

The number of data members in this **DDS_DynamicData** (p. 1771) sample.

6.60.2.2 stored_size

```
DDS_Long DDS_DynamicDataInfo::stored_size
```

The number of bytes currently used to store the data of this **DDS_DynamicData** (p. 1771) sample.

6.61 DDS_DynamicDataJsonParserProperties_t Struct Reference

A collection of attributes used to configure **DDS_DynamicData** (p. 1771) objects.

6.61.1 Detailed Description

A collection of attributes used to configure **DDS_DynamicData** (p. 1771) objects.

To ensure that new objects are initialized to known values, assign them with the static initializer **DDS_DynamicData↩ Property_t_INITIALIZER** (p. 326).

See also

DDS_DynamicDataProperty_t_INITIALIZER (p. 326)

6.62 DDS_DynamicDataMemberInfo Struct Reference

A descriptor for a single member (i.e. field) of dynamically defined data type.

Data Fields

- **DDS_DynamicDataMemberId member_id**

  *An integer that uniquely identifies the data member within this **DDS_DynamicData** (p. 1771) sample's type.*
- const char * **member_name**

  The string name of the data member.
- **DDS_Boolean member_exists**

  Indicates whether the member exists in this sample.
- **DDS_TCKind member_kind**

  The kind of type of this data member (e.g., integer, structure, etc.).
- **DDS_UnsignedLong element_count**

  The number of elements within this data member.
- **DDS_TCKind element_kind**

  The kind of type of the elements within this data member.

6.62.1 Detailed Description

A descriptor for a single member (i.e. field) of dynamically defined data type.

See also

DDS_DynamicData_get_member_info (p. 349)

6.62.2 Field Documentation

6.62.2.1 member_id

```
DDS_DynamicDataMemberId DDS_DynamicDataMemberInfo::member_id
```

An integer that uniquely identifies the data member within this **DDS_DynamicData** (p. 1771) sample's type.

The member ID is assigned automatically by the middleware based on the member's declaration order within the type. It is a 1-based index of the member's position in the type.

See also

DDS_TCKind (p. 242)

6.62.2.2 member_name

```
const char* DDS_DynamicDataMemberInfo::member_name
```

The string name of the data member.

This name will be unique among members of the same type. However, a single named member may have multiple type representations.

6.62.2.3 member_exists

```
DDS_Boolean DDS_DynamicDataMemberInfo::member_exists
```

Indicates whether the member exists in this sample.

A member that is defined in a type may not exist in a sample of that type in the following situations

- The member is optional and is unset
- Being part of a union, the discriminator doesn't select this member
- When getting the information about a sequence element, with index `i`, and `i` is greater than the current sequence length but smaller than its maximum length.

See also

DDS_DynamicData_member_exists_in_type (p. 348)

6.62.2.4 member_kind

DDS_TCKind DDS_DynamicDataMemberInfo::member_kind

The kind of type of this data member (e.g., integer, structure, etc.).

This is a convenience field; it is equivalent to looking up the member in the **DDS_TypeCode** (p. 2077) and getting the **DDS_TCKind** (p. 242) from there.

6.62.2.5 element_count

DDS_UnsignedLong DDS_DynamicDataMemberInfo::element_count

The number of elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report zero (0) here.

6.62.2.6 element_kind

DDS_TCKind DDS_DynamicDataMemberInfo::element_kind

The kind of type of the elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report **DDS_TK_NULL** (p. 242) here.

6.63 DDS_DynamicDataProperty_t Struct Reference

A collection of attributes used to configure **DDS_DynamicData** (p. 1771) objects.

Data Fields

- **DDS_Long buffer_initial_size**

  *The initial amount of memory used by the underlying **DDS_DynamicData** (p. 1771) buffer, in bytes.*
- **DDS_Long buffer_max_size**

  *The maximum amount of memory that the underlying **DDS_DynamicData** (p. 1771) buffer may use, in bytes.*

6.63.1 Detailed Description

A collection of attributes used to configure **DDS_DynamicData** (p. 1771) objects.

To ensure that new objects are initialized to known values, assign them with the static initializer **DDS_DynamicData↩ Property_t_INITIALIZER** (p. 326).

See also

DDS_DynamicDataProperty_t_INITIALIZER (p. 326)

6.63.2 Field Documentation

6.63.2.1 buffer_initial_size

DDS_Long DDS_DynamicDataProperty_t::buffer_initial_size

The initial amount of memory used by the underlying **DDS_DynamicData** (p. 1771) buffer, in bytes.

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The initial buffer size will be set to the minimum amount of space required to hold the overhead required by the DynamicData internal representation (about 100 bytes) in addition to the minimum deserialized size of a sample. The minimum deserialized size of a sample assumes that all strings are allocated to their default values, sequences are left to length 0, and all optional members are unset.

If set to any value other than 0: The underlying buffer will be allocated to the provided size plus the overhead required by the DynamicData internal representation (about 100 bytes). If the provided size plus the overhead is less than the size used when buffer_initial_size is left to 0, then the default value is used.

See also

DDS_DynamicDataProperty_t::buffer_max_size (p. 1783)

6.63.2.2 buffer_max_size

DDS_Long DDS_DynamicDataProperty_t::buffer_max_size

The maximum amount of memory that the underlying **DDS_DynamicData** (p. 1771) buffer may use, in bytes.

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

A DynamicData object will grow to this size from the initial size as needed. The buffer_max_size includes all overhead that is required for the internal DynamicData representation and therefore represents a hard upper limit on the size of the underlying DynamicData buffer.

If set to -1 (default): The buffer will grow unbounded to the size required to fit all members.

If set to any value other than -1: The buffer will not grow beyond this size. If setting a member's values requires the buffer to grow beyond this maximum, the member will fail to be set. If the buffer is required to grow beyond this maximum during deserialization, the sample will fail to be deserialized. The buffer_max_size cannot be smaller than the buffer_initial_size.

See also

DDS_DynamicDataProperty_t::buffer_initial_size (p. 1783)

6.64 DDS_DynamicDataSeq Struct Reference

An ordered collection of **DDS_DynamicData** (p. 1771) elements.

6.64.1 Detailed Description

An ordered collection of **DDS_DynamicData** (p. 1771) elements.

Instantiates **FooSeq** (p. 2120) < **DDS_DynamicData** (p. 1771) > .

See also

FooSeq (p. 2120)
DDS_DynamicData (p. 1771)

6.65 DDS_DynamicDataTypeProperty_t Struct Reference

A collection of attributes used to configure **DDS_DynamicDataTypeSupport** (p. 328) objects.

Data Fields

- struct **DDS_DynamicDataProperty_t data**

  *These properties will be provided to every new **DDS_DynamicData** (p. 1771) sample created from the **DDS_DynamicDataTypeSupport** (p. 328).*
- struct **DDS_DynamicDataTypeSerializationProperty_t serialization**

  Properties that govern how the data of this type will be serialized on the network.

6.65.1 Detailed Description

A collection of attributes used to configure **DDS_DynamicDataTypeSupport** (p. 328) objects.

The properties of a **DDS_DynamicDataTypeSupport** (p. 328) object contain the properties that will be used to instantiate any samples created by that object.

6.65.2 Field Documentation

6.65.2.1 data

`struct` **DDS_DynamicDataProperty_t** DDS_DynamicDataTypeProperty_t::data

These properties will be provided to every new **DDS_DynamicData** (p. 1771) sample created from the **DDS_Dynamic↩ DataTypeSupport** (p. 328).

These properties are also used to create the samples that are kept in the DataReader's queue.

6.65.2.2 serialization

`struct` **DDS_DynamicDataTypeSerializationProperty_t** DDS_DynamicDataTypeProperty_t::serialization

Properties that govern how the data of this type will be serialized on the network.

6.66 DDS_DynamicDataTypeSerializationProperty_t Struct Reference

Properties that govern how data of a certain type will be serialized on the network.

Data Fields

- **DDS_Boolean use_42e_compatible_alignment**

  *[**No longer supported**] Use RTI Connext 4.2e-compatible alignment for large primitive types.*
- **DDS_UnsignedLong max_size_serialized**

  *[**No longer supported**] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_max_size** (p. 1783) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.*
- **DDS_UnsignedLong min_size_serialized**

  *[**No longer supported**] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_initial_↩ size** (p. 1783) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.*
- **DDS_Boolean trim_to_size**

  Controls the growth of the buffer in a DynamicData object.
- **DDS_Boolean skip_deserialization**

  Enable skipping the deserialization of data on the DataReader side.

6.66.1 Detailed Description

Properties that govern how data of a certain type will be serialized on the network.

6.66.2 Field Documentation

6.66.2.1 use_42e_compatible_alignment

```
DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::use_42e_compatible_alignment
```

[**No longer supported**] Use RTI Connext 4.2e-compatible alignment for large primitive types.

In RTI Connext 4.2e, the default alignment for large primitive types – **DDS_LongLong** (p. 1205), **DDS_UnsignedLong↩ Long** (p. 1205), **DDS_Double** (p. 1205), and **DDS_LongDouble** (p. 1206) – was not RTPS-compliant. This compatibility mode allows applications targeting post-4.2e versions of RTI Connext to interoperate with 4.2e-based applications, regardless of the data types they use.

If this flag is not set, all data will be serialized in an RTPS-compliant manner, which for the types listed above, will not be interoperable with RTI Connext 4.2e.

6.66.2.2 max_size_serialized

```
DDS_UnsignedLong DDS_DynamicDataTypeSerializationProperty_t::max_size_serialized
```

[**No longer supported**] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_max↩ _size** (p. 1783) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's **DDS_TypeCode** (p. 2077), whichever is smaller.

6.66.2.3 min_size_serialized

```
DDS_UnsignedLong DDS_DynamicDataTypeSerializationProperty_t::min_size_serialized
```

[**No longer supported**] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_initial↩ _size** (p. 1783) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

Default: 0xFFFFFFFF, a sentinel that indicates that this value must be equal to the value specified in max_size_↩ serialized.

6.66.2.4 trim_to_size

```
DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::trim_to_size
```

Controls the growth of the buffer in a DynamicData object.

This property only applies to DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The buffer will not be reallocated unless the deserialized size of the incoming sample is greater than the current buffer size.

If set to 1: The buffer of a DynamicData object obtained from the DDS sample pool will be freed and re-allocated for each sample to just fit the size of the deserialized data of the incoming sample. The newly allocated size will not be smaller than **DDS_DynamicDataProperty_t::buffer_initial_size** (p. 1783).

6.66.2.5 skip_deserialization

```
DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::skip_deserialization
```

Enable skipping the deserialization of data on the DataReader side.

Setting this member to **DDS_BOOLEAN_TRUE** (p. 1203) boosts the performance for use cases in which the application does not require accessing the value of the different members of the received DynamicData object. Those use cases include recording, replaying, and bridging. You can access the CDR buffer of a DynamicData object by calling the function **DDS_DynamicData_get_cdr_buffer** (p. 334). This configuration option is only available in C, Traditional C++, Modern C++, and Python language bindings.

When this option is set to **DDS_BOOLEAN_TRUE** (p. 1203), many of the DynamicData APIs cannot be used to access or manipulate the received DynamicData object. See each functions's documentation for whether or not the function is supported for DynamicData objects in CDR format.

See also

DDS_DynamicData_is_cdr (p. 335)

DDS_DynamicData_get_cdr_buffer (p. 334)

DDS_DynamicData_set_cdr_buffer (p. 334)

[default] DDS_BOOLEAN_FALSE (p. 1203)

6.67 DDS_EndpointGroup_t Struct Reference

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

Data Fields

- char * **role_name**

  Defines the role name of the endpoint group.
- int **quorum_count**

  Defines the minimum number of members that satisfies the endpoint group.

6.67.1 Detailed Description

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

6.67.2 Field Documentation

6.67.2.1 role_name

```
char* DDS_EndpointGroup_t::role_name
```

Defines the role name of the endpoint group.

If used in the **DDS_AvailabilityQosPolicy** (p. 1547) on a **DDS_DataWriter** (p. 488), it specifies the name that identifies a Durable Subcription.

The role name can be at most 255 characters in length.

6.67.2.2 quorum_count

```
int DDS_EndpointGroup_t::quorum_count
```

Defines the minimum number of members that satisfies the endpoint group.

If used in the **DDS_AvailabilityQosPolicy** (p. 1547) on a **DDS_DataWriter** (p. 488), it specifies the number of Data↩ Readers that must acknowledge a sample before the sample is considered to be acknowledged by the Durable Subscription.

6.68 DDS_EndpointGroupSeq Struct Reference

A sequence of **DDS_EndpointGroup_t** (p. 1787).

6.68.1 Detailed Description

A sequence of **DDS_EndpointGroup_t** (p. 1787).

In the context of Collaborative DataWriters, it can be used by a **DDS_DataReader** (p. 618) to define a group of remote DataWriters that the **DDS_DataReader** (p. 618) will wait to discover before skipping missing samples.

In the context of Durable Subscriptions, it can be used to create a set of Durable Subscriptions identified by a name and a quorum count.

Instantiates:

<<***generic***>> *(*p. *1015)* **FooSeq** (p. 2120)

6.72 DDS_EntityFactoryQosPolicy Struct Reference

<<***spec***>> *(p. 791)* A QoS policy for all **DDS_Entity** (p. 1362) types that can act as factories for one or more other **DDS_Entity** (p. 1362) types.

Data Fields

- **DDS_Boolean autoenable_created_entities**

  <<***basic***>> *(p. 784)* <<***spec***>> *(p. 791) Specifies whether the entity acting as a factory automatically enables the instances it creates.*

6.72.1 Detailed Description

<<***spec***>> *(p. 791)* A QoS policy for all **DDS_Entity** (p. 1362) types that can act as factories for one or more other **DDS_Entity** (p. 1362) types.

Entity:

DDS_DomainParticipantFactory (p. 32), **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **YES** (p. 1247)

6.72.2 Usage

This policy controls the behavior of the **DDS_Entity** (p. 1362) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Connext uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **DDS_DataReader** (p. 618) is created in an enabled state, its existence is immediately propagated for discovery and the **DDS_DataReader** (p. 618) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **DDS_DataReader** (p. 618), and thus, it may not be desireable for the **DDS_DataReader** (p. 618) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled, too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

6.72.3 Field Documentation

6.72.3.1 autoenable_created_entities

```
DDS_Boolean DDS_EntityFactoryQosPolicy::autoenable_created_entities
```

<<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791)* Specifies whether the entity acting as a factory automatically enables the instances it creates.

The setting of `autoenable_created_entities` to **DDS_BOOLEAN_TRUE** (p. 1203) indicates that the factory `create_<entity>` operation(s) will automatically invoke the **DDS_Entity_enable** (p. 1365) operation each time a new **DDS_Entity** (p. 1362) is created. Therefore, the **DDS_Entity** (p. 1362) returned by `create_<entity>` will already be enabled. A setting of **DDS_BOOLEAN_FALSE** (p. 1203) indicates that the **DDS_Entity** (p. 1362) will not be automatically enabled. Your application will need to call **DDS_Entity_enable** (p. 1365) itself.

The default setting of `autoenable_created_entities` = **DDS_BOOLEAN_TRUE** (p. 1203) means that, by default, it is not necessary to explicitly call **DDS_Entity_enable** (p. 1365) on newly created entities.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Mutable (p. 952), **Application Startup** (p. 839)

6.73 DDS_EntityNameQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Assigns a name and a role name to a **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). Except for **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Data Fields

- char * **name**

  <<***basic***>> *(p. 784)* <<***extension***>> *(p. 796) The name of the entity.*
- char * **role_name**

  <<***extension***>> *(p. 796) The entity role name.*

6.73.1 Detailed Description

<<***extension***>> *(p. 796)* Assigns a name and a role name to a **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), **DDS_Subscriber** (p. 575), **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). Except for **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

DDS_DomainParticipant (p. 76), **DDS_Subscriber** (p. 575), **DDS_Publisher** (p. 446), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = NO;
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.73.2 Usage

The name and role name can be at most 255 characters in length.

The strings must be null-terminated strings allocated with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528).

If you provide a non-null pointer when getting the QoS, then it should point to valid memory that can be written to, to avoid ungraceful failures.

6.73.3 Field Documentation

6.73.3.1 name

```
char* DDS_EntityNameQosPolicy::name
```

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The name of the entity.

[default] null

[range] Null terminated string with length not exceeding 255. It can be null.

Categories

Immutable (p. 916), **Debuggability** (p. 849), **Discovery Metadata** (p. 960)

6.73.3.2 role_name

```
char* DDS_EntityNameQosPolicy::role_name
```

<<***extension***>> *(*p. *796)* The entity role name.

With Durable Subscriptions this name is used to specify to which Durable Subscription the **DDS_DataReader** (p. 618) belongs.

With Collaborative DataWriters this name is used to specify to which endpoint group the **DDS_DataWriter** (p. 488) belongs.

[range] Null terminated string with length not exceeding 255. It can be null.

[default] null

Categories

Immutable (p. 916), **Debuggability** (p. 849), **Discovery Metadata** (p. 960), **Durability** (p. 861)

6.74 DDS_EnumMember Struct Reference

A description of a member of an enumeration.

Data Fields

- char * **name**

  The name of the enumeration member.
- **DDS_Long ordinal**

  The value associated the the enumeration member.

6.74.1 Detailed Description

A description of a member of an enumeration.

See also

DDS_EnumMemberSeq (p. 1795)

DDS_TypeCodeFactory_create_enum_tc (p. 297)

6.76 DDS_EventQosPolicy Struct Reference

<<***extension***>> *(*p. *796)* Settings for event.

Data Fields

- struct **DDS_ThreadSettings_t thread**

  <<***extension***>> *(*p. *796) Event thread QoS.*
- **DDS_Long initial_count**

  <<***extension***>> *(*p. *796) The initial number of events.*
- **DDS_Long max_count**

  <<***extension***>> *(*p. *796) The maximum number of events.*

6.76.1 Detailed Description

<<***extension***>> *(*p. *796)* Settings for event.

In a **DDS_DomainParticipant** (p. 76), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **DDS_DomainParticipant** (p. 76) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **DDS_DomainParticipant** (p. 76) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.76.2 Field Documentation

6.76.2.1 thread

```
struct DDS_ThreadSettings_t DDS_EventQosPolicy::thread
```

<<***extension***>> *(*p. *796)* Event thread QoS.

There is only one event thread.

Priority:
[default] The actual value depends on your architecture:
For Windows: -2
For Linux: OS default priority

6.76.2.3 max_count

```
DDS_Long DDS_EventQosPolicy::max_count
```

<<***extension***>> *(p. 796)* The maximum number of events.

The maximum number of events. If the limit is reached, no new event can be added.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), >= initial_count

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.77 DDS_ExpressionProperty Struct Reference

Provides additional information about the filter expression passed to **DDS_ContentFilter::writer_compile** (p. 1573).

Data Fields

- **DDS_Boolean key_only_filter**

  Indicates if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.
- **DDS_Boolean writer_side_filter_optimization**

  Indicates if the filter implementation can cache the filtering result for the provided expression.

6.77.1 Detailed Description

Provides additional information about the filter expression passed to **DDS_ContentFilter::writer_compile** (p. 1573).

It is used by the filter implementation to indicate to the middleware whether or not the **DDS_ContentFilter** (p. 1571) will cache the result of filter evaluation.

6.77.2 Field Documentation

6.77.2.1 key_only_filter

```
DDS_Boolean DDS_ExpressionProperty::key_only_filter
```

Indicates if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.

When this field is set to **DDS_BOOLEAN_TRUE** (p. 1203), it indicates to RTI Connext that the filter expression is based only on key fields.

6.77.2.2 writer_side_filter_optimization

```
DDS_Boolean DDS_ExpressionProperty::writer_side_filter_optimization
```

Indicates if the filter implementation can cache the filtering result for the provided expression.

When this field is set to **DDS_BOOLEAN_TRUE** (p. 1203), RTI Connext will do no caching or explicit filter evaluation for the associated **DDS_DataReader** (p. 618). Instead, it will rely on the filter implementation to provide appropriate results.

6.78 DDS_FilterSampleInfo Struct Reference

Provides meta information associated with the sample.

Data Fields

- struct **DDS_SampleIdentity_t related_sample_identity**

  The identity of another sample related to this one.
- struct **DDS_GUID_t related_source_guid**

  Identifies the application logical data source that is related to the sample being written.
- struct **DDS_GUID_t related_reader_guid**

  Identifies a DataReader that is logically related to the sample.
- struct **DDS_SampleIdentity_t sample_identity**

  The identity of the sample.
- struct **DDS_GUID_t source_guid**

  Identifies the application logical data source associated with the sample being written.

6.78.1 Detailed Description

Provides meta information associated with the sample.

This can be used by a content filter to perform filtering on meta data.

6.78.2 Field Documentation

6.78.2.1 related_sample_identity

struct **DDS_SampleIdentity_t** DDS_FilterSampleInfo::related_sample_identity

The identity of another sample related to this one.

The value of this field identifies another sample that is logically related to the one that is written. For example, the **DDS_DataWriter** (p. 488) created by a Replier uses this field to associate the identity of the request sample with a response sample.

The related_sample_identity can be set using the field **DDS_WriteParams_t::related_sample_identity** (p. 2108) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

Default value **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 1393) denotes a sample not associated with any other sample.

A **DDS_DataReader** (p. 618) can inspect the related sample identity of a received sample by accessing the fields **DDS_SampleInfo::related_original_publication_virtual_guid** (p. 1998) and **DDS_SampleInfo::related_original_publication_virtual_sequence_number** (p. 1999).

6.78.2.2 related_source_guid

struct **DDS_GUID_t** DDS_FilterSampleInfo::related_source_guid

Identifies the application logical data source that is related to the sample being written.

The related_source_guid can be set by using the field **DDS_WriteParams_t::related_source_guid** (p. 2111) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

Default value **DDS_GUID_UNKNOWN** (p. 1215) denotes a sample as lacking a related data source.

A **DDS_DataReader** (p. 618) can inspect the related_source_guid of a received sample by accessing the field **DDS_SampleInfo::related_source_guid** (p. 1999).

6.78.2.3 related_reader_guid

struct **DDS_GUID_t** DDS_FilterSampleInfo::related_reader_guid

Identifies a DataReader that is logically related to the sample.

The related_reader_guid can be set by using the field **DDS_WriteParams_t::related_reader_guid** (p. 2111) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

Default value **DDS_GUID_UNKNOWN** (p. 1215) denotes a sample without an associated DataReader.

A **DDS_DataReader** (p. 618) can inspect the related_reader_guid of a received sample by accessing the field **DDS_SampleInfo::related_source_guid** (p. 1999).

6.78.2.4 sample_identity

`struct` **`DDS_SampleIdentity_t`** `DDS_FilterSampleInfo::sample_identity`

The identity of the sample.

The value of this field uniquely identifies a sample within its source DataWriter.

The identity of a sample can be set by using the field **DDS_WriteParams_t::identity** (p. 2108) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

Default value **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 1393) can be used to let the DataWriter assign a default identity to a sample. In this case, sample_identity.writer_guid will be set to the GUID of the DataWriter, while sample_↩ identity.sequence_number will be set to the next sequence number to be written by the DataWriter.

A **DDS_DataReader** (p. 618) can inspect the identity of a received sample by accessing the fields **DDS_Sample↩ Info::original_publication_virtual_guid** (p. 1998) and **DDS_SampleInfo::original_publication_virtual_sequence↩ _number** (p. 1998).

6.78.2.5 source_guid

`struct` **`DDS_GUID_t`** `DDS_FilterSampleInfo::source_guid`

Identifies the application logical data source associated with the sample being written.

The source_guid can be set by using the field **DDS_WriteParams_t::source_guid** (p. 2110) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

Default value **DDS_GUID_UNKNOWN** (p. 1215) denotes a sample without a logical data source associated with it.

A **DDS_DataReader** (p. 618) can inspect the logical data source of a sample by accessing the field **DDS_SampleInfo↩ ::source_guid** (p. 1999).

6.79 DDS_FloatSeq Struct Reference

Instantiates **`FooSeq`** `(p. 2120)` < **DDS_Float** (p. 1205) >

6.79.1 Detailed Description

Instantiates **`FooSeq`** `(p. 2120)` < **DDS_Float** (p. 1205) >

Instantiates:

<<***generic***>> *(p. 1015)* **FooSeq** (p. 2120)

See also

DDS_Float (p. 1205)

FooSeq (p. 2120)

6.80 DDS_FlowControllerProperty_t Struct Reference

Determines the flow control characteristics of the **DDS_FlowController** (p. 562).

Data Fields

- **DDS_FlowControllerSchedulingPolicy scheduling_policy**

  Scheduling policy.
- struct **DDS_FlowControllerTokenBucketProperty_t token_bucket**

  Settings for the token bucket.

6.80.1 Detailed Description

Determines the flow control characteristics of the **DDS_FlowController** (p. 562).

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **DDS_DataWriter** (p. 488) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the **DDS_FlowController** (p. 562), and do not depend on the number of **DDS_DataWriter** (p. 488) instances the **DDS_FlowController** (p. 562) is servicing. For instance, the specified flow rate does *not* double simply because two **DDS_DataWriter** (p. 488) instances are waiting to write.

Entity:

DDS_FlowController (p. 562)

Properties:

RxO (p. 1247) = N/A

Changeable (p. 1247) = **NO** (p. 1247) for **DDS_FlowControllerProperty_t::scheduling_policy** (p. 1802), **YES** (p. 1247) for **DDS_FlowControllerProperty_t::token_bucket** (p. 1803). However, the special value of **DDS_DURATION_INFINITE** (p. 1210) as **DDS_FlowControllerTokenBucketProperty_t::period** (p. 1805) is strictly used to create an *on-demand* **DDS_FlowController** (p. 562). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

6.80.2 Field Documentation

6.80.2.1 scheduling_policy

DDS_FlowControllerSchedulingPolicy DDS_FlowControllerProperty_t::scheduling_policy

Scheduling policy.

Determines the scheduling policy for servicing the **DDS_DataWriter** (p. 488) instances associated with the **DDS_↩ FlowController** (p. 562).

[default] DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY (p. 563)

6.80.2.2 token_bucket

struct **DDS_FlowControllerTokenBucketProperty_t** DDS_FlowControllerProperty_t::token_bucket

Settings for the token bucket.

6.81 DDS_FlowControllerTokenBucketProperty_t Struct Reference

DDS_FlowController (p. 562) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Data Fields

- **DDS_Long max_tokens**

  Maximum number of tokens than can accumulate in the token bucket.
- **DDS_Long tokens_added_per_period**

  The number of tokens added to the token bucket per specified period.
- **DDS_Long tokens_leaked_per_period**

  The number of tokens removed from the token bucket per specified period.
- struct **DDS_Duration_t period**

  Period for adding tokens to and removing tokens from the bucket.
- **DDS_Long bytes_per_token**

  Maximum number of bytes allowed to send for each token available.

6.81.1 Detailed Description

DDS_FlowController (p. 562) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same token(s). In other words, each token can only contribute to a single network packet.

Entity:

DDS_FlowController (p. 562)

Properties:

RxO (p. 1247) = N/A

Changeable (p. 1247) = **YES** (p. 1247). However, the special value of **DDS_DURATION_INFINITE** (p. 1210) as **DDS_FlowControllerTokenBucketProperty_t::period** (p. 1805) is strictly used to create an *on-demand* **DDS_Flow↩ Controller** (p. 562). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

6.81.2 Field Documentation

6.81.2.1 max_tokens

```
DDS_Long DDS_FlowControllerTokenBucketProperty_t::max_tokens
```

Maximum number of tokens than can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **DDS_FlowControllerTokenBucketProperty_t::bytes_per_token** (p. 1805), determines the maximum allowable data burst.

Use **DDS_LENGTH_UNLIMITED** (p. 1328) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1,**DDS_LENGTH_UNLIMITED** (p. 1328)]

6.81.2.2 tokens_added_per_period

DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_added_per_period

The number of tokens added to the token bucket per specified period.

DDS_FlowController (p. 562) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **DDS_DataWriter** (p. 488) instances based on the **DDS_FlowController↩ Property_t::scheduling_policy** (p. 1802).

Use **DDS_LENGTH_UNLIMITED** (p. 1328) to add the maximum number of tokens allowed by **DDS_FlowController↩ TokenBucketProperty_t::max_tokens** (p. 1804).

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1,**DDS_LENGTH_UNLIMITED** (p. 1328)]

6.81.2.3 tokens_leaked_per_period

DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_leaked_per_period

The number of tokens removed from the token bucket per specified period.

DDS_FlowController (p. 562) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **DDS_LENGTH_UNLIMITED** (p. 1328) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

[range] [0,**DDS_LENGTH_UNLIMITED** (p. 1328)]

6.81.2.4 period

struct **DDS_Duration_t** DDS_FlowControllerTokenBucketProperty_t::period

Period for adding tokens to and removing tokens from the bucket.

DDS_FlowController (p. 562) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **DDS_DURATION_INFINITE** (p. 1210) can be used to create an *on-demand* **DDS_FlowController** (p. 562), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **DDS_FlowController_trigger_flow** (p. 566). This external trigger adds **DDS_FlowControllerTokenBucketProperty↩ _t::tokens_added_per_period** (p. 1804) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 1210)

6.81.2.5 bytes_per_token

```
DDS_Long DDS_FlowControllerTokenBucketProperty_t::bytes_per_token
```

Maximum number of bytes allowed to send for each token available.

DDS_FlowController (p. 562) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each **DDS_DataWriter** (p. 488). That is, in cases where **DDS_Flow↩ ControllerTokenBucketProperty_t::bytes_per_token** (p. 1805) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of **DDS_FlowControllerProperty_t::scheduling_↩ policy** (p. 1802)).

Where fragmentation is required, the fragment size will be **DDS_FlowControllerTokenBucketProperty_t::bytes_↩ per_token** (p. 1805) or the minimum largest message size across all transports installed with the **DDS_DataWriter** (p. 488), whichever is less.

Use **DDS_LENGTH_UNLIMITED** (p. 1328) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **DDS_DataWriter** (p. 488) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1024,**DDS_LENGTH_UNLIMITED** (p. 1328)]

6.82 DDS_GroupDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Data Fields

- struct **DDS_OctetSeq value**
  *<<**spec**>> (p. 791) a sequence of octets*

6.82.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Entity:

DDS_Publisher (p. 446), **DDS_Subscriber** (p. 575)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **YES** (p. 1247)

See also

DDS_DomainParticipant_get_builtin_subscriber (p. 128)

6.82.2 Usage

The additional information is attached to a **DDS_Publisher** (p. 446) or **DDS_Subscriber** (p. 575). This extra data is not used by RTI Connext itself. When a remote application discovers the **DDS_Publisher** (p. 446) or **DDS_Subscriber** (p. 575), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the **DDS_TopicDataQosPolicy** (p. 2046) and **DDS_UserDataQosPolicy** (p. 2092), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with **DDS_DataReaderListener** (p. 1593), **DDS_DataWriterListener** (p. 1644) and operations such as **DDS_DomainParticipant_ignore_publication** (p. 131) and **DDS_DomainParticipant_ignore_subscription** (p. 132), this QoS policy can help an application to define and enforce its own security policies. For example, an application can implement matching policies similar to those of the **DDS_PartitionQosPolicy** (p. 1884), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS_DomainParticipantResourceLimitsQosPolicy::publisher_group_data_max_length** (p. 1749) and **DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length** (p. 1749).

6.82.3 Field Documentation

6.82.3.1 value

```
struct DDS_OctetSeq DDS_GroupDataQosPolicy::value
```

<<***spec***>> *(p. 791)* a sequence of octets

[default] Empty (zero-sized)

[range] Octet sequence of length [0,max_length]

Categories

Mutable (p. 952), **Application-Defined Metadata** (p. 837), **Discovery Metadata** (p. 960)

6.83 DDS_GUID_t Struct Reference

Type for *GUID* (Global Unique Identifier) representation.

Data Fields

- **DDS_Octet value** [DDS_GUID_LENGTH]

  A 16 byte array containing the GUID value.

6.83.1 Detailed Description

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

Alternative representation of **DDS_RTPS_GUID_t** (p. 1959). Memory and wire representation for this type is the same as the one for **DDS_RTPS_GUID_t** (p. 1959).

6.83.2 Field Documentation

6.83.2.1 value

```
DDS_Octet DDS_GUID_t::value[DDS_GUID_LENGTH]
```

A 16 byte array containing the GUID value.

6.84 DDS_HistoryQosPolicy Struct Reference

<<***spec***>> *(*p. *791)* Specifies the behavior of RTI Connext in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Data Fields

- **DDS_HistoryQosPolicyKind kind**

  <<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791) Specifies the kind of history to be kept.*

- **DDS_Long depth**

  <<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791) Specifies the number of samples per instance to be kept, when the* `kind` *is* ***DDS_KEEP_LAST_HISTORY_QOS*** *(*p. *1295)*

6.84.1 Detailed Description

<<***spec***>> *(p. 791)* Specifies the behavior of RTI Connext in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

This QoS policy specifies how much data must to stored by RTI Connext for a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). It controls whether RTI Connext should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the **DDS_DataWriter** (p. 488) on behalf of existing **DDS_DataReader** (p. 618) entities. The behavior with regards to a **DDS_DataReader** (p. 618) entities discovered after a sample is written is controlled by the **DURABILITY** (p. 1287) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Connext.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

See also

DDS_ReliabilityQosPolicy (p. 1940)

DDS_HistoryQosPolicy (p. 1808)

6.84.2 Usage

This policy controls the behavior of RTI Connext when the value of an instance changes before it is finally communicated to **DDS_DataReader** (p. 618) entities.

When a **DDS_DataWriter** (p. 488) sends data, or a **DDS_DataReader** (p. 618) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with **DDS_ReliabilityQosPolicy** (p. 1940) by controlling whether RTI Connext guarantees that *all* of the sent data is received (**DDS_KEEP_ALL_HISTORY_QOS** (p. 1295)) or if only the last N data values sent are guaranteed to be received (**DDS_KEEP_LAST_HISTORY_QOS** (p. 1295))–this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **DDS_DurabilityQosPolicy** (p. 1762) to receive previously published data is controlled by **DDS_DurabilityQosPolicy::writer_depth** (p. 1765), not by the History QoS policy.

Note that the History QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **DDS_ResourceLimitsQosPolicy** (p. 1953).

If `kind` is **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295) (the default), then RTI Connext will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of `depth` regulates the maximum number of values (up to and including the most current one) RTI Connext will maintain and deliver until the samples are fully acknowledged. After N values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length *N*.

For keyed-data, there is different behavior on the publishing and subscribing sides associated with how invalid samples representing the disposal of or unregistration from an instance affect history.

On the publishing side, unregistering from or disposing of an instance creates an invalid sample that is accounted for in the history depth. This means that an invalid sample may replace a value that is currently being stored in the writer queue.

On the subscribing side, however, invalid samples do not count towards history depth and will not replace a value that is being stored in the reader queue.

On both the publishing and subscribing sides, there can only ever be one invalid sample per-instance and that one sample can be in different states depending on whether the instance has been disposed, unregistered, or both.

The default (and most common setting) for `depth` is 1, indicating that only the most recent value should be delivered.

If `kind` is **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295), then RTI Connext will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Connext can use to keep this history are limited by the settings of the **RESOURCE_LIMITS** (p. 1327). If the limit is reached, then the behavior of RTI Connext will depend on the **RELIABILITY** (p. 1323). If the Reliability `kind` is **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325), then the old values will be discarded. If Reliability `kind` is RELIABLE, then RTI Connext will block the **DDS_DataWriter** (p. 488) until it can deliver the necessary old values to all subscribers.

6.84.3 Consistency

This QoS policy's `depth` must be consistent with the **RESOURCE_LIMITS** (p. 1327) `max_samples_per_↩ instance`. For these two QoS to be consistent, they must verify that *depth <= max_samples_per_instance*.

See also

DDS_ResourceLimitsQosPolicy (p. 1953)

6.84.4 Field Documentation

6.84.4.1 kind

DDS_HistoryQosPolicyKind DDS_HistoryQosPolicy::kind

*<<**basic**>> (p. 784) <<**spec**>> (p. 791)* Specifies the kind of history to be kept.

For DataWriters, the samples are only kept either until they are fully acknowledged by all matching DataReaders or until they are replaced or removed. Samples can be replaced or removed for a number of reasons, including but not limited to **DDS_LifespanQosPolicy** (p. 1818) expiration, replacement because the **DDS_HistoryQosPolicy::depth** (p. 1810) has been exceeded, or one of the **DDS_ResourceLimitsQosPolicy** (p. 1953) settings has been exceeded.

[default] DDS_KEEP_LAST_HISTORY_QOS (p. 1295)

Categories

Immutable (p. 916), **Applied Per-Instance** (p. 958), **Reliability** (p. 897), **Data Availability** (p. 844)

6.84.4.2 depth

DDS_Long DDS_HistoryQosPolicy::depth

<<***basic***>> *(p. 784)* <<***spec***>> *(p. 791)* Specifies the number of samples per instance to be kept, when the `kind` is **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295)

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE_LIMITS** (p. 1327) policy. That is:

depth <= **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956)

When the `kind` is **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295), the depth has no effect. Its implied value is `infinity` (in practice limited by the settings of the **RESOURCE_LIMITS** (p. 1327) policy).

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the **DDS_DurabilityQosPolicy::writer_depth** (p. 1765), not this depth.

[default] 1

[range] [1,100 million], <= **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956)

6.95 DDS_LatencyBudgetQosPolicy Struct Reference

<<***spec***>> *(*p. *791)* Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Data Fields

- struct **DDS_Duration_t duration**

  <<***spec***>> *(*p. *791) Duration of the maximum acceptable delay.*

6.95.1 Detailed Description

<<***spec***>> *(p. 791)* Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

This policy is a *hint* to a DDS implementation; it can be used to change how it processes and sends data that has low latency requirements. The DDS specification does not mandate whether or how this policy is used.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_↩ STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **YES** (p. 1247)

See also

DDS_PublishModeQosPolicy (p. 1924)

DDS_FlowController (p. 562)

6.95.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero `duration`, RTI Connext can optimize its internal operation.

RTI Connext uses it in conjunction with **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321) **DDS_Data↩ Writer** (p. 488) instances associated with a **DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY** (p. 563) **DDS_Flow↩ Controller** (p. 562) only. Together with the time of write, **DDS_LatencyBudgetQosPolicy::duration** (p. 1818) determines the deadline of each individual sample. RTI Connext uses this information to prioritize the sending of asynchronously published data; see **DDS_AsynchronousPublisherQosPolicy** (p. 1539).

6.95.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered duration* <= *requested duration* evaluates to 'TRUE'.

6.95.4 Field Documentation

6.95.4.1 duration

`struct` **`DDS_Duration_t`** `DDS_LatencyBudgetQosPolicy::duration`

[default] 0 (meaning minimize the delay)

Categories

Mutable (p. 952), **Discovery Metadata** (p. 960), **Matching** (p. 965), **Data Availability** (p. 844)

6.96 DDS_LifespanQosPolicy Struct Reference

<<***spec***>> *(*p. *791)* Specifies how long the data written by the **DDS_DataWriter** (p. 488) is considered valid.

Data Fields

- struct **DDS_Duration_t duration**
  <<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791) Maximum duration for the data's validity.*

6.96.1 Detailed Description

<<***spec***>> *(*p. *791)* Specifies how long the data written by the **DDS_DataWriter** (p. 488) is considered valid.

Each data sample written by the **DDS_DataWriter** (p. 488) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the **DDS_Data↩ Reader** (p. 618) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the **DDS_DataWriter** (p. 488)'s cache is computed by adding the duration specified by this QoS policy to the time when the sample is added to the **DDS_DataWriter** (p. 488)'s cache. This timestamp is not necessarily equal to the sample's source timestamp that can be provided by the user using the **Foo↩ DataWriter_write_w_timestamp** (p. 503) or **FooDataWriter_write_w_params** (p. 504) API.

The expiration time of each sample from the **DDS_DataReader** (p. 618)'s cache is computed by adding the duration to the reception timestamp.

See also

FooDataWriter_write (p. 499)

FooDataWriter_write_w_timestamp (p. 503)

Entity:

DDS_Topic (p. 174), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **YES** (p. 1247)

6.96.2 Usage

The Lifespan QoS policy can be used to control how much data is stored by RTI Connext. Even if it is configured to store "all" of the data sent or received for a topic (see **DDS_HistoryQosPolicy** (p. 1808)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have 'expired.'

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

6.97 DDS_Listener Struct Reference

<<***interface***>> *(*p. *1015)* Abstract base class for all Listener interfaces.

Data Fields

- void * **listener_data**

  A place for listener implementors to keep a pointer to data that may be needed by their listener.

6.97.1 Detailed Description

<<***interface***>> *(*p. *1015)* Abstract base class for all Listener interfaces.

Entity:

DDS_Entity (p. 1362)

QoS:

All QoS Policies (p. 1240)

Status:

Status Kinds (p. 1224)

All the supported kinds of concrete **DDS_Listener** (p. 1819) interfaces (one per concrete **DDS_Entity** (p. 1362) type) derive from this root and add functions whose prototype depends on the concrete Listener.

Listeners provide a way for RTI Connext to asynchronously alert the application when there are relevant status changes.

Almost every application will have to implement listener interfaces.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **DDS_Listener** (p. 1819) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **DDS_Entity** (p. 1362).

6.97.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 1224)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is `on_<communication_status>`(), which takes a parameter of type `<communication_status>` as listed in **Status Kinds** (p. 1224).

- `on_<communication_status>` is available on the relevant **DDS_Entity** (p. 1362) as well as those that embed it, as expressed in the following figure:

listener processing. The most *specific* relevant enabled listener is called."

- When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Connext which operations are enabled within the listener (cf. operation **DDS_Entity** (p. 1362) set_listener()).

- When a plain communication status changes, RTI Connext triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **DDS_DomainParticipant** (p. 76)) and to set dedicated behaviors only where needed.

6.97.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- First, RTI Connext tries to trigger the **DDS_SubscriberListener::on_data_on_readers** (p. 2015) with a parameter of the related **DDS_Subscriber** (p. 575);
- If this does not succeed (there is no listener or the operation is not enabled), RTI Connext tries to trigger **DDS_DataReaderListener::on_data_available** (p. 1595) on all the related **DDS_DataReaderListener** (p. 1593) objects, with a parameter of the related **DDS_DataReader** (p. 618).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding **DDS_DataReader** (p. 618) objects by calling **DDS_Subscriber_get_datareaders** (p. 591) on the related **DDS_Subscriber** (p. 575) and then get the data by calling **FooDataReader_read** (p. 628) or **FooDataReader_take** (p. 629) on the returned **DDS_DataReader** (p. 618) objects), or it wants to treat each **DDS_DataReader** (p. 618) independently and it may choose the second option (and then get the data by calling **FooDataReader_read** (p. 628) or **FooDataReader_take** (p. 629) on the related **DDS_DataReader** (p. 618)).

Note that if **DDS_SubscriberListener::on_data_on_readers** (p. 2015) is called, RTI Connext will *not* try to call **DDS_DataReaderListener::on_data_available** (p. 1595). However, an application can force a call to the **DDS_DataReader** (p. 618) objects that have data by calling **DDS_Subscriber_notify_datareaders** (p. 593).

6.97.4 Operations Allowed in Listener Callbacks

See `Restricted Operations in Listener Callbacks`, in the Core Libraries User's Manual.

6.97.5 Best Practices with Listeners

Note that all the issues described below are avoided by using **DDS_WaitSet** (p. 1373).

Avoid blocking or performing a lot of processing in Listener callbacks

Listeners are invoked by internal threads that perform critical functions within the middleware and need to run in a timely manner. By default, Connext DDS creates a few threads to use to receive data and only a single thread to handle periodic events.

Because of this, user applications installing Listeners should never block in a Listener callback. There are several negative consequences of blocking in a listener callback:

- The application may lose data for the DataReader the listener is installed on, because the receive thread is not removing it from the socket buffer and it gets overwritten.

- The application may receive strictly reliable data with a delay, because the receive thread is not removing it from the socket buffer and if it gets overwritten it must be re-sent.
- The application may lose or delay data for other DataReaders, because by default all DataReaders created with the same DomainParticipant share the same threads.
- The application may not be notified of periodic events on time

If the application needs to make a blocking call when data is available, or when another event occurs, the application should use **DDS_WaitSet** (p. 1373).

Avoid taking application mutexes/semaphores in Listener callbacks

Taking application mutexes/sempahores within a Listener callback may lead to unexpected deadlock scenarios.

When a Listener callback is invoked the EA (Exclusive Area) of the Entity 'E' to which the callback applies is taken by the middleware.

If the application takes an application mutex 'M' within a critical section in which the application makes DDS calls affecting 'E', this may lead to following deadlock:

The middleware thread is within the entity EA trying to acquire the mutex 'M'. At the same time, the application thread has acquired 'M' and is blocked trying to acquire the entity EA.

Do not write data with a DataWriter within the on_data_available callback

Avoid writing data with a DataWriter within the **DDS_DataReaderListener::on_data_available()** (p. 1595) callback. If the write operation blocks because e.g. the send window is full, this will lead to a deadlock.

Do not call wait_for_acknowledgements within the on_data_available callback

Do not call the **DDS_DataWriter_wait_for_acknowledgments** (p. 546) within the **DDS_DataReaderListener::on_↩ data_available()** (p. 1595) callback. This will lead to deadlock.

6.97.6 Field Documentation

6.97.6.1 listener_data

```
void* DDS_Listener::listener_data
```

A place for listener implementors to keep a pointer to data that may be needed by their listener.

6.98 DDS_LivelinessChangedStatus Struct Reference

DDS_LIVELINESS_CHANGED_STATUS (p. 1233)

Data Fields

- **DDS_Long alive_count**

  *The total count of currently alive **DDS_DataWriter** (p. 488) entities that write the **DDS_Topic** (p. 174) that this **DDS_DataReader** (p. 618) reads.*
- **DDS_Long not_alive_count**

  *The total count of currently not_alive **DDS_DataWriter** (p. 488) entities that write the **DDS_Topic** (p. 174) that this **DDS_DataReader** (p. 618) reads.*
- **DDS_Long alive_count_change**

  The change in the alive_count since the last time the listener was called or the status was read.
- **DDS_Long not_alive_count_change**

  The change in the not_alive_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_publication_handle**

  *This InstanceHandle can be used to look up which remote **DDS_DataWriter** (p. 488) was the last to cause this DataReader's status to change, using **DDS_DataReader_get_matched_publication_data** (p. 680).*

6.98.1 Detailed Description

DDS_LIVELINESS_CHANGED_STATUS (p. 1233)

The **DDS_DataReaderListener::on_liveliness_changed** (p. 1594) callback may be invoked for the following reasons:

- The liveliness of any **DDS_DataWriter** (p. 488) matching this DataReader (as defined by the **DDS_LivelinessQosPolicyKind** (p. 1298) setting) is lost.
- A DataWriter's liveliness is recovered after being lost.
- A new matching DataWriter has been discovered.
- A matching DataWriter has been deleted.
- A QoS Policy has changed such that a DataWriter that matched this DataReader before no longer matches (such as a change to the **DDS_PartitionQosPolicy** (p. 1884)). In this case, RTI Connext will no longer keep track of the DataWriter's liveliness. Furthermore, consider two scenarios:
  - DataWriter was alive when it and DataReader stopped matching: **DDS_LivelinessChangedStatus::alive_count** (p. 1824) will decrease (since there's one less matching alive DataWriter) and **DDS_LivelinessChangedStatus::not_alive_count** (p. 1824) will remain the same (since the DataWriter is still alive).
  - DataWriter was not alive when it and DataReader stopped matching: **DDS_LivelinessChangedStatus::alive_count** (p. 1824) will remain the same (since the matching DataWriter was not alive) and **DDS_LivelinessChangedStatus::not_alive_count** (p. 1824) will decrease (since there's one less not-alive matching DataWriter).

    Note: There are several ways that a DataWriter and DataReader can become incompatible after the DataWriter has lost liveliness. For example, when the **DDS_LivelinessQosPolicyKind** (p. 1298) is set to DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS, it is possible that the DataWriter has not asserted its liveliness in a timely manner, and then a QoS change occurs on the DataWriter or DataReader that makes the entities incompatible.

- A QoS Policy (such as the **DDS_PartitionQosPolicy** (p. 1884)) has changed such that a DataWriter that was unmatched with the DataReader now matches.

Examples

HelloWorld_subscriber.c.

6.98.2 Field Documentation

6.98.2.1 alive_count

DDS_Long DDS_LivelinessChangedStatus::alive_count

The total count of currently alive **DDS_DataWriter** (p. 488) entities that write the **DDS_Topic** (p. 174) that this **DDS_↩ DataReader** (p. 618) reads.

6.98.2.2 not_alive_count

DDS_Long DDS_LivelinessChangedStatus::not_alive_count

The total count of currently not_alive **DDS_DataWriter** (p. 488) entities that write the **DDS_Topic** (p. 174) that this **DDS_DataReader** (p. 618) reads.

6.98.2.3 alive_count_change

DDS_Long DDS_LivelinessChangedStatus::alive_count_change

The change in the alive_count since the last time the listener was called or the status was read.

6.98.2.4 not_alive_count_change

DDS_Long DDS_LivelinessChangedStatus::not_alive_count_change

The change in the not_alive_count since the last time the listener was called or the status was read.

Note that a positive not_alive_count_change means one of the following:

- The DomainParticipant containing the matched DataWriter has lost liveliness or has been deleted.
- The matched DataWriter has lost liveliness or has been deleted.

6.98.2.5 last_publication_handle

```
DDS_InstanceHandle_t DDS_LivelinessChangedStatus::last_publication_handle
```

This InstanceHandle can be used to look up which remote **DDS_DataWriter** (p. 488) was the last to cause this Data↩ Reader's status to change, using **DDS_DataReader_get_matched_publication_data** (p. 680).

It's possible that the DataWriter has been purged from the discovery database. (See the "Discovery Overview" section of the User's Manual.) If so, the **DDS_DataReader_get_matched_publication_data** (p. 680) method will not be able to return information about the DataWriter. In this case, the only way to get information about the lost DataWriter is if you cached the information previously.

6.99 DDS_LivelinessLostStatus Struct Reference

DDS_LIVELINESS_LOST_STATUS (p. 1233)

Data Fields

- **DDS_Long total_count**

  *Total cumulative number of times that a previously-alive **DDS_DataWriter** (p. 488) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.*
- **DDS_Long total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.

6.99.1 Detailed Description

DDS_LIVELINESS_LOST_STATUS (p. 1233)

Entity:

DDS_DataWriter (p. 488)

Listener:

DDS_DataWriterListener (p. 1644)

The liveliness that the **DDS_DataWriter** (p. 488) has committed through its **DDS_LivelinessQosPolicy** (p. 1826) was not respected; thus **DDS_DataReader** (p. 618) entities will consider the **DDS_DataWriter** (p. 488) as no longer "alive/active".

6.99.2 Field Documentation

6.99.2.1 total_count

DDS_Long DDS_LivelinessLostStatus::total_count

Total cumulative number of times that a previously-alive **DDS_DataWriter** (p. 488) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **DDS_DataWriter** (p. 488) simply remains not alive for another liveliness period.

6.99.2.2 total_count_change

DDS_Long DDS_LivelinessLostStatus::total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

6.100 DDS_LivelinessQosPolicy Struct Reference

Specifies and configures the mechanism that allows **DDS_DataReader** (p. 618) entities to detect when **DDS_Data↩ Writer** (p. 488) entities become disconnected or "dead.".

Data Fields

- **DDS_LivelinessQosPolicyKind kind**

  *<<**basic**>> (p. 784) <<**spec**>> (p. 791) The kind of liveliness desired.*
- struct **DDS_Duration_t lease_duration**

  *<<**basic**>> (p. 784) <<**spec**>> (p. 791) The duration within which a **DDS_DataWriter** (p. 488) must be asserted, or else it is assumed to be not alive.*
- **DDS_Long assertions_per_lease_duration**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) The number of assertions a **DDS_DataWriter** (p. 488) will send during a its **DDS_LivelinessQosPolicy::lease_duration** (p. 1828).*

6.100.1 Detailed Description

Specifies and configures the mechanism that allows **DDS_DataReader** (p. 618) entities to detect when **DDS_Data↩ Writer** (p. 488) entities become disconnected or "dead.".

The liveliness status of a **DDS_DataWriter** (p. 488) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 1303) policy. The application is also informed via **DDS_Listener** (p. 1819) when an **DDS_DataWriter** (p. 488) is no longer alive.

A **DDS_DataWriter** (p. 488) commits to signalling its liveliness at intervals not to exceed the **DDS_LivelinessQos↩ Policy::lease_duration** (p. 1828) configured on the **DDS_DataWriter** (p. 488). The rate at which the **DDS_DataWriter** (p. 488) will signal its liveliness is defined by **DDS_LivelinessQosPolicy::assertions_per_lease_duration** (p. 1829).

The **DDS_DataReader** (p. 618) lease_duration specifies the maximum period at which matching DataWriters must have their liveliness asserted.

In addition, in the subscribing application Connext DDS uses an internal thread that wakes up at the period set by the DataReader's lease_duration to see if a DataWriter lease_duration has been violated.

Important: The DataReader lease_duration only configures how often a DataReader will check the liveliness of the matching DataWriters. The DataWriter lease_duration configures the period at which a DataWriter must assert its liveliness and is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

Listeners are used to notify a **DDS_DataReader** (p. 618) of loss of liveliness and **DDS_DataWriter** (p. 488) of violations to the liveliness contract. The on_liveliness_lost() callback is only called *once*, after the first time the lease_duration is exceeded (when the **DDS_DataWriter** (p. 488) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected DataWriters.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_LIVELINESS_LOST_STATUS (p. 1233), **DDS_LivelinessLostStatus** (p. 1825);
DDS_LIVELINESS_CHANGED_STATUS (p. 1233), **DDS_LivelinessChangedStatus** (p. 1823);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_OFFERED_INCOMPATIBLE_QOS_↩ STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.100.2 Usage

This policy controls the mechanism and parameters used by RTI Connext to ensure that particular DataWriters on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 1303) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 1299) liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Connext takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a **DDS_↩ DomainParticipant** (p. 76) is running and the link connecting it to remote participants remains connected, the entities within the **DDS_DomainParticipant** (p. 76) will be considered alive. This requires the lowest overhead.

The manual settings (**DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 1299), **DDS_MANUAL_BY_↩ TOPIC_LIVELINESS_QOS** (p. 1299)) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding **DDS_Entity** (p. 1362) is still alive. The action can be explicit by calling the **DDS_DataWriter_assert_liveliness** (p. 541) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 1299) requires only that one **DDS_Entity** (p. 1362) within a participant is asserted to be alive to deduce all other **DDS_Entity** (p. 1362) objects within the same **DDS_DomainParticipant** (p. 76) are also alive.

- The setting **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 1299) requires that at least one instance within the **DDS_DataWriter** (p. 488) is asserted.

Changes in **LIVELINESS** (p. 1298) must be detected by the Service with a time-granularity greater or equal to the **DDS_LivelinessQosPolicy::lease_duration** (p. 1828). This ensures that the value of the **DDS_LivelinessChangedStatus** (p. 1823) is updated at least once during each lease_duration and the related Listeners and **DDS_WaitSet** (p. 1373) s are notified within a lease_duration from the time the **LIVELINESS** (p. 1298) changed.

6.100.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered kind >= requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_LivelinessQosPolicyKind** (p. 1298) kind are considered ordered such that: **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 1299) < **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 1299) < **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 1299).

- the inequality *offered* `lease_duration` *<= requested* `lease_duration` evaluates to **DDS_BOOLEAN_TRUE** (p. 1203).

<<***extension***>> *(p. 796)* Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

6.101.2 Field Documentation

6.101.2.1 kind

```
DDS_Long DDS_Locator_t::kind
```

The kind of locator.

If the Locator_t kind is **DDS_LOCATOR_KIND_UDPv4** (p. 1112), the address contains an IPv4 address. In this case, the leading 12 octets of the **DDS_Locator_t::address** (p. 1830) must be zero. The last 4 octets of **DDS_Locator_t::address** (p. 1830) are used to store the IPv4 address.

If the Locator_t kind is **DDS_LOCATOR_KIND_UDPv6** (p. 1112), the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the **DDS_Locator_t::address** (p. 1830) field.

6.101.2.2 port

```
DDS_UnsignedLong DDS_Locator_t::port
```

the port number

6.101.2.3 address

```
DDS_Octet DDS_Locator_t::address[ DDS_LOCATOR_ADDRESS_LENGTH_MAX]
```

A **DDS_LOCATOR_ADDRESS_LENGTH_MAX** (p. 1106) octet field to hold the IP address.

6.102 DDS_LocatorFilter_t Struct Reference

<<***extension***>> *(p. 796)* Specifies the configuration of an individual channel within a MultiChannel DataWriter.

Data Fields

- struct **DDS_LocatorSeq locators**

  <<***extension***>> *(p. 796) Sequence containing from one to 16* ***DDS_Locator_t*** *(p. 1830), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.*
- char * **filter_expression**

  <<***extension***>> *(p. 796) A logical expression used to determine the data that will be published in the channel.*

6.102.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the configuration of an individual channel within a MultiChannel DataWriter.

QoS:

DDS_LocatorFilterQosPolicy (p. 1832)

6.102.2 Field Documentation

6.102.2.1 locators

```
struct DDS_LocatorSeq DDS_LocatorFilter_t::locators
```

<<***extension***>> *(p. 796)* Sequence containing from one to 16 **DDS_Locator_t** (p. 1830), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

[default] Empty sequence.

6.102.2.2 filter_expression

```
char* DDS_LocatorFilter_t::filter_expression
```

<<***extension***>> *(p. 796)* A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS_LocatorFilterQosPolicy::filter_name** (p. 1833)

Important: This value must be an allocated string with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528). It should not be assigned to a string constant.

6.103.2.1 locator_filters

```
struct DDS_LocatorFilterSeq DDS_LocatorFilterQosPolicy::locator_filters
```

<<***extension***>> *(p. 796)* A sequence of **DDS_LocatorFilter_t** (p. 1831). Each **DDS_LocatorFilter_t** (p. 1831) reports the configuration of a single channel of a MultiChannel DataWriter.

A sequence length of zero indicates the **DDS_MultiChannelQosPolicy** (p. 1860) is not in use.

[default] Empty sequence.

6.103.2.2 filter_name

```
char* DDS_LocatorFilterQosPolicy::filter_name
```

<<***extension***>> *(p. 796)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported: **DDS_SQLFILTER_NAME** (p. 162) and **DDS_STRINGMATCHFILTER_NAME** (p. 163).

Warning

This value must be assigned to either one of the predefined values (**DDS_SQLFILTER_NAME** (p. 162) or **DDS_STRINGMATCHFILTER_NAME** (p. 163)), or to an allocated string with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528). It should not be assigned to a string constant.

[default] DDS_STRINGMATCHFILTER_NAME (p. 163)

6.104 DDS_LocatorFilterSeq Struct Reference

Declares IDL `sequence<` **DDS_LocatorFilter_t** (p. 1831) `>`.

6.104.1 Detailed Description

Declares IDL `sequence<` **DDS_LocatorFilter_t** (p. 1831) `>`.

A sequence of **DDS_LocatorFilter_t** (p. 1831) used to report the channels' properties. If the length of the sequence is zero, the **DDS_MultiChannelQosPolicy** (p. 1860) is not in use.

Instantiates:

<<***generic***>> *(p. 1015)* **FooSeq** (p. 2120)

6.106.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the RTI Connext logging facility.

All the properties associated with RTI Connext logging can be configured using this QoS policy. This allows you to configure logging using XML QoS Profiles. See the "Troubleshooting" chapter in the `User's Manual` for details.

Entity:

DDS_DomainParticipantFactory (p. 32)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **Changeable** (p. 1247)

6.106.2 Field Documentation

6.106.2.1 verbosity

NDDS_Config_LogVerbosity DDS_LoggingQosPolicy::verbosity

<<***basic***>> *(*p. *784)* <<***extension***>> (p. *796)* The verbosities at which RTI Connext diagnostic information is logged.

[default] NDDS_CONFIG_LOG_VERBOSITY_ERROR (p. 1445)

Categories

Mutable (p. 952), **Logging** (p. 877), **Debuggability** (p. 849)

6.106.2.2 category

NDDS_Config_LogCategory DDS_LoggingQosPolicy::category

<<***basic***>> (p. *784)* <<***extension***>> *(*p. *796)* Categories of logged messages.

[default] Logging will be enabled for all the categories.

Categories

Mutable (p. 952), **Logging** (p. 877), **Debuggability** (p. 849)

6.106.2.3 print_format

NDDS_Config_LogPrintFormat DDS_LoggingQosPolicy::print_format

<<***extension***>> *(*p. *796)* The format used to output RTI Connext diagnostic information.

[default] NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT (p. 1448).

Categories

Mutable (p. 952), **Logging** (p. 877), **Debuggability** (p. 849)

6.106.2.4 output_file

```
char* DDS_LoggingQosPolicy::output_file
```

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Specifies the file to which log messages will be redirected to.

If the value of ouput_file is set to NULL, log messages will sent to standard output.

If **DDS_LoggingQosPolicy::max_bytes_per_file** (p. 1836) is not **DDS_LENGTH_UNLIMITED** (p. 1328), this is used as the file name preffix for a set of numbered files.

Important: This value must be an allocated string with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528). It should not be assigned to a string constant.

[default] NULL

6.110.1 Detailed Description

<<***extension***>> *(*p. *796)* Configures the use of a dedicated **DDS_DomainParticipant** (p. 76) to distribute the RTI Connext application telemetry data.

6.110.2 Field Documentation

6.110.2.1 enable

```
DDS_Boolean DDS_MonitoringDedicatedParticipantSettings::enable
```

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* Enables the use of a dedicated **DDS_DomainParticipant** (p. 76) to distribute the RTI Connext application telemetry data.

Setting this value to **DDS_BOOLEAN_FALSE** (p. 1203) is not currently supported.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Mutable (p. 952), **Debuggability** (p. 849), **QoS Profile Management** (p. 895)

6.110.2.2 domain_id

```
int DDS_MonitoringDedicatedParticipantSettings::domain_id
```

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The domain ID used in the creation of RTI Monitoring Library 2.0 **DDS_DomainParticipant** (p. 76).

By default, the RTI Monitoring Library 2.0 DomainParticipant is created in domain 101 with the domain tag 'RTI_o11y'. The domain tag provides further isolation in case the application also uses domain 101.

The domain ID can be changed using this field. Changing the domain tag is not recommended. However, if you need to change it, you must do so by configuring the domain tag in the **DDS_DomainParticipantQos** (p. 1729) of the profile set in **DDS_MonitoringDedicatedParticipantSettings::participant_qos_profile_name** (p. 1840).

[default] 101

Categories

Mutable (p. 952), **Debuggability** (p. 849), **Discovery** (p. 854), **Discovery Isolation** (p. 860)

6.110.2.3 participant_qos_profile_name

```
char* DDS_MonitoringDedicatedParticipantSettings::participant_qos_profile_name
```

<<***extension***>> *(*p. *796)* The fully qualified name of the profile used to configure the **DDS_DomainParticipant** (p. 76) that will be used to distribute telemetry data.

[default] NULL

Categories

Mutable (p. 952), **Debuggability** (p. 849), **QoS Profile Management** (p. 895)

6.110.2.4 collector_initial_peers

```
struct DDS_StringSeq DDS_MonitoringDedicatedParticipantSettings::collector_initial_peers
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **DDS_MonitoringDistributionSettings::dedicated_participant** (p. 1842).

These initial peers should correspond with the RTI Observability Collector Service with which RTI Monitoring Library 2.0 has to communicate. The collector_initial_peers works the same as initial_peers for other DomainParticipants, except that it allows you to easily specify the initial peer(s) for the RTI Monitoring Library 2.0 **DDS_DomainParticipant** (p. 76), which may have different initial peer(s) than those used by your application.

If no collector_initial_peers are specified, or if it is explicitly set to an empty list, the **DDS_DiscoveryQosPolicy::initial_peers** (p. 1719) list of **DDS_MonitoringDedicatedParticipantSettings::participant_qos_profile_name** (p. 1840) will be used as the initial peers of **DDS_MonitoringDistributionSettings::dedicated_participant** (p. 1842).

[default] An empty sequence.

See also

DDS_DiscoveryQosPolicy::initial_peers (p. 1719) for further information about initial peers.

- struct **DDS_Duration_t publication_period**

  <<***basic***>> *(p. 784)* <<***extension***>> *(p. 796) Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.*

6.112.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the distribution of event metrics.

Event metrics are provided to RTI Monitoring Library 2.0 when they change.

For example, if the liveliness of a **DDS_DataWriter** (p. 488) is lost, a matching **DDS_DataReader** (p. 618) will push the new value of **DDS_LivelinessChangedStatus** (p. 1823) to RTI Monitoring Library 2.0 so that the liveliness status change can be distributed.

There are three kinds of event metrics:

- **Configuration metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to QoS policies.
- **Status metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to the event statuses such as **DDS_LivelinessChangedStatus** (p. 1823).
- **Resource metrics:** Provided to RTI Monitoring Library 2.0 when a resource (such as **DDS_DataWriter** (p. 488)) is created or deleted.

The event metrics that will be distributed for an observable resource can be configured with **DDS_MonitoringTelemetryData::metrics** (p. 1859).

6.112.2 Field Documentation

6.112.2.1 concurrency_level

```
DDS_UnsignedLong DDS_MonitoringEventDistributionSettings::concurrency_level
```

<<***extension***>> *(p. 796)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the event metrics pushed to RTI Monitoring Library 2.0 will be stored in a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for event metrics, each queue protected by its own mutex. Each resource (e.g, a **DDS_DataReader** (p. 618)) will be associated with one of the queues when the resource is registered with RTI Monitoring Library 2.0. Therefore, all the event metrics for a single resource always go to the same queue.

The event metrics for two resources associated with different event queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The event metrics added to the event queues are processed by a single thread configured using **DDS_Monitoring↩ EventDistributionSettings::thread** (p. 1845).

[default] 5

[range] [1, 100]

6.113 DDS_MonitoringLoggingDistributionSettings Struct Reference

<<***extension***>> *(p. 796)* Configures the distribution of log messages.

Data Fields

- **DDS_UnsignedLong concurrency_level**

  *<<**extension**>> (p. 796) Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.*
- **DDS_UnsignedLong max_historical_logs**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) The number of log messages that RTI Monitoring Library 2.0 will keep as history.*
- char * **datawriter_qos_profile_name**

  *<<**extension**>> (p. 796) The fully qualified name of the profile used to configure the **DDS_DataWriter** (p. 488) that distributes log messages.*
- struct **DDS_ThreadSettings_t thread**

  *<<**extension**>> (p. 796) The settings of the logging thread.*
- struct **DDS_Duration_t publication_period**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) Period at which the logging thread publishes log messages.*

6.113.1 Detailed Description

*<<**extension**>> (p. 796)* Configures the distribution of log messages.

Log messages are pushed into RTI Monitoring Library 2.0 and published by the logging thread.

The logging thread only publishes a log message with a Syslog level smaller than or equal to the forwarding level of the **NDDS_Config_LogFacility** (p. 1448) associated with the log message.

The default value of the forwarding level for all facilities is **NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING** (p. 1450). This value can be changed with the **DDS_MonitoringTelemetryData::logs** (p. 1859) QoS Policy or by sending a command to RTI Monitoring Library 2.0.

In this release, commands can only be sent from the RTI Observability Dashboards.

RTI Monitoring Library 2.0 can be configured to keep a history of log messages for later distribution when a log snapshot is requested by a RTI Observability Collector Service.

The log messages maintained in the history are the last 'n' messages published by the logging thread (where 'n' is the value of **DDS_MonitoringLoggingDistributionSettings::max_historical_logs** (p. 1848)).

6.113.2 Field Documentation

6.113.2.1 concurrency_level

```
DDS_UnsignedLong DDS_MonitoringLoggingDistributionSettings::concurrency_level
```

<<***extension***>> *(p. 796)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the log messages pushed to RTI Monitoring Library 2.0 will be stored into a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for log messages, each queue protected by its own mutex.

The log messages generated by a single thread will always be pushed to the same queue. The log messages for two threads associated with different log queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The log messages added to the log queues are processed and published by a single thread configured using **DDS_↩ MonitoringLoggingDistributionSettings::thread** (p. 1849).

[default] 5

[range] [1, 100]

- struct **DDS_StringSeq enabled_metrics_selection**

  <<***extension***>> *(*p. *796) A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by* ***DDS_MonitoringMetricSelection::resource_↩ selection*** *(*p. *1852).*
- struct **DDS_StringSeq disabled_metrics_selection**

  <<***extension***>> *(*p. *796) A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by* ***DDS_MonitoringMetricSelection::resource_↩ selection*** *(*p. *1852).*

6.115.1 Detailed Description

<<***extension***>> *(*p. *796)* This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.

6.115.2 Field Documentation

6.115.2.1 resource_selection

```
char* DDS_MonitoringMetricSelection::resource_selection
```

<<***extension***>> *(*p. *796)* An expression pattern that selects a subset of resources by matching the pattern to the resource names. **DDS_MonitoringMetricSelection::enabled_metrics_selection** (p. 1853) and **DDS_Monitoring↩ MetricSelection::disabled_metrics_selection** (p. 1853) are applied to this subset of resources.

Examples of resource expression patterns:

- /applications/myApp/domain_participants/myParticipant
- /applications/*/domain_participants/*/subscribers/*
- /applications/myApp/domain_participants/GUID(1234.5678.4321.8765)
- //myEntity

The first expression refers to a DomainParticipant named "myParticipant" that belongs to an application named "myApp". The second expression applies to all the Subscribers in the system (resource name wildcards follow the POSIX fnmatch syntax). The third expression refers to a DomainParticipant with a specific resource GUID in the "myApp" application. The last expression uses the XPath "//" operator. It matches observable resources named "myEntity" no matter where they are located in the resource hieararchy.

See the Telemetry Data / Resources chapter of the RTI Connext Observability Framework documentation for further information on the observable resource names and expression patterns.

Categories

Mutable (p. 952), **Debuggability** (p. 849)

6.115.2.2 enabled_metrics_selection

`struct` **`DDS_StringSeq`** `DDS_MonitoringMetricSelection::enabled_metrics_selection`

<<***extension***>> *(p. 796)* A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **DDS_MonitoringMetricSelection::resource_selection** (p. 1852).

This sequence is evaluated first, followed by **DDS_MonitoringMetricSelection::disabled_metrics_selection** (p. 1853). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_*
- dds_application_*

The first pattern refers to a specific DataWriter metric (**DDS_DurabilityQosPolicy::writer_depth** (p. 1765)). The second pattern refers to all the DataReader **DDS_ReliabilityQosPolicy** (p. 1940) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connext Observability Framework documentation for further information on the metric names and metric patterns.

Mutable (p. 952), **Debuggability** (p. 849)

6.115.2.3 disabled_metrics_selection

```
struct DDS_StringSeq DDS_MonitoringMetricSelection::disabled_metrics_selection
```

<<***extension***>> *(p. 796)* A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **DDS_MonitoringMetricSelection::resource_selection** (p. 1852).

This sequence is evaluated after **DDS_MonitoringMetricSelection::enabled_metrics_selection** (p. 1853). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_*
- dds_application_*

The first pattern refers to a specific DataWriter metric (**DDS_DurabilityQosPolicy::writer_depth** (p. 1765)). The second pattern refers to all the DataReader **DDS_ReliabilityQosPolicy** (p. 1940) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connext Observability Framework documentation for further information on the metric names and metric patterns.

6.117.1 Detailed Description

<<***extension***>> *(*p. *796)* Configures the distribution of periodic metrics.

Periodic metrics change often, and they are polled and published periodically by a thread created by RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 obtains periodic metrics by polling the current value of periodic statuses such as **DDS_DataWriterProtocolStatus** (p. 1654).

The periodic metrics that will be distributed for an observable resource can be configured with **DDS_MonitoringTelemetryData::metrics** (p. 1859).

6.117.2 Field Documentation

6.117.2.1 datawriter_qos_profile_name

```

6.118 DDS_MonitoringQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

Data Fields

- **DDS_Boolean enable**

  <<***basic***>> *(p. 784)* <<***extension***>> *(p. 796) Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.*
- char * **application_name**

  <<***basic***>> *(p. 784)* <<***extension***>> *(p. 796) The name of the resource that represents this RTI Connext application.*
- struct **DDS_MonitoringDistributionSettings distribution_settings**

  <<***extension***>> *(p. 796) Configures the distribution of telemetry data.*
- struct **DDS_MonitoringTelemetryData telemetry_data**

  <<***extension***>> *(p. 796) Configures the telemetry data that will be distributed.*

6.118.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

6.118.2 Field Documentation

6.118.2.1 enable

```
DDS_Boolean DDS_MonitoringQosPolicy::enable
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 is **automatically enabled** under the following conditions:

- For RTI Connext applications that link with the RTI Connext shared libraries as long as the rtimonitoring2 shared library is in the library search path. There is no need to link with rtimonitoring2.
- For RTI Connext applications that link with the RTI Connext static libraries, including rtimonitoring2, as long as the application calls the API **RTI_Monitoring_initialize** (p. 1437).

RTI Monitoring Library 2.0 is **not automatically enabled** for RTI Connext RTI DDS Ping, RTI DDS Spy, RTI Monitor, RTI Admin Console nor RTI Observability Collector Service.

You can override the default behavior and control whether RTI Monitoring Library 2.0 is enabled or disabled in two ways in order of precedence:

- **Environment variable:** Set `RTI_MONITORING2_ENABLE` to `true` or `false`. This is the simplest way to enable or disable the library without modifying your application or its configuration.
- **QoS policy:** Set this field to **DDS_BOOLEAN_TRUE** (p. 1203) or **DDS_BOOLEAN_FALSE** (p. 1203) programmatically or via XML.

The environment variable should not be changed at runtime. If you need to **enable** or **disable** RTI Monitoring Library 2.0 at runtime, use this field instead.

Note: Enabling and disabling RTI Monitoring Library 2.0 while DDS Entities are being created or deleted is not a safe operation. The entities created while RTI Monitoring Library 2.0 is being enabled may not be monitored.

Categories

Mutable (p. 952), **Debuggability** (p. 849)

6.118.2.2 application_name

```
char* DDS_MonitoringQosPolicy::application_name
```

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* The name of the resource that represents this RTI Connext application.

When this member is set to a value other than NULL , the resource identifier representing this application will be:

/applications/<application_name>

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The application_name should be unique across the RTI Connext system; however, RTI Monitoring Library 2.0 does not currently enforce uniqueness.

When this member is set to NULL , RTI Monitoring Library 2.0 will automatically assign a resource identifier with this format:

/applications/<host_name:process_id:uuid>

[default] NULL

6.120 DDS_MultiChannelQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Data Fields

- struct **DDS_ChannelSettingsSeq channels**

  <<***extension***>> *(p. 796) A sequence of* ***DDS_ChannelSettings_t*** *(p. 1564) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.*
- char * **filter_name**

  <<***extension***>> *(p. 796) Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.*

6.120.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **DDS_DataWriter** (p. 488) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.120.2 Usage

By using this QoS, a **DDS_DataWriter** (p. 488) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the fields within the data. When your application's code calls **FooDataWriter_write** (p. 499), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded. In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

6.120.3 Field Documentation

6.120.3.1 channels

`struct` **`DDS_ChannelSettingsSeq`** `DDS_MultiChannelQosPolicy::channels`

<<***extension***>> *(p. 796)* A sequence of **DDS_ChannelSettings_t** (p. 1564) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **DDS_MultiChannelQosPolicy** (p. 1860) is not in use.

The sequence length cannot be greater than **DDS_DomainParticipantResourceLimitsQosPolicy::channel_seq_↩ max_length** (p. 1754).

[default] Empty sequence.

Categories

Immutable (p. 916), **Discovery Metadata** (p. 960), **Data Availability** (p. 844)

6.120.3.2 filter_name

```
char* DDS_MultiChannelQosPolicy::filter_name
```

<<***extension***>> *(p. 796)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported:

- **DDS_SQLFILTER_NAME** (p. 162)
- **DDS_STRINGMATCHFILTER_NAME** (p. 163)

Warning

The value for this field can be one of the constants above or a string allocated with **DDS_String_dup()** (p. 1528) to specify your own filter. You should not assign a string literal. When you assign a new value with **DDS_String_dup()** (p. 1528), first check if the current value is one of the constants above. If it is, simply replace it; if it's not, you have to release the current string and assign the new one. Here is an example of such an approach:

```
struct DDS_DataWriterQos writer_qos;
char *filter_name = NULL;
DDS_DataWriterQos_initialize(&writer_qos);
...
DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
...
filter_name = writer_qos.multi_channel.filter_name;
if (filter_name == DDS_SQLFILTER_NAME
        || filter_name == DDS_STRINGMATCH_FILTER_NAME) {
    // Since the value was never on the heap, this won't leak memory
    filter_name = NULL;
} else {
    // This means the value is present on the heap
    DDS_String_free(filter_name);
}
// New value using DDS_String_dup() or one of the predefined constants
filter_name = DDS_String_dup("My custom filter name");
...
DDS_DataWriterQos_finalize(&writer_qos);
```

The strings allocated with **DDS_String_dup()** (p. 1528) are released when `writer_qos` is finalized.

More information about string handling can be found under **String Conventions** (p. 1527).

6.125 DDS_OfferedDeadlineMissedStatus Struct Reference

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 1230)

Data Fields

- **DDS_Long total_count**
  Total cumulative count of the number of times the ***DDS_DataWriter*** *(*p. *488) failed to write within its offered deadline.*
- **DDS_Long total_count_change**
  The incremental changes in total_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_instance_handle**
  Handle to the last instance in the ***DDS_DataWriter*** *(*p. *488) for which an offered deadline was missed.*

6.125.1 Detailed Description

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 1230)

Entity:

DDS_DataWriter (p. 488)

Listener:

DDS_DataWriterListener (p. 1644)

The deadline that the **DDS_DataWriter** (p. 488) has committed through its **DDS_DeadlineQosPolicy** (p. 1685) was not respected for a specific instance.

6.125.2 Field Documentation

6.125.2.1 total_count

```
DDS_Long DDS_OfferedDeadlineMissedStatus::total_count
```

Total cumulative count of the number of times the **DDS_DataWriter** (p. 488) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the `total_count` will be incremented by one.

6.125.2.2 total_count_change

```
DDS_Long DDS_OfferedDeadlineMissedStatus::total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

6.125.2.3 last_instance_handle

```
DDS_InstanceHandle_t DDS_OfferedDeadlineMissedStatus::last_instance_handle
```

Handle to the last instance in the **DDS_DataWriter** (p. 488) for which an offered deadline was missed.

6.126 DDS_OfferedIncompatibleQosStatus Struct Reference

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231)

Data Fields

- **DDS_Long total_count**

  *Total cumulative number of times the concerned **DDS_DataWriter** (p. 488) discovered a **DDS_DataReader** (p. 618) for the same **DDS_Topic** (p. 174), common partition with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 488).*
- **DDS_Long total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.
- **DDS_QosPolicyId_t last_policy_id**

  *The **DDS_QosPolicyId_t** (p. 1248) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- struct **DDS_QosPolicyCountSeq policies**

  *A list containing for each policy the total number of times that the concerned **DDS_DataWriter** (p. 488) discovered a **DDS_DataReader** (p. 618) for the same **DDS_Topic** (p. 174) and common partition with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 488).*

6.126.1 Detailed Description

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231)

Entity:

DDS_DataWriter (p. 488)

Listener:

DDS_DataWriterListener (p. 1644)

The qos policy value was incompatible with what was requested.

6.126.2 Field Documentation

6.126.2.1 total_count

```
DDS_Long DDS_OfferedIncompatibleQosStatus::total_count
```

Total cumulative number of times the concerned **DDS_DataWriter** (p. 488) discovered a **DDS_DataReader** (p. 618) for the same **DDS_Topic** (p. 174), common partition with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 488).

6.126.2.2 total_count_change

```
DDS_Long DDS_OfferedIncompatibleQosStatus::total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

6.126.2.3 last_policy_id

```
DDS_QosPolicyId_t DDS_OfferedIncompatibleQosStatus::last_policy_id
```

The **DDS_QosPolicyId_t** (p. 1248) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

6.126.2.4 policies

`struct` **`DDS_QosPolicyCountSeq`** `DDS_OfferedIncompatibleQosStatus::policies`

A list containing for each policy the total number of times that the concerned **DDS_DataWriter** (p. 488) discovered a **DDS_DataReader** (p. 618) for the same **DDS_Topic** (p. 174) and common partition with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 488).

6.127 DDS_OwnershipQosPolicy Struct Reference

<<***spec***>> *(p. 791)* Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 488) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Data Fields

OWNERSHIP_STRENGTH (p. 1304)

6.127.2 Usage

Along with the **OWNERSHIP_STRENGTH** (p. 1304), this QoS policy specifies if **DDS_DataReader** (p. 618) entities can receive updates to the same instance (identified by its key) from multiple **DDS_DataWriter** (p. 488) entities at the same time.

There are two kinds of ownership, selected by the setting of the `kind:` SHARED and EXCLUSIVE.

6.127.2.1 SHARED ownership

DDS_SHARED_OWNERSHIP_QOS (p. 1304) indicates that RTI Connext does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the **DDS_Topic** (p. 174) will be able to access modifications from all **DDS_DataWriter** (p. 488) objects, subject to the settings of other QoS that may filter particular samples (e.g. the **TIME_BASED_FILTER** (p. 1331) or **HISTORY** (p. 1294) policy). In any case, there is no "filtering" of modifications made based on the identity of the **DDS_DataWriter** (p. 488) that causes the modification.

6.127.2.2 EXCLUSIVE ownership

DDS_EXCLUSIVE_OWNERSHIP_QOS (p. 1304) indicates that each instance of a data type can only be modified by one **DDS_DataWriter** (p. 488). In other words, at any point in time, a single **DDS_DataWriter** (p. 488) owns each instance and is the only one whose modifications will be visible to the **DDS_DataReader** (p. 618) objects. The owner is determined by selecting the **DDS_DataWriter** (p. 488) with the highest value of the **DDS_OwnershipStrengthQos↩ Policy::value** (p. 1873) that is currently alive, as defined by the **LIVELINESS** (p. 1298) policy, and has not violated its **DEADLINE** (p. 1274) contract with regards to the data instance.

Ownership can therefore change as a result of:

- a **DDS_DataWriter** (p. 488) in the system with a higher value of the strength that modifies the instance,
- a change in the strength value of the **DDS_DataWriter** (p. 488) that owns the instance, and
- a change in the liveliness of the **DDS_DataWriter** (p. 488) that owns the instance.
- a deadline with regards to the instance that is missed by the **DDS_DataWriter** (p. 488) that owns the instance.

The behavior of the system is as if the determination was made independently by each **DDS_DataReader** (p. 618). Each **DDS_DataReader** (p. 618) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **DDS_DataReader** (p. 618) objects for that **DDS_Topic** (p. 174) have a consistent picture of who owns each instance.

It is also not a requirement that the **DDS_DataWriter** (p. 488) objects are aware of whether they own a particular instance. There is no error or notification given to a **DDS_DataWriter** (p. 488) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple **DDS_DataWriter** (p. 488) objects with the same strength modify the same instance. If this occurs RTI Connext will pick one of the **DDS_DataWriter** (p. 488) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all **DDS_DataReader** (p. 618) objects will make the same choice of the particular **DDS_DataWriter** (p. 488) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new **DDS_DataWriter** (p. 488) with higher same strength, or a new **DDS_DataWriter** (p. 488) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **DDS_DataWriter** (p. 488) as long as they affect instances whose values have not been set by the higher-strength **DDS_DataWriter** (p. 488).

6.127.3 Compatibility

The value of the **DDS_OwnershipQosPolicyKind** (p. 1303) offered must exactly match the one requested or else they are considered incompatible.

6.127.4 Relationship between registration, liveliness and ownership

The need for registering/unregistering instances stems from two use cases:

- Ownership resolution on redundant systems
- Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the **FooDataWriter_unregister_instance** (p. 496) and **FooDataWriter_dispose** (p. 505).

6.127.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **DDS_DataWriter** (p. 488) entities are "capable" of writing the same instance. In this situation, the **DDS_DataWriter** (p. 488) entities are configured such that:

- Either both are writing the instance "constantly"
- Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 1304) and arbitrate themselves by means of the **DDS_OwnershipStrengthQosPolicy** (p. 1872). Regardless of the scheme, the desired behavior from the **DDS_DataReader** (p. 618) point of view is that **DDS_DataReader** (p. 618) normally receives data from the primary unless the "primary" writer stops writing, in which case the **DDS_DataReader** (p. 618) starts to receive data from the secondary **DDS_DataWriter** (p. 488).

This approach requires some mechanism to detect that a **DDS_DataWriter** (p. 488) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault The application logic that was writing the data is faulty and has stopped calling **FooDataWriter_write** (p. 499).

Arbitrating from a **DDS_DataWriter** (p. 488) to one of a higher strength is simple and the decision can be taken autonomously by the **DDS_DataReader** (p. 618). Switching ownership from a higher strength **DDS_DataWriter** (p. 488) to one of a lower strength **DDS_DataWriter** (p. 488) requires that the **DDS_DataReader** (p. 618) can make a determination that the stronger **DDS_DataWriter** (p. 488) is "no longer writing the instance".

6.127.4.1.1 Case where the data is periodically updated This determination is reasonably simple when the data is being written periodically at some rate. The **DDS_DataWriter** (p. 488) simply states its offered **DDS_DeadlineQosPolicy** (p. 1685) (maximum interval between updates), and the **DDS_DataReader** (p. 618) automatically monitors that the **DDS_DataWriter** (p. 488) indeed updates the instance at least once per **DDS_DeadlineQosPolicy::period** (p. 1687) set by the **DDS_DataReader** (p. 618). If the deadline is missed, the **DDS_DataReader** (p. 618) considers the **DDS_DataWriter** (p. 488) "not alive" and automatically gives ownership to the next highest-strength **DDS_DataWriter** (p. 488) that *is* alive.

6.127.4.1.2 Case where data is not periodically updated The case where the **DDS_DataWriter** (p. 488) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. Ownership is maintained while the **DDS_DataWriter** (p. 488) is "alive" and for the **DDS_DataWriter** (p. 488) to be alive it must fulfill its **DDS_LivelinessQosPolicy** (p. 1826) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], LIVELINESS must be **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 1299). The **DDS_DataWriter** (p. 488) can retain ownership by periodically writing data or else calling assert_liveliness if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the **DDS_DataWriter** (p. 488) process periodically writes data or calls **DDS_DomainParticipant_assert_liveliness** (p. 135). However, this scenario requires that the **DDS_DataReader** (p. 618) knows what instances are being "written" by the **DDS_DataWriter** (p. 488). That is the only way that the **DDS_DataReader** (p. 618) deduces the ownership of specific instances from the fact that the **DDS_DataWriter** (p. 488) is still "alive". Hence the need for the **DDS_DataWriter** (p. 488) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the **DDS_DataWriter** (p. 488) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the **DDS_DataReader** (p. 618).

6.127.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it knows that some specific writers have the minimum configured readers (e.g the alarm monitor is up).

A *more* common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the **DDS_DeadlineQosPolicy** (p. 1685) and the on_deadline_missed listener provides the notification. The case where data is not periodically updated requires the use of the **DDS_LivelinessQosPolicy** (p. 1826) in combination with register↩ _instance/unregister_instance to detect whether the "connectivity" has been lost, and the notification is provided by means of **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

6.127.4.3 Semantic Difference between unregister_instance and dispose

FooDataWriter_dispose (p. 505) is semantically different from **FooDataWriter_unregister_instance** (p. 496). **Foo↩ DataWriter_dispose** (p. 505) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas **FooDataWriter_↩ unregister_instance** (p. 496) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **DDS_DataWriter** (p. 488) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **DDS_Topic** (p. 174) with **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 1304), if the current owner of an instance *disposes* it, the readers accessing the instance will see the instance_state as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **DDS_DataWriter** (p. 488) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a **DDS_Topic** (p. 174) with **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 1304), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

DDS_UnsignedLong DDS_ParticipantBuiltinTopicData::available_builtin_endpoints_ext

Extended bitmap of builtin endpoints supported by the participant.

This bitmap is an extension of the **DDS_ParticipantBuiltinTopicData::dds_builtin_endpoints** (p. 1875) field. It is used to indicate additional builtin endpoints that may be available on the participant.

Bit	Endpoint
0	TypeLookupServiceRequestSecureWriter
1	TypeLookupServiceRequestSecureReader
2	TypeLookupServiceReplySecureWriter
3	TypeLookupServiceReplySecureReader

6.129.2.8 default_unicast_locators

struct **DDS_LocatorSeq** DDS_ParticipantBuiltinTopicData::default_unicast_locators

<<***extension***>> *(p. 1014)* Unicast locators used when individual entities do not specify unicast locators.

6.129.2.9 product_version

struct **DDS_ProductVersion_t** DDS_ParticipantBuiltinTopicData::product_version

<<***extension***>> *(p. 1014)* This is a vendor specific parameter. It gives the current version for rti-dds.

6.129.2.10 participant_name

struct **DDS_EntityNameQosPolicy** DDS_ParticipantBuiltinTopicData::participant_name

<<***extension***>> *(*p. *1014)* The participant name and role name.

This parameter contains the name and the role name of the discovered participant.

6.129.2.11 domain_id

DDS_DomainId_t DDS_ParticipantBuiltinTopicData::domain_id

<<***extension***>> *(*p. *1014)* Domain ID associated with the discovered participant.

6.129.2.12 transport_info

struct **DDS_TransportInfoSeq** DDS_ParticipantBuiltinTopicData::transport_info

<<***extension***>> *(*p. *1014)* A sequence of **DDS_TransportInfo_t** (p. 2058) containing information about each of the installed transports of the discovered participant.

This parameter contains a sequence of **DDS_TransportInfo_t** (p. 2058) containing the class_id and message_size_↩ max for all installed transports of the discovered participant. The maximum number of **DDS_TransportInfo_t** (p. 2058) that will be stored in this sequence is controlled by the Domain Participant's resource limit **DDS_DomainParticipant**↩ **ResourceLimitsQosPolicy::transport_info_list_max_length** (p. 1758).

6.129.2.13 reachability_lease_duration

struct **DDS_Duration_t** DDS_ParticipantBuiltinTopicData::reachability_lease_duration

<<***extension***>> *(*p. *1014)* Locator reachability lease duration.

This parameter contains the value of the participant properties: **dds.domain_participant.locator_reachability_**↩ **lease_duration.sec** and **dds.domain_participant.locator_reachability_lease_duration.nanosec** used to configured the locator reachability lease duration.

6.129.2.14 partition

struct **DDS_PartitionQosPolicy** DDS_ParticipantBuiltinTopicData::partition

<<***extension***>> *(*p. *1014)* PartitionQosPolicy of the participant.

6.129.2.15 trust_protection_info

DDS_ParticipantTrustProtectionInfo DDS_ParticipantBuiltinTopicData::trust_protection_info

<<***extension***>> *(p. 1014)* Trust Plugins protection information associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two DomainParticipants will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.129.2.16 trust_algorithm_info

DDS_ParticipantTrustAlgorithmInfo DDS_ParticipantBuiltinTopicData::trust_algorithm_info

<<***extension***>> *(p. 1014)* Trust Plugins algorithms associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata. trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two DomainParticipants will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.129.2.17 partial_configuration

DDS_Boolean DDS_ParticipantBuiltinTopicData::partial_configuration

<<***extension***>> *(p. 1014)* Indicates whether a **DDS_ParticipantBuiltinTopicData** (p. 1873) only contains bootstrapping information.

If this is **DDS_BOOLEAN_TRUE** (p. 1203), the **DDS_ParticipantBuiltinTopicData** (p. 1873) only contains bootstrapping information. If it is **DDS_BOOLEAN_FALSE** (p. 1203), it contains both bootstrapping and configuration information. The following fields are valid when this is set to **DDS_BOOLEAN_TRUE** (p. 1203):

- **DDS_ParticipantBuiltinTopicData::key** (p. 1874)
- **DDS_ParticipantBuiltinTopicData::property** (p. 1874) (only dds.domain_participant.domain_tag is valid if set)
- **DDS_ParticipantBuiltinTopicData::rtps_protocol_version** (p. 1875)
- **DDS_ParticipantBuiltinTopicData::rtps_vendor_id** (p. 1875)
- **DDS_ParticipantBuiltinTopicData::product_version** (p. 1876)

- **DDS_ParticipantBuiltinTopicData::domain_id** (p. 1877)
- **DDS_ParticipantBuiltinTopicData::transport_info** (p. 1877)
- **DDS_ParticipantBuiltinTopicData::partition** (p. 1877)
- **DDS_ParticipantBuiltinTopicData::trust_protection_info** (p. 1877)
- **DDS_ParticipantBuiltinTopicData::trust_algorithm_info** (p. 1878)

All other fields are invalid.

This field will only be set to **DDS_BOOLEAN_TRUE** (p. 1203) if a participant using **DDS_DISCOVERYCONFIG_↩ BUILTIN_SPDP2** (p. 1283) receives a bootstrap message and **DDS_DiscoveryConfigQosPolicy::ignore_default_↩ domain_announcements** (p. 1707) is set to **DDS_BOOLEAN_FALSE** (p. 1203) (non-default).

If a participant is using **DDS_DISCOVERYCONFIG_BUILTIN_SPDP** (p. 1282), this field will always be set to **DDS_↩ BOOLEAN_FALSE** (p. 1203).

6.130 DDS_ParticipantBuiltinTopicDataSeq Struct Reference

Instantiates **FooSeq** (p. 2120) < **DDS_ParticipantBuiltinTopicData** (p. 1873) > .

6.130.1 Detailed Description

Trust Plugins signature algorithm requirements of the DomainParticipant in the context of checking that messages are authentic.

6.137 DDS_PartitionQosPolicy Struct Reference

<<***spec***>> *(p. 791)* Set of strings that introduces logical partitions in **DDS_DomainParticipant** (p. 76), **DDS_↩ Publisher** (p. 446), or **DDS_Subscriber** (p. 575) entities.

Data Fields

- struct **DDS_StringSeq name**

  *<<**basic**>> (p. 784) <<**spec**>> (p. 791) A list of partition names*

6.137.1 Detailed Description

*<<**spec**>> (p. 791)* Set of strings that introduces logical partitions in **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), or **DDS_Subscriber** (p. 575) entities.

This QoS policy is used to set string identifiers that are used for partitioning entities that would otherwise be connected to and exchange data with each other:

- A **DDS_DataWriter** (p. 488) within a **DDS_Publisher** (p. 446) only communicates with a **DDS_DataReader** (p. 618) in a **DDS_Subscriber** (p. 575) if (in addition to matching the **DDS_Topic** (p. 174) and having compatible QoS) the **DDS_Publisher** (p. 446) and **DDS_Subscriber** (p. 575) have a common partition name string.
- **DDS_DomainParticipant** (p. 76) entities (with the same domain ID and domain tag) are visible to each other only if they have at least one partition name string in common.

Entity:

DDS_Publisher (p. 446), **DDS_Subscriber** (p. 575), **DDS_DomainParticipant** (p. 76)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **YES** (p. 1247)

6.137.2 Usage

The Partition QoS policy provides another way to control which entities will match-and thus communicate with-which other entities. It can be used to prevent entities that would have otherwise matched from talking to each other. Much in the same way that only applications within the same DDS domain will communicate with each other, only entities that belong to the same partition can talk to each other.

The Partition QoS policy allows you to add one or more strings, "partitions", to an entity:

- A DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).
- DomainParticipants (with the same domain ID and domain tag) are visible to each other only if they have at least one partition in common.

Since the set of partitions for an entity can be dynamically changed, the Partition QoS policy is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data with each other.

DomainParticipant partitions and Publisher/Subscriber partitions are independent of each other. You can use both features independently or in combination to provide the right level of isolation.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of an entity intersect with the partitions or wildcard patterns of otherwise matching entities, the entities match; otherwise they do not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.6). A **DDS_DomainParticipant** (p. 76), **DDS_Publisher** (p. 446), or **DDS_Subscriber** (p. 575) entity may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used on the entities, RTI Connext will not try to match two regular expressions.

Each entity must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If an entity has not specified a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating **DDS_Entity** (p. 1362) objects in different domains in several ways.

- First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Connext itself to see entities in a domain it does not belong to.
- Second, a **DDS_Entity** (p. 1362) can only belong to one domain whereas a **DDS_Entity** (p. 1362) can be in multiple partitions.
- Finally, as far as RTI Connext is concerned, each unique data instance is identified by the tuple **(DomainID, domain tag, DDS_Topic (p. 174), key)**. Therefore two **DDS_Entity** (p. 1362) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

For more information, see the "PARTITION QosPolicy" section of the `Core Libraries User's Manual`.

6.137.3 Field Documentation

6.137.3.1 name

```
struct  DDS_StringSeq DDS_PartitionQosPolicy::name
```

<<***basic***>> (p. *784)* <<***spec***>> (p. *791)* A list of partition names

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224) when setting a **DDS_Publisher** (p. 446)'s or **DDS_Subscriber** (p. 575)'s QoS.

- A partition name string cannot be NULL, nor can it contain the reserved comma character (',').
- The maximum number of partition name strings allowable in a **DDS_PartitionQosPolicy** (p. 1884) is specified on a domain basis in **DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions** (p. 1750). The length of this sequence may not be greater than that value.
- The maximum cumulative length of all partition name strings in a **DDS_PartitionQosPolicy** (p. 1884) is specified on a domain basis in **DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_↩ characters** (p. 1750).

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1527). In particular, be careful to avoid a situation in which RTI Connext allocates a string on your behalf and you then reuse that string in such a way that RTI Connext believes it to have more memory allocated to it than it actually does.

[default] Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Connext will assume the entity to be in default partition (empty string partition "").

[range] List of partition name with above restrictions

- **DDS_UnsignedLong reader_checkpoint_frequency**

  <<***extension***>> (p. 796) *Controls how often the reader state is stored into the database.*

6.138.1 Detailed Description

Configures durable writer history and durable reader state.

In a **DDS_DataWriter** (p. 488), this structure configures durable writer history. This feature allows a DataWriter to persist its historical cache, so that it can survive shutdowns, crashes, and restarts. When an application restarts, each DataWriter that has been configured to have durable writer history automatically loads all of the data in this cache from disk and can carry on sending data as if it had never stopped executing.

In a **DDS_DataReader** (p. 618), this structure configures durable reader state. This feature allows a DataReader to persist its state and remember which data it has already received. When an application restarts, each DataReader that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the DataReader before the restart will be suppressed so that it is not even sent over the network.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

QoS:

DDS_DurabilityQosPolicy (p. 1762)

6.138.2 Field Documentation

6.138.2.1 enable

```
DDS_Boolean DDS_PersistentStorageSettings::enable
```

<<***extension***>> *(p. 796)* Enables durable writer history in a **DDS_DataWriter** (p. 488) and durable reader state in a **DDS_DataReader** (p. 618).

When this field is set to **DDS_BOOLEAN_TRUE** (p. 1203), the persistent storage configuration using this structure will take precedence over the configuration using the deprecated **dds.data_writer.history.odbc_plugin.builtin**.∗ and **dds.data_reader.state**.∗ properties.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.2 file_name

```
char* DDS_PersistentStorageSettings::file_name
```

<<***extension***>> *(p. 796)* The file name where the durable writer history or durable reader state will be stored.

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **DDS_PersistentStorageSettings::restore** (p. 1891) is set to **DDS_BOOLEAN_TRUE** (p. 1203), the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **DDS_DataReaderProtocolQosPolicy::virtual_guid** (p. 1597) and **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p. 1650) will be set by RTI Connext based on the file content. If you change these fields, the value will be ignored.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

[default] NULL

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.3 trace_file_name

```
char* DDS_PersistentStorageSettings::trace_file_name
```

<<***extension***>> *(p. 796)* The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] NULL

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.4 journal_kind

```
DDS_PersistentJournalKind DDS_PersistentStorageSettings::journal_kind
```

<<***extension***>> *(p. 796)* Sets the journal mode of the persistent storage.

[default] DDS_WAL_PERSISTENT_JOURNAL (p. 1288)

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.5 synchronization_kind

```
DDS_PersistentSynchronizationKind DDS_PersistentStorageSettings::synchronization_kind
```

<<***extension***>> *(p. 796)* Sets the level of synchronization with the physical disk.

[default] DDS_NORMAL_PERSISTENT_SYNCHRONIZATION (p. 1289)

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.6 vacuum

```
DDS_Boolean DDS_PersistentStorageSettings::vacuum
```

<<***extension***>> *(p. 796)* Sets the auto-vacuum status of the storage.

When auto-vacuum is **DDS_BOOLEAN_TRUE** (p. 1203), the storage files will be compacted automatically with every transaction.

When auto-vacuum is **DDS_BOOLEAN_FALSE** (p. 1203), after data is deleted from the storage files, the files remain the same size.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.7 restore

```
DDS_Boolean DDS_PersistentStorageSettings::restore
```

<<***extension***>> *(p. 796)* Indicates if the persisted writer history or reader state must be restored.

For a **DDS_DataWriter** (p. 488), this field indicates whether or not the persisted writer history must be restored once the DataWriter is restarted.

For a **DDS_DataReader** (p. 618), this field indicates whether or not the persisted reader state must be restored once the DataReader is restarted.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Durability** (p. 861)

6.138.2.8 writer_instance_cache_allocation

`struct` **`DDS_AllocationSettings_t`** `DDS_PersistentStorageSettings::writer_instance_cache_allocation`

<<***extension***>> *(p. 796)* Configures the resource limits associated with the instance durable writer history cache.

This field only applies to **DDS_DataWriter** (p. 488) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses an instance cache.

Do not confuse this limit with the initial and maximum number of instances that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956) and **DDS_ResourceLimitsQosPolicy::initial_instances** (p. 1957).

If **DDS_PersistentStorageSettings::writer_memory_state** (p. 1893) is set to **DDS_BOOLEAN_TRUE** (p. 1203), then the value of **DDS_AllocationSettings_t::max_count** (p. 1538) is set to **DDS_LENGTH_UNLIMITED** (p. 1328), overwriting any value set by the user.

DDS_AllocationSettings_t::incremental_count (p. 1538) is ignored.

[range] DDS_AllocationSettings_t::max_count (p. 1538) in interval [1, INT_MAX], **DDS_LENGTH_AUTO** (p. 1323), or **DDS_LENGTH_UNLIMITED** (p. 1328). **DDS_AllocationSettings_t::initial_count** (p. 1538) in interval [1, INT_MAX], or **DDS_LENGTH_AUTO** (p. 1323).

DDS_LENGTH_AUTO (p. 1323) means that the value will be set to the equivalent value of **DDS_ResourceLimits↩ QosPolicy** (p. 1953).

[default] DDS_AllocationSettings_t::max_count (p. 1538) = **DDS_LENGTH_AUTO** (p. 1323) (= **DDS_Resource↩ LimitsQosPolicy::max_instances** (p. 1956)) and **DDS_AllocationSettings_t::initial_count** (p. 1538) = **DDS_↩ LENGTH_AUTO** (p. 1323) (= **DDS_ResourceLimitsQosPolicy::initial_instances** (p. 1957)).

Categories

Immutable (p. 916), **Durability** (p. 861), **Sample Memory Management** (p. 904)

6.138.2.9 writer_sample_cache_allocation

`struct` **`DDS_AllocationSettings_t`** `DDS_PersistentStorageSettings::writer_sample_cache_allocation`

<<***extension***>> *(p. 796)* Configures the resource limits associated with the sample durable writer history cache.

This field only applies to **DDS_DataWriter** (p. 488) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses a sample cache.

Do not confuse this limit with the initial and maximum number of samples that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956) and **DDS_ResourceLimitsQosPolicy::initial_samples** (p. 1957).

DDS_AllocationSettings_t::incremental_count (p. 1538) is ignored.

[range] DDS_AllocationSettings_t::max_count (p. 1538) in interval [1, INT_MAX], **DDS_LENGTH_AUTO** (p. 1323), or **DDS_LENGTH_UNLIMITED** (p. 1328). **DDS_AllocationSettings_t::initial_count** (p. 1538) in interval [1, INT_MAX], or **DDS_LENGTH_AUTO** (p. 1323).

DDS_LENGTH_AUTO (p. 1323) means that the value will be set to the equivalent value of **DDS_ResourceLimits↩ QosPolicy** (p. 1953).

[default] DDS_AllocationSettings_t::max_count (p. 1538) = 32 and **DDS_AllocationSettings_t::initial_count** (p. 1538) = 32.

Categories

Immutable (p. 916), **Durability** (p. 861), **Sample Memory Management** (p. 904)

6.138.2.10 writer_memory_state

DDS_Boolean DDS_PersistentStorageSettings::writer_memory_state

<<***extension***>> *(p. 796)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.

This field only applies to **DDS_DataWriter** (p. 488) entities.

If this field is set to **DDS_BOOLEAN_TRUE** (p. 1203), then **DDS_AllocationSettings_t::max_count** (p. 1538) in **DDS_PersistentStorageSettings::writer_instance_cache_allocation** (p. 1891) is set to **DDS_LENGTH_UNLIMITED** (p. 1328), overwriting any value set by the user.

In addition, the durable writer history will keep a fixed state overhead per sample in memory. This mode provides the best durable writer history performance. However, the restore operation will be slower, and the maximum number of samples that the durable writer history can manage is limited by the available physical memory.

If this field is set to **DDS_BOOLEAN_FALSE** (p. 1203), all the state will be kept in the underlying database. In this mode, the maximum number of samples in the durable writer history is not limited by the physical memory available.

This field is always set to **DDS_BOOLEAN_FALSE** (p. 1203) when the DataWriter is configured with **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1943) set to **DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1325) or **DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 1326), or **DDS_AvailabilityQosPolicy::enable_required_subscriptions** (p. 1550) is set to **DDS_BOOLEAN_TRUE** (p. 1203).

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Durability** (p. 861), **Middleware Memory Management** (p. 880)

6.138.2.11 reader_checkpoint_frequency

DDS_UnsignedLong DDS_PersistentStorageSettings::reader_checkpoint_frequency

<<***extension***>> *(p. 796)* Controls how often the reader state is stored into the database.

This field only applies to **DDS_DataReader** (p. 618) entities.

A value of N means store the state once every N received and processed samples.

The circumstances under which a data sample is considered "processed by the application" depends on the DataReader configuration.

For additional information on when a sample is considered "processed by the application" see `Durable Reader State`, in the Core Libraries User's Manual.

A high value will provide better performance. However, if the DataReader is restarted it may receive some duplicate samples.

[range] [1, 1000000] **[default]** 1

  <<***extension***>> *(*p. *796) Indicates whether or not a* ***DDS_DataReader*** *(*p. *618) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.*

6.139.1 Detailed Description

<<***spec***>> *(*p. *791)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Connext. Specifically, this policy affects the application's ability to:

- specify and receive coherent changes to instances
- specify the relative order in which changes are presented

Entity:

DDS_Publisher (p. 446), **DDS_Subscriber** (p. 575)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_↩ STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.139.2 Usage

A **DDS_DataReader** (p. 618) will usually receive data in the order that it was sent by a **DDS_DataWriter** (p. 488), and the data is presented to the **DDS_DataReader** (p. 618) as soon as the application receives the next expected value. However, sometimes you may want a set of data for the same DataWriter or different DataWriters to be presented to the DataReader(s) only after *all* of the elements of the set have been received, but not before. Or you may want the data to be presented in a different order than that in which it was sent. Specifically for keyed data, you may want the middleware to present the data in keyed – or *instance* – order, such that samples pertaining to the same instance are presented together.

The Presentation QoS policy is a request-offered QoS policy that allows you to specify different *scopes* of presentation. It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- `coherent_access` controls whether RTI Connext will preserve the groupings of changes made by a publishing application by means of the operations **DDS_Publisher_begin_coherent_changes** (p. 462) and **DDS_↩ Publisher_end_coherent_changes** (p. 463).

- `ordered_access` controls whether RTI Connext will preserve the order of changes.

- `access_scope` controls the granularity of the other settings. See below:

If `coherent_access` is set, then the `access_scope` set on the **DDS_Subscriber** (p. 575) controls the maximum extent of coherent changes. The behavior is as follows:

- If `access_scope` is set to **DDS_INSTANCE_PRESENTATION_QOS** (p. 1307) (the default), the behavior is the same as **DDS_TOPIC_PRESENTATION_QOS** (p. 1307).

- If `access_scope` is set to **DDS_TOPIC_PRESENTATION_QOS** (p. 1307), then coherent changes (indicated by their enclosure within calls to **DDS_Publisher_begin_coherent_changes** (p. 462) and **DDS_Publisher_end_↩ coherent_changes** (p. 463)) will be made available as a unit to each remote **DDS_DataReader** (p. 618) independently. That is, changes made to instances within each individual **DDS_DataWriter** (p. 488) will be presented as a unit. They will not be grouped with changes made to instances belonging to a different **DDS_DataWriter** (p. 488).

- If access_scope is set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307), then coherent changes made to instances through a set of **DDS_DataWriter** (p. 488) entities attached to a common **DDS_Publisher** (p. 446) will be made available as a unit to the **DDS_DataReader** (p. 618) entities within a **DDS_Subscriber** (p. 575).

If `ordered_access` is set, then the `access_scope` set on the **DDS_Subscriber** (p. 575) controls the maximum extent to which order will be preserved by RTI Connext.

- If `access_scope` is set to **DDS_INSTANCE_PRESENTATION_QOS** (p. 1307) (the lowest level), then the relative order of DDS samples sent by a **DDS_DataWriter** (p. 488) is only preserved on a per-instance basis. If two DDS samples refer to the same instance (identified by Topic and a particular value for the key), then the order in which they are stored in the **DDS_DataReader** (p. 618) queue is consistent with the order in which the changes occurred. However, if the two DDS samples belong to different instances, the order in which they are presented may or may not match the order in which the changes occurred. This is the case even if it is the same application thread making the changes using the same **DDS_DataWriter** (p. 488).

- If access_scope is set to **DDS_TOPIC_PRESENTATION_QOS** (p. 1307), changes (creations, deletions, modifications) made by a single **DDS_DataWriter** (p. 488) to one or more instances are presented to a **DDS_DataReader** (p. 618) in the same order in which they occur. Changes made to instances though different **DDS_DataWriter** (p. 488) entities are not required to be presented in the order in which they occur. This is the case even if the changes are made by a single application thread using **DDS_DataWriter** (p. 488) objects attached to the same **DDS_Publisher** (p. 446).

- Finally, if access_scope is set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307), changes made to instances via **DDS_DataWriter** (p. 488) entities attached to the same **DDS_Publisher** (p. 446) object are presented to the **DDS_DataReader** (p. 618) entities within a **DDS_Subscriber** (p. 575) in the same order in which they occur. For this to happen, the application must take the samples using the Subscriber's **DDS_Subscriber_begin_access** (p. 590) and **DDS_Subscriber_end_access** (p. 591) operations.

See the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the Core Libraries User's Manual for more information.

If access_scope is set to **DDS_HIGHEST_OFFERED_PRESENTATION_QOS** (p. 1307) on the **DDS_Subscriber** (p. 575), then the **DDS_Subscriber** (p. 575) will use the access_scope offered by the remote **DDS_Publisher** (p. 446).

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily imply that the **DDS_Subscriber** (p. 575) **will** indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the **DDS_DataReader** (p. 618) objects.

For **DDS_GROUP_PRESENTATION_QOS** (p. 1307) the subscribing application must use the APIs **DDS_Subscriber_begin_access** (p. 590), **DDS_Subscriber_end_access** (p. 591) and **DDS_Subscriber_get_datareaders** (p. 591) to access the changes in the proper order. If you do not use these operations, the data may not be ordered across DataWriters that belong to the same **DDS_Publisher** (p. 446).

The field **DDS_SampleInfo::coherent_set_info** (p. 2000) is set when a sample is part of a coherent set. This field provides information to identify the coherent set that a sample is part of. In addition, **DDS_CoherentSetInfo_t::incomplete_coherent_set** (p. 1568) indicates if a sample is part of an incomplete coherent set (one for which not all samples have been received). Coherent sets for which some of the samples are filtered out by content or time on the **DDS_DataWriter** (p. 488) are considered incomplete.

By default, the samples that are received from an incomplete coherent set are dropped by the DataReader(s) and they are not provided to the application. Such samples are reported as lost in the SAMPLE_LOST Status. By setting **DDS_PresentationQosPolicy::drop_incomplete_coherent_set** (p. 1898) to **DDS_BOOLEAN_FALSE** (p. 1203), you can change this behavior and, in this case, samples from incomplete coherent sets will be provided to the application. These samples have **DDS_CoherentSetInfo_t::incomplete_coherent_set** (p. 1568) set to **DDS_BOOLEAN_TRUE** (p. 1203).

6.139.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered* access_scope >= *requested* access_scope evaluates to 'TRUE' or requested access_scope is **DDS_HIGHEST_OFFERED_PRESENTATION_QOS** (p. 1307). For the purposes of this inequality, the values of access_scope are considered ordered such that **DDS_INSTANCE_PRESENTATION_QOS** (p. 1307) < **DDS_TOPIC_PRESENTATION_QOS** (p. 1307) < **DDS_GROUP_PRESENTATION_QOS** (p. 1307).

- requested `coherent_access` is **DDS_BOOLEAN_FALSE** (p. 1203), or else both offered and requested `coherent_access` are **DDS_BOOLEAN_TRUE** (p. 1203).

- requested `ordered_access` is **DDS_BOOLEAN_FALSE** (p. 1203), or else both offered and requested `ordered_access` are **DDS_BOOLEAN_TRUE** (p. 1203).

6.139.4 Field Documentation

6.139.4.1 access_scope

DDS_PresentationQosPolicyAccessScopeKind DDS_PresentationQosPolicy::access_scope

<<***spec***>> *(p. 791)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] DDS_INSTANCE_PRESENTATION_QOS (p. 1307)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Applied Per-Instance** (p. 958), **Sample Ordering** (p. 908), **Data Availability** (p. 844)

6.139.4.2 coherent_access

DDS_Boolean DDS_PresentationQosPolicy::coherent_access

<<***spec***>> *(p. 791)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

Note: To use this feature, the DataWriter must be configured for RELIABLE communication (see **DDS_RELIABLE_↩ RELIABILITY_QOS** (p. 1325)).

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Sample Ordering** (p. 908), **Data Availability** (p. 844)

6.139.4.3 ordered_access

```
DDS_Boolean DDS_PresentationQosPolicy::ordered_access
```

<<***spec***>> *(p. 791)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Applied Per-Instance** (p. 958), **Sample Ordering** (p. 908), **Data Availability** (p. 844)

6.139.4.4 drop_incomplete_coherent_set

```
DDS_Boolean DDS_PresentationQosPolicy::drop_incomplete_coherent_set
```

<<***extension***>> *(p. 796)* Indicates whether or not a **DDS_DataReader** (p. 618) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.

Note that a coherent set will be considered incomplete if some of its samples are filtered by content or time on the DataWriter side.

By default, the samples that are received from an incomplete coherent set are dropped (and reported as lost) by the DataReader(s) and they are not provided to the application. By setting this parameter to **DDS_BOOLEAN_FALSE** (p. 1203), you can change this behavior.

Samples from an incomplete coherent set have **DDS_CoherentSetInfo_t::incomplete_coherent_set** (p. 1568) set to **DDS_BOOLEAN_TRUE** (p. 1203) in **DDS_SampleInfo::coherent_set_info** (p. 2000).

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Sample Ordering** (p. 908), **Data Availability** (p. 844)

6.140 DDS_PrintFormatProperty Struct Reference

A collection of attributes used to configure how data samples will be formatted when converted to a string.

Data Fields

- **DDS_PrintFormatKind kind**

  The kind of format to be used when converting a data sample to a string.
- **DDS_Boolean pretty_print**

  Choose whether to print a data sample in a more readable format or to eliminate all white space.
- **DDS_Boolean enum_as_int**

  Choose whether to print enum values as integers or as strings.
- **DDS_Boolean include_root_elements**

  Choose whether or not to include the root elements of the print format in the output string.

6.140.1 Detailed Description

A collection of attributes used to configure how data samples will be formatted when converted to a string.

To ensure that new objects are initialized to known values, assign them with the static initializer **DDS_PrintFormat↩ Property_INITIALIZER** (p. 171).

See also

DDS_PrintFormatProperty_INITIALIZER (p. 171)

Examples

HelloWorldPlugin.c.

6.140.2 Field Documentation

6.140.2.1 kind

```
DDS_PrintFormatKind DDS_PrintFormatProperty::kind
```

The kind of format to be used when converting a data sample to a string.

Data samples can be represented in a default, XML, or JSON format.

See also

DDS_PrintFormatKind (p. 185)

[default] DDS_DEFAULT_PRINT_FORMAT (p. 185)

6.140.2.2 pretty_print

DDS_Boolean DDS_PrintFormatProperty::pretty_print

Choose whether to print a data sample in a more readable format or to eliminate all white space.

A value of **DDS_BOOLEAN_TRUE** (p. 1203) will add indentation and newlines to the string representation of the data sample making it more readable. For example:

```
<FooType>
   <myLong>5</myLong>
</FooType>
```

A value of **DDS_BOOLEAN_FALSE** (p. 1203) will cause all white space in the string representation of the data sample to be eliminated. For example:

```
<FooType><myLong>5</myLong></FooType>
```

[default] DDS_BOOLEAN_TRUE (p. 1203)

6.140.2.3 enum_as_int

DDS_Boolean DDS_PrintFormatProperty::enum_as_int

Choose whether to print enum values as integers or as strings.

A value of **DDS_BOOLEAN_TRUE** (p. 1203) will cause enumeration literals to be printed using their integer value. For example:

```
<FooType>
   <myEnum>5</myEnum>
</FooType>
```

A value of **DDS_BOOLEAN_FALSE** (p. 1203) will cause enumeration literals to be printed as strings using their member names. For example:

```
<FooType>
   <myEnum>RED</myEnum>
</FooType>
```

[default] DDS_BOOLEAN_FALSE (p. 1203)

6.140.2.4 include_root_elements

DDS_Boolean DDS_PrintFormatProperty::include_root_elements

Choose whether or not to include the root elements of the print format in the output string.

This field only applies if the **DDS_PrintFormatProperty::kind** (p. 1899) is **DDS_XML_PRINT_FORMAT** (p. 185) or **DDS_JSON_PRINT_FORMAT** (p. 185)

If the value is **DDS_BOOLEAN_TRUE** (p. 1203) and the kind is **DDS_XML_PRINT_FORMAT** (p. 185) then a top-level tag with the type's name in it will be included in the output. For example:

```
<FooType>
   <myLong>5</myLong>
</FooType>
```

If the value is **DDS_BOOLEAN_TRUE** (p. 1203) and the kind is **DDS_JSON_PRINT_FORMAT** (p. 185) then top-level opening and closing braces will be included in the output. For example:

```
{
   "myLong":5
}
```

If the value is **DDS_BOOLEAN_FALSE** (p. 1203) the elements described above will not be included in the output. For example:

```
<myLong>5</myLong>
"myLong":5
```

[default] DDS_BOOLEAN_TRUE (p. 1203)

6.142.1 Detailed Description

*<<**extension**>> (p. 796)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Connext in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Connext, and the locations specified by an environment variable.

You may disable any or all of these default locations using the Profile QoS policy.

Entity:

DDS_DomainParticipantFactory (p. 32)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **Changeable** (p. 1247)

6.143 DDS_Property_t Struct Reference

Properties are name/value pairs objects.

Data Fields

- char * **name**

  Property name.
- char * **value**

  Property value.
- **DDS_Boolean propagate**

  Indicates if the property must be propagated on discovery.

6.143.1 Detailed Description

Properties are name/value pairs objects.

6.143.2 Field Documentation

6.143.2.1 name

```
char* DDS_Property_t::name
```

Property name.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528).

6.143.2.2 value

```
char* DDS_Property_t::value
```

Property value.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 1528) or **DDS_String_dup** (p. 1528).

6.143.2.3 propagate

```
DDS_Boolean DDS_Property_t::propagate
```

Indicates if the property must be propagated on discovery.

6.144 DDS_PropertyQosPolicy Struct Reference

*<<**extension**>> (p. 796)* Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Data Fields

- struct **DDS_PropertySeq value**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) Sequence of properties.*

6.144.1 Detailed Description

<<***extension***>> *(p. 796)* Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

DDS_DomainParticipant (p. 76) **DDS_DataReader** (p. 618) **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = N/A;
Changeable (p. 1247) = **YES** (p. 1247)

See also

DDS_DomainParticipant_get_builtin_subscriber (p. 128)

6.144.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488), or **DDS_DomainParticipant** (p. 76). This is similar to the **DDS_UserDataQosPolicy** (p. 2092), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the `Property Reference Guide`.

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 780)
- Durable Reader State, see **Configuring Durable Reader State** (p. 782)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 1046), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 1062), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 1040)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 728)
- **Clock Selection** (p. 25)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Connext to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **DDS_UserDataQosPolicy** (p. 2092) or **DDS_Group↩ DataQosPolicy** (p. 1806)).

6.144.2.1 Reasons for Using the PropertyQosPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connext capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 1308) page.

6.144.3 Field Documentation

6.144.3.1 value

`struct` **`DDS_PropertySeq`** `DDS_PropertyQosPolicy::value`

6.147.2 Field Documentation

6.147.2.1 key

DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::key

DCPS key to distinguish entries.

6.147.2.2 participant_key

DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::participant_key

DCPS key of the participant to which the DataWriter belongs.

6.147.2.3 topic_name

char* DDS_PublicationBuiltinTopicData::topic_name

Name of the related **DDS_Topic** (p. 174).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1527).

See also

String Conventions (p. 1527)

6.147.2.4 type_name

char* DDS_PublicationBuiltinTopicData::type_name

Name of the type attached to the **DDS_Topic** (p. 174).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1527).

See also

String Conventions (p. 1527)

6.147.2.5 durability

struct **DDS_DurabilityQosPolicy** DDS_PublicationBuiltinTopicData::durability

durability policy of the corresponding DataWriter

6.147.2.6 durability_service

struct **DDS_DurabilityServiceQosPolicy** DDS_PublicationBuiltinTopicData::durability_service

durability_service policy of the corresponding DataWriter

6.147.2.7 deadline

struct **DDS_DeadlineQosPolicy** DDS_PublicationBuiltinTopicData::deadline

Policy of the corresponding DataWriter.

6.147.2.8 latency_budget

struct **DDS_LatencyBudgetQosPolicy** DDS_PublicationBuiltinTopicData::latency_budget

Policy of the corresponding DataWriter.

6.147.2.9 liveliness

struct **DDS_LivelinessQosPolicy** DDS_PublicationBuiltinTopicData::liveliness

Policy of the corresponding DataWriter.

6.147.2.10 reliability

struct **DDS_ReliabilityQosPolicy** DDS_PublicationBuiltinTopicData::reliability

Policy of the corresponding DataWriter.

6.147.2.11 lifespan

struct **DDS_LifespanQosPolicy** DDS_PublicationBuiltinTopicData::lifespan

Policy of the corresponding DataWriter.

6.147.2.12 user_data

struct **DDS_UserDataQosPolicy** DDS_PublicationBuiltinTopicData::user_data

Policy of the corresponding DataWriter.

6.147.2.13 ownership

struct **DDS_OwnershipQosPolicy** DDS_PublicationBuiltinTopicData::ownership

Policy of the corresponding DataWriter.

6.147.2.14 ownership_strength

struct **DDS_OwnershipStrengthQosPolicy** DDS_PublicationBuiltinTopicData::ownership_strength

Policy of the corresponding DataWriter.

6.147.2.15 destination_order

struct **DDS_DestinationOrderQosPolicy** DDS_PublicationBuiltinTopicData::destination_order

Policy of the corresponding DataWriter.

Warning

Only the field **DDS_DestinationOrderQosPolicy::kind** (p. 1690) is propagated during discovery. The other fields always contain their default values.

6.147.2.16 presentation

struct **DDS_PresentationQosPolicy** DDS_PublicationBuiltinTopicData::presentation

Policy of the Publisher to which the DataWriter belongs.

6.147.2.17 partition

struct **DDS_PartitionQosPolicy** DDS_PublicationBuiltinTopicData::partition

Policy of the Publisher to which the DataWriter belongs.

6.147.2.18 topic_data

struct **DDS_TopicDataQosPolicy** DDS_PublicationBuiltinTopicData::topic_data

Policy of the related Topic.

6.147.2.19 group_data

struct **DDS_GroupDataQosPolicy** DDS_PublicationBuiltinTopicData::group_data

Policy of the Publisher to which the DataWriter belongs.

6.147.2.20 representation

struct **DDS_DataRepresentationQosPolicy** DDS_PublicationBuiltinTopicData::representation

Data representation policy of the corresponding DataWriter.

6.147.2.21 data_tags

DDS_DataTagQosPolicy DDS_PublicationBuiltinTopicData::data_tags

Tags of the corresponding DataWriter.

6.147.2.22 type_code

```
struct DDS_TypeCode* DDS_PublicationBuiltinTopicData::type_code
```

<<***extension***>> *(*p. *1014)* Type code information of the corresponding Topic.

If using TypeObject v2 (**DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283)), which is the default, this is NULL if the type is not yet resolved. If the remote endpoint's topic name matches the **DDS_Discovery↩ ConfigQosPolicy::request_types_filter** (p. 1716), this will always contain the TypeCode converted from the complete TypeObject v2 representation (if non-NULL); the minimal TypeObject v2 will not be provided even if available. If the topic name does not match the **DDS_DiscoveryConfigQosPolicy::request_types_filter** (p. 1716) and the complete TypeObject v2 is resolved, this will contain the TypeCode converted from the complete TypeObject v2 representation. If the topic name does not match the **DDS_DiscoveryConfigQosPolicy::request_types_filter** (p. 1716), and only the minimal TypeObject v2 is resolved, this will contain the TypeCode converted from the minimal TypeObject v2 representation. As such, information that is not available in the minimal TypeObject v2 representation will be lost (such as default values) and member names will be the stringified version of the hashed member name, rather than the full member name. See `TypeLookup Service` for more information.

6.147.2.23 publisher_key

```
DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::publisher_key
```

<<***extension***>> *(*p. *1014)* DCPS key of the publisher to which the DataWriter belongs

6.147.2.24 property

```
struct DDS_PropertyQosPolicy DDS_PublicationBuiltinTopicData::property
```

<<***extension***>> *(*p. *1014)* Properties of the corresponding DataWriter.

6.147.2.25 unicast_locators

```
struct DDS_LocatorSeq DDS_PublicationBuiltinTopicData::unicast_locators
```

<<***extension***>> *(*p. *1014)* Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

6.147.2.26 virtual_guid

```
struct DDS_GUID_t DDS_PublicationBuiltinTopicData::virtual_guid
```

<<***extension***>> *(*p. *1014)* Virtual GUID associated to the DataWriter.

See also

DDS_GUID_t (p. 1807)

6.147.2.27 service

```
struct DDS_ServiceQosPolicy DDS_PublicationBuiltinTopicData::service
```

<<***extension***>> *(*p. *1014)* Policy of the corresponding DataWriter.

6.147.2.28 rtps_protocol_version

```
DDS_ProtocolVersion_t DDS_PublicationBuiltinTopicData::rtps_protocol_version
```

<<***extension***>> *(*p. *1014)* Version number of the RTPS wire protocol used.

6.147.2.29 rtps_vendor_id

```
struct DDS_VendorId_t DDS_PublicationBuiltinTopicData::rtps_vendor_id
```

<<***extension***>> *(*p. *1014)* ID of vendor implementing the RTPS wire protocol.

6.147.2.30 product_version

```
struct DDS_ProductVersion_t DDS_PublicationBuiltinTopicData::product_version
```

<<***extension***>> *(*p. *1014)* This is a vendor specific parameter. It gives the current version for rti-dds.

6.147.2.31 locator_filter

struct **DDS_LocatorFilterQosPolicy** DDS_PublicationBuiltinTopicData::locator_filter

<<***extension***>> *(*p. *1014)* Policy of the corresponding DataWriter

Related to **DDS_MultiChannelQosPolicy** (p. 1860).

6.147.2.32 disable_positive_acks

DDS_Boolean DDS_PublicationBuiltinTopicData::disable_positive_acks

<<***extension***>> *(*p. *1014)* This is a vendor specific parameter. Determines whether matching DataReaders send positive acknowledgements for reliability.

6.147.2.33 publication_name

struct **DDS_EntityNameQosPolicy** DDS_PublicationBuiltinTopicData::publication_name

<<***extension***>> *(*p. *1014)* The publication name and role name.

This member contains the name and the role name of the discovered publication.

6.147.2.34 trust_protection_info

struct **DDS_EndpointTrustProtectionInfo** DDS_PublicationBuiltinTopicData::trust_protection_info

<<***extension***>> *(*p. *1014)* Trust Plugins protection information associated with the discovered DataWriter.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.147.2.35 trust_algorithm_info

`struct` **DDS_EndpointTrustAlgorithmInfo** DDS_PublicationBuiltinTopicData::trust_algorithm_info

<<***extension***>> *(*p. *1014)* Trust Plugins algorithms associated with the discovered DataWriter.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.147.2.36 related_datareader_key

DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::related_datareader_key

<<***extension***>> *(*p. *1014)* Key of the related DataReader that is created as a part of the Remote Procedure Call (RPC) or Request-Reply endpoints.

This field will be set to something other than **DDS_BUILTIN_TOPIC_KEY_UNKNOWN** (p. 1113) only when the discovered DataWriter is a part of Remote Procedure Call (RPC) or Request-Reply endpoints.

6.150 DDS_PublicationMatchedStatus Struct Reference

DDS_PUBLICATION_MATCHED_STATUS (p. 1234)

Data Fields

- **DDS_Long total_count**

  The total cumulative number of times that this ***DDS_DataWriter*** *(*p. *488) discovered a "match" with a* ***DDS_DataReader*** *(*p. *618).*
- **DDS_Long total_count_change**

  The changes in total_count since the last time the listener was called or the status was read.
- **DDS_Long current_count**

  The current number of DataReaders with which this ***DDS_DataWriter*** *(*p. *488) is matched.*
- **DDS_Long current_count_peak**

  <<***extension***>> *(*p. *1014) Greatest number of DataReaders that matched this* ***DDS_DataWriter*** *(*p. *488) simultaneously.*
- **DDS_Long current_count_change**

  The change in current_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_subscription_handle**

  This InstanceHandle can be used to look up which remote ***DDS_DataReader*** *(*p. *618) was the last to cause this Data↩ Writer's status to change, using* ***DDS_DataWriter_get_matched_subscription_data*** *(*p. *543).*

6.150.1 Detailed Description

DDS_PUBLICATION_MATCHED_STATUS (p. 1234)

A "match" happens when the **DDS_DataWriter** (p. 488) finds a **DDS_DataReader** (p. 618) with the same **DDS_Topic** (p. 174), same or compatible data type, and requested QoS that is compatible with that offered by the **DDS_DataWriter** (p. 488). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDS_DataWriter** (p. 488) will become "unmatched" from a remote **DDS_DataReader** (p. 618) when that **DDS_DataReader** (p. 618) goes away for any of the following reasons:

- The matched **DDS_DataReader** (p. 618)'s **DDS_DomainParticipant** (p. 76) has lost liveliness.
- This DataWriter or the matched DataReader has changed QoS such that the entities are now incompatible.
- The matched DataReader has been deleted.

This status may reflect changes from multiple match or unmatch events, and the **DDS_PublicationMatchedStatus↩ ::current_count_change** (p. 1920) can be used to determine the number of changes since the listener was called back or the status was checked.

6.150.2 Field Documentation

6.150.2.1 total_count

DDS_Long DDS_PublicationMatchedStatus::total_count

The total cumulative number of times that this **DDS_DataWriter** (p. 488) discovered a "match" with a **DDS_DataReader** (p. 618).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **DDS_PublicationMatchedStatus** (p. 1919).

6.150.2.2 total_count_change

DDS_Long DDS_PublicationMatchedStatus::total_count_change

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times this DataWriter ever matched with a DataReader).

6.150.2.3 current_count

DDS_Long DDS_PublicationMatchedStatus::current_count

The current number of DataReaders with which this **DDS_DataWriter** (p. 488) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **DDS_PublicationMatchedStatus** (p. 1919).

6.150.2.4 current_count_peak

DDS_Long DDS_PublicationMatchedStatus::current_count_peak

<<***extension***>> *(p. 1014)* Greatest number of DataReaders that matched this **DDS_DataWriter** (p. 488) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, total_count can be higher than current_count_peak.)

6.150.2.5 current_count_change

```
DDS_Long DDS_PublicationMatchedStatus::current_count_change
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataReaders have become unmatched for one or more of the reasons described in **DDS_PublicationMatchedStatus** (p. 1919).

6.150.2.6 last_subscription_handle

```
DDS_InstanceHandle_t DDS_PublicationMatchedStatus::last_subscription_handle
```

This InstanceHandle can be used to look up which remote **DDS_DataReader** (p. 618) was the last to cause this Data↩ Writer's status to change, using **DDS_DataWriter_get_matched_subscription_data** (p. 543).

If the DataReader no longer matches this DataWriter due to any of the reasons in **DDS_PublicationMatchedStatus** (p. 1919) except incompatible QoS, then the DataReader has been purged from this DataWriter's DomainParticipant discovery database. (See the "Discovery Overview" section of the `User's Manual`.) In that case, the **DDS_Data↩ Writer_get_matched_subscription_data** (p. 543) method will not be able to return information about the DataReader. The only way to get information about the lost DataReader is if you cached the information previously.

6.151 DDS_PublisherListener Struct Reference

<<***interface***>> *(p. 1015)* **DDS_Listener** (p. 1819) for **DDS_Publisher** (p. 446) status.

Data Fields

- struct **DDS_DataWriterListener as_datawriterlistener**
  *The superclass instance of this **DDS_PublisherListener** (p. 1921).*

6.151.1 Detailed Description

<<***interface***>> *(p. 1015)* **DDS_Listener** (p. 1819) for **DDS_Publisher** (p. 446) status.

Entity:

DDS_Publisher (p. 446)

Status:

Data Fields

- **DDS_PublishModeQosPolicyKind kind**

  <<***basic***>> *(p. 784)* <<***extension***>> (p. *796) Publishing mode*
- char * **flow_controller_name**

  <<***extension***>> (p. *796) Name of the associated flow controller*
- **DDS_Long priority**

  <<***extension***>> (p. *796) Publication priority*

6.154.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

The publishing mode of a **DDS_DataWriter** (p. 488) determines whether data is written synchronously in the context of the user thread when calling **FooDataWriter_write** (p. 499) or asynchronously in the context of a separate thread internal to the middleware.

Each **DDS_Publisher** (p. 446) spawns a single asynchronous publishing thread (**DDS_AsynchronousPublisherQos↩ Policy::thread** (p. 1540)) to serve all its asynchronous **DDS_DataWriter** (p. 488) instances.

DDS_AsynchronousPublisherQosPolicy (p. 1539)

DDS_HistoryQosPolicy (p. 1808)

DDS_FlowController (p. 562)

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.154.2 Usage

The fastest way for RTI Connext to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead.

When data is written asynchronously, a **DDS_FlowController** (p. 562), identified by `flow_controller_name`, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a **DDS_DataWriter** (p. 488). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The **FooDataWriter_write** (p. 499) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.

- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.

- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 2131). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding **DDS_FlowController** (p. 562)). The number of samples that will be queued is determined by the **DDS_HistoryQosPolicy** (p. 1808). When using **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295), only the most recent **DDS_HistoryQosPolicy::depth** (p. 1810) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

6.154.3 Field Documentation

6.154.3.1 kind

DDS_PublishModeQosPolicyKind DDS_PublishModeQosPolicy::kind

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* Publishing mode

[default] DDS_SYNCHRONOUS_PUBLISH_MODE_QOS (p. 1321)

Categories

Immutable (p. 916), **Flow Control** (p. 865)

6.154.3.2 flow_controller_name

```
char* DDS_PublishModeQosPolicy::flow_controller_name
```

<<***extension***>> *(p. 796)* Name of the associated flow controller

The following builitin values are supported:

- **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 567)
- **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 567)
- **DDS_ON_DEMAND_FLOW_CONTROLLER_NAME** (p. 568)

NULL value or zero-length string refers to **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 567).

Warning

The value for this field can be one of the constants above or a string allocated with **DDS_String_dup()** (p. 1528) to specify your own custom flow controller name. You should not assign a string literal. When you assign a new value with **DDS_String_dup()** (p. 1528), first check if the current value is one of the constants above. If it is, simply replace it; if it's not, you have to release the current string and assign the new one. Here is an example of such an approach:

```
struct DDS_DataWriterQos writer_qos;
char *flow_controller_name = NULL;
DDS_DataWriterQos_initialize(&writer_qos);
...
DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
...
flow_controller_name = writer_qos.publish_mode.flow_controller_name;
if (flow_controller_name == DDS_DEFAULT_FLOW_CONTROLLER_NAME
        || flow_controller_name == DDS_FIXED_RATE_FLOW_CONTROLLER_NAME
        || flow_controller_name == DDS_ON_DEMAND_FLOW_CONTROLLER_NAME) {
    // Since the value was never on the heap, this won't leak memory
    flow_controller_name = NULL;
} else {
    // This means the value is present on the heap
    DDS_String_free(flow_controller_name);
}
// New value using DDS_String_dup() or one of the predefined constants
flow_controller_name = DDS_String_dup("My custom flow controller name");
...
DDS_DataWriterQos_finalize(&writer_qos);
```

The strings allocated with **DDS_String_dup()** (p. 1528) are released when `writer_qos` is finalized.

More information about string handling can be found under **String Conventions** (p. 1527).

Immutable (p. 916), **Flow Control** (p. 865)

6.154.3.3 priority

```
DDS_Long DDS_PublishModeQosPolicy::priority
```

<<***extension***>> *(p. 796)* Publication priority

A positive integer value designating the relative priority of the **DDS_DataWriter** (p. 488), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321)) with **DDS_FlowControllerProperty_t::scheduling_policy** (p. 1802) set to **DDS_HPF_FLOW_CONTROLLER_SCHED_POLICY** (p. 564).

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), then the channel will inherit the publication priority of the DataWriter.

If the publicaton priority of the DataWriter, and of any channel of a multi-channel DataWriter, are **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is **DDS_PUBLICATION_PRIORITY_AUTOMATIC** (p. 1320), then the DataWriter will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **DDS_WriteParams_t** (p. 2107) of the **FooDataWriter_write_w_params** (p. 504) function.

For dispose and unregister samples, use the **DDS_WriteParams_t** (p. 2107) of **FooDataWriter_dispose_w_params** (p. 507) and **FooDataWriter_unregister_instance_w_params** (p. 499).

[default] DDS_PUBLICATION_PRIORITY_UNDEFINED (p. 1320)

6.157 DDS_QosPrintFormat Struct Reference

A collection of attributes used to configure how a QoS appears when printed.

Data Fields

- **DDS_Boolean is_standalone**

  Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).
- **DDS_Boolean print_private**

  Configures how private QoS policies should be printed.
- **DDS_UnsignedLong indent**

  Conifgures how much additional indent should be added to the string representation of a QoS.

6.157.1 Detailed Description

A collection of attributes used to configure how a QoS appears when printed.

To ensure that new objects of this type are initialized to a known value, assign them with the static initializer **DDS_↩ QosPrintFormat_INITIALIZER** (p. 1247).

6.157.2 Field Documentation

6.157.2.1 is_standalone

```
DDS_Boolean DDS_QosPrintFormat::is_standalone
```

Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).

The default value for this property (false) results in QoS being printed starting from the <ENTITY_qos> tag (where the <ENTITY_qos> tag is, e.g., <domain_participant_qos>, or, <datareader_qos>. This result cannot be directly parsed as valid XML (as it lacks <dds>, <qos_library>, and <qos_profile> tags). If is_standalone is set to true, these additional tags are printed, resulting in valid, parseable XML.

For example, with is_standalone set to false, a Qos may appear as:

```
<datareader_qos>

    <durability>

        <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>

    </durability>

</datareader_qos>
```

Setting is_standalone to true would result in the same Qos being printed as:

```
<?xml version="1.0"?>

<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

    <qos_library name="QosLibrary">

        <qos_profile name="QosProfile">

            <datareader_qos>

                <durability>

                    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>

                </durability>

            </datareader_qos>

        </qos_profile>

    </qos_library>

</dds>
```

[default] false

6.157.2.2 print_private

```
DDS_Boolean DDS_QosPrintFormat::print_private
```

Configures how private QoS policies should be printed.

There are some QoS policies which are not intended for external use. By default, these QoS policies are only printed if they are different to the default value for that policy. When true, private policies are treated like any other policy, and printed if they are different to the supplied base QoS. These private policies cannot be parsed from XML, and are always printed as XML comments.

[default] false

6.157.2.3 indent

```
DDS_UnsignedLong DDS_QosPrintFormat::indent
```

Conifgures how much additional indent should be added to the string representation of a QoS.

Configures how much additional indent is applied when converting a QoS to a string. This value acts as a total offset on the string, increasing the indent which is applied to all elements by the same amount. With indent set to 0, a string representation of a QoS may appear as:

```
<datareader_qos>
    <durability>
        <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
    </durability>
</datareader_qos>
```

Setting the indent property to 1, the same QoS would be printed as:

```
    <datareader_qos>
        <durability>
            <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
        </durability>
    </datareader_qos>
```

I.e., the entire structure is indented.

[default] 0

- struct **DDS_Duration_t autopurge_disposed_instances_delay**

  *<<**extension**>> (p. 796) Minimum duration for which the **DDS_DataReader** (p. 618) will maintain information about a received instance once its* `instance_state` *becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716) and there are no samples for the instance in the DataReader queue.*
- struct **DDS_Duration_t autopurge_nowriter_instances_delay**

  *<<**extension**>> (p. 796) Minimum duration for which the **DDS_DataReader** (p. 618) will maintain information about a received instance once its* `instance_state` *becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716) and there are no samples for the instance in the DataReader queue.*

6.160.1 Detailed Description

*<<**spec**>> (p. 791)* Controls how a DataReader manages the lifecycle of the data that it has received.

When a DataReader receives data, it is stored in a receive queue for the DataReader. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Connext will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more DataWriters alive for that data. It specifies how long a **DDS_DataReader** (p. 618) must retain information regarding instances that have the instance_state **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The **DDS_DataReader** (p. 618) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as **DDS_HistoryQosPolicy** (p. 1808) and **DDS_ResourceLimits↩ QosPolicy** (p. 1953).

The **DDS_DataReader** (p. 618) also maintains information regarding the identity, `view_state` and `instance_↩ state` of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the **DDS_DataReader** (p. 618) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the **DDS_DataReader** (p. 618) will have taken for that instance will have an `instance_state` of either **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_↩ STATE** (p. 716) or **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of **READER_DATA_LIFECYCLE** (p. 1322), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the **DDS_DataReader** (p. 618) from reclaiming the resources and they would remain in the **DDS_DataReader** (p. 618) indefinitely.

A DataReader can also reclaim all resources for instances that have an instance state of **DDS_NOT_ALIVE_↩ DISPOSED_INSTANCE_STATE** (p. 716) and for which all DDS samples have been 'taken'. DataReaders will only reclaim resources in this situation when the autopurge_disposed_instances_delay has been set to zero.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Connext detects that there are no longer DataWriters alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

DDS_DataReader (p. 618)

Properties:

6.160.2.3 autopurge_disposed_instances_delay

`struct` **`DDS_Duration_t`** `DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_instances_delay`

<<***extension***>> *(p. 796)* Minimum duration for which the **DDS_DataReader** (p. 618) will maintain information about a received instance once its `instance_state` becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716) and there are no samples for the instance in the DataReader queue.

After this time elapses, when the last sample for the disposed instance is taken, the **DDS_DataReader** (p. 618) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set keep_minimum_state_for_instances to FALSE in **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619).

The only currently supported values are **DDS_DURATION_ZERO** (p. 1211) and **DDS_DURATION_INFINITE** (p. 1210). A value of **DDS_DURATION_ZERO** (p. 1211) will purge an instance's state immediately after the instance state transitions to **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716), as long as all samples, including the dispose sample, associated with that instance have been 'taken'.

[default] DDS_DURATION_INFINITE (p. 1210)

Immutable (p. 916), **Instance Lifecycle** (p. 869), **Sample Memory Management** (p. 904), **Data Availability** (p. 844)

6.160.2.4 autopurge_nowriter_instances_delay

`struct` **`DDS_Duration_t`** `DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_instances_delay`

<<***extension***>> *(p. 796)* Minimum duration for which the **DDS_DataReader** (p. 618) will maintain information about a received instance once its `instance_state` becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716) and there are no samples for the instance in the DataReader queue.

An instance will transition to the **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716) `instance_state` when all known writers for the instance have either lost liveliness or have unregistered themselves from the instance. After this time elapses, when the last sample for the instance without writers is taken, the **DDS_DataReader** (p. 618) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set keep_minimum_state_for_instances to FALSE in **DDS_DataReaderResourceLimitsQosPolicy** (p. 1619).

The only currently supported values are **DDS_DURATION_ZERO** (p. 1211) and **DDS_DURATION_INFINITE** (p. 1210). A value of **DDS_DURATION_ZERO** (p. 1211) will purge an instance's state immediately after the instance state transitions to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716), as long as all samples, including the no_↩ writers sample, associated with that instance have been 'taken'.

[default] DDS_DURATION_ZERO (p. 1211)

  *<<**extension**>> (p. 796) The receive buffer size in bytes.*
- **DDS_Long buffer_alignment**

  ***[DEPRECATED] (p. 968)** <<**extension**>> (p. 796) The receive buffer alignment.*

6.161.1 Detailed Description

*<<**extension**>> (p. 796)* Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

See also

Controlling CPU Core Affinity for RTI Threads (p. 1239)

6.161.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports.

RTI uses a separate receive thread per port per transport plug-in. To force RTI Connext to use a separate thread to process the data for a **DDS_DataReader** (p. 618), set a unique port for the **DDS_TransportUnicastQosPolicy** (p. 2071) or **DDS_TransportMulticastQosPolicy** (p. 2064) for the **DDS_DataReader** (p. 618).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **DDS_DomainParticipant** (p. 76) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

6.161.3 Field Documentation

6.161.3.1 thread

`struct DDS_ThreadSettings_t DDS_ReceiverPoolQosPolicy::thread`

<<***extension***>> *(p. 796)* Receiver pool thread(s).

There is at least one receive thread, possibly more.

[default] priority above normal.
The actual value depends on your architecture:

For Windows: 2
For Linux: OS default priority

Categories

Immutable (p. 916), **Concurrency** (p. 841)

6.161.3.2 buffer_size

`DDS_Long DDS_ReceiverPoolQosPolicy::buffer_size`

<<***extension***>> *(p. 796)* The receive buffer size in bytes.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

buffer_size must always be at least as large as the maximum **NDDS_Transport_Property_t::message_size_max** (p. 2131) across *all* of the transports being used that are not doing zero-copy.

By default (**DDS_LENGTH_AUTO** (p. 1323)): the size is equal to the maximum **NDDS_Transport_Property_t↩ ::message_size_max** (p. 2131) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set **NDDS_Transport_Property_t::message_size_max** (p. 2131) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the buffer_size should be equal to the original **NDDS_Transport_Property_t::message_size_max** (p. 2131).

[default] DDS_LENGTH_AUTO (p. 1323)

[range] [1, 1 GB] or **DDS_LENGTH_AUTO** (p. 1323)

6.162.1 Detailed Description

*<<**extension**>> (p. 796) <<**spec**>> (p. 791)* Indicates the level of reliability offered/requested by RTI Connext.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 1231)

Properties:

RxO (p. 1247) = YES
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247) (the instance_state_consistency_kind is **Changeable** (p. 1247) = **NO** (p. 1247))

6.162.2 Usage

This policy indicates the level of reliability requested by a **DDS_DataReader** (p. 618) or offered by a **DDS_DataWriter** (p. 488).

The reliability of a connection between a DataWriter and DataReader is entirely user configurable. It can be done on a per DataWriter/DataReader connection. A connection may be configured to be "best effort" which means that RTI Connext will not use any resources to monitor or guarantee that the data sent by a DataWriter is received by a DataReader.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from

DataWriters to DataReaders. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a DataWriter is received reliably by DataReaders. This means that RTI Connext must check whether or not data was received, and repair any data that was rejected by resending a copy of the data as many times as it takes for the DataReader to receive the data. RTI Connext uses a reliability protocol configured and tuned by these QoS policies: **DDS_History↩ QosPolicy** (p. 1808), **DDS_DataWriterProtocolQosPolicy** (p. 1649), **DDS_DataReaderProtocolQosPolicy** (p. 1596), and **DDS_ResourceLimitsQosPolicy** (p. 1953).

The Reliability QoS policy is simply a switch to turn on the reliability protocol for a DataWriter/DataReader connection. The level of reliability provided by RTI Connext is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Connext to deliver *all* data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last *N* values are guaranteed to be delivered reliably to DataReaders (where *N* is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last *N* are received. Only the last *N* data packets are monitored and repaired if necessary.

These levels are ordered, **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325) < **DDS_RELIABLE_RELIABILITY_↩ QOS** (p. 1325). A **DDS_DataWriter** (p. 488) offering one level is implicitly offering all levels below.

The setting of this policy has a dependency on the setting of the **RESOURCE_LIMITS** (p. 1327) policy. In case the reliability kind is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325) the write operation on the **DDS_DataWriter** (p. 488) may block if the modification would cause data to be lost or else cause one of the limits in specified in the **RESOURCE↩ _LIMITS** (p. 1327) to be exceeded. Under these circumstances, the **RELIABILITY** (p. 1323) `max_blocking_time` configures the maximum duration the write operation may block.

If the **DDS_ReliabilityQosPolicy::kind** (p. 1943) is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325), data samples originating from a single **DDS_DataWriter** (p. 488) cannot be made available to the **DDS_DataReader** (p. 618) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Connext will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the **DDS_DataWriter** (p. 488) history before it is accessible by the **DDS_DataReader** (p. 618).

If the **DDS_ReliabilityQosPolicy::kind** (p. 1943) is set to **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325), the service will not re-transmit missing data samples. However, for data samples originating from any one DataWriter the service will ensure they are stored in the **DDS_DataReader** (p. 618) history in the same order they originated in the **DDS_DataWriter** (p. 488). In other words, the **DDS_DataReader** (p. 618) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

DDS_HistoryQosPolicy (p. 1808)

DDS_ResourceLimitsQosPolicy (p. 1953)

6.162.3 Compatibility

The value offered is considered compatible with the value requested if and only if:

- The inequality *offered* `kind` >= *requested* `kind` evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_ReliabilityQosPolicy::kind** (p. 1943) are considered ordered such that **DDS_BEST_EFFORT↩ _RELIABILITY_QOS** (p. 1325) < **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325). If **DDS_ReliabilityQos↩ Policy::exact_reliability_kind_match** (p. 1944) is set to true, then only exact kind matches, *offered* `kind` == *requested* `kind`, are considered compatible.

- The offered acknowledgment_kind = **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 1325) and requested acknowledgment_kind = **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 1325) OR offered acknowledgment_kind != **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 1325).

- The inequality *offered* `instance_state_consistency_kind` >= *requested* `instance_state_consistency_kind` evaluates to 'TRUE'. For the purposes of this inequaility, the values of **DDS_ReliabilityQosPolicy::instance_state_consistency_kind** (p. 1944) are considered ordered such that **DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1326) < **DDS_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1326).

6.162.4 Field Documentation

6.162.4.1 kind

6.162.4.4 instance_state_consistency_kind

DDS_InstanceStateConsistencyKind DDS_ReliabilityQosPolicy::instance_state_consistency_kind

<<***extension***>> *(p. 796)* Whether instance state consistency is enabled

A DataReader that determines that the DataWriter is no longer alive will transition instances to NOT_ALIVE_NO_↩ WRITERS if there are no other DataWriters updating that instance. If the DataReader rediscovers the DataWriter, the DataReader does not automatically transition instances back to the state they were in prior to the disconnection until it gets updates (i.e., samples) for them.

If `InstanceStateConsistencyKind` is set to `RECOVER_INSTANCE_STATE_CONSISTENCY`, then when the DataReader rediscovers a DataWriter, the DataReader will query the DataWriter for the state of its instances, and restore the instances to their correct state.

[default] DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY (p. 1326) for **DDS_DataReader** (p. 618), **DDS↩ _RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1326) for **DDS_DataWriter** (p. 488)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Reliability** (p. 897), **Instance Lifecycle** (p. 869)

6.162.4.5 exact_reliability_kind_match

```
DDS_Boolean DDS_ReliabilityQosPolicy::exact_reliability_kind_match
```

<<***extension***>> *(p. 796)* Whether an exact reliability kind match is required for endpoint matching.

If set to TRUE in the DataWriter, the offered and requested reliability kinds must be exactly the same to be considered compatible for endpoint matching. If set to FALSE in the DataWriter, the offered reliability kind must be greater than or equal to the requested reliability kind to be considered compatible for endpoint matching. Set it to TRUE in the Data↩ Writer to save memory and CPU cycles if communication with **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325) DataReaders is not required.

This setting has no effect on DataReaders.

[default] FALSE

6.163 DDS_ReliableReaderActivityChangedStatus Struct Reference

<<***extension***>> *(p. 1014)* Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

Data Fields

- **DDS_Long active_count**

  The current number of reliable readers currently matched with this reliable writer.
- **DDS_Long inactive_count**

  The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.
- **DDS_Long active_count_change**

  The most recent change in the number of active remote reliable readers.
- **DDS_Long inactive_count_change**

  The most recent change in the number of inactive remote reliable readers.
- **DDS_InstanceHandle_t last_instance_handle**

  The instance handle of the last reliable remote reader to be determined inactive.

6.163.1 Detailed Description

<<***extension***>> *(*p. *1014)* Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

Entity:

DDS_DataWriter (p. 488)

Listener:

DDS_DataWriterListener (p. 1644)

This status is the reciprocal status to the **DDS_LivelinessChangedStatus** (p. 1823) on the reader. It is different than the **DDS_LivelinessLostStatus** (p. 1825) on the writer in that the latter informs the writer about its own liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

6.163.2 Field Documentation

6.163.2.1 active_count

```
DDS_Long DDS_ReliableReaderActivityChangedStatus::active_count
```

The current number of reliable readers currently matched with this reliable writer.

6.163.2.2 inactive_count

```
DDS_Long DDS_ReliableReaderActivityChangedStatus::inactive_count
```

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats **DDS_RtpsReliableWriterProtocol_t::max_↩ heartbeat_retries** (p. 1971) times, each heartbeat having been separated from the previous by the current heartbeat period.

6.163.2.3 active_count_change

DDS_Long DDS_ReliableReaderActivityChangedStatus::active_count_change

The most recent change in the number of active remote reliable readers.

6.163.2.4 inactive_count_change

DDS_Long DDS_ReliableReaderActivityChangedStatus::inactive_count_change

The most recent change in the number of inactive remote reliable readers.

6.163.2.5 last_instance_handle

DDS_InstanceHandle_t DDS_ReliableReaderActivityChangedStatus::last_instance_handle

The instance handle of the last reliable remote reader to be determined inactive.

6.164 DDS_ReliableWriterCacheChangedStatus Struct Reference

<<***extension***>> *(*p. *1014)* A summary of the state of a data writer's cache of unacknowledged samples written.

Data Fields

- struct **DDS_ReliableWriterCacheEventCount empty_reliable_writer_cache**
  The number of times the reliable writer's cache of unacknowledged samples has become empty.
- struct **DDS_ReliableWriterCacheEventCount full_reliable_writer_cache**
  The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.
- struct **DDS_ReliableWriterCacheEventCount low_watermark_reliable_writer_cache**
  The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.
- struct **DDS_ReliableWriterCacheEventCount high_watermark_reliable_writer_cache**
  The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.
- **DDS_Long unacknowledged_sample_count**
  The current number of unacknowledged samples in the writer's cache.
- **DDS_Long unacknowledged_sample_count_peak**
  The highest value that unacknowledged_sample_count has reached until now.
- **DDS_LongLong replaced_unacknowledged_sample_count**
  The number of unacknowledged samples that have been replaced in the writer's cache.

6.164.1 Detailed Description

<<***extension***>> *(*p. *1014)* A summary of the state of a data writer's cache of unacknowledged samples written.

Entity:

DDS_DataWriter (p. 488)

Listener:

DDS_DataWriterListener (p. 1644)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

6.164.2 Field Documentation

6.164.2.1 empty_reliable_writer_cache

`struct` **`DDS_ReliableWriterCacheEventCount`** `DDS_ReliableWriterCacheChangedStatus::empty_reliable_writer_cache`

The number of times the reliable writer's cache of unacknowledged samples has become empty.

6.164.2.2 full_reliable_writer_cache

`struct` **`DDS_ReliableWriterCacheEventCount`** `DDS_ReliableWriterCacheChangedStatus::full_reliable_writer_cache`

The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.

Applies to writer's cache when the send window is enabled (when both **DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1978) and **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1978) are not **DDS_LENGTH_UNLIMITED** (p. 1328)).

Otherwise, applies when the number of unacknowledged samples has reached the send window limit.

6.164.2.3 low_watermark_reliable_writer_cache

struct **DDS_ReliableWriterCacheEventCount** DDS_ReliableWriterCacheChangedStatus::low_watermark_↩
reliable_writer_cache

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

When the writer's send window is enabled, the low watermark is scaled down, if necessary, to fit within the current send window.

Set the low watermark value using the **DDS_RtpsReliableWriterProtocol_t::low_watermark** (p. 1966) field of the **DDS_RtpsReliableWriterProtocol_t** (p. 1965) structure.

6.164.2.4 high_watermark_reliable_writer_cache

struct **DDS_ReliableWriterCacheEventCount** DDS_ReliableWriterCacheChangedStatus::high_watermark_↩
reliable_writer_cache

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

When the writer's send window is enabled, the high watermark is scaled down, if necessary, to fit within the current send window.

Set the high watermark value using the **DDS_RtpsReliableWriterProtocol_t::high_watermark** (p. 1967) field of the **DDS_RtpsReliableWriterProtocol_t** (p. 1965) structure.

6.164.2.5 unacknowledged_sample_count

DDS_Long DDS_ReliableWriterCacheChangedStatus::unacknowledged_sample_count

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

6.164.2.6 unacknowledged_sample_count_peak

DDS_Long DDS_ReliableWriterCacheChangedStatus::unacknowledged_sample_count_peak

The highest value that unacknowledged_sample_count has reached until now.

6.164.2.7 replaced_unacknowledged_sample_count

DDS_LongLong DDS_ReliableWriterCacheChangedStatus::replaced_unacknowledged_sample_count

The number of unacknowledged samples that have been replaced in the writer's cache.

Total number of unacknowledged samples that have been replaced by a DataWriter after applying **DDS_KEEP_LAST↩_HISTORY_QOS** (p. 1295) policy.

6.165 DDS_ReliableWriterCacheEventCount Struct Reference

<<***extension***>> *(p. 1014)* The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

Data Fields

- **DDS_Long total_count**

  The total number of times the event has occurred.
- **DDS_Long total_count_change**

  The incremental number of times the event has occurred since the listener was last invoked or the status read.

6.165.1 Detailed Description

<<***extension***>> *(p. 1014)* The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

The threshold interpretation depends on the usage of this data type in **DDS_ReliableWriterCacheChangedStatus** (p. 1947).

6.166.2 Field Documentation

6.166.2.1 total_count

```
DDS_Long DDS_RequestedDeadlineMissedStatus::total_count
```

Total cumulative count of the missed deadlines detected for any instance read by the **DDS_DataReader** (p. 618).

6.166.2.2 total_count_change

DDS_Long DDS_RequestedDeadlineMissedStatus::total_count_change

The incremental number of missed deadlines detected since the last time the listener was called or the status was read.

6.166.2.3 last_instance_handle

DDS_InstanceHandle_t DDS_RequestedDeadlineMissedStatus::last_instance_handle

Handle to the last instance in the **DDS_DataReader** (p. 618) for which a requested deadline was missed.

6.167 DDS_RequestedIncompatibleQosStatus Struct Reference

DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 1231)

Data Fields

- **DDS_Long total_count**

  *Total cumulative count of how many times the concerned **DDS_DataReader** (p. 618) discovered a **DDS_DataWriter** (p. 488) for the same **DDS_Topic** (p. 174) with an offered QoS that is incompatible with that requested by the **DDS_DataReader** (p. 618).*
- **DDS_Long total_count_change**

  The change in `total_count` since the last time the listener was called or the status was read.
- **DDS_QosPolicyId_t last_policy_id**

  *The **DDS_QosPolicyId_t** (p. 1248) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- struct **DDS_QosPolicyCountSeq policies**

  *A list containing, for each policy, the total number of times that the concerned **DDS_DataReader** (p. 618) discovered a **DDS_DataWriter** (p. 488) for the same **DDS_Topic** (p. 174) with an offered QoS that is incompatible with that requested by the **DDS_DataReader** (p. 618).*

  ***[DEPRECATED]** (p. **968**) <<**extension**>> (p. 796) Number of hash buckets for instances.*

6.168.1 Detailed Description

*<<**spec**>> (p. 791)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Entity:

DDS_Topic (p. 174), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Status:

DDS_SAMPLE_REJECTED_STATUS (p. 1232), **DDS_SampleRejectedStatus** (p. 2002)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.168.2 Usage

This policy controls the resources that RTI Connext can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **DDS_DurabilityQosPolicy** (p. 1762)), this QoS policy determines the actual maximum queue size when the **DDS_HistoryQosPolicy** (p. 1808) is set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 1295).

In general, this QoS policy is used to limit the amount of system memory that RTI Connext can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If **DDS_DataWriter** (p. 488) objects are communicating samples faster than they are ultimately taken by the **DDS_DataReader** (p. 618) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single **DDS_DataReader** (p. 618) cannot keep up with its corresponding **DDS_DataWriter** (p. 488). The behavior in this case depends on the setting for the **RELIABILITY** (p. 1323). If reliability is **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 1325), then RTI Connext is allowed to drop samples. If the reliability is **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325), RTI Connext will block the **DDS_DataWriter** (p. 488) or discard the sample at the **DDS_DataReader** (p. 618) in order not to lose existing samples.

The constant **DDS_LENGTH_UNLIMITED** (p. 1328) may be used to indicate the absence of a particular limit. For example setting **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956) to **DDS_LENGTH_UNLIMITED** (p. 1328) will cause RTI Connext not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the **DDS_DataWriter** (p. 488) may block on a write() call even though the **DDS_HistoryQosPolicy** (p. 1808) is **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295). To guarantee the writer does not block for **DDS_KEEP_LAST_HISTORY_QOS** (p. 1295), make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

See also

DDS_ReliabilityQosPolicy (p. 1940)

DDS_HistoryQosPolicy (p. 1808)

6.168.3 Consistency

The setting of **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956) must be consistent with **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956). For these two values to be consistent, it must be true that **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956) >= **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956). As described above, this limit will not be enforced if **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1956) is set to **DDS_LENGTH_UNLIMITED** (p. 1328).

The setting of **RESOURCE_LIMITS** (p. 1327) `max_samples_per_instance` must be consistent with the **HISTORY** (p. 1294) `depth`. For these two QoS to be consistent, it must be true that *depth* <= *max_samples_per_instance*.

6.171.1 Detailed Description

<<***extension***>> *(p. 796)* Qos related to reliable reader protocol defined in RTPS.

It is used to config reliable reader according to RTPS protocol.

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

QoS:

DDS_DataReaderProtocolQosPolicy (p. 1596) **DDS_DiscoveryConfigQosPolicy** (p. 1691)

6.171.2 Field Documentation

6.171.2.1 min_heartbeat_response_delay

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableReaderProtocol_t::min_heartbeat_response_delay`

<<***extension***>> *(p. 796)* The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0, 1 year], <= max_heartbeat_response_delay

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.171.2.2 max_heartbeat_response_delay

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableReaderProtocol_t::max_heartbeat_response_delay`

<<***extension***>> *(p. 796)* The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

[default] The default value depends on the container policy:

- For **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 1599): 0.5 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_reader** (p. 1698): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_reader** (p. 1699): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_reader** (p. 1704): 0 seconds

[range] [0, 1 year], >= min_heartbeat_response_delay

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.171.2.3 heartbeat_suppression_duration

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableReaderProtocol_t::heartbeat_suppression_duration`

<<***extension***>> *(p. 796)* The duration a reader ignores consecutively received heartbeats

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

[default] 0.0625 seconds

[range] [0, 1 year],

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.171.2.4 nack_period

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::nack_period
```

<<***extension***>> *(p. 796)* The period at which to send NACKs

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

[default] 5 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.171.2.5 receive_window_size

```
DDS_Long DDS_RtpsReliableReaderProtocol_t::receive_window_size
```

<<***extension***>> *(p. 796)* The number of received out-of-order samples a reader can keep at a time

A reliable reader stores the out-of-order samples it receives until it can present them to the application in-order. The receive window is the maximum number of out-of-order samples that a reliable reader keeps at a given time. When the receive window is full, subsequently received out-of-order samples are dropped.

[default] 256

[range] [>= 1]

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.171.2.6 round_trip_time

`struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::round_trip_time`

<<***extension***>> *(p. 796)* The duration from sending a NACK to receiving a repair of a sample

This round-trip time is an estimate of the time starting from when the reader sends a NACK for a specific sample to when it receives that sample. For each sample, the reader will not send a subsequent NACK for it until the round-trip time has passed, thus preventing inefficient redundant requests.

[default] 0 seconds

[range] [0 nanosec, 1 year]

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.171.2.7 app_ack_period

`struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::app_ack_period`

<<***extension***>> *(p. 796)* The period at which application-level acknowledgment messages are sent

A **DDS_DataReader** (p. 618) sends application-level acknowledgment messages to a **DDS_DataWriter** (p. 488) at this periodic rate, and will continue sending until it receives a message from the **DDS_DataWriter** (p. 488) that it has received and processed the acknowledgment and an AppAckConfirmation has been received by the **DDS_DataReader** (p. 618). Note: application-level acknowledgment messages can also be sent non-periodically, as determined by **DDS_Rtps↩ ReliableReaderProtocol_t::samples_per_app_ack** (p. 1964).

[default] 5 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 916), **Reliability** (p. 897), **Application Acknowledgement** (p. 836)

6.171.2.8 min_app_ack_response_keep_duration

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::min_app_ack_response_keep_duration
```

<<***extension***>> *(p. 796)* Minimum duration for which application-level acknowledgment response data is kept

The user-specified response data of an explicit application-level acknowledgment (called by **DDS_DataReader_acknowledge_sample** (p. 678) or **DDS_DataReader_acknowledge_all** (p. 678)) is cached by the **DDS_DataReader** (p. 618) for the purpose of reliably resending the data with the acknowledgment message. After this duration has passed from the time of the first acknowledgment, the response data is dropped from the cache and will not be resent with future acknowledgments for the corresponding sample(s).

[default] 0 sec

[range] [0 sec, 1 year]

Categories

Immutable (p. 916), **Reliability** (p. 897), **Application Acknowledgement** (p. 836)

6.171.2.9 samples_per_app_ack

```
DDS_Long DDS_RtpsReliableReaderProtocol_t::samples_per_app_ack
```

<<***extension***>> *(p. 796)* The minimum number of samples acknowledged by one application-level acknowledgment message

This setting applies only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1943) = **DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 1326) or **DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1325)

A **DDS_DataReader** (p. 618) will immediately send an application-level acknowledgment message when it has at least this many samples that have been acknowledged. It will not send an acknowledgment message until it has at least this many samples pending acknowledgment.

For example, calling **DDS_DataReader_acknowledge_sample** (p. 678) this many times consecutively will trigger the sending of an acknowledgment message. Calling **DDS_DataReader_acknowledge_all** (p. 678) may trigger the sending of an acknowledgment message, if at least this many samples are being acknowledged at once.

This is independent of the **DDS_RtpsReliableReaderProtocol_t::app_ack_period** (p. 1963), where a **DDS_DataReader** (p. 618) will send acknowledgement messages at the periodic rate regardless.

When this is set to **DDS_LENGTH_UNLIMITED** (p. 1328), then acknowledgement messages are sent only periodically, at the rate set by **DDS_RtpsReliableReaderProtocol_t::app_ack_period** (p. 1963).

[default] 1

[range] [1, 1000000], or **DDS_LENGTH_UNLIMITED** (p. 1328)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Application Acknowledgement** (p. 836)

6.172.1 Detailed Description

*<<**extension**>> (p. 796)* QoS related to the reliable writer protocol defined in RTPS.

It is used to configure a reliable writer according to RTPS protocol.

The reliability protocol settings are applied to batches instead of individual data samples when batching is enabled.

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

QoS:

DDS_DataWriterProtocolQosPolicy (p. 1649) **DDS_DiscoveryConfigQosPolicy** (p. 1691)

6.172.2 Field Documentation

6.172.2.1 low_watermark

DDS_Long DDS_RtpsReliableWriterProtocol_t::low_watermark

<<***extension***>> *(p. 796)* When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 1236) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be greater than or equal to zero and strictly less than high_watermark.

The high and low watermarks are used for switching between the regular and fast heartbeat rates (**DDS_Rtps↩ ReliableWriterProtocol_t::heartbeat_period** (p. 1968) and **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_↩ period** (p. 1968), respectively). When the number of unacknowledged samples in the queue of a reliable **DDS_↩ DataWriter** (p. 488) meets or exceeds high_watermark, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 1236) is changed, and the DataWriter will start heartbeating at **DDS_RtpsReliableWriterProtocol_t::fast_↩ heartbeat_period** (p. 1968). When the number of samples meets or falls below low_watermark, **DDS_RELIABLE↩ _WRITER_CACHE_CHANGED_STATUS** (p. 1236) is changed, and the heartbeat rate will return to the "normal" rate (**DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1968)).

[default] 0

[range] [0, 100 million], < high_watermark

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.2 high_watermark

DDS_Long DDS_RtpsReliableWriterProtocol_t::high_watermark

<<***extension***>> *(p. 796)* When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 1236) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be strictly greater than low_watermark and less than or equal to a maximum that depends on the container QoS policy:

In **DDS_DomainParticipantQos::discovery_config** (p. 1732):

For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700)
high_watermark<= **DDS_AllocationSettings_t::max_count** (p. 1538) in **DDS_DomainParticipantResourceLimits↩ QosPolicy::local_writer_allocation** (p. 1737)

For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702)
high_watermark<= **DDS_AllocationSettings_t::max_count** (p. 1538) in **DDS_DomainParticipantResourceLimits↩ QosPolicy::local_reader_allocation** (p. 1738)

In **DDS_DataWriterQos::protocol** (p. 1671):

For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653),

high_watermark<=**DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956) if batching is disabled. Otherwise, high_watermark<=**DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 1677) high_watermark<=**DDS_↩ RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1978)

[default] 1

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 1328), > low_watermark <= *maximum* which depends on the container policy

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.3 heartbeat_period

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableWriterProtocol_t::heartbeat_period`

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* The period at which to send heartbeats.

A reliable writer will send periodic heartbeats at this rate.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): 200 ms
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): 1.0 seconds

[range] [1 nanosec,1 year], >= **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period** (p. 1968), >= **DDS_↩ RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period** (p. 1969)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.4 fast_heartbeat_period

`struct` **DDS_Duration_t** DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period

*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

This heartbeat period will be used when the number of unacknowledged samples in the cache of a reliable writer meets or exceeds the writer's high watermark and has not subsequently dropped to the low watermark. The normal period will be used at all other times.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): 200 ms seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): 1.0 seconds

[range] [1 nanosec,1 year], <= **DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1968)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.5 late_joiner_heartbeat_period

`struct` **DDS_Duration_t** DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period

*<<**basic**>> (p. 784) <<**extension**>> (p. 796)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

This heartbeat period will be used when a reliable reader joins after a reliable writer with non-volatile durability has begun publishing samples. Once the reliable reader has received all cached samples, it will be serviced at the same rate as other reliable readers.

This period must not be slower (i.e., must be of the same or shorter duration) than the normal heartbeat period.

A reliable writer will use whichever heartbeat period is faster, the current heartbeat period being used for other reliable readers or the **DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period** (p. 1969), to service the late joining reader. This means that if the **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period** (p. 1968) is currently being used and is faster than the late_joiner_heartbeat_period, then the fast_heartbeat_period will continue to be used for the late joiner as well.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): 200 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): 1.0 seconds

[range] [1 nanosec,1 year], <= **DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1968)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.6 virtual_heartbeat_period

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableWriterProtocol_t::virtual_heartbeat_period`

<<***extension***>> *(p. 796)* The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

A reliable writer will send periodic virtual heartbeats at this rate.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): **DDS_DURATION_AUTO** (p. 1211). If **DDS_PresentationQosPolicy::access_scope** (p. 1897) is set to **DDS_GROUP_PRESENTATION_QOS** (p. 1307) on the DataWriter, this value is set to **DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1968). Otherwise, the value is set to **DDS_DURATION_INFINITE** (p. 1210).
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): **DDS_DURATION_INFINITE** (p. 1210)
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): **DDS_DURATION_INFINITE** (p. 1210)
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): **DDS_DURATION_INFINITE** (p. 1210)

[range] > 1 nanosec, **DDS_DURATION_INFINITE** (p. 1210), or **DDS_DURATION_AUTO** (p. 1211)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.7 samples_per_virtual_heartbeat

DDS_Long DDS_RtpsReliableWriterProtocol_t::samples_per_virtual_heartbeat

<<***extension***>> *(p. 796)* The number of samples that a reliable writer has to publish before sending a virtual heartbeat.

[default] DDS_LENGTH_UNLIMITED (p. 1328)

[range] [1,1000000], **DDS_LENGTH_UNLIMITED** (p. 1328)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.8 max_heartbeat_retries

DDS_Long DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries

<<***extension***>> *(p. 796)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.

When a remote reader has not acked all the samples the reliable writer has in its queue, and max_heartbeat_retries number of periodic heartbeats has been sent without receiving any ack/nack back, the remote reader will be marked as inactive (not alive) and be ignored until it resumes sending ack/nack.

Note that piggyback heartbeats do NOT count towards this value.

[default] 150

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 1328)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Liveliness** (p. 876)

6.172.2.9 inactivate_nonprogressing_readers

DDS_Boolean DDS_RtpsReliableWriterProtocol_t::inactivate_nonprogressing_readers

<<***extension***>> *(p. 796)* Whether to treat remote readers as inactive when their NACKs do not progress

Nominally, a remote reader is marked inactive when a successive number of periodic heartbeats equal or greater than **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1971) have been sent without receiving any ack/nacks back.

By setting this **DDS_BOOLEAN_TRUE** (p. 1203), it changes the conditions of inactivating a remote reader: a reader will be considered inactive when it either does not send any ack/nacks or keeps sending non-progressing nacks for **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1971) number of heartbeat periods, where a non-progressing nack is one whose oldest sample requested has not advanced from the oldest sample requested of the previous nack.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Liveliness** (p. 876)

6.172.2.10 heartbeats_per_max_samples

DDS_Long DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples

<<***extension***>> *(p. 796)* The number of piggyback heartbeats sent per max send window.

When a DataWriter is configured with a fixed send window size (**DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1978) is equal to effective max_send_window_size), a piggyback heartbeat is sent every [(effective max send window size/heartbeats_per_max_samples)] number of samples written.

Otherwise, the number of piggyback heartbeats sent is scaled according to the current size of the send window. For example, consider a **DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples** (p. 1972) of 50. If the current send window size is 100, a piggyback heartbeat will be sent every 2 samples. If the send window size grows to 150, a piggyback heartbeat will be sent every 3 samples, and so on. Additionally, when the send window size grows, a piggyback heartbeat is sent with the next sample. (If it weren't, the sending of that heartbeat could be delayed, since the heartbeat rate scales with the increasing window size.)

The effective max send window is calculated as follows:

Without batching:

min (**DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956), **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1978))

With batching:

min (**DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 1677), **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1978))

If heartbeats_per_max_samples is set to zero, no piggyback heartbeats will be sent.

If current send window size is **DDS_LENGTH_UNLIMITED** (p. 1328), 100 million is assumed as the effective max send window.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): 8
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): 8
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): 8
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): 1

[range] [0, 100 million]

- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): heartbeats_per_max_samples<= **DDS_AllocationSettings_t::max_count** (p. 1538) in **DDS_Domain↩ ParticipantResourceLimitsQosPolicy::local_writer_allocation** (p. 1737)
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): heartbeats_per_max_samples<= **DDS_AllocationSettings_t::max_count** (p. 1538) in **DDS_Domain↩ ParticipantResourceLimitsQosPolicy::local_reader_allocation** (p. 1738)
- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653):

heartbeats_per_max_samples<= **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1956) if batching is disabled. Otherwise:
heartbeats_per_max_samples<= **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 1677)

heartbeats_per_max_samples<= **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1978)

Categories

Immutable (p. 916), **Reliability** (p. 897)

6.172.2.11 min_nack_response_delay

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableWriterProtocol_t::min_nack_response_delay`

<<***extension***>> *(p. 796)* The minimum delay to respond to a NACK or NACK_FRAG.

When a reliable writer receives a NACK or a NACK_FRAG from a remote reader, the writer can choose to delay a while before it sends repair samples/fragments or a heartbeat. This sets the value of the minimum delay.

Delaying repairs can lower the amount of duplicate repair data sent to the remote reader. If the writer receives the same NACKs or NACK_FRAGs back-to-back within this wait time, it will combine them into one repair action.

[default] 0 seconds

[range] [0, 1 day], <= max_nack_response_delay

Categories

Immutable (p. 916), **Reliability** (p. 897), **Fragmentation** (p. 867)

6.172.2.12 max_nack_response_delay

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableWriterProtocol_t::max_nack_response_delay`

<<***extension***>> *(p. 796)* The maximum delay to respond to a NACK or NACK_FRAG.

This sets the value of maximum delay between receiving a NACK or a NACK_FRAG and sending repair samples/fragments or a heartbeat.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): 0.2 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): 0 seconds

[range] [0,1 day], >= min_nack_response_delay

Categories

Immutable (p. 916), **Reliability** (p. 897), **Fragmentation** (p. 867)

6.172.2.13 nack_suppression_duration

`struct` **`DDS_Duration_t`** `DDS_RtpsReliableWriterProtocol_t::nack_suppression_duration`

<<***extension***>> *(p. 796)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs/NACK_FRAGs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs/NACK_FRAGs are ignored to prevent redundant repairs from being sent.

A redundant NACK is a NACK that requests the same or lower first sequence number (SN) than the last NACK from the same reader.

A redundant NACK_FRAG is a NACK_FRAG that requests the same first fragment number for a sample as the last NACK_FRAG from the same reader.

The suppression duration applies separately to NACKs and NACK_FRAGS. For example, replying to a NACK_FRAG message in between receiving two NACK messages will not cause the second NACK message to be suppressed if the two NACK messages are received more than the suppression duration apart.

[default] 0 seconds

[range] [0, 1 day]

Categories

Immutable (p. 916), **Reliability** (p. 897), **Fragmentation** (p. 867)

6.172.2.14 max_bytes_per_nack_response

DDS_Long DDS_RtpsReliableWriterProtocol_t::max_bytes_per_nack_response

<<***extension***>> *(p. 796)* The maximum total message size when resending rejected samples or data fragments.

As part of the reliable communication protocol, DataWriters send heartbeat (HB) messages to their DataReaders. Each HB message contains the sequence number of the most recent sample sent by the DataWriter.

In response, a DataReader may send a negative acknowledgement (NACK) message, indicating what sequence numbers it did not receive, if any. If the samples were fragmented, it can also send a NACK_FRAG requesting the fragments of a sample that did not arrive. If the DataReader is missing some samples or fragments, the DataWriter will send them again.

max_bytes_per_nack_response determines the maximum size of the message sent by the DataWriter in response to a NACK or NACK_FRAG. This message may contain multiple samples or fragments. The DataWriter will always send at least one message, even if the size of that message exceeds the max_bytes_per_nack_response value.

If the total size of all samples or fragments that needs to be resent is larger than max_bytes_per_nack_response, the remaining samples or fragments will be resent the next time a NACK or NACK_FRAG arrives.

Note: If **DDS_RtpsReliableWriterProtocol_t::min_nack_response_delay** (p. 1973) and **DDS_RtpsReliableWriter↩ Protocol_t::max_nack_response_delay** (p. 1973) are both **DDS_DURATION_ZERO** (p. 1211) (which means repairs are processed immediately), this limit applies separately to NACKs and NACK_FRAGs: repairing a NACK in this case does not affect the maximum size of a NACK_FRAG response and vice versa. Otherwise, the limit applies to the total size of the response, including received NACKs and NACK_FRAGs.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 1653): 131072 bytes
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 1700): 131072 bytes
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 1702): 131072 bytes
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 1704): 9216 bytes

[range] [0, 1 GB]

6.172.2.17 disable_positive_acks_enable_adaptive_sample_keep_duration

DDS_Boolean DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1976) = **DDS_BOOLEAN_TRUE** (p. 1203), enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_increase_sample_keep_duration_factor** (p. 1977). Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_decrease_sample_keep_duration_factor** (p. 1977).

The lower and upper bounds of the dynamic sample keep duration are set by **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration** (p. 1975) and **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_duration** (p. 1976), respectively.

When **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1976) = **DDS_BOOLEAN_FALSE** (p. 1203), the sample keep duration is set to **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration** (p. 1975) .

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Reliability** (p. 897), **Durability** (p. 861)

6.172.2.18 disable_positive_acks_decrease_sample_keep_duration_factor

DDS_Long DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_decrease_sample_keep_duration_factor

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Controls rate of contraction of dynamic sample keep duration.

Used when **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1976) = **DDS_BOOLEAN_TRUE** (p. 1203).

When the adaptive algorithm determines that the keep duration should be decreased, this factor (a percentage) is multiplied with the current keep duration to get the new shorter keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 95% would result in a new keep duration of 19 milliseconds.

[default] 95

[range] <= 100

  <<***extension***>> *(p. 796) Additional offset for **usertraffic** unicast port.*

6.173.1 Detailed Description

<<***extension***>> *(p. 796)* RTPS well-known port mapping configuration.

RTI Connext uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Connext. These parameters are exposed in **DDS_Rtps↩ WellKnownPorts_t** (p. 1983). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **DDS_RtpsWellKnownPorts_t** (p. 1983), the port numbers depend on:

- `domain_id`, as specified in **DDS_DomainParticipantFactory_create_participant** (p. 41)
- `participant_id`, as specified using **DDS_WireProtocolQosPolicy::participant_id** (p. 2103)

The `domain_id` parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The `participant_id` parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The *metatraffic_unicast_port* is used to exchange discovery metatraffic using unicast.

```
metatraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + b
```

The *metatraffic_multicast_port* is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1719) on a **DDS_↩ DomainParticipant** (p. 76) entity.

```
metatraffic_multicast_port = port_base + (domain_id_gain * domain_id) + builtin_multicast_port_offset
```

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **DDS_DataReaderQos::multicast** (p. 1616), **DDS_DataReaderQos↩ ::unicast** (p. 1616), or by the **DDS_DataWriterQos::unicast** (p. 1672) QoS policies.

The *usertraffic_unicast_port* is used to exchange user data using unicast.

```
usertraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + u
```

The *usertraffic_multicast_port* is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using **DDS_TransportMulticastQosPolicy** (p. 2064).

```
usertraffic_multicast_port = port_base + (domain_id_gain * domain_id) + user_multicast_port_offset
```

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also **DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS** (p. 1351)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Connext middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

Note: On Windows, you should avoid using ports 49152 through 65535 for inbound traffic. RTI Connext's ephemeral ports (see "Ports Used for Communication" in the `User's Manual`) may be within that range (see `https↩ ://msdn.microsoft.com/en-us/library/windows/desktop/ms737550(v=vs.85).aspx`). With the default RtpsWellKnownPorts settings, port 49152 corresponds to domain ID 167, so using domain IDs 168 through 232 on Windows introduces the risk of a port collision and failure to create the Domain Participant when using multicast discovery. You may see this error:

RTIOsapiSocket_bindWithIP:OS bind() failure, error 0X271D: An attempt was made to access a socket in a way forbidden by its access permissions.

QoS:

DDS_WireProtocolQosPolicy (p. 2099)

6.173.2 Field Documentation

6.173.2.1 port_base

```
DDS_Long DDS_RtpsWellKnownPorts_t::port_base
```

<<***extension***>> *(p. 796)* The base port offset.

All mapped well-known ports are offset by this value.

[default] 7400

[range] [>= 1], but resulting ports must be within the range imposed by the underlying transport.

6.173.2.2 domain_id_gain

```
DDS_Long DDS_RtpsWellKnownPorts_t::domain_id_gain
```

<<***extension***>> *(p. 796)* Tunable domain gain parameter.

Multiplier of the `domain_id`. Together with `participant_id_gain`, it determines the highest `domain_id` and `participant_id` allowed on this network.

In general, there are two ways to setup `domain_id_gain` and `participant_id_gain` parameters.

If `domain_id_gain` > `participant_id_gain`, it results in a port mapping layout where all **DDS_Domain↩ Participant** (p. 76) instances within a single domain occupy a consecutive range of `domain_id_gain` ports. Precisely, all ports occupied by the domain fall within:

```
(port_base + (domain_id_gain * domain_id))
```

and:

```
(port_base + (domain_id_gain * (domain_id + 1)) - 1)
```

Under such a case, the highest `domain_id` is limited only by the underlying transport's maximum port. The highest `participant_id`, however, must satisfy:

```
max_participant_id < (domain_id_gain / participant_id_gain)
```

On the contrary, if `domain_id_gain` <= `participant_id_gain`, it results in a port mapping layout where a given domain's **DDS_DomainParticipant** (p. 76) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain Id = 1	Participant ID = 2
	Domain Id = 0	Participant ID = 2
	Domain Id = 1	Participant ID = 1
	Domain Id = 0	Participant ID = 1
	Domain Id = 1	Participant ID = 0
lower port number	Domain Id = 0	Participant ID = 0

Under this case, the highest participant_id is limited only by the underlying transport's maximum port. The highest domain_id, however, must satisfy:

```
max_domain_id < (participant_id_gain / domain_id_gain)
```

Additionally, domain_id_gain also determines the range of the port-specific offsets.

```
domain_id_gain > abs(builtin_multicast_port_offset - user_multicast_port_offset)
```

```
domain_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

Violating this may result in port aliasing and undefined discovery behavior.

[default] 250

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

6.173.2.3 participant_id_gain

```
DDS_Long DDS_RtpsWellKnownPorts_t::participant_id_gain
```

<<***extension***>> *(p. 796)* Tunable participant gain parameter.

Multiplier of the participant_id. See **DDS_RtpsWellKnownPorts_t::domain_id_gain** (p. 1986) for its implications on the highest domain_id and participant_id allowed on this network.

Additionally, participant_id_gain also determines the range of builtin_unicast_port_offset and user_unicast_port_offset.

```
participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

[default] 2

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

```

<<***extension***>> *(*p. *796)* Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 1

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

6.173.2.7 user_unicast_port_offset

```
DDS_Long DDS_RtpsWellKnownPorts_t::user_unicast_port_offset
```

<<***extension***>> *(*p. *796)* Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 11

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

6.174 DDS_SampleHandler Struct Reference

<<***experimental***>> *(*p. *1014)* <<***extension***>> *(*p. *1014)* <<***interface***>> *(*p. *1015)* Handler called by a sample dispatcher, such as **DDS_SampleProcessor** (p. 1505).

Data Fields

- void * **handler_data**

  A place for handler implementors to keep a pointer to data that may be needed by their handler.
- DDS_SampleHandler_OnNewSampleCallback **on_new_sample**

  *Handles the dispatch of a sample read from the assocaited **DDS_DataReader** (*p. *618).*

6.174.1 Detailed Description

*<<**experimental**>> (p. 1014) <<**extension**>> (p. 1014) <<**interface**>> (p. 1015)* Handler called by a sample dispatcher, such as **DDS_SampleProcessor** (p. 1505).

6.174.2 Field Documentation

6.174.2.1 handler_data

```
void* DDS_SampleHandler::handler_data
```

A place for handler implementors to keep a pointer to data that may be needed by their handler.

6.174.2.2 on_new_sample

```
DDS_SampleHandler_OnNewSampleCallback DDS_SampleHandler::on_new_sample
```

Handles the dispatch of a sample read from the assocaited **DDS_DataReader** (p. 618).

This operation is called from the dispatcher after reading a new sample from an associated **DDS_DataReader** (p. 618). Note that the type of the data portion of the Sample must correspond with the type of the associated **DDS_DataReader** (p. 618).

6.175 DDS_SampleIdentity_t Struct Reference

Type definition for a Sample Identity.

Data Fields

- struct **DDS_GUID_t writer_guid**
  16-byte identifier identifying the virtual GUID.
- struct **DDS_SequenceNumber_t sequence_number**
  monotonically increasing 64-bit integer that identifies the sample in the data source.

6.175.1 Detailed Description

Type definition for a Sample Identity.

A SampleIdentity defines a pair (Virtual Writer GUID, Sequence Number) that uniquely identifies a sample within a DDS domain and a Topic.

6.176 DDS_SampleInfo Struct Reference

Information that accompanies each sample that is `read` or `taken`.

Data Fields

- **DDS_SampleStateKind sample_state**

  The sample state of the sample.
- **DDS_ViewStateKind view_state**

  The view state of the instance.
- **DDS_InstanceStateKind instance_state**

  The instance state of the instance.
- struct **DDS_Time_t source_timestamp**

  The timestamp when the sample was written by a DataWriter.
- **DDS_InstanceHandle_t instance_handle**

  Identifies locally the corresponding instance.
- **DDS_InstanceHandle_t publication_handle**

  Identifies locally the DataWriter that modified the instance.
- **DDS_Long disposed_generation_count**

  The disposed generation count of the instance at the time of sample reception.
- **DDS_Long no_writers_generation_count**

  The no writers generation count of the instance at the time of sample reception.
- **DDS_Long sample_rank**

  The sample rank of the sample.
- **DDS_Long generation_rank**

  The generation rank of the sample.
- **DDS_Long absolute_generation_rank**

  The absolute generation rank of the sample.
- **DDS_Boolean valid_data**

  Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `instance_state` of the instance.
- struct **DDS_Time_t reception_timestamp**

  *<<**extension**>> (p. 1014) The timestamp when the sample was committed by a DataReader.*
- struct **DDS_SequenceNumber_t publication_sequence_number**

  *<<**extension**>> (p. 1014) The publication sequence number.*
- struct **DDS_SequenceNumber_t reception_sequence_number**

  *<<**extension**>> (p. 1014) The reception sequence number when sample was committed by a DataReader*
- struct **DDS_GUID_t original_publication_virtual_guid**

  *<<**extension**>> (p. 1014) The original publication virtual GUID.*
- struct **DDS_SequenceNumber_t original_publication_virtual_sequence_number**

  *<<**extension**>> (p. 1014) The original publication virtual sequence number.*
- struct **DDS_GUID_t related_original_publication_virtual_guid**

  *<<**extension**>> (p. 1014) The original publication virtual GUID of a related sample.*
- struct **DDS_SequenceNumber_t related_original_publication_virtual_sequence_number**

  *<<**extension**>> (p. 1014) The original publication virtual sequence number of a related sample.*
- **DDS_SampleFlag flag**

<<***extension***>> *(p. 1014) Flags associated with the sample.*

- struct **DDS_GUID_t source_guid**

  <<***extension***>> *(p. 1014) The application logical data source associated with the sample.*
- struct **DDS_GUID_t related_source_guid**

  <<***extension***>> *(p. 1014) The application logical data source that is related to the sample.*
- struct **DDS_GUID_t related_subscription_guid**

  <<***extension***>> *(p. 1014) The related_reader_guid associated with the sample.*
- struct **DDS_GUID_t topic_query_guid**

  <<***extension***>> *(p. 1014) The GUID of the **DDS_TopicQuery** (p. 708) that is related to the sample.*
- struct **DDS_CoherentSetInfo_t * coherent_set_info**

  <<***extension***>> *(p. 1014) The information about the coherent set that this sample is a part of.*

6.176.1 Detailed Description

Information that accompanies each sample that is `read` or `taken`.

6.176.2 Interpretation of the SampleInfo

The **DDS_SampleInfo** (p. 1990) contains information pertaining to the associated `Data` instance sample including:

- the `sample_state` of the `Data` value (i.e., if it has already been read or not)
- the `view_state` of the related instance (i.e., if the instance is new or not)
- the `instance_state` of the related instance (i.e., if the instance is alive or not)
- **DDS_SampleInfo::valid_data** (p. 1997) flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the `instance_state` of the corresponding instance.
- The values of `disposed_generation_count` and `no_writers_generation_count` for the related instance at the time the sample was received. These counters indicate the number of times the instance had become ALIVE (with `instance_state=` **DDS_ALIVE_INSTANCE_STATE** (p. 716)) at the time the sample was received.
- The `sample_rank` and `generation_rank` of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the `read` or `take` operations.
- The `absolute_generation_rank` of the sample within the **DDS_DataReader** (p. 618). This rank provides a preview of what is available within the **DDS_DataReader** (p. 618).
- The `source_timestamp` of the sample. This is the timestamp provided by the **DDS_DataWriter** (p. 488) at the time the sample was produced.

6.176.3 Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count

For each instance, RTI Connext internally maintains two counts, the **DDS_SampleInfo::disposed_generation_count** (p. 1995) and **DDS_SampleInfo::no_writers_generation_count** (p. 1995), relative to each DataReader:

- The **DDS_SampleInfo::disposed_generation_count** (p. 1995) and **DDS_SampleInfo::no_writers_generation_count** (p. 1995) are initialized to zero when the **DDS_DataReader** (p. 618) first detects the presence of a never-seen-before instance.
- The **DDS_SampleInfo::disposed_generation_count** (p. 1995) is incremented each time the instance_state of the corresponding instance changes from **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716) to **DDS_ALIVE_INSTANCE_STATE** (p. 716).
- The **DDS_SampleInfo::no_writers_generation_count** (p. 1995) is incremented each time the instance_state of the corresponding instance changes from **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716) to **DDS_ALIVE_INSTANCE_STATE** (p. 716).
- These 'generation counts' are reset to zero when the instance resource is reclaimed.

The **DDS_SampleInfo::disposed_generation_count** (p. 1995) and **DDS_SampleInfo::no_writers_generation_count** (p. 1995) available in the **DDS_SampleInfo** (p. 1990) capture a snapshot of the corresponding counters at the time the sample was received.

6.176.4 Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank

The **DDS_SampleInfo::sample_rank** (p. 1996) and **DDS_SampleInfo::generation_rank** (p. 1996) available in the **DDS_SampleInfo** (p. 1990) are computed based solely on the actual samples in the ordered collection returned by read or take.

- The **DDS_SampleInfo::sample_rank** (p. 1996) indicates the number of samples of the same instance that follow the current one in the collection.
- The **DDS_SampleInfo::generation_rank** (p. 1996) available in the **DDS_SampleInfo** (p. 1990) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The **DDS_SampleInfo::generation_rank** (p. 1996) is computed using the formula:

```
generation_rank = (MRSIC.disposed_generation_count

                       + MRSIC.no_writers_generation_count)

                  - (S.disposed_generation_count

                       + S.no_writers_generation_count)
```

The **DDS_SampleInfo::absolute_generation_rank** (p. 1996) available in the **DDS_SampleInfo** (p. 1990) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

```
absolute_generation_rank = (MRS.disposed_generation_count

                                + MRS.no_writers_generation_count)

                           - (S.disposed_generation_count

                                + S.no_writers_generation_count)
```

6.176.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance re-appeared again). Using the information in the **DDS_SampleInfo** (p. 1990), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with sample_rank == 0. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with generation_rank == 0. An application desiring only samples pertaining to the latest generation available will ignore samples for which absolute_generation_rank != 0. Other application-defined criteria may also be used.

DDS_SampleStateKind (p. 711), **DDS_InstanceStateKind** (p. 715), **DDS_ViewStateKind** (p. 713), **DDS_↩ SampleInfo::valid_data** (p. 1997)

"Statechart of the \p instance_state and \p view_state of a single instance"

6.176.6 Field Documentation

6.176.6.1 sample_state

```
DDS_SampleStateKind DDS_SampleInfo::sample_state
```

The sample state of the sample.

Indicates whether or not the corresponding data sample has already been read.

See also

DDS_SampleStateKind (p. 711)

6.176.6.2 view_state

```
DDS_ViewStateKind DDS_SampleInfo::view_state
```

The view state of the instance.

Indicates whether the **DDS_DataReader** (p. 618) has already seen samples for the most-current generation of the related instance.

See also

DDS_ViewStateKind (p. 713)

6.176.6.3 instance_state

```
DDS_InstanceStateKind DDS_SampleInfo::instance_state
```

The instance state of the instance.

Indicates whether the instance is currently in existence or, if it has been disposed, the reason why it was disposed.

See also

DDS_InstanceStateKind (p. 715)

6.176.6.4 source_timestamp

```
struct DDS_Time_t DDS_SampleInfo::source_timestamp
```

The timestamp when the sample was written by a DataWriter.

6.176.6.5 instance_handle

```
DDS_InstanceHandle_t DDS_SampleInfo::instance_handle
```

Identifies locally the corresponding instance.

The handle is equal to **DDS_HANDLE_NIL** (p. 227) for unkeyed topics.

6.176.6.6 publication_handle

```
DDS_InstanceHandle_t DDS_SampleInfo::publication_handle
```

Identifies locally the DataWriter that modified the instance.

The `publication_handle` is the same **DDS_InstanceHandle_t** (p. 213) that is returned by the operation **DDS_DataReader_get_matched_publications** (p. 679) and can also be used as a parameter to the operation **DDS_DataReader_get_matched_publication_data** (p. 680).

6.176.6.7 disposed_generation_count

```
DDS_Long DDS_SampleInfo::disposed_generation_count
```

The disposed generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 716) to **DDS_ALIVE_INSTANCE_STATE** (p. 716). The counter is reset when the instance resource is reclaimed (removed from the DataReader cache).

See also

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 1992)
Interpretation of the SampleInfo counters and ranks (p. 1993)

6.176.6.8 no_writers_generation_count

DDS_Long DDS_SampleInfo::no_writers_generation_count

The no writers generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716) to **DDS_ALIVE_INSTANCE_STATE** (p. 716). The counter is reset when the instance resource is reclaimed (removed from the DataReader cache).

See also

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 1992)
Interpretation of the SampleInfo counters and ranks (p. 1993)

6.176.6.9 sample_rank

DDS_Long DDS_SampleInfo::sample_rank

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by `read` or `take`.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1992)
Interpretation of the SampleInfo counters and ranks (p. 1993)

6.176.6.10 generation_rank

DDS_Long DDS_SampleInfo::generation_rank

The generation rank of the sample.

Indicates the generation difference (number of times the instance was NOT_ALIVE and become alive again) between the time the sample was received and the time the most recent sample in the collection related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1992)
Interpretation of the SampleInfo counters and ranks (p. 1993)

6.176.6.11 absolute_generation_rank

DDS_Long DDS_SampleInfo::absolute_generation_rank

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1992)
Interpretation of the SampleInfo counters and ranks (p. 1993)

6.176.6.12 valid_data

DDS_Boolean DDS_SampleInfo::valid_data

Indicates whether the DataSample contains data or else it is only used to communicate a change in the instance_state of the instance.

Normally each DataSample contains both a **DDS_SampleInfo** (p. 1990) and some Data. However there are situations where a DataSample contains only the **DDS_SampleInfo** (p. 1990) and does not have any associated data. This occurs when the RTI Connext notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Connext detects that an instance has no writers and changes the corresponding instance_state to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 716).

The application can distinguish whether a particular DataSample has data by examining the value of the **DDS_SampleInfo::valid_data** (p. 1997). If this flag is set to **DDS_BOOLEAN_TRUE** (p. 1203), then the DataSample contains valid Data. If the flag is set to **DDS_BOOLEAN_FALSE** (p. 1203), the DataSample contains no Data.

To ensure correctness and portability, the valid_data flag must be examined by the application prior to accessing the Data associated with the DataSample and if the flag is set to **DDS_BOOLEAN_FALSE** (p. 1203), the application should not access the Data associated with the DataSample, that is, the application should access only the **DDS_SampleInfo** (p. 1990).

6.176.6.13 reception_timestamp

struct **DDS_Time_t** DDS_SampleInfo::reception_timestamp

<<***extension***>> *(p. 1014)* The timestamp when the sample was committed by a DataReader.

6.176.6.14 publication_sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::publication_sequence_number
```

<<***extension***>> *(p. 1014)* The publication sequence number.

6.176.6.15 reception_sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::reception_sequence_number
```

<<***extension***>> *(p. 1014)* The reception sequence number when sample was committed by a DataReader

6.176.6.16 original_publication_virtual_guid

```
struct DDS_GUID_t DDS_SampleInfo::original_publication_virtual_guid
```

<<***extension***>> *(p. 1014)* The original publication virtual GUID.

If the **DDS_PresentationQosPolicy::access_scope** (p. 1897) of the **DDS_Publisher** (p. 446) is **DDS_GROUP_↩ PRESENTATION_QOS** (p. 1307), this field contains the **DDS_Publisher** (p. 446) virtual GUID that uniquely identifies the DataWriter group.

See also

DDS_SampleInfo_get_sample_identity (p. 703)

6.176.6.17 original_publication_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::original_publication_virtual_sequence_number
```

<<***extension***>> *(p. 1014)* The original publication virtual sequence number.

If the **DDS_PresentationQosPolicy::access_scope** (p. 1897) of the **DDS_Publisher** (p. 446) is **DDS_GROUP_↩ PRESENTATION_QOS** (p. 1307), this field contains the **DDS_Publisher** (p. 446) virtual sequence number that uniquely identifies a sample within the DataWriter group.

See also

DDS_SampleInfo_get_sample_identity (p. 703)

6.176.6.18 related_original_publication_virtual_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_original_publication_virtual_guid
```

<<***extension***>> *(*p. *1014)* The original publication virtual GUID of a related sample.

See also

DDS_SampleInfo_get_related_sample_identity (p. 703)

6.176.6.19 related_original_publication_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::related_original_publication_virtual_sequence_number
```

<<***extension***>> *(*p. *1014)* The original publication virtual sequence number of a related sample.

See also

DDS_SampleInfo_get_related_sample_identity (p. 703)

6.176.6.20 flag

```
DDS_SampleFlag DDS_SampleInfo::flag
```

<<***extension***>> *(*p. *1014)* Flags associated with the sample.

The flags can be set by using the field **DDS_WriteParams_t::flag** (p. 2110) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

6.176.6.21 source_guid

```
struct DDS_GUID_t DDS_SampleInfo::source_guid
```

<<***extension***>> *(*p. *1014)* The application logical data source associated with the sample.

The source_guid can be set by using the field **DDS_WriteParams_t::source_guid** (p. 2110) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

See also

DDS_WriteParams_t::source_guid (p. 2110) for additional information on **source_guid** (p. 1999) and when it is used.

6.176.6.22 related_source_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_source_guid
```

<<***extension***>> *(p. 1014)* The application logical data source that is related to the sample.

The related_source_guid can be set by using the field **DDS_WriteParams_t::related_source_guid** (p. 2111) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

6.176.6.23 related_subscription_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_subscription_guid
```

<<***extension***>> *(p. 1014)* The related_reader_guid associated with the sample.

The related_reader_guid can be set by using the field **DDS_WriteParams_t::related_reader_guid** (p. 2111) when writing a sample using the function **FooDataWriter_write_w_params** (p. 504).

6.176.6.24 topic_query_guid

```
struct DDS_GUID_t DDS_SampleInfo::topic_query_guid
```

<<***extension***>> *(p. 1014)* The GUID of the **DDS_TopicQuery** (p. 708) that is related to the sample.

This GUID indicates whether a sample is part of the response to a **DDS_TopicQuery** (p. 708) or a regular ("live") sample:

- If the sample was written for the TopicQuery stream, this field contains the GUID of the target TopicQuery.
- If the sample was written for the live stream, this field will be set to **DDS_GUID_UNKNOWN** (p. 1215).

6.176.6.25 coherent_set_info

```
struct DDS_CoherentSetInfo_t* DDS_SampleInfo::coherent_set_info
```

<<***extension***>> *(p. 1014)* The information about the coherent set that this sample is a part of.

This field is set for all samples that are part of a coherent set. Coherent sets are initiated using the operation **DDS_Publisher_begin_coherent_changes** (p. 462) and finalized using the operation **DDS_Publisher_end_coherent_changes** (p. 463).

See also

DDS_Publisher_begin_coherent_changes (p. 462) for additional information on coherent sets.

6.177 DDS_SampleInfoSeq Struct Reference

Declares IDL `sequence` < **DDS_SampleInfo** (p. 1990) > .

DDS_SAMPLE_REJECTED_STATUS (p. 1232)

Data Fields

- **DDS_Long total_count**

  *Total cumulative count of samples rejected by the **DDS_DataReader** (p. 618).*
- **DDS_Long total_count_change**

  The incremental number of samples rejected since the last time the listener was called or the status was read.
- **DDS_SampleRejectedStatusKind last_reason**

  Reason for rejecting the last sample rejected.
- **DDS_InstanceHandle_t last_instance_handle**

  Handle to the instance being updated by the last sample that was rejected.

6.179.1 Detailed Description

DDS_SAMPLE_REJECTED_STATUS (p. 1232)

Examples

HelloWorld_subscriber.c.

6.179.2 Field Documentation

6.179.2.1 total_count

DDS_Long DDS_SampleRejectedStatus::total_count

Total cumulative count of samples rejected by the **DDS_DataReader** (p. 618).

6.179.2.2 total_count_change

DDS_Long DDS_SampleRejectedStatus::total_count_change

The incremental number of samples rejected since the last time the listener was called or the status was read.

6.179.2.3 last_reason

DDS_SampleRejectedStatusKind DDS_SampleRejectedStatus::last_reason

Reason for rejecting the last sample rejected.

See also

DDS_SampleRejectedStatusKind (p. 625)

6.179.2.4 last_instance_handle

DDS_InstanceHandle_t DDS_SampleRejectedStatus::last_instance_handle

Handle to the instance being updated by the last sample that was rejected.

If the sample was rejected because of **DDS_REJECTED_BY_DECODE_FAILURE** (p. 627) and the **DDS_Data↩ Writer** (p. 488) set **DDS_DataWriterProtocolQosPolicy::disable_inline_keyhash** (p. 1652) to **DDS_BOOLEAN_↩ TRUE** (p. 1203), then the last_instance_handle may not be correct if the sample was encrypted.

6.180 DDS_SequenceNumber_t Struct Reference

Type for *sequence* number representation.

Data Fields

- **DDS_Long high**
  The most significant part of the sequence number.
- **DDS_UnsignedLong low**
  The least significant part of the sequence number.

6.180.1 Detailed Description

Type for *sequence* number representation.

Represents a 64-bit sequence number.

6.180.2 Field Documentation

6.180.2.1 high

DDS_Long DDS_SequenceNumber_t::high

The most significant part of the sequence number.

6.180.2.2 low

DDS_UnsignedLong DDS_SequenceNumber_t::low

The least significant part of the sequence number.

6.181 DDS_ServiceQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Service or tool associated with a DDS entity.

Data Fields

- **DDS_ServiceQosPolicyKind kind**
  <<***extension***>> *(p. 796) The kind of service.*

6.181.1 Detailed Description

<<***extension***>> *(p. 796)* Service or tool associated with a DDS entity.

This QoS policy is intended to be used by RTI infrastructure services and RTI tools.

User applications should not modify its value.

Entity:

DDS_DomainParticipant (p. 76), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.181.2 Field Documentation

6.181.2.1 kind

6.182.2 Field Documentation

6.182.2.1 service_id

```
DDS_Long DDS_ServiceRequest::service_id
```

The id of the service that the request was sent on.

There can be multiple services that use the built-in ServiceRequest topic. The service_id identifies which service a specific request was sent from.

See also

DDS_UNKNOWN_SERVICE_REQUEST_ID (p. 1102)

DDS_TOPIC_QUERY_SERVICE_REQUEST_ID (p. 1103)

6.182.2.2 instance_id

`struct` **`DDS_GUID_t`** `DDS_ServiceRequest::instance_id`

Each ServiceRequest is keyed on the instance_id.

The instance_id provides a way for users to differentiate between different requests coming from the same service.

6.182.2.3 request_body

`struct` **`DDS_OctetSeq`** `DDS_ServiceRequest::request_body`

Service-specific information.

Each service uses the request_body field to send information specific to that service in the form of an opaque sequence of bytes. Each service provides a helper function that will deserialize the information from the request body.

DDS_TopicQueryHelper_topic_query_data_from_service_request (p. 709)

6.183 DDS_ServiceRequestAcceptedStatus Struct Reference

DDS_SERVICE_REQUEST_ACCEPTED_STATUS (p. 1235)

Data Fields

- **DDS_Long total_count**

  *The total cumulative number of ServiceRequests that have been accepted by a **DDS_DataWriter** (p. 488).*
- **DDS_Long total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.
- **DDS_Long current_count**

  *The current number of ServiceRequests that have been accepted by this **DDS_DataWriter** (p. 488).*
- **DDS_Long current_count_change**

  The change in current_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_request_handle**

  *A handle to the last **DDS_ServiceRequest** (p. 2006) that caused the **DDS_DataWriter** (p. 488)'s status to change.*
- **DDS_Long service_id**

  ID of the service to which the accepted Request belongs.

6.183.1 Detailed Description

DDS_SERVICE_REQUEST_ACCEPTED_STATUS (p. 1235)

Currently, the only service that causes the ServiceRequestAcceptedStatus to be triggered is the **DDS_TopicQuery** (p. 708) service. A **DDS_ServiceRequest** (p. 2006) is accepted when a **DDS_DataWriter** (p. 488) matches with a **DDS_DataReader** (p. 618) that has created a **DDS_TopicQuery** (p. 708).

This status is also changed (and the listener, if any, called) when a ServiceRequest has been cancelled, or deleted. This will happen when a **DDS_DataReader** (p. 618) deletes a TopicQuery using **DDS_DataReader_delete_topic_↩query** (p. 693).

6.183.2 Field Documentation

6.183.2.1 total_count

DDS_Long DDS_ServiceRequestAcceptedStatus::total_count

The total cumulative number of ServiceRequests that have been accepted by a **DDS_DataWriter** (p. 488).

This number increases whenever a new request is accepted. It does not change when a request is cancelled.

6.183.2.2 total_count_change

DDS_Long DDS_ServiceRequestAcceptedStatus::total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

6.183.2.3 current_count

DDS_Long DDS_ServiceRequestAcceptedStatus::current_count

The current number of ServiceRequests that have been accepted by this **DDS_DataWriter** (p. 488).

This number increases when a new request is accepted and decreases when an existing request is cancelled.

6.183.2.4 current_count_change

DDS_Long DDS_ServiceRequestAcceptedStatus::current_count_change

The change in current_count since the last time the listener was called or the status was read.

6.183.2.5 last_request_handle

DDS_InstanceHandle_t DDS_ServiceRequestAcceptedStatus::last_request_handle

A handle to the last **DDS_ServiceRequest** (p. 2006) that caused the **DDS_DataWriter** (p. 488)'s status to change.

6.183.2.6 service_id

DDS_Long DDS_ServiceRequestAcceptedStatus::service_id

ID of the service to which the accepted Request belongs.

6.187 DDS_StringSeq Struct Reference

Instantiates **FooSeq** (p. 2120) < char* > with value type semantics.

6.187.1 Detailed Description

Instantiates **FooSeq** (p. 2120) < char* > with value type semantics.

StringSeq is a sequence that contains strings.

Even though the element type is a `char*`, i.e. a pointer, the sequence semantically behaves as a sequence of char* *value* types. When a **DDS_StringSeq** (p. 2010) is copied or deleted, the contained strings are also respectively copied or deleted.

Important: Users of this type must understand its memory management contract.

- Ownership of this sequence's buffer implies ownership of the pointers stored in that buffer; a loan of the buffer implies lack of ownership of the pointers. In other words, for a type **FooSeq** (p. 2120) where **Foo** (p. 2116) is a pointer, ownership of **Foo** (p. 2116) implies ownership of * **Foo** (p. 2116). In other words, deleting a string sequence that owns its memory implies the deletion of all strings in that sequence. See **FooSeq_loan_contiguous** (p. 1521) for more information about sequence memory ownership.
- The second important rule is that non-NULL strings are *assumed to be of sufficient size* to store the necessary characters. This is a dangerous rule, but it cannot be avoided because a string doesn't store the amount of memory it has. The only other alternative is to always free and re-allocate memory. Not only would this latter policy be very expensive, but it would essentially render any loaned **DDS_StringSeq** (p. 2010) immutable, since to modify any string in it would require freeing and re-allocating that string, which would violate the first principle discussed above.

It is also worth noting that the element type of a string sequence is char*, not const char*. It is therefore incorrect and dangerous, for example, to insert a string literal into a string sequence without first copying it into mutable memory.

In order to guarantee correct behavior, it is recommended that the contained elements always be manipulated using the string support API's described in **String Support** (p. 1526).

6.189 DDS_StructMember Struct Reference

A description of a member of a struct.

Data Fields

- char * **name**

  The name of the struct member.
- const **DDS_TypeCode** * **type**

  The type of the struct member.
- **DDS_Boolean is_pointer**

  Indicates whether the struct member is a pointer or not.
- **DDS_Short bits**

  Number of bits of a bitfield member.
- **DDS_Boolean is_key**

  Indicates if the struct member is a key member or not.
- **DDS_Long id**

  The member ID.
- **DDS_Boolean is_optional**

  Indicates if the struct member is optional or required.
- **DDS_Boolean is_must_understand**

  Indicates if the struct member is annotated as "must understand".

6.189.1 Detailed Description

A description of a member of a struct.

See also

DDS_StructMemberSeq (p. 2014)

DDS_TypeCodeFactory_create_struct_tc (p. 292)

6.189.2 Field Documentation

6.189.2.1 name

```
char* DDS_StructMember::name
```

The name of the struct member.

Cannot be NULL.

6.189.2.2 type

```
const  DDS_TypeCode* DDS_StructMember::type
```

The type of the struct member.

Cannot be NULL.

6.189.2.3 is_pointer

```
DDS_Boolean DDS_StructMember::is_pointer
```

Indicates whether the struct member is a pointer or not.

6.189.2.4 bits

```
DDS_Short DDS_StructMember::bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **DDS_TYPECODE_NOT_BITFIELD** (p. 237).

6.189.2.5 is_key

```
DDS_Boolean DDS_StructMember::is_key
```

Indicates if the struct member is a key member or not.

6.189.2.6 id

```
DDS_Long DDS_StructMember::id
```

The member ID.

Use **DDS_TYPECODE_MEMBER_ID_INVALID** (p. 236) to have the member ID automatically assigned.

6.189.2.7 is_optional

```
DDS_Boolean DDS_StructMember::is_optional
```

Indicates if the struct member is optional or required.

6.189.2.8 is_must_understand

```
DDS_Boolean DDS_StructMember::is_must_understand
```

Indicates if the struct member is annotated as "must understand".

6.190 DDS_StructMemberSeq Struct Reference

Defines a sequence of struct members.

6.190.1 Detailed Description

Defines a sequence of struct members.

6.191 DDS_SubscriberListener Struct Reference

<<***interface***>> *(*p. *1015)* **DDS_Listener** (p. 1819) for status about a subscriber.

Data Fields

- struct **DDS_DataReaderListener as_datareaderlistener**
  *The superclass instance of this **DDS_SubscriberListener** (*p. *2014).*
- **DDS_SubscriberListener_DataOnReadersCallback on_data_on_readers**
  *Handles the **DDS_DATA_ON_READERS_STATUS** (*p. *1232) communication status.*

6.191.1 Detailed Description

<<***interface***>> *(p. 1015)* **DDS_Listener** (p. 1819) for status about a subscriber.

Entity:

DDS_Subscriber (p. 575)

Status:

DDS_DATA_AVAILABLE_STATUS (p. 1232);
DDS_DATA_ON_READERS_STATUS (p. 1232);
DDS_LIVELINESS_CHANGED_STATUS (p. 1233), **DDS_LivelinessChangedStatus** (p. 1823);
DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 1231), **DDS_RequestedDeadlineMissedStatus** (p. 1951);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 1231), **DDS_RequestedIncompatibleQosStatus** (p. 1952);
DDS_SAMPLE_LOST_STATUS (p. 1232), **DDS_SampleLostStatus** (p. 2001);
DDS_SAMPLE_REJECTED_STATUS (p. 1232), **DDS_SampleRejectedStatus** (p. 2002);
DDS_SUBSCRIPTION_MATCHED_STATUS (p. 1234), **DDS_SubscriptionMatchedStatus** (p. 2028);

See also

DDS_Listener (p. 1819)

Status Kinds (p. 1224)

Operations Allowed in Listener Callbacks (p. 1821)

6.191.2 Field Documentation

6.191.2.1 as_datareaderlistener

```
struct DDS_DataReaderListener DDS_SubscriberListener::as_datareaderlistener
```

The superclass instance of this **DDS_SubscriberListener** (p. 2014).

6.191.2.2 on_data_on_readers

```
DDS_SubscriberListener_DataOnReadersCallback DDS_SubscriberListener::on_data_on_readers
```

Handles the **DDS_DATA_ON_READERS_STATUS** (p. 1232) communication status.

6.192 DDS_SubscriberQos Struct Reference

QoS policies supported by a **DDS_Subscriber** (p. 575) entity.

Data Fields

- struct **DDS_PresentationQosPolicy presentation**
  *Presentation policy, **PRESENTATION** (p. 1306).*
- struct **DDS_PartitionQosPolicy partition**
  *<<**basic**>> (p. 784) Partition policy, **PARTITION** (p. 1305).*
- struct **DDS_GroupDataQosPolicy group_data**
  *Group data policy, **GROUP_DATA** (p. 1295).*
- struct **DDS_EntityFactoryQosPolicy entity_factory**
  *<<**basic**>> (p. 784) Entity factory policy, **ENTITY_FACTORY** (p. 1291).*
- struct **DDS_EntityNameQosPolicy subscriber_name**
  *<<**extension**>> (p. 1014) EntityName policy, **ENTITY_NAME** (p. 1292).*

6.192.1 Detailed Description

QoS policies supported by a **DDS_Subscriber** (p. 575) entity.

You must set certain members in a consistent manner:

length of **DDS_GroupDataQosPolicy::value** (p. 1807) <= **DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length** (p. 1749)

length of **DDS_PartitionQosPolicy::name** (p. 1886) <= **DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions** (p. 1750)

combined number of characters (including terminating 0) in **DDS_PartitionQosPolicy::name** (p. 1886) <= **DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters** (p. 1750)

If any of the above are not true, **DDS_Subscriber_set_qos** (p. 595) and **DDS_Subscriber_set_qos_with_profile** (p. 595) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224)

6.192.2 Field Documentation

6.192.2.1 presentation

`struct` **DDS_PresentationQosPolicy** `DDS_SubscriberQos::presentation`

Presentation policy, **PRESENTATION** (p. 1306).

6.192.2.2 partition

`struct` **DDS_PartitionQosPolicy** `DDS_SubscriberQos::partition`

<<***basic***>> *(p. 784)* Partition policy, **PARTITION** (p. 1305).

6.192.2.3 group_data

`struct` **DDS_GroupDataQosPolicy** `DDS_SubscriberQos::group_data`

Group data policy, **GROUP_DATA** (p. 1295).

6.192.2.4 entity_factory

`struct` **DDS_EntityFactoryQosPolicy** `DDS_SubscriberQos::entity_factory`

<<***basic***>> *(p. 784)* Entity factory policy, **ENTITY_FACTORY** (p. 1291).

6.192.2.5 subscriber_name

`struct` **DDS_EntityNameQosPolicy** `DDS_SubscriberQos::subscriber_name`

<<***extension***>> *(p. 1014)* EntityName policy, **ENTITY_NAME** (p. 1292).

6.193 DDS_SubscriberSeq Struct Reference

Declares IDL `sequence <` **DDS_Subscriber** (p. 575) `>` .

6.193.1 Detailed Description

Declares IDL `sequence <` **DDS_Subscriber** (p. 575) `>` .

struct **DDS_LivelinessQosPolicy** DDS_SubscriptionBuiltinTopicData::liveliness

Policy of the corresponding DataReader.

6.194.2.9 reliability

struct **DDS_ReliabilityQosPolicy** DDS_SubscriptionBuiltinTopicData::reliability

Policy of the corresponding DataReader.

6.194.2.10 ownership

struct **DDS_OwnershipQosPolicy** DDS_SubscriptionBuiltinTopicData::ownership

Policy of the corresponding DataReader.

6.194.2.11 destination_order

struct **DDS_DestinationOrderQosPolicy** DDS_SubscriptionBuiltinTopicData::destination_order

Policy of the corresponding DataReader.

Warning

Only the field **DDS_DestinationOrderQosPolicy::kind** (p. 1690) is propagated during discovery. The other fields always contain their default values.

6.194.2.12 user_data

struct **DDS_UserDataQosPolicy** DDS_SubscriptionBuiltinTopicData::user_data

Policy of the corresponding DataReader.

6.194.2.13 time_based_filter

struct **DDS_TimeBasedFilterQosPolicy** DDS_SubscriptionBuiltinTopicData::time_based_filter

Policy of the corresponding DataReader.

6.194.2.14 presentation

struct **DDS_PresentationQosPolicy** DDS_SubscriptionBuiltinTopicData::presentation

Policy of the Subscriber to which the DataReader belongs.

6.194.2.15 partition

struct **DDS_PartitionQosPolicy** DDS_SubscriptionBuiltinTopicData::partition

Policy of the Subscriber to which the DataReader belongs.

6.194.2.16 topic_data

struct **DDS_TopicDataQosPolicy** DDS_SubscriptionBuiltinTopicData::topic_data

Policy of the related Topic.

6.194.2.17 group_data

struct **DDS_GroupDataQosPolicy** DDS_SubscriptionBuiltinTopicData::group_data

Policy of the Subscriber to which the DataReader belongs.

6.194.2.18 type_consistency

struct **DDS_TypeConsistencyEnforcementQosPolicy** DDS_SubscriptionBuiltinTopicData::type_consistency

Policy of the corresponding DataReader.

6.194.2.19 representation

struct **DDS_DataRepresentationQosPolicy** DDS_SubscriptionBuiltinTopicData::representation

Data representation policy of the corresponding DataReader.

6.194.2.20 data_tags

DDS_DataTagQosPolicy DDS_SubscriptionBuiltinTopicData::data_tags

Tags of the corresponding DataReader.

6.194.2.21 type_code

```
struct DDS_TypeCode* DDS_SubscriptionBuiltinTopicData::type_code
```

<<***extension***>> *(p. 1014)* Type code information of the corresponding Topic.

If using TypeObject v2 (**DDS_DISCOVERYCONFIG_TYPE_LOOKUP_SERVICE_CHANNEL** (p. 1283)) this is NULL if the type is not yet resolved. If the remote endpoint's topic name matches the **DDS_DiscoveryConfigQosPolicy::request_types_filter** (p. 1716), this will always contain the TypeCode converted from the complete TypeObject v2 representation (if non-NULL); the minimal TypeObject v2 will not be provided even if available. If the topic name does not match the **DDS_DiscoveryConfigQosPolicy::request_types_filter** (p. 1716) and the complete TypeObject v2 is resolved, this will contain the TypeCode converted from the complete TypeObject v2 representation. If the topic name does not match the **DDS_DiscoveryConfigQosPolicy::request_types_filter** (p. 1716), and only the minimal TypeObject v2 is resolved, this will contain the TypeCode converted from the minimal TypeObject v2 representation. As such, information that is not available in the minimal TypeObject v2 representation will be lost (such as default values) and member names will be the stringified version of the hashed member name, rather than the full member name. See `TypeLookup Service` for more information.

6.194.2.22 subscriber_key

```
DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::subscriber_key
```

<<***extension***>> *(p. 1014)* DCPS key of the subscriber to which the DataReader belongs.

6.194.2.23 property

```
struct DDS_PropertyQosPolicy DDS_SubscriptionBuiltinTopicData::property
```

<<***extension***>> *(p. 1014)* Properties of the corresponding DataReader.

6.194.2.24 unicast_locators

```
struct DDS_LocatorSeq DDS_SubscriptionBuiltinTopicData::unicast_locators
```

<<***extension***>> *(p. 1014)* Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

6.194.2.25 multicast_locators

```
struct DDS_LocatorSeq DDS_SubscriptionBuiltinTopicData::multicast_locators
```

<<***extension***>> *(p. 1014)* Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

6.194.2.26 content_filter_property

`struct` **DDS_ContentFilterProperty_t** DDS_SubscriptionBuiltinTopicData::content_filter_property

<<***extension***>> *(*p. *1014)* This field provides all the required information to enable content filtering on the Writer side.

6.194.2.27 virtual_guid

`struct` **DDS_GUID_t** DDS_SubscriptionBuiltinTopicData::virtual_guid

<<***extension***>> *(*p. *1014)* Virtual GUID associated to the DataReader.

See also

DDS_GUID_t (p. 1807)

6.194.2.28 service

`struct` **DDS_ServiceQosPolicy** DDS_SubscriptionBuiltinTopicData::service

<<***extension***>> *(*p. *1014)* Policy of the corresponding DataReader.

6.194.2.29 rtps_protocol_version

DDS_ProtocolVersion_t DDS_SubscriptionBuiltinTopicData::rtps_protocol_version

<<***extension***>> *(*p. *1014)* Version number of the RTPS wire protocol used.

6.194.2.30 rtps_vendor_id

`struct` **DDS_VendorId_t** DDS_SubscriptionBuiltinTopicData::rtps_vendor_id

<<***extension***>> *(*p. *1014)* ID of vendor implementing the RTPS wire protocol.

6.194.2.31 product_version

struct **DDS_ProductVersion_t** DDS_SubscriptionBuiltinTopicData::product_version

<<***extension***>> *(*p. *1014)* This is a vendor specific parameter. It gives the current version of RTI Connext

6.194.2.32 disable_positive_acks

DDS_Boolean DDS_SubscriptionBuiltinTopicData::disable_positive_acks

<<***extension***>> *(*p. *1014)* This is a vendor specific parameter. Determines whether the corresponding DataReader sends positive acknowledgments for reliability.

6.194.2.33 subscription_name

struct **DDS_EntityNameQosPolicy** DDS_SubscriptionBuiltinTopicData::subscription_name

<<***extension***>> *(*p. *1014)* The subscription name and role name.

This member contains the name and the role name of the discovered subscription.

6.194.2.34 trust_protection_info

struct **DDS_EndpointTrustProtectionInfo** DDS_SubscriptionBuiltinTopicData::trust_protection_info

<<***extension***>> *(*p. *1014)* Trust plugins protection information associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.194.2.35 trust_algorithm_info

`struct` **DDS_EndpointTrustAlgorithmInfo** DDS_SubscriptionBuiltinTopicData::trust_algorithm_info

<<***extension***>> *(*p. *1014)* Trust Plugins algorithms associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.194.2.36 related_datawriter_key

DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::related_datawriter_key

<<***extension***>> *(*p. *1014)* Key of the related DataWriter that is created as a part of the Remote Procedure Call (RPC) or Request-Reply endpoints.

This field will be set to something other than **DDS_BUILTIN_TOPIC_KEY_UNKNOWN** (p. 1113) only when the discovered DataReader is a part of Remote Procedure Call (RPC) or Request-Reply endpoints.

6.197 DDS_SubscriptionMatchedStatus Struct Reference

DDS_SUBSCRIPTION_MATCHED_STATUS (p. 1234)

Data Fields

- **DDS_Long total_count**

  *The total cumulative number of times that this **DDS_DataReader** (p. 618) discovered a "match" with a **DDS_DataWriter** (p. 488).*
- **DDS_Long total_count_change**

  The changes in total_count since the last time the listener was called or the status was read.
- **DDS_Long current_count**

  *The current number of DataWriters with which the **DDS_DataReader** (p. 618) is matched.*
- **DDS_Long current_count_peak**

  <<***extension***>> *(p. 1014) Greatest number of DataWriters that matched this DataReader simultaneously.*
- **DDS_Long current_count_change**

  The change in current_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_publication_handle**

  *This InstanceHandle can be used to look up which remote **DDS_DataWriter** (p. 488) was the last to cause this Data↩ Reader's status to change, using **DDS_DataReader_get_matched_publication_data** (p. 680).*

6.197.1 Detailed Description

DDS_SUBSCRIPTION_MATCHED_STATUS (p. 1234)

A "match" happens when the **DDS_DataReader** (p. 618) finds a **DDS_DataWriter** (p. 488) with the same **DDS_Topic** (p. 174), same or compatible data type, and an offered QoS that is compatible with that requested by the **DDS_Data↩ Reader** (p. 618). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDS_DataReader** (p. 618) will become "unmatched" from a remote **DDS_DataWriter** (p. 488) when that **DDS_DataWriter** (p. 488) goes away for any of the following reasons:

- The **DDS_DomainParticipant** (p. 76) containing the matched **DDS_DataWriter** (p. 488) has lost liveliness.
- This DataReader or the matched DataWriter has changed QoS such that the entities are now incompatible.
- The matched DataWriter has been deleted.

This status may reflect changes from multiple match or unmatch events, and the **DDS_SubscriptionMatchedStatus::current_count_change** (p. 2030) can be used to determine the number of changes since the listener was called back or the status was checked.

Note: A DataWriter's loss of liveliness (which is determined by **DDS_LivelinessQosPolicyKind** (p. 1298)) does not trigger an unmatch event. So a DataWriter may still match even though its liveliness is lost.

Examples

HelloWorld_subscriber.c.

6.197.2 Field Documentation

6.197.2.1 total_count

DDS_Long DDS_SubscriptionMatchedStatus::total_count

The total cumulative number of times that this **DDS_DataReader** (p. 618) discovered a "match" with a **DDS_DataWriter** (p. 488).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **DDS_SubscriptionMatchedStatus** (p. 2028).

6.197.2.2 total_count_change

DDS_Long DDS_SubscriptionMatchedStatus::total_count_change

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times the DataReader ever matched with a DataWriter).

6.197.2.3 current_count

DDS_Long DDS_SubscriptionMatchedStatus::current_count

The current number of DataWriters with which the **DDS_DataReader** (p. 618) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **DDS_SubscriptionMatchedStatus** (p. 2028).

6.197.2.4 current_count_peak

DDS_Long DDS_SubscriptionMatchedStatus::current_count_peak

<<***extension***>> *(*p. *1014)* Greatest number of DataWriters that matched this DataReader simultaneously.

That is, there was no moment in time when more than this many DataWriters matched this DataReader. (As a result, total_count can be higher than current_count_peak.)

6.197.2.5 current_count_change

DDS_Long DDS_SubscriptionMatchedStatus::current_count_change

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataWriters have become unmatched for one or more of the reasons described in **DDS_SubscriptionMatchedStatus** (p. 2028).

6.197.2.6 last_publication_handle

DDS_InstanceHandle_t DDS_SubscriptionMatchedStatus::last_publication_handle

This InstanceHandle can be used to look up which remote **DDS_DataWriter** (p. 488) was the last to cause this Data↩Reader's status to change, using **DDS_DataReader_get_matched_publication_data** (p. 680).

If the DataWriter no longer matches this DataReader due to any of the reasons in **DDS_SubscriptionMatchedStatus** (p. 2028) except incompatible QoS, then the DataWriter has been purged from this DataReader's DomainParticipant discovery database. (See the "Discovery Overview" section of the User's Manual.) In that case, the **DDS_Data↩Reader_get_matched_publication_data** (p. 680) method will not be able to return information about the DataWriter. The only way to get information about the lost DataWriter is if you cached the information previously.

6.198 DDS_SystemResourceLimitsQosPolicy Struct Reference

<<***extension***>> *(*p. *796)* Configures **DDS_DomainParticipant** (p. 76)-independent resources used by RTI Connext. Mainly used to change the maximum number of **DDS_DomainParticipant** (p. 76) entities that can be created within a single process (address space).

Data Fields

- **DDS_Long max_objects_per_thread**

  [DEPRECATED] (p. ***968)*** <<***extension***>> *(*p. *796) The maximum number of objects that can be stored per thread for a* ***DDS_DomainParticipantFactory*** *(*p. *32).*
- **DDS_Long initial_objects_per_thread**

  <<***extension***>> *(*p. *796) The number of objects per thread for a* ***DDS_DomainParticipantFactory*** *(*p. *32) for which infrastructure will initially be allocated.*

6.198.1 Detailed Description

<<***extension***>> *(p. 796)* Configures **DDS_DomainParticipant** (p. 76)-independent resources used by RTI Connext. Mainly used to change the maximum number of **DDS_DomainParticipant** (p. 76) entities that can be created within a single process (address space).

Entity:

DDS_DomainParticipantFactory (p. 32)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.198.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple **DDS_DomainParticipant** (p. 76) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of **DDS_DomainParticipant** (p. 76) entities that can be created in a single process/address space. These values cannot be changed after a DomainParticipant has been created and they cannot be set in a QoS XML file.

6.198.3 Field Documentation

6.198.3.1 max_objects_per_thread

```
DDS_Long DDS_SystemResourceLimitsQosPolicy::max_objects_per_thread
```

[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* The maximum number of objects that can be stored per thread for a **DDS_DomainParticipantFactory** (p. 32).

This value is the upper bound on the number of objects that can be stored per thread. When a **DDS_Domain↩ ParticipantFactory** (p. 32) is created, infrastructure will be created to manage the number of objects specified by initial_objects_per_thread. As more objects are required by the application, the infrastructure will be automatically grown to accommodate up to max_objects_per_thread objects. Leave this property set to the default value to allow the infrastructure to grow as needed. If you wish to strictly control memory allocation, set max_objects_per_thread to a smaller value, but note that this runs the risk of a runtime error and reduced application functionality if your limit is reached.

[default] 261120

[range] [1, 261120]

Categories

Immutable (p. 916), **Middleware Memory Management** (p. 880)

6.198.3.2 initial_objects_per_thread

```
DDS_Long DDS_SystemResourceLimitsQosPolicy::initial_objects_per_thread
```

<<***extension***>> *(p. 796)* The number of objects per thread for a **DDS_DomainParticipantFactory** (p. 32) for which infrastructure will initially be allocated.

The infrastructure for managing thread-specific objects will initially be sized according to this value. The infrastructure will grow automatically, up to a maximum of max_objects_per_thread, as required by the application at runtime. If you are certain that more than the default value of initial_objects_per_thread will be required for your application and you wish to reduce the number of memory allocations performed while your application reaches steady state, you may set this value to a larger number. To improve the efficiency of memory allocation, RTI Connext may initially size the infrastructure to a larger value than the value of initial_objects_per_thread. The infrastructure will never be sized less than initial_objects_per_thread or greater than max_objects_per_thread. When the infrastructure for managing thread-specific objects is created or increased, a log message stating "Allowed number of thread specific objects is now " will be produced at the local log level.

[default] 1024

[range] [1, 261120]; must be less than or equal to max_objects_per_thread

6.201 DDS_ThreadFactory Struct Reference

<<***extension***>> *(p. 1014)* <<***interface***>> *(p. 1015)* Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDS_ThreadFactory_OnSpawned↩ Function** (p. 1435) that specifies the operation to run in the new thread.

Data Fields

- void * **factory_data**

  A place for interface implementors to keep a pointer to data that may be needed by their factory.
- **DDS_ThreadFactory_CreateThreadCallback create_thread**

  Handles the creation of new threads.
- **DDS_ThreadFactory_DeleteThreadCallback delete_thread**

  Handles the deletion of threads previously created by this factory.

6.201.1 Detailed Description

<<***extension***>> *(*p. *1014)* <<***interface***>> *(*p. *1015)* Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDS_ThreadFactory_OnSpawned↩ Function** (p. 1435) that specifies the operation to run in the new thread.

6.201.2 Field Documentation

6.201.2.1 factory_data

```
void* DDS_ThreadFactory::factory_data
```

A place for interface implementors to keep a pointer to data that may be needed by their factory.

6.201.2.2 create_thread

```
DDS_ThreadFactory_CreateThreadCallback DDS_ThreadFactory::create_thread
```

Handles the creation of new threads.

This callback is called by the middleware whenever it needs to create a new thread. The operation creates a new thread of control that will call the function specified by **DDS_ThreadFactory_OnSpawnedFunction** (p. 1435). On success, this operation must guarantee that after return the new thread of control been spawned and its execution has started or will start some time after.

The **DDS_ThreadFactory_OnSpawnedFunction** (p. 1435), function must be called in the new thread and return its value on finalization. The function should be called as follows:

```
void * thread_out = on_spawned(thread_params);

...

return thread_out;
```

Some thread frameworks do this directly by just receiving the function and its parameters as arguments on thread creation. For instance, POSIX follows this model when creating a thread and the start_routine function has the same signature as **DDS_ThreadFactory_OnSpawnedFunction** (p. 1435), so the parameter can be passed directly:

```
int result = pthread_create(&pthread_handle, &attr, on_spawned, thread_params);

...

return &pthread_handle;
```

6.201.2.3 delete_thread

DDS_ThreadFactory_DeleteThreadCallback DDS_ThreadFactory::delete_thread

Handles the deletion of threads previously created by this factory.

This callback is called by the middleware whenever it needs to delete a thread. This operation deletes a thread previously created via a call to **DDS_ThreadFactory::create_thread** (p. 2034) on the same factory object. On success, the thread must be deleted but it does not have to guarantee that the execution has finished. Likewise, resources associated with the underlying operating system may be still in use. Depending on the thread framework, resources allocated on thread creation are released upon thread finalization. POSIX follows this model so no actions are required on the thread handle returned by pthread_create().

6.202 DDS_ThreadSettings_t Struct Reference

The properties of a thread of execution.

Data Fields

- **DDS_ThreadSettingsKindMask mask**

  Describes the type of thread.
- **DDS_Long priority**

  Thread priority.
- **DDS_Long stack_size**

  The thread stack-size.
- struct **DDS_LongSeq cpu_list**

  The list of processors on which the thread(s) may run.
- **DDS_ThreadSettingsCpuRotationKind cpu_rotation**

  Determines how processor affinity is applied to multiple threads.

6.202.1 Detailed Description

The properties of a thread of execution.

QoS:

DDS_EventQosPolicy (p. 1796) **DDS_DatabaseQosPolicy** (p. 1581) **DDS_ReceiverPoolQosPolicy** (p. 1938) **DDS_AsynchronousPublisherQosPolicy** (p. 1539)

6.204 DDS_TimeBasedFilterQosPolicy Struct Reference

<<***spec***>> *(*p. *791)* Filter that allows a **DDS_DataReader** (p. 618) to specify that it is interested only in (potentially) a subset of the values of the data.

Data Fields

- struct **DDS_Duration_t minimum_separation**

  <<***basic***>> *(*p. *784)* <<***spec***>> *(*p. *791) The minimum separation duration between subsequent samples.*

6.204.1 Detailed Description

<<***spec***>> *(*p. *791)* Filter that allows a **DDS_DataReader** (p. 618) to specify that it is interested only in (potentially) a subset of the values of the data.

The filter states that the **DDS_DataReader** (p. 618) does not want to receive more than one value each `minimum_separation`, regardless of how fast the changes occur.

Entity:

DDS_DataReader (p. 618)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **YES** (p. 1247)

6.204.2 Usage

You can use this QoS policy to reduce the amount of data received by a **DDS_DataReader** (p. 618). **DDS_DataWriter** (p. 488) entities may send data faster than needed by a **DDS_DataReader** (p. 618). For example, a **DDS_DataReader** (p. 618) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measured in tenths (0.1) of a second up to several seconds. However, a **DDS_DataWriter** (p. 488) of sensor information may have other **DDS_DataReader** (p. 618) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **DDS_DataReader** (p. 618) entities can set their own time-based filters, so that data published faster than the period set by a each **DDS_DataReader** (p. 618) will not be delivered to that **DDS_DataReader** (p. 618).

The **TIME_BASED_FILTER** (p. 1331) also applies to each instance separately; that is, the constraint is that the **DDS_DataReader** (p. 618) does not want to see more than one sample of each instance per `minimum_separation` period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **DDS_DataReader** (p. 618), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort data delivery, if the data type is unkeyed and the **DDS_DataWriter** (p. 488) has an infinite **DDS_LivelinessQosPolicy::lease_duration** (p. 1828), RTI Connext will only send as many packets to a **DDS_DataReader** (p. 618) as required by the TIME_BASED_FILTER, no matter how fast **FooDataWriter_write** (p. 499) is called.

For multicast data delivery to multiple DataReaders, the one with the lowest `minimum_separation` determines the DataWriter's send rate. For example, if a **DDS_DataWriter** (p. 488) sends over multicast to two DataReaders, one with `minimum_separation` of 2 seconds and one with `minimum_separation` of 1 second, the DataWriter will send every 1 second.

In configurations where RTI Connext must send all the data published by the **DDS_DataWriter** (p. 488) (for example, when the **DDS_DataWriter** (p. 488) is reliable, when the data type is keyed, or when the **DDS_DataWriter** (p. 488) has a finite **DDS_LivelinessQosPolicy::lease_duration** (p. 1828)), only the data that passes the TIME_BASED_FILTER will be stored in the receive queue of the **DDS_DataReader** (p. 618). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

6.204.3 Consistency

It is inconsistent for a **DDS_DataReader** (p. 618) to have a `minimum_separation` longer than its **DEADLINE** (p. 1274) `period`.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time t=0 seconds. You then publish your next sample at t=1 seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at t=2 seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your `minimum_separation` to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your `minimum_separation` to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See **DDS_DeadlineQosPolicy** (p. 1685) for more information about the interactions between deadlines and time-based filters.

The setting of a **TIME_BASED_FILTER** (p. 1331) – that is, the selection of a `minimum_separation` with a value greater than zero – is consistent with all settings of the **HISTORY** (p. 1294) and **RELIABILITY** (p. 1323) QoS. The **TIME↩ _BASED_FILTER** (p. 1331) specifies the samples that are of interest to the **DDS_DataReader** (p. 618). The **HISTORY** (p. 1294) and **RELIABILITY** (p. 1323) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the **DDS_DataReader** (p. 618); that is, they apply *after* the **TIME_BASED_FILTER** (p. 1331) has been applied.

In the case where the reliability QoS kind is **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325), in steady-state – defined as the situation where the **DDS_DataWriter** (p. 488) does not write new samples for a period "long" compared to the `minimum_separation` – the system should guarantee delivery of the last sample to the **DDS_DataReader** (p. 618).

  Policy of the corresponding Topic.
- struct **DDS_DataRepresentationQosPolicy representation**
  Data representation policy of the corresponding Topic.

6.205.1 Detailed Description

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS_TOPIC_TOPIC_NAME** (p. 1096). It contains QoS policies and additional information that apply to the remote **DDS_Topic** (p. 174).

Note: The **DDS_TopicBuiltinTopicData** (p. 2040) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS_PublicationBuiltinTopicData** (p. 1909) and **DDS_Subscription↩ BuiltinTopicData** (p. 2018)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

6.205.2 Field Documentation

6.205.2.1 key

```
DDS_BuiltinTopicKey_t DDS_TopicBuiltinTopicData::key
```

DCPS key to distinguish entries.

6.205.2.2 name

```
char* DDS_TopicBuiltinTopicData::name
```

Name of the **DDS_Topic** (p. 174).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1527).

See also

String Conventions (p. 1527)

6.205.2.3 type_name

```
char* DDS_TopicBuiltinTopicData::type_name
```

Name of the type attached to the **DDS_Topic** (p. 174).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1527).

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Data Fields

- struct **DDS_OctetSeq value**
  a sequence of octets

6.208.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Entity:

DDS_Topic (p. 174)

Properties:

RxO (p. 1247) = NO
Changeable (p. 1247) = **YES** (p. 1247)

See also

DDS_DomainParticipant_get_builtin_subscriber (p. 128)

6.208.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDS_Topic** (p. 174) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Connext.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with **DDS_DataReaderListener** (p. 1593), **DDS_DataWriterListener** (p. 1644), or operations such as **DDS_DomainParticipant_ignore_topic** (p. 131), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS_DomainParticipantResourceLimitsQosPolicy::topic_data_max_length** (p. 1748).

6.208.3 Field Documentation

6.208.3.1 value

`struct` **`DDS_OctetSeq`** `DDS_TopicDataQosPolicy::value`

a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0,max_length]

6.209 DDS_TopicListener Struct Reference

<<***interface***>> *(*p. *1015)* **DDS_Listener** (p. 1819) for **DDS_Topic** (p. 174) entities.

Data Fields

- struct **DDS_Listener as_listener**
  The superclass instance of this ***DDS_TopicListener*** *(*p. *2047).*
- **DDS_TopicListener_InconsistentTopicCallback on_inconsistent_topic**
  Handle the ***DDS_INCONSISTENT_TOPIC_STATUS*** *(*p. *1230) status.*

6.209.1 Detailed Description

<<***interface***>> *(*p. *1015)* **DDS_Listener** (p. 1819) for **DDS_Topic** (p. 174) entities.

Entity:

DDS_Topic (p. 174)

Status:

DDS_INCONSISTENT_TOPIC_STATUS (p. 1230), **DDS_InconsistentTopicStatus** (p. 1811)

This is the interface that can be implemented by an application-provided class and then registered with the **DDS_Topic** (p. 174) such that the application can be notified by RTI Connext of relevant status changes.

See also

Status Kinds (p. 1224)

DDS_Listener (p. 1819)

DDS_Topic_set_listener (p. 198)

Operations Allowed in Listener Callbacks (p. 1821)

6.209.2 Field Documentation

6.209.2.1 as_listener

`struct` **DDS_Listener** DDS_TopicListener::as_listener

The superclass instance of this **DDS_TopicListener** (p. 2047).

6.209.2.2 on_inconsistent_topic

DDS_TopicListener_InconsistentTopicCallback DDS_TopicListener::on_inconsistent_topic

Handle the **DDS_INCONSISTENT_TOPIC_STATUS** (p. 1230) status.

This callback is called when a remote **DDS_Topic** (p. 174) is discovered but is inconsistent with the locally created **DDS_Topic** (p. 174) of the same topic name.

6.210 DDS_TopicQos Struct Reference

QoS policies supported by a **DDS_Topic** (p. 174) entity.

- struct **DDS_DataRepresentationQosPolicy representation**

  *Data representation policy, **DATA_REPRESENTATION** (p. 1258).*

6.210.1 Detailed Description

QoS policies supported by a **DDS_Topic** (p. 174) entity.

You must set certain members in a consistent manner:

length of **DDS_TopicQos::topic_data** (p. 2049) .value <= **DDS_DomainParticipantQos::resource_limits** (p. 1731) .topic_data_max_length

If any of the above are not true, **DDS_Topic_set_qos** (p. 196), **DDS_Topic_set_qos_with_profile** (p. 197) and **DDS_DomainParticipant_set_default_topic_qos** (p. 86) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 1224) and **DDS_DomainParticipant_create_topic** (p. 114) will return NULL.

Entity:

DDS_Topic (p. 174)

struct DDS_TopicDataQosPolicy DDS_TopicQos::topic_data
```

Topic data policy, **TOPIC_DATA** (p. 1331).

6.210.2.2 durability

`struct` **DDS_DurabilityQosPolicy** DDS_TopicQos::durability

Durability policy, **DURABILITY** (p. 1287).

6.210.2.3 durability_service

`struct` **DDS_DurabilityServiceQosPolicy** DDS_TopicQos::durability_service

DurabilityService policy, **DURABILITY_SERVICE** (p. 1291).

6.210.2.4 deadline

`struct` **DDS_DeadlineQosPolicy** DDS_TopicQos::deadline

<<***basic***>> *(p. 784)* Deadline policy, **DEADLINE** (p. 1274).

6.210.2.5 latency_budget

`struct` **DDS_LatencyBudgetQosPolicy** DDS_TopicQos::latency_budget

Latency budget policy, **LATENCY_BUDGET** (p. 1296).

6.210.2.6 liveliness

`struct` **DDS_LivelinessQosPolicy** DDS_TopicQos::liveliness

Liveliness policy, **LIVELINESS** (p. 1298).

6.210.2.7 reliability

`struct` **DDS_ReliabilityQosPolicy** DDS_TopicQos::reliability

Reliability policy, **RELIABILITY** (p. 1323).

6.210.2.8 destination_order

`struct` **DDS_DestinationOrderQosPolicy** DDS_TopicQos::destination_order

Destination order policy, **DESTINATION_ORDER** (p. 1275).

6.210.2.9 history

`struct` **DDS_HistoryQosPolicy** DDS_TopicQos::history

<<***basic***>> *(p. 784)* History policy, **HISTORY** (p. 1294).

6.210.2.10 resource_limits

`struct` **DDS_ResourceLimitsQosPolicy** DDS_TopicQos::resource_limits

Resource limits policy, **RESOURCE_LIMITS** (p. 1327).

6.210.2.11 transport_priority

`struct` **DDS_TransportPriorityQosPolicy** DDS_TopicQos::transport_priority

Transport priority policy, **TRANSPORT_PRIORITY** (p. 1339).

6.210.2.12 lifespan

`struct` **DDS_LifespanQosPolicy** DDS_TopicQos::lifespan

<<***basic***>> *(p. 784)* Lifespan policy, **LIFESPAN** (p. 1297).

6.210.2.13 ownership

`struct` **DDS_OwnershipQosPolicy** DDS_TopicQos::ownership

<<***basic***>> *(p. 784)* Ownership policy, **OWNERSHIP** (p. 1303).

6.210.2.14 representation

`struct` **`DDS_DataRepresentationQosPolicy`** `DDS_TopicQos::representation`

Data representation policy, **DATA_REPRESENTATION** (p. 1258).

6.211 DDS_TopicQueryData Struct Reference

<<***extension***>> *(p. 1014)* Provides information about a **DDS_TopicQuery** (p. 708)

Data Fields

- struct **DDS_TopicQuerySelection topic_query_selection**
  The data selection.
- char * **topic_name**
  *The topic name of the **DDS_DataReader** (p. 618).*
- struct **DDS_GUID_t original_related_reader_guid**
  *Identifies the **DDS_DataReader** (p. 618) that created the **DDS_TopicQuery** (p. 708).*

6.211.1 Detailed Description

<<***extension***>> *(p. 1014)* Provides information about a **DDS_TopicQuery** (p. 708)

Contains the information about a TopicQuery that can be retrieved using **DDS_TopicQueryHelper_topic_query_data_from_service_request** (p. 709).

See also

DDS_TopicQueryHelper_topic_query_data_from_service_request (p. 709)

6.211.2 Field Documentation

The data selection.

6.211.2.2 topic_name

```
char* DDS_TopicQueryData::topic_name
```

The topic name of the **DDS_DataReader** (p. 618).

6.211.2.3 original_related_reader_guid

```
struct DDS_GUID_t DDS_TopicQueryData::original_related_reader_guid
```

Identifies the **DDS_DataReader** (p. 618) that created the **DDS_TopicQuery** (p. 708).

6.212 DDS_TopicQueryDispatchQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Configures the ability of a **DDS_DataWriter** (p. 488) to publish samples in response to a **DDS_TopicQuery** (p. 708)

Data Fields

- **DDS_Boolean enable**

  <<***extension***>> *(p. 796) Allows this writer to dispatch TopicQueries*
- struct **DDS_Duration_t publication_period**

  <<***basic***>> *(p. 784)* <<***extension***>> *(p. 796) Sets the periodic interval at which samples are published.*
- **DDS_Long samples_per_period**

  <<***extension***>> *(p. 796) Sets the maximum number of samples to publish in each publication_period.*

6.212.1 Detailed Description

<<***extension***>> *(p. 796)* Configures the ability of a **DDS_DataWriter** (p. 488) to publish samples in response to a **DDS_TopicQuery** (p. 708)

Enables the ability of a **DDS_DataWriter** (p. 488) to publish historical samples upon reception of a **DDS_TopicQuery** (p. 708) and how often they are published.

Since a TopicQuery selects previously written samples, the DataWriter must have a **DDS_DurabilityQosPolicy**↩ **::kind** (p. 1765) different from **DDS_VOLATILE_DURABILITY_QOS** (p. 1289). Also, **DDS_ReliabilityQosPolicy::kind** (p. 1943) must be set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325).

Only samples that fall within the **DDS_DurabilityQosPolicy::writer_depth** (p. 1765) for an instance are evaluated against the TopicQuery filter. While the DataWriter is waiting for acknowledgements from one or more DataReaders, there may temporarily be more than **DDS_DurabilityQosPolicy::writer_depth** (p. 1765) samples per instance in the

DataWriter's queue if the **DDS_HistoryQosPolicy::depth** (p. 1810) is set to a higher value than **DDS_DurabilityQos↩ Policy::writer_depth** (p. 1765). Those additional samples past **DDS_DurabilityQosPolicy::writer_depth** (p. 1765) are not eligible to be sent in response to the TopicQuery.

A TopicQuery may select multiple samples at once. The writer will publish them periodically, independently from newly written samples. **DDS_TopicQueryDispatchQosPolicy::publication_period** (p. 2054) configures the frequency of that period and **DDS_TopicQueryDispatchQosPolicy::samples_per_period** (p. 2055) configures the maximum number of samples to publish each period.

If the DataWriter blocks during the publication of one of these samples, it will stop and try again the next period. (See **FooDataWriter_write** (p. 499) for the conditions that may cause the write operation to block.)

All the DataWriters that belong to a single **DDS_Publisher** (p. 446) and enable TopicQueries share the same event thread, but each DataWriter schedules separate events. To configure that thread, see **DDS_AsynchronousPublisher↩ QosPolicy::topic_query_publication_thread** (p. 1542).

If the DataWriter is dispatching more than one TopicQuery at the same time, the configuration of this periodic event applies to all of them. For example, if a DataWriter receives two TopicQueries around the same time, the period is 1 second, the number of samples per period is 10, the first TopicQuery selects 5 samples, and the second one selects 8, the DataWriter will immediately attempt to publish all 5 for the first TopicQuery and 5 for the second one. After one second, it will publish the remaining 3 samples.

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = N/A

6.213 DDS_TopicQuerySelection Struct Reference

<<***extension***>> *(*p. *1014)* Specifies the data query that defines a **DDS_TopicQuery** (p. 708)

Data Fields

- char * **filter_class_name**

  The name of the filter to use.
- char * **filter_expression**

  The filter expression.
- struct **DDS_StringSeq filter_parameters**

  The query parameters.
- **DDS_TopicQuerySelectionKind kind**

  Indicates whether the sample selection is limited to cached samples or not.

6.213.1 Detailed Description

<<***extension***>> *(p. 1014)* Specifies the data query that defines a **DDS_TopicQuery** (p. 708)

The query format is similar to the expression and parameters of a **DDS_QueryCondition** (p. 700) or a **DDS_ContentFilteredTopic** (p. 176), as described in **DDS_DomainParticipant_create_contentfilteredtopic_with_filter** (p. 118).

There are two special queries:

- **DDS_TOPIC_QUERY_SELECTION_SELECT_ALL** (p. 710)
- **DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER** (p. 710)

6.213.2.4 kind

```
DDS_TopicQuerySelectionKind DDS_TopicQuerySelection::kind
```

Indicates whether the sample selection is limited to cached samples or not.

[default] DDS_TOPIC_QUERY_SELECTION_KIND_HISTORY_SNAPSHOT (p. 709)

6.214 DDS_TransportBuiltinQosPolicy Struct Reference

*<<**extension**>> (p. 796)* Specifies which built-in transports are used.

Data Fields

- **DDS_TransportBuiltinKindMask mask**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) Specifies the built-in transports that are registered automatically when the **DDS_DomainParticipant** (p. 76) is enabled.*

6.214.1 Detailed Description

*<<**extension**>> (p. 796)* Specifies which built-in transports are used.

Three different transport plug-ins are built into the core RTI Connext libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plug-ins are used by a **DDS_DomainParticipant** (p. 76). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.217 DDS_TransportMulticastMapping_t Struct Reference

<<***extension***>> *(*p. *796)* Type representing a list of multicast mapping elements.

Data Fields

- char * **addresses**

  <<***extension***>> *(*p. *796) A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive multicast traffic for the entity with a topic that matches the* ***DDS_TransportMulticastMapping_t::topic_expression*** *(*p. *2060).*

- char * **topic_expression**

  <<***extension***>> *(*p. *796) A regular expression that will be used to map topic names to corresponding multicast receive addresses.*

- struct **DDS_TransportMulticastMappingFunction_t** **mapping_function**

  <<***extension***>> *(*p. *796) Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.*

6.217.1 Detailed Description

<<***extension***>> *(*p. *796)* Type representing a list of multicast mapping elements.

A multicast mapping element specifies a string containing a list of IP addresses, a topic expression and a mapping function.

QoS:

DDS_TransportMulticastMappingQosPolicy (p. 2062)

6.217.2 Field Documentation

6.217.2.1 addresses

```
char* DDS_TransportMulticastMapping_t::addresses
```

<<***extension***>> *(*p. *796)* A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive *multicast* traffic for the entity with a topic that matches the **DDS_TransportMulticastMapping_t::topic_↩ expression** (p. 2060).

The string must contain IPv4 or IPv6 addresses separated by commas. For example: "239.255.100.1,239.255.100.↩ 2,239.255.100.3"

You may specify ranges of addresses by enclosing the start address and the end address in square brackets. For example: "[239.255.100.1,239.255.100.3]"

You may combine the two approaches. For example:

"239.255.200.1,[239.255.100.1,239.255.100.3], 239.255.200.3"

IPv4 addresses must be specified in Dot-decimal notation.

IPv6 addresses must be specified using 8 groups of 16-bit hexadecimal values separated by colons. For example: FF00:0000:0000:0000:0202:B3FF:FE1E:8329

Leading zeroes can be skipped. For example: "FF00:0:0:0:202:B3FF:FE1E:8329"

You may replace a consecutive number of zeroes with a double colon, but only once within an address. For example: "FF00::202:B3FF:FE1E:8329"

[default] NULL

6.217.2.2 topic_expression

```
char* DDS_TransportMulticastMapping_t::topic_expression
```

<<***extension***>> *(*p. *796)* A regular expression that will be used to map topic names to corresponding multicast receive addresses.

A topic name must match the expression before a corresponding address is assigned.

[default] NULL

6.217.2.3 mapping_function

```
struct DDS_TransportMulticastMappingFunction_t DDS_TransportMulticastMapping_t::mapping_function
```

<<***extension***>> *(*p. *796)* Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.

This function is optional. If not specified, the middleware will use a hash function to perform the mapping.

6.218 DDS_TransportMulticastMappingFunction_t Struct Reference

Type representing an external mapping function.

Data Fields

- char * **dll**

  Specifies a dynamic library that contains a mapping function.
- char * **function_name**

  Specifies the name of a mapping function.

6.218.1 Detailed Description

Type representing an external mapping function.

A mapping function is defined by a dynamic library name and a function name.

QoS:

DDS_TransportMulticastMappingQosPolicy (p. 2062)

6.218.2 Field Documentation

6.218.2.1 dll

```
char* DDS_TransportMulticastMappingFunction_t::dll
```

Specifies a dynamic library that contains a mapping function.

A relative or absolute path can be specified.

If the name is specified as "foo", the library name on Linux systems will be libfoo.so; on Windows systems it will be foo.dll.

[default] NULL

6.218.2.2 function_name

```
char* DDS_TransportMulticastMappingFunction_t::function_name
```

Specifies the name of a mapping function.

This function must be implemented in the library specified in **DDS_TransportMulticastMappingFunction_t::dll** (p. 2061).

The function must implement the following interface:

int function(const char* topic_name, int numberOfAddresses);

The function must return an integer that indicates the *index* of the address to use for the given `topic_name`. For example, if the first address in the list should be used, it must return 0; if the second address in the list should be used, it must return 1, etc.

6.219 DDS_TransportMulticastMappingQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

Data Fields

- struct **DDS_TransportMulticastMappingSeq value**

  <<***extension***>> *(p. 796) A sequence of multicast communication mappings.*

6.219.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

This QoS policy provides an alternate way to assign multicast receive addresses to DataReaders. It allows you to perform multicast configuration at the **DDS_DomainParticipant** (p. 76) level.

To use multicast communication *without* this QoS policy, you must explicitly assign a multicast receive address on each **DDS_DataReader** (p. 618). This can quickly become difficult to configure as more DataReaders of different topics and multicast addresses are added.

With this QoS policy, you can configure a set of multicast addresses on the **DDS_DomainParticipant** (p. 76); those addresses will then be automatically assigned to the DomainParticipant's DataReaders. A single configuration on the **DDS_DomainParticipant** (p. 76) can thus replace per-DataReader configuration.

On the DomainParticipant, the set of assignable addresses can be configured for specific topics. Addresses are configured on topics because efficient usage of multicast will have all DataWriters and DataReaders of a single topic using the same multicast address.

You can specify a mapping between a topic's name and a multicast address. For example, topic 'A' can be assigned to address 239.255.1.1 and topic 'B' can be assigned to address 239.255.1.2.

You can use filter expressions to configure a subset of topics to use a specific list of addresses. For example, suppose topics "X", "Y" and "Z" need to be sent to any address within the range [239.255.1.1, 239.255.1.255]. You can specify an expression on the topic name (e.g. "[X-Z]") corresponding to that range of addresses. Then the DomainParticipant will select an address for a topic whose name matches the expression.

The middleware will use a hash function to perform the mapping from topic to address. Alternatively, you can specify a pluggable mapping function.

IMPORTANT: All the strings defined in each element of the sequence must be assigned using RTI_String_dup("foo");. For example:

mcastMappingElement->addresses = DDS_String_dup("[239.255.1.1,239.255.1.255]");

NOTE: To use this QoS policy, you must:

- Set **DDS_TransportMulticastQosPolicy::kind** (p. 2065) to **DDS_AUTOMATIC_TRANSPORT_MULTICAST_↩QOS** (p. 1338).
- Set the first element in **DDS_DataReader** (p. 618)'s **DDS_TransportMulticastQosPolicy::value** (p. 2065) with an empty address.

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A

<<***extension***>> *(*p. *796)* Specifies the multicast address on which a **DDS_DataReader** (p. 618) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS_DomainParticipant** (p. 76) level) transports with which to receive the multicast data.

Data Fields

- struct **DDS_TransportMulticastSettingsSeq value**

  <<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796) A sequence of multicast communications settings.*
- **DDS_TransportMulticastQosPolicyKind kind**

  <<***extension***>> *(*p. *796) A value that specifies a way to determine how to obtain the multicast address.*

6.221.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies the multicast address on which a **DDS_DataReader** (p. 618) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS_DomainParticipant** (p. 76) level) transports with which to receive the multicast data.

By default, a **DDS_DataWriter** (p. 488) will send individually addressed packets for each **DDS_DataReader** (p. 618) that subscribes to the topic of the DataWriter – this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **DDS_DataWriter** (p. 488) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **DDS_Topic** (p. 174).

Entity:

DDS_DataReader (p. 618)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.221.2 Field Documentation

6.221.2.1 value

`struct` **`DDS_TransportMulticastSettingsSeq`** `DDS_TransportMulticastQosPolicy::value`

<<***basic***>> *(p. 784)* <<***extension***>> *(p. 796)* A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_DomainParticipantQos** (p. 1729).

[default] Empty sequence.

Immutable (p. 916), **Transports** (p. 911), **Data Availability** (p. 844)

6.222 DDS_TransportMulticastSettings_t Struct Reference

Type representing a list of multicast locators.

Data Fields

- struct **DDS_StringSeq transports**

  <<***extension***>> *(p. 796) A sequence of transport aliases that specifies the transports on which to receive multicast traffic for the entity.*
- char * **receive_address**

  <<***extension***>> *(p. 796) The multicast group address on which the entity can receive data.*
- **DDS_Long receive_port**

  <<***extension***>> *(p. 796) The multicast port on which the entity can receive data.*

6.222.1 Detailed Description

Type representing a list of multicast locators.

A multicast locator specifies a transport class, a multicast address, and a multicast port number on which messages can be received by an entity.

QoS:

DDS_TransportMulticastQosPolicy (p. 2064)

6.222.2 Field Documentation

6.222.2.1 transports

```
struct DDS_StringSeq DDS_TransportMulticastSettings_t::transports
```

<<***extension***>> *(p. 796)* A sequence of transport aliases that specifies the transports on which to receive *multicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias in this sequence are used to subscribe to the multicast group addresses. Thus, this list of aliases sub-selects from the transport s available to the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1527). In particular, be careful to avoid a situation in which RTI Connext allocates a string on your behalf and you then reuse that string in such a way that RTI Connext believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 1333).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

6.222.2.2 receive_address

```
char* DDS_TransportMulticastSettings_t::receive_address
```

<<***extension***>> *(p. 796)* The multicast group address on which the entity can receive data.

Must must be an address in the proper format (see **Address Format** (p. 1356)).

[default] NONE/INVALID. Required to specify a multicast group address to join.

[range] A valid IPv4 or IPv6 multicast address.

See also

Address Format (p. 1356)

6.222.2.3 receive_port

```
DDS_Long DDS_TransportMulticastSettings_t::receive_port
```

<<***extension***>> *(*p. *796)* The multicast port on which the entity can receive data.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id` (see **DDS_WireProtocolQosPolicy::participant_id** (p. 2103)).

[range] [0,0xffffffff]

DDS_TransportMulticastSettings_t (p. 2066)

6.224 DDS_TransportPriorityQosPolicy Struct Reference

<<***spec***>> *(*p. *791)* This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Data Fields

- **DDS_Long value**

  <<***spec***>> (p. *791) This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.*

6.224.1 Detailed Description

<<***spec***>> *(p. 791)* This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DataWriter or DataReader basis that the data sent by that endpoint is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **FooDataWriter_write** (p. 499). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

DDS_DataWriter (p. 488), **DDS_DataReader** (p. 618), **DDS_Topic** (p. 174)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.224.2 Usage

In RTI Connext, for the IP-based transports (UDPv4, UDPv6, Real-Time WAN, and TCP), the value set in the Transport Priority QoS policy can be used to set the differentiated services field (DS field) bits of the IPv4 and IPv6 headers for datagrams sent by a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). It is platform-dependent on how and whether setting the DS field has an effect. Some platforms may require external permissions in order to set the DS field.

The transport priority value is not provided as is to the transports, but transformed according to the following fields: transport_priority_mask (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 2147)), transport_priority_mapping_low (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 2147)), and transport_priority_mapping_high (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 2147)). If you want the priority value to be exactly equal to the DS value, then the only change you need to make is to set transport_priority_mask to `0xff` (and keep the transport_priority_mapping_low and transport_priority_mapping_high defaults).

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **DDS_DataWriter** (p. 488) and a **DDS_DataReader** (p. 618). All network elements, including switches and routers, must have the capability and be enabled to actually use the DS field to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a *system* level; just turning it on in an application may have no effect at all at a transport level.

For additional details on how to set the DS field in IP-based transports, see the "TRANSPORT_PRIORITY QosPolicy" section of the `User's Manual`.

6.224.3 Field Documentation

6.224.3.1 value

DDS_Long DDS_TransportPriorityQosPolicy::value

<<***spec***>> *(*p. *791)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

6.226 DDS_TransportUnicastQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Data Fields

- struct **DDS_TransportUnicastSettingsSeq value**

  <<***extension***>> *(p. 796) A sequence of unicast communication settings.*

6.226.1 Detailed Description

<<***extension***>> *(p. 796)* Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Entity:

DDS_DomainParticipant (p. 76), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.226.2 Usage

RTI Connext may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **DDS_Entity** (p. 1362) announces to remote applications a list of (up to 16) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/NACKs and heartbeats). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_DomainParticipantQos** (p. 1729).

Note: RTI Connext internally uses several dynamic locator lists to keep track of configured unicast locators. The initial size of these lists can be configured with the **DDS_DomainParticipant** (p. 76) property 'dds.domain_participant.initial_locator_list_size'. By default, the initial size is derived from local information, such as the number of local locators. To prevent dynamic resizing at runtime, set the property's value to the maximum number of locators that a single participant or endpoint may advertise at any given time in your system.

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the Entity (see **DDS_TransportBuiltinQosPolicy** (p. 2057) and **DDS_TransportSelectionQosPolicy** (p. 2070)). Also, the associated ports are automatically determined (see **DDS_RtpsWellKnownPorts_t** (p. 1983)).

Use this QoS policy to manually set the receive address list for an Entity. You may optionally set a port to use a non-default receive port as well. Only the first 16 addresses will be used.

RTI Connext will create a receive thread for every unique port number that it encounters (on a per transport basis).

- For a **DDS_DomainParticipant** (p. 76), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.

- For a **DDS_DataReader** (p. 618), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **DDS_DomainParticipant** (p. 76).

- For a reliable **DDS_DataWriter** (p. 488), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **DDS_DomainParticipant** (p. 76).

6.226.3 Field Documentation

6.226.3.1 value

`struct` **DDS_TransportUnicastSettingsSeq** `DDS_TransportUnicastQosPolicy::value`

<<***extension***>> *(*p. *796)* A sequence of unicast communication settings.

An empty sequence means that applicable defaults specified by elsewhere (e.g. **DDS_DomainParticipantQos**↩ **::default_unicast** (p. 1731)) should be used.

The RTPS wire protocol currently limits the maximum number of unicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 1905) associated with the **DDS_DomainParticipantQos** (p. 1729).

[default] Empty sequence.

6.227 DDS_TransportUnicastSettings_t Struct Reference

Type representing a list of unicast locators.

Data Fields

- struct **DDS_StringSeq transports**

  <<***extension***>> *(*p. *796) A sequence of transport aliases that specifies the unicast interfaces on which to receive unicast traffic for the entity.*
- **DDS_Long receive_port**

  <<***extension***>> *(*p. *796) The unicast port on which the entity can receive data.*

6.227.1 Detailed Description

Type representing a list of unicast locators.

A unicast locator specifies a transport class, a unicast address, and a unicast port number on which messages can be received by an entity.

QoS:

DDS_TransportUnicastQosPolicy (p. 2071)

6.227.2 Field Documentation

6.227.2.1 transports

`struct` **DDS_StringSeq** `DDS_TransportUnicastSettings_t::transports`

<<***extension***>> *(p. 796)* A sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias on this sequence are used to determine the unicast interfaces used by the entity.

Thus, this list of aliases sub-selects from the transports available to the entity.

Each unicast interface on a transport results in a unicast locator for the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1527). In particular, be careful to avoid a situation in which RTI Connext allocates a string on your behalf and you then reuse that string in such a way that RTI Connext believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 1333).

[default] Empty sequence; i.e. all the transports available to the entity.
[range] Any sequence of non-null, non-empty strings.

6.227.2.2 receive_port

DDS_Long `DDS_TransportUnicastSettings_t::receive_port`

<<***extension***>> *(p. 796)* The unicast port on which the entity can receive data.

Must be an *unused* unicast port on the system.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id`, and the **DDS_WireProtocolQosPolicy::participant_id** (p. 2103).

[range] [0,0xffffffff]

See also

DDS_WireProtocolQosPolicy::participant_id (p. 2103).

6.228 DDS_TransportUnicastSettingsSeq Struct Reference

Declares IDL sequence< **DDS_TransportUnicastSettings_t** (p. 2073) >

6.228.1 Detailed Description

Declares IDL sequence< **DDS_TransportUnicastSettings_t** (p. 2073) >

Instantiates:

<<***generic***>> *(p. 1015)* **FooSeq** (p. 2120)

6.229.2 Field Documentation

6.229.2.1 supported_mask

DDS_TrustAlgorithmSet DDS_TrustAlgorithmRequirements::supported_mask

Trust Plugins algorithms that an entity supports.

6.229.2.2 required_mask

DDS_TrustAlgorithmSet DDS_TrustAlgorithmRequirements::required_mask

Trust Plugins algorithms that an entity uses.

6.230 DDS_TypeAllocationParams_t Struct Reference

Configures whether or not to allocate pointer and optional members.

Data Fields

- **DDS_Boolean allocate_pointers**
  Whether to allocate pointer members or not.
- **DDS_Boolean allocate_optional_members**
  Whether to allocate optional members or not.

6.230.1 Detailed Description

Configures whether or not to allocate pointer and optional members.

By default pointers are allocated and optional members are not.

This structure is also defined in xcdr.1.0/srcC/typeObject/TypeObjectInfrastructure.h. If changes are made, please ensure they are made in both locations.

Examples

HelloWorld.c, and **HelloWorldPlugin.c**.

6.230.2 Field Documentation

6.230.2.1 allocate_pointers

DDS_Boolean DDS_TypeAllocationParams_t::allocate_pointers

Whether to allocate pointer members or not.

Examples

HelloWorld.c, and **HelloWorldPlugin.c**.

6.230.2.2 allocate_optional_members

DDS_Boolean DDS_TypeAllocationParams_t::allocate_optional_members

Whether to allocate optional members or not.

6.231 DDS_TypeCode Struct Reference

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with rtiddsgen (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

6.231.1 Detailed Description

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with rtiddsgen (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

You create **DDS_TypeCode** (p. 2077) objects using the **DDS_TypeCodeFactory** (p. 2077) singleton. Then you can use the functions on *this* class to inspect and modify the data type definition.

This class is based on a similar class from CORBA.

MT Safety:

SAFE for read-only access, UNSAFE for modification. Modifying a single **DDS_TypeCode** (p. 2077) object concurrently from multiple threads is *unsafe*. Modifying a **DDS_TypeCode** (p. 2077) from a single thread while concurrently reading the state of that **DDS_TypeCode** (p. 2077) from another thread is also *unsafe*. However, reading the state of a **DDS_TypeCode** (p. 2077) concurrently from multiple threads, without any modification, is *safe*.

Examples

HelloWorld.c, and **HelloWorldPlugin.c**.

6.232 DDS_TypeCodeFactory Struct Reference

A singleton factory for creating, copying, and deleting data type definitions dynamically.

6.232.1 Detailed Description

A singleton factory for creating, copying, and deleting data type definitions dynamically.

You can access the singleton with the **DDS_TypeCodeFactory_get_instance** (p. 290) function.

If you want to publish and subscribe to data of types that are not known to you at system design time, this class will be your starting point. After creating a data type definition with this class, you will modify that definition using the **DDS_TypeCode** (p. 2077) class and then register it with the **Dynamic Data** (p. 315) API.

The functions of this class fall into several categories:

Getting definitions for primitive types:
Type definitions for primitive types (e.g. integers, floating point values, etc.) are pre-defined; your application only needs to *get* them, not *create* them.

- **DDS_TypeCodeFactory_get_primitive_tc** (p. 292)

Creating definitions for strings, arrays, and sequences:
Type definitions for strings, arrays, and sequences (i.e. variables-size lists) must be created as you need them, because the type definition includes the maximum length of those containers.

- **DDS_TypeCodeFactory_create_string_tc** (p. 299)
- **DDS_TypeCodeFactory_create_wstring_tc** (p. 300)
- **DDS_TypeCodeFactory_create_array_tc** (p. 301)
- **DDS_TypeCodeFactory_create_sequence_tc** (p. 300)

Creating definitions for structured types:
Structured types include structures, value types, and unions.

- **DDS_TypeCodeFactory_create_struct_tc** (p. 292)
- **DDS_TypeCodeFactory_create_value_tc** (p. 294)
- **DDS_TypeCodeFactory_create_union_tc** (p. 296)

Creating definitions for other types:
The type system also supports enumerations and aliases (i.e. `typedef`s in C and C++).

- **DDS_TypeCodeFactory_create_enum_tc** (p. 297)
- **DDS_TypeCodeFactory_create_alias_tc** (p. 299)

Deleting type definitions:
When you're finished using a type definition, you should delete it. (*Note* that you only need to delete a **DDS_TypeCode** (p. 2077) that you *created*; if you got the object from **DDS_TypeCodeFactory_get_primitive_tc** (p. 292), you must *not* delete it.)

- **DDS_TypeCodeFactory_delete_tc** (p. 291)

Copying type definitions:
You can also create deep copies of type definitions:

- **DDS_TypeCodeFactory_clone_tc** (p. 291)

6.233 DDS_TypeCodePrintFormatProperty Struct Reference

A collection of attributes used to configure how a TypeCode appears when converted to a string.

Data Fields

- **DDS_Long indent**

  *Configures how much indent should be added to the string representation of a **DDS_TypeCode** (p. 2077).*
- **DDS_Boolean print_ordinals**

  *Configures whether or not to print the ordinal value of each enumerator within a **DDS_TypeCode** (p. 2077).*
- **DDS_TypeCodePrintFormatKind print_kind**

  Configures whether the type should be printed in XML or IDL format.
- **DDS_Boolean print_complete_type**

  Configures whether or not to print the complete type.

6.233.1 Detailed Description

A collection of attributes used to configure how a TypeCode appears when converted to a string.

To ensure that new objects are initialized to a known value, assign them with the static initializer **DDS_TypeCode_↩ PrintFormat_INITIALIZER** (p. 240).

6.233.2 Field Documentation

6.233.2.1 indent

```
DDS_Long DDS_TypeCodePrintFormatProperty::indent
```

Configures how much indent should be added to the string representation of a **DDS_TypeCode** (p. 2077).

Configures how much additional indent is applied when converting a TypeCode to a string. This value acts as a total offset on the string, increasing the indent applied to all elements by the same amount. With an indent of 0, a string representation of a TypeCode may appear as:

```
struct myType {
    long x;
};
```

Using an indent of 1, the same TypeCode would be printed as:

```
    struct myType {
        long x;
    };
```

I.e., the entire structure is indented.

6.233.2.2 print_ordinals

DDS_Boolean DDS_TypeCodePrintFormatProperty::print_ordinals

Configures whether or not to print the ordinal value of each enumerator within a **DDS_TypeCode** (p. 2077).

When set to true, the ordinal value of each enumerator within an enum will be printed, otherwise only non-default ordinals are printed. Take for example the following enum:

```
enum myEnum {
    RED,
    GREEN = 3,
    BLUE,
};
```

When print_ordinals is set to false it would be printed as:

```
enum myEnum {
    RED,
    GREEN = 3,
    BLUE,
};
```

But with print_ordinals set to true it would be printed as:

```
enum myEnum {
    RED = 0,
    GREEN = 3,
    BLUE = 4,
};
```

6.233.2.3 print_kind

DDS_TypeCodePrintFormatKind DDS_TypeCodePrintFormatProperty::print_kind

Configures whether the type should be printed in XML or IDL format.

When print_kind is DDS_TYPE_CODE_PRINT_KIND_IDL, the type will be printed in IDL format. For example:

```
struct Foo {
    float32 bar;
};
```

When print_kind is DDS_TYPE_CODE_PRINT_KIND_XML, the type will be printed in XML format. For example:

```
<struct name="Foo">
    <member name="bar" type="float32"/>
</struct>
```

6.233.2.4 print_complete_type

DDS_Boolean DDS_TypeCodePrintFormatProperty::print_complete_type

Configures whether or not to print the complete type.

When print_complete_type is true, the complete type will be printed. When print_complete_type is false, only the top level will be printed.

Take for example the following types:

```
struct Foo {
    float32 member;
};
struct Bar {
    Foo foo;
};
```

When print_complete_type is false, this is printed as:

```
struct Bar {
    Foo foo;
};
```

When print_complete_type is true, this is printed as:

```
struct Foo {
    float32 member;
};
struct Bar {
    Foo foo;
};
```

6.234 DDS_TypeConsistencyEnforcementQosPolicy Struct Reference

<<***spec***>> *(p. 791)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

  <<***spec***>> *(p. 791) Controls whether member names are taken into consideration for type assignability.*
- **DDS_Boolean prevent_type_widening**

  <<***spec***>> *(p. 791) Controls whether type widening is allowed.*
- **DDS_Boolean force_type_validation**

  <<***spec***>> *(p. 791) Controls whether type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_DataReader** (p. 618).*
- **DDS_Boolean ignore_enum_literal_names**

  <<***spec***>> *(p. 791) Controls whether enumeration constant names are taken into consideration for type assignability.*

6.234.1 Detailed Description

<<***spec***>> *(p. 791)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

This policy defines a type consistency kind, which allows applications to select from among a set of predetermined behaviors. The following consistency kinds are specified: **DDS_DISALLOW_TYPE_COERCION** (p. 1343), **DDS_↩ ALLOW_TYPE_COERCION** (p. 1343) and **DDS_AUTO_TYPE_COERCION** (p. 1343).

The type-consistency-enforcement rules consist of two steps:

Step 1. If both the DataWriter and DataReader specify a TypeObject, it is considered first. If the DataReader allows type coercion, then its type must be assignable from the DataWriter's type, taking into account the values of prevent_type_↩ widening, ignore_sequence_bounds, ignore_string_bounds, ignore_member_names, and ignore_enum_literal_names. If the DataReader does not allow type coercion, then its type must be equivalent to the type of the DataWriter.

Step 2. If either the DataWriter or the DataReader does not provide a TypeObject definition, then the registered type names are examined. The DataReader's and DataWriter's registered type names must match exactly, as was true in RTI Connext releases prior to 5.0.0.

If either Step 1 or Step 2 fails, the Topics associated with the DataReader and DataWriter are considered to be inconsistent and the **DDS_InconsistentTopicStatus** (p. 1811) is updated.

The default enforcement kind is **DDS_AUTO_TYPE_COERCION** (p. 1343). This default kind translates to **DDS_↩ ALLOW_TYPE_COERCION** (p. 1343) except in the following cases:

- When a **Zero Copy** (p. 209) DataReader is used, the kind is translated to **DDS_DISALLOW_TYPE_COERCION** (p. 1343).

- When the middleware is introspecting the built-in topic data declaration of a remote DataReader in order to determine whether it can match with a local DataWriter, if it observes that no TypeConsistencyEnforcement↩ QosPolicy value is provided (as would be the case when communicating with a Service implementation not in conformance with this specification), it assumes a kind of **DDS_DISALLOW_TYPE_COERCION** (p. 1343).

For additional information on type consistency enforcement refer to the `Extensible Types Guide` and the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

Entity:

DDS_DataReader (p. 618)

Properties:

RxO (p. 1247) = N/A

6.234.2 Field Documentation

6.234.2.1 kind

DDS_TypeConsistencyKind DDS_TypeConsistencyEnforcementQosPolicy::kind

<<***spec***>> *(p. 791)* Type consistency kind.

[default] DDS_AUTO_TYPE_COERCION (p. 1343)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.234.2.2 ignore_sequence_bounds

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_sequence_bounds`

<<***spec***>> *(p. 791)* Controls whether sequence bounds are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 1203), then sequence bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 sequence type with maximum length L2 would be assignable to a T1 sequence type with maximum length L1, even if L2 is greater than L1. If the option is set to **DDS_BOOLEAN_FALSE** (p. 1203), then sequence bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that L1 >= L2.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.234.2.3 ignore_string_bounds

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_string_bounds`

<<***spec***>> *(p. 791)* Controls whether string bounds are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 1203), then string bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 string type with maximum length L2 would be assignable to a T1 string type with maximum length L1, even if L2 is greater than L1. If the option is set to **DDS_BOOLEAN_FALSE** (p. 1203), then string bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that L1 >= L2.

[default] DDS_BOOLEAN_TRUE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.234.2.4 ignore_member_names

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_member_names`

<<***spec***>> *(p. 791)* Controls whether member names are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 1203), then member names are not considered as part of the type assignability. If the option is set to **DDS_BOOLEAN_FALSE** (p. 1203), then member names are taken into consideration for type assignability, and in order for members with the same ID to be assignable, the members must also have the same name.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.234.2.5 prevent_type_widening

```
DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::prevent_type_widening
```

<<***spec***>> *(p. 791)* Controls whether type widening is allowed.

If the option is set to **DDS_BOOLEAN_FALSE** (p. 1203), then type widening is permitted. If the option is set to **DDS_BOOLEAN_TRUE** (p. 1203), then a wider type may not be assignable from a narrower type.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.234.2.6 force_type_validation

```
DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::force_type_validation
```

<<***spec***>> *(p. 791)* Controls whether type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_DataReader** (p. 618).

If the option is set to **DDS_BOOLEAN_TRUE** (p. 1203), then type information must be available in order to complete matching between a **DDS_DataWriter** (p. 488) and a **DDS_DataReader** (p. 618). If the option is set to **DDS_BOOLEAN_FALSE** (p. 1203), then matching can occur without complete type information as long as the type names match exactly. Note that if the types have the same name but are not assignable, DataReaders may fail to deserialize incoming data samples.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.234.2.7 ignore_enum_literal_names

```
DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_enum_literal_names
```

<<***spec***>> *(p. 791)* Controls whether enumeration constant names are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 1203), then enumeration constants may change their names, but not their values, and still maintain assignability. If the option is set to **DDS_BOOLEAN_FALSE** (p. 1203), then in order for enumerations to be assignable, any constant that has the same value in both enumerations must also have the same name.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Matching** (p. 965), **Discovery Metadata** (p. 960), **Type System** (p. 914)

6.235 DDS_TypeDeallocationParams_t Struct Reference

Configures whether to release or not pointer and optional members.

Data Fields

- **DDS_Boolean delete_pointers**

  Whether to delete pointer members or not.
- **DDS_Boolean delete_optional_members**

  Whether to delete optional members or not.

6.235.1 Detailed Description

Configures whether to release or not pointer and optional members.

By default both pointers optional members are released when they are not null.

This structure is also defined in xcdr.1.0/srcC/typeObject/TypeObjectInfrastructure.h. If changes are made, please ensure they are made in both locations.

Examples

HelloWorld.c, and **HelloWorldPlugin.c**.

6.235.2 Field Documentation

6.235.2.1 delete_pointers

```
DDS_Boolean DDS_TypeDeallocationParams_t::delete_pointers
```

Whether to delete pointer members or not.

Examples

HelloWorld.c, and **HelloWorldPlugin.c**.

6.235.2.2 delete_optional_members

```
DDS_Boolean DDS_TypeDeallocationParams_t::delete_optional_members
```

Whether to delete optional members or not.

Examples

HelloWorld.c, and **HelloWorldPlugin.c**.

6.236 DDS_TypeSupportQosPolicy Struct Reference

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Allows you to attach application-specific values to a **DDS_Data↩ Writer** (p. 488) or **DDS_DataReader** (p. 618), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Data Fields

- void ∗ **plugin_data**

  [DEPRECATED] (p. ***968)*** <<***extension***>> *(*p. *796) Value to pass into the type plugin's de-/serialization function*
- **DDS_CdrPaddingKind cdr_padding_kind**

  [DEPRECATED] (p. ***968)*** <<***extension***>> *(*p. *796) Determines whether or not the padding bytes will be set to zero during CDR serialization.*

6.236.1 Detailed Description

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Allows you to attach application-specific values to a **DDS_Data↩ Writer** (p. 488) or **DDS_DataReader** (p. 618), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions and choose whether or not to set the padding bytes to zero when serializing a sample using CDR encapsulation.

Entity:

DDS_DomainParticipant (p. 76), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = NO

Changeable (p. 1247) = **UNTIL ENABLE** (p. 1247)

6.236.2 Usage

The **DDS_TypeSupportQosPolicy::plugin_data** (p. 2088) allows you to associate a pointer to an object with a **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618). This object pointer is passed to the serialization routine of the data type associated with the **DDS_DataWriter** (p. 488) or the deserialization routine of the data type associated with the **DDS_DataReader** (p. 618).

You can modify the rtiddsgen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a **DDS_DataWriter** (p. 488) or received by a **DDS_DataReader** (p. 618) is serialized or deserialized on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the TypeSupport QoS policy could be used to signal the serialization routine to send the row/column names the first time a **DDS_DataWriter** (p. 488) calls **FooDataWriter_write** (p. 499), and then never again.

The **DDS_TypeSupportQosPolicy::cdr_padding_kind** (p. 2088) allows you to choose whether or not the padding bytes are set to zero during CDR serialization.

6.236.3 Field Documentation

6.236.3.1 plugin_data

```
void* DDS_TypeSupportQosPolicy::plugin_data
```

[DEPRECATED] (p. **968)** <<***extension***>> *(*p. *796)* Value to pass into the type plugin's de-/serialization function

[default] NULL

Categories

Immutable (p. 916), **Application-Defined Metadata** (p. 837)

6.236.3.2 cdr_padding_kind

`DDS_CdrPaddingKind DDS_TypeSupportQosPolicy::cdr_padding_kind`

[DEPRECATED] (p. 968) <<***extension***>> *(p. 796)* Determines whether or not the padding bytes will be set to zero during CDR serialization.

In a DomainParticipant, this value configures how the padding bytes are set when serializing data for the Built-In Topic DataWriters and DataReaders. A value of **DDS_AUTO_CDR_PADDING** (p. 1344) defaults to **DDS_NOT_SET_CDR_PADDING** (p. 1344).

For DataWriters and DataReaders, this value configures how padding bytes are set when serializing data for that entity. A value of **DDS_AUTO_CDR_PADDING** (p. 1344) means that the entity will inherit whatever value is set on the DomainParticipant.

[default] DDS_AUTO_CDR_PADDING (p. 1344)

6.238 DDS_UnionMember Struct Reference

A description of a member of a union.

Data Fields

- char * **name**

  The name of the union member.
- **DDS_Boolean is_pointer**

  Indicates whether the union member is a pointer or not.
- struct **DDS_LongSeq labels**

  The labels of the union member.
- const **DDS_TypeCode** * **type**

  The type of the union member.

6.238.1 Detailed Description

A description of a member of a union.

See also

DDS_UnionMemberSeq (p. 2091)

DDS_TypeCodeFactory_create_union_tc (p. 296)

6.238.2 Field Documentation

6.238.2.1 name

```
char* DDS_UnionMember::name
```

The name of the union member.

Cannot be NULL.

6.238.2.2 is_pointer

```
DDS_Boolean DDS_UnionMember::is_pointer
```

Indicates whether the union member is a pointer or not.

6.238.2.3 labels

`struct` **DDS_LongSeq** `DDS_UnionMember::labels`

The labels of the union member.

Each union member should contain at least one label. If the union discriminator type is not **DDS_Long** (p. 1205) the label value should be evaluated to an integer value. For instance, 'a' would be evaluated to 97.

6.238.2.4 type

`const` **DDS_TypeCode*** `DDS_UnionMember::type`

The type of the union member.

Cannot be NULL.

6.239 DDS_UnionMemberSeq Struct Reference

Defines a sequence of union members.

6.239.1 Detailed Description

6.243 DDS_UserDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Data Fields

- struct **DDS_OctetSeq value**
  <<***spec***>> *(p. 791) a sequence of octets*

6.243.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 164) during discovery.

Entity:

DDS_DomainParticipant (p. 76), **DDS_DataReader** (p. 618), **DDS_DataWriter** (p. 488)

Properties:

RxO (p. 1247) = NO;
Changeable (p. 1247) = **YES** (p. 1247)

See also

DDS_DomainParticipant_get_builtin_subscriber (p. 128)

6.243.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDS_Entity** (p. 1362) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Connext.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as **DDS_DomainParticipant_ignore_participant** (p. 130), **DDS_Domain↩ Participant_ignore_publication** (p. 131), **DDS_DomainParticipant_ignore_subscription** (p. 132), and **DDS_↩ DomainParticipant_ignore_topic** (p. 131), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS_DomainParticipantResourceLimitsQosPolicy::participant_user_data_max_length** (p. 1748), **DDS_DomainParticipantResourceLimitsQosPolicy::writer_user_data_max_length** (p. 1749), and **DDS_Domain↩ ParticipantResourceLimitsQosPolicy::reader_user_data_max_length** (p. 1750).

6.243.3 Field Documentation

6.243.3.1 value

`struct DDS_OctetSeq DDS_UserDataQosPolicy::value`

6.244 DDS_ValueMember Struct Reference

A description of a member of a value type.

Data Fields

- char * **name**
  The name of the value member.
- const **DDS_TypeCode** * **type**
  The type of the value member.
- **DDS_Boolean is_pointer**
  Indicates whether the value member is a pointer or not.
- **DDS_Short bits**
  Number of bits of a bitfield member.
- **DDS_Boolean is_key**
  Indicates if the value member is a key member or not.
- **DDS_Visibility access**
  The type of access (public, private) for the value member.
- **DDS_Long id**
  The member ID.
- **DDS_Boolean is_optional**
  Indicates if the value member is optional or required.
- **DDS_Boolean is_must_understand**
  Indicates if the value member is annotated as "must understand".

6.244.1 Detailed Description

A description of a member of a value type.

See also

6.244.2 Field Documentation

6.244.2.1 name

```
char* DDS_ValueMember::name
```

The name of the value member.

Cannot be NULL.

6.244.2.2 type

```
const  DDS_TypeCode* DDS_ValueMember::type
```

The type of the value member.

Cannot be NULL.

6.244.2.3 is_pointer

```
DDS_Boolean DDS_ValueMember::is_pointer
```

Indicates whether the value member is a pointer or not.

6.244.2.4 bits

```
DDS_Short DDS_ValueMember::bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **DDS_TYPECODE_NOT_BITFIELD** (p. 237).

6.244.2.5 is_key

```
DDS_Boolean DDS_ValueMember::is_key
```

Indicates if the value member is a key member or not.

6.244.2.6 access

```
DDS_Visibility DDS_ValueMember::access
```

The type of access (public, private) for the value member.

It can take the values: **DDS_PRIVATE_MEMBER** (p. 238) or **DDS_PUBLIC_MEMBER** (p. 239).

6.244.2.7 id

```
DDS_Long DDS_ValueMember::id
```

The member ID.

Use **DDS_TYPECODE_MEMBER_ID_INVALID** (p. 236) to have the member ID automatically assigned.

6.244.2.8 is_optional

```
DDS_Boolean DDS_ValueMember::is_optional
```

Indicates if the value member is optional or required.

6.244.2.9 is_must_understand

```
DDS_Boolean DDS_ValueMember::is_must_understand
```

Indicates if the value member is annotated as "must understand".

6.247 DDS_VirtualWriterInfo Struct Reference

The structure that contains the information of a virtual writer.

6.247.1 Detailed Description

The structure that contains the information of a virtual writer.

6.248 DDS_WaitSetProperty_t Struct Reference

<<***extension***>> *(p. 1014)* Specifies the **DDS_WaitSet** (p. 1373) behavior for multiple trigger events.

Data Fields

- **DDS_Long max_event_count**

  *Maximum number of trigger events to cause a **DDS_WaitSet** (p. 1373) to awaken.*
- struct **DDS_Duration_t max_event_delay**

  *Maximum delay from occurrence of first trigger event to cause a **DDS_WaitSet** (p. 1373) to awaken.*

6.248.1 Detailed Description

<<***extension***>> *(p. 1014)* Specifies the **DDS_WaitSet** (p. 1373) behavior for multiple trigger events.

In simple use, a **DDS_WaitSet** (p. 1373) returns when a single trigger event occurs on one of its attached **DDS_Condition** (p. 1372) (s), or when the `timeout` maximum wait duration specified in the **DDS_WaitSet_wait** (p. 1383) call expires.

The **DDS_WaitSetProperty_t** (p. 2097) allows configuration of the waiting behavior of a **DDS_WaitSet** (p. 1373). If no conditions are true at the time of the call to wait, then the `max_event_count` parameter may be used to configure the WaitSet to wait for `max_event_count` trigger events to occur before returning, or to wait for up to `max_event_delay` time from the occurrence of the first trigger event before returning.

The `timeout` maximum wait duration specified in the **DDS_WaitSet_wait** (p. 1383) call continues to apply.

Entity:

DDS_WaitSet (p. 1373)

Properties:

RxO (p. 1247) = N/A

Changeable (p. 1247) = **YES** (p. 1247)

6.248.2 Field Documentation

6.248.2.1 max_event_count

DDS_Long DDS_WaitSetProperty_t::max_event_count

Maximum number of trigger events to cause a **DDS_WaitSet** (p. 1373) to awaken.

The **DDS_WaitSet** (p. 1373) will wait until up to `max_event_count` trigger events have occurred before returning. The **DDS_WaitSet** (p. 1373) may return earlier if either the `timeout` duration has expired, or `max_event_delay` has elapsed since the occurrence of the first trigger event. `max_event_count` may be used to "collect" multiple trigger events for processing at the same time.

[default] 1

[range] >= 1

;

6.248.2.2 max_event_delay

`struct` **`DDS_Duration_t`** `DDS_WaitSetProperty_t::max_event_delay`

Maximum delay from occurrence of first trigger event to cause a **DDS_WaitSet** (p. 1373) to awaken.

The **DDS_WaitSet** (p. 1373) will return no later than `max_event_delay` after the first trigger event. `max_event_delay` may be used to establish a maximum latency for events reported by the **DDS_WaitSet** (p. 1373).

Note that **DDS_RETCODE_TIMEOUT** (p. 1224) is *not* returned if `max_event_delay` is exceeded. **DDS_RETCODE_TIMEOUT** (p. 1224) is returned only if the `timeout` duration expires before any trigger events occur.

[default] DDS_DURATION_INFINITE (p. 1210) ;

6.250 DDS_WireProtocolQosPolicy Struct Reference

<<***extension***>> *(p. 796)* Specifies the wire-protocol-related attributes for the **DDS_DomainParticipant** (p. 76).

Data Fields

- **DDS_Long participant_id**

  *<<**basic**>> (p. 784) <<**extension**>> (p. 796) A value used to distinguish among different participants belonging to the same domain on the same host.*
- **DDS_UnsignedLong rtps_host_id**

  *<<**extension**>> (p. 796) The RTPS Host ID of the domain participant.*
- **DDS_UnsignedLong rtps_app_id**

  *<<**extension**>> (p. 796) The RTPS App ID of the domain participant.*
- **DDS_UnsignedLong rtps_instance_id**

  *<<**extension**>> (p. 796) The RTPS Instance ID of the **DDS_DomainParticipant** (p. 76).*
- struct **DDS_RtpsWellKnownPorts_t rtps_well_known_ports**

  *<<**extension**>> (p. 796) Configures the RTPS well-known port mappings.*
- **DDS_RtpsReservedPortKindMask rtps_reserved_port_mask**

  *<<**extension**>> (p. 796) Specifies which well-known ports to reserve when enabling the participant.*
- **DDS_WireProtocolQosPolicyAutoKind rtps_auto_id_kind**

  *<<**extension**>> (p. 796) Kind of auto mechanism used to calculate the GUID prefix.*
- **DDS_Boolean compute_crc**

  *<<**extension**>> (p. 796) Adds RTPS CRC submessage to every message when this field is set to **DDS_BOOLEAN_TRUE** (p. 1203).*
- **DDS_Boolean check_crc**

  *<<**extension**>> (p. 796) Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to **DDS_BOOLEAN_TRUE** (p. 1203).*

6.250.1 Detailed Description

*<<**extension**>> (p. 796)* Specifies the wire-protocol-related attributes for the **DDS_DomainParticipant** (p. 76).

Entity:

DDS_DomainParticipant (p. 76)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **NO** (p. 1247)

6.250.2 Usage

This QoS policy configures some participant-wide properties of the DDS Real-Time Publish Subscribe (RTPS) on-the-wire protocol. (**DDS_DataWriterProtocolQosPolicy** (p. 1649) and **DDS_DataReaderProtocolQosPolicy** (p. 1596) configure RTPS and reliability properties on a per **DDS_DataWriter** (p. 488) or **DDS_DataReader** (p. 618) basis.)

NOTE: The default QoS policies returned by RTI Connext contain the correctly initialized wire protocol attributes. The defaults are not normally expected to be modified, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **DDS_DomainParticipant** (p. 76) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **DDS_DomainParticipant** (p. 76) must have a unique value for this prefix relative to all other participants in its domain.

If an application dies unexpectedly and is restarted, the IDs used by the new instance of DomainParticipants should be different than the ones used by the previous instances. A change in these values allows other DomainParticipants to know that they are communicating with a new instance of an application, and not the previous instance.

For legacy reasons, RTI Connext divides the 96-bit prefix into three integers:

- The first integer is called host ID. The original purpose of this integer was to contain the identity of the machine on which the DomainParticipant is executing.
- The second integer is called an application ID. The original purpose of this integer was to contain a value that identifies the process or task in which the DomainParticipant is contained.
- The third integer is called instance ID. The original purpose was to contain a value that uniquely identifies a DomainParticipant within a task or process.

The **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) field can be used to configure the algorithm that RTI Connext uses to populate the 96-bit prefix. Then you can optionally overwrite specific parts of the 96-bit prefix by explicitly configuring the **DDS_WireProtocolQosPolicy::rtps_host_id** (p. 2103) (first integer), **DDS_WireProtocol↩ QosPolicy::rtps_app_id** (p. 2104) (second integer), and **DDS_WireProtocolQosPolicy::rtps_instance_id** (p. 2104) (third integer).

The **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) field supports three different prefix generation algorithms:

1. In the default and most common scenario, **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is set to **DDS_RTPS_AUTO_ID_FROM_UUID** (p. 1350). As the name suggests, this mechanism uses a unique, randomly generated UUID to fill the **rtps_host_id**, **rtps_app_id**, or **rtps_instance_id** fields. The first two bytes of the **rtps_host_id** are replaced with the RTI vendor ID (0x0101).

2. (Legacy) When rtps_auto_id_kind is set to **DDS_RTPS_AUTO_ID_FROM_IP** (p. 1350), the 96-bit prefix is generated as follows:

   - **rtps_host_id:** The 32-bit value of the IPv4 of the first up and running interface of the host machine is assigned. If the host does not have an IPv4 address, the host-id will be automatically set to 0x7F000001.
   - **rtps_app_id:** The process (or task) ID is assigned.
   - **rtps_instance_id:** A counter is assigned that is incremented per new participant within a process.

   DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

3. (Legacy) When rtps_auto_id_kind is set to **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 1350), the 96-bit prefix is generated as follows:

- **rtps_host_id:** The first 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
- **rtps_app_id:** The last 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
- **rtps_instance_id:** This field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant.

DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

Some examples are provided to clarify the behavior of this QoSPolicy in case you want to change the default behavior with **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 1350).

First, get the participant QoS from the DomainParticipantFactory:
```
DDS_DomainParticipantFactory_get_default_participant_qos(

                        DDS_DomainParticipantFactory_get_instance(),

                        &participant_qos);
```

Second, change the **DDS_WireProtocolQosPolicy** (p. 2099) using one of the options shown below.

Third, create the **DDS_DomainParticipant** (p. 76) as usual, using the modified QoS structure instead of the default one.

Option 1: Use **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 1350) to explicitly set just the application/task identifier portion of the **rtps_instance_id** field.

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  = (/* App ID */ (12 << 8) |

                                                  /* Instance ID*/ (DDS_RTPS_AUTO_ID));
```

Option 2: Handle only the per participant counter and let RTI Connext handle the application/task identifier:
```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  =  (/* App ID */ (DDS_RTPS_AUTO_ID) |

                                                  /* Instance ID*/ (12));
```

Option 3: Handle the entire **rtps_instance_id** field yourself:
```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  = ( /* App ID */ (12 << 8)) |

                                                   /* Instance ID */ (9) )
```

NOTE: If you are using **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 1350) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Connext handle the entire **rtps_instance_id** field:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = DDS_RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  = DDS_RTPS_AUTO_ID;
```

NOTE: If you are using **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 1350) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

6.250.3 Field Documentation

6.250.3.1 participant_id

DDS_Long DDS_WireProtocolQosPolicy::participant_id

<<***basic***>> *(*p. *784)* <<***extension***>> *(*p. *796)* A value used to distinguish among different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **DDS_DataReaderQos::unicast** (p. 1616) or **DDS_DataWriterQos::unicast** (p. 1672)).

For more information on port mapping, please refer to **DDS_RtpsWellKnownPorts_t** (p. 1983).

Each **DDS_DomainParticipant** (p. 76) in the same domain and running on the same host, must have a unique `participant_id`. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Connext will *automatically* resolve the participant ID as follows.

- RTI Connext will pick the *smallest* participant ID based on the unicast ports available on the transports enabled for discovery.
- RTI Connext will attempt to resolve an automatic port index either when a DomainPartcipant is enabled, or when a DataReader or DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainPartcipant is enabled.

[default] -1 [automatic], i.e. RTI Connext will automatically pick the `participant_id`, as described above.

[range] [>= 0], or -1, and does not violate guidelines stated in **DDS_RtpsWellKnownPorts_t** (p. 1983).

6.250.3.2 rtps_host_id

```
DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_host_id
```

<<***extension***>> *(*p. *796)* The RTPS Host ID of the domain participant.

A specific host ID that is unique in the domain.

[default] DDS_RTPS_AUTO_ID (p. **??**). The default value is interpreted as follows:
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to **DDS_RTPS_AUTO_ID_FROM_IP** (p. 1350), the value will be interpreted as the IPv4 address of the *first* up and running interface of the host machine.
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 1350), the value will be interpreted as the first 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to **DDS_RTPS_AUTO_ID_FROM_UUID** (p. 1350), the value will be the first 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.250.3.3 rtps_app_id

```
DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_app_id
```

<<***extension***>> *(*p. *796)* The RTPS App ID of the domain participant.

A participant specific ID that, together with the rtps_instance_id, is unique within the scope of the rtps_host_id.

If a participant dies and is restarted, it is recommended that it be given an app ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] DDS_RTPS_AUTO_ID (p. **??**). The default value is interpreted as follows:
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to ***DDS_RTPS_AUTO_ID_FROM_IP*** *(*p. *1350)* the value will be the process (or task) ID.
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to ***DDS_RTPS_AUTO_ID_FROM_MAC*** *(*p. *1350)* the value will be the last 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to ***DDS_RTPS_AUTO_ID_FROM_UUID*** *(*p. *1350)*, the value will be the middle 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.250.3.4 rtps_instance_id

DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_instance_id

<<***extension***>> *(*p. *796)* The RTPS Instance ID of the **DDS_DomainParticipant** (p. 76).

This is an instance-specific ID of a participant that, together with the rtps_app_id, is unique within the scope of the rtps_host_id.

If a participant dies and is restarted, it is recommended that it be given an instance ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] DDS_RTPS_AUTO_ID (p. **??**). The default value is interpreted as follows:
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to ***DDS_RTPS_AUTO_ID_FROM_IP*** *(*p. *1350)*, a counter is assigned that is incremented per new participant. For VxWorks-653, the first 8 bits are assigned to the partition id for the application.
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to ***DDS_RTPS_AUTO_ID_FROM_MAC*** *(*p. *1350)*, the first 24 bits are assigned to the application/task identifier and the last 8 bits are assigned to a counter that is incremented per new paricipant.
If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 2106) is equal to ***DDS_RTPS_AUTO_ID_FROM_UUID*** *(*p. *1350)*, the value will be the last 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff] **NOTE:** If you use ***DDS_RTPS_AUTO_ID_FROM_MAC*** *(*p. *1350)* as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both the two parts are non-zero, otherwise the middleware will take responsibility for them. We recommend that you always specify the two parts separately in order to avoid errors. (examples)

6.250.3.5 rtps_well_known_ports

struct **DDS_RtpsWellKnownPorts_t** DDS_WireProtocolQosPolicy::rtps_well_known_ports

<<***extension***>> *(*p. *796)* Configures the RTPS well-known port mappings.

Determines the well-known multicast and unicast port mappings for discovery (meta) traffic and user traffic.

[default] DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS (p. 1351)

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.250.3.6 rtps_reserved_port_mask

`DDS_RtpsReservedPortKindMask DDS_WireProtocolQosPolicy::rtps_reserved_port_mask`

<<***extension***>> *(p. 796)* Specifies which well-known ports to reserve when enabling the participant.

Specifies which of the well-known multicast and unicast ports will be reserved when the DomainParticipant is enabled. Failure to allocate a port that is computed based on the **DDS_RtpsWellKnownPorts_t** (p. 1983) will be detected at this time, and the enable operation will fail.

[default] DDS_RTPS_RESERVED_PORT_MASK_DEFAULT (p. 1347)

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.250.3.7 rtps_auto_id_kind

`DDS_WireProtocolQosPolicyAutoKind DDS_WireProtocolQosPolicy::rtps_auto_id_kind`

<<***extension***>> *(p. 796)* Kind of auto mechanism used to calculate the GUID prefix.

[default] DDS_RTPS_AUTO_ID_FROM_UUID (p. 1350)

Categories

Immutable (p. 916), **Discovery** (p. 854)

6.250.3.8 compute_crc

`DDS_Boolean DDS_WireProtocolQosPolicy::compute_crc`

<<***extension***>> *(p. 796)* Adds RTPS CRC submessage to every message when this field is set to **DDS_BOOLEAN_TRUE** (p. 1203).

The computed CRC covers the entire RTPS message excluding the RTPS header.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Security** (p. 909)

6.250.3.9 check_crc

```
DDS_Boolean DDS_WireProtocolQosPolicy::check_crc
```

<<***extension***>> *(p. 796)* Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to **DDS_BOOLEAN_TRUE** (p. 1203).

DDS_WireProtocolQosPolicy::compute_crc (p. 2106) must be enabled at the publishing application for validating the message at the subscribing application.

[default] DDS_BOOLEAN_FALSE (p. 1203)

  Identifies the application logical data source associated with the sample being written.
- struct **DDS_GUID_t related_source_guid**

  Identifies the application logical data source that is related to the sample being written.
- struct **DDS_GUID_t related_reader_guid**

  Identifies a DataReader that is logically related to the sample that is being written.

6.251.1 Detailed Description

<<***extension***>> *(p. 1014)* Input parameters for writing with **FooDataWriter_write_w_params** (p. 504), **FooData↩ Writer_dispose_w_params** (p. 507), **FooDataWriter_register_instance_w_params** (p. 496), **FooDataWriter_↩ unregister_instance_w_params** (p. 499)

6.251.2 Field Documentation

6.251.2.1 replace_auto

DDS_Boolean DDS_WriteParams_t::replace_auto

Allows retrieving the actual value of those fields that were automatic.

When this field is set, the fields that were configured with an automatic value (for example, **DDS_AUTO_SAMPLE_↩ IDENTITY** (p. 1392)) receive their actual value after **FooDataWriter_write_w_params** (p. 504) is called.

To reset those fields to their automatic value after calling **FooDataWriter_write_w_params** (p. 504), use **DDS_Write↩ Params_reset** (p. 1392)

6.251.2.2 identity

struct **DDS_SampleIdentity_t** DDS_WriteParams_t::identity

Identity of the sample.

Identifies the sample being written. The identity consists of a pair (Virtual Writer GUID, Virtual Sequence Number).

Use the default value to let RTI Connext determine the sample identity as follows:

- The Virtual Writer GUID is the virtual GUID associated with the writer writing the sample. This virtual GUID is configured using **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p. 1650).
- The sequence number is increased by one with respect to the previous value.

The virtual sequence numbers for a virtual writer must be strictly monotonically increasing. If the user tries to write a sample with a sequence number smaller or equal to the last sequence number, the write operation will fail.

A DataReader can access the identity of a received sample by using the fields **DDS_SampleInfo::original↩ _publication_virtual_guid** (p. 1998) and **DDS_SampleInfo::original_publication_virtual_sequence_number** (p. 1998) in the **DDS_SampleInfo** (p. 1990).

[default] DDS_AUTO_SAMPLE_IDENTITY (p. 1392).

6.251.2.3 related_sample_identity

```
struct DDS_SampleIdentity_t DDS_WriteParams_t::related_sample_identity
```

The identity of another sample related to this one.

Identifies another sample that is logically related to the one that is written.

When this field is set, the related sample identity is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1990) (see **DDS_SampleInfo_get_related_sample_identity** (p. 703)).

The default value is **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 1393), and is not propagated.

A DataReader can access the related identity of a received sample by using the fields **DDS_SampleInfo::related_original_publication_virtual_guid** (p. 1998) and **DDS_SampleInfo::related_original_publication_virtual_sequence_number** (p. 1999) in the **DDS_SampleInfo** (p. 1990).

[default] DDS_UNKNOWN_SAMPLE_IDENTITY (p. 1393)

6.251.2.4 source_timestamp

```
struct DDS_Time_t DDS_WriteParams_t::source_timestamp
```

Source timestamp upon write.

Specifies the source timestamp that will be available to the **DDS_DataReader** (p. 618) objects by means of the `source_timestamp` attribute within the **DDS_SampleInfo** (p. 1990).

[default] DDS_TIME_INVALID (p. 1210).

6.251.2.5 cookie

```
struct DDS_Cookie_t DDS_WriteParams_t::cookie
```

Octet sequence identifying written data sample.

Used in the callback **DDS_DataWriterListener::on_sample_removed** (p. 1647) to associate a removed sample with a written sample.

[default] Empty sequence (zero-length).

6.251.2.6 handle

```
DDS_InstanceHandle_t DDS_WriteParams_t::handle
```

Instance handle.

Either the handle returned by a previous call to **FooDataWriter_register_instance** (p. 494), or else the special value **DDS_HANDLE_NIL** (p. 227).

[default] DDS_HANDLE_NIL (p. 227)

6.251.2.7 priority

DDS_Long DDS_WriteParams_t::priority

Publication priority.

A positive integer value designating the relative priority of the sample, used to determine the transmission order of pending writes.

Use of publication priorities requires an asynchronous publisher (**DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 1321)) with **DDS_FlowControllerProperty_t::scheduling_policy** (p. 1802) set to **DDS_HPF_FLOW_CONTROLLER_SCHED_POLICY** (p. 564).

Larger numbers have higher priority.

For multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

If the publication priority of the parent DataWriter, or for multi-channel DataWriters, if the publication priority of the parent channel, is set to **DDS_PUBLICATION_PRIORITY_AUTOMATIC** (p. 1320), then the DataWriter or channel will be assigned the priority of the largest publication priority of all samples in the DataWriter or channel.

If the publication priority of the parent DataWriter, and for multi-channel DataWriters, if the publication priority of the parent channel, are set to **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 1320), then the DataWriter or channel will be assigned the lowest priority, regardless of the value of the publication priorities of samples written to the DataWriter or channel.

The publication priority of each sample can be set in the **DDS_WriteParams_t** (p. 2107) of **FooDataWriter_write_w_params** (p. 504).

For dispose and unregister samples, use the **DDS_WriteParams_t** (p. 2107) of **FooDataWriter_dispose_w_params** (p. 507) and **FooDataWriter_unregister_instance_w_params** (p. 499).

[default] 0 (lowest priority)

See also

DDS_ChannelSettings_t::priority (p. 1565)

6.251.2.8 flag

DDS_SampleFlag DDS_WriteParams_t::flag

Flags associated with the sample.

The flags are represented as a 32-bit integer, of which only the 16 least-significant bits are used.

RTI reserves least-significant bits [0-7] for middleware-specific usage.

The application can use least-significant bits [8-15].

The first bit (**DDS_REDELIVERED_SAMPLE** (p. 1389)) is reserved for marking samples as redelivered when using RTI Queuing Service.

The second bit (**DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 1389)) is used to indicate that a response sample is not the last response sample for a given request. This bit is usually set by a Replier sending multiple responses for a request.

An application can inspect the flags associated with a received sample by checking the field **DDS_SampleInfo::flag** (p. 1999).

[default] 0 (no flags are set)

6.251.2.9 source_guid

```
struct DDS_GUID_t DDS_WriteParams_t::source_guid
```

Identifies the application logical data source associated with the sample being written.

When this field is set, the source_guid is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1990) (see **DDS_SampleInfo::source_guid** (p. 1999)).

The default value is **DDS_GUID_AUTO** (p. 1215), and is not propagated.

This field is used by RTI Connext in the following cases:

- In RTI Queuing Service, this field and **DDS_WriteParams_t::related_source_guid** (p. 2111) play a crucial role in ensuring that replies are correctly routed back to the requester in request/reply scenarios.
- In RTI Routing Service, this field is used by the TopicQuery proxy feature to identify the original writer(s) that published the response samples for the TopicQuery. When dealing with snapshot TopicQueries, there will be one final sample (sample without the flag **DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE** (p. 1389)) per original writer that published one or more response samples.

You can use this field for your own purposes unless you are using Queuing Service or Routing Service as described above.

[default] DDS_GUID_AUTO (p. 1215) (the source_guid is automatically set to the **DDS_DataWriter** (p. 488) virtual GUID).

See also

DDS_WriteParams_t::related_source_guid (p. 2111)

6.251.2.10 related_source_guid

```
struct DDS_GUID_t DDS_WriteParams_t::related_source_guid
```

Identifies the application logical data source that is related to the sample being written.

When this field is set, the related_source_guid is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1990) (see **DDS_SampleInfo::related_source_guid** (p. 1999)).

This field and **DDS_WriteParams_t::source_guid** (p. 2110) are used by RTI Queuing Service, to ensure that replies are correctly routed back to the requester in request/reply scenarios.

The default value is **DDS_GUID_UNKNOWN** (p. 1215), and is not propagated.

[default] DDS_GUID_UNKNOWN (p. 1215)

See also

DDS_WriteParams_t::source_guid (p. 2110)

6.251.2.11 related_reader_guid

```
struct DDS_GUID_t DDS_WriteParams_t::related_reader_guid
```

Identifies a DataReader that is logically related to the sample that is being written.

When this field is set, the related_reader_guid is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1990) (see **DDS_SampleInfo::related_subscription_guid** (p. 2000)).

The default value is **DDS_GUID_UNKNOWN** (p. 1215), and is not propagated.

The main use case for this field is point-to-point sample distribution using CFT. DataReaders install a CFT on the related_reader_guid using a unique GUID. For example, the filter for DataReader 'n' can be:

```
@related_reader_guid.value = &hex(00000000000000000000000000000001)
```

Then, a DataWriter that wants to send the sample to DataReader 'n' will use the **FooDataWriter_write_w_params** (p. 504) function and set related_reader_guid to the value used by DataReader 'n' in its filter expression.

This field is currently used by RTI Queuing Service to distribute a sample to only one of the Consumer's DataReaders attached to a SharedReaderQueue.

[default] DDS_GUID_UNKNOWN (p. 1215)

6.252 DDS_WriterDataLifecycleQosPolicy Struct Reference

*<<**spec**>> (p. 791)* Controls how a **DDS_DataWriter** (p. 488) handles the lifecycle of the instances (keys) that it is registered to manage.

Data Fields

- **DDS_Boolean autodispose_unregistered_instances**

  *<<**spec**>> (p. 791) Boolean flag that controls whether or not a writer will also dispose of an instance when the **DDS_DataWriter** (p. 488) unregisters from the instance by means of the unregister operations.*
- struct **DDS_Duration_t autopurge_unregistered_instances_delay**

  *<<**extension**>> (p. 796) Maximum duration for which the **DDS_DataWriter** (p. 488) will maintain information regarding an instance once it has unregistered the instance.*
- struct **DDS_Duration_t autopurge_disposed_instances_delay**

  *<<**extension**>> (p. 796) Maximum duration for which the **DDS_DataWriter** (p. 488) will maintain information regarding an instance once it has disposed the instance.*

6.252.1 Detailed Description

*<<**spec**>> (p. 791)* Controls how a **DDS_DataWriter** (p. 488) handles the lifecycle of the instances (keys) that it is registered to manage.

Entity:

DDS_DataWriter (p. 488)

Properties:

RxO (p. 1247) = N/A
Changeable (p. 1247) = **YES** (p. 1247)

6.252.2 Usage

This policy determines how the **DDS_DataWriter** (p. 488) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the **DDS_DataWriter** (p. 488) or implicitly registered by directly writing the data).

You may use **FooDataWriter_unregister_instance** (p. 496) to indicate that the **DDS_DataWriter** (p. 488) no longer wants to send data for a **DDS_Topic** (p. 174).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a **DDS_DataWriter** (p. 488) unregisters an instance, RTI Connext can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see **DDS_OwnershipQosPolicy** (p. 1867)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other DataWriters to send updates for the value of that instance regardless of Ownership Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

6.252.3 Field Documentation

6.252.3.1 autodispose_unregistered_instances

```
DDS_Boolean DDS_WriterDataLifecycleQosPolicy::autodispose_unregistered_instances
```

<<***spec***>> *(p. 791)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **DDS_DataWriter** (p. 488) unregisters from the instance by means of the unregister operations.

- **DDS_BOOLEAN_TRUE** (p. 1203)
  The **DDS_DataWriter** (p. 488) will dispose of the instance each time it is unregistered. The behavior is identical to explicitly calling one of the `dispose` operations on the instance prior to calling the `unregister` operation.
- **DDS_BOOLEAN_FALSE** (p. 1203) (default)
  The **DDS_DataWriter** (p. 488) will not dispose of the instance. The application can still call one of the dispose operations prior to unregistering the instance and dispose of the instance that way.

[default] DDS_BOOLEAN_FALSE (p. 1203)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869), **Sample Memory Management** (p. 904)

6.252.3.2 autopurge_unregistered_instances_delay

`struct` **`DDS_Duration_t`** `DDS_WriterDataLifecycleQosPolicy::autopurge_unregistered_instances_delay`

<<***extension***>> *(p. 796)* Maximum duration for which the **DDS_DataWriter** (p. 488) will maintain information regarding an instance once it has unregistered the instance.

Determines how long the **DDS_DataWriter** (p. 488) will maintain information regarding an instance that has been unregistered. By default, the **DDS_DataWriter** (p. 488) resources associated with an instance (e.g., the space needed to remember the Instance Key or KeyHash) are released lazily. This means the resources are only reclaimed when the space is needed for another instance because **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956) is exceeded. This behavior can be changed by setting autopurge_unregistered_instances_delay to a value other than **DDS_DURATION↩_INFINITE** (p. 1210).

After this time elapses, the **DDS_DataWriter** (p. 488) will purge all internal information regarding the instance, including historical samples, even if **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1956) has not been reached.

The purging of unregistered instances can be done based on the source timestamp of the unregister sample or the time where the unregister sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

For durable writer history, autopurge_unregistered_instances_delay supports only the **DDS_DURATION_INFINITE** (p. 1210) value.

With **DDS_VOLATILE_DURABILITY_QOS** (p. 1289) durability, unregistered instances are removed as soon as all samples for the instance are fully acknowledged, regardless of how this field is set.

[default] **DDS_DURATION_INFINITE** (p. 1210) (disabled) for all **DDS_DataWriter** (p. 488) except for the built-in discovery DataWriters
DDS_DURATION_ZERO (p. 1211) for built-in discovery DataWriters (see **DDS_DiscoveryConfigQosPolicy↩::publication_writer_data_lifecycle** (p. 1701), **DDS_DiscoveryConfigQosPolicy::subscription_writer_data↩_lifecycle** (p. 1702) and **DDS_DiscoveryConfigQosPolicy::participant_configuration_writer_data_lifecycle** (p. 1715)).

[range] [0, 1 year] or **DDS_DURATION_INFINITE** (p. 1210)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869), **Sample Memory Management** (p. 904)

6.252.3.3 autopurge_disposed_instances_delay

```
struct DDS_Duration_t DDS_WriterDataLifecycleQosPolicy::autopurge_disposed_instances_delay
```

<<***extension***>> *(p. 796)* Maximum duration for which the **DDS_DataWriter** (p. 488) will maintain information regarding an instance once it has disposed the instance.

Determines how long the **DDS_DataWriter** (p. 488) will maintain information regarding an instance that has been disposed of. By default, disposing of an instance does not make it eligible to be purged. By setting autopurge_disposed↩ _instances_delay to a value other than **DDS_DURATION_INFINITE** (p. 1210), the DataWriter will delete the resources associated with an instance (including historical samples) once the time has elapsed and all matching DataReaders have acknowledged all the samples for this instance including the dispose sample.

The purging of disposed instances can be done based on the source timestamp of the dispose sample or the time when the dispose sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

This QoS value is supported with durable DataWriter queues only for **DDS_DURATION_ZERO** (p. 1211) and **DDS_**↩ **DURATION_INFINITE** (p. 1210) values (finite values are not supported).

[default] DDS_DURATION_INFINITE (p. 1210) (disabled)

[range] [0, 1 year] or **DDS_DURATION_INFINITE** (p. 1210)

Categories

Immutable (p. 916), **Instance Lifecycle** (p. 869), **Sample Memory Management** (p. 904)

6.253 DDS_WstringSeq Struct Reference

Instantiates **FooSeq** (p. 2120) < **DDS_Wchar** (p. 1204)* >

6.253.1 Detailed Description

DDS_Wchar (p. 1204)

DDS_StringSeq (p. 2010)

FooSeq (p. 2120)

6.254 Foo Struct Reference

A representative user-defined data type.

6.254.1 Detailed Description

A representative user-defined data type.

Foo (p. 2116) represents a user-defined data-type that is intended to be distributed using DDS.

The type **Foo** (p. 2116) is usually defined using IDL syntax and placed in a ".idl" file that is then processed using rtiddsgen. The rtiddsgen utility generates the helper classes **FooSeq** (p. 2120) as well as the necessary code for DDS to manipulate the type (serialize it so that it can be sent over the network) as well as the implied **FooDataReader** (p. 2119) and **FooDataWriter** (p. 2119) types that allow the application to send and receive data of this type.

6.255 FooBarReplier Struct Reference

Allows receiving requests and sending replies.

6.255.1 Detailed Description

Allows receiving requests and sending replies.

A Replier is an entity with two associated **topics** (p. 166): a request topic and a reply topic. It can receive requests by subscribing to the request topic and can send replies to those requests by publishing the reply topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by rtiddsgen, the **DDS built-in types** (p. 307), and **DDS_DynamicData** (p. 1771). **Note:** At this moment, in the C version of this API, only rtiddsgen-generated types are supported.

To create a Replier for two types, a request type `TReq=`**`Foo`** `(p. 2116)` and a reply type `TRep=Bar`, your application needs to instantiate the data structure **`FooBarReplier`** `(p. 2116)` and the specific operations that can publish and subscribe to those types. In this documentation we refer to the type-dependent operations as `FooBarReplier_` (for example, **FooBarReplier_take_requests** (p. 772)). Some operations are type-independent and their names always begin with `RTI_Connext_Replier_` (for example, **RTI_Connext_Replier_wait_for_requests** (p. 769)). See **Creating a Replier** (p. 1009).

A Replier has four main types of operations:

- Waiting for requests to be received from the middleware
- Getting those requests

- Receiving requests (a convenience operation that is a combination of waiting and getting in a single operation)
- Sending a reply for a previously received request (i.e., publishing a reply sample on the reply topic with special meta-data so that the orignal Requester can identify it)

For multi-reply scenarios in which a **FooBarReplier** (p. 2116) generates more than one reply for a request, the **FooBar↩ Replier** (p. 2116) should mark all the intermediate replies (all but the last) using the **DDS_INTERMEDIATE_REPLY_↩ SEQUENCE_SAMPLE** (p. 1389) flag in **DDS_WriteParams_t::flag** (p. 2110).

Much like a Requester, a Replier has an associated **DDS_DomainParticipant** (p. 76), which can be shared with other Repliers or RTI Connext routines. All the other entities required for the request-reply interaction, including a **DDS_↩ DataWriter** (p. 488) for writing replies and a **DDS_DataReader** (p. 618) for reading requests, are automatically created when the Replier is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **RTI_Connext_Requester↩ Params::qos_profile_name** (p. 2182)). By default, they are created with **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 1012)

There are several ways to use a Replier:

- A thread **receives** (p. 771) requests and then dispatches them. If the computation of a reply is a simple operation, consider using a **FooBarSimpleReplier** (p. 2118) instead of a Replier.
- Polling without waiting, using **FooBarReplier_take_requests** (p. 772) directly.
- Using a **RTI_Connext_ReplierListener** (p. 2175) to get notified and **get** (p. 772) the requests within the callback.

Replier example (p. 1010)

6.256 FooBarRequester Struct Reference

Allows sending requests and receiving replies.

6.256.1 Detailed Description

Allows sending requests and receiving replies.

A requester is an entity with two associated **topics** (p. 166): a request topic and a reply topic. It can send requests by publishing samples of the request topic and receive replies to those requests by subscribing to the reply topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by rtiddsgen, the **DDS built-in types** (p. 307), and **DDS_DynamicData** (p. 1771). **Note:** At this moment, in the C version of this API, only rtiddsgen-generated types are supported.

To create a Requester for two types, a request type TReq=**Foo** (p. 2116) and a reply type TRep=Bar, your application needs to instantiate the data structure **FooBarRequester** (p. 2117) and the specific operations that can publish and subscribe to those types. In this documentation we refer to the type-dependent operations as FooBar↩Requester_ (for example, **FooBarRequester_take_replies** (p. 757)). Some operations are type-independent and their name always begins with RTI_Connext_Requester_ (for example, **RTI_Connext_Requester_wait_for_↩replies** (p. 751)).

See **Creating a Requester** (p. 1006) to see how to instantiate a **FooBarRequester** (p. 2117).

A Replier and a Requester communicate when they use the same topics for requests and replies (see **RTI_Connext↩_RequesterParams::service_name** (p. 2181)) on the same **domain** (p. 76).

A Requester can send requests and receive one or multiple replies. It does that using the following operations:

- Sending requests (i.e. publishing request samples on the request topic)
- Waiting for replies to be received by the middleware (for any request or for a specific request)
- Getting those replies from the middleware. There are two ways to do this: take (the data samples are removed from the middleware), read (the data samples remain in the middleware and can be read or taken again).
- A convenience operation, receive (which is a combination of wait and take).

In all cases, the middleware guarantees that a requester only receives reply samples that are associated with those requests that it sends.

For multi-reply scenarios, in which a Requester receives multiple replies from a Replier for a given request, the Requester can check if a reply is the last reply of a sequence of replies. To do so, see if the bit **DDS_INTERMEDIATE_REPLY↩_SEQUENCE_SAMPLE** (p. 1389) is set in **DDS_SampleInfo::flag** (p. 1999) after receiving each reply. This indicates it is NOT the last reply.

A requester has an associated **DDS_DomainParticipant** (p. 76), which can be shared with other requesters or RTI Connext routines. All the other RTI Connext entities required for the request-reply interaction, including a **DDS_Data↩Writer** (p. 488) for writing requests and a **DDS_DataReader** (p. 618) for reading replies, are automatically created when the requester is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **RTI_Connext_Requester↩Params::qos_profile_name** (p. 2182)). By default, they are created with **DDS_RELIABLE_RELIABILITY_QOS** (p. 1325). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 1012)

Request-Reply Examples (p. 1004)

Requester example (p. 1007)

6.257 FooBarSimpleReplier Struct Reference

A callback-based replier.

6.257.1 Detailed Description

A callback-based replier.

A SimpleReplier is based on a **RTI_Connext_SimpleReplierListener** (p. 2183) that users provide . Requests are passed to the callback, which returns a reply. The reply is directed only to the Requester that sent the request.

SimpleRepliers are useful for simple use cases where a single reply for a request can be generated quickly, for example, looking up a table.

When more than one reply for a request can be generated or the processing is complex or needs to happen asynchronously, use a **FooBarReplier** (p. 2116) instead.

6.260 FooSeq Struct Reference

*<<**interface**>> (p. 1015) <<**generic**>> (p. 1015)* A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **`Foo`** (p. 2116).

6.260.1 Detailed Description

*<<**interface**>> (p. 1015) <<**generic**>> (p. 1015)* A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **`Foo`** (p. 2116).

For users who define data types in OMG IDL, this type corresponds to the IDL express `sequence<`**`Foo`** (p. 2116)`>`.

For any user-data type **`Foo`** (p. 2116) that an application defines for the purpose of data-distribution with RTI Connext, a **`FooSeq`** (p. 2120) is generated. We refer to an IDL `sequence<`**`Foo`** (p. 2116)`>` as **`FooSeq`** (p. 2120).

The state of a sequence is described by the properties 'maximum', 'length' and 'owned'.

- The 'maximum' represents the size of the underlying buffer; this is the maximum number of elements it can possibly hold. It is returned by the **FooSeq_get_maximum** (p. 1514) operation.
- The 'length' represents the actual number of elements it currently holds. It is returned by the **FooSeq_get_length** (p. 1515) operation.
- The 'owned' flag represents whether the sequence owns the underlying buffer. It is returned by the **FooSeq_↩ has_ownership** (p. 1524) operation. If the sequence does not own the underlying buffer, the underlying buffer is loaned from somewhere else. This flag influences the lifecycle of the sequence and what operations are allowed on it. The general guidelines are provided below and more details are described in detail as pre-conditions and post-conditions of each of the sequence's operations:
  - If owned == **DDS_BOOLEAN_TRUE** (p. 1203), the sequence has ownership on the buffer. It is then responsible for destroying the buffer when the sequence is destroyed.
  - If the owned == **DDS_BOOLEAN_FALSE** (p. 1203), the sequence does not have ownership on the buffer. This implies that the sequence is loaning the buffer. The sequence cannot be destroyed until the loan is returned.
  - A sequence with a zero maximum always has owned == **DDS_BOOLEAN_TRUE** (p. 1203)

6.262 NDDS_Config_LibraryVersion_t Struct Reference

The version of a single library shipped as part of an RTI Connext distribution.

Data Fields

- **DDS_Long major**

  The major version of a single RTI Connext library.
- **DDS_Long minor**

  The minor version of a single RTI Connext library.
- char **release**

  The release letter of a single RTI Connext library.
- **DDS_Long build**

  The build number of a single RTI Connext library.

6.262.1 Detailed Description

The version of a single library shipped as part of an RTI Connext distribution.

RTI Connext is comprised of a number of separate libraries. Although RTI Connext as a whole has a version, the individual libraries each have their own versions as well. It may be necessary to check these individual library versions when seeking technical support.

6.262.2 Field Documentation

6.262.2.1 major

DDS_Long NDDS_Config_LibraryVersion_t::major

The major version of a single RTI Connext library.

6.262.2.2 minor

DDS_Long NDDS_Config_LibraryVersion_t::minor

The minor version of a single RTI Connext library.

6.262.2.3 release

char NDDS_Config_LibraryVersion_t::release

The release letter of a single RTI Connext library.

6.262.2.4 build

DDS_Long NDDS_Config_LibraryVersion_t::build

The build number of a single RTI Connext library.

6.263 NDDS_Config_Logger Struct Reference

<<***interface***>> *(*p. *1015)* The singleton type used to configure RTI Connext logging.

6.263.1 Detailed Description

<<***interface***>> *(*p. *1015)* The singleton type used to configure RTI Connext logging.

6.264 NDDS_Config_LoggerDevice Struct Reference

<<***interface***>> *(*p. *1015)* Logging device interface. Use for user-defined logging devices.

Data Fields

- **NDDS_Config_LoggerDeviceWriteFnc write**
  Write a log message to a specified logging device.
- **NDDS_Config_LoggerDeviceCloseFnc close**
  Close the logging device.

6.264.1 Detailed Description

<<***interface***>> *(p. 1015)* Logging device interface. Use for user-defined logging devices.

Interface for handling log messages.

By default, the logger sends the log messages generated by RTI Connext to the standard output.

You can use the function **NDDS_Config_Logger_set_output_file** (p. 1452) to redirect the log messages to a file.

To further customize the management of generated log messages, the logger offers the function **NDDS_Config_↩ Logger_set_output_device** (p. 1456) that allows you to install a user-defined logging device.

The logging device installed by the user must implement this interface.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **DDS_DomainParticipant_get↩ _current_time** (p. 137), from any of the logging device operations.

6.264.2 Field Documentation

6.264.2.1 write

NDDS_Config_LoggerDeviceWriteFnc NDDS_Config_LoggerDevice::write

Write a log message to a specified logging device.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **DDS_DomainParticipant_get↩ _current_time** (p. 137), from any of the logging device operations.

6.264.2.2 close

NDDS_Config_LoggerDeviceCloseFnc NDDS_Config_LoggerDevice::close

Close the logging device.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **DDS_DomainParticipant_get↩ _current_time** (p. 137), from any of the logging device operations.

6.265 NDDS_Config_LogMessage Struct Reference

A log message's input parameter to a logging device, including the text and additional information.

Data Fields

- const char * **text**

  Message text.
- **NDDS_Config_LogLevel level**

  Message level.
- **DDS_Boolean is_security_message**

  Indicates if the message is a security-related message.
- **DDS_Boolean is_license_message**

  Indicates if the message is a license-related message.
- **DDS_UnsignedLong message_id**

  A numeric code that identifies a specific log message.
- struct **DDS_Duration_t timestamp**

  The time when the log message was printed.
- **NDDS_Config_LogFacility facility**

  *The Facility associated with the log message. See **NDDS_Config_LogFacility** (p. 1448).*

6.265.1 Detailed Description

A log message's input parameter to a logging device, including the text and additional information.

6.265.2 Field Documentation

6.265.2.1 text

```
const char* NDDS_Config_LogMessage::text
```

Message text.

6.265.2.2 level

```
NDDS_Config_LogLevel NDDS_Config_LogMessage::level
```

Message level.

6.265.2.3 is_security_message

DDS_Boolean NDDS_Config_LogMessage::is_security_message

Indicates if the message is a security-related message.

A "security-related message" is a log message that meets any of the following:

- A security event logged with the RTI Security Plugins Logging Plugin.
- Any regular message coming from the RTI Security Plugins.
- RTI TLS Support log messages related to OpenSSL (e.g., SSL handshake failures or certificate validation failures).

6.265.2.4 is_license_message

DDS_Boolean NDDS_Config_LogMessage::is_license_message

Indicates if the message is a license-related message.

When using a licensed version of RTI Connext (such as the RTI Connext Express edition), certain messages related to the license, such as the trial expiration date or license limitations, are logged when a DomainParticipant is created. This flag indicates whether the message is one of those license-related messages.

6.265.2.5 message_id

DDS_UnsignedLong NDDS_Config_LogMessage::message_id

A numeric code that identifies a specific log message.

Two log messages that have the same message_id will have a similar structure. E.g. "ERROR: Failed to get Data↩ WriterQos" and "ERROR: Failed to get TopicName". In this case, the message_id is associated to the get failure.

6.265.2.6 timestamp

struct **DDS_Duration_t** NDDS_Config_LogMessage::timestamp

The time when the log message was printed.

6.265.2.7 facility

NDDS_Config_LogFacility NDDS_Config_LogMessage::facility

The Facility associated with the log message. See **NDDS_Config_LogFacility** (p. 1448).

6.266 NDDS_Config_Version_t Struct Reference

<<***interface***>> *(p. 1015)* The version of an RTI Connext distribution.

6.266.1 Detailed Description

<<***interface***>> *(p. 1015)* The version of an RTI Connext distribution.

The complete version is made up of the versions of the individual libraries that make up the product distribution.

6.267 NDDS_Transport_Address_t Struct Reference

Addresses are stored individually as network-ordered bytes.

`#include <transport_common_user.h>`

Data Fields

- unsigned char **network_ordered_value** [NDDS_TRANSPORT_ADDRESS_LENGTH]

6.267.1 Detailed Description

Addresses are stored individually as network-ordered bytes.

RTI Connext addresses are numerically stored in a transport independent manner. RTI Connext uses a IPv6-compatible format, which means that the data structure to hold an **NDDS_Transport_Address_t** (p. 2126) is the same size as a data structure needed to hold an IPv6 address.

In addition, the functions provided to translate a string representation of an RTI Connext address to a value assumes that the string presentation follows the IPv6 address presentation as specified in RFC 2373.

An **NDDS_Transport_Address_t** (p. 2126) always stores the address in network-byte order (which is Big Endian).

For example, IPv4 multicast address of 225.0.0.0 is represented by

{{0,0,0,0, 0,0,0,0, 0,0,0,0, 0xE1,0,0,0}} regardless of endianness,

where 0xE1 is the 13th byte of the structure (`network_ordered_value`[12]).

6.267.2 Field Documentation

6.267.2.1 network_ordered_value

```
unsigned char NDDS_Transport_Address_t::network_ordered_value[NDDS_TRANSPORT_ADDRESS_LENGTH]
```

network-byte ordered (i.e., bit 0 is the most significant bit and bit 128 is the least significant bit).

6.268 NDDS_Transport_Interface_t Struct Reference

Storage for the description of a network interface used by a Transport Plugin.

```
#include <transport_common.h>
```

Data Fields

- **NDDS_Transport_ClassId_t transport_classid**

  The transport classid of the interface.
- **NDDS_Transport_Address_t address**

  An unicast address that uniquely identifies this interface in the network specified by the transport class.
- **NDDS_Transport_Interface_Status_t status**

  The state of the interface.
- RTI_UINT16 **rank**

  Rank of the interface. Used when allow_interfaces_list Qos is set. A rank value will be assigned to each of the interfaces that match the allow_interfaces_list filter allowing an endpoint to prioritize some interfaces upon others.

6.268.1 Detailed Description

Storage for the description of a network interface used by a Transport Plugin.

6.268.2 Field Documentation

6.268.2.1 transport_classid

```
NDDS_Transport_ClassId_t NDDS_Transport_Interface_t::transport_classid
```

The transport classid of the interface.

6.268.2.2 address

NDDS_Transport_Address_t NDDS_Transport_Interface_t::address

An unicast address that uniquely identifies this interface in the network specified by the transport class.

6.268.2.3 status

NDDS_Transport_Interface_Status_t NDDS_Transport_Interface_t::status

The state of the interface.

6.268.2.4 rank

RTI_UINT16 NDDS_Transport_Interface_t::rank

Rank of the interface. Used when allow_interfaces_list Qos is set. A rank value will be assigned to each of the interfaces that match the allow_interfaces_list filter allowing an endpoint to prioritize some interfaces upon others.

6.269 NDDS_Transport_Property_t Struct Reference

Base configuration structure that must be inherited by derived Transport Plugin classes.

#include <transport_interface_user.h>

Data Fields

- **NDDS_Transport_ClassId_t classid**

  The Transport-Plugin Class ID.
- RTI_INT32 **address_bit_count**

  Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.
- RTI_INT32 **properties_bitmap**

  A bitmap that defines various properties of the transport to the RTI Connext core.
- RTI_INT32 **gather_send_buffer_count_max**

  Specifies the maximum number of buffers that RTI Connext can pass to the `send()` function of a transport plugin.
- RTI_INT32 **message_size_max**

  The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.
- char ** **allow_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length` > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

- RTI_INT32 **allow_interfaces_list_length**

  Number of elements in the `allow_interfaces_list`.
- char ** **deny_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length` *> 0), deny the use of these interfaces.*
- RTI_INT32 **deny_interfaces_list_length**

  Number of elements in the `deny_interfaces_list`.
- char ** **allow_multicast_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length` *> 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.*
- RTI_INT32 **allow_multicast_interfaces_list_length**

  Number of elements in the `allow_multicast_interfaces_list`.
- char ** **deny_multicast_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length` *> 0), deny the use of those interfaces for multicast.*
- RTI_INT32 **deny_multicast_interfaces_list_length**

  Number of elements in `deny_multicast_interfaces_list`.
- struct **NDDS_Transport_UUID transport_uuid**

  Univocally identifies a transport plugin.
- char * **thread_name_prefix**

  Prefix used to name the transport threads.
- RTI_INT32 **max_interface_count**

  Maximum number of addresses from the `allow_interfaces_list` *that will be announced.*

6.269.1 Detailed Description

Base configuration structure that must be inherited by derived Transport Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Connext. The RTI Connext core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

In the C-language, this can be done by creating a custom plugin property structure whose first member is a **NDDS_Transport_Property_t** (p. 2128) structure.

For example,

```
struct MyTransport_Plugin_Property_t {
    NDDS_Transport_Property_t base_properties;
    int myIntProperty;
    < etc >;
};
```

WARNING: The transport properties of an instance of a Transport Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

6.269.2 Field Documentation

6.269.2.1 classid

NDDS_Transport_ClassId_t NDDS_Transport_Property_t::classid

The Transport-Plugin Class ID.

The transport plugin sets the value for this field.

Class IDs below **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 1027) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

Invariant

The `classid` is invariant for the lifecycle of a transport plugin.

6.269.2.2 address_bit_count

RTI_INT32 NDDS_Transport_Property_t::address_bit_count

Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.

The transport plugin sets the value for this field.

A transport plugin should define the range of addresses that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected. The sign of this field determines whether the count of bits starts on the most significant bit (negative sign) or on the least significant bit (positive sign).

For example, for an address range of 0-255, the address_bit_count should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

See also

Transport Class Attributes (p. 723)

6.269.2.3 properties_bitmap

```
RTI_INT32 NDDS_Transport_Property_t::properties_bitmap
```

A bitmap that defines various properties of the transport to the RTI Connext core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Connext tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also

NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (p. 1027)

6.269.2.4 gather_send_buffer_count_max

```
RTI_INT32 NDDS_Transport_Property_t::gather_send_buffer_count_max
```

Specifies the maximum number of buffers that RTI Connext can pass to the `send()` function of a transport plugin.

The transport plugin `send()` API supports a gather-send concept, where the `send()` call can take several discontiguous buffers, assemble and send them in a single message. This enables RTI Connext to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Connext from trying to gather too many buffers into a send call for the transport plugin.

RTI Connext requires all transport-plugin implementations to support a gather-send of least a minimum number of buffers. This minimum number is defined to be **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_↩ COUNT_MIN** (p. 1028).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the `send()` call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the receive_rEA() call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Connext layer.

6.269.2.5 message_size_max

```
RTI_INT32 NDDS_Transport_Property_t::message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this property. In any case, this value must be set before the transport plugin is registered, so that RTI Connext can properly use the plugin.

For information about the default value for different transports, see the `Core Libraries User's Manual`.

6.269.2.6 allow_interfaces_list

```
char** NDDS_Transport_Property_t::allow_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length` > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that Domain↩ Participant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.∗, 192.168.∗, 192.∗, ether0

The left-to-right order of this list matters if you are using the max_interface_count to limit the allowable interfaces further. See `max_interface_count`.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 76) is deleted.

[default] empty list that represents all available interfaces.

See also

NDDS_Transport_Property_t::max_interface_count (p. 2135)

6.269.2.7 allow_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_interfaces_list_length
```

Number of elements in the `allow_interfaces_list`.

By default, `allow_interfaces_list_length` = 0, i.e. an empty list.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

6.269.2.8 deny_interfaces_list

```
char** NDDS_Transport_Property_t::deny_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length` > 0), deny the use of these interfaces.

This "black" list is applied *after* the `allow_interfaces_list` and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that Domain↩ Participant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.∗, 192.168.∗, 192.∗, ether0

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 76) is deleted.

[default] empty list that represents no denied interfaces.

6.269.2.9 deny_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_interfaces_list_length
```

Number of elements in the `deny_interfaces_list`.

By default, `deny_interfaces_list_length` = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

6.269.2.10 allow_multicast_interfaces_list

```
char** NDDS_Transport_Property_t::allow_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.↩ e., `allow_multicast_interfaces_list_length` > 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the `allow_interfaces_list` "white" list *and* the `deny_interfaces_list` "black" list.

After `allow_multicast_interfaces_list`, the `deny_multicast_interfaces_list` is applied. Multicast output will be sent and may be received over the interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast. It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 76) is deleted.

[default] empty list that represents all available interfaces.

6.269.2.11 allow_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_multicast_interfaces_list_length
```

Number of elements in the `allow_multicast_interfaces_list`.

By default, `allow_multicast_interfaces_list_length` = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

6.269.2.12 deny_multicast_interfaces_list

```
char** NDDS_Transport_Property_t::deny_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length` > 0), deny the use of those interfaces for multicast.

This "black" list is applied after `allow_multicast_interfaces_list` and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 76) is deleted.

[default] empty list that represents no denied interfaces.

6.269.2.13 deny_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_multicast_interfaces_list_length
```

Number of elements in `deny_multicast_interfaces_list`.

By default, `deny_multicast_interfaces_list_length` = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

6.269.2.14 transport_uuid

```
struct NDDS_Transport_UUID NDDS_Transport_Property_t::transport_uuid
```

Univocally identifies a transport plugin.

It represents the prefix of the participant GUID.

6.269.2.15 thread_name_prefix

```
char* NDDS_Transport_Property_t::thread_name_prefix
```

Prefix used to name the transport threads.

This field is optional.

The maximum size of this string is 8 characters.

If "thread_name_prefix" is not set by the user, RTI Connext creates the following prefix: 'r' + 'Tr' + participant identifier + '\0'.

Where 'r' indicates this is a thread from RTI, 'Tr' indicates the thread is related to a transport, and participant identifier contains 5 characters as follows:

If participant_name is set: The participant identifier will be the first 3 characters and the last 2 characters of the participant_name.

If participant_name is not set, then the identifier is computed as domain_id (3 characters) followed by participant_id (2 characters).

If participant_name is not set and the participant_id is set to -1 (defalt value), then the participant identifier is computed as the last 5 digits of the rtps_instance_id in the participant GUID.

6.269.2.16 max_interface_count

```
RTI_INT32 NDDS_Transport_Property_t::max_interface_count
```

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

By default, `max_interface_count` = LENGTH_UNLIMITED: all the interfaces are announced.

This feature is useful if you want to control the network interfaces on which your DomainParticipants receive data. For example, if you have one wired and one wireless interface both up and running, and `max_interface_count` is set to 1, the DomainParticipant will receive data over the interface you list first in the `allow_interfaces_list` -for example, the wired one.

RTI Connext selects the preferred interface(s) by iterating over the list of allowed interfaces until the first `max_↩ interfaces_count` of active interfaces encountered are announced. The order of iteration is left to right as specified in the `allow_interfaces_list` setting.

This setting applies only if the `allow_interfaces_list` is not empty.

The `max_interface_count` setting does not consider end-to-end connectivity to select interfaces. The decision is based purely on whether interfaces are up or down in a node. Therefore, this feature is not intended to be used in the following scenarios:

- A DomainParticipant is not reachable by other DomainParticipants in all the interfaces in the `allow_↩ interfaces_list`. This could occur if the DomainParticipant is in different subnets, and some of these subnets cannot be reached by other DomainParticipants.
- End-to-end connectivity issues lead to situations in which the interfaces selected after applying `max_↩ interface_count` cannot be reached by other DomainParticipants.

For UDPv4 and UDPv6 transports, this feature also affects multicast traffic by limiting the interfaces over which a DomainParticipant sends multicast traffic. The (allow/deny)_multicast_interfaces_list applies to the interfaces selected by using the `max_interfaces_count` property.

Note: If a pattern string in the `allow_interfaces_list` matches multiple interface addresses, and `max_↩ interface_count` is set to a finite value, the order for the matching allowed interfaces is decided based on the order in which the operating system provides these interfaces.

[default] LENGTH_UNLIMITED

6.270.2.1 parent

`struct` **`NDDS_Transport_Property_t`** `NDDS_Transport_Shmem_Property_t::parent`

Generic properties of all transport plugins.

6.270.2.2 received_message_count_max

`RTI_INT32 NDDS_Transport_Shmem_Property_t::received_message_count_max`

Number of messages that can be buffered in the receive queue.

This does not guarantee that the Transport-Plugin will actually be able to buffer `received_message_count_max` messages of the maximum size set in **NDDS_Transport_Property_t::message_size_max** (p. 2131). The total number of bytes that can be buffered for a transport plug-in is actually controlled by `receive_buffer_size`.

See also

NDDS_Transport_Property_t (p. 2128), **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (p. 1042)

6.270.2.3 receive_buffer_size

```
RTI_INT32 NDDS_Transport_Shmem_Property_t::receive_buffer_size
```

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue. The actual number of bytes allocated is:

```
size = receive_buffer_size + message_size_max +
       received_message_count_max * fixedOverhead
```

where `fixedOverhead` is some small number of bytes used by the queue data structure. The following rules are noted:

- `receive_buffer_size` < `message_size_max` * `received_message_count_max`, then the transport plugin will not be able to store `received_message_count_max` messages of size `message_size_max`.

- `receive_buffer_size` > `message_size_max` * `received_message_count_max`, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then `receive_buffer_size` should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the `receive_buffer_size` to 100 K bytes. This allows the user to optimize the memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

NOTE, the queue will always be able to hold 1 message of `message_size_max` bytes, no matter what the value of receive_buffer_size is.

Configurable IPv4/UDP Transport-Plugin properties.

#include <transport_udpv4.h>

Data Fields

- struct **NDDS_Transport_Property_t parent**

  Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**

  Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**

  Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**

  Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**

  Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**

  Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonup_interfaces**

  ***[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- RTI_INT32 **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing a zero copy.*
- RTI_INT32 **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**

  Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**

  Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**

  Set low value of output range to IPv4 TOS.
- RTI_INT32 **transport_priority_mapping_high**

  Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**

  Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**

  Controls whether or not to reuse multicast receive resources.
- RTI_INT32 **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**

  Disables detection of network interface changes.

- RTI_UINT32 **join_multicast_group_timeout**

  [Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.
- char * **public_address**

  Public IP address associated with the transport instantiation.
- RTI_INT32 **port_offset**

  *Port offset to allow multiple instances of UDPv4 transports in the same **DDS_DomainParticipant** (p. 76).*

6.273.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

NDDS_Transport_Support_set_builtin_transport_property() (p. 736)

NDDS_Transport_UDPv4_new (p. 1051)

6.273.2 Field Documentation

6.273.2.1 parent

`struct` **NDDS_Transport_Property_t** NDDS_Transport_UDPv4_Property_t::parent

Generic properties of all transport plugins.

6.273.2.2 send_socket_buffer_size

RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 2131). Its maximum value is dependent on the operating system.

By default, it will be set to **NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1049).

The maximum value for this property depends on the operating system.

Valid values are:

- **NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1049): `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the default value.
- **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 1049): `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. RTI Connext will use the OS default.
- **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX** (p. 1048): RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the send buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

6.273.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 2131). Its maximum value is dependent on the operating system.

By default, it will be set to **NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1049).

The maximum value for this property depends on the operating system.

Valid values are:

- **NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1049): `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the default value.
- **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 1049): `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. RTI Connext will use the OS default.
- **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX** (p. 1048): RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the receive buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

6.273.2.4 unicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

6.273.2.5 multicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use all the network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

6.273.2.6 multicast_ttl

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

See also

NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT (p. 1050)

6.273.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connext will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

6.273.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

6.273.2.9 ignore_nonup_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_Property_t::disable_interface_tracking** (p. 2149) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

6.273.2.10 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

6.273.2.11 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connext will use the zero-copy API if offered by the OS.

6.273.2.12 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

6.273.2.13 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **DDS_DomainParticipant_get_participant_protocol_status** (p. 127).

[default] 1 (enabled)

6.273.2.14 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 2147) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 2147) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 1339)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

6.273.2.15 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 2147) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 2147) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

6.273.2.16 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 2147) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 2147) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

6.273.2.17 send_ping

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

6.273.2.18 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

6.273.2.19 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

6.273.2.20 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

Setting this to 0 (FALSE) prevents multicast crosstalk by uniquely configuring a port and creating a receive thread for each multicast group address.

[default] 1.

6.273.2.21 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 2131) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↩ _max, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 2131)

6.273.2.22 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connext application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connext 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

6.273.2.23 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

On Windows, a network interface may be detected before it is allowed to join a multicast group address. This property adjusts how much time (milliseconds) to wait for the ADD_MEMBERSHIP multicast operation to succeed before withdrawing.

[default] 5000

6.273.2.24 public_address

```
char* NDDS_Transport_UDPv4_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **DDS_DomainParticipant** (p. 76) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **DDS_RtpsWellKnownPorts_t** (p. 1983)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **DDS_DomainParticipant** (p. 76) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] NULL (the transport uses the IP addresses obtained from the NICs)

6.273.2.25 port_offset

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv4 transports in the same **DDS_DomainParticipant** (p. 76).

By default, it is not possible to have multiple instances of the UDPv4 transport in the same **DDS_DomainParticipant** (p. 76). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv4 transport in the same **DDS_DomainParticipant** (p. 76).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

[default] 0

6.274 NDDS_Transport_UDPv4_WAN_Property_t Struct Reference

Configurable IPv4/UDP WAN Transport-Plugin properties.

```
#include <transport_udpv4.h>
```

Data Fields

- struct **NDDS_Transport_Property_t parent**

  Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**

  Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonup_interfaces**

  ***[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- RTI_INT32 **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing a zero copy.*
- RTI_INT32 **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**

  Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**

  Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**

Set low value of output range to IPv4 TOS.

- RTI_INT32 **transport_priority_mapping_high**

  Set high value of output range to IPv4 TOS.

- RTI_INT32 **send_ping**

  Configures whether to send PING messages.

- RTI_INT32 **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

- RTI_UINT32 **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.

- RTI_INT32 **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.

- RTI_INT32 **disable_interface_tracking**

  Disables detection of network interface changes.

- char * **public_address**

  Public IP address associated with the transport instantiation.

- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo** * **comm_ports_list**

  Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

- RTI_INT32 **comm_ports_list_length**

  Number of elements in the ***NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list*** *(p. 2158).*

- RTI_INT32 **port_offset**

  Port offset to allow coexistence with built-in UDPv4 transport.

- RTI_UINT32 **binding_ping_period**

  Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

6.274.1 Detailed Description

Configurable IPv4/UDP WAN Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

NDDS_Transport_Support_set_builtin_transport_property() (p. 736)

NDDS_Transport_UDPv4_WAN_new (p. 1058)

6.274.2 Field Documentation

6.274.2.1 parent

`struct` **NDDS_Transport_Property_t** `NDDS_Transport_UDPv4_WAN_Property_t::parent`

Generic properties of all transport plugins.

6.274.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

See also

NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size (p. 2142)

6.274.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

See also

NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size (p. 2143)

6.274.2.4 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

6.274.2.5 ignore_nonup_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking** (p. 2157) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

6.274.2.6 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

6.274.2.7 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connext will use the zero-copy API if offered by the OS.

6.274.2.8 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

This property is not supported on Windows when using the Real-Time WAN Transport. The send sockets cannot be configured to be non-blocking because Windows does not provide a way to configure a socket to only be non-blocking for send operations but not receive operations.

6.274.2.9 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **DDS_DomainParticipant_get_participant_protocol_status** (p. 127).

[default] 1 (enabled)

6.274.2.10 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 2156) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 2156) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 1339)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

6.274.2.11 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 2155) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 2156) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

6.274.2.12 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 2155) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 2156) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

6.274.2.13 send_ping

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

6.274.2.14 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

6.274.2.15 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

6.274.2.16 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 2131) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↩ _max, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 2131)

6.274.2.17 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connext application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connext 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

6.274.2.18 public_address

```
char* NDDS_Transport_UDPv4_WAN_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary for the Real-Time WAN Transport associated with an external **DDS_DomainParticipant** (p. 76) (publicly reachable) in order to support the two communication scenarios shown in the Figure below.

For an external **DDS_DomainParticipant** (p. 76) behind a NAT-enabled router, this address is the public IP address of the router.

When this property is set, the DomainParticipant will announce PUBLIC+UUID locators to other DomainParticipants. These locators are reachable locators because they contain this public IP address.

For additional information on Real-Time WAN Transport locators, see the `Core Libraries User's Manual`.

with a Participant that has a Public Address"

[default] NULL (the transport will announce UUID locators)

6.274.2.19 comm_ports_list

struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo*** NDDS_Transport_UDPv4_WAN_Property_t::comm_↩ports_list

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

Array containing the mapping between "RTPS ports", "UDP receive host ports", and "UDP receive public ports".

When the transport is configured using properties, the port mapping array is provided using a JSON string.

For example:

```
{
    "default": {"host": 8192, "public": 9678},
    "mappings": [
        {"rtps": 1234, "host": 9999, "public": 5678},
        {"rtps": 1235, "host": 9990, "public": 5679},
    ]
}
```

It is also possible to configure the mapping with XML:

```
<transport_builtin>
    <udpv4_wan>
        <comm_ports>
            <default>
                <host>8192</host>
                <public>9678</public>
            </default>
            <mappings>
                <element>
                    <rtps>1234</rtps>
                    <host>9999</host>
                    <public>5678</public>
                </element>
                <element>
                    <rtps>1235</rtps>
                    <host>9990</host>
                    <public>5679</public>
                </element>
            </mappings>
        </comm_ports>
    </udpv4_wan>
<transport_builtin>
```

For additional information on how to set the value of this property, see the `Core Libraries User's Manual`.

[default] NULL (The UDP ports used for communications will be derived from the RTPS ports associated with the locators for the DomainParticipant and its Endpoints (DataWriters and DataReaders)).

6.274.2.20 comm_ports_list_length

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list_length
```

Number of elements in the **NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list** (p. 2158).

[default] 0

6.274.2.21 port_offset

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::port_offset
```

Port offset to allow coexistence with built-in UDPv4 transport.

This property allows using the built-in UDPv4 transport and the Real-Time WAN Transport at the same time.

```
<transport_builtin>

    <mask>UDPv4_WAN|UDPv4</mask>

</transport_builtin>
```

When the UDP ports used by Real-Time WAN Transport are not explicitly set, they are calculated as follows: RTPS port + port_offset.

[default] 125

6.274.2.22 binding_ping_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::binding_ping_period
```

Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

Configures the period in milliseconds at which BINDING_PING messages are sent by a local transport instance to a remote transport instance. For example, 1000 means to send BINDING_PING messages every second.

BINDING_PING messages are used on the sending side to open NAT bindings from a local transport instance to a remote transport instance and they are sent periodically to keep the bindings open.

On the receiving side, BINDING_PINGS are used to calculate the public IP transport address of an UUID locator. This address will be used to send data to the locator.

For additional information on the role of BINDING_PING, see the Core Libraries User's Manual.

From a configuration point of view, and to avoid communication disruptions, the period at which a transport instance sends BINDING_PING messages should be smaller than the NAT binding session timeout. This timeout depends on the NAT router configuration.

[default] 1000 (1 sec)

6.275 NDDS_Transport_UDPv6_Property_t Struct Reference

Configurable IPv6/UDP Transport-Plugin properties.

```
#include <transport_udpv6.h>
```

Data Fields

- struct **NDDS_Transport_Property_t parent**

  Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**

  Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**

  Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**

  Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**

  Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**

  Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing zero copy.*
- RTI_INT32 **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **enable_v4mapped**

  Specify whether UDPv6 transport will process IPv4 addresses.
- RTI_UINT32 **transport_priority_mask**

  Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**

  Set low value of output range to IPv6 TCLASS.
- RTI_INT32 **transport_priority_mapping_high**

  Set high value of output range to IPv6 TCLASS.
- RTI_INT32 **send_ping**

  Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.
- RTI_UINT32 **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**

Controls whether or not to reuse multicast receive resources.

- RTI_INT32 **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.

- RTI_INT32 **disable_interface_tracking**

  Disables detection of network interface changes.

- RTI_UINT32 **join_multicast_group_timeout**

  [Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

- char * **public_address**

  Public IP address associated with the transport instantiation.

- RTI_INT32 **port_offset**

  *Port offset to allow multiple instances of UDPv6 transports in the same **DDS_DomainParticipant** (p. 76).*

6.275.1 Detailed Description

Configurable IPv6/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

NDDS_Transport_Support_set_builtin_transport_property() (p. 736)

NDDS_Transport_UDPv6_new (p. 1067)

6.275.2 Field Documentation

6.275.2.1 parent

`struct` **`NDDS_Transport_Property_t`** `NDDS_Transport_UDPv6_Property_t::parent`

Generic properties of all transport plugins.

6.275.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 2131). Its maximum value is dependent on the operating system.

By default, it will be set to **NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1065).

The maximum value for this property depends on the operating system.

Valid values are:

- **NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1065): `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the default value.
- **NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 1065): `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. RTI Connext will use the OS default.
- **NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX** (p. 1064): RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the send buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

6.275.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 2131). Its maximum value is dependent on the operating system.

By default, it will be set to **NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1065).

The maximum value for this property depends on the operating system.

Valid values are:

- **NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 1065): `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the default value.
- **NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 1065): `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. RTI Connext will use the OS default.
- **NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX** (p. 1064): RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the receive buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

6.275.2.4 unicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

6.275.2.5 multicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

6.275.2.6 multicast_ttl

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

See also

NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT (p. 1066)

6.275.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connext will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

6.275.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows.

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

6.275.2.9 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- **1**: Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

6.275.2.10 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Connext will use the zero copy API if offered by the OS.

6.275.2.11 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS.

6.275.2.12 enable_v4mapped

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::enable_v4mapped
```

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

[default] 0.

6.275.2.13 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with **NDDS_↩ Transport_UDPv6_Property_t::transport_priority_mapping_low** (p. 2167) and **NDDS_Transport_UDPv6_↩ Property_t::transport_priority_mapping_high** (p. 2167) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 1339)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

[default] 0.

6.275.2.14 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p. 2166) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p. 2167) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0.

6.275.2.15 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p. 2166) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p. 2167) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0xff.

6.275.2.16 send_ping

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_ping
```

Configures whether to send PING messages.

See also

NDDS_Transport_UDPv4_Property_t::send_ping (p. 2148)

6.275.2.17 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.

See also

NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection (p. 2148)

6.275.2.18 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

See also

NDDS_Transport_UDPv4_Property_t::interface_poll_period (p. 2148)

6.275.2.19 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

See also

NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource (p. 2148)

6.275.2.20 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 2131) plus this overhead is larger than the UDPv6 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↩ _max, to 65535 minus this overhead.

[default] 48.

See also

NDDS_Transport_Property_t::message_size_max (p. 2131)

6.275.2.21 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

See also

NDDS_Transport_UDPv4_Property_t::disable_interface_tracking (p. 2149)

6.275.2.22 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

See also

NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout (p. 2149)

6.275.2.23 public_address

```
char* NDDS_Transport_UDPv6_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **DDS_DomainParticipant** (p. 76) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **DDS_RtpsWellKnownPorts_t** (p. 1983)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **DDS_DomainParticipant** (p. 76) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] NULL (the transport uses the IP addresses obtained from the NICs)

6.275.2.24 port_offset

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv6 transports in the same **DDS_DomainParticipant** (p. 76).

By default, it is not possible to have multiple instances of the UDPv6 transport in the same **DDS_DomainParticipant** (p. 76). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv6 transport in the same **DDS_DomainParticipant** (p. 76).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

[default] 0

6.276 NDDS_Transport_UUID Struct Reference

Unequivocally identifies a transport plugin instance.

`#include <transport_common.h>`

6.276.1 Detailed Description

Unequivocally identifies a transport plugin instance.

6.277 NDDS_Utility_HeapMonitoringParams_t Struct Reference

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

Data Fields

- **NDDS_Utility_HeapMonitoringSnapshotOutputFormat snapshot_output_format**
  Specify the format of the output of the snapshot.
- **NDDS_Utility_HeapMonitoringSnapshotContentFormat snapshot_content_format**
  It is a bitmap to decide which information of the snapshot will be displayed.

6.277.1 Detailed Description

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

6.277.2 Field Documentation

6.277.2.1 snapshot_output_format

NDDS_Utility_HeapMonitoringSnapshotOutputFormat NDDS_Utility_HeapMonitoringParams_t::snapshot_↩output_format

Specify the format of the output of the snapshot.

The enum can take two options:

- **NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_STANDARD** (p. 1478):
  The output of the snapshot will be in plain text.

- **NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_COMPRESSED** (p. 1478):
  The output of the snapshot will be compressed using Zlib techonology.
  The file can be uncompressed using zlib-flate.

[default] NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_STANDARD (p. 1478).

6.277.2.2 snapshot_content_format

NDDS_Utility_HeapMonitoringSnapshotContentFormat NDDS_Utility_HeapMonitoringParams_t::snapshot_↩
content_format

It is a bitmap to decide which information of the snapshot will be displayed.

```suggestion Bitmap that specifies the field to display in the snapshot.

You can combine these values by logically ORing them together. For example: (**NDDS_UTILITY_HEAP**↩
**_MONITORING_SNAPSHOT_CONTENT_BIT_TOPIC** (p. 1479) | **NDDS_UTILITY_HEAP_MONITORING_**↩
**SNAPSHOT_CONTENT_BIT_FUNCTION** (p. 1479))

**[default] NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_DEFAULT** (p. 1479)

## 6.278 NDDS_Utility_NetworkCaptureParams_t Struct Reference

Input parameters for starting network capture.

### Data Fields

- struct **DDS_StringSeq transports**
  *List of transports to capture.*
- **NDDS_Utility_NetworkCaptureContentKindMask dropped_content**
  *Exclude contents from the capture file.*
- **NDDS_Utility_NetworkCaptureTrafficKindMask traffic**
  *Traffic direction to capture.*
- **DDS_Boolean parse_encrypted_content**
  *If secure traffic should be decrypted or not.*
- struct **DDS_ThreadSettings_t checkpoint_thread_settings**
  *The properties of the checkpoint thread.*
- **DDS_Long frame_queue_size**
  *Size of the frame queue (Bytes).*

### 6.278.1 Detailed Description

Input parameters for starting network capture.

### 6.278.2 Field Documentation
```

6.278.2.1 transports

struct **DDS_StringSeq** NDDS_Utility_NetworkCaptureParams_t::transports

List of transports to capture.

Network Capture will only save RTPS frames if the associated transport protocol is part of this sequence.

[default] Empty sequence initializer. This means that by default all transports will be captured.

6.278.2.2 dropped_content

NDDS_Utility_NetworkCaptureContentKindMask NDDS_Utility_NetworkCaptureParams_t::dropped_content

Exclude contents from the capture file.

It accepts values from **NDDS_Utility_NetworkCaptureContentKind** (p. 1488) and **NDDS_Utility_NetworkCapture↩ ContentKindMask** (p. 1487) .

We can choose to exclude user data or encrypted content from the capture file.

[default] No content is excluded - **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT** (p. 1486).

6.278.2.3 traffic

NDDS_Utility_NetworkCaptureTrafficKindMask NDDS_Utility_NetworkCaptureParams_t::traffic

Traffic direction to capture.

It accepts values from **NDDS_Utility_NetworkCaptureTrafficKind** (p. 1488) and **NDDS_Utility_NetworkCapture↩ TrafficKindMask** (p. 1487) .

[default] Capture both inbound and outbound traffic - **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_↩ DEFAULT** (p. 1486).

6.278.2.4 parse_encrypted_content

DDS_Boolean NDDS_Utility_NetworkCaptureParams_t::parse_encrypted_content

If secure traffic should be decrypted or not.

Network Capture supports decryption of RTPS messages and submessages. It does not support decryption of the user data payload (<data_protection_kind> tag in the GovernanceDocument).

[default] DDS_BOOLEAN_FALSE (p. 1203)

6.278.2.5 checkpoint_thread_settings

```
struct DDS_ThreadSettings_t NDDS_Utility_NetworkCaptureParams_t::checkpoint_thread_settings
```

The properties of the checkpoint thread.

The checkpoint thread is a per-participant thread responsible for reading frames from a queue and saving them to disk (as soon as they are produced).

The members that can be configured are:

- **DDS_ThreadSettings_t::mask** (p. 2035). Default value of (**DDS_THREAD_SETTINGS_PRIORITY_ENFORCE** (p. 1239) | **DDS_THREAD_SETTINGS_STDIO** (p. 1239)).
- **DDS_ThreadSettings_t::priority** (p. 2036). Platform-dependent - Consult `Platform Notes` for additional details.
- **DDS_ThreadSettings_t::stack_size** (p. 2036). Platform-dependent - Consult `Platform Notes` for additional details.

6.278.2.6 frame_queue_size

```
DDS_Long NDDS_Utility_NetworkCaptureParams_t::frame_queue_size
```

Size of the frame queue (Bytes).

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

6.279 RTI_Connext_Replier Struct Reference

The type-independent version of a Replier.

6.279.1 Detailed Description

The type-independent version of a Replier.

Any `FooBarReplier*` can be safely `cast to RTI_Connext_Replier*`.

See also

FooBarReplier (p. 2116)

FooBarSimpleReplier (p. 2118)

6.280 RTI_Connext_ReplierListener Struct Reference

Called when a **FooBarReplier** (p. 2116) has new available requests.

Data Fields

- **RTI_Connext_ReplierListener_OnRequestAvailableCallback on_request_available**
  User callback.
- void * **user_data**
  User data attached to a listener.

6.280.1 Detailed Description

Called when a **FooBarReplier** (p. 2116) has new available requests.

A replier listener is a way to implement a callback that will be invoked when requests are available. It is an optional **RTI_Connext_ReplierParams** (p. 2176).

This listener simply notifies when requests are available. The callback implementation can then use **FooBarReplier_take_requests** (p. 772) to retrieve them.

A simpler callback mechanism, where one request sample is a parameter and the reply is the callback return value, is implemented by the **FooBarSimpleReplier** (p. 2118).

See also

FooBarReplier_create_w_params (p. 770)

6.280.2 Field Documentation

6.280.2.1 user_data

```
void* RTI_Connext_ReplierListener::user_data
```

User data attached to a listener.

6.281 RTI_Connext_ReplierParams Struct Reference

Contains the parameters for creating a **FooBarReplier** (p. 2116).

Data Fields

- **DDS_DomainParticipant** * **participant**

  The participant this replier uses to join a domain.
- char * **service_name**

  The service name the Replier offers and Requesters use to match.
- char * **request_topic_name**

  Sets a specific request topic name.
- char * **reply_topic_name**

  Sets a specific reply topic name.
- char * **qos_library_name**

  *Sets the library that contains the **RTI_Connext_ReplierParams::qos_profile_name** (p. 2178).*
- char * **qos_profile_name**

  Sets a QoS profile for the entities in this replier.
- const struct **DDS_DataWriterQos** * **datawriter_qos**

  Sets the quality of service of the reply DataWriter.
- const struct **DDS_DataReaderQos** * **datareader_qos**

  Sets the quality of service of the request DataReader.
- **DDS_Publisher** * **publisher**

  Sets a specific Publisher.
- **DDS_Subscriber** * **subscriber**

  Sets a specific Subscriber.
- struct **RTI_Connext_ReplierListener** * **listener**

  Sets a listener that is called when requests are available.

6.281.1 Detailed Description

Contains the parameters for creating a **FooBarReplier** (p. 2116).

See also

RTI_Connext_RequesterParams (p. 2180)

6.281.2 Field Documentation

6.281.2.1 participant

```
DDS_DomainParticipant* RTI_Connext_ReplierParams::participant
```

The participant this replier uses to join a domain.

6.281.2.2 service_name

```
char* RTI_Connext_ReplierParams::service_name
```

The service name the Replier offers and Requesters use to match.

See also

RTI_Connext_RequesterParams::service_name (p. 2181)

6.281.2.3 request_topic_name

```
char* RTI_Connext_ReplierParams::request_topic_name
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RTI_Connext_↩ ReplierParams::service_name** (p. 2177). If that topic already exists, it will be reused. This is useful to have the Replier use a **DDS_ContentFilteredTopic** (p. 176) to receive only certain requests.

6.281.2.4 reply_topic_name

```
char* RTI_Connext_ReplierParams::reply_topic_name
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on c the **RTI_Connext↩ _ReplierParams::service_name** (p. 2177). If that topic already exists, it will be reused.

6.281.2.5 qos_library_name

```
char* RTI_Connext_ReplierParams::qos_library_name
```

Sets the library that contains the **RTI_Connext_ReplierParams::qos_profile_name** (p. 2178).

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.281.2.6 qos_profile_name

```
char* RTI_Connext_ReplierParams::qos_profile_name
```

Sets a QoS profile for the entities in this replier.

Specifies the XML QoS profile that will be used to configure the quality of service for the Replier's underlying reply DataWriter and request DataReader.

Parameters

qos_library_name	The name of the QoS library
qos_profile_name	The name of the QoS profile inside the QoS library

See also

RTI_Connext_RequesterParams::qos_profile_name (p. 2182)

Configuring Request-Reply QoS profiles (p. 1012)

Configuring QoS Profiles with XML (p. 973)

6.281.2.7 datawriter_qos

```
const struct DDS_DataWriterQos* RTI_Connext_ReplierParams::datawriter_qos
```

Sets the quality of service of the reply DataWriter.

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.281.2.8 datareader_qos

```
const struct  DDS_DataReaderQos* RTI_Connext_ReplierParams::datareader_qos
```

Sets the quality of service of the request DataReader.

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.281.2.9 publisher

```
DDS_Publisher* RTI_Connext_ReplierParams::publisher
```

Sets a specific Publisher.

See also

RTI_Connext_RequesterParams::publisher (p. 2183)

6.281.2.10 subscriber

```
DDS_Subscriber* RTI_Connext_ReplierParams::subscriber
```

Sets a specific Subscriber.

See also

RTI_Connext_RequesterParams::subscriber (p. 2183)

6.281.2.11 listener

```
struct  RTI_Connext_ReplierListener* RTI_Connext_ReplierParams::listener
```

Sets a listener that is called when requests are available.

See also

RTI_Connext_ReplierListener (p. 2175)

6.282 RTI_Connext_Requester Struct Reference

The type-independent version of a Requester.

6.282.1 Detailed Description

The type-independent version of a Requester.

Any `FooBarRequester*` can be safely `cast to RTI_Connext_Requester*`.

See also

FooBarRequester (p. 2117)

6.283 RTI_Connext_RequesterParams Struct Reference

Contains the parameters for creating a **FooBarRequester** (p. 2117).

Data Fields

- **DDS_DomainParticipant** * **participant**

  The participant this requester uses to join a DDS domain.
- char * **service_name**

  The service name that Repliers and Requester use to match and communicate.
- char * **request_topic_name**

  Sets a specific request topic name.
- char * **reply_topic_name**

  Sets a specific reply topic name.
- char * **qos_library_name**

  *Sets the library that contains the **RTI_Connext_RequesterParams::qos_profile_name** (p. 2182).*
- char * **qos_profile_name**

  Sets a QoS profile for the entities in this requester.
- const struct **DDS_DataWriterQos** * **datawriter_qos**

  Sets the quality of service of the request DataWriter.
- const struct **DDS_DataReaderQos** * **datareader_qos**

  Sets the quality of service of the request DataReader.
- **DDS_Publisher** * **publisher**

  Sets a specific Publisher.
- **DDS_Subscriber** * **subscriber**

  Sets a specific Subscriber.

6.283.1 Detailed Description

Contains the parameters for creating a **FooBarRequester** (p. 2117).

The following parameters are required to create a Requester:

- A **DDS_DomainParticipant** (p. 76) (**RTI_Connext_RequesterParams::participant** (p. 2181)), and
- Either a service name (**RTI_Connext_RequesterParams::service_name** (p. 2181))
- Or custom topic names (**RTI_Connext_RequesterParams::request_topic_name** (p. 2181) and **RTI_Connext↩ _RequesterParams::reply_topic_name** (p. 2182))

The rest of the parameters that can be set in a RequesterParams object are optional.

See also

Creating a Requester with optional parameters (p. 1006)

6.283.2 Field Documentation

6.283.2.1 participant

```
DDS_DomainParticipant* RTI_Connext_RequesterParams::participant
```

The participant this requester uses to join a DDS domain.

6.283.2.2 service_name

```
char* RTI_Connext_RequesterParams::service_name
```

The service name that Repliers and Requester use to match and communicate.

A Requester and a Replier need to be configured with the same topic names in order to match.

The service name is used to generate a request topic and a reply topic that the Requester and Replier will use to communicate. For example, the service name "MyService" will be used to create topics named "MyServiceRequest" and "MyServiceReply".

In some cases, the name of these topics is known beforehand or needs to be customized for another reason. The service name can be overridden by setting specific request and reply topic names using **RTI_Connext_Requester↩ Params::request_topic_name** (p. 2181) and **RTI_Connext_RequesterParams::reply_topic_name** (p. 2182).

6.283.2.3 request_topic_name

```
char* RTI_Connext_RequesterParams::request_topic_name
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RTI_Connext↩ _RequesterParams::service_name** (p. 2181). If that topic already exists, it will be reused.

6.283.2.4 reply_topic_name

```
char* RTI_Connext_RequesterParams::reply_topic_name
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RTI_Connext↩ _RequesterParams::service_name** (p. 2181). If that topic already exists, it will be reused.

6.283.2.5 qos_library_name

```
char* RTI_Connext_RequesterParams::qos_library_name
```

Sets the library that contains the **RTI_Connext_RequesterParams::qos_profile_name** (p. 2182).

See also

RTI_Connext_RequesterParams::qos_profile_name (p. 2182)

6.283.2.6 qos_profile_name

```
char* RTI_Connext_RequesterParams::qos_profile_name
```

Sets a QoS profile for the entities in this requester.

Specifies an XML QoS profile that will be used to configure the quality of service of a Requester's underlying request DataWriter and reply DataReader.

Within that profile, the DataWriter QoS in <datawriter_qos> will be used to configure the request DataWriter and the DataReader.

Alternatively, you can set the QoS using the DataWriterQos and DataReaderQos objects (**RTI_Connext_Requester↩ Params::datawriter_qos** (p. 2182), **RTI_Connext_RequesterParams::datareader_qos** (p. 2183)).

The library where this profile is located has to be set with **RTI_Connext_RequesterParams::qos_library_name** (p. 2182)

See also

RTI_Connext_RequesterParams::qos_library_name (p. 2182)

Configuring Request-Reply QoS profiles (p. 1012)

Configuring QoS Profiles with XML (p. 973)

6.283.2.7 datawriter_qos

```
const struct  DDS_DataWriterQos* RTI_Connext_RequesterParams::datawriter_qos
```

Sets the quality of service of the request DataWriter.

See also

RTI_Connext_RequesterParams::qos_profile_name (p. 2182)

6.283.2.8 datareader_qos

```
const struct  DDS_DataReaderQos* RTI_Connext_RequesterParams::datareader_qos
```

Sets the quality of service of the request DataReader.

See also

RTI_Connext_RequesterParams::qos_profile_name (p. 2182)

6.283.2.9 publisher

```
DDS_Publisher* RTI_Connext_RequesterParams::publisher
```

Sets a specific Publisher.

By default, a Requester uses the DomainParticipant's implicit Publisher. Sometimes a different Publisher may be needed, for example, to use non-default PublisherQos.

6.283.2.10 subscriber

```
DDS_Subscriber* RTI_Connext_RequesterParams::subscriber
```

Sets a specific Subscriber.

By default, a Requester uses the DomainParticipant's implicit Subscriber. Sometimes a different Subscriber may be needed, for example, to use non-default SubscriberQos.

6.284 RTI_Connext_SimpleReplierListener Struct Reference

The listener called by a SimpleReplier.

Data Fields

- **RTI_Connext_SimpleReplierListener_OnRequestAvailableCallback on_request_available**
  User callback that receives a request and provides a reply.
- **RTI_Connext_SimpleReplierListener_OnReturnLoanCallback return_loan**
  Returns a previously generated reply to the user.
- void * **user_data**
  User data attached to a listener.

6.284.1 Detailed Description

The listener called by a SimpleReplier.

See also

FooBarSimpleReplier (p. 2118)
SimpleReplier example (p. 1011)

6.284.2 Field Documentation

6.284.2.1 user_data

```
void* RTI_Connext_SimpleReplierListener::user_data
```

User data attached to a listener.

6.285 RTI_Connext_SimpleReplierParams Struct Reference

Contains the parameters for creating a **FooBarSimpleReplier** (p. 2118).

Data Fields

- **DDS_DomainParticipant** * **participant**

  The participant this replier uses to join a DDS domain.
- char * **service_name**

  The service name the Replier offers and Requesters use to match.
- char * **request_topic_name**

  Sets a specific request topic name.
- char * **reply_topic_name**

  Sets a specific reply topic name.
- char * **qos_library_name**

  *Sets the library that contains the **RTI_Connext_SimpleReplierParams::qos_profile_name** (p. 2186).*
- char * **qos_profile_name**

  Sets a QoS profile for the entities in this replier.
- const struct **DDS_DataWriterQos** * **datawriter_qos**

  Sets the quality of service of the reply DataWriter.
- const struct **DDS_DataReaderQos** * **datareader_qos**

  Sets the quality of service of the request DataReader.
- **DDS_Publisher** * **publisher**

  Sets a specific Publisher.
- **DDS_Subscriber** * **subscriber**

  Sets a specific Subscriber.
- struct **RTI_Connext_SimpleReplierListener** * **simple_listener**

  Sets a listener that is called when requests are available.

6.285.1 Detailed Description

Contains the parameters for creating a **FooBarSimpleReplier** (p. 2118).

The parameters for a SimpleReplier are identical to those of the Replier, except for the SimpleReplierListener, which is required and has a different user callback.

See also

RTI_Connext_ReplierParams (p. 2176)

6.285.2 Field Documentation

6.285.2.1 participant

```
DDS_DomainParticipant* RTI_Connext_SimpleReplierParams::participant
```

The participant this replier uses to join a DDS domain.

6.285.2.2 service_name

```
char* RTI_Connext_SimpleReplierParams::service_name
```

The service name the Replier offers and Requesters use to match.

See also

RTI_Connext_RequesterParams::service_name (p. 2181)

6.285.2.3 request_topic_name

```
char* RTI_Connext_SimpleReplierParams::request_topic_name
```

Sets a specific request topic name.

This is an alternative to **RTI_Connext_SimpleReplierParams::service_name** (p. 2185)

6.285.2.4 reply_topic_name

```
char* RTI_Connext_SimpleReplierParams::reply_topic_name
```

Sets a specific reply topic name.

This is an alternative to **RTI_Connext_SimpleReplierParams::service_name** (p. 2185)

6.285.2.5 qos_library_name

```
char* RTI_Connext_SimpleReplierParams::qos_library_name
```

Sets the library that contains the **RTI_Connext_SimpleReplierParams::qos_profile_name** (p. 2186).

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.285.2.6 qos_profile_name

```
char* RTI_Connext_SimpleReplierParams::qos_profile_name
```

Sets a QoS profile for the entities in this replier.

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.285.2.7 datawriter_qos

```
const struct DDS_DataWriterQos* RTI_Connext_SimpleReplierParams::datawriter_qos
```

Sets the quality of service of the reply DataWriter.

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.285.2.8 datareader_qos

```
const struct DDS_DataReaderQos* RTI_Connext_SimpleReplierParams::datareader_qos
```

Sets the quality of service of the request DataReader.

See also

RTI_Connext_ReplierParams::qos_profile_name (p. 2178)

6.285.2.9 publisher

```
DDS_Publisher* RTI_Connext_SimpleReplierParams::publisher
```

Sets a specific Publisher.

See also

RTI_Connext_RequesterParams::publisher (p. 2183)

6.285.2.10 subscriber

```
DDS_Subscriber* RTI_Connext_SimpleReplierParams::subscriber
```

Sets a specific Subscriber.

See also

RTI_Connext_RequesterParams::subscriber (p. 2183)

6.285.2.11 simple_listener

```
struct RTI_Connext_SimpleReplierListener* RTI_Connext_SimpleReplierParams::simple_listener
```

Sets a listener that is called when requests are available.

See also

RTI_Connext_ReplierListener (p. 2175)

6.286 TransportAllocationSettings_t Struct Reference

Allocation settings used by various internal buffers.

```
#include <transport_common_user.h>
```

6.286.1 Detailed Description

Allocation settings used by various internal buffers.

An allocation setting structure defines the rules of memory management used by internal buffers.

An internal buffer can provide blocks of memory of fixed size. They are used in several places of any transport, and this structure defines its starting size, limits, and how to increase its capacity.

It contains three values:

- initial_count: the number of individual elements that are allocated when the buffer is created.
- max_count: the maximum number of elements the buffer can hold. The buffer will grow up to this amount. After this limit is reached, new allocation requests will fail. For unlimited size, use the value NDDS_TRANSPORT_↩ ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED
- incremental_count: The amount of elements that are allocated at every increment. You can use the value↩ : NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC to have the buffer double its size at every reallocation request.

155  * \defgroup NDDS_Transport_Interface_t Interface
156  * \ingroup NDDS_TransportCommonComponent
157  * \brief Abstraction of a Transport Plugin network interface.
158  *
159  * A Transport Plugin may be able to use several logical or physical
160  * network interfaces in a single node (machine).  For example, there
161  * may be multiple NICs for IP networks or multiple serial ports for
162  * serial networks.
163  *
164  * An instance of a Transport Plugin is a conduit to one or more network
165  * interfaces associated with the transport.
166  *
167  * Instances of a Transport Plugin must assign a unique unicast
168  * address to each of the network interfaces that it can use to send
169  * and receive messages.  The unicast address should be within the
170  * range of addresses that are addressable by the Transport Plugin (as
171  * defined by the plugin itself).
172  *
173  * Then, when \ndds sends a message to an unicast destination address,
174  * the destination address will be made of two parts.  The network
175  * address and an interface address.  The network address portion will
176  * be used by \ndds to select the Transport Plugin instance that will
177  * send the message.  The interface address portion is passed to the
178  * Transport Plugin instance as the destination interface to which the
179  * message should be sent.

315 /*i
316  * \defgroup NDDS_TransportPriority Transport Priority
317  * \ingroup NDDS_TransportCommonComponent
318  *
319  * \brief A QoS set in DDS DataWriters, \idref_TransportPriorityQosPolicy
320  * that is passed to the Transport Plugin when creating SendResources.
321  *
322  * Sometimes also referred to as Transport QoS or CoS (class of
323  * service), a transport priority at the Transport Plugin level is
324  * directly set by the value of the \idref_TransportPriorityQosPolicy
325  * set on DataWriters. The \ndds core will pass the value of the
326  * \idref_TransportPriorityQosPolicy to the \c share/create SendResource
327  * functions of the Transport API when a DataWriter is created.
328  *
329  * The \ndds core itself does not do anything with the transport priority
330  * except passing it from the user code that set the value via the DDS
331  * API to the Transport API.
332  *
333  * Only Transport Plugin implementations that have the concept of
334  * sending of messages at different priorities or with different
335  * classes of service (CoSs) will find this support useful.  It is up
336  * to each implementation to use the transport priority in what ever
337  * way it can to configure itself.  Transport Plugins implementations
338  * that do not have a concept of sending data with different priorities
339  * can ignore it.
340  *
341  * For example, TCP/IP-based plugins may offer the user application the
342  * ability to specify different CoS for DataWriters so that individual
343  * message streams may be treated differently by the physical transport
344  * itself.

```
40  * \brief Allocation settings used by various internal buffers.
41  *
42  * An allocation setting structure defines the rules of memory management
43  * used by internal buffers.
44  *
45  * An internal buffer can provide blocks of memory of fixed size. They
46  * are used in several places of any transport, and this structure
47  * defines its starting size, limits, and how to increase its capacity.
48  *
49  * It contains three values:
50  * <ul><li>initial_count: the number of individual elements that are
51  *         allocated when the buffer is created.
52  *
53  *     <li>max_count: the maximum number of elements the buffer can
54  *         hold. The buffer will grow up to this amount. After this
55  *         limit is reached, new allocation requests will fail.
56  *         For unlimited size, use the value
57  *         NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED
58  *
59  *     <li>incremental_count: The amount of elements that are allocated
60  *         at every increment.
61  *         You can use the value:
62  *         NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC
63  *         to have the buffer double its size at every reallocation request.

302  * \defgroup NDDS_Transport_Address_t Transport Address
303  * \ingroup NDDSTransportModule
304  *
305  * \brief Transport-independent addressing scheme using IPv6
306  * presentation strings and numerically stored in network-ordered format.
307  *
308  * The APIs of \ndds uses IPv6 address notation for all transports.
309  *
310  * Transport Plugin implementations that are not IP-based are required to map
311  * whatever addressing scheme natively used by the physical transport (if any)
312  * to an address in IPv6 notation and vice versa.
313  *
314  * IPv6 addresses are numerically stored in 16 bytes. An IPv6 address can be
315  * presented In string notation in a variety of ways. For example,
316  *
317  * \code
318  * "00AF:0000:0037:FE01:0000:0000:034B:0089"
319  * "AF:0:37:FE01:0:0:34B:89"
320  * "AF:0:37:FE01::34B:89"
321  * \endcode
322  *
323  * are all valid IPv6 presentation of the same address.
324  *
325  * IPv4 address in dot notation can be used to specify the last 4 bytes of the
326  * address.  For example,
327  *
328  * \code
329  * "0000:0000:0000:0000:0000:0000:192.168.0.1"
330  * "0:0:0:0:0:0:192.168.0.1"
331  * "::192.168.0.1"
332  * \endcode
333  *
334  * are all valid IPv6 presentation of the same address.
335  *
336  * For a complete description of valid IPv6 address notation, consult the IPv6
337  * Addressing Architecture (RFC 2373).
338  *
339  * Addresses are divided into unicast addresses and multicast addresses.
340  *
341  * Multicast addresses are defined as
342  *
343  * \li Addresses that start with 0xFF.
344  * That is \c FFxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx.
345  *
346  * or an IPv4 multicast address
347  *
348  * \li Address in the range \c [::224.0.0.0, ::239.255.255.255]
349  *
350  * Multicast addresses do not refer to any specific destination (network
351  * interface). Instead, they usually refer to a group of network interfaces,
352  * often called a "multicast group".
353  *
354  * Unicast addresses always refer to a specific network interface.
355  *
356  */

360
361 /*e
362  * \ingroup NDDS_Transport_Address_t
363  * \brief Addresses are stored individually as network-ordered bytes.
```

```
364  *
365  * \ndds addresses are numerically stored in a transport independent manner.
366  * \ndds uses a IPv6-compatible format, which means that the data structure to
367  * hold an NDDS_Transport_Address_t is the same size as a data structure needed
368  * to hold an IPv6 address.
369  *
370  * In addition, the functions provided to translate a string representation of
371  * an \ndds address to a value assumes that the string presentation follows the
372  * IPv6 address presentation as specified in RFC 2373.
373  *
374  * An NDDS_Transport_Address_t always stores the address in network-byte order
375  * (which is Big Endian).
376  *
377  * For example, IPv4 multicast address of 225.0.0.0 is represented by
378  *
379  * {{0,0,0,0, 0,0,0,0, 0,0,0,0, 0xE1,0,0,0}} regardless of endianness,
380  *
381  * where 0xE1 is the 13th byte of the structure (\c network_ordered_value[12]).

306
307 /*i \ingroup NDDS_Transport_UDP_InterfaceListenerClass
308  * \brief A user-provided function to be used to filter out particular
309  * network interfaces to be used by the Transport Plugin.
310  *
311  * The user may implement this function and pass it to an
312  * instance of a Transport Plugin to reject or accept network
313  * interfaces that the plugin offers as ones to use to receive
314  * messages.
315  *
316  * When \ndds contacts other applications, it will provide a list of
317  * interfaces that other applications can use to send messages (on a
318  * plugin by plugin basis).  The addresses of the interfaces are used
319  * as the destination addresses of messages that are sent.  If a plugin
320  * rejects one of the available network interfaces, then that interface
321  * will not be offered as one to which other plugins should send
322  * messages.
323  *
324  * For interfaces that can be used by the plugin, this function also
325  * enables the user to select which interfaces \ndds is allowed to use
326  * in sending multicast messages.  The set of interfaces enabled for
327  * multicast sending is a subset of the interfaces that can be used for
328  * receiving.  That is, an interface cannot be enabled to send
329  * multicast messages but disabled for receiving unicast messages.
330  *
331  * Only IP network interfaces that are "UP" (enabled by the OS and
332  * ready to use) will be passed to this filter function.  The ones that
333  * are "DOWN" will not be used by definition.
334  *
335  * @param plugin \st_in The instance of the plugin for which the filter
336  * is being called.
337  *
338  * @param multicast_enabled_out \st_out The filter should set whether
339  * or not the plugin is allowed to use this interface for
340  * sending/receiving multicast messages.
```

```
341  *
342  * @param interface_in \st_in An interface offered by the plugin as a
343  * candidate for receive messages.
344  *
345  * @return 1 to use the interface.
346  *         \c multicast_enabled_out will indicate whether it is also OK
347  *         to use the interface to send multicast messages.
348  *
349  * @return 0 to reject using the interface.

425  * \ingroup NDDS_Transport_UDP_SocketFactoryClass
426  * \brief Create a new receiving socket for the transport, which
427  * may be a multicast transport.
428  *
429  * @pre valid IP unicast transport.
430  *
431  * @post A valid, bound unicast receive socket.
432  *
433  * @param port_inout. \b InOut. NOT optional. If
434  * NDDS_TRANSPORT_PORT_INVALID, a new, previously unassigned port must
435  * be chosen, and the port must be assigned a new value so the caller
436  * knows which port it is listening on.  If the port is a valid value,
437  * you must attempt to bind to that port, and not proceed in case of
438  * failure (such as if the port is already bound).
439  *
440  * @param transport_in \b In. The transport that wishes to use the
441  * socket.  Properties of the IP unicast transport described in
442  * NDDS_Transport_UDP_Property_t must be met in "at least" manner.  That
443  * is, doing more than requested is allowed (but will lead to waste
444  * unless the implementer has other insights which suggests more
445  * optimal use of resources), but creation of a socket that cannot meet
446  * the minimum requirement will put the system into an inconsistent
447  * state.  For example, the receiving socket will be either polled or
448  * blocking; if the transport is polled
449  * (NDDS_Transport_Plugin_isPolled) it is an error to create a blocking
450  * socket.  On the other hand, creating a socket that can buffer more
451  * data than requires is allowed.  Specific property of the transport,
452  * such as the maximum message size to be buffered, can be queried from
453  * the NDDS_Transport_Plugin#property.
454  *
455  * @param transport_priority_in \b In. transport_priority hint.  The
456  * RTI supplied socket factory NDDS_Transport_UDP_SocketFactory does not
457  * act on transport_priority.  If you want to implement a
458  * transport_priority aware socket factory, either implement your own
459  * from scratch or use
460  * NDDS_Transport_UDP_SocketFactory_createReceiveSocket and specialize.
461  *
462  * @param multicast_address_in \b In. Valid if joining a multicast group.

558 /*i \ingroup NDDS_Transport_UDP_Plugin
559  * \brief Create an instance of a UDP Transport Plugin.
560  *
561  * An application may create and register multiple instances of this
562  * Transport Plugin with \ndds. Multiple instances of the plugin may be useful
563  * for partitioning the network interfaces across multiple \ndds domains.
564  * However, note that the underlying transport, the operating system's IP layer,
565  * is still a "singleton."  For example, if a unicast transport has already
566  * bound to a port, and another unicast transport tries to bind to the same
567  * port, the second attempt will fail.
568  *
569  * The transport plugin honors the interface/multicast "white" and "black"
570  * lists specified in the NDDS_Transport_UDP_Property_t#parent:
571  * - NDDS_Transport_Property_t#allow_interfaces_list,
572  * - NDDS_Transport_Property_t#deny_interfaces_list,
573  * - NDDS_Transport_Property_t#allow_multicast_interfaces_list,
574  * - NDDS_Transport_Property_t#deny_multicast_interfaces_list
575  *
576  * The format of a string in these lists is assumed to be in standard IPv4
577  * dot notation, possibly containing wildcards. For example:
578  *       - 10.10.30.232
579  *       - 10.10.*.*
580  *       - 192.168.1.*
581  *       - etc.
582  * Strings not in the correct format will be ignored.
583  *
```

```
584  * @param property_in \st_in Desired behavior of this transport. May be

499 /*i \ingroup NDDS_Transport_UDPv4_InterfaceListenerClass
500  * \brief A user-provided function to be used to filter out particular
501  * network interfaces to be used by the Transport Plugin.
502  *
503  * The user may implement this function and pass it to an
504  * instance of an UDPv4 Transport Plugin to reject or accept network
505  * interfaces that the plugin offers as ones to use to receive
506  * messages.
507  *
508  * When \ndds contacts other applications, it will provide a list of
509  * interfaces that other applications can use to send messages (on a
510  * plugin by plugin basis).  The addresses of the interfaces are used
511  * as the destination addresses of messages that are sent.  If a plugin
512  * rejects one of the available network interfaces, then that interface
513  * will not be offered as one to which other plugins should send
514  * messages.
515  *
516  * For interfaces that can be used by the plugin, this function also
517  * enables the user to select which interfaces \ndds is allowed to use
518  * in sending multicast messages.  The set of interfaces enabled for
519  * multicast sending is a subset of the interfaces that can be used for
520  * receiving.  That is, an interface cannot be enabled to send
521  * multicast messages but disabled for receiving unicast messages.
522  *
523  * Only IP network interfaces that are "UP" (enabled by the OS and
524  * ready to use) will be passed to this filter function.  The ones that
525  * are "DOWN" will not be used by definition.
526  *
527  * @param plugin \st_in The instance of the plugin for which the filter
528  * is being called.
529  *
530  * @param multicast_enabled_out \st_out The filter should set whether
531  * or not the plugin is allowed to use this interface for
532  * sending/receiving multicast messages.
533  *
534  * @param interface_in \st_in An interface offered by the plugin as a
535  * candidate for receive messages.
536  *
537  * @return 1 to use the interface, 0 to reject using the interface.
538  *         \c multicast_enabled_out will indicate whether it is also OK
```

```
539  *         to use the interface to send multicast messages.

488
489 /*e \ingroup NDDS_Transport_UDPv6_Plugin
490  * \brief Create an instance of a UDPv6 Transport Plugin.
491  *
492  * An application may create and register multiple instances of this
493  * Transport Plugin with \ndds. Multiple instances of the plugin may be useful
494  * for partitioning the network interfaces across multiple \ndds domains.
495  * However, note that the underlying transport, the operating system's IP layer,
496  * is still a "singleton."  For example, if a unicast transport has already
497  * bound to a port, and another unicast transport tries to bind to the same
498  * port, the second attempt will fail.
499  *
500  * The transport plugin honors the interface/multicast "white" and "black"
501  * lists specified in the NDDS_Transport_UDPv6_Property_t#parent:
502  * - NDDS_Transport_Property_t#allow_interfaces_list,
503  * - NDDS_Transport_Property_t#deny_interfaces_list,
504  * - NDDS_Transport_Property_t#allow_multicast_interfaces_list,
505  * - NDDS_Transport_Property_t#deny_multicast_interfaces_list
506  *
507  * The format of a string in these lists is assumed to be in standard IPv6
508  * dot notation, possibly containing wildcards. For example:
509  *       - 10.10.30.232
```

```
510  *       - 10.10.*.*
511  *       - 192.168.1.*
512  *       - etc.
513  * Strings not in the correct format will be ignored.
514  *
515  * @param property_in \st_in Desired behavior of this transport. May be
516  * NULL for default property.
517  *
518  * @return A UDPv6 Transport Plugin instance on success; or NULL on failure.
519  */

Chapter 8

Example Documentation

8.1 HelloWorld.idl

8.1.1 IDL Type Description

The data type to be disseminated by RTI Connext is described in language-independent IDL. The IDL file is input to rtiddsgen (see the `Code Generator User's Manual` for more information), which produces the following files.

The programming language specific type representation of the type **Foo** (p. 2116) = HelloWorld, for use in the application code.

- HelloWorld.h
- HelloWorld.c

User Data Type Support (p. 209) types as required by the DDS specification for use in the application code.

- HelloWorldSupport.h
- HelloWorldSupport.c

Methods required by the RTI Connext implementation. These contains the auto-generated methods for serializing and deserializing the type.

- HelloWorldPlugin.h
- HelloWorldPlugin.c

8.1.1.1 HelloWorld.idl

```
struct HelloWorld {
    string<128> msg;
};
```

8.2 HelloWorld.c

8.2.1 Programming Language Type Description

The following programming language specific type representation is generated by rtiddsgen (see the `Code Generator User's Manual` for more information) for use in application code, where:

- **Foo** (p. 2116) = HelloWorld
- **FooSeq** (p. 2120) = HelloWorldSeq

8.2.1.1 HelloWorld.h

/* HelloWorld_publisher.c

A publication of data of type HelloWorld

This file is derived from code automatically generated by the rtiddsgen
command:

rtiddsgen -language C -example <arch> HelloWorld.idl

Example publication of type HelloWorld automatically generated by
'rtiddsgen'. To test it, follow these steps:

(1) Compile this file and the example subscription.

(2) Start the subscription on the same domain used for RTI Connext

(3) Start the publication on the same domain used for RTI Connext

(4) [Optional] Specify the list of discovery initial peers and
multicast receive addresses via an environment variable or a file
(in the current working directory) called NDDS_DISCOVERY_PEERS.

You can run any number of publisher and subscriber programs, and can
add and remove them dynamically from the domain.

*/
/* HelloWorld_subscriber.c

A subscription example

This file is derived from code automatically generated by the rtiddsgen
command:

rtiddsgen -language C -example <arch> HelloWorld.idl

Example subscription of type HelloWorld automatically generated by
'rtiddsgen'. To test it, follow these steps:

(1) Compile this file and the example publication.

(2) Start the subscription on the same domain used for RTI Connext

(3) Start the publication on the same domain used for RTI Connext

(4) [Optional] Specify the list of discovery initial peers and
multicast receive addresses via an environment variable or a file
(in the current working directory) called NDDS_DISCOVERY_PEERS.

You can run any number of publisher and subscriber programs, and can
add and remove them dynamically from the domain.
