This operation can be called from the dispatch callback of the **dds::core::cond::Condition** (p. 948) this **rti::core↩ ::cond::AsyncWaitSet** (p. 840) is dispatching. After succesfully calling this operation, if the **dds::core::cond::↩ Condition** (p. 948) becomes active this **rti::core::cond::AsyncWaitSet** (p. 840) is allowed to dispatch it again from any available thread from the pool.

You may call this operation any time you need the same **dds::core::cond::Condition** (p. 948) to be dispatched concurrently.

This operation will fail with **dds::core::PreconditionNotMetError** (p. 1941) if you call it from a different context than the dispatch callback or on a different **dds::core::cond::Condition** (p. 948).

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.21.6.12 property()

```
AsyncWaitSetProperty rti::core::cond::AsyncWaitSet::property ( )  [inline]
```

Retrieves the **rti::core::cond::AsyncWaitSetProperty** (p. 858) configuration of the associated **rti::core::cond::↩ AsyncWaitSet** (p. 840).

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.21.6.13 conditions() [1/2]

```
ConditionSeq rti::core::cond::AsyncWaitSet::conditions ( ) const  [inline]
```

Returns the list of attached **dds::core::cond::Condition** (p. 948) (s).

8.21.6.14 conditions() [2/2]

```
ConditionSeq & rti::core::cond::AsyncWaitSet::conditions (
            ConditionSeq & attached_conditions ) const  [inline]
```

Retrieves the list of attached **dds::core::cond::Condition** (p. 948) (s).

Parameters

attached_conditions	<<***inout***>> *(p. 355)* a ConditionSeq object where the list of attached conditions will be returned.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.22 rti::core::cond::AsyncWaitSetCompletionToken Class Reference

Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **AsyncWaitSet** (p. 840) behavior.

```
#include <AsyncWaitSet.hpp>
```

Inheritance diagram for rti::core::cond::AsyncWaitSetCompletionToken:

Public Member Functions

- **AsyncWaitSetCompletionToken** (**AsyncWaitSet** &aws)

  *Creates a new **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853).*
- void **wait** (const **dds::core::Duration** &max_wait= **dds::core::Duration::infinite**())

  *Waits for the request associated to an operation made on the **rti::core::cond::AsyncWaitSet** (p. 840) to complete.*

Static Public Member Functions

- static **AsyncWaitSetCompletionToken Ignore** ()

  *For the operations that allow an **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853), this sentinel can be provided to indicate an **rti::core::cond::AsyncWaitSet** (p. 840) to perform the action associating a 'null' completion token.*

8.22.1 Detailed Description

Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **AsyncWaitSet** (p. 840) behavior.

A **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) can be in one of the following states:

- `READY`: The completion token can be used to associate a new request. Calling **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) on a ready completion token will return immediately with success. A ready completion token can only transition to the queued state.
- `QUEUED`: The completion token has an associated request that is pending processing. Calling **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) on a queued completion token will block until the request completes or times out. A queued completion token can only transition to the processed state.
- `PROCESS`: The completion token has an associated request that has been processed but the application did not call **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) yet. Calling **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) on a processed completion token will return immediately with the return code result of processing the associated request. A processed completion token can transition to both ready or queued states.

8.22.2 AsyncWaitSetCompletionToken management

The same **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) instance can be reused reused multiple times to associate a request and wait for its completion. Reusing is allowed only if the completion token is either in `READY` or `PROCESSED` state. Otherwise the **rti::core::cond::AsyncWaitSet** (p. 840) operation that associates the completion token will fail with **dds::core::PreconditionNotMetError** (p. 1941).

The completion token functionality can be viewed as a **rti::core::cond::AsyncWaitSet** (p. 840) internal detail from which your application should not need to know. In general, it is recommended to use the default flavor of **rti::core::cond::↩ AsyncWaitSet** (p. 840) operations that handle the internals of the completion tokens for you.

Nevertheless, if a completion token represents an expensive resource in your environment, your application may want to have full control of how and when completion tokens are created. It's for these reasons why is exposed as a public collaborator of the **rti::core::cond::AsyncWaitSet** (p. 840).

MT Safety:

Safe.

rti::core::cond::AsyncWaitSet (p. 840)

8.22.3 Constructor & Destructor Documentation

8.22.3.1 AsyncWaitSetCompletionToken()

```
rti::core::cond::AsyncWaitSetCompletionToken::AsyncWaitSetCompletionToken (
              AsyncWaitSet & aws )  [inline]
```

Creates a new **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853).

All the created **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) must be deleted by calling rti::core::cond::↩ AsyncWaitSet::delete_completion_token.

See also

rti::core::cond::AsyncWaitSet::delete_completion_token

rti::core::cond::AsyncWaitSet::delete

8.22.4 Member Function Documentation

8.22.4.1 wait()

```
void rti::core::cond::AsyncWaitSetCompletionToken::wait (
            const  dds::core::Duration & max_wait =  dds::core::Duration::infinite() )  [inline]
```

Waits for the request associated to an operation made on the **rti::core::cond::AsyncWaitSet** (p. 840) to complete.

This operation will block the calling thread for a maximum amount of time specified by `max_wait` until the **rti::core::cond::AsyncWaitSet** (p. 840) request associated with this completion token completes.

If there is no timeout, upon return it is guaranteed that the request associated with this token completed. This operation may fail due to an error during the wait or while processing the associated request.

If this operation is called from within the context of one of the threads that comprise the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840), it will fail with **dds::core::PreconditionNotMetError** (p. 1941).

If the operation failed with **dds::core::TimeoutError** (p. 2473) your application can wait again on this completion token.

Parameters

max_wait	<<***in***>> *(p. 355)* Cannot be NULL. Maximum time to wait for the request associated to this completion token to complete before timeout.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.23 rti::core::cond::AsyncWaitSetListener Class Reference

Listener (p. 1637) for receiving event notifications related to the thread pool of the **AsyncWaitSet** (p. 840).

`#include <AsyncWaitSetListener.hpp>`

Inheritance diagram for rti::core::cond::AsyncWaitSetListener:

Public Member Functions

- virtual void **on_thread_spawned** (ThreadId thread_id)=0

  *Handles the spawning of each thread comprising the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).*
- virtual void **on_thread_deleted** (ThreadId thread_id)=0

  *Handles the deletion of each thread comprising the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).*
- virtual void **on_wait_timeout** (ThreadId thread_id)=0

  *Handles the wait timeout generated by the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 840).*

8.23.1 Detailed Description

Listener (p. 1637) for receiving event notifications related to the thread pool of the **AsyncWaitSet** (p. 840).

8.23.2 Member Function Documentation

8.23.2.1 on_thread_spawned()

```
virtual void rti::core::cond::AsyncWaitSetListener::on_thread_spawned (
            ThreadId thread_id )  [pure virtual]
```

Handles the spawning of each thread comprising the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).

Implemented in **rti::core::cond::NoOpAsyncWaitSetListener** (p. 1837).

8.23.2.2 on_thread_deleted()

```
virtual void rti::core::cond::AsyncWaitSetListener::on_thread_deleted (
            ThreadId thread_id )  [pure virtual]
```

Handles the deletion of each thread comprising the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).

Implemented in **rti::core::cond::NoOpAsyncWaitSetListener** (p. 1837).

8.23.2.3 on_wait_timeout()

```
virtual void rti::core::cond::AsyncWaitSetListener::on_wait_timeout (
            ThreadId thread_id )  [pure virtual]
```

Handles the wait timeout generated by the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 840).

Implemented in **rti::core::cond::NoOpAsyncWaitSetListener** (p. 1837).

8.24 rti::core::cond::AsyncWaitSetProperty Class Reference

Specifies the **rti::core::cond::AsyncWaitSet** (p. 840) behavior.

`#include <rti/core/cond/AsyncWaitSet.hpp>`

Public Member Functions

- **AsyncWaitSetProperty** ()

  Creates the default property.
- **AsyncWaitSetProperty** (**rti::core::cond::WaitSetProperty** &the_waitset_property, **dds::core::Duration** &the_wait_timeout, int32_t the_level, const std::string &the_thread_name_prefix, **rti::core::ThreadSettings** &the_thread_settings, int32_t the_thread_pool_size)

  Creates an instance with all the specified parameters.
- **rti::core::cond::WaitSetProperty waitset_property** () const

  Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **waitset_property** (**rti::core::cond::WaitSetProperty** &the_waitset_property)

  *Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **dds::core::cond::WaitSet** (p. 2617).*
- **dds::core::Duration wait_timeout** () const

  Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **wait_timeout** (**dds::core::Duration** &the_wait_timeout)

  Asynchronous wait timeout.
- int32_t **level** () const

  Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **level** (int32_t the_level)

  *Specifies the level of an **rti::core::cond::AsyncWaitSet** (p. 840).*
- const std::string **thread_name_prefix** () const

  Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **thread_name_prefix** (const std::string &thr_thread_name_prefix)

  *Prefix used to compose the name of each thread that comprises the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).*
- **rti::core::ThreadSettings thread_settings** () const

  Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **thread_settings** (**rti::core::ThreadSettings** &the_thread_settings)

  ***rti::core::ThreadSettings** (p. 2449) for each thread comprising the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).*
- int32_t **thread_pool_size** () const

  Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **thread_pool_size** (int32_t the_level)

  *Number of threads that comprise the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).*

8.24.1 Detailed Description

Specifies the **rti::core::cond::AsyncWaitSet** (p. 840) behavior.

This property allows configuring the behavior of the asynchronous wait and the **dds::core::cond::Condition** (p. 948) dispatch, as well as the parameters of the thread pool.

See also

rti::core::cond::WaitSetProperty (p. 2627)

rti::core::ThreadSettings (p. 2449)

8.24.2 Constructor & Destructor Documentation

8.24.2.1 AsyncWaitSetProperty() [1/2]

```
rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty ( )  [inline]
```

Creates the default property.

The default value for each field is documented in its corresponding setter.

8.24.2.2 AsyncWaitSetProperty() [2/2]

```
rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty (
             rti::core::cond::WaitSetProperty & the_waitset_property,
             dds::core::Duration & the_wait_timeout,
            int32_t the_level,
            const std::string & the_thread_name_prefix,
             rti::core::ThreadSettings & the_thread_settings,
            int32_t the_thread_pool_size )
```

Creates an instance with all the specified parameters.

8.24.3 Member Function Documentation

8.24.3.1 waitset_property() [1/2]

```
 rti::core::cond::WaitSetProperty rti::core::cond::AsyncWaitSetProperty::waitset_property ( )
const
```

Getter (see setter with the same name)

8.24.3.2 waitset_property() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::waitset_property (
            rti::core::cond::WaitSetProperty & the_waitset_property )
```

Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **dds::core::cond::WaitSet** (p. 2617).

See also

rti::core::cond::WaitSetProperty (p. 2627)

8.24.3.3 wait_timeout() [1/2]

```
dds::core::Duration rti::core::cond::AsyncWaitSetProperty::wait_timeout ( ) const
```

Getter (see setter with the same name)

8.24.3.4 wait_timeout() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::wait_timeout (
            dds::core::Duration & the_wait_timeout )
```

Asynchronous wait timeout.

Specifies the maximum amount of time the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 840) waits for an attached **dds::core::cond::Condition** (p. 948) to trigger before it wakes up.

Duration must be a value greater than zero.

See also

dds::core::cond::WaitSet::wait (p. 2621)

[default] dds::core::Duration::infinite() (p. 1451)

8.24.3.5 level() [1/2]

```
int32_t rti::core::cond::AsyncWaitSetProperty::level ( ) const
```

Getter (see setter with the same name)

8.24.3.6 level() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::level (
            int32_t the_level )
```

Specifies the level of an **rti::core::cond::AsyncWaitSet** (p. 840).

The level prevents an application to deadlock when it uses multiple **rti::core::cond::AsyncWaitSet** (p. 840) instances that call operations on each other from the context of one of their thread pool's thread.

Inside the context of one of these threads, the application can synchronize only with other **rti::core::cond::Async↩ WaitSet** (p. 840) of bigger level.

[default] 1

8.24.3.7 thread_name_prefix() [1/2]

```
const std::string rti::core::cond::AsyncWaitSetProperty::thread_name_prefix ( ) const
```

Getter (see setter with the same name)

8.24.3.8 thread_name_prefix() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::thread_name_prefix (
            const std::string & thr_thread_name_prefix )
```

Prefix used to compose the name of each thread that comprises the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).

The composed name has the form:

`thread_name_prefix##[index]AWs` where [index] is an integer that identifies the thread relative to the **rti↩ ::core::cond::AsyncWaitSet** (p. 840).

If the string is empty, the default prefix will be used.

[default] Empty string (use default prefix)

8.24.3.9 thread_settings() [1/2]

```
rti::core::ThreadSettings rti::core::cond::AsyncWaitSetProperty::thread_settings ( ) const
```

Getter (see setter with the same name)

8.24.3.10 thread_settings() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::thread_settings (
            rti::core::ThreadSettings & the_thread_settings )
```

rti::core::ThreadSettings (p. 2449) for each thread comprising the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).

Each thread within the pool is created with the same settings.

[default] Default thread settings values.

See also

rti::core::ThreadSettings (p. 2449)

8.24.3.11 thread_pool_size() [1/2]

```
int32_t rti::core::cond::AsyncWaitSetProperty::thread_pool_size ( ) const
```

Getter (see setter with the same name)

8.24.3.12 thread_pool_size() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::thread_pool_size (
            int32_t the_level )
```

Number of threads that comprise the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).

Size must be equal to or greater than one.

[default] 1

8.25 rti::util::atomic_shared_ptr< T > Class Template Reference

Utility class to provide atomic operations on std::shared_ptr.

```
#include <atomic_shared_ptr.hpp>
```

8.25.1 Detailed Description

template<**class T**>
class rti::util::atomic_shared_ptr< **T** >

Utility class to provide atomic operations on std::shared_ptr.

This class provides a simple wrapper around std::shared_ptr to allow atomic operations such as store and load. It is useful in multi-threaded environments where shared pointers need to be accessed and modified safely.

8.26 rti::config::activity_context::AttributeKindMask Class Reference

The attributes used in the string representation of the Activity Context can be configured through this mask.

`#include <ActivityContext.hpp>`

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**
  A typedef of std::bitset<32> for convenience.

Public Member Functions

- **AttributeKindMask** ()
  Not provide any attribute of the resource of the Activity Context.
- **AttributeKindMask** (uint64_t mask)
  *Construct a **AttributeKindMask*** (p. *863) from an integer.*
- **AttributeKindMask** (const **MaskType** &mask)
  *Construct a **AttributeKindMask*** (p. *863) from a MaskType object.*

Static Public Member Functions

- static const **AttributeKindMask** **guid_prefix** ()
  Provide the entity GUID prefix to the resource of the Activity Context.
- static const **AttributeKindMask** **topic** ()
  Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic".
- static const **AttributeKindMask** **type** ()
  Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type".
- static const **AttributeKindMask** **entity_kind** ()
  Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity".
- static const **AttributeKindMask** **domain_id** ()
  Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain".
- static const **AttributeKindMask** **entity_name** ()
  Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name".
- static const **AttributeKindMask** **default_mask** ()
  Provide the default attributes of the resource of the Activity Context.
- static const **AttributeKindMask** **none** ()
  Not provide any attribute of the resource of the Activity Context.
- static const **AttributeKindMask** **all** ()
  Provide all the possibles attributes of the resource of the Activity Context.

8.26.1 Detailed Description

The attributes used in the string representation of the Activity Context can be configured through this mask.

This mask indicates what attributes of the resource are used when RTI Connext logs a message or when the Heap Monitoring utility saves statistics for a memory allocation.

8.26.2 Member Typedef Documentation

8.26.2.1 MaskType

```
typedef std::bitset<32>  rti::config::activity_context::AttributeKindMask::MaskType
```

A typedef of std::bitset<32> for convenience.

8.26.3 Constructor & Destructor Documentation

8.26.3.1 AttributeKindMask() [1/3]

```
rti::config::activity_context::AttributeKindMask::AttributeKindMask ( )  [inline]
```

Not provide any attribute of the resource of the Activity Context.

8.26.3.2 AttributeKindMask() [2/3]

```
rti::config::activity_context::AttributeKindMask::AttributeKindMask (
            uint64_t mask )  [inline], [explicit]
```

Construct a **AttributeKindMask** (p. 863) from an integer.

Parameters

mask	Value whose bits are copied to the bitset positions

8.26.3.3 AttributeKindMask() [3/3]

```
rti::config::activity_context::AttributeKindMask::AttributeKindMask (
            const  MaskType & mask )  [inline]
```

Construct a **AttributeKindMask** (p. 863) from a MaskType object.

Parameters

mask	A std::bitset<32> to construct this **AttributeKindMask** (p. 863) from

8.26.4 Member Function Documentation

8.26.4.1 guid_prefix()

```
static const  AttributeKindMask rti::config::activity_context::AttributeKindMask::guid_prefix ( )
[inline], [static]
```

Provide the entity GUID prefix to the resource of the Activity Context.

For example:

- For the following string representation of the context:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The GUID prefix is 0X101A76B,0X79E5D71,0X50EE914. If the bit ActivityContextAttributeKind::GUID_PREFIX is not set, the string representation will not show the GUID prefix:
  `[:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`

8.26.4.2 topic()

```
static const  AttributeKindMask rti::config::activity_context::AttributeKindMask::topic ( )  [inline],
[static]
```

Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic".

For example:

- For the following string representation of the context:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The Topic is "test." If the bit ActivityContextAttributeKind::TOPIC is not set, the string representation will not show the Topic:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Type=Foo,Domain=1}|Write]`

8.26.4.3 type()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::type ( ) [inline],
[static]
```

Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type".

For example:

- For the following string representation of the context:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The data type is "Foo." If the bit ActivityContextAttributeKind::TYPE is not set, the string representation will not show the data type:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Domain=1}|Write]`

8.26.4.4 entity_kind()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::entity_kind ( )
[inline], [static]
```

Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity".

For example:

- For the following string representation of the context:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The entity kind is "Writer." If the bit ActivityContextAttributeKind::ENTITY_KIND is not set, the string representation will not show the entity kind:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Topic=test,Type=Foo,Domain=1}|Write]`

8.26.4.5 domain_id()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::domain_id ( )
[inline], [static]
```

Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain".

For example:

- For the following string representation of the context:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The domain ID is "1." If the bit ActivityContextAttributeKind::DOMAIN_ID is not set, the string representation will not show the domain ID:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}|Write]`

8.26.4.6 entity_name()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::entity_name ( )
[inline], [static]
```

Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name".

For example:

- For the following string representation of the context:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The entity name is "testDataWriterName." If the bit ActivityContextAttributeKind::ENTITY_NAME is not set, the string representation will not show the entity name:
  `[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`

8.26.4.7 default_mask()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::default_mask ( )
[inline], [static]
```

Provide the default attributes of the resource of the Activity Context.

8.26.4.8 none()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::none ( ) [inline],
[static]
```

Not provide any attribute of the resource of the Activity Context.

8.26.4.9 all()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::all ( ) [inline],
[static]
```

Provide all the possibles attributes of the resource of the Activity Context.

8.27.1 Detailed Description

<<***extension***>> *(p. 116)* Configures data availability in the context of Collaborative DataWriters and Required Subscriptions

Entity:

dds::sub::DataReader (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **YES** (p. 514) (only on a **dds::pub::DataWriter** (p. 1138) except for the member **rti::core**↩**::policy::Availability::enable_required_subscriptions** (p. 871))

8.27.2 Usage

This QoS policy is used in the context of two features:

- Collaborative DataWriters
- Required Subscriptions

Collaborative DataWriters

The Collaborative DataWriters feature allows having multiple DataWriters publishing samples from a common logical data source. The DataReaders will combine the samples coming from the DataWriters in order to reconstruct the correct order at the source.

This QoS policy allows you to configure the ordering and combination process in the DataReader and can be used to support two different use cases:

- **Ordered delivery of samples in high-availability scenarios** One example of this is RTI Persistence **Service** (p. 2350). When a late-joining DataReader configured with **dds::core::policy::Durability** (p. 1433) set to **dds::core::policy::DurabilityKind_def::PERSISTENT** (p. 1442) or **dds::core::policy::DurabilityKind_def::↩ TRANSIENT** (p. 1442) joins a DDS domain, it will start receiving historical samples from multiple DataWriters. For example, if the original DataWriter is still alive, the newly created DataReader will receive samples from the original DataWriter and one or more RTI Persistence **Service** (p. 2350) DataWriters (PRSTDataWriters). This policy can be used to configure the sample ordering process on the DataReader.

- **Ordered delivery of samples in load-balanced scenarios** Multiple instances of the same application can work together to process and deliver samples. When the samples arrive through different data-paths out of order, the DataReader will be able to reconstruct the order at the destination. An example of this is when multiple instances of RTI Persistence **Service** (p. 2350) are used to persist the data. Persisting data to a database on disk can be a bottleneck for throughput. You can improve scalability and performance by dividing the workload across different instances of RTI Persistence **Service** (p. 2350) that use different databases. For example, samples larger than 10 are persisted by Persistence **Service** (p. 2350) 1, samples less than or equal to 10 are persisted by Persistence **Service** (p. 2350) 2.

- **Ordered delivery of samples with Group Ordered Access** This policy can also be used to configure the sample ordering process when the Subscriber is configured with **dds::core::policy::Presentation** (p. 1942) access_↩ scope set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951). In this case, the Subscriber must deliver in order the samples published by a group of DataWriters that belong to the same Publisher and have access_scope set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951).

Each sample published in a DDS domain for a given logical data source is uniquely identified by a pair (virtual GUID, virtual sequence number). Samples from the same data source (same virtual GUID) can be published by different DataWriters. A DataReader will deliver a sample (VGUIDn, VSNm) to the application if one of the following conditions is satisfied:

- (VGUIDn, VSNm-1) has already been delivered to the application.
- All the known DataWriters publishing VGUIDn have announced that they do not have (VGUIDn, VSNm-1).

- None of the known DataWriters publishing GUIDn have announced potential availability of (VGUIDn, VSNm-1) and both timeouts in this QoS policy have expired.

A DataWriter announces potential availability of samples by using virtual heartbeats (HBs).

When **dds::core::policy::Presentation::access_scope** (p. 1947) is set to **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951) or **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951), the virtual HB contains information about the samples contained in the **dds::pub::DataWriter** (p. 1138) history.

When **dds::core::policy::Presentation::access_scope** (p. 1947) is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951), the virtual HB contains information about all DataWriters in the **dds::pub::Publisher** (p. 1993).

The frequency at which virtual HBs are sent is controlled by the protocol parameters **rti::core::policy::RtpsReliableWriterProtocol::virtual_heartbeat_period** (p. 2237) and **rti::core::policy::RtpsReliableWriterProtocol::samples_per_virtual_heartbeat** (p. 2238).

Required Subscriptions

In the context of Required Subscriptions, this QoS policy can be used to configure a set of Required Subscriptions on a **dds::pub::DataWriter** (p. 1138).

Required subscriptions are preconfigured, named subscriptions that may leave and subsequently rejoin the network from time to time, at the same or different physical locations. Any time a required subscription is disconnected, any samples that would have been delivered to it are stored for delivery if and when the subscription rejoins the network.

8.27.3 Consistency

For a DataWriter, the setting of **AVAILABILITY** (p. 516) must be set consistenly with that of the **RELIABILITY** (p. 544) and **DURABILITY** (p. 529).

If **rti::core::policy::Availability::enable_required_subscriptions** (p. 871) is set to true, **dds::core::policy::Reliability::kind** (p. 2153) must be set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157), **dds::core::policy::Durability** (p. 1433) must be set to a value different than **dds::core::policy::DurabilityKind_def::VOLATILE** (p. 1442), and **dds::core::policy::Durability::writer_depth** (p. 1439) must be set to either **rti::core::policy::auto_writer_depth()** (p. 531) or **dds::core::LENGTH_UNLIMITED** (p. 438).

8.27.4 Constructor & Destructor Documentation

8.27.4.1 Availability() [1/2]

```
rti::core::policy::Availability::Availability ( )  [inline]
```

Creates the default policy.

8.27.4.2 Availability() [2/2]

```
rti::core::policy::Availability::Availability (
            bool the_enable_required_subscriptions,
            const  dds::core::Duration & the_data_waiting_time,
            const  dds::core::Duration & the_endpoint_waiting_time,
            const  rti::core::EndpointGroupSeq & the_required_enpoint_groups )
```

Creates a policy with all the paramters.

8.27.5 Member Function Documentation

8.27.5.1 enable_required_subscriptions() [1/2]

```
Availability & rti::core::policy::Availability::enable_required_subscriptions (
            bool the_enable_required_subscriptions )
```

<<***extension***>> *(*p. *116)* Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 1138)

[default] false

Categories

Immutable (p. 243), **Reliability** (p. 222), **Durability** (p. 184), **Data Availability** (p. 167)

8.27.5.2 enable_required_subscriptions() [2/2]

```
bool rti::core::policy::Availability::enable_required_subscriptions ( ) const
```

Getter (see setter with the same name)

8.27.5.3 max_data_availability_waiting_time() [1/2]

```
Availability & rti::core::policy::Availability::max_data_availability_waiting_time (
            const  dds::core::Duration & the_data_waiting_time )
```

<<***extension***>> *(p. 116)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.

Collaborative DataWriters

A sample identified by (VGUIDn, VSNm) will be delivered to the application if this timeout expires for the sample and the following two conditions are satisfied:

- None of the known DataWriters publishing VGUIDn have announced potential availability of (VGUIDn, VSNm-1).
- The DataWriters for all the endpoint groups specified in **required_matched_endpoint_groups** (p. 873) have been discovered or **max_endpoint_availability_waiting_time** (p. 872) has expired.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] **dds::core::Duration::automatic()** (p. 1451) (**dds::core::Duration::infinite()** (p. 1451) for **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951). Otherwise, 0 seconds)

[range] [0, **dds::core::Duration::infinite()** (p. 1451)], **dds::core::Duration::automatic()** (p. 1451)

Categories

Mutable (p. 280), **Reliability** (p. 222), **Durability** (p. 184), **Data Availability** (p. 167)

8.27.5.4 max_data_availability_waiting_time() [2/2]

```
dds::core::Duration rti::core::policy::Availability::max_data_availability_waiting_time ( ) const
```

Getter (see setter with the same name)

8.27.5.5 max_endpoint_availability_waiting_time() [1/2]

```
Availability & rti::core::policy::Availability::max_endpoint_availability_waiting_time (
            const  dds::core::Duration & the_endpoint_waiting_time )
```

<<***extension***>> *(p. 116)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).

Collaborative DataWriters

The set of endpoint groups that are required to provide samples for a data source can be configured using **required_matched_endpoint_groups** (p. 873).

A non-consecutive sample identified by (VGUIDn, VSNm) cannot be delivered to the application unless DataWriters for all the endpoint groups in **required_matched_endpoint_groups** (p. 873) are discovered or this timeout expires.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] **dds::core::Duration::automatic()** (p. 1451) (**dds::core::Duration::infinite()** (p. 1451) for **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951). Otherwise, 0 seconds)

[range] [0, **dds::core::Duration::infinite()** (p. 1451)], **dds::core::Duration::automatic()** (p. 1451)

Categories

Mutable (p. 280), **Reliability** (p. 222), **Durability** (p. 184), **Data Availability** (p. 167)

8.27.5.6 max_endpoint_availability_waiting_time() [2/2]

```
dds::core::Duration rti::core::policy::Availability::max_endpoint_availability_waiting_time ( )
const
```

Getter (see setter with the same name)

8.27.5.7 required_matched_endpoint_groups() [1/2]

```
Availability & rti::core::policy::Availability::required_matched_endpoint_groups (
            const  rti::core::EndpointGroupSeq & the_required_enpoint_groups )
```

<<***extension***>> *(p. 116)* A sequence of endpoint groups.

Collaborative DataWriters

In the context of Collaborative DataWriters, it specifies the set of endpoint groups that are expected to provide samples for the same data source.

The quorum count in a group represents the number of DataWriters that must be discovered for that group before the DataReader is allowed to provide non consecutive samples to the application.

A DataWriter becomes a member of an endpoint group by configuring the role_name in **rti::core::policy::EntityName** (p. 1530).

Required Subscriptions

In the context of Required Subscriptions, it specifies the set of Required Subscriptions on a **dds::pub::DataWriter** (p. 1138).

Each Required Subscription is specified by a name and a quorum count.

The quorum count represents the number of DataReaders that have to acknowledge the sample before it can be considered fully acknowledged for that Required Subscription.

A DataReader is associated with a Required Subscription by configuring the role_name in **rti::core::policy::Entity↩ Name** (p. 1530).

[default] Empty sequence

Categories

Mutable (p. 280), **Reliability** (p. 222), **Durability** (p. 184), **Data Availability** (p. 167)

8.27.5.8 required_matched_endpoint_groups() [2/2]

```
 rti::core::EndpointGroupSeq rti::core::policy::Availability::required_matched_endpoint_groups ( )
const
```

Getter (see setter with the same name)

8.28 dds::core::basic_string< CharType, Allocator > Class Template Reference

<<***value-type***>> *(p. 350)* A string convertible to std::string and with similar functionality

`#include <dds/core/String.hpp>`

Public Member Functions

- **basic_string** ()
  Creates an empty string.
- **basic_string** (const **basic_string** &other)
  Copy constructor.
- **basic_string** (const CharType *other_str)
  Constructor from C string.
- **basic_string** (const std::basic_string< CharType > &std_string)
  Constructor from `std::basic_string`.
- **basic_string** (size_t the_size)
  Creates a string of a given size, initialized to '\0'.
- **basic_string** (**basic_string** &&other) OMG_NOEXCEPT
  <<***C++11***>> *(p. 353) Move constructor*
- const CharType * **c_str** () const
  Gets the underlying C string.
- size_type **size** () const
  Gets the size.
- **basic_string** & **operator=** (const **basic_string** &other)
  Assignment operator.
- **basic_string** & **operator=** (**basic_string** &&other) OMG_NOEXCEPT
  <<***C++11***>> *(p. 353) Move-assignment operator*
- bool **operator==** (const **basic_string** &other) const
  Returns if two strings are equal.
- bool **operator!=** (const **basic_string** &other) const
  Returns if two strings are different.
- std::basic_string< CharType > **to_std_string** () const
  *Creates a `std::basic_string` from this **`dds::core::basic_string`** (p. `875`).*
- **operator std::basic_string< CharType >** () const
  *Creates a `std::string` from this **`dds::core::string`** (p. `435`).*

Related Functions

(Note that these are not member functions.)

- template<typename CharType , typename Allocator >
  std::ostream & **operator<<** (std::ostream &out, const **basic_string**< CharType, Allocator > &the_string)
  Prints the string.

8.28.1 Detailed Description

template<typename CharType, typename Allocator>
class dds::core::basic_string< CharType, Allocator >

<<***value-type***>> *(p. 350)* A string convertible to std::string and with similar functionality

In many cases, for performance reasons and other implementation requirements, the RTI Connext API uses **dds::core::string** (p. 435) instead of std::string. The most significant case is the C++ types that rtiddsgen generates from **IDL** (p. 606).

A **dds::core::string** (p. 435) provides a subset of the functionality of a `std::string`. It also provides automatic conversion to and from `std::string`.

8.28.2 Constructor & Destructor Documentation

8.28.2.1 basic_string() [1/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string ( )  [inline]
```

Creates an empty string.

8.28.2.2 basic_string() [2/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
            const  basic_string< CharType, Allocator > & other )  [inline]
```

Copy constructor.

References **dds::core::basic_string< CharType, Allocator >::c_str()**, and **dds::core::basic_string< CharType, Allocator >::size()**.

8.28.2.3 basic_string() [3/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
            const CharType * other_str )  [inline]
```

Constructor from C string.

8.28.2.4 basic_string() [4/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
            const std::basic_string< CharType > & std_string )  [inline]
```

Constructor from `std::basic_string`.

8.28.2.5 basic_string() [5/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
            size_t the_size )  [inline], [explicit]
```

Creates a string of a given size, initialized to '\0'.

8.28.2.6 basic_string() [6/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
             basic_string< CharType, Allocator > && other )  [inline]
```

<<***C++11***>> *(p. 353)* Move constructor

8.28.3 Member Function Documentation

8.28.3.1 c_str()

```
template<typename CharType , typename Allocator >
const CharType *  dds::core::basic_string< CharType, Allocator >::c_str ( ) const  [inline]
```

Gets the underlying C string.

Referenced by **dds::core::basic_string< CharType, Allocator >::basic_string()**, and **dds::core::basic_string< CharType, Allocator >::operator<<()**.

8.28.3.2 size()

```
template<typename CharType , typename Allocator >
size_type  dds::core::basic_string< CharType, Allocator >::size ( ) const  [inline]
```

Gets the size.

Referenced by **dds::core::basic_string< CharType, Allocator >::basic_string()**, **dds::core::basic_string< CharType, Allocator >::operator=()**, and **dds::core::basic_string< CharType, Allocator >::operator==()**.

8.28.3.3 operator=() [1/2]

```
template<typename CharType , typename Allocator >
basic_string &  dds::core::basic_string< CharType, Allocator >::operator= (
             const  basic_string< CharType, Allocator > & other )  [inline]
```

Assignment operator.

References **dds::core::basic_string< CharType, Allocator >::size()**, and **dds::core::Duration::swap()**.

8.28.3.4 operator=() [2/2]

```
template<typename CharType , typename Allocator >
basic_string &  dds::core::basic_string< CharType, Allocator >::operator= (
              basic_string< CharType, Allocator > && other )  [inline]
```

<<***C++11***>> *(p. 353)* Move-assignment operator

References **dds::core::Duration::swap()**.

8.28.3.5 operator==()

```
template<typename CharType , typename Allocator >
bool  dds::core::basic_string< CharType, Allocator >::operator== (
             const  basic_string< CharType, Allocator > & other ) const  [inline]
```

Returns if two strings are equal.

References **dds::core::basic_string< CharType, Allocator >::size()**.

8.28.3.6 operator"!=()

```
template<typename CharType , typename Allocator >
bool  dds::core::basic_string< CharType, Allocator >::operator!= (
            const  basic_string< CharType, Allocator > & other ) const  [inline]
```

Returns if two strings are different.

8.28.3.7 to_std_string()

```
template<typename CharType , typename Allocator >
std::basic_string< CharType >  dds::core::basic_string< CharType, Allocator >::to_std_string ( )
const  [inline]
```

Creates a `std::basic_string` from this **dds::core::basic_string** (p. 875).

8.28.3.8 operator std::basic_string< CharType >()

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::operator std::basic_string< CharType > ( ) const
[inline]
```

Creates a `std::string` from this **dds::core::string** (p. 435).

8.28.4 Friends And Related Function Documentation

8.28.4.1 operator<<()

```
template<typename CharType , typename Allocator >
std::ostream & operator<< (
            std::ostream & out,
            const  basic_string< CharType, Allocator > & the_string )  [related]
```

Prints the string.

References **dds::core::basic_string< CharType, Allocator >::c_str()**.

8.29 rti::core::policy::Batch Class Reference

<<***extension***>> *(p. 116)* Allows a **dds::pub::DataWriter** (p. 1138) to batch multiple samples into a single network packet to increase throughput.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Batch** ()

  Creates the default policy (batching is disabled)
- **Batch** & **enable** (bool the_enable)

  Enables or disables batching.
- bool **enable** () const

  Returns whether batching is enabled or not.
- **Batch** & **max_data_bytes** (int32_t the_max_data_bytes)

  Sets the maximum cumulative length of all serialized samples in a batch.
- int32_t **max_data_bytes** () const

  Getter (see setter with the same name)
- **Batch** & **max_samples** (int32_t the_max_samples)

  Sets the maximum number of samples in a batch.
- int32_t **max_samples** () const

  Getter (see setter with the same name)
- **Batch** & **max_flush_delay** (const **dds::core::Duration** &the_max_flush_delay)

  Sets the maximum delay after which a batch is flushed.
- **dds::core::Duration** **max_flush_delay** () const

  Getter (see setter with the same name)
- **Batch** & **source_timestamp_resolution** (const **dds::core::Duration** &the_source_timestamp_resolution)

  Sets the timestamp resolution of the samples in a batch.
- **dds::core::Duration** **source_timestamp_resolution** () const

  Getter (see setter with the same name)
- **Batch** & **thread_safe_write** (bool the_thread_safe_write)

  Indicates if the write operation needs to be thread-safe.
- bool **thread_safe_write** () const

  Getter (see setter with the same name)

Static Public Member Functions

- static **Batch** **Enabled** ()

  *Returns an instance that enables batching with the default **max_samples()** (p. 883) and **max_data_bytes()** (p. 882).*
- static **Batch** **Disabled** ()

  Returns an instance that disables batching.
- static **Batch** **EnabledWithMaxDataBytes** (int32_t the_max_bytes)

  *Returns an instance that enables batching with **max_data_bytes()** (p. 882)*
- static **Batch** **EnabledWithMaxSamples** (int32_t the_max_samples)

  *Returns an instance that enables batching with **max_samples()** (p. 883)*

8.29.1 Detailed Description

<<***extension***>> *(p. 116)* Allows a **dds::pub::DataWriter** (p. 1138) to batch multiple samples into a single network packet to increase throughput.

This QoS policy configures the ability of the middleware to collect multiple user data samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

This QoS policy can be used to dramatically increase effective throughput for small data samples. Usually, throughput for small samples (size $<$ 2048 bytes) is limited by CPU capacity and not by network bandwidth. Batching many smaller samples to be sent in a single large packet will increase network utilization, and thus throughput, in terms of samples per second.

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.29.2 Constructor & Destructor Documentation

8.29.2.1 Batch()

```
rti::core::policy::Batch::Batch ( )  [inline]
```

Creates the default policy (batching is disabled)

8.29.3 Member Function Documentation

8.29.3.1 Enabled()

```
static  Batch rti::core::policy::Batch::Enabled ( )  [inline], [static]
```

Returns an instance that enables batching with the default **max_samples()** (p. 883) and **max_data_bytes()** (p. 882).

8.29.3.2 Disabled()

```
static Batch rti::core::policy::Batch::Disabled ( ) [inline], [static]
```

Returns an instance that disables batching.

8.29.3.3 EnabledWithMaxDataBytes()

```
static Batch rti::core::policy::Batch::EnabledWithMaxDataBytes (
            int32_t the_max_bytes ) [inline], [static]
```

Returns an instance that enables batching with **max_data_bytes()** (p. 882)

For example:

```
using namespace rti::core::policy;
writer_qos « Batch::EnabledWithMaxDataBytes(2048);
```

8.29.3.4 EnabledWithMaxSamples()

```
static Batch rti::core::policy::Batch::EnabledWithMaxSamples (
            int32_t the_max_samples ) [inline], [static]
```

Returns an instance that enables batching with **max_samples()** (p. 883)

8.29.3.5 enable() [1/2]

```
Batch & rti::core::policy::Batch::enable (
            bool the_enable )
```

Enables or disables batching.

Referenced by **max_data_bytes()**, and **max_flush_delay()**.

8.29.3.6 enable() [2/2]

```
bool rti::core::policy::Batch::enable ( ) const
```

Returns whether batching is enabled or not.

8.29.3.7 max_data_bytes() [1/2]

```
Batch & rti::core::policy::Batch::max_data_bytes (
            int32_t the_max_data_bytes )
```

Sets the maximum cumulative length of all serialized samples in a batch.

A batch is flushed automatically when this maximum is reached.

max_data_bytes does not include the meta data associated with the batch samples. Each sample has at least 8 bytes of meta data containing information such as the timestamp and sequence number. The meta data can be as large as 52 bytes for keyed topics and 20 bytes for unkeyed topics.

Note: Batches must contain whole samples. If a new batch is started and its initial sample causes the serialized size to exceed max_data_bytes, RTI Connext will send the sample in a single batch.

[default] 1024

[range] [1,**dds::core::LENGTH_UNLIMITED** (p. 438)]

8.29.4 Consistency

The setting of **rti::core::policy::Batch::max_data_bytes** (p. 882) must be consistent with **rti::core::policy::Batch↩ ::max_samples** (p. 883). For these two values to be consistent, they cannot be both **dds::core::LENGTH_UNLIMITED** (p. 438).

Categories

Immutable (p. 243), **Batching** (p. 161), **Throughput** (p. 236)

Referenced by **max_flush_delay()**.

8.29.4.1 max_data_bytes() [2/2]

```
int32_t rti::core::policy::Batch::max_data_bytes ( ) const
```

Getter (see setter with the same name)

References **enable()**.

8.29.4.2 max_samples() [1/2]

```
Batch & rti::core::policy::Batch::max_samples (
            int32_t the_max_samples )
```

Sets the maximum number of samples in a batch.

A batch is flushed automatically when this maximum is reached.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1,**dds::core::LENGTH_UNLIMITED** (p. 438)]

8.29.5 Consistency

The setting of **rti::core::policy::Batch::max_samples** (p. 883) must be consistent with **rti::core::policy::Batch↩ ::max_data_bytes** (p. 882). For these two values to be consistent, they cannot be both **dds::core::LENGTH_↩ UNLIMITED** (p. 438).

Categories

Immutable (p. 243), **Batching** (p. 161), **Throughput** (p. 236)

8.29.5.1 max_samples() [2/2]

```
int32_t rti::core::policy::Batch::max_samples ( ) const
```

Getter (see setter with the same name)

8.29.5.2 max_flush_delay() [1/2]

```
Batch & rti::core::policy::Batch::max_flush_delay (
            const  dds::core::Duration & the_max_flush_delay )
```

Sets the maximum delay after which a batch is flushed.

A batch is flushed automatically after the delay specified by this parameter.

The delay is measured from the time the first sample in the batch is written by the application.

[default] dds::core::Duration::infinite() (p. 1451)

[range] [0,**dds::core::Duration::infinite()** (p. 1451)]

8.29.6 Consistency

The setting of **rti::core::policy::Batch::max_flush_delay** (p. 884) must be consistent with **rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch** (p. 836) and **rti::core::policy::Batch::thread_safe_write** (p. 886). If the delay is different than **dds::core::Duration::infinite()** (p. 1451), **rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch** (p. 836) must be set to false and **rti::core::policy::Batch::thread_safe_write** (p. 886) must be set to true.

Categories

Immutable (p. 243), **Batching** (p. 161), **Throughput** (p. 236)

References **enable()**, and **max_data_bytes()**.

8.29.6.1 max_flush_delay() [2/2]

```
dds::core::Duration rti::core::policy::Batch::max_flush_delay ( ) const
```

Getter (see setter with the same name)

8.29.6.2 source_timestamp_resolution() [1/2]

```
Batch & rti::core::policy::Batch::source_timestamp_resolution (
            const  dds::core::Duration & the_source_timestamp_resolution )
```

Sets the timestamp resolution of the samples in a batch.

The value of this field determines how the source timestamp is associated with the samples in a batch.

A sample written with timestamp 't' inherits the source timestamp 't2' associated with the previous sample unless ('t' - 't2') $>$ source_timestamp_resolution.

If source_timestamp_resolution is set to **dds::core::Duration::infinite()** (p. 1451), every sample in the batch will share the source timestamp associated with the first sample.

If source_timestamp_resolution is set to zero, every sample in the batch will contain its own source timestamp corresponding to the moment when the sample was written.

The performance of the batching process is better when source_timestamp_resolution is set to **dds::core::Duration::infinite()** (p. 1451).

[default] dds::core::Duration::infinite() (p. 1451)

[range] [0,**dds::core::Duration::infinite()** (p. 1451)]

8.29.7 Consistency

The setting of **rti::core::policy::Batch::source_timestamp_resolution** (p. 885) must be consistent with **rti::core::policy::Batch::thread_safe_write** (p. 886). If **rti::core::policy::Batch::thread_safe_write** (p. 886) is set to false, **rti::core::policy::Batch::source_timestamp_resolution** (p. 885) must be set to **dds::core::Duration::infinite()** (p. 1451).

Categories

Immutable (p. 243), **Batching** (p. 161), **Throughput** (p. 236), **Data Availability** (p. 167)

8.29.7.1 source_timestamp_resolution() [2/2]

```
dds::core::Duration rti::core::policy::Batch::source_timestamp_resolution ( ) const
```

Getter (see setter with the same name)

8.29.7.2 thread_safe_write() [1/2]

```
Batch & rti::core::policy::Batch::thread_safe_write (
            bool the_thread_safe_write )
```

Indicates if the write operation needs to be thread-safe.

If this parameter is set to true, multiple threads can call write on the **dds::pub::DataWriter** (p. 1138) concurrently.

[default] true

8.29.8 Consistency

The setting of **rti::core::policy::Batch::thread_safe_write** (p. 886) must be consistent with **rti::core::policy::Batch::source_timestamp_resolution** (p. 885). If **rti::core::policy::Batch::thread_safe_write** (p. 886) is set to false, **rti::core::policy::Batch::source_timestamp_resolution** (p. 885) must be set to **dds::core::Duration::infinite()** (p. 1451).

Categories

Immutable (p. 243), **Batching** (p. 161), **Throughput** (p. 236), **Concurrency** (p. 164)

8.29.8.1 thread_safe_write() [2/2]

```
bool rti::core::policy::Batch::thread_safe_write ( ) const
```

Getter (see setter with the same name)

8.30 rti::core::bounded_sequence< T, MaxLength > Class Template Reference

<<***value-type***>> *(*p. *350)* A bounded sequence of elements

```
#include <rti/core/BoundedSequence.hpp>
```

Public Types

- typedef std::vector< T > **vector_type**
  The type of the underlying vector.
- typedef vector_type::value_type **value_type**
  The type of the elements, `T`.
- typedef vector_type::allocator_type **allocator_type**
  The allocator type of the underlying vector.
- typedef vector_type::size_type **size_type**
  The size type.
- typedef vector_type::difference_type **difference_type**
  The difference type.
- typedef vector_type::reference **reference**
  The reference type.
- typedef vector_type::const_reference **const_reference**
  The const reference type.
- typedef vector_type::pointer **pointer**
  The pointer type.
- typedef vector_type::const_pointer **const_pointer**
  The const pointer type.
- typedef vector_type::iterator **iterator**
  The iterator type.
- typedef vector_type::const_iterator **const_iterator**
  The const iterator type.
- typedef vector_type::reverse_iterator **reverse_iterator**
  The reverse iterator type.
- typedef vector_type::const_reverse_iterator **const_reverse_iterator**
  The const reverse iterator type.

- **const_reference front** () const

  Returns a const reference to the first element.
- **reference back** ()

Returns a reference to the last element.

- **const_reference back** () const

  Returns a const reference to the last element.

- **pointer data** ()

  Returns a pointer to the underlying data buffer.

- **const_pointer data** () const

  Returns a pointer to the underlying data buffer.

- **iterator begin** () OMG_NOEXCEPT

  Returns an iterator to the first element.

- **const_iterator begin** () const OMG_NOEXCEPT

  Returns an const iterator to the first element.

- **const_iterator cbegin** () const OMG_NOEXCEPT

  Returns an const iterator to the first element.

- **iterator end** () OMG_NOEXCEPT

  Returns an iterator to one past the last element.

- **const_iterator end** () const OMG_NOEXCEPT

  Returns an const iterator to one past the last element.

- **const_iterator cend** () const OMG_NOEXCEPT

  Returns a const iterator to one past the last element.

- **reverse_iterator rbegin** () OMG_NOEXCEPT

  Returns an iterator to the reverse-beginning of the sequence.

- **const_reverse_iterator rbegin** () const OMG_NOEXCEPT

  Returns a const iterator to the reverse-beginning of the sequence.

- **const_reverse_iterator crbegin** () const OMG_NOEXCEPT

  Returns a const iterator to the reverse-beginning of the sequence.

- **reverse_iterator rend** () OMG_NOEXCEPT

  Returns an iterator to the reverse-end of the sequence.

- **const_reverse_iterator crend** () const OMG_NOEXCEPT

  Returns a const iterator to the reverse-end of the sequence.

- bool **empty** () const OMG_NOEXCEPT

  Returns whether there are no elements.

- **size_type size** () const OMG_NOEXCEPT

  Returns the number of elements.

- **size_type max_size** () const OMG_NOEXCEPT

  Returns `MaxLength`*.*

- void **reserve** (**size_type** new_capacity)

  Pre-allocates elements up to new_capacity.

- **size_type capacity** () const OMG_NOEXCEPT

  Returns the current capacity.

- void **clear** () OMG_NOEXCEPT

  Removes the elements.

- void **shrink_to_fit** ()

  Destroys any extra elements reserved above the current size.

- **iterator insert** (**iterator** pos, const T &value)

  Inserts a new element in a position specified by an iterator.

- **iterator erase** (**iterator** pos)

  Erases an element specified by an iterator.

- void **push_back** (const T &value)

  Adds a new element at the end.
- void **push_back** (T &&value)

  Adds a new element at the end by moving it.
- void **pop_back** ()

  Removes the last element.
- void **resize** (**size_type** count)

  Resizes the container to contain count elements.
- void **resize** (**size_type** count, const T &value)

  Resizes the container to contain count elements.
- void **swap** (**bounded_sequence** &other) OMG_NOEXCEPT

  Swap the contents of two sequences.

8.30.1 Detailed Description

template<typename T, size_t MaxLength>
class rti::core::bounded_sequence< T, MaxLength >

<<***value-type***>> *(*p. *350)* A bounded sequence of elements

Template Parameters

T	The element type
MaxLength	The maximum number of elements

IDL bounded sequences map to this type, as described in **Working with IDL types** (p. 606).

This type has a interface similar to std::vector, but it differs in two aspects:

- It enforces its bound, `MaxLength`, in its operations. Operations that would make the sequence grow beyond the limit throw **`dds::core::PreconditionNotMetError`** (p. 1941).

- it implements a different element life-cycle strategy that optimizes the performance of the internal **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) serialization operations. Just like a std::vector, a **bounded_sequence** (p. 887) has a size and a capacity. But when capacity > size, the extra elements are default-constructed, unlike a std::vector where the extra elements are uninitialized memory. Functions that reduce the size of the sequence do not destroy the elements that they remove. Only **shrink_to_fit()** (p. 902) does.

See also

Working with IDL types (p. 606).

Examples

Foo.hpp.

8.30.2 Member Typedef Documentation

8.30.2.1 vector_type

```
template<typename T , size_t MaxLength>
typedef std::vector<T>  rti::core::bounded_sequence< T, MaxLength >::vector_type
```

The type of the underlying vector.

8.30.2.2 value_type

```
template<typename T , size_t MaxLength>
typedef vector_type::value_type  rti::core::bounded_sequence< T, MaxLength >::value_type
```

The type of the elements, `T`.

8.30.2.3 allocator_type

```
template<typename T , size_t MaxLength>
typedef vector_type::allocator_type  rti::core::bounded_sequence< T, MaxLength >::allocator_type
```

The allocator type of the underlying vector.

8.30.2.4 size_type

```
template<typename T , size_t MaxLength>
typedef vector_type::size_type  rti::core::bounded_sequence< T, MaxLength >::size_type
```

The size type.

8.30.2.5 difference_type

```
template<typename T , size_t MaxLength>
typedef vector_type::difference_type  rti::core::bounded_sequence< T, MaxLength >::difference_↩
type
```

The difference type.

8.30.2.6 reference

```
template<typename T , size_t MaxLength>
typedef vector_type::reference  rti::core::bounded_sequence< T, MaxLength >::reference
```

The reference type.

8.30.2.7 const_reference

```
template<typename T , size_t MaxLength>
typedef vector_type::const_reference  rti::core::bounded_sequence< T, MaxLength >::const_reference
```

The const reference type.

8.30.2.8 pointer

```
template<typename T , size_t MaxLength>
typedef vector_type::pointer  rti::core::bounded_sequence< T, MaxLength >::pointer
```

The pointer type.

8.30.2.9 const_pointer

```
template<typename T , size_t MaxLength>
typedef vector_type::const_pointer  rti::core::bounded_sequence< T, MaxLength >::const_pointer
```

The const pointer type.

8.30.2.10 iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::iterator  rti::core::bounded_sequence< T, MaxLength >::iterator
```

The iterator type.

8.30.2.11 const_iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::const_iterator  rti::core::bounded_sequence< T, MaxLength >::const_iterator
```

The const iterator type.

8.30.2.12 reverse_iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::reverse_iterator  rti::core::bounded_sequence< T, MaxLength >::reverse_↩
iterator
```

The reverse iterator type.

8.30.2.13 const_reverse_iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::const_reverse_iterator  rti::core::bounded_sequence< T, MaxLength >::const↩
_reverse_iterator
```

The const reverse iterator type.

8.30.3 Constructor & Destructor Documentation

8.30.3.1 bounded_sequence() [1/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence ( )  [inline]
```

Creates an empty **bounded_sequence** (p. 887).

8.30.3.2 bounded_sequence() [2/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
            const  bounded_sequence< T, MaxLength > & other )  [inline]
```

Copy constructor.

8.30.3.3 bounded_sequence() [3/9]

```
template<typename T , size_t MaxLength>
template<size_t M>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
            const  bounded_sequence< T, M > & other )  [inline], [explicit]
```

Copies a bounded sequence with a different bound `M`.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if other.size() > MaxLength

8.30.3.4 bounded_sequence() [4/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
             size_type count )  [inline]
```

Create a **bounded_sequence** (p. 887) with a number of default-constructed elements.

8.30.3.5 bounded_sequence() [5/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
             size_type count,
            const  value_type & value )  [inline]
```

Create a **bounded_sequence** (p. 887) with a number of elements.

8.30.3.6 bounded_sequence() [6/9]

```
template<typename T , size_t MaxLength>
template<typename InputIt , typename Category = typename std::iterator_traits<InputIt>::iterator↩
_category>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
            InputIt && first,
            InputIt && last )  [inline]
```

Create a **bounded_sequence** (p. 887) from a range of elements.

8.30.3.7 bounded_sequence() [7/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
            const std::vector< T > & v )  [inline]
```

Create a **bounded_sequence** (p. 887) copying the elements of a std::vector.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if v.size() > MaxLength

8.30.3.8 bounded_sequence() [8/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
             bounded_sequence< T, MaxLength > && other )  [inline]
```

<<***C++11***>> *(p. 353)* Move constructor

8.30.3.9 bounded_sequence() [9/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
            std::vector< T > && v )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a **bounded_sequence** (p. 887) by moving a std::vector

8.30.4 Member Function Documentation

8.30.4.1 operator=() [1/6]

```
template<typename T , size_t MaxLength>
bounded_sequence &  rti::core::bounded_sequence< T, MaxLength >::operator= (
            const  bounded_sequence< T, MaxLength > & other )  [inline]
```

Assignment operator.

References **rti::core::bounded_sequence< T, MaxLength >::begin()**, **rti::core::bounded_sequence< T, Max↩ Length >::end()**, and **rti::core::bounded_sequence< T, MaxLength >::size()**.

8.30.4.2 operator=() [2/6]

```
template<typename T , size_t MaxLength>
template<typename U , size_t M>
bounded_sequence &  rti::core::bounded_sequence< T, MaxLength >::operator= (
            const  bounded_sequence< U, M > & other )  [inline]
```

Copies the elements of a sequence with a different bound.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if other.size() > MaxLength

References **rti::core::bounded_sequence< T, MaxLength >::begin()**, **rti::core::bounded_sequence< T, Max↩ Length >::end()**, and **rti::core::bounded_sequence< T, MaxLength >::size()**.

8.30.4.3 operator=() [3/6]

```
template<typename T , size_t MaxLength>
bounded_sequence &  rti::core::bounded_sequence< T, MaxLength >::operator= (
            const std::vector< T > & v )  [inline]
```

Copies the elements of a std::vector.

8.30.4.4 operator=() [4/6]

```
template<typename T , size_t MaxLength>
bounded_sequence &  rti::core::bounded_sequence< T, MaxLength >::operator= (
             bounded_sequence< T, MaxLength > && other )  [inline]
```

<<***C++11***>> *(p. 353)* Move-assignment operator

8.30.4.5 operator=() [5/6]

```
template<typename T , size_t MaxLength>
bounded_sequence &  rti::core::bounded_sequence< T, MaxLength >::operator= (
            std::vector< T > && v )  [inline]
```

<<***C++11***>> *(p. 353)* Moves a std::vector into this **bounded_sequence** (p. 887)

8.30.4.6 operator=() [6/6]

```
template<typename T , size_t MaxLength>
bounded_sequence &  rti::core::bounded_sequence< T, MaxLength >::operator= (
            std::initializer_list< T > l )  [inline]
```

<<***C++11***>> *(p. 353)* Copies the elements in an initializer_list

Parameters

l	The initializer list

8.30.4.7 operator[]() [1/2]

```
template<typename T , size_t MaxLength>
reference  rti::core::bounded_sequence< T, MaxLength >::operator[] (
              size_type pos )  [inline]
```

Index access.

8.30.4.8 operator[]() [2/2]

```
template<typename T , size_t MaxLength>
const_reference  rti::core::bounded_sequence< T, MaxLength >::operator[] (
              size_type pos ) const  [inline]
```

Index access.

8.30.4.9 at() [1/2]

```
template<typename T , size_t MaxLength>
reference  rti::core::bounded_sequence< T, MaxLength >::at (
              size_type pos )  [inline]
```

Index access with bounds check.

Exceptions

std::out_of_range	if pos is >= **size()** (p. 901)

8.30.4.10 at() [2/2]

```
template<typename T , size_t MaxLength>
const_reference  rti::core::bounded_sequence< T, MaxLength >::at (
              size_type pos ) const  [inline]
```

Index access with bounds check.

Exceptions

std::out_of_range	if pos is >= **size()** (p. 901)

8.30.4.11 front() [1/2]

```
template<typename T , size_t MaxLength>
reference rti::core::bounded_sequence< T, MaxLength >::front ( ) [inline]
```

Returns a reference to the first element.

8.30.4.12 front() [2/2]

```
template<typename T , size_t MaxLength>
const_reference rti::core::bounded_sequence< T, MaxLength >::front ( ) const [inline]
```

Returns a const reference to the first element.

8.30.4.13 back() [1/2]

```
template<typename T , size_t MaxLength>
reference rti::core::bounded_sequence< T, MaxLength >::back ( ) [inline]
```

Returns a reference to the last element.

8.30.4.14 back() [2/2]

```
template<typename T , size_t MaxLength>
const_reference rti::core::bounded_sequence< T, MaxLength >::back ( ) const [inline]
```

Returns a const reference to the last element.

8.30.4.15 data() [1/2]

```
template<typename T , size_t MaxLength>
pointer rti::core::bounded_sequence< T, MaxLength >::data ( ) [inline]
```

Returns a pointer to the underlying data buffer.

8.30.4.16 data() [2/2]

```
template<typename T , size_t MaxLength>
const_pointer rti::core::bounded_sequence< T, MaxLength >::data ( ) const [inline]
```

Returns a pointer to the underlying data buffer.

8.30.4.17 begin() [1/2]

```
template<typename T , size_t MaxLength>
iterator rti::core::bounded_sequence< T, MaxLength >::begin ( ) [inline]
```

Returns an iterator to the first element.

Referenced by **rti::core::bounded_sequence< T, MaxLength >::operator=()**.

8.30.4.18 begin() [2/2]

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::begin ( ) const [inline]
```

Returns an const iterator to the first element.

8.30.4.19 cbegin()

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::cbegin ( ) const [inline]
```

Returns an const iterator to the first element.

8.30.4.20 end() [1/2]

```
template<typename T , size_t MaxLength>
iterator rti::core::bounded_sequence< T, MaxLength >::end ( ) [inline]
```

Returns an iterator to one past the last element.

Referenced by **rti::core::bounded_sequence< T, MaxLength >::operator=()**.

8.30.4.21 end() [2/2]

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::end ( ) const [inline]
```

Returns an const iterator to one past the last element.

8.30.4.22 cend()

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::cend ( ) const [inline]
```

Returns a const iterator to one past the last element.

8.30.4.23 rbegin() [1/2]

```
template<typename T , size_t MaxLength>
reverse_iterator rti::core::bounded_sequence< T, MaxLength >::rbegin ( ) [inline]
```

Returns an iterator to the reverse-beginning of the sequence.

8.30.4.24 rbegin() [2/2]

```
template<typename T , size_t MaxLength>
const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::rbegin ( ) const [inline]
```

Returns a const iterator to the reverse-beginning of the sequence.

8.30.4.25 crbegin()

```
template<typename T , size_t MaxLength>
const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::crbegin ( ) const [inline]
```

Returns a const iterator to the reverse-beginning of the sequence.

8.30.4.26 rend()

```
template<typename T , size_t MaxLength>
reverse_iterator rti::core::bounded_sequence< T, MaxLength >::rend ( ) [inline]
```

Returns an iterator to the reverse-end of the sequence.

8.30.4.27 crend()

```
template<typename T , size_t MaxLength>
const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::crend ( ) const [inline]
```

Returns a const iterator to the reverse-end of the sequence.

8.30.4.28 empty()

```
template<typename T , size_t MaxLength>
bool rti::core::bounded_sequence< T, MaxLength >::empty ( ) const [inline]
```

Returns whether there are no elements.

8.30.4.29 size()

```
template<typename T , size_t MaxLength>
size_type rti::core::bounded_sequence< T, MaxLength >::size ( ) const [inline]
```

Returns the number of elements.

Referenced by **rti::core::bounded_sequence< T, MaxLength >::operator=()**.

8.30.4.30 max_size()

```
template<typename T , size_t MaxLength>
size_type  rti::core::bounded_sequence< T, MaxLength >::max_size ( ) const  [inline]
```

Returns MaxLength.

8.30.4.31 reserve()

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::reserve (
              size_type new_capacity )  [inline]
```

Pre-allocates elements up to new_capacity.

This operation reserves space for new_capacity elements and, unlike std::vector, it also default-constructs the extra elements. The **size()** (p. 901) remains the same.

8.30.4.32 capacity()

```
template<typename T , size_t MaxLength>
size_type  rti::core::bounded_sequence< T, MaxLength >::capacity ( ) const  [inline]
```

Returns the current capacity.

See also

reserve() (p. 902)

8.30.4.33 clear()

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::clear ( )  [inline]
```

Removes the elements.

This operation resizes the sequence to 0, but it doesn't destroy the elements, like std::vector would.

To destroy the elements, follow with a call to shrink_to_fit.

8.30.4.34 shrink_to_fit()

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::shrink_to_fit ( )  [inline]
```

Destroys any extra elements reserved above the current size.

Note that **resize()** (p. 904) or **clear()** (p. 902) alone won't destroy the extra elements when they reduce the size of a sequence.

For example

```
bounded_sequence<Foo, 20> s;
s.resize(10); // 10 elements
s.resize(4);  // size is now 4, but the other 6 elements are not destroyed
s.shrink_to_fit(); // size is 4, and the other 6 elements are destroyed
```

8.30.4.35 insert()

```
template<typename T , size_t MaxLength>
iterator  rti::core::bounded_sequence< T, MaxLength >::insert (
              iterator pos,
             const T & value )  [inline]
```

Inserts a new element in a position specified by an iterator.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if **size()** (p. 901) == MaxLength

8.30.4.36 erase()

```
template<typename T , size_t MaxLength>
iterator  rti::core::bounded_sequence< T, MaxLength >::erase (
              iterator pos )  [inline]
```

Erases an element specified by an iterator.

8.30.4.37 push_back() [1/2]

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::push_back (
             const T & value )  [inline]
```

Adds a new element at the end.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if **size()** (p. 901) == MaxLength

8.30.4.38 push_back() [2/2]

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::push_back (
            T && value )  [inline]
```

Adds a new element at the end by moving it.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if **size()** (p. 901) == MaxLength

8.30.4.39 pop_back()

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::pop_back ( )  [inline]
```

Removes the last element.

The element removed is not destroyed. To destroy it, follow pop_back with a call to shrink_to_fit.

8.30.4.40 resize() [1/2]

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::resize (
             size_type count )  [inline]
```

Resizes the container to contain count elements.

If count $<$ **size()** (p. 901), the sequence is reduced to the first count elements, but elements are not destroyed.

If count $>$ **size()** (p. 901), the sequence is expanded as follows: if **capacity()** (p. 902) $>=$ count, new elements are not constructed, since they already had been. If **capacity()** (p. 902) $<$ count, the extra elements are default-constructed.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if count $>$ MaxLength

8.30.4.41 resize() [2/2]

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::resize (
              size_type count,
             const T & value )  [inline]
```

Resizes the container to contain count elements.

This overload specifies the value.

8.30.4.42 swap()

```
template<typename T , size_t MaxLength>
void  rti::core::bounded_sequence< T, MaxLength >::swap (
              bounded_sequence< T, MaxLength > & other )  [inline]
```

Swap the contents of two sequences.

8.31 dds::topic::BuiltinTopicKey Class Reference

The key of the built-in topics.

```
#include <dds/topic/BuiltinTopicKey.hpp>
```

Public Member Functions

- **TBuiltinTopicKey** ()

  Creates a key whose value() are all zeros.
- std::vector< uint32_t > **value** () const

  Returns a copy of the four integers that represent the key.

Static Public Member Functions

- static D **unknown** ()

  *Unknown **BuiltinTopicKey** (p. 905).*

8.31.1 Detailed Description

The key of the built-in topics.

Each remote **dds::core::Entity** (p. 1520) to be discovered can be uniquely identified by this key. This is the key of all the built-in topic data types.

8.32.1 Detailed Description

<<***extension***>> (p. *116)* Configures several resource management aspects of the built-in topic DataReaders

Defines the resources that can be used for a built-in-topic data reader.

A built-in topic data reader subscribes reliably to built-in topics containing declarations of new entities or updates to existing entities in the domain. Keys are used to differentiate among entities of the same type. RTI Connext assigns a unique key to each entity in a domain.

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

QoS:

rti::core::policy::DiscoveryConfig (p. 1271)

8.32.2 Constructor & Destructor Documentation

8.32.2.1 BuiltinTopicReaderResourceLimits()

```
rti::core::policy::BuiltinTopicReaderResourceLimits::BuiltinTopicReaderResourceLimits ( )  [inline]
```

Creates an instance with the default settings.

8.32.3 Member Function Documentation

8.32.3.1 initial_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::initial_samples (
            int32_t the_initial_samples )
```

<<***extension***>> *(*p. *116)* Initial number of samples.

This should be a value between 1 and initial number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently.

[default] 64

[range] [1, 1 million], <= max_samples

Categories

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::disable↩
_fragmentation_support (
            bool the_disable_fragmentation_support )
```

[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Determines whether the built-in topic **dds::sub::DataReader** (p. 976) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] false

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Fragmentation** (p. 191), **Sending Large Data** (p. 197)

8.32.3.16 disable_fragmentation_support() [2/2]

```
bool rti::core::policy::BuiltinTopicReaderResourceLimits::disable_fragmentation_support ( ) const
```

Getter (see setter with the same name)

8.32.3.17 max_fragmented_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↩
fragmented_samples (
            int32_t the_max_fragmented_samples )
```

<<***extension***>> *(p. 116)* The maximum number of samples for which the built-in topic **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.

At any given time, a built-in topic **dds::sub::DataReader** (p. 976) may store fragments for up to `max_fragmented↩_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different built-in topic **dds::pub::DataWriter** (p. 1138) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **rti::core::policy::BuiltinTopicReaderResourceLimits::max_samples** (p. 909).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **rti::core::policy::BuiltinTopicReaderResourceLimits::disable_fragmentation_support** (p. 913) is false.

[default] 1024

[range] [1, 1 million]

Categories

8.32.3.18 max_fragmented_samples() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragmented_samples ( ) const
```

Getter (see setter with the same name)

8.32.3.19 initial_fragmented_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::initial_fragmented_samples (
            int32_t the_initial_fragmented_samples )
```

<<***extension***>> *(*p. *116)* The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.

Only applies if **rti::core::policy::BuiltinTopicReaderResourceLimits::disable_fragmentation_support** (p. 913) is false.

[default] 4

[range] [1,1024], <= max_fragmented_samples

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Fragmentation** (p. 191), **Sending Large Data** (p. 197)

8.32.3.20 initial_fragmented_samples() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::initial_fragmented_samples ( ) const
```

Getter (see setter with the same name)

8.32.3.21 max_fragmented_samples_per_remote_writer() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragmented_samples_per_remote_writer (
            int32_t the_max_fragmented_samples_per_remote_writer )
```

<<***extension***>> *(*p. *116)* The maximum number of samples per remote writer for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **rti::core::policy::BuiltinTopicReaderResourceLimits::disable_fragmentation_support** (p. 913) is false.

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Fragmentation** (p. 191), **Sending Large Data** (p. 197)

8.32.3.22 max_fragmented_samples_per_remote_writer() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragmented_samples_per_remote_↩
writer ( ) const
```

Getter (see setter with the same name)

8.32.3.23 max_fragments_per_sample() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↩
fragments_per_sample (
            int32_t the_max_fragments_per_sample )
```

<<***extension***>> *(*p. *116)* Maximum number of fragments for a single sample.

Only applies if **rti::core::policy::BuiltinTopicReaderResourceLimits::disable_fragmentation_support** (p. 913) is false.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 438)

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Fragmentation** (p. 191), **Sending Large Data** (p. 197)

8.32.3.24 max_fragments_per_sample() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragments_per_sample ( ) const
```

Getter (see setter with the same name)

8.32.3.25 dynamically_allocate_fragmented_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::dynamically_allocate_fragmented_samples (
            bool the_dynamically_allocate_fragmented_samples )
```

<<***extension***>> *(p. 116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to false, the middleware will allocate memory upfront for storing fragments for up to **rti::core::policy::DataReaderResourceLimits::initial_fragmented_samples** (p. 1093) samples. This memory may grow up to **rti::core::policy::DataReaderResourceLimits::max_fragmented_samples** (p. 1092) if needed.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 1092) is false.

[default] true

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Fragmentation** (p. 191), **Sending Large Data** (p. 197)

8.32.3.26 dynamically_allocate_fragmented_samples() [2/2]

( ) const
```

Getter (see setter with the same name)

8.33 dds::core::BytesTopicType Class Reference

Built-in type consisting of a variable-length array of opaque bytes.

```
#include <dds/core/BuiltinTopicTypes.hpp>
```

Public Member Functions

- **BytesTopicType** ()

  Creates a sample with an empty array of bytes.
- **BytesTopicType** (const std::vector< uint8_t > &the_data)

  Creates a sample with a vector of bytes.
- **operator std::vector< uint8_t >** () const

  Automatic conversion to std::vector.
- std::vector< uint8_t > **data** () const

  Gets the bytes in a std::vector.
- void **data** (const std::vector< uint8_t > &value)

  Sets the bytes.
- uint8_t & **operator[ ]** (uint32_t index)

  Access the bytes by index.
- uint8_t **operator[ ]** (uint32_t index) const

  Access the bytes by index.
- int32_t **length** () const

  Get the number of bytes.

8.33.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

See also

Built-in Types (p. 50)

8.33.2 Constructor & Destructor Documentation

8.33.2.1 BytesTopicType() [1/2]

```
dds::core::BytesTopicType::BytesTopicType ( )  [inline]
```

Creates a sample with an empty array of bytes.

8.33.2.2 BytesTopicType() [2/2]

```
dds::core::BytesTopicType::BytesTopicType (
            const std::vector< uint8_t > & the_data )  [inline]
```

Creates a sample with a vector of bytes.

Parameters

the_data	The octets

Note that this constructor is implicit so you can use a std::vector<uint8_t> wherever a **BytesTopicType** (p. 917) instance is expected

8.33.3 Member Function Documentation

8.33.3.1 operator std::vector< uint8_t >()

```
dds::core::BytesTopicType::operator std::vector< uint8_t > ( ) const  [inline]
```

Automatic conversion to std::vector.

Returns

A copy of the bytes

8.33.3.2 data() [1/2]

```
std::vector< uint8_t > dds::core::BytesTopicType::data ( ) const  [inline]
```

Gets the bytes in a std::vector.

Returns

A copy of the bytes

8.33.3.3 data() [2/2]

```
void dds::core::BytesTopicType::data (
            const std::vector< uint8_t > & value )  [inline]
```

Sets the bytes.

Parameters

value	The bytes

8.33.3.4 operator[]() [1/2]

```
uint8_t & dds::core::BytesTopicType::operator[] (
            uint32_t index )  [inline]
```

Access the bytes by index.

References **dds::core::Value< D >::delegate()**.

8.33.3.5 operator[]() [2/2]

```
uint8_t dds::core::BytesTopicType::operator[] (
            uint32_t index ) const  [inline]
```

Access the bytes by index.

References **dds::core::Value< D >::delegate()**.

8.33.3.6 length()

```
int32_t dds::core::BytesTopicType::length ( ) const  [inline]
```

Get the number of bytes.

References **dds::core::Value< D >::delegate()**.

8.34 rti::core::policy::CdrPaddingKind_def Struct Reference

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) CdrPaddingKind

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  ZERO ,
  NOT_SET ,
  AUTO }

  The underlying `enum` *type.*

8.34.1 Detailed Description

<<***extension***>> *(*p. *354)* The definition of the **dds::core::safe_enum** (p. 2265) CdrPaddingKind

The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

8.34.2 Member Enumeration Documentation

8.34.2.1 type

`enum` **rti::core::policy::CdrPaddingKind_def::type**

The underlying `enum` type.

Enumerator

ZERO	Set padding bytes to zero during CDR serialization.
NOT_SET	Don't set padding bytes to any value.
AUTO	Set the value automatically, depending on the Entity. When set on a DomainParticipant the default behavior is NOT_SET When set on a DataWriter or DataReader the behavior is to inherit the value from the DomainParticipant.

8.35 rti::core::ChannelSettings Class Reference

<<***extension***>> *(*p. *354)* Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1749)

`#include <rti/core/PolicySettings.hpp>`

Public Member Functions

- **ChannelSettings** (const **TransportMulticastSettingsSeq** &the_multicast_settings, const std::string &the_↩ filter_expression, int32_t the_priority)

Creates an instance with the specified multicast settings, filter expression and priority.

- **ChannelSettings** & **multicast_settings** (const **TransportMulticastSettingsSeq** &the_multicast_settings)

  *<<**extension**>> (p. 116) A sequence of **rti::core::TransportMulticastSettings** (p. 2549) used to configure the multicast addresses associated with a channel.*
- **TransportMulticastSettingsSeq** **multicast_settings** () const

  Getter (see the setter with the same name)
- **ChannelSettings** & **filter_expression** (const std::string &the_filter_expression)

  *<<**extension**>> (p. 116) A logical expression used to determine the data that will be published in the channel.*
- std::string **filter_expression** () const

  Getter (see the setter with the same name)
- **ChannelSettings** & **priority** (int32_t the_priority)

  *<<**extension**>> (p. 116) Publication priority*
- int32_t **priority** () const

  Getter (see the setter with the same name)

8.35.1 Detailed Description

*<<**extension**>> (p. 354)* Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1749)

QoS:

rti::core::policy::MultiChannel (p. 1749)

8.35.2 Constructor & Destructor Documentation

8.35.2.1 ChannelSettings()

```
rti::core::ChannelSettings::ChannelSettings (
            const  TransportMulticastSettingsSeq & the_multicast_settings,
            const std::string & the_filter_expression,
            int32_t the_priority )  [inline]
```

Creates an instance with the specified multicast settings, filter expression and priority.

See individual setters.

8.35.3 Member Function Documentation

8.35.3.1 multicast_settings() [1/2]

```
ChannelSettings & rti::core::ChannelSettings::multicast_settings (
            const  TransportMulticastSettingsSeq & the_multicast_settings )
```

<<***extension***>> *(p. 116)* A sequence of **rti::core::TransportMulticastSettings** (p. 2549) used to configure the multicast addresses associated with a channel.

The sequence cannot be empty.

The maximum number of multicast locators in a channel is limited to 16 (a locator is defined by a transport alias, a multicast address and a port). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1384).

[default] Empty sequence (invalid value)

Categories

Immutable (p. 243), **Transports** (p. 237), **Content Filtering** (p. 165)

8.35.3.2 multicast_settings() [2/2]

```
TransportMulticastSettingsSeq rti::core::ChannelSettings::multicast_settings ( ) const
```

Getter (see the setter with the same name)

8.35.3.3 filter_expression() [1/2]

```
ChannelSettings & rti::core::ChannelSettings::filter_expression (
            const std::string & the_filter_expression )  [inline]
```

<<***extension***>> *(p. 116)* A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

The syntax of the expression will depend on the value of **rti::core::policy::MultiChannel::filter_name** (p. 1752)

The filter expression length (including NULL-terminated character) cannot be greater than **rti::core::policy::Domain↩ ParticipantResourceLimits::channel_filter_expression_max_length** (p. 1424).

See also

Queries and Filters Syntax (p. 84)

[default] NULL (invalid value)

Categories

Immutable (p. 243), **Content Filtering** (p. 165)

8.35.3.4 filter_expression() [2/2]

```
std::string rti::core::ChannelSettings::filter_expression ( ) const  [inline]
```

Getter (see the setter with the same name)

8.35.3.5 priority() [1/2]

```
ChannelSettings & rti::core::ChannelSettings::priority (
            int32_t the_priority )  [inline]
```

<<***extension***>> *(*p. *116)* Publication priority

A positive integer value designating the relative priority of the channel, used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**rti::core::policy::PublishModeKind_def::↩ ASYNCHRONOUS** (p. 2019)) with **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) set to Flow↩ ControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST.

Larger numbers have higher priority.

If the publication priority of the channel is any value other than PUBLICATION_PRIORITY_UNDEFINED, then the channel's priority will take precedence over the data writer's priority.

If the publication priority of the channel is set to PUBLICATION_PRIORITY_UNDEFINED, then the channel's priority will be set to the value of the data writer's priority.

If the publicaton priority of both the data writer and the channel are PUBLICATION_PRIORITY_UNDEFINED, the channel will be assigned the lowest priority value.

If the publication priority of the channel is PUBLICATION_PRIORITY_AUTOMATIC, then the channel will be assigned the priority of the largest publication priority of all samples in the channel. The publication priority of each sample can be set in the **rti::pub::WriteParams** (p. 2642) of the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179) function.

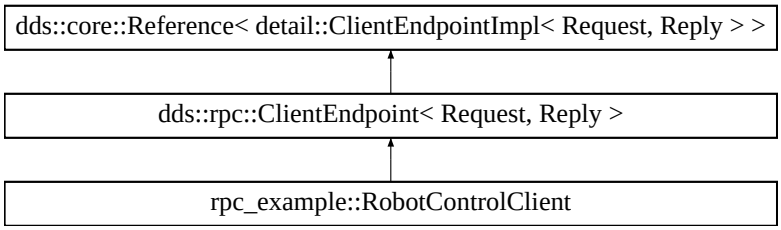
[default] PUBLICATION_PRIORITY_UNDEFINED

Categories

Immutable (p. 243), **Transports** (p. 237), **Data Availability** (p. 167)

8.35.3.6 priority() [2/2]

```
int32_t rti::core::ChannelSettings::priority ( ) const  [inline]
```



Getter (see the setter with the same name)

8.36 dds::rpc::ClientEndpoint< Request, Reply > Class Template Reference

<<***reference-type***>> *(p. 351)* Manages the DDS entities required to make remote function calls.

`#include <dds/rpc/ClientEndpoint.hpp>`

Inheritance diagram for dds::rpc::ClientEndpoint< Request, Reply >:

Public Types

- using **RequestType** = Request

  The type used to make function calls.
- using **ReplyType** = Reply

  The type used to receive the results of function calls.

Public Member Functions

- **ClientEndpoint** (const **ClientParams** &params)

  *Creates a new **ClientEndpoint** (p. 925).*
- void **close** ()

  Destroyes the underlying requester and other resources.
- bool **closed** () const

  Whether this instance has been closed already.
- bool **wait_for_service** (const **dds::core::Duration** &max_wait= **dds::core::Duration::infinite**())

  Waits for one or more services to be discovered. This function takes advantage of enhanced discovery, making sure both the Client and the Service discover each other.
- **dds::pub::DataWriter**< **RequestType** > **request_datawriter** () const

  Accesses the underlying DataWriter that sends the requests (function calls)
- **dds::sub::DataReader**< **ReplyType** > **reply_datareader** () const

  Accesses the underlying DataReader that receives the replies (return values from the function calls)

8.36.1 Detailed Description

template<**typename Request, typename Reply**>
class dds::rpc::ClientEndpoint< **Request, Reply** >

<<***reference-type***>> *(p. 351)* Manages the DDS entities required to make remote function calls.

This class is always the base of a concrete client, such as **rpc_example::RobotControlClient** (p. 2217).

8.36.2 Member Typedef Documentation

8.36.2.1 RequestType

```
template<typename Request , typename Reply >
using  dds::rpc::ClientEndpoint< Request, Reply >::RequestType = Request
```

The type used to make function calls.

8.36.2.2 ReplyType

```
template<typename Request , typename Reply >
using  dds::rpc::ClientEndpoint< Request, Reply >::ReplyType = Reply
```

The type used to receive the results of function calls.

8.36.3 Constructor & Destructor Documentation

8.36.3.1 ClientEndpoint()

```
template<typename Request , typename Reply >
dds::rpc::ClientEndpoint< Request, Reply >::ClientEndpoint (
            const  ClientParams & params )  [inline], [explicit]
```

Creates a new **ClientEndpoint** (p. 925).

8.36.4 Member Function Documentation

8.36.4.1 close()

```
template<typename Request , typename Reply >
void  dds::rpc::ClientEndpoint< Request, Reply >::close ( )  [inline]
```

Destroyes the underlying requester and other resources.

Any operation after **close()** (p. 926) throws **dds::core::AlreadyClosedError** (p. 806)

8.36.4.2 closed()

```
template<typename Request , typename Reply >
bool  dds::rpc::ClientEndpoint< Request, Reply >::closed ( ) const  [inline]
```

Whether this instance has been closed already.

8.36.4.3 wait_for_service()

```
template<typename Request , typename Reply >
bool  dds::rpc::ClientEndpoint< Request, Reply >::wait_for_service (
            const  dds::core::Duration & max_wait =  dds::core::Duration::infinite() )  [inline]
```

Waits for one or more services to be discovered. This function takes advantage of enhanced discovery, making sure both the Client and the Service discover each other.

Parameters

max_wait	The maximum time to wait. Default: **dds::core::Duration::infinite()** (p. 1451) (unlimited period to wait).

Returns

True if a Service is discovered. False if a timeout occurs.

Exceptions

dds::core::AlreadyClosedError *(p. 806)*	if the Client is closed while waiting.

8.36.4.4 request_datawriter()

```
template<typename Request , typename Reply >
dds::pub::DataWriter<  RequestType >  dds::rpc::ClientEndpoint< Request, Reply >::request_↩
datawriter ( ) const  [inline]
```

Accesses the underlying DataWriter that sends the requests (function calls)

Returns

The DataWriter

8.36.4.5 reply_datareader()

```
template<typename Request , typename Reply >
dds::sub::DataReader< ReplyType > dds::rpc::ClientEndpoint< Request, Reply >::reply_datareader
( ) const [inline]
```

Accesses the underlying DataReader that receives the replies (return values from the function calls)

Returns

The DataReader

8.37 dds::rpc::ClientParams Class Reference

<<***value-type***>> *(p. 350)* The parameters used to configure a **ClientEndpoint** (p. 925)

`#include <dds/rpc/ClientEndpoint.hpp>`

Inherits rti::request::detail::EntityParamsWithSetters< ActualEntity >.

Public Member Functions

- **ClientParams** (**dds::domain::DomainParticipant** participant)
  Construct a new Client Params object.
- **ClientParams** & **function_call_max_wait** (const **dds::core::Duration** &max_wait)
  Specifies the maximum wait time for all the remote calls.
- **dds::core::Duration function_call_max_wait** () const
  Returns the maximum wait time.

8.37.1 Detailed Description

<<***value-type***>> *(p. 350)* The parameters used to configure a **ClientEndpoint** (p. 925)

Since clients use a **rti::request::Requester** (p. 2187) to communicate with a service, the **ClientParams** (p. 928) type contains the same parameters as an **rti::request::RequesterParams** (p. 2199), plus function_call_max_wait.

8.37.2 Constructor & Destructor Documentation

8.37.2.1 ClientParams()

```
dds::rpc::ClientParams::ClientParams (
            dds::domain::DomainParticipant participant ) [inline]
```

Construct a new Client Params object.

Parameters

participant	The DomainParticipant is a required parameter

8.37.3 Member Function Documentation

8.37.3.1 function_call_max_wait() [1/2]

```
ClientParams & dds::rpc::ClientParams::function_call_max_wait (
            const  dds::core::Duration & max_wait )  [inline]
```

Specifies the maximum wait time for all the remote calls.

Parameters

max_wait	The maximum wait time for all remote calls made by a client

Returns

This object

8.37.3.2 function_call_max_wait() [2/2]

```
dds::core::Duration dds::rpc::ClientParams::function_call_max_wait ( ) const  [inline]
```

Returns the maximum wait time.

8.38 dds::sub::CoherentAccess Class Reference

<<***value-type***>> *(p. 350)* Controls whether RTI Connext will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_changes.

```
#include "dds/sub/CoherentAccess.hpp"
```

Public Member Functions

- **CoherentAccess** (const **dds::sub::Subscriber** &sub)

  *Creating a **CoherentAccess*** (p. *929*) *object indicates that the application is about to access the data samples in any of the **DataReader*** (p. *976*) *objects attached to the provided **Subscriber*** (p. *2410*).

- void **end** ()

  *Explicitly indicate that the application has finished accessing the data samples in **DataReader*** (p. *976*) *objects managed by the **Subscriber*** (p. *2410*).

- ∼**CoherentAccess** ()

  The destructor implicitly ends coherent access.

8.38.1 Detailed Description

<<***value-type***>> (p. *350*) Controls whether RTI Connext will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_changes.

8.38.2 Constructor & Destructor Documentation

8.38.2.1 CoherentAccess()

```
dds::sub::CoherentAccess::CoherentAccess (
            const  dds::sub::Subscriber & sub )  [inline], [explicit]
```

Creating a **CoherentAccess** (p. 929) object indicates that the application is about to access the data samples in any of the **DataReader** (p. 976) objects attached to the provided **Subscriber** (p. 2410).

If the **dds::core::policy::Presentation::access_scope** (p. 1947) of the **dds::sub::Subscriber** (p. 2410) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951) or **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1951) and **dds::core::policy::Presentation::ordered_access** (p. 1948) is true, the application is required to use this operation to access the samples in order across DataWriters of the same group (**dds::pub::Publisher** (p. 1993) with **dds::core::policy::Presentation::access_scope** (p. 1947) set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951)).

In the above case, this operation must be called prior to calling any of the sample-accessing operations, or **dds::sub::find** (p. 672)

Once the application has finished accessing the data samples, it must call **dds::sub::CoherentAccess::end()** (p. 931) or let this object be destroyed.

The application is not required to call **dds::sub::CoherentAccess::CoherentAccess()** (p. 930) / **dds::sub::CoherentAccess::end()** (p. 931) to access the samples in order if the **PRESENTATION** (p. 540) policy in the **dds::pub::Publisher** (p. 1993) has **dds::core::policy::Presentation::access_scope** (p. 1947) set to something other than **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951). In this case, calling **dds::sub::CoherentAccess::CoherentAccess()** (p. 930) / **dds::sub::CoherentAccess::end()** (p. 931) is not considered an error and has no effect.

Calls to **dds::sub::CoherentAccess::CoherentAccess()** (p. 930) / **dds::sub::CoherentAccess::end()** (p. 931) may be nested and must be balanced.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

See also

Access to data samples (p. 62)

dds::sub::find (p. 672)

PRESENTATION (p. 540)

8.38.2.2 ~CoherentAccess()

```
dds::sub::CoherentAccess::~CoherentAccess ( )  [inline]
```

The destructor implicitly ends coherent access.

See also

end() (p. 931)

8.38.3 Member Function Documentation

8.38.3.1 end()

```
void dds::sub::CoherentAccess::end ( )  [inline]
```

Explicitly indicate that the application has finished accessing the data samples in **DataReader** (p. 976) objects managed by the **Subscriber** (p. 2410).

This operation must be used to close a corresponding begin_access().

This call must close a previous call to **dds::sub::CoherentAccess::CoherentAccess()** (p. 930)(), otherwise the operation will fail with the error **dds::core::PreconditionNotMetError** (p. 1941).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869).

8.39 dds::pub::CoherentSet Class Reference

<<***value-type***>> *(*p. *350)* A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.

```
#include "dds/pub/CoherentSet.hpp"
```

Public Member Functions

- **CoherentSet** (const **dds::pub::Publisher** &pub)

  Creating a ***CoherentSet*** *(*p. *932) object indicates that the application will begin a coherent set of modifications using* ***dds::pub::DataWriter*** *(*p. *1138) objects attached to the* ***dds::pub::Publisher*** *(*p. *1993).*
- void **end** ()

  Explicitly terminate a coherent set initiated by the ***CoherentSet*** *(*p. *932) constructor.*
- ∼**CoherentSet** ()

  Implicitly terminate a coherent set.

8.39.1 Detailed Description

<<***value-type***>> *(*p. *350)* A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.

In this case, the receiver will only be able to access the data after all the modifications in the set are available at the subscribing end.

8.39.2 Constructor & Destructor Documentation

8.39.2.1 CoherentSet()

```
dds::pub::CoherentSet::CoherentSet (
            const  dds::pub::Publisher & pub )  [inline], [explicit]
```

Creating a **CoherentSet** (p. 932) object indicates that the application will begin a coherent set of modifications using **dds::pub::DataWriter** (p. 1138) objects attached to the **dds::pub::Publisher** (p. 1993).

A 'coherent set' is a set of modifications that must be propagated in such a way that they are interpreted at the receiver's side as a consistent set of modifications; that is, the receiver will only be able to access the data after all the modifications in the set are available at the receiver end.

A connectivity change may occur in the middle of a set of coherent changes; for example, the set of partitions used by the **dds::pub::Publisher** (p. 1993) or one of its subscribers (**dds::sub::Subscriber** (p. 2410)) may change, a late-joining **dds::sub::DataReader** (p. 976) may appear on the network, or a communication failure may occur. In the event that such a change prevents an entity from receiving the entire set of coherent changes, that entity must behave as if it had received none of the set.

These calls can be nested. In that case, the coherent set terminates only with the last call to **dds::pub::CoherentSet::end()** (p. 933). **Publisher** (p. 1993)'s samples (samples published by any of the DataWriters within the **Publisher** (p. 1993)) that are not published within a begin_coherent_changes/end_coherent_changes block will not be provided to the DataReaders as a set.

The support for coherent changes enables a publishing application to change the value of several data-instances that could belong to the same or different topics and have those changes be seen *atomically* by the readers. This is useful in cases where the values are inter-related (for example, if there are two data-instances representing the altitude and velocity vector of the same aircraft and both are changed, it may be useful to communicate those values in a way the reader can see both together; otherwise, it may, e.g., erroneously interpret that the aircraft is on a collision course).

Note

Coherent sets don't apply to Topic Queries. If a **rti::sub::TopicQuery** (p. 2516) selects only a subset of samples that was published as a coherent set, the subscribing application will receive them regardless of their membership to the coherent set.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

See also

dds::core::policy::Presentation (p. 1942)

Parameters

pub	The **Publisher** (p. 1993)

8.39.2.2 ~CoherentSet()

```
dds::pub::CoherentSet::~CoherentSet ( )  [inline]
```

Implicitly terminate a coherent set.

See also

end() (p. 933)

8.39.3 Member Function Documentation

8.39.3.1 end()

```
void dds::pub::CoherentSet::end ( )  [inline]
```

Explicitly terminate a coherent set initiated by the **CoherentSet** (p. 932) constructor.

Precondition

If there is no matching call to **dds::pub::CoherentSet::CoherentSet** (p. 932) the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869).

8.40 rti::core::CoherentSetInfo Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A CoherentSampleInfo provides information about the coherent set associated with a sample.

```
#include "rti/core/CoherentSetInfo.hpp"
```

Public Member Functions

- **CoherentSetInfo** ()

  Create a default CoherentSampleInfo object.
- **CoherentSetInfo** (const **Guid** &the_group_guid, const **SequenceNumber** &the_coherent_set_sequence_number, const **SequenceNumber** &the_group_coherent_set_sequence_number, bool the_incomplete_coherent_set)

  Creates CoherentSampleInfo object with the specified parameters.
- const **Guid** & **group_guid** () const

  *Gets the coherent set group **Guid** (p. 1596).*
- **Guid** & **group_guid** ()

  *Gets the coherent set group **Guid** (p. 1596).*
- **CoherentSetInfo** & **group_guid** (const **Guid** &value)

  *Sets the coherent set group **Guid** (p. 1596).*
- const **SequenceNumber** & **coherent_set_sequence_number** () const

  Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.
- **SequenceNumber** & **coherent_set_sequence_number** ()

  Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.
- **CoherentSetInfo** & **coherent_set_sequence_number** (const **SequenceNumber** &value)

  Sets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.
- const **SequenceNumber** & **group_coherent_set_sequence_number** () const

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

- **SequenceNumber** & **group_coherent_set_sequence_number** ()

  Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.
- **CoherentSetInfo** & **group_coherent_set_sequence_number** (const **SequenceNumber** &value)

  Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.
- bool **incomplete_coherent_set** () const

  Indicates if a sample is part of an incomplete coherent set.
- **CoherentSetInfo** & **incomplete_coherent_set** (bool value)

  Sets the incomplete coherent set status.

Static Public Member Functions

- static **CoherentSetInfo** **unknown** ()

  An invalid or unknown coherent set info.

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator**<< (std::ostream &out, const **CoherentSetInfo** &csi)

  *Prints a **CoherentSetInfo** (p. 934) to an output stream.*

8.40.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A CoherentSampleInfo provides information about the coherent set associated with a sample.

8.40.2 Constructor & Destructor Documentation

8.40.2.1 CoherentSetInfo() [1/2]

```
rti::core::CoherentSetInfo::CoherentSetInfo ( )  [inline]
```

Create a default CoherentSampleInfo object.

8.40.2.2 CoherentSetInfo() [2/2]

```
rti::core::CoherentSetInfo::CoherentSetInfo (
            const  Guid & the_group_guid,
            const  SequenceNumber & the_coherent_set_sequence_number,
            const  SequenceNumber & the_group_coherent_set_sequence_number,
            bool the_incomplete_coherent_set )  [inline]
```

Creates CoherentSampleInfo object with the specified parameters.

8.40.3 Member Function Documentation

8.40.3.1 group_guid() [1/3]

```
const  Guid & rti::core::CoherentSetInfo::group_guid ( ) const  [inline]
```

Gets the coherent set group **Guid** (p. 1596).

This GUID identifies the **dds::pub::DataWriter** (p. 1138) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410).

8.40.3.2 group_guid() [2/3]

```
Guid & rti::core::CoherentSetInfo::group_guid ( )  [inline]
```

Gets the coherent set group **Guid** (p. 1596).

This GUID identifies the **dds::pub::DataWriter** (p. 1138) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410).

8.40.3.3 group_guid() [3/3]

```
CoherentSetInfo & rti::core::CoherentSetInfo::group_guid (
            const  Guid & value )  [inline]
```

Sets the coherent set group **Guid** (p. 1596).

This GUID identifies the **dds::pub::DataWriter** (p. 1138) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410).

8.40.3.4 coherent_set_sequence_number() [1/3]

```
const SequenceNumber & rti::core::CoherentSetInfo::coherent_set_sequence_number ( ) const [inline]
```

Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.

When **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410) is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) or **dds::core::policy::↩ PresentationAccessScopeKind_def::TOPIC** (p. 1951), the coherent set associated with a sample is identified by the pair (group_guid, coherent_set_sequence_number).

8.40.3.5 coherent_set_sequence_number() [2/3]

```
SequenceNumber & rti::core::CoherentSetInfo::coherent_set_sequence_number ( ) [inline]
```

Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.

When **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410) is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) or **dds::core::policy::↩ PresentationAccessScopeKind_def::TOPIC** (p. 1951), the coherent set associated with a sample is identified by the pair (group_guid, coherent_set_sequence_number).

8.40.3.6 coherent_set_sequence_number() [3/3]

```
CoherentSetInfo & rti::core::CoherentSetInfo::coherent_set_sequence_number (
            const SequenceNumber & value ) [inline]
```

Sets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.

This GUID identifies the **dds::pub::DataWriter** (p. 1138) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410).

8.40.3.7 group_coherent_set_sequence_number() [1/3]

```
const SequenceNumber & rti::core::CoherentSetInfo::group_coherent_set_sequence_number ( ) const
[inline]
```

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

When **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410) is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951), the coherent set associated with a sample is identified by the pair (group_guid, group_coherent_set_sequence_number).

8.40.3.8 group_coherent_set_sequence_number() [2/3]

```
SequenceNumber & rti::core::CoherentSetInfo::group_coherent_set_sequence_number ( )  [inline]
```

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

When **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410) is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951), the coherent set associated with a sample is identified by the pair (group_guid, group_coherent_set_sequence_number).

8.40.3.9 group_coherent_set_sequence_number() [3/3]

```
CoherentSetInfo & rti::core::CoherentSetInfo::group_coherent_set_sequence_number (
            const  SequenceNumber & value )  [inline]
```

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

This GUID identifies the **dds::pub::DataWriter** (p. 1138) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1947) in the **dds::sub::Subscriber** (p. 2410).

8.40.3.10 incomplete_coherent_set() [1/2]

```
bool rti::core::CoherentSetInfo::incomplete_coherent_set ( ) const  [inline]
```

Indicates if a sample is part of an incomplete coherent set.

8.40.3.11 incomplete_coherent_set() [2/2]

```
CoherentSetInfo & rti::core::CoherentSetInfo::incomplete_coherent_set (
            bool value )  [inline]
```

Sets the incomplete coherent set status.

8.40.3.12 unknown()

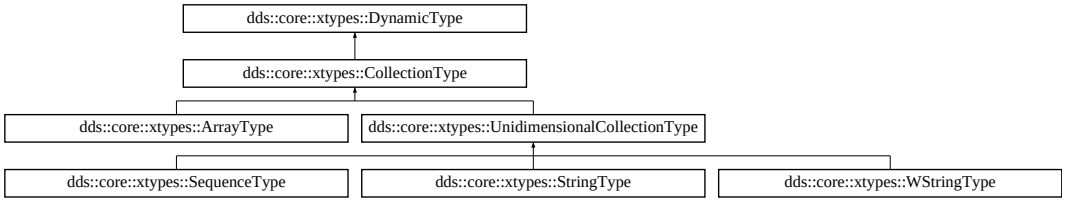
```
static  CoherentSetInfo rti::core::CoherentSetInfo::unknown ( )  [inline], [static]
```

An invalid or unknown coherent set info.

8.40.4 Friends And Related Function Documentation

8.40.4.1 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const  CoherentSetInfo & csi )  [related]
```



Prints a **CoherentSetInfo** (p. 934) to an output stream.

8.41 dds::core::xtypes::CollectionType Class Reference

<<***value-type***>> *(p. 350)* The base class of all collection types

`#include <dds/core/xtypes/CollectionTypes.hpp>`

Inheritance diagram for dds::core::xtypes::CollectionType:

Public Member Functions

QoS:

dds::core::policy::DataRepresentation (p. 1113)

8.43.2 Constructor & Destructor Documentation

8.43.2.1 CompressionSettings() [1/3]

```
rti::core::CompressionSettings::CompressionSettings ( )  [inline]
```

Creates an instance with default, compression_ids, writer_compression_level and writer_compression_threshold.

8.43.2.2 CompressionSettings() [2/3]

```
rti::core::CompressionSettings::CompressionSettings (
            const  rti::core::CompressionIdMask compression_ids )  [inline], [explicit]
```

Creates an instance with the given compression_ids.

8.43.2.3 CompressionSettings() [3/3]

```
rti::core::CompressionSettings::CompressionSettings (
            const  rti::core::CompressionIdMask compression_ids,
            const uint32_t writer_compression_level,
            const int32_t writer_compression_threshold )  [inline]
```

Creates an instance with the given compression_ids, writer_compression_level and writer_compression_threshold.

References **compression_ids()**, **compression_level_default()**, **writer_compression_level()**, and **writer_↩ compression_threshold()**.

8.43.3 Member Function Documentation

8.43.3.1 compression_level_default()

```
static uint32_t rti::core::CompressionSettings::compression_level_default ( )  [inline], [static]
```

Return the default value for the compression level.

Referenced by **CompressionSettings()**.

8.43.3.2 compression_level_best_compression()

```
static uint32_t rti::core::CompressionSettings::compression_level_best_compression ( )  [inline],
[static]
```

Get the compression level that can be used to achieve the best compression ratio.

8.43.3.3 compression_level_best_speed()

```
static uint32_t rti::core::CompressionSettings::compression_level_best_speed ( )  [inline], [static]
```

Get the compression level that can be used to achieve the best compression speed.

8.43.3.4 compression_ids() [1/2]

```
rti::core::CompressionIdMask rti::core::CompressionSettings::compression_ids ( ) const  [inline]
```

Getter for compression_ids.

Referenced by **CompressionSettings()**.

8.43.3.5 compression_ids() [2/2]

```
CompressionSettings rti::core::CompressionSettings::compression_ids (
            rti::core::CompressionIdMask compression_ids )  [inline]
```

Setter for compression_ids.

A bitmap that represents the compression algorithm IDs (**rti::core::CompressionIdMask** (p. 940)) that are supported by the endpoint. The **dds::pub::DataWriter** (p. 1138) creation will fail if more than one algorithm is provided.

If a **dds::pub::DataWriter** (p. 1138) inherits multiple compression IDs from a **dds::topic::Topic** (p. 2474), only the least significant bit enabled will be inherited. This forces the following order of preference: **rti::core::CompressionIdMask↩ ::zlib()** (p. 942), **rti::core::CompressionIdMask::bzip2()** (p. 942), **rti::core::CompressionIdMask::lz4()** (p. 943).

Interactions with Security and Batching: Currently, the only algorithm that is supported when compression and batching are enabled on the same **dds::pub::DataWriter** (p. 1138) is **rti::core::CompressionIdMask::zlib()** (p. 942).

The combination of compression, batching, and data protection is supported. First, compression is applied to the entire batch. Then, data protection is applied to the compressed batch.

Note: When **rti::core::policy::DataWriterProtocol::serialize_key_with_dispose** (p. 1215) is enabled and a dispose message is sent, the serialized key is not compressed.

[default] For **dds::topic::Topic** (p. 2474), **dds::pub::DataWriter** (p. 1138) a **rti::core::CompressionIdMask** (p. 940) mask set to **rti::core::CompressionIdMask::none()** (p. 942)

[default] For **dds::sub::DataReader** (p. 976) a **rti::core::CompressionIdMask** (p. 940) mask set to **rti::core::↩ CompressionIdMask::all()** (p. 941).

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Sending Large Data** (p. 197)

8.43.3.6 writer_compression_level() [1/2]

```
uint32_t rti::core::CompressionSettings::writer_compression_level ( ) const  [inline]
```

Getter for writer_compression_level.

Referenced by **CompressionSettings()**.

8.43.3.7 writer_compression_level() [2/2]

```
CompressionSettings rti::core::CompressionSettings::writer_compression_level (
            uint32_t writer_compression_level )  [inline]
```

Setter for writer_compression_level.

Compression algorithms typically allow you to choose a level with which to compress the data. Each level has trade-offs between the resulting compression ratio and the speed of compression.

[range] [0, 10]

The value 1 represents the fastest compression time and the lowest compression ratio. The value 10 represents the slowest compression time but the highest compression ratio.

A value of 0 disables compression.

[default] rti::core::CompressionSettings::compression_level_best_compression() (p. 945)

Note

Only available for a **dds::pub::DataWriter** (p. 1138) and **dds::topic::Topic** (p. 2474).

Categories

Immutable (p. 243), **Sending Large Data** (p. 197)

8.43.3.8 writer_compression_threshold() [1/2]

```
int32_t rti::core::CompressionSettings::writer_compression_threshold ( ) const  [inline]
```

Getter for writer_compression_threshold.

Referenced by **CompressionSettings()**.

8.43.3.9 writer_compression_threshold() [2/2]

```
CompressionSettings rti::core::CompressionSettings::writer_compression_threshold (
            int32_t writer_compression_threshold )  [inline]
```

Setter for writer_compression_threshold.

Any sample with a serialized size greater than or equal to the threshold will be eligible to be compressed. All samples with an eligible serialized size will be compressed. Only if the compressed size is smaller than the serialized size will the sample be stored and sent compressed on the wire.

For batching we check the maximum serialized size of the batch, calculated as serialized_sample_max_size * **rti::core::policy::Batch::max_samples** (p. 883)

[range] [0, 2147483647] or **dds::core::LENGTH_UNLIMITED** (p. 438)

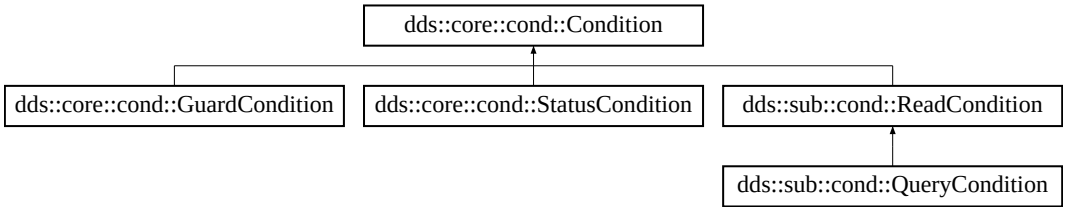
Setting the threshold to **dds::core::LENGTH_UNLIMITED** (p. 438) disables the compression.

[default] rti::core::CompressionSettings::compression_threshold_default() (8192)

Note

Only available for a **dds::pub::DataWriter** (p. 1138) and **dds::topic::Topic** (p. 2474).

Categories



Immutable (p. 243), **Sending Large Data** (p. 197)

8.44 dds::core::cond::Condition Class Reference

<<***reference-type***>> *(p. 351)* Abstract base class of all the conditions

`#include <dds/core/cond/Condition.hpp>`

Inheritance diagram for dds::core::cond::Condition:

Public Member Functions

- void **dispatch** ()

  Dispatches the functors that have been registered with the condition.
- bool **trigger_value** () const

  *This operation retrieves the trigger_value of the **Condition** (p. 948).*

8.44.1 Detailed Description

<<***reference-type***>> *(p. 351)* Abstract base class of all the conditions

Note

Condition (p. 948) and its subclasses provide all the functions of a <<***reference-type***>> *(p. 351)* except **close()** (p. 1024) and retain().

This basic class is specialised in three classes:

dds::core::cond::GuardCondition (p. 1594), **dds::core::cond::StatusCondition** (p. 2372), and **dds::sub::cond::ReadCondition** (p. 2133).

A **dds::core::cond::Condition** (p. 948) has a `trigger_value` that can be true or false and is set automatically by RTI Connext.

See also

dds::core::cond::WaitSet (p. 2617)

Waitset Use Cases (p. 330)

8.44.2 Member Function Documentation

8.44.2.1 dispatch()

```
void dds::core::cond::Condition::dispatch ( )  [inline]
```

Dispatches the functors that have been registered with the condition.

If **trigger_value()** (p. 949) is true, calling **dispatch()** (p. 949) will call the registered functor handlers.

Note: it is more common to use **WaitSet::dispatch()** (p. 2624) rather than this function.

8.44.2.2 trigger_value()

```
bool dds::core::cond::Condition::trigger_value ( ) const  [inline]
```

This operation retrieves the trigger_value of the **Condition** (p. 948).

8.45 rti::queuing::ConsumerAvailabilityParams Class Reference

Definition of the availability feedback information that can be provided by consumers to Queuing Service.

```
#include <QueueSupport.hpp>
```

Public Attributes

- bool **reception_enabled**

  *Flag that provides a way to indicate whether or not the **QueueConsumer** (p. 2063) can receive samples from Queuing Service.*
- int **unacked_threshold**

  *Maximum number of samples pending acknowledgement that the **QueueConsumer** (p. 2063) can have to maintain sample reception. Note: This value is only applied when **ConsumerAvailabilityParams::reception_enabled** (p. 950) is true.*

8.45.1 Detailed Description

Definition of the availability feedback information that can be provided by consumers to Queuing Service.

8.45.2 Member Data Documentation

8.45.2.1 reception_enabled

```
bool rti::queuing::ConsumerAvailabilityParams::reception_enabled
```

Flag that provides a way to indicate whether or not the **QueueConsumer** (p. 2063) can receive samples from Queuing Service.

This value acts as a switch that QueueConsumers can use to temporarily enable or disable the reception of samples from Queuing Service.

8.45.2.2 unacked_threshold

```
int rti::queuing::ConsumerAvailabilityParams::unacked_threshold
```

Maximum number of samples pending acknowledgement that the **QueueConsumer** (p. 2063) can have to maintain sample reception. Note: This value is only applied when **ConsumerAvailabilityParams::reception_enabled** (p. 950) is true.

Once this value is reached, the **QueueConsumer** (p. 2063) will not receive more samples until it acknowledged enough samples so that it is one again under the unacked threshold.

This value has precedence over the unacked threshold settings defined in the Queuing Service configuration. This allows you to dynamically change the threshold on a per Consumer basis.

8.46 rti::topic::ContentFilter< T, CompileData > Class Template Reference

<<***extension***>> *(p. 354)* A class to inherit from when implementing a custom content filter

```
#include <rti/topic/ContentFilter.hpp>
```

Public Member Functions

- virtual CompileData & **compile** (const std::string &expression, const **dds::core::StringSeq** &parameters, const **dds::core::optional**< **dds::core::xtypes::DynamicType** > &type_code, const std::string &type_class_name, CompileData *old_compile_data)=0

  Compile an instance of the content filter according to the filter expression and parameters of the given data type.
- virtual bool **evaluate** (CompileData &compile_data, const T &sample, const **FilterSampleInfo** &meta_data)=0

  Evaluate whether the sample is passing the filter or not according to the sample content.
- virtual void **finalize** (CompileData &compile_data)=0

  A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

Related Functions

(Note that these are not member functions.)

- **no_compile_data_t no_compile_data**

  A constant to return if your compile function does not create any compile data

8.46.1 Detailed Description

template<typename T, typename CompileData = no_compile_data_t>
class rti::topic::ContentFilter< T, CompileData >

<<***extension***>> *(p. 354)* A class to inherit from when implementing a custom content filter

This interface can be implemented by an application-provided class and then registered with the DomainParticipant such that samples can be filtered for **dds::topic::ContentFilteredTopic** (p. 954) with the filter name that the filter is registered with.

Note: the API for using a custom content filter is subject to change in a future release.

For an example of how to create a custom content filter see **Creating Custom Content Filters** (p. 333)

Template Parameters

T	The type of the samples that this **ContentFilter** (p. 950) will filter
CompileData	the type of the data that the compile function will return. If your compile function will not return data, you can leave this template parameter to the default **no_compile_data_t** (p. 1835) type and return rti::topic::no_compile_data in your compile function

See also

rti::topic::CustomFilter (p. 967)

dds::domain::DomainParticipant::register_contentfilter() (p. 1349)

8.46.2 Member Function Documentation

8.46.2.1 compile()

```
template<typename T , typename CompileData = no_compile_data_t>
virtual CompileData &  rti::topic::ContentFilter< T, CompileData >::compile (
            const std::string & expression,
            const  dds::core::StringSeq & parameters,
            const  dds::core::optional<  dds::core::xtypes::DynamicType > & type_code,
            const std::string & type_class_name,
            CompileData * old_compile_data )  [pure virtual]
```

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This method is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **dds::topic::ContentFilteredTopic** (p. 954) with the matching filter name is created, or when a **dds::sub::DataReader** (p. 976) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

expression	An std::string with the filter expression. If you want to manipulate this string, you **must** first make a copy of it.
parameters	A string sequence with the expression parameters the ContentFilteredTopic was created with. The string sequence is **equal** (but **not** identical) to the string sequence passed to **dds::topic::ContentFilteredTopic()** (p. 954). Note that the sequence passed to the compile function is **owned** by RTI Connext and **must not** be referenced outside the compile function.
type_code	The DynamicType for the related Topic of the ContentFilteredTopic. A type code is a description of a type in terms of which **types** it contains (int32, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
type_class_name	Fully qualified class name of the related Topic.
old_compile_data	The previous CompileData value from a previous call to this instance of a content filter. If the compile function is called more than once for an instance of a ContentFilteredTopic, e.g., if the expression parameters are changed, then the CompileData value returned by the previous invocation is passed in the old_compile_data parameter (which can be NULL). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing previously allocated resources.

Returns

User specified compile data for this instance of the content filter. This value is then passed to the evaluate finalize functions for this instance of the content filter. Can be set to rti::topic::no_compile_data.

8.46.2.2 evaluate()

```
template<typename T , typename CompileData = no_compile_data_t>
virtual bool  rti::topic::ContentFilter< T, CompileData >::evaluate (
             CompileData & compile_data,
             const T & sample,
             const  FilterSampleInfo & meta_data )  [pure virtual]
```

Evaluate whether the sample is passing the filter or not according to the sample content.

This method is called when a sample for a locally created **dds::sub::DataReader** (p. 976) associated with the filter is received, or when a sample for a discovered **dds::sub::DataReader** (p. 976) assocated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

compile_data	The last return value of the compile function for this instance of the content filter.
sample	A deserialized sample to be filtered.
meta_data	Meta data associated with the sample.

Returns

The function must return false if the sample should be filtered out (did not pass the filter), true otherwise

8.46.2.3 finalize()

```
template<typename T , typename CompileData = no_compile_data_t>
virtual void  rti::topic::ContentFilter< T, CompileData >::finalize (
             CompileData & compile_data )  [pure virtual]
```

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

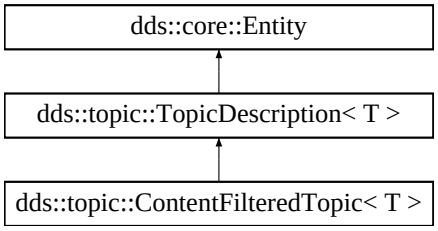
This method is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local **dds::topic::ContentFilteredTopic** (p. 954) with the matching filter name is deleted, or when a **dds::sub::DataReader** (p. 976) with a matching filter name is removed due to discovery.

This method is also called on all instances of the discovered **dds::sub::DataReader** (p. 976) with a matching filter name if the filter is unregistered with **dds::domain::DomainParticipant::unregister_contentfilter(const std::string & filter_name)** (p. 1350).

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters



compile_data	The last return value of the compile function for this instance of the content filter.

8.47 dds::topic::ContentFilteredTopic< T > Class Template Reference

<<***reference-type***>> *(p. 351)* Specialization of **TopicDescription** (p. 2503) that allows for content-based subscriptions.

`#include <dds/topic/ContentFilteredTopic.hpp>`

Inheritance diagram for dds::topic::ContentFilteredTopic< T >:

Public Member Functions

- **ContentFilteredTopic** (const **Topic**< T > &the_topic, RTI_STRING_IN the_name, const **dds::topic::Filter** & **filter**)

  *Creates a **ContentFilteredTopic** (p. 954) to perform content-based subscriptions.*
- std::string **filter_expression** () const

  Gets the filter expression.
- const **dds::core::StringSeq** **filter_parameters** () const

  Gets the filter expression parameters.
- template<typename FwdIterator >
  void **filter_parameters** (const FwdIterator &begin, const FwdIterator &end)

  Modifies the filter parameters.
- const **dds::topic::Topic**< T > & **topic** () const

  Gets the related topic.
- void **filter** (const **dds::topic::Filter** &the_filter)

  <<***extension***>> *(p. 354) Modifies the filter*
- void **append_to_expression_parameter** (int32_t index, const std::string &val)

  <<***extension***>> *(p. 354) Appends a term to a parameter*
- void **remove_from_expression_parameter** (int32_t index, const std::string &val)

  <<***extension***>> *(p. 354) Removes a term from a parameter*

Related Functions

(Note that these are not member functions.)

- template<typename BinIterator >
  uint32_t **find_registered_content_filters** (const **dds::domain::DomainParticipant** & **participant**, BinIterator begin)

  *Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant*** (p. *1326*).

8.47.1 Detailed Description

template<typename T>
class dds::topic::ContentFilteredTopic< T >

<<***reference-type***>> *(p. 351)* Specialization of **TopicDescription** (p. 2503) that allows for content-based subscriptions.

It describes a more sophisticated subscription that indicates a **dds::sub::DataReader** (p. 976) does not want to necessarily see all values of each instance published under the **dds::topic::Topic** (p. 2474). Rather, it wants to see only the values whose contents satisfy certain criteria. This class therefore can be used to request content-based subscriptions.

The selection of the content is done using the `filter_expression` with parameters `expression_parameters`.

- The `filter_expression` attribute is a string that specifies the criteria to select the data samples of interest. It is similar to the WHERE part of an SQL clause.

- The `expression_parameters` attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the `filter_expression`. The number of supplied parameters must fit with the requested values in the `filter_expression` (i.e. the number of n tokens).

Queries and Filters Syntax (p. 84) describes the syntax of `filter_expression` and `expression_parameters`.

Template Parameters

T	The topic-type

See also

Filtering with ContentFilteredTopic (p. 332)
Creating Custom Content Filters (p. 333)

8.47.2 Constructor & Destructor Documentation

8.47.2.1 ContentFilteredTopic()

```
template<typename T >
dds::topic::ContentFilteredTopic< T >::ContentFilteredTopic (
            const  Topic< T > & the_topic,
            RTI_STRING_IN the_name,
            const  dds::topic::Filter & filter )  [inline]
```

Creates a **ContentFilteredTopic** (p. 954) to perform content-based subscriptions.

The **ContentFilteredTopic** (p. 954) only relates to samples published under that **Topic** (p. 2474), filtered according to their content. The filtering is done by means of evaluating a logical expression that involves the values of some of the data-fields in the sample. The logical expression derived from the **Filter** (p. 1558) arguments.

Queries and Filters Syntax (p. 84) describes the syntax of filter_expression and expression_parameters.

Precondition

The application is not allowed to create two **ContentFilteredTopic** (p. 954) objects with the same topic name attached to the same DomainParticipant. If the application attempts this, this function will fail and throw **dds::core::Error** (p. 1539).

By default this function will create a content filter using the built-in SQL filter which implements a superset of the DDS specification. This filter requires that all IDL types have been compiled with DynamicType (also known as TypeCode). If this precondition is not met, this operation return throws **dds::core::Error** (p. 1539). Do not use rtiddsgen's -notypecode option if you want to use the built-in SQL filter.

To use a different filter, set **Filter::name()** (p. 1562).

Parameters

the_topic	The **Topic** (p. 2474) to be filtered
the_name	Name for the new content filtered topic, must not exceed 255 characters.
filter	The filter to apply, which includes the filter name (by default SQL), the filter expression and the expression parameters.

8.47.3 Member Function Documentation

8.47.3.1 filter_expression()

```
template<typename T >
std::string  dds::topic::ContentFilteredTopic< T >::filter_expression ( ) const  [inline]
```

Gets the filter expression.

8.47.3.2 filter_parameters() [1/2]

```
template<typename T >
const  dds::core::StringSeq  dds::topic::ContentFilteredTopic< T >::filter_parameters ( ) const
[inline]
```

Gets the filter expression parameters.

8.47.3.3 filter_parameters() [2/2]

```
template<typename T >
template<typename FwdIterator >
void  dds::topic::ContentFilteredTopic< T >::filter_parameters (
             const FwdIterator & begin,
             const FwdIterator & end )  [inline]
```

Modifies the filter parameters.

Template Parameters

FwdIterator	A forward iterator whose value type is std::string (or convertible to std::string)

Parameters

begin	The beginning of the range
end	The end of the range (can't contain more than 100 elements)

8.47.3.4 topic()

```
template<typename T >
const  dds::topic::Topic< T > &  dds::topic::ContentFilteredTopic< T >::topic ( ) const  [inline]
```

Gets the related topic.

8.47.3.5 filter()

```
template<typename T >
void filter (
             const  dds::topic::Filter & the_filter )
```

<<***extension***>> *(*p. *354)* Modifies the filter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Parameters

the_filter	Contains the new filter expression and parameters. The filter name is immutable: if filter->**name()** (p. 2504) is different it will be ignored.

Changes the `filter_expression` and `expression_parameters` associated with the **dds::topic::Content↩ FilteredTopic** (p. 954).

8.47.3.6 append_to_expression_parameter()

```
template<typename T >
void append_to_expression_parameter (
             int32_t index,
             const std::string & val )
```

<<***extension***>> *(p. 354)* Appends a term to a parameter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Appends the input string to the end of the specified parameter string, separated by a comma. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks.

This method can be used in expression parameters associated with MATCH operators in order to add a pattern to the match pattern list. For example, if the filter expression parameter value is:

'IBM'

Then append_to_expression_parameter(0, "MSFT") would generate the new value:

'IBM,MSFT'

Parameters

index	<<***in***>> *(p. 355)* The index of the parameter string to be modified. The first index is index 0. When using the **rti::topic::stringmatch_filter_name** (p. 49) filter, `index` *must* be 0.
val	<<***in***>> *(p. 355)* The string term to be appended to the parameter string.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.47.3.7 remove_from_expression_parameter()

```
template<typename T >
void remove_from_expression_parameter (
            int32_t index,
            const std::string & val )
```

<<***extension***>> *(p. 354)* Removes a term from a parameter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Removes the input string from the specified parameter string. To be found and removed, the input string must exist as a complete term, bounded by comma separators or the strong boundary. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks. If the removed term was the last entry in the string, the result will be a string of empty quotation marks.

This method can be used in expression parameters associated with MATCH operators in order to remove a pattern from the match pattern list. For example, if the filter expression paremeter value is:

'IBM,MSFT'

Then remove_from_expression_parameter(0, "IBM") would generate the expression:

'MSFT'

Parameters

index	<<***in***>> *(p. 355)* The index of the parameter string to be modified. The first index is index 0. When using the **rti::topic::stringmatch_filter_name** (p. 49) filter, `index` *must* be 0.
val	<<***in***>> *(p. 355)* The string term to be removed from the parameter string.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.47.4 Friends And Related Function Documentation

8.47.4.1 find_registered_content_filters()

```
template<typename BinIterator >
uint32_t find_registered_content_filters (
```

```
const  dds::domain::DomainParticipant & participant,
BinIterator begin )  [related]
```

Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

The names of the RTI Connext built-in content filters will not be returned as part of the list.

Template Parameters

BinIterator	A back-inserting iterator whose value type is `std::string` (or convertible to)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) that the content filters are registered with
begin	A back-inserting iterator to the position in the destination container to insert the the names of the found content filters into

Returns

The number of found content filters

References **rti::topic::find_registered_content_filters()**.

8.48 rti::core::ContentFilterProperty Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Provides all the required information to enable content filtering.

```
#include <ContentFilterProperty.hpp>
```

Public Member Functions

```
optional_string rti::core::ContentFilterProperty::filter_class_name ( ) const  [inline]
```

Identifies the filter class this filter belongs to.

8.48.2.4 filter_expression()

```
optional_string rti::core::ContentFilterProperty::filter_expression ( ) const  [inline]
```

The filter expression.

8.48.2.5 related_topic_name()

```
optional_string rti::core::ContentFilterProperty::related_topic_name ( ) const  [inline]
```

The name of the ContentFilteredTopic's related Topic.

8.49 rti::util::network_capture::ContentKindMask Class Reference

<<***extension***>> *(p. 354)* Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.

```
#include <network_capture.hpp>
```

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**

  A typedef of std::bitset<32> for convenience.

Public Member Functions

- **ContentKindMask** ()

  *Default constructor for **ContentKindMask** (p. 962).*
- **ContentKindMask** (uint64_t mask)

  *Construct a **ContentKindMask** (p. 962) from an integer.*
- **ContentKindMask** (const **MaskType** &mask)

  *Construct a **ContentKindMask** (p. 962) from a MaskType object.*

Static Public Member Functions

- static const **ContentKindMask** **user** ()

  The serialized data coming from a user.
- static const **ContentKindMask** **encrypted** ()

  The encrypted user data.
- static const **ContentKindMask** **default_mask** ()

  *Default mask for **network_capture::ContentKindMask** (p. 962): do not remove any content.*
- static const **ContentKindMask** **none** ()

  The RTPS frames in the capture file will be saved as they are.
- static const **ContentKindMask** **all** ()

  The RTPS frames in the capture file will not include user data (either plain or encrypted).

8.49.1 Detailed Description

<<***extension***>> *(p. 354)* Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.

The masks are based on a combination (or only one) of the **network_capture::ContentKindMask** (p. 962) bitmaps.

See also

network_capture::ContentKindMask (p. 962)

8.49.2 Member Typedef Documentation

8.49.2.1 MaskType

```
typedef std::bitset<32>  rti::util::network_capture::ContentKindMask::MaskType
```

A typedef of std::bitset<32> for convenience.

8.49.3 Constructor & Destructor Documentation

8.49.3.1 ContentKindMask() [1/3]

```
rti::util::network_capture::ContentKindMask::ContentKindMask ( )  [inline]
```

Default constructor for **ContentKindMask** (p. 962).

8.49.3.2 ContentKindMask() [2/3]

```
rti::util::network_capture::ContentKindMask::ContentKindMask (
            uint64_t mask )  [inline], [explicit]
```

Construct a **ContentKindMask** (p. 962) from an integer.

Parameters

mask	Value whose bits are copied to the bitset positions

8.49.3.3 ContentKindMask() [3/3]

```
rti::util::network_capture::ContentKindMask::ContentKindMask (
            const  MaskType & mask )  [inline]
```

Construct a **ContentKindMask** (p. 962) from a MaskType object.

Parameters

mask	A std::bitset<32> to construct this NetworkCaptureContentKindMask from.

8.49.4 Member Function Documentation

8.49.4.1 user()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::user ( ) [inline],
[static]
```

The serialized data coming from a user.

8.49.4.2 encrypted()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::encrypted ( ) [inline],
[static]
```

The encrypted user data.

8.49.4.3 default_mask()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::default_mask ( ) [inline],
[static]
```

Default mask for **network_capture::ContentKindMask** (p. 962): do not remove any content.

It is equivalent to **network_capture::ContentKindMask::none()** (p. 964).

[default] Do not remove any content.

8.49.4.4 none()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::none ( ) [inline],
[static]
```

The RTPS frames in the capture file will be saved as they are.

8.49.4.5 all()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::all ( ) [inline],
[static]
```

The RTPS frames in the capture file will not include user data (either plain or encrypted).

Its value is the result of setting the bits for removing user data and removing encrypted data: (**network_capture::ContentKindMask::user()** (p. 964)) | **network_capture::ContentKindMask::encrypted()** (p. 964))

8.50 rti::core::Cookie Class Reference

Unique identifier for a written data sample in the form of a sequence of bytes.

```
#include <rti/core/Cookie.hpp>
```

Public Member Functions

- **Cookie** ()

  Creates an empty cookie.
- template<typename ByteContainer >
  Cookie (const ByteContainer &bytes)

  Creates a new cookie with the bytes inside a container.
- **dds::core::vector**< uint8_t > & **value** ()

  Retrieves a reference to the vector of bytes.
- const **dds::core::vector**< uint8_t > & **value** () const

  Retrieves a const reference to the vector of bytes.
- template<typename T >
  T * **to_pointer** () const

  Converts a cookie into a pointer.

Related Functions

(Note that these are not member functions.)

- typedef **dds::core::vector**< **Cookie** > **CookieSeq**

  *A sequence of **Cookie** (p. 965) objects.*
- std::ostream & **operator**<< (std::ostream &out, const **Cookie** &cookie)

  *Prints a **Cookie** (p. 965) to an output stream.*

8.50.1 Detailed Description

Unique identifier for a written data sample in the form of a sequence of bytes.

See also

dds::pub::DataWriter::write(const T&, rti::pub::WriteParams&) (p. 1179)

8.50.2 Constructor & Destructor Documentation

8.50.2.1 Cookie() [1/2]

```
rti::core::Cookie::Cookie ( )  [inline]
```

Creates an empty cookie.

8.50.2.2 Cookie() [2/2]

```
template<typename ByteContainer >
rti::core::Cookie::Cookie (
            const ByteContainer & bytes )  [inline], [explicit]
```

Creates a new cookie with the bytes inside a container.

8.50.3 Member Function Documentation

8.50.3.1 value() [1/2]

```
dds::core::vector< uint8_t > & rti::core::Cookie::value ( )
```

Retrieves a reference to the vector of bytes.

8.50.3.2 value() [2/2]

```
const  dds::core::vector< uint8_t > & rti::core::Cookie::value ( ) const
```

Retrieves a const reference to the vector of bytes.

8.50.3.3 to_pointer()

```
template<typename T >
T * rti::core::Cookie::to_pointer ( ) const  [inline]
```

Converts a cookie into a pointer.

Utility function that allows retrieving a pointer stored in a cookie.

Precondition

The cookie's value was filled with a pointer, otherwise the value returned may not be a valid memory address.

Template Parameters

T	The pointer type

Returns

The pointer this cookie represents

8.50.4 Friends And Related Function Documentation

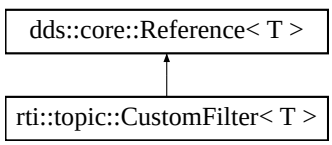
8.50.4.1 CookieSeq

```
typedef  dds::core::vector< Cookie>  CookieSeq  [related]
```

A sequence of **Cookie** (p. 965) objects.

8.50.4.2 operator<<()

```
std::ostream & operator<< (
             std::ostream & out,
             const  Cookie & cookie )  [related]
```



Prints a **Cookie** (p. 965) to an output stream.

8.51 rti::topic::CustomFilter< T > Class Template Reference

<<***extension***>> *(p. 354)* <<***reference-type***>> *(p. 351)* A wrapper class for the user-defined implementation of a **ContentFilter** (p. 950).

```
#include <rti/topic/CustomFilter.hpp>
```

Inheritance diagram for rti::topic::CustomFilter< T >:

Public Member Functions

- **CustomFilter** (typename dds::core::smart_ptr_traits< T >::ref_type content_filter_ref)

  *Create a **CustomFilter** (p. 967) which holds a shared pointer to a user-defined content filter.*
- const T * **get** () const

  Get a const pointer to the underlying content filter.
- T * **get** ()

  Get a pointer to the underlying content filter.

8.51.1 Detailed Description

template<typename T>
class rti::topic::CustomFilter< T >

*<<**extension**>> (p. 354) <<**reference-type**>> (p. 351)* A wrapper class for the user-defined implementation of a **ContentFilter** (p. 950).

In order to register a custom content filter a user must:

- Implement the content filter by creating their own class which inherits from one of the abstract classes: **ContentFilter** (p. 950), **WriterContentFilter** (p. 2652), or **WriterContentFilterHelper** (p. 2657)
- Create a **CustomFilter** (p. 967) which holds a shared pointer to the user-defined content filter
- Register the **CustomFilter** (p. 967) with the **dds::domain::DomainParticipant** (p. 1326) using **dds::domain::DomainParticipant::register_contentfilter** (p. 1349)

The **CustomFilter** (p. 967) class prevents your content filter from being deleted while RTI Connext is using your filter by retaining a reference to your filter until it is no longer being used by RTI Connext.

For an example of how to create anad register a custom content filter see **Creating Custom Content Filters** (p. 333).

Template Parameters

T	The type of the custom content filter that is being registered. It must be a type which inherits and implements the interface of one of **ContentFilter** (p. 950), **WriterContentFilter** (p. 2652), or **WriterContentFilterHelper** (p. 2657)

8.51.2 Constructor & Destructor Documentation

8.51.2.1 CustomFilter()

```
template<typename T >
rti::topic::CustomFilter< T >::CustomFilter (
            typename dds::core::smart_ptr_traits< T >::ref_type content_filter_ref )  [inline]
```

Create a **CustomFilter** (p. 967) which holds a shared pointer to a user-defined content filter.

Parameters

content_filter_ref	A shared pointer to a user-defined content filter object.

8.51.3 Member Function Documentation

8.51.3.1 get() [1/2]

```
template<typename T >
const T *  rti::topic::CustomFilter< T >::get ( ) const  [inline]
```

Get a const pointer to the underlying content filter.

8.51.3.2 get() [2/2]

```
template<typename T >
T *  rti::topic::CustomFilter< T >::get ( )  [inline]
```

Get a pointer to the underlying content filter.

8.52 rti::core::policy::Database Class Reference

<<***extension***>> *(p. 116)* Configures threads and resource limits that RTI Connext uses to control its internal database

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Database** & **thread** (const **rti::core::ThreadSettings** &the_thread)

  Sets the thread settings.
- const **rti::core::ThreadSettings** & **thread** () const

  Gets the thread settings (by const reference)
- **rti::core::ThreadSettings** & **thread** ()

  Gets the thread settings by reference.
- **Database** & **shutdown_timeout** (const **dds::core::Duration** &the_shutdown_timeout)

  [DEPRECATED] *(*p. ***296****) The maximum wait time during a shutdown.*
- **dds::core::Duration** **shutdown_timeout** () const

  Getter (see setter with the same name)
- **Database** & **cleanup_period** (const **dds::core::Duration** &the_cleanup_period)

  [DEPRECATED] *(*p. ***296****) The period at which the database thread wakes up to remove deleted records.*
- **dds::core::Duration** **cleanup_period** () const

  Getter (see setter with the same name)
- **Database** & **shutdown_cleanup_period** (const **dds::core::Duration** &period)

  [DEPRECATED] *(*p. ***296****) The clean-up period used during database shut-down.*

- int32_t **initial_records** () const

  Getter (see setter with the same name)
- **Database** & **max_skiplist_level** (int32_t the_max_skiplist_level)

  [DEPRECATED] *(*p. ***296****) The maximum level of the skiplist.*
- **Database** & **max_weak_references** (int32_t the_max_weak_references)
- int32_t **max_weak_references** () const

  Getter (see setter with the same name)
- **Database** & **initial_weak_references** (int32_t the_initial_weak_references)
- int32_t **initial_weak_references** () const

  Getter (see setter with the same name)

8.52.1 Detailed Description

<<***extension***>> *(*p. *116**)* Configures threads and resource limits that RTI Connext uses to control its internal database

RTI uses an internal in-memory "database" to store information about entities created locally as well as remote entities found during the discovery process. This database uses a background thread to garbage-collect records related to deleted entities. When the **dds::domain::DomainParticipant** (p. 1326) that maintains this database is deleted, it shuts down this thread.

The **Database** (p. 969) QoS policy is used to configure how RTI Connext manages its database, including how often it cleans up, the priority of the database thread, and limits on resources that may be allocated by the database.

You may be interested in modifying the **rti::core::policy::Database::shutdown_timeout** (p. 972) and **rti::core::policy::Database::shutdown_cleanup_period** (p. 973) parameters to decrease the time it takes to delete a **dds::domain::DomainParticipant** (p. 1326) when your application is shutting down.

The **rti::core::policy::DomainParticipantResourceLimits** (p. 1391) controls the memory allocation for elements stored in the database.

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) **NO** (p. 514)

8.52.2 Member Function Documentation

8.52.2.1 thread() [1/3]

```
Database & rti::core::policy::Database::thread (
            const  rti::core::ThreadSettings & the_thread )
```

Sets the thread settings.

There is only one database thread: the clean-up thread.

[default] Priority: LOW.
The actual value depends on your architecture:

For Windows: -3
For Linux: OS default priority
For a complete list of platform specific values, please refer to `Platform Notes`.

[default] Stack Size: The actual value depends on your architecture:

For Windows: OS default stack size
For Linux: OS default stack size
For a complete list of platform specific values, please refer to `Platform Notes`.

[default] Mask: **rti::core::ThreadSettingsKindMask::stdio()** (p. 2456)

Categories

Immutable (p. 243), **Concurrency** (p. 164)

8.52.2.2 thread() [2/3]

```
const  rti::core::ThreadSettings & rti::core::policy::Database::thread ( ) const
```

Gets the thread settings (by const reference)

8.52.2.3 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::Database::thread ( )
```

Gets the thread settings by reference.

See also

thread(const rti::core::ThreadSettings&) (p. 971)

8.52.2.4 shutdown_timeout() [1/2]

```
Database & rti::core::policy::Database::shutdown_timeout (
            const  dds::core::Duration & the_shutdown_timeout )
```

[DEPRECATED] (p. **296)** The maximum wait time during a shutdown.

The domain participant will exit after the timeout, even if the database has not been fully cleaned up.

[default] 15 seconds

[range] [0,**dds::core::Duration::infinite()** (p. 1451)]

Categories

Immutable (p. 243)

8.52.2.5 shutdown_timeout() [2/2]

```
dds::core::Duration rti::core::policy::Database::shutdown_timeout ( ) const
```

Getter (see setter with the same name)

8.52.2.6 cleanup_period() [1/2]

```
Database & rti::core::policy::Database::cleanup_period (
            const  dds::core::Duration & the_cleanup_period )
```

[DEPRECATED] (p. **296)** The period at which the database thread wakes up to remove deleted records.

[default] 61 seconds

[range] [0,1 year]

Categories

Immutable (p. 243)

8.52.2.7 cleanup_period() [2/2]

```
dds::core::Duration rti::core::policy::Database::cleanup_period ( ) const
```

Getter (see setter with the same name)

8.52.2.8 shutdown_cleanup_period() [1/2]

```
Database & rti::core::policy::Database::shutdown_cleanup_period (
            const  dds::core::Duration & period )
```

[DEPRECATED] (p. **296)** The clean-up period used during database shut-down.

If you would like to shorten the time taken for a DomainParticipant to shutdown, you can decrease this value.

It is recommended to set this value to something other than 0 if running in an RTOS environment, to avoid CPU starvation.

[default] 10 milliseconds

[range] [0,1 year]

Categories

Immutable (p. 243)

8.52.2.9 shutdown_cleanup_period() [2/2]

```
dds::core::Duration rti::core::policy::Database::shutdown_cleanup_period ( ) const
```

Getter (see setter with the same name)

8.52.2.10 initial_records() [1/2]

```
Database & rti::core::policy::Database::initial_records (
            int32_t the_initial_records )
```

[default] 1024

[range] [1,10 million]

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.52.2.11 initial_records() [2/2]

```
int32_t rti::core::policy::Database::initial_records ( ) const
```

Getter (see setter with the same name)

8.52.2.12 max_skiplist_level()

```
Database & rti::core::policy::Database::max_skiplist_level (
            int32_t the_max_skiplist_level )
```

[DEPRECATED] (p. 296) The maximum level of the skiplist.

The skiplist is used to keep records in the database. Usually, the search time is log2(N), where N is the total number of records in one skiplist. However, once N exceeds 2^n, where n is the maximum skiplist level, the search time will become more and more linear. Therefore, the maximum level should be set such that 2^n is larger than the maximum(N among all skiplists). Usually, the maximum N is the maximum number of remote and local writers or readers.

[default] 7

[range] [1,31]

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.52.2.13 max_weak_references() [1/2]

```
Database & rti::core::policy::Database::max_weak_references (
            int32_t the_max_weak_references )
```

A weak reference is an internal data structure that refers to a record within RTI Connext' internal database. This field configures the maximum number of such references that RTI Connext may create.

The actual number of weak references is permitted to grow from an initial value (indicated by **rti::core::policy::↩ Database::initial_weak_references** (p. 975)) to this maximum. To prevent RTI Connext from allocating any weak references after the system has reached a steady state, set the initial and maximum values equal to one another. To indicate that the number of weak references should continue to grow as needed indefinitely, set this field to **dds::core↩ ::LENGTH_UNLIMITED** (p. 438). Be aware that although a single weak reference occupies very little memory, allocating a very large number of them can have a significant impact on your overall memory usage.

Tuning this value precisely is difficult without intimate knowledge of the structure of RTI Connext' database; doing so is an advanced feature not required by most applications. The default value has been chosen to be sufficient for reasonably large systems. If you believe you may need to modify this value, please consult with RTI support personnel for assistance.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_weak_references

See also

rti::core::policy::Database::initial_weak_references (p. 975)

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.52.2.14 max_weak_references() [2/2]

```
int32_t rti::core::policy::Database::max_weak_references ( ) const
```

Getter (see setter with the same name)

8.52.2.15 initial_weak_references() [1/2]

```
Database & rti::core::policy::Database::initial_weak_references (
            int32_t the_initial_weak_references )
```

See **rti::core::policy::Database::max_weak_references** (p. 974) for more information about what a weak reference is.

If the QoS set contains an initial_weak_references value that is too small to ever grow to **rti::core::policy::Database↩ ::max_weak_references** (p. 974) using RTI Connext' internal algorithm, this value will be adjusted upwards as necessary. Subsequent accesses of this value will reveal the actual initial value used.

Changing the value of this field is an advanced feature; it is recommended that you consult with RTI support personnel before doing so.

[default] 2049, which is the minimum initial value imposed by RTI Connext when the maximum is unlimited. If a lower value is specified, it will simply be increased to 2049 automatically.

[range] [1, 100 million], <= max_weak_references

8.53.1 Detailed Description

template<typename T>
class dds::sub::DataReader< T >

<<***reference-type***>> *(p. 351)* Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **dds::sub::Subscriber** (p. 2410).

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to

QoS:

dds::sub::qos::DataReaderQos (p. 1072)

Status:

dds::core::status::StatusMask::data_available() (p. 2383);
dds::core::status::StatusMask::liveliness_changed() (p. 2383), **dds::core::status::LivelinessChangedStatus** (p. 1652);
dds::core::status::StatusMask::requested_deadline_missed() (p. 2380), **dds::core::status::RequestedDeadlineMissedStatus** (p. 2184);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2381), **dds::core::status::RequestedIncompatibleQosStatus** (p. 2185);
dds::core::status::StatusMask::sample_lost() (p. 2381), **dds::core::status::SampleLostStatus** (p. 2303);
dds::core::status::StatusMask::sample_rejected() (p. 2382), **dds::core::status::SampleRejectedStatus** (p. 2315);

dds::core::status::StatusMask::subscription_matched() (p. 2384), **dds::core::status::Subscription↩ MatchedStatus** (p. 2439);

Listener:

dds::sub::DataReaderListener (p. 1055)

A **dds::sub::DataReader** (p. 976) refers to exactly one TopicDescription (either a **dds::topic::Topic** (p. 2474), a **dds↩ ::topic::ContentFilteredTopic** (p. 954) or a MultiTopic) that identifies the data to be read.

The subscription has a unique resulting type. The data-reader may give access to several instances of the resulting type, which can be distinguished from each other by their `key`.

The following operations may be called even if the **dds::sub::DataReader** (p. 976) is not enabled. Other operations will fail with the value **dds::core::NotEnabledError** (p. 1869) if called on a disabled **dds::sub::DataReader** (p. 976):

- **dds::sub::DataReader::qos(const dds::sub::qos::DataReaderQos&)** (p. 1008), **dds::sub::DataReader↩ ::qos() const** (p. 1007), **dds::sub::DataReader::set_listener** (p. 1006), **dds::sub::DataReader::get↩ _listener** (p. 1007), **dds::core::Entity::enable** (p. 1524), **dds::core::cond::StatusCondition::Status↩ Condition(const dds::core::Entity&)** (p. 2373), **dds::core::Entity::status_changes()** (p. 1525), **dds::sub::↩ DataReader::liveliness_changed_status** (p. 1011), **dds::sub::DataReader::requested_deadline_missed↩ _status** (p. 1011), **dds::sub::DataReader::requested_incompatible_qos_status** (p. 1012), **dds::sub::Data↩ Reader::sample_lost_status** (p. 1011), **dds::sub::DataReader::sample_rejected_status** (p. 1011), **dds↩ ::sub::DataReader::subscription_matched_status** (p. 1012)

All sample-accessing operations may fail with the expection **dds::core::PreconditionNotMetError** (p. 1941) as described in **dds::sub::CoherentAccess::CoherentAccess()** (p. 930).

8.53.2 Constructor & Destructor Documentation

8.53.2.1 DataReader() [1/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::sub::Subscriber & sub,
            const  dds::topic::Topic< T > & topic )  [inline]
```

Create a **DataReader** (p. 976).

It uses the default DataReaderQos, and no listener.

Parameters

sub	the **Subscriber** (p. 2410) owning this **DataReader** (p. 976).
topic	the Topic associated with this **DataReader** (p. 976).

8.53.2.2 DataReader() [2/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
             const  dds::sub::Subscriber & sub,
             const  dds::topic::Topic< T > & topic,
             const  dds::sub::qos::DataReaderQos & the_qos,
              dds::sub::DataReaderListener< T > * the_listener = NULL,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 976).

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

When a **DataReader** (p. 976) is created, only those transports already registered are available to the **DataReader** (p. 976). See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If the qos parameter is omitted it is not safe to create the datareader while another thread may be simultaneously calling dds::sub::Subscriber::default_datareader_qos(dds::sub::qos::DataReaderQos).

Precondition

If sub is enabled, the topic must be enabled. If it is not, this operation will fail and no **DataReader** (p. 976) will be created.

The given **dds::topic::Topic** (p. 2474) must have been created from the same participant as this subscriber. If it was created from a different participant no **DataReader** (p. 976) will be created.

Parameters

sub	the **Subscriber** (p. 2410) owning this **DataReader** (p. 976).
topic	the Topic associated with this **DataReader** (p. 976).
the_qos	the QoS settings for this **DataReader** (p. 976).
the_listener	the listener.
mask	the event mask associated to the **DataReader** (p. 976) listener.

dds::core::QosProvider::datareader_qos() (p. 2033)

dds::sub::qos::DataReaderQos::operator=(const dds::topic::qos::TopicQos&) (p. 1076) which allows assigning the contents of a TopicQos into a DataReaderQos

listener() (p. 1006)

8.53.2.3 DataReader() [3/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
             const  dds::sub::Subscriber & sub,
             const  dds::topic::Topic< T > & topic,
             const  dds::sub::qos::DataReaderQos & the_qos,
             std::shared_ptr<  Listener > the_listener,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 976).

When a **DataReader** (p. 976) is created, only those transports already registered are available to the **DataReader** (p. 976). See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If the qos parameter is omitted it is not safe to create the datareader while another thread may be simultaneously calling dds::sub::Subscriber::default_datareader_qos(dds::sub::qos::DataReaderQos).

Precondition

If sub is enabled, the topic must be enabled. If it is not, this operation will fail and no **DataReader** (p. 976) will be created.

The given **dds::topic::Topic** (p. 2474) must have been created from the same participant as this subscriber. If it was created from a different participant no **DataReader** (p. 976) will be created.

Parameters

sub	the **Subscriber** (p. 2410) owning this **DataReader** (p. 976).
topic	the Topic associated with this **DataReader** (p. 976).
the_qos	the QoS settings for this **DataReader** (p. 976).
the_listener	A shared_ptr to the listener. See **set_listener()** (p. 1006) for more information.
mask	Indicates which status updates the listener will receive

dds::core::QosProvider::datareader_qos() (p. 2033)

dds::sub::qos::DataReaderQos::operator=(const dds::topic::qos::TopicQos&) (p. 1076) which allows assigning the contents of a TopicQos into a DataReaderQos

8.53.2.4 DataReader() [4/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::sub::Subscriber & sub,
            const  dds::topic::ContentFilteredTopic< T > & topic )  [inline]
```

Create a **DataReader** (p. 976) for a **dds::topic::ContentFilteredTopic** (p. 954).

This **DataReader** (p. 976) will only receive that data that matches the Filter associated with the ContentFilteredTopic. The QoS will be set to sub.default_datareader_qos().

Parameters

sub	the **Subscriber** (p. 2410) owning this **DataReader** (p. 976).
topic	the content filtered topic

8.53.2.5 DataReader() [5/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::sub::Subscriber & sub,
            const  dds::topic::ContentFilteredTopic< T > & topic,
            const  dds::sub::qos::DataReaderQos & the_qos,
             dds::sub::DataReaderListener< T > * the_listener = NULL,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 976) for a **dds::topic::ContentFilteredTopic** (p. 954).

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

This **DataReader** (p. 976) will only receive that data that mathes the Filter associated with the ContentFilteredTopic.

Parameters

sub	the subscriber owning this **DataReader** (p. 976).
topic	the content filtered topic.
the_qos	the QoS settings for this **DataReader** (p. 976).
the_listener	the listener.
mask	the event mask associated to the **DataReader** (p. 976) listener.

8.53.2.6 DataReader() [6/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::sub::Subscriber & sub,
            const  dds::topic::ContentFilteredTopic< T > & topic,
            const  dds::sub::qos::DataReaderQos & the_qos,
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 976) for a **dds::topic::ContentFilteredTopic** (p. 954) with a listener.

This **DataReader** (p. 976) will only receive that data that mathes the Filter associated with the ContentFilteredTopic.

Parameters

sub	the subscriber owning this **DataReader** (p. 976).
topic	the content filtered topic.
the_qos	the QoS settings for this **DataReader** (p. 976).
the_listener	the listener.
mask	the event mask associated to the **DataReader** (p. 976) listener.

8.53.2.7 DataReader() [7/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::topic::Topic< T > & topic )  [inline], [explicit]
```

Create a **DataReader** (p. 976).

It uses default DataReaderQos, and no listener. The reader is created in the implicit subscriber (**rti::sub::implicit_subscriber** (p. 754)(topic.participant()))

Parameters

topic	the Topic associated with this **DataReader** (p. 976).

8.53.2.8 DataReader() [8/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::topic::Topic< T > & topic,
            const  dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Create a **DataReader** (p. 976) with QoS.

The reader is created in the implicit subscriber.

Parameters

topic	the Topic associated with this **DataReader** (p. 976).
the_qos	the QoS settings for this **DataReader** (p. 976).

8.53.2.9 DataReader() [9/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::topic::ContentFilteredTopic< T > & topic,
            const  dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Create a **DataReader** (p. 976) for a **dds::topic::ContentFilteredTopic** (p. 954).

This **DataReader** (p. 976) will only receive that data that matches the Filter associated with the ContentFilteredTopic.

The reader is created in the implicit subscriber.

Parameters

topic	the content filtered topic.
the_qos	the QoS settings for this **DataReader** (p. 976).

8.53.2.10 DataReader() [10/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::topic::Topic< T > & topic,
            const  dds::sub::qos::DataReaderQos & the_qos,
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 976).

When a **DataReader** (p. 976) is created, only those transports already registered are available to the **DataReader** (p. 976). See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If the qos parameter is omitted it is not safe to create the datareader while another thread may be simultaneously calling dds::sub::Subscriber::default_datareader_qos(dds::sub::qos::DataReaderQos).

The reader is created in the implicit subscriber (**rti::sub::implicit_subscriber** (p. 754)(topic.↩ participant()))

Parameters

topic	the Topic associated with this **DataReader** (p. 976).
the_qos	the QoS settings for this **DataReader** (p. 976).
the_listener	A shared_ptr to the listener. See **set_listener()** (p. 1006) for more information.
mask	Indicates which status updates the listener will receive

See also

Specifying QoS on entities (p. 513) for information on setting QoS before entity creation

dds::core::QosProvider::datareader_qos() (p. 2033)

dds::sub::qos::DataReaderQos::operator=(const dds::topic::qos::TopicQos&) (p. 1076) which allows assigning the contents of a TopicQos into a DataReaderQos

8.53.2.11 DataReader() [11/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::topic::ContentFilteredTopic< T > & topic )  [inline], [explicit]
```

Create a **DataReader** (p. 976) for a **dds::topic::ContentFilteredTopic** (p. 954).

This **DataReader** (p. 976) will only receive that data that matches the Filter associated with the ContentFilteredTopic. The QoS will be set to sub.default_datareader_qos().

The reader is created in the implicit subscriber.

Parameters

topic	the content filtered topic

8.53.2.12 DataReader() [12/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
            const  dds::topic::ContentFilteredTopic< T > & topic,
            const  dds::sub::qos::DataReaderQos & the_qos,
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 976) for a **dds::topic::ContentFilteredTopic** (p. 954) with a listener.

This **DataReader** (p. 976) will only receive that data that matches the Filter associated with the ContentFilteredTopic.

The reader is created in the implicit subscriber.

Parameters

topic	the content filtered topic.
the_qos	the QoS settings for this **DataReader** (p. 976).
the_listener	the listener.
mask	the event mask associated to the **DataReader** (p. 976) listener.

8.53.3 Member Function Documentation

8.53.3.1 default_filter_state() [1/2]

```
template<typename T >
const  dds::sub::status::DataState &  dds::sub::DataReader< T >::default_filter_state ( )  [inline]
```

Returns the default state for read/take operations.

If left as default, it is set to **dds::sub::status::DataState::any()** (p. 1124).

8.53.3.2 default_filter_state() [2/2]

```
template<typename T >
DataReader &  dds::sub::DataReader< T >::default_filter_state (
             const  dds::sub::status::DataState & state )  [inline]
```

Set the default state filter for read/take operations.

Parameters

state	the state mask that will be used to read/take samples.

8.53.3.3 operator>>() [1/4]

```
template<typename T >
DataReader &  dds::sub::DataReader< T >::operator>> (
              dds::sub::LoanedSamples< T > & ls )  [inline]
```

Use the stream operator to take samples, placing them into a **LoanedSamples** (p. 1663) container.

For example:
```
reader » loaned_samples;
```

If you want to read samples, instead of take, you must use the stream manipulator **read(dds::sub::ReadMode↩ DummyType)** (p. 1024) and operator>>(bool(∗manipulator)(**ReadModeDummyType** (p. 2144)))

For example:
```
reader » read » loaned_samples;
```

Parameters

ls	The **LoanedSamples** (p. 1663) container to put the taken samples into

See also

operator>>(bool(∗manipulator)(**ReadModeDummyType** (p. 2144)))

operator>>(Functor f) (p. 995)

Accessing Received Data (p. 318)

8.53.3.4 operator>>() [2/4]

```
template<typename T >
ManipulatorSelector  dds::sub::DataReader< T >::operator>> (
            bool(*)( ReadModeDummyType) manipulator )  [inline]
```

Use the stream operator to read or take samples.

The read and take manipulators are defined externally to make it possible to control whether the stream operators reads or takes.

This stream operator can be chained together with **operator>>(Functor f)** (p. 995) to set other various properties of the read/take operation.

It is used as follows:

```
dr » read » loanedSamples;
dr » take » loanedSamples;
```

If either the read or take manipulator is not passed into the stream, the default behavior is to take.

Parameters

manipulator	Either read or take

See also

operator>>(Functor f) (p. 995)

operator>>(dds::sub::LoanedSamples<T>& ls) (p. 993)

ReadModeDummyType (p. 2144)

Accessing Received Data (p. 318)

8.53.3.5 operator>>() [3/4]

```
template<typename T >
template<typename Functor >
ManipulatorSelector  dds::sub::DataReader< T >::operator>> (
            Functor f )  [inline]
```

Use the stream operator to dictate the behavior of the read or take operation.

There are a number of pre-defined stream manipulators (functions which return a functor that will be used by the stream operator). They dictate how the samples will be read or taken:

- max_samples: Read/Take up to a maximum number of samples
- content: Read/Take using a **Query** (p. 2053)
- condition: Read/Take using a **dds::sub::cond::ReadCondition** (p. 2133)
- state: Read/Take only samples with a specific DataState
- instance: Read/Take a specific instance
- next_instance: Read/Take the next instance after a specified instance

For example, to read up to 10 samples that have not been read before:

```
dr » read
   » max_samples(10)
   » state(DataState::new_data())
   » loanedSamples;
```

Parameters

f	Each of the stream manipulators listed above return a Functor that will be passed to the stream operator. These Functors do not need to be accessed by the user directly. They should instead be passed indirectly via the return value of one of the provided stream manipulators.

8.53.3.6 read() [1/5]

```
template<typename T >
LoanedSamples< T >  dds::sub::DataReader< T >::read ( )  [inline]
```

Read all samples using the default filter state.

This operation offers the same functionality and API as **dds::sub::DataReader::take** (p. 997) except that the samples returned remain in the **dds::sub::DataReader** (p. 976) such that they can be retrieved again by means of a read or take operation.

Please refer to the documentation of **dds::sub::DataReader::take** (p. 997) for details on the number of samples returned as well as the order in which the samples appear in these sequences.

The act of reading a sample changes its `sample_state` to **dds::sub::status::SampleState::read()** (p. 2318). If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the instance to be **dds::sub::status::ViewState::not_new_view()** (p. 2616). It will not affect the `instance_state` of the instance.

Once the application completes its use of the samples, it must 'return the loan' to the **dds::sub::DataReader** (p. 976). This can be done explicitly by calling the **dds::sub::LoanedSamples::return_loan()** (p. 1667) operation or implicitly by the **dds::sub::LoanedSamples** (p. 1663) destructor.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **dds::sub::SampleInfo** (p. 2285) objects after the call to **dds::sub::LoanedSamples::return_loan()** (p. 1667). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While the loan must be returned at some point, you do *not* have to do so before the next **dds::sub::DataReader::take** (p. 997) call. However, failure to return the loan will eventually deplete the **dds::sub::DataReader** (p. 976) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **dds::sub::DataReader** (p. 976) is specified by the **dds::core::policy::ResourceLimits** (p. 2203) and the **rti::core::policy::DataReaderResourceLimits** (p. 1081).

Important: If the samples "returned" by this method are loaned from RTI Connext (see **dds::sub::DataReader::take** (p. 997) for more information on memory loaning), it is important that their contents not be changed. Because the memory in which the data is stored belongs to the middleware, any modifications made to the data will be seen the next time the same samples are read or taken; the samples will no longer reflect the state that was received from the network.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941), **dds::core::NotEnabledError** (p. 1869).

See also

dds::sub::DataReader::take (p. 997)

Accessing Received Data (p. 318)

select() (p. 1003)

8.53.3.7 take() [1/5]

```
template<typename T >
LoanedSamples< T >  dds::sub::DataReader< T >::take ( )  [inline]
```

Take all samples using the default filter state.

The operation will return the list of samples received by the **dds::sub::DataReader** (p. 976) since the last **dds::sub::DataReader::take** (p. 997) operation that matches the specified SampleStateMask, ViewStateMask and InstanceStateMask.

This operation may fail with **dds::core::Error** (p. 1539) if the **rti::core::policy::DataReaderResourceLimits::max_outstanding_reads** (p. 1091) limit has been exceeded.

The actual number of samples returned depends on the information that has been received by the middleware as well as the **dds::core::policy::History** (p. 1602), **dds::core::policy::ResourceLimits** (p. 2203), **rti::core::policy::DataReaderResourceLimits** (p. 1081) and the characteristics of the data-type that is associated with the **dds::sub::DataReader** (p. 976):

- In the case where the **dds::core::policy::History::kind** (p. 1604) is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607), the call will return at most **dds::core::policy::History::depth** (p. 1605) samples for each ALIVE instance and (**dds::core::policy::History::depth** (p. 1605) +1) samples for each NOT_ALIVE instance. The extra sample is an invalid sample (**dds::sub::SampleInfo::valid** (p. 2289) is FALSE) that is used to indicate the instance state transition from ALIVE to NOT_ALIVE.

- The maximum number of samples returned is limited by **dds::core::policy::ResourceLimits::max_samples** (p. 2205), and by **rti::core::policy::DataReaderResourceLimits::max_samples_per_read** (p. 1091).

- For multiple instances, the number of samples returned is additionally limited by the product (**dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207)
  - **dds::core::policy::ResourceLimits::max_instances** (p. 2206))

- If **rti::core::policy::DataReaderResourceLimits::max_infos** (p. 1087) is limited, the number of samples returned may also be limited if insufficient **dds::sub::SampleInfo** (p. 2285) resources are available.

If the read or take succeeds and the number of samples returned has been limited (by means of a maximum limit, as listed above, or insufficient **dds::sub::SampleInfo** (p. 2285) resources), the call will complete successfully and provide those samples the reader is able to return. The user may need to make additional calls, or return outstanding loaned buffers in the case of insufficient resources, in order to access remaining samples.

Note that in the case where the **dds::topic::Topic** (p. 2474) associated with the **dds::sub::DataReader** (p. 976) is bound to a data-type that has no key definition, then there will be at most one instance in the **dds::sub::DataReader** (p. 976). So the per-sample limits will apply.

The act of *taking* a sample removes it from RTI Connext so it cannot be read or taken again. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the sample's instance to **dds::sub::status::ViewState::not_new_view()** (p. 2616). It will not affect the `instance_state` of the sample's instance.

Once the application completes its use of the samples it must 'return the loan' to the **dds::sub::DataReader** (p. 976) by calling the **dds::sub::LoanedSamples::return_loan()** (p. 1667) operation. The **dds::sub::LoanedSamples** (p. 1663) destructor also takes care of returning the loan for you, so calling **dds::sub::LoanedSamples::return_loan()** (p. 1667) explicitly is not required.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **dds::sub::SampleInfo** (p. 2285) objects after the call to **dds::sub::LoanedSamples::return_loan()** (p. 1667). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call **dds::sub::LoanedSamples::return_loan()** (p. 1667) at some point, you do *not* have to do so before the next **dds::sub::DataReader::take** (p. 997) call. However, failure to return the loan will eventually deplete the **dds::sub::DataReader** (p. 976) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **dds::sub::DataReader** (p. 976) is specified by the **dds::core::policy::ResourceLimits** (p. 2203) and the **rti::core::policy::DataReaderResourceLimits** (p. 1081).

To copy samples from the reader instead of taking a loan, you can use any of the read or take operations that receive an iterator to a container in which to copy the samples:

- **read(SamplesFWIterator sfit, int32_t max_samples)** (p. 1000)
- **take(SamplesFWIterator sfit, int32_t max_samples)** (p. 1001)
- **read(SamplesBIIterator sbit)** (p. 1001)
- **take(SamplesBIIterator sbit)** (p. 1002)

The order of the samples returned to the caller depends on the **dds::core::policy::Presentation** (p. 1942).

- If **dds::core::policy::Presentation::access_scope** (p. 1947) is **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951), the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **dds::core::policy::Presentation::access_scope** (p. 1947) is **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951) and **dds::core::policy::Presentation::ordered_access** (p. 1948) is set to false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **dds::core::policy::Presentation::access_scope** (p. 1947) is **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951) and **dds::core::policy::Presentation::ordered_access** (p. 1948) is set to true, then the returned collection is a list where the relative order of samples as they were written by a DataWriter is preserved also across different instances. In other words, changes made by a single DataWriter are made available to subscribers in the same order in which they occur. Samples belonging to the same instance may or may not be consecutive. This is because, to preserve order within a single DataWriter, it may be necessary to mix samples from different instances.

- If **dds::core::policy::Presentation::access_scope** (p. 1947) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951) and **dds::core::policy::Presentation::ordered_access** (p. 1948) is set to false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **dds::core::policy::Presentation::access_scope** (p. 1947) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951) and **dds::core::policy::Presentation::ordered_access** (p. 1948) is set to true, then changes made to instances by a set of DataWriters attached to a common Publisher are made available in the order in which they were written. For this to happen, the application must take the samples using the **Subscriber** (p. 2410)'s **dds::sub::CoherentAccess::CoherentAccess()** (p. 930) and **dds::sub::CoherentAccess::end()** (p. 931) operations.

See the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the Core Libraries User's Manual for more information.

In all of the above cases, the relative order between the samples of one instance is consistent with the **DESTINATION_ORDER** (p. 524) policy:

- If **dds::core::policy::DestinationOrder::kind** (p. 1261) is **dds::core::policy::DestinationOrderKind_def::BY_RECEPTION_TIMESTAMP** (p. 1264), samples belonging to the same instances will appear in the relative order in which there were received (FIFO, earlier samples ahead of the later samples).

- If **dds::core::policy::DestinationOrder::kind** (p. 1261) is **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264), samples belonging to the same instances will appear in the relative order implied by the `source_timestamp` (FIFO, smaller values of `source_timestamp` ahead of the larger values).

In addition to the collection of samples, the read and take operations also use a collection of **dds::sub::SampleInfo** (p. 2285) structures.

Some elements in the returned collection may not have valid data. If the instance_state in the **dds::sub::SampleInfo** (p. 2285) is **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) or **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617), then the last sample for that instance in the collection (that is, the one whose **dds::sub::SampleInfo** (p. 2285) has sample_rank==0) does not contain valid data.

Samples that contain no data do not count towards the limits imposed by the **dds::core::policy::ResourceLimits** (p. 2203). The act of reading/taking a sample sets its sample_state to **dds::sub::status::SampleState::read()** (p. 2318).

If the sample belongs to the most recent generation of the instance, it will also set the view_state of the instance to **dds::sub::status::ViewState::not_new_view()** (p. 2616). It will not affect the instance_state of the instance.

For an example on how `take` can be used, please refer to the **Accessing Received Data** (p. 318) "receive example".

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941), **dds::core::NotEnabledError** (p. 1869).

See also

dds::sub::DataReader::read (p. 996)

Accessing Received Data (p. 318)

select() (p. 1003)

Examples

Foo_subscriber.cxx.

8.53.3.8 read() [2/5]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t  dds::sub::DataReader< T >::read (
             SamplesFWIterator sfit,
             int32_t max_samples )  [inline]
```

Read up to max_samples samples using the default filter state.

The samples are copied into the application provided container using the forward iterator parameter.

Template Parameters

SamplesFWIterator	A forward iterator whose value type is dds::sub::Sample<T>

Parameters

sfit	samples forward iterator
max_samples	the maximum number of samples to read

Returns

uint32_t the number of read samples.

See also

read() (p. 996)

Accessing Received Data (p. 318)

8.53.3.9 take() [2/5]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t  dds::sub::DataReader< T >::take (
             SamplesFWIterator sfit,
             int32_t max_samples )  [inline]
```

Take up to max_samples samples using the default filter state.

The samples are copied into the application provided container using the forward iterator parameter.

Template Parameters

SamplesFWIterator	A forward iterator whose value type is dds::sub::Sample<T>

Parameters

sfit	samples forward iterator.
max_samples	the maximum number of samples to take.

Returns

uint32_t The number of taken samples.

See also

take() (p. 997)

Accessing Received Data (p. 318)

8.53.3.10 read() [3/5]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t  dds::sub::DataReader< T >::read (
             SamplesBIIterator sbit )  [inline]
```

Read all samples available in the reader cache using the default filter state.

The samples are copied into the application provided container using a back-inserting iterator. Notice that as a consequence of using a back-inserting iterator, this operation may allocate memory to resize the underlying container.

Template Parameters

SamplesBIIterator	A back-inserting iterator whose value type is dds::sub::Sample<T>.

Parameters

sbit	samples back-inserting iterator.

Returns

uint32_t the number of read samples.

For example:

```
std::vector<Foo> samples;
// inserts copies of all available samples at the end of 'samples'
uint32_t count = reader.read(std::back_inserter(samples));
assert(count == samples.size());
```

Note

This function should not be confused with **read(T& sample)** (p. 1018), an extension function that reads a single sample and assigns it to the argument.

See also

read() (p. 996)

Accessing Received Data (p. 318)

8.53.3.11 take() [3/5]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t  dds::sub::DataReader< T >::take (
             SamplesBIIterator sbit )  [inline]
```

Take all samples available in the reader cache samples using the default filter state.

The samples are copied into the application provided container using a back-inserting iterator. Notice that as a consequence of using a back-inserting iterator, this operation may allocate memory to resize the underlying container.

Template Parameters

SamplesBIIterator	A back-inserting iterator whose value type is dds::sub::Sample<T>

Parameters

sbit	samples back-inserting iterator.

Returns

the number of taken samples.

Note

This function should not be confused with **take(T& sample)** (p. 1020), an extension function that takes a single sample and assigns it to the argument.

See also

take() (p. 997)

Accessing Received Data (p. 318)

8.53.3.12 select()

```
template<typename T >
Selector dds::sub::DataReader< T >::select ( ) [inline]
```

Get a **Selector** (p. 2320) to perform complex data selections, such as per-instance selection, content and status filtering.

The selector can be used as follows:

```
LoanedSamples<Foo> samples = reader.select()
    .instance(handle)
    .content(query)
    .state(state)
    .take();
```

This shows how samples can be taken by selecting a specific instance, then filtering by state and content.

Note that when the application wants to access all available samples it can simply call **DataReader::read()** (p. 996) or **DataReader::take()** (p. 997).

Returns

A **Selector** (p. 2320), typically used in-line to configure it and finally call **Selector::read()** (p. 2325) or **Selector::take()** (p. 2326).

See also

Selector (p. 2320), for the different **parameters** (p. 2063) that can be set to configure what samples to **read** (p. 996) or **take** (p. 997).

Selecting what samples to read (p. 319)

8.53.3.13 key_value() [1/2]

```
template<typename T >
T &  dds::sub::DataReader< T >::key_value (
             T & key_holder,
             const  dds::core::InstanceHandle & handle )  [inline]
```

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the key inside the `key_holder` instance.

For keyed data types, this operation may fail with **dds::core::InvalidArgumentError** (p. 1619) if the `handle` does not correspond to an existing data-object known to the **DataReader** (p. 976).

Parameters

key_holder	A user data type specific key holder of type T whose key fields are filled by this operation. If T has no key, this operation has no effect.
handle	The instance whose key is to be retrieved. If T has a key, `handle` must represent an existing instance of type T known to the **DataReader** (p. 976). Otherwise, this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If T has a key and `handle` is **dds::core::InstanceHandle::nil()** (p. 1614), this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If T has a key and `handle` represents an instance of another type or an instance of type T that has been unregistered, this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If T has no key, this method has no effect.

8.53.3.14 key_value() [2/2]

```
template<typename T >
dds::topic::TopicInstance< T > &  dds::sub::DataReader< T >::key_value (
              dds::topic::TopicInstance< T > & key_holder,
             const  dds::core::InstanceHandle & handle )  [inline]
```

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the key inside the `key_holder` instance.

For keyed data types, this operation may fail with **dds::core::InvalidArgumentError** (p. 1619) if the `handle` does not correspond to an existing data-object known to the **DataReader** (p. 976).

Parameters

key_holder	A TopicInstance whose sample's key fields are filled by this operation. If T does not have a key, this method has no effect.

Parameters

handle	The instance whose key is to be retrieved. If T has a key, `handle` must represent an existing instance of type T known to the **DataReader** (p. 976). Otherwise, this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If T has a key and `handle` is **dds::core::InstanceHandle::nil()** (p. 1614), this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If T has a key and `handle` represents an instance of another type or an instance of type T that has been unregistered, this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If T has no key, this method has no effect.

8.53.3.15 lookup_instance()

```
template<typename T >
dds::core::InstanceHandle  dds::sub::DataReader< T >::lookup_instance (
             const T & key_holder ) const  [inline]
```

Retrieve the InstanceHandle that corresponds to an instance key holder.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. If the instance is unknown to the **DataReader** (p. 976), or if for any other reason the Service is unable to provide an instance handle, the Service will return the special value **dds::core::InstanceHandle::nil()** (p. 1614).

Parameters

key_holder	<<***in***>> *(*p. *355)* a user data type specific key holder.

Returns

the instance handle associated with this instance. If `T` has no key, this method has no effect and returns **dds::core::InstanceHandle::nil()** (p. 1614)

8.53.3.16 topic_description()

```
template<typename T >
dds::topic::TopicDescription< DataType >  dds::sub::DataReader< T >::topic_description ( ) const
[inline]
```

Returns the **dds::topic::TopicDescription** (p. 2503) associated with the **DataReader** (p. 976).

Returns that same TopicDescription that was used to create the **dds::sub::DataReader** (p. 976).

Returns

TopicDescription associated with the **dds::sub::DataReader** (p. 976).

8.53.3.17 subscriber()

```
template<typename T >
const  dds::sub::Subscriber &  dds::sub::DataReader< T >::subscriber ( ) const  [inline]
```

Returns the **Subscriber** (p. 2410) to which the **DataReader** (p. 976) belongs.

8.53.3.18 listener() [1/2]

```
template<typename T >
void  dds::sub::DataReader< T >::listener (
             Listener * the_listener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener associated with this reader.

[DEPRECATED] The use of **set_listener()** (p. 1006) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Parameters

the_listener	The **DataReaderListener** (p. 1055) to set
event_mask	The **dds::core::status::StatusMask** (p. 2375) associated with the listener

8.53.3.19 listener() [2/2]

```
template<typename T >
Listener *  dds::sub::DataReader< T >::listener ( ) const  [inline]
```

Returns the listener currently associated with this **DataReader** (p. 976).

[DEPRECATED] Prefer **get_listener()** (p. 1007) instead of this function.

If there's no listener it returns NULL.

8.53.3.20 set_listener() [1/2]

```
template<typename T >
void  dds::sub::DataReader< T >::set_listener (
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener associated with this reader.

The **DataReader** (p. 976) will hold a shared_ptr to the listener argument, ensuring that it is not deleted at least until this **DataReader** (p. 976) is deleted or the listener is reset with set_listener(nullptr).

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the reader. If it does, the application needs to manually reset the listener or manually close this **DataReader** (p. 976) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.
event_mask	A mask that indicates which status updates will be notified to the listener

8.53.3.21 set_listener() [2/2]

```
template<typename T >
void  dds::sub::DataReader< T >::set_listener (
            std::shared_ptr<  Listener > the_listener )  [inline]
```

Sets the listener associated with this reader.

If `the_listener` is not `nullptr`, this overload is equivalent to:
```
reader.set_listener(the_listener, dds::core::status::StatusMask::all());
```

If `the_listener` is `nullptr`, it is equivalent to:
```
reader.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.

8.53.3.22 get_listener()

```
template<typename T >
std::shared_ptr<  Listener >  dds::sub::DataReader< T >::get_listener ( ) const  [inline]
```

Returns the listener currently associated with this **DataReader** (p. 976).

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.53.3.23 qos() [1/2]

```
template<typename T >
const  dds::sub::qos::DataReaderQos  dds::sub::DataReader< T >::qos ( ) const  [inline]
```

Get the QoS associated with this reader.

8.53.3.24 qos() [2/2]

```
template<typename T >
void  dds::sub::DataReader< T >::qos (
            const  dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Set the QoS associated with this reader.

This operation modifies the QoS of the **DataReader** (p. 976).

The **dds::core::policy::UserData** (p. 2591), **dds::core::policy::Deadline** (p. 1255), **dds::core::policy::Latency↩Budget** (p. 1631), **dds::core::policy::TimeBasedFilter** (p. 2469), **dds::core::policy::ReaderDataLifecycle** (p. 2137) can be changed. The other policies are immutable.

Parameters

the_qos	The DataReaderQos to be set to. Policies must be consistent. Immutable policies cannot be changed after the **DataReader** (p. 976) is enabled. **dds::sub::Subscriber::default_datareader_qos()** (p. 2417) can be used to set the QoS of the **DataReader** (p. 976) to match the current default DataReaderQos set in the **Subscriber** (p. 2410).

Exceptions

dds::core::ImmutablePolicyError *(p. 1609),or*	**dds::core::InconsistentPolicyError** (p. 1610).,

See also

dds::sub::qos::DataReaderQos (p. 1072) for rules on consistency among QoS

set_qos (abstract) (p. 1522)

Operations Allowed in Listener Callbacks (p. 1639)

8.53.3.25 operator<<()

```
template<typename T >
DataReader &  dds::sub::DataReader< T >::operator<< (
            const  dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Set the QoS associated with this reader.

Parameters

the_qos	the new qos for this **DataReader** (p. 976).

See also

qos(const dds::sub::qos::DataReaderQos& qos) (p. 1008)

8.53.3.26 operator>>() [4/4]

```
template<typename T >
DataReader &  dds::sub::DataReader< T >::operator>> (
              dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Get the QoS associated with this reader.

Parameters

the_qos	the object to populate with the qos for this DataWriter.

See also

qos() (p. 1007)

8.53.3.27 wait_for_historical_data()

```
template<typename T >
void  dds::sub::DataReader< T >::wait_for_historical_data (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits until all "historical" data is received for DataReaders that have a non-VOLATILE Durability Qos kind.

This operation is intended only for **dds::sub::DataReader** (p. 976) entities that have a non-VOLATILE Durability QoS kind.

As soon as an application enables a non-VOLATILE **dds::sub::DataReader** (p. 976), it will start receiving both "historical" data (i.e., the data that was written prior to the time the **dds::sub::DataReader** (p. 976) joined the domain) as well as any new data written by the **dds::pub::DataWriter** (p. 1138) entities. There are situations where the application logic may require the application to wait until all "historical" data is received. This is the purpose of the **dds::sub::DataReader::wait_for_historical_data** (p. 1009) operations.

dds::sub::DataReader::wait_for_historical_data() (p. 1009) blocks the calling thread until either all "historical" data is received, or until the duration specified by the max_wait parameter elapses, whichever happens first. It will return

immediately if no DataWriters have been discovered at the time the operation is called; therefore it is advisable to make sure at least one **dds::pub::DataWriter** (p. 1138) has been discovered before calling this operation. (One way to do this is by using **dds::sub::DataReader::subscription_matched_status** (p. 1012).)

A successful completion indicates that all the "historical" data was "received"; timing out indicates that max_wait elapsed before all the data was received.

Parameters

max_wait	<<***in***>> *(*p. *355)* Timeout value.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473) or **dds::core::NotEnabledError** (p. 1869).

8.53.3.28 liveliness_changed_status()

```
template<typename T >
dds::core::status::LivelinessChangedStatus dds::sub::DataReader< T >::liveliness_changed_status
( ) const [inline]
```

Get the LivelinessChangedStatus for this **DataReader** (p. 976).

See also

dds::core::status::LivelinessChangedStatus (p. 1652)

8.53.3.29 sample_rejected_status()

```
template<typename T >
dds::core::status::SampleRejectedStatus dds::sub::DataReader< T >::sample_rejected_status ( )
const [inline]
```

Get the SampleRejectedStatus for this **DataReader** (p. 976).

See also

dds::core::status::SampleRejectedStatus (p. 2315)

8.53.3.30 sample_lost_status()

```
template<typename T >
dds::core::status::SampleLostStatus dds::sub::DataReader< T >::sample_lost_status ( ) const
[inline]
```

Get the SampleLostStatus for this **DataReader** (p. 976).

See also

dds::core::status::SampleLostStatus (p. 2303)

8.53.3.31 requested_deadline_missed_status()

```
template<typename T >
dds::core::status::RequestedDeadlineMissedStatus dds::sub::DataReader< T >::requested_deadline↩
_missed_status ( ) [inline]
```

Get the RequestedDeadlineMissedStatus for this **DataReader** (p. 976).

See also

dds::core::status::RequestedDeadlineMissedStatus (p. 2184)

8.53.3.32 requested_incompatible_qos_status()

```
template<typename T >
dds::core::status::RequestedIncompatibleQosStatus dds::sub::DataReader< T >::requested_incompatible↩
_qos_status ( ) const [inline]
```

Get the RequestedIncompatibleQosStatus for this **DataReader** (p. 976).

See also

dds::core::status::RequestedIncompatibleQosStatus (p. 2185)

8.53.3.33 subscription_matched_status()

```
template<typename T >
dds::core::status::SubscriptionMatchedStatus dds::sub::DataReader< T >::subscription_matched_↩
status ( ) const [inline]
```

Get the SubscriptionMatchedStatus for this **DataReader** (p. 976).

See also

dds::core::status::SubscriptionMatchedStatus (p. 2439)

8.53.3.34 datareader_cache_status()

```
template<typename T >
rti::core::status::DataReaderCacheStatus datareader_cache_status ( ) const
```

<<***extension***>> *(p. 354)* Get the DataReaderCacheStatus for this **DataReader** (p. 976)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

See also

rti::core::status::DataReaderCacheStatus (p. 1046)

8.53.3.35 datareader_protocol_status()

```
template<typename T >
rti::core::status::DataReaderProtocolStatus datareader_protocol_status ( ) const
```

<<***extension***>> *(p. 354)* Get the DataReaderProtocolStatus for this **DataReader** (p. 976)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

See also

rti::core::status::DataReaderProtocolStatus (p. 1065)

8.53.3.36 matched_publication_datareader_protocol_status()

```
template<typename T >
rti::core::status::DataReaderProtocolStatus matched_publication_datareader_protocol_status (
            const  dds::core::InstanceHandle & publication_handle )
```

<<***extension***>> *(p. 354)* Get the DataReaderProtocolStatus for this **DataReader** (p. 976)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

See also

rti::core::status::DataReaderProtocolStatus (p. 1065)

8.53.3.37 acknowledge_all() [1/2]

```
template<typename T >
void acknowledge_all ( )
```

<<***extension***>> *(*p. *354)* Acknowledge all previously accessed samples

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) = **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **DataReader** (p. 976) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 2228) and **rti::core::RtpsReliableReaderProtocol::app_ack_period** (p. 2227).

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.53.3.38 acknowledge_all() [2/2]

```
template<typename T >
void acknowledge_all (
            const AckResponseData & response_data )
```

<<***extension***>> *(*p. *354)* Acknowledge all previously accessed samples

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) = **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **DataReader** (p. 976) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 2228) and **rti::core::RtpsReliableReaderProtocol::app_ack_period** (p. 2227).

The maximum length of the response is configured using **rti::core::policy::DataReaderResourceLimits::max_app_ack_response_length** (p. 1101).

Parameters

response_data	<<***in***>> *(*p. *355)* Response data sent to **dds::pub::DataWriter** (p. 1138) upon acknowledgment

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.53.3.39 acknowledge_sample() [1/2]

```
template<typename T >
void acknowledge_sample (
            const  dds::sub::SampleInfo & sample_info )
```

<<***extension***>> *(*p. *354)* Acknowledge a single sample explicitly

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) = **rti::core::policy::↩ AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **Data↩ Reader** (p. 976) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 2228) and **rti::core::RtpsReliableReader↩ Protocol::app_ack_period** (p. 2227).

Parameters

sample_info	<<***in***>> *(*p. *355)* **dds::sub::SampleInfo** (p. 2285) identifying the sample being acknowledged.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.53.3.40 acknowledge_sample() [2/2]

```
template<typename T >
void acknowledge_sample (
```

```
const  dds::sub::SampleInfo & sample_info,
const AckResponseData & response_data )
```

<<***extension***>> *(p. 354)* Acknowledge a single sample explicitly

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) = **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **DataReader** (p. 976) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 2228) and **rti::core::RtpsReliableReaderProtocol::app_ack_period** (p. 2227).

The maximum length of the response is configured using **rti::core::policy::DataReaderResourceLimits::max_app_ack_response_length** (p. 1101)

Parameters

sample_info	<<***in***>> *(p. 355)* **dds::sub::SampleInfo** (p. 2285) identifying the sample being acknowledged.
response_data	<<***in***>> *(p. 355)* Response data sent to **dds::pub::DataWriter** (p. 1138) upon acknowledgment (via **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207))

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.53.3.41 close_contained_entities()

```
template<typename T >
void close_contained_entities ( )
```

<<***extension***>> *(p. 354)* Closes all the entities created from this **DataReader** (p. 976)

Note

Calling this function explicitly is not necessary to close a **DataReader** (p. 976).

Deletes all contained **dds::sub::cond::ReadCondition** (p. 2133), **dds::sub::cond::QueryCondition** (p. 2059), and **rti::sub::TopicQuery** (p. 2516) objects.

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1941) if the any of the contained entities is in a state where it cannot be deleted.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::PreconditionNotMetError** (p. 1941)

8.53.3.42 read_noexcept()

```
template<typename T >
rti::core::Result< dds::sub::LoanedSamples< T > > read_noexcept ( ) [noexcept]
```

<<***extension***>> *(p. 354)* Alternative to **read()** (p. 996) that doesn't throw exceptions.

This operation behaves exactly like **read()** (p. 996) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Example:

```
// Call the extension function
auto result = reader->read_noexcept();
if (result.is_ok()) {
    for (const auto& sample : result.get()) {
        // ...
    }
}
```

Returns

A Result that contains the **LoanedSamples** (p. 1663) if the operation was succesful. When an error occurs, the Result contains the return code.

8.53.3.43 take_noexcept()

```
template<typename T >
rti::core::Result< dds::sub::LoanedSamples< T > > take_noexcept ( ) [noexcept]
```

<<***extension***>> *(p. 354)* Alternative to **take()** (p. 997) that doesn't throw exceptions.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation behaves exactly like **take()** (p. 997) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Example:

```
// Call the extension function
auto result = reader->take_noexcept();
if (result.is_ok()) {
    for (const auto& sample : result.get()) {
        // ...
    }
}
```

Returns

A Result that contains the **LoanedSamples** (p. 1663) if the operation was succesful. When an error occurs, the Result contains the return code.

8.53.3.44 read() [4/5]

```
template<typename T >
bool read (
            T & sample )
```

<<***extension***>> *(p. 354)* Copies the next not-previously-accessed valid data value from the **DataReader** (p. 976) via a read operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This function ignores **SampleInfo** (p. 2285) and therefore also skips samples with invalid data.

Parameters

sample	The sample where to copy the values of the next unread sample if the function returned true, or undefinded values otherwise.

Returns

True if there was an unread sample

See also

read(T& sample, dds::sub::SampleInfo& sample_info) (p. 1019)

8.53.3.45 read() [5/5]

```
template<typename T >
bool read (
            T & sample,
             dds::sub::SampleInfo & sample_info )
```

<<***extension***>> *(p. 354)* Copies the next not-previously-accessed data value from the **DataReader** (p. 976) via a read operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Returns

True if there was an unread sample

This operation copies the next not-previously-accessed data value from the **dds::sub::DataReader** (p. 976). This operation also copies the corresponding **dds::sub::SampleInfo** (p. 2285). The implied order among the samples stored in the **dds::sub::DataReader** (p. 976) is the same as for the **dds::sub::DataReader::read** (p. 996) operation.

The **dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1019) operation is semantically equivalent to the **dds::sub::DataReader::read** (p. 996) operation, where the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

Note

Calling **dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1019) from the **dds::sub::DataReaderListener::on_data_available()** (p. 1058) callback reads only one sample of potentially many samples in the reader queue, because **dds::sub::DataReaderListener::on_data_available()** (p. 1058) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1019) in a loop within the on_data_available callback until **dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1019) returns false . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use **dds::sub::DataReader::read** (p. 996) rather than **dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1019) in order to read more than one sample at a time.)

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869).

See also

dds::sub::DataReader::read (p. 996)

8.53.3.46 take() [4/5]

```
template<typename T >
bool take (
             T & sample )
```

<<***extension***>> *(p. 354)* Copies the next not-previously-accessed valid data value from the **DataReader** (p. 976) via a take operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This function ignores **SampleInfo** (p. 2285) and therefore also skips samples with invalid data.

Parameters

sample	The sample where to copy the values of the next unread sample if the function returned true, or undefinded values otherwise.

Returns

True if there was an unread sample to take. When this returns false, the argument is not modified.

Example:

```
Foo sample;
bool read_new_sample = reader.extensions().take(sample);
```

See also

take(T& sample, dds::sub::SampleInfo& sample_info) (p. 1021)

8.53.3.47 take() [5/5]

```
template<typename T >
bool take (
             T & sample,
              dds::sub::SampleInfo & sample_info )
```

<<***extension***>> *(p. 354)* Copies the next not-previously-accessed data value from the **DataReader** (p. 976) via a take operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation copies the next not-previously-accessed data value from the **dds::sub::DataReader** (p. 976) and 'removes' it from the **dds::sub::DataReader** (p. 976) so that it is no longer accessible. This operation also copies the corresponding **dds::sub::SampleInfo** (p. 2285). This operation is analogous to the **dds::sub::DataReader::read(↩ T& sample, dds::sub::SampleInfo& sample_info)** (p. 1019) except for the fact that the sample is removed from the **dds::sub::DataReader** (p. 976).

The **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1021) operation is semantically equivalent to the **dds::sub::DataReader::take** (p. 997) operation, where the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

Note

Calling **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1021) from the **dds::sub::DataReaderListener::on_data_available()** (p. 1058) callback retrieves only one sample of potentially many samples in the reader queue, because **dds::sub::DataReaderListener::on_data_available()** (p. 1058) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **dds↩ ::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1021) in a loop within the on↩ _data_available callback until **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1021) returns false . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use the **dds::sub::DataReader::take** (p. 997) rather than **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 1021) in order to take more than one sample at a time.)

Exceptions

One	of the **Standard Exceptions** (p. 428),

dds::core::NotEnabledError (p. 1869).

See also

dds::sub::DataReader::take (p. 997)

8.53.3.48 is_data_consistent() [1/2]

```
template<typename T >
bool is_data_consistent (
            const T & sample,
            const  dds::sub::SampleInfo & sample_info )
```

<<***extension***>> *(p. 354)* Checks if the sample has been overwritten by the DataWriter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Parameters

sample	**Sample** (p. 2270) to be validated
sample_info	**dds::sub::SampleInfo** (p. 2285) object received with the sample

See also

dds::sub::DataReader::is_data_consistent (p. 1022)

8.53.3.49 is_data_consistent() [2/2]

```
template<typename T >
bool is_data_consistent (
            const  rti::sub::LoanedSample< T > & sample )
```

<<***extension***>> *(p. 354)* Checks if the sample has been overwritten by the DataWriter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

When a sample is received via **Zero Copy transfer over shared memory** (p. 50), the sample can be reused by the DataWriter once it is removed from the DataWriter's send queue. Since there is no synchronization between the **DataReader** (p. 976) and the DataWriter, the sample could be overwritten by the DataWriter before it is processed by the **DataReader** (p. 976). The **dds::sub::DataReader::is_data_consistent** (p. 1022) operation can be used after processing the sample to check if it was overwritten by the DataWriter.

A precondition for using this operation is to set **rti::core::DataWriterShmemRefTransferModeSettings::enable_data_consistency_check** (p. 1252) to true.

Warning

This operation cannot be used when the data type is annotated with `@language_binding(FLAT_DATA)`. Reading a FlatData sample delivered with Zero Copy transfer over shared memory while the DataWriter is overwriting it is undefined behavior. An application-level synchronization mechanism is required in this case.

Parameters

sample	<<***in***>> *(p. 355)* **Sample** (p. 2270) to be validated

Returns

true if the sample is consistent (i.e., the sample has not been overwritten by the DataWriter)

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::PreconditionNotMetError** (p. 1941).

8.53.3.50 topic_name()

```
template<typename T >
const std::string & topic_name ( ) const
```

<<***extension***>> *(p. 354)* Get the topic name associated with this **DataReader** (p. 976)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.53.3.51 type_name()

```
template<typename T >
const std::string & type_name ( ) const
```

<<***extension***>> *(p. 354)* Get the type name associated with this **DataReader** (p. 976)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Examples

Foo.hpp.

8.53.3.52 close()

```
template<typename T >
void close ( )
```

Close this **DataReader** (p. 976).

8.53.4 Friends And Related Function Documentation

8.53.4.1 read()

```
template<typename T >
bool read (
            dds::sub::ReadModeDummyType  )  [related]
```

The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.

Usage:
```
reader » read » loaned_samples;
```

See also

dds::sub::DataReader::operator >>(bool(∗manipulator)(**ReadModeDummyType** (p. 2144)))

8.53.4.2 take()

```
template<typename T >
bool take (
              dds::sub::ReadModeDummyType  )  [related]
```

The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.

Usage:
```
reader » take » loaned_samples;
```

The default mode to access samples is to take, so the above is equivalent to:
```
reader » loaned_samples;
```

See also

dds::sub::DataReader::operator >>(bool(*manipulator)(**ReadModeDummyType** (p. 2144)))

8.53.4.3 max_samples()

```
template<typename T >
dds::sub::functors::MaxSamplesManipulatorFunctor max_samples (
             uint32_t n )  [related]
```

Stream manipulator to set the maximum number of samples to read or take.

Use this function to set the maximum number of samples to read/take by passing it to the **DataReader::operator >>(Functor f)** (p. 995) operator.

Parameters

n	The maximum number of samples to take

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

8.53.4.4 content()

```
template<typename T >
dds::sub::functors::ContentFilterManipulatorFunctor content (
             const  dds::sub::Query & query )  [related]
```

Stream manipulator to set a **Query** (p. 2053) to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the **Query** (p. 2053)'s expression. If the **DataReader** (p. 976) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the condition(const dds::sub::cond::QueryCondition& query_condition) manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **condition()** (p. 1026), then the previously set QueryCondition will be cleared.

Parameters

query	The **Query** (p. 2053) to use during the read/take

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

dds::sub::condition(const dds::sub::cond::QueryCondition& query_condition)

8.53.4.5 condition()

```
template<typename T >
dds::sub::functors::ConditionManipulatorFunctor condition (
             const  dds::sub::cond::ReadCondition & condition )  [related]
```

Stream manipulator to set a QueryCondition to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the Query↩ Conditions's expression and state. If the **DataReader** (p. 976) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the **content(const dds::sub::Query& query)** (p. 1025) manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **content()** (p. 1025) and/or **state(const dds::sub::status::DataState& s)** (p. 1027), then the previously set **Query** (p. 2053) and DataState will be cleared.

This manipulator is effectively a combination of the content and state manipulators.

For example:
```
reader » read
       » content(dds::sub::Query(system.reader, "foo = 7"))
       » state(dds::sub::status::DataState::new_data())
       » samples;
```

is equivalent to:
```
reader » read
       » condition(Query(system.reader, "foo = 7"), DataState()::new_data())
       » samples;
```

Parameters

condition	The QueryCondition to use during the read/take

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

content(const dds::sub::Query& query) (p. 1025)

References **dds::sub::condition()**.

8.53.4.6 state()

```
template<typename T >
dds::sub::functors::StateFilterManipulatorFunctor state (
             const  dds::sub::status::DataState & s )  [related]
```

Stream manipulator to specify the DataState of the samples that should be read/taken.

By setting the **dds::sub::status::DataState** (p. 1118) you can specify the state of the samples that should be read or taken. The DataState of a sample encapsulates the **dds::sub::status::SampleState** (p. 2316), **dds::sub::status::ViewState** (p. 2614), and **dds::sub::status::InstanceState** (p. 1615) of a sample.

If this stream manipulator comes before a call to the condition(const dds::sub::cond::QueryCondition& query_condition) manipulator then it will be overridden and will not have any effect on the read or take operation.

Parameters

s	The DataState of the samples to be read or taken

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

8.53.4.7 instance()

```
template<typename T >
dds::sub::functors::InstanceManipulatorFunctor instance (
            const  dds::core::InstanceHandle & h )  [related]
```

Stream manipulator to specify the instance whose samples should be read or taken.

This operation causes the subsequent read or take operation to access only samples belonging the single specified instance whose handle is `h`.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **SampleInfo** (p. 2285) verifies **SampleInfo.instance_handle()** (p. 2290) == `h`.

The subsequent read/take operation will be semantically equivalent to a read or take without specifying the instance, except in building the collection, the **DataReader** (p. 976) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The subsequent read/take may operation may fail with **dds::core::InvalidArgumentError** (p. 1619) if the Instance↩ Handle does not correspond to an existing data-object known to the **DataReader** (p. 976).

Parameters

h	The handle of the instance to access

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

8.53.4.8 next_instance()

```
template<typename T >
dds::sub::functors::NextInstanceManipulatorFunctor next_instance (
            const  dds::core::InstanceHandle & h )  [related]
```

Stream manipulator to specify the samples belonging to the 'next' instance after the provided instance handle should be accessed.

This operation causes the subsequent read or take operation to access only samples belonging a single instance whose handle is considered 'next' after the provided InstanceHandle `h`.

The accessed samples will all belong to the 'next' instance with InstanceHandle 'greater' than the specified previous handle that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the **dds::sub::DataReader** (p. 976). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of **dds::sub::DataReader::Selector::next_instance** (p. 2322) is 'as if' the **dds::sub::DataReader** (p. 976) invoked **dds::sub::instance(const dds::core::InstanceHandle& h)** (p. 665), passing the smallest instance_handle among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **dds::core::InstanceHandle::nil()** (p. 1614) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle` == **dds::core::InstanceHandle::nil()** (p. 1614) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation **dds::sub::DataReader::Selector::next_instance** (p. 2322) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle` == **dds::core::InstanceHandle::nil()** (p. 1614), examines the samples returned, and then uses the `instance_handle` returned in the **dds::sub::SampleInfo** (p. 2285) as the value of the `previous_handle` argument to the next call to **dds::sub::DataReader::Selector::next_instance** (p. 2322). The iteration continues until the read/take operation doesn't return any more samples. This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the **dds::sub::DataReader::Selector::next_instance** (p. 2322) operation with a `previous_handle` that does not correspond to an instance currently managed by the **dds::sub::DataReader** (p. 976). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the **dds::sub::DataReader** (p. 976). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

Parameters

h	The reference instance. The instance after this one will be selected

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

8.53.4.9 ignore() [1/2]

```
template<typename T >
void ignore (
              dds::domain::DomainParticipant & participant,
             const  dds::core::InstanceHandle & handle )  [related]
```

Instructs RTI Connext to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the **dds::sub::Subscriber** (p. 2410) (see **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)). After this call, any data received related to that subscription's **dds::sub::DataReader** (p. 976) will be ignored.

This operation can be used to ignore local *and* remote DataReaders.

The subscription to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataReader** (p. 976), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 2285) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 976) for the subscription topic.

- To ignore a *local* **DataReader** (p. 976), the `handle` can be obtained by calling **dds::core::Entity::instance_handle()** (p. 1525) for the local **DataReader** (p. 976).

There is no way to reverse this operation.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::SubscriptionBuiltinTopicData (p. 2428)

dds::topic::subscription_topic_name() (p. 444)

dds::sub::builtin_subscriber (p. 671)

Parameters

participant	The DomainParticipant for which the remote entity will be ignored
handle	The InstanceHandle of the remote entity that has to be ignored

8.53.4.10 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
              dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             FwdIterator end )  [related]
```

Instructs RTI Connext to locally ignore subscriptions.

Parameters

participant	The DomainParticipant for which the remote entity will be ignored
begin	A forward iterator to the initial position in a **dds::core::InstanceHandleSeq** (p. 619) holding the handles to the remote DataReaders to be ignored.
end	A forward iterator to the final position in a **dds::core::InstanceHandleSeq** (p. 619) holding the handles to the remote DataReaders to be ignored.

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 1030);

References **dds::sub::begin()**, **dds::sub::end()**, and **dds::sub::ignore()**.

8.53.4.11 matched_publications() [1/2]

```
template<typename T >
const  ::dds::core::InstanceHandleSeq matched_publications (
             const  dds::sub::DataReader< T > & reader )  [related]
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 976).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2474).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1326) has not indicated that the publication's **dds::domain::DomainParticipant** (p. 1326) should be "ignored" by means of the **dds::pub::ignore** (p. 647) API.

- If the subscription is using a **dds::topic::ContentFilteredTopic** (p. 954) and the publication is using the **rti::core::policy::MultiChannel** (p. 1749), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **dds::pub::DataWriter** (p. 1138) entities. These handles match the ones that appear in the `instance_handle` field of the **dds::sub::SampleInfo** (p. 2285) when reading the **dds::topic::publication_topic_name()** (p. 443) builtin topic.

This API may return the publication handles of publications that are not alive. **dds::sub::DataReader::is_matched_publication_alive** (p. 1035) can be used to check the liveliness of the remote publication.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::OutOfResourcesError** (p. 1898) if the sequence is too small and the system cannot resize it, or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to

Parameters

reader	The reader whose publications are being retrieved

Returns

An InstanceHandleSeq containing the InstanceHandles of the matched publications for the provided **DataReader** (p. 976)

8.53.4.12 matched_publications() [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_publications (
             const  dds::sub::DataReader< T > & reader,
             FwdIterator begin,
             FwdIterator end )  [related]
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 976).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2474).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1326) has not indicated that the publication's **dds::domain::DomainParticipant** (p. 1326) should be "ignored" by means of the **dds::pub::ignore** (p. 647) API.
- If the subscription is using a **dds::topic::ContentFilteredTopic** (p. 954) and the publication is using the **rti::core::policy::MultiChannel** (p. 1749), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **dds::pub::DataWriter** (p. 1138) entities. These handles match the ones that appear in the `instance_handle` field of the **dds::sub::SampleInfo** (p. 2285) when reading the **dds::topic::publication_topic_name()** (p. 443) builtin topic.

This API may return the publication handles of publications that are not alive. **dds::sub::DataReader::is_matched_publication_alive** (p. 1035) can be used to check the liveliness of the remote publication.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::OutOfResourcesError** (p. 1898) if the sequence is too small and the system cannot resize it, or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to
FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

Parameters

reader	The reader whose publications are being retrieved
begin	A forward iterator to the beginning position in the destination container of matching InstanceHandles
end	A forward iterator to the ending position in the destination container of matching InstanceHandles

Returns

An iterator placed at the last position in the container where a InstanceHandle was inserted

References **dds::sub::begin()**, **dds::sub::end()**, and **dds::sub::matched_publications()**.

8.53.4.13 matched_publication_data() [1/2]

```
template<typename T >
const  dds::topic::PublicationBuiltinTopicData matched_publication_data (
             const  dds::sub::DataReader< T > & reader,
             const  dds::core::InstanceHandle & handle )  [related]
```

This operation retrieves the information on a publication that is currently "associated" with the **DataReader** (p. 976).

The publication_handle must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 976). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). Use the operation **dds::sub::matched_publications** (p. 668) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 976).

Note: This operation does not retrieve the **dds::topic::PublicationBuiltinTopicData::type** (p. 1985). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 1058) (if a reader listener is installed on the dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData>).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to

Parameters

reader	The reader associated with the publication whose data is being retrieved
handle	The InstanceHandle Handle to a specific publication associated with the DataWriter. Must correspond to a publication currently associated with the **DataReader** (p. 976).

Returns

The **dds::topic::PublicationBuiltinTopicData** (p. 1977) of the publication that is associated with the provided handle

8.53.4.14 matched_publication_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData matched_publication_participant_data (
             const  dds::sub::DataReader< T > & reader,
             const  dds::core::InstanceHandle & handle )  [related]
```

<<***extension***>> *(p. 354)* This operation retrieves the information on the discovered **dds::domain::DomainParticipant** (p. 1326) associated with the publication that is currently matching with the **dds::sub::DataReader** (p. 976).

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

The `publication_handle` must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 976). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1941) if the publication corresponds to the same **dds::domain::DomainParticipant** (p. 1326) that the **DataReader** (p. 976) belongs to. Use the operation **dds::sub::matched_publications** (p. 668) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 976).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to

Parameters

reader	The reader to lookup the matched participant data of
handle	The InstanceHandle to a specific publication. Must correspond to a publication currently associated with the **DataReader** (p. 976). This handle is available in the **dds::sub::SampleInfo::publication_handle()** (p. 2290)

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1908) of the DomainParticipant of a matched publication of a **dds::sub::DataReader** (p. 976)

8.53.4.15 is_matched_publication_alive()

```
template<typename T >
bool is_matched_publication_alive (
            const  dds::sub::DataReader< T > & reader,
            const  dds::core::InstanceHandle & handle )  [related]
```

<<***extension***>> *(p. 354)* Check if a matched publication is alive.

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to.

Parameters

reader	The **DataReader** (p. 976).
handle	The **dds::core::InstanceHandle** (p. 1612) of the matched publication.

This API is used for querying the endpoint liveliness of a matched publication. A matched publication will be marked as not alive if the liveliness that it committed to through its **LIVELINESS** (p. 535) QoS policy was not respected. Note that if the participant associated with the matched publication loses liveliness, the **dds::core::InstanceHandle** (p. 1612) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1619).

of the matched publication. See **dds::sub::matched_publications** (p. 668) for a description of what is considered a matched publication.

Exceptions

One	of the **Standard Exceptions** (p. 428)

Returns

A boolean indicating whether or not the matched publication is alive.

8.53.4.16 matched_publication_data() [2/2]

```
template<typename T >
std::vector<  dds::topic::PublicationBuiltinTopicData > matched_publication_data (
             const  dds::sub::DataReader< T > & reader )  [related]
```

<<***extension***>> *(p. 354)* Obtain the PublicationBuiltinTopicData for all of the publications matched with a **DataReader** (p. 976).

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

This API retrieves the matched subscription data from all of the publications currently matched a **DataReader** (p. 976).

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to.

Parameters

reader	The **DataReader** (p. 976).

Returns

A std::vector containing all of the matched publication data.

8.53.4.17 find() [1/4]

```
template<typename Reader , typename FwdIterator >
uint32_t find (
             const  dds::sub::Subscriber & subscriber,
             RTI_STRING_IN topic_name,
             FwdIterator begin,
             uint32_t max_size )  [related]
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2410) (**Built-in Topics** (p. 46)) to access the built-in **dds::sub::DataReader** (p. 976) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 976) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 976) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 976) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 976) before the **dds::domain::DomainParticipant** (p. 1326) is enabled. Looking up builtin **dds::sub::DataReader** (p. 976) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 976) (see **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1326).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 671).
- Call **dds::sub::find()** (p. 672).
- Call **enable()** (p. 1524) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 976) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 976) is attached to the **dds::sub::Subscriber** (p. 2410), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 976) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 976).

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
FwdIterator	The type of forward iterator passed to this function

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the **DataReader** (p. 976) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataReader** (p. 976) that is to be looked up.
begin	A forward iterator to the position in the destination container where the DataReaders will be copied into
max_size	Only 1 **DataReader** (p. 976) will be returned from this function

Returns

The number of DataReaders that were found (either 0 or 1)

References **dds::sub::begin()**.

8.53.4.18 find() [2/4]

```
template<typename Reader , typename BinIterator >
uint32_t find (
             const  dds::sub::Subscriber & subscriber,
             RTI_STRING_IN topic_name,
             BinIterator begin )  [related]
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2410) (**Built-in Topics** (p. 46)) to access the built-in **dds::sub::DataReader** (p. 976) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 976) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 976) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 976) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 976) before the **dds::domain::DomainParticipant** (p. 1326) is enabled. Looking up builtin **dds::sub::DataReader** (p. 976) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 976) (see **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1326).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 671).
- Call **dds::sub::find()** (p. 672).
- Call **enable()** (p. 1524) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 976) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 976) is attached to the **dds::sub::Subscriber** (p. 2410), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 976) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 976).

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
BinIterator	The type of back-inserting iterator passed to this function

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the **DataReader** (p. 976) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataReader** (p. 976) that is to be looked up.
begin	A back-inserting iterator to the position in the destination container to insert the found **DataReader** (p. 976) into

Returns

The number of DataReaders that were found (either 0 or 1)

References **dds::sub::begin()**.

8.53.4.19 find() [3/4]

```
template<typename READER , typename T , typename FwdIterator >
uint32_t find (
            const  dds::sub::Subscriber & subscriber,
```

```
            const  dds::topic::TopicDescription< T > & topic_description,
            FwdIterator begin,
            uint32_t max_size )  [related]
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching TopicDescription.

8.53.4.21 find_datareaders() [1/2]

```
template<typename AnyDataReaderBackInsertIterator >
uint32_t find_datareaders (
             dds::sub::Subscriber subscriber,
            AnyDataReaderBackInsertIterator begin )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all the **dds::sub::DataReader** (p. 976) created from this **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderBackInsertIterator	Type of the back-inserting iterator passed into this function, whose value_type must be **dds::sub::AnyDataReader** (p. 807).

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the DataReaders belong to
begin	A back-inserting iterator to the position in the destination container to insert the found DataReaders into

Returns

The number of found DataReaders

See also

Looking up DataReaders (p. 322)

References **rti::sub::begin()**.

8.53.4.22 find_datareaders() [2/2]

```
template<typename AnyDataReaderForwardIterator >
uint32_t find_datareaders (
             dds::sub::Subscriber subscriber,
            AnyDataReaderForwardIterator begin,
            uint32_t max_size )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all the readers created from a subscriber.

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderForwardIterator	A forward iterator whose `value_type` is **dds::sub::AnyDataReader** (p. 807)

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the readers belong to
begin	A forward iterator to the position in the destination container where to begin copying the found readers into.

Parameters

max_size	The maximum number of readers to return

Returns

The number of found readers

See also

Looking up DataReaders (p. 322)

References **rti::sub::begin()**.

8.53.4.23 find_datareader_by_topic_name()

```
template<typename Reader >
Reader find_datareader_by_topic_name (
              dds::sub::Subscriber subscriber,
             const std::string & topic_name )  [related]
```

<<***extension***>> *(*p. *354)* Retrieves a **dds::sub::DataReader** (p. 976) with the given topic name within the **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Use this operation on the built-in **dds::sub::Subscriber** (p. 2410) (**Built-in Topics** (p. 46)) to access the built-in **dds::sub::DataReader** (p. 976) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 976) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 976) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 976) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 976) before the **dds::domain::DomainParticipant** (p. 1326) is enabled. Looking up builtin **dds::sub::DataReader** (p. 976) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 976) (see **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1326).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 671).
- Call **dds::sub::find()** (p. 672).
- Call **enable()** (p. 1524) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 976) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 976) is attached to the **dds::sub::Subscriber** (p. 2410), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 976) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 976).

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) that created the **DataReader** (p. 976) to find
topic_name	Topic name of the **DataReader** (p. 976) to find

Returns

The **DataReader** (p. 976) with the given topic name, or **dds::core::null** (p. 438) if it doesn't exist

See also

Looking up DataReaders (p. 322)

References **dds::core::null**.

8.53.4.24 find_datareader_by_name() [1/2]

```
template<typename Reader >
Reader find_datareader_by_name (
             dds::sub::Subscriber subscriber,
            const std::string & datareader_name )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) with the given name within the **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Every **dds::sub::DataReader** (p. 976) in the system has an entity name which is configured and stored in the <<***extension***>> *(p. 354)* EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves the **dds::sub::DataReader** (p. 976) within the **dds::sub::Subscriber** (p. 2410) whose name matches the one specified. If there are several **dds::sub::DataReader** (p. 976) with the same name within the **dds::sub::Subscriber** (p. 2410), the operation returns the first matching occurrence.

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) that created the **DataReader** (p. 976) to find
datareader_name	Entity name of the **DataReader** (p. 976) to find

Returns

The **DataReader** (p. 976) with the given name, or **dds::core::null** (p. 438) if it doesn't exist

See also

Looking up DataReaders (p. 322)

References **dds::core::null**.

8.53.4.25 find_datareader_by_topic_description()

```
template<typename Reader , typename T >
Reader find_datareader_by_topic_description (
            const  dds::sub::Subscriber & subscriber,
            const  dds::topic::TopicDescription< T > & topic_description )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) with the given TopicDescription within the **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

Reader	The type of the reader returned, for example, dds::sub::DataReader<Foo>, or **dds::sub::AnyDataReader** (p. 807)
T	The topic-type

Parameters

Parameters

subscriber	The **Subscriber** (p. 2410) to which the **DataReader** (p. 976) belongs
topic_description	The TopicDescription identifying the **DataReader** (p. 976) to find

Returns

The found **DataReader** (p. 976), or **dds::core::null** (p. 438) if it doesn't exist

References **dds::core::null**.

8.53.4.26 find_datareader_by_name() [2/2]

```
template<typename Reader >
Reader find_datareader_by_name (
              dds::domain::DomainParticipant participant,
             const std::string & datareader_name )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) within the **dds::domain::DomainParticipant** (p. 1326) with the given name

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Every **dds::sub::DataReader** (p. 976) in the system has an entity name which is configured and stored in the Entity↩ Name policy, **ENTITY_NAME** (p. 532).

Every **dds::sub::Subscriber** (p. 2410) in the system has an entity name which is also configured and stored in the EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves a **dds::sub::DataReader** (p. 976) within a **dds::sub::Subscriber** (p. 2410) given the specified name which encodes both to the **dds::sub::DataReader** (p. 976) and the **dds::sub::Subscriber** (p. 2410) name.

If there are several **dds::sub::DataReader** (p. 976) with the same name within the corresponding **dds::sub::Subscriber** (p. 2410) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::sub::Subscriber** (p. 2410) to which the **dds::sub::Data↩ Reader** (p. 976) belongs and the entity name of of the **dds::sub::DataReader** (p. 976) itself, separated by a double colon "::". For example: MySubscriberName::MyDataReaderName

The plain name contains the **dds::sub::DataReader** (p. 976) name only. In this situation it is implied that the **dds::sub↩ ::DataReader** (p. 976) belongs to the implicit **dds::sub::Subscriber** (p. 2410) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::sub::Subscriber** (p. 2410) name part being "implicit". For example: the plain name "MyDataReaderName" is equivalent to specifiying the fully qualified name "implicit::MyDataReaderName"

The **dds::sub::DataReader** (p. 976) is only looked up within the **dds::sub::Subscriber** (p. 2410) specified in the fully qualified name, or within the implicit **dds::sub::Subscriber** (p. 2410) if the name was not fully qualified.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) within which the **dds::sub::DataReader** (p. 976) exists
datareader_name	EntityName of the **DataReader** (p. 976) to find

Returns

The first reader with the given name or **dds::core::null** (p. 438) if it is not found.

  *The number of samples expired by the DataReader due to **dds::core::policy::Lifespan** (p. 1635) or the autopurge sample delays.*

- int64_t **virtual_duplicate_dropped_sample_count** () const

  The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

- int64_t **replaced_dropped_sample_count** () const

  *The number of samples replaced by the DataReader due to **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607) replacement.*

- int64_t **writer_removed_batch_sample_dropped_sample_count** () const

  The number of batch samples received by the DataReader that were marked as removed by the DataWriter.

- int64_t **total_samples_dropped_by_instance_replacement** () const

  *The number of samples with sample state **dds::sub::status::SampleState::not_read()** (p. 2318) that were dropped when removing an instance due to instance replacement. See **rti::core::policy::DataReaderResourceLimits::instance_replacement** (p. 1106) for more details about when instances are replaced.*

- int64_t **alive_instance_count** () const

  *The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState::alive()** (p. 1617).*

- int64_t **alive_instance_count_peak** () const

  *The highest value of **rti::core::status::DataReaderCacheStatus::alive_instance_count** (p. 1051) over the lifetime of the DataReader.*

- int64_t **no_writers_instance_count** () const

  *The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617).*

- int64_t **no_writers_instance_count_peak** () const

  *The highest value of **rti::core::status::DataReaderCacheStatus::no_writers_instance_count** (p. 1051) over the lifetime of the DataReader.*

- int64_t **disposed_instance_count** () const

  *The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).*

- int64_t **disposed_instance_count_peak** () const

  *The highest value of **rti::core::status::DataReaderCacheStatus::disposed_instance_count** (p. 1052) over the lifetime of the DataReader.*

- int64_t **detached_instance_count** () const

  The number of minimal instance states currently being maintained in the DataReader's queue.

- int64_t **detached_instance_count_peak** () const

  *The highest value of **rti::core::status::DataReaderCacheStatus::detached_instance_count** (p. 1052) over the lifetime of the DataReader.*

- int64_t **compressed_sample_count** () const

  The number of received samples compressed by a DataWriter.

8.54.1 Detailed Description

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::datareader_cache()** (p. 2386)

Entity:

dds::sub::DataReader (p. 976)

8.54.2 Member Function Documentation

8.54.2.1 sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::sample_count ( ) const  [inline]
```

The number of samples in the reader's queue.

includes samples that may not yet be available to be read or taken by the user, due to samples being received out of order or **PRESENTATION** (p. 540)

8.54.2.2 sample_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::sample_count_peak ( ) const  [inline]
```

The highest number of samples in the reader's queue over the lifetime of the reader.

8.54.2.3 old_source_timestamp_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::old_source_timestamp_dropped_sample_count ( )
const  [inline]
```

The number of samples dropped as a result of receiving a sample older than the last one, using **dds::core::policy::↩ DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264).

When the DataReader is using **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264):

- If the DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped.
- If the DataReader receives a sample for an instance with a source timestamp that is equal to the last source timestamp received for the instance and the writer has a higher virtual GUID, the sample is dropped.

8.54.2.4 tolerance_source_timestamp_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::tolerance_source_timestamp_dropped_sample_count
( ) const  [inline]
```

The number of samples dropped as a result of receiving a sample in the future, using **dds::core::policy::Destination↩ OrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264).

When the DataReader is using **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264): the DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than the source_timestamp_tolerance. Otherwise, the sample is dropped.

8.54.2.5 ownership_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::ownership_dropped_sample_count ( ) const  [inline]
```

The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.

When using Exclusive Ownership, the DataReader receives data from multiple DataWriters. Each instance can only be owned by one DataWriter.

If other DataWriters write samples on this instance, the samples will be dropped.

8.54.2.6 content_filter_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::content_filter_dropped_sample_count ( ) const
[inline]
```

The number of user samples filtered by the DataReader due to Content-Filtered Topics.

When using a content filter on the DataReader side, if the sample received by the DataReader does not pass the filter, it will be dropped.

8.54.2.7 time_based_filter_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::time_based_filter_dropped_sample_count ( ) const
[inline]
```

The number of user samples filtered by the DataReader due to **dds::core::policy::TimeBasedFilter** (p. 2469).

When using **TIME_BASED_FILTER** (p. 547) on the DataReader side, if the sample received by the DataReader does not pass the minimum_separation filter, it will be dropped.

8.54.2.8 expired_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::expired_dropped_sample_count ( ) const  [inline]
```

The number of samples expired by the DataReader due to **dds::core::policy::Lifespan** (p. 1635) or the autopurge sample delays.

- **dds::core::policy::Lifespan** (p. 1635)
  When a sample expires due to **dds::core::policy::Lifespan** (p. 1635), the data is removed from the DataReader caches. This sample will be considered dropped if its **dds::sub::status::SampleState** (p. 2316) was **dds::sub↩ ::status::SampleState::not_read()** (p. 2318).
- **dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay** (p. 2140)
  When a sample expires due to **dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay** (p. 2140), this sample will be considered dropped if its **dds::sub::status::SampleState** (p. 2316) was **dds::sub↩ ::status::SampleState::not_read()** (p. 2318).
- **dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay** (p. 2141)
  When a sample expires due to **dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_↩ delay** (p. 2141), this sample will be considered dropped if its **dds::sub::status::SampleState** (p. 2316) was **dds↩ ::sub::status::SampleState::not_read()** (p. 2318).

8.54.2.9 virtual_duplicate_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::virtual_duplicate_dropped_sample_count ( ) const
[inline]
```

The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

When two DataWriters with the same logical data source publish a sample with the same sequence_number, one sample will be dropped and the other will be received by the DataReader.

This can happen when multiple writers are writing on behalf of the same original DataWriter: for example, in systems with redundant Routing Services or when a DataReader is receiving samples both directly from the original DataWriter and from an instance of Persistence Service.

8.54.2.10 replaced_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::replaced_dropped_sample_count ( ) const  [inline]
```

The number of samples replaced by the DataReader due to **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607) replacement.

When the number of samples for an instance in the queue reaches the **dds::core::policy::History::depth** (p. 1605) value, a new sample for the instance will replace the oldest sample for the instance in the queue.

The new sample will be accepted and the old sample will be dropped.

This counter will only be updated if the replaced sample's **dds::sub::status::SampleState** (p. 2316) was **dds::sub↩ ::status::SampleState::not_read()** (p. 2318).

8.54.2.11 writer_removed_batch_sample_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::writer_removed_batch_sample_dropped_sample_count
( ) const  [inline]
```

The number of batch samples received by the DataReader that were marked as removed by the DataWriter.

When the DataReader receives a batch, the batch can contain samples marked as removed by the DataWriter. Examples of removed samples in a batch could be because of sample replacement due to **dds::core::policy::History↩ Kind_def::KEEP_LAST** (p. 1607) **dds::core::policy::History** (p. 1602) QoS on the DataWriter or because the duration in **dds::core::policy::Lifespan** (p. 1635) was reached. By default, any sample marked as removed from a batch is dropped (unless you set the dds.data_reader.accept_writer_removed_batch_samples property in the **rti::core↩ ::policy::Property** (p. 1969) to true). Note: Historical data with removed batch samples written before the DataReader joined the DDS domain will also be included in the count.

8.54.2.12 total_samples_dropped_by_instance_replacement()

```
int64_t rti::core::status::DataReaderCacheStatus::total_samples_dropped_by_instance_replacement (
) const  [inline]
```

The number of samples with sample state **dds::sub::status::SampleState::not_read()** (p. 2318) that were dropped when removing an instance due to instance replacement. See **rti::core::policy::DataReaderResourceLimits↩ ::instance_replacement** (p. 1106) for more details about when instances are replaced.

8.54.2.13 alive_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::alive_instance_count ( ) const  [inline]
```

The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState↩ ::alive()** (p. 1617).

8.54.2.14 alive_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::alive_instance_count_peak ( ) const  [inline]
```

The highest value of **rti::core::status::DataReaderCacheStatus::alive_instance_count** (p. 1051) over the lifetime of the DataReader.

See also

rti::core::status::DataReaderCacheStatus::alive_instance_count (p. 1051)

8.54.2.15 no_writers_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::no_writers_instance_count ( ) const  [inline]
```

The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState↩ ::not_alive_no_writers()** (p. 1617).

8.54.2.16 no_writers_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::no_writers_instance_count_peak ( ) const  [inline]
```

The highest value of **rti::core::status::DataReaderCacheStatus::no_writers_instance_count** (p. 1051) over the lifetime of the DataReader.

See also

rti::core::status::DataReaderCacheStatus::no_writers_instance_count (p. 1051)

8.54.2.17 disposed_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::disposed_instance_count ( ) const  [inline]
```

The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState↩ ::not_alive_disposed()** (p. 1617).

8.54.2.18 disposed_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::disposed_instance_count_peak ( ) const  [inline]
```

The highest value of **rti::core::status::DataReaderCacheStatus::disposed_instance_count** (p. 1052) over the lifetime of the DataReader.

See also

rti::core::status::DataReaderCacheStatus::disposed_instance_count (p. 1052)

8.54.2.19 detached_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::detached_instance_count ( ) const  [inline]
```

The number of minimal instance states currently being maintained in the DataReader's queue.

If **rti::core::policy::DataReaderResourceLimits::keep_minimum_state_for_instances** (p. 1101) is true, the DataReader will keep up to a maximum of **rti::core::policy::DataReaderResourceLimits::max_total_instances** (p. 1096) detached instances in its queue. For a more in-depth description of detached instances, refer to **rti::core::policy::DataReaderResourceLimits::max_total_instances** (p. 1096).

8.54.2.20 detached_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::detached_instance_count_peak ( ) const  [inline]
```

The highest value of **rti::core::status::DataReaderCacheStatus::detached_instance_count** (p. 1052) over the lifetime of the DataReader.

See also

rti::core::status::DataReaderCacheStatus::detached_instance_count (p. 1052)

8.54.2.21 compressed_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::compressed_sample_count ( ) const  [inline]
```

The number of received samples compressed by a DataWriter.

These include data, dispose, and unregister samples sent by a DataWriter.

8.55 rti::core::policy::DataReaderInstanceRemovalKind_def Struct Reference

Sets the kinds of instances that can be replaced when instance resource limits (**dds::core::policy::ResourceLimits::max_instances** (p. 2206)) are reached.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  NO_INSTANCE ,
  EMPTY_INSTANCES ,
  FULLY_PROCESSED_INSTANCES ,
  ANY_INSTANCE }

  The underlying `enum` *type.*

8.55.1 Detailed Description

Sets the kinds of instances that can be replaced when instance resource limits (**dds::core::policy::ResourceLimits↩ ::max_instances** (p. 2206)) are reached.

See also

rti::core::policy::DataReaderResourceLimits::instance_replacement (p. 1106)

8.55.2 Member Enumeration Documentation

8.55.2.1 type

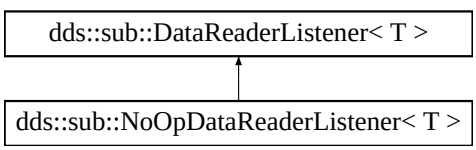
`enum` **rti::core::policy::DataReaderInstanceRemovalKind_def::type**

The underlying `enum` type.

Enumerator

NO_INSTANCE	No instance can be removed. If an instance resource is required because **dds::core::policy::ResourceLimits::max_instances** (p. 2206) is reached, this setting will disallow instances from being replaced. Samples for new instances will be dropped and reported as lost with reason **rti::core::status::SampleLostState::lost_by_instances_limit()** (p. 2299).
EMPTY_INSTANCES	Only empty instances can be removed. Instances can be replaced only if they are empty. An instance is considered empty when all samples have been taken or removed from the DataReader queue due to the **dds::core::policy::Lifespan** (p. 1635) or sample purging due to the **dds::core::policy::ReaderDataLifecycle** (p. 2137), and there are no outstanding loans on any of the instance's samples.

Enumerator



FULLY_PROCESSED_INSTANCES	Only fully-processed instances can be removed. An instance is considered fully processed if every sample for the instance has been processed by the application. A sample is considered processed by the application depending on the **dds::core::policy::Reliability::kind** (p. 2153): • **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) (depends on the **rti::core::policy::AcknowledgmentKind_def** (p. 797)): – **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 797) or **rti::core::policy::AcknowledgmentKind_def::↩ APPLICATION_AUTO** (p. 798): The sample is considered processed when it has been read or taken by the application and return_loan has been called. – **rti::core::policy::AcknowledgmentKind_def::↩ APPLICATION_EXPLICIT** (p. 798): The sample is considered processed when the subscribing application has explicitly acknowledged the DDS sample, the AppAckConf has been received, and the application has called return_loan. • **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157): All samples are considered processed when they have been read or taken by the application and return_loan has been called.
ANY_INSTANCE	Any instance can be removed. Instances can be replaced regardless of whether the subscribing application has processed all of the samples. Samples that have not been processed will be removed.

8.56 dds::sub::DataReaderListener< T > Class Template Reference

The **Listener** (p. 1637) to notify status changes for a **dds::sub::DataReader** (p. 976).

8.56.1 Detailed Description

template<typename T>
class dds::sub::DataReaderListener< T >

The **Listener** (p. 1637) to notify status changes for a **dds::sub::DataReader** (p. 976).

Entity:

dds::sub::DataReader (p. 976)

Status:

dds::core::status::StatusMask::data_available() (p. 2383);
dds::core::status::StatusMask::liveliness_changed() (p. 2383), **dds::core::status::LivelinessChangedStatus** (p. 1652);
dds::core::status::StatusMask::requested_deadline_missed() (p. 2380), **dds::core::status::RequestedDeadlineMissedStatus** (p. 2184);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2381), **dds::core::status::RequestedIncompatibleQosStatus** (p. 2185);
dds::core::status::StatusMask::sample_lost() (p. 2381), **dds::core::status::SampleLostStatus** (p. 2303);
dds::core::status::StatusMask::sample_rejected() (p. 2382), **dds::core::status::SampleRejectedStatus** (p. 2315);
dds::core::status::StatusMask::subscription_matched() (p. 2384), **dds::core::status::SubscriptionMatchedStatus** (p. 2439);

8.56.2 Member Function Documentation

8.56.2.1 on_requested_deadline_missed()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_requested_deadline_missed (
              DataReader< T > & reader,
             const  dds::core::status::RequestedDeadlineMissedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::RequestedDeadlineMissedStatus** (p. 2184) status.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1839), and **dds::sub::NoOpDataReaderListener< T >** (p. 1839).

8.56.2.2 on_requested_incompatible_qos()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_requested_incompatible_qos (
              DataReader< T > & reader,
             const  dds::core::status::RequestedIncompatibleQosStatus & status )  [pure virtual]
```

Handles the **dds::core::status::RequestedIncompatibleQosStatus** (p. 2185) status.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1839), and **dds::sub::NoOpDataReaderListener< T >** (p. 1839).

8.56.2.3 on_sample_rejected()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_sample_rejected (
              DataReader< T > & reader,
             const  dds::core::status::SampleRejectedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::SampleRejectedStatus** (p. 2315) status.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1839), and **dds::sub::NoOpDataReaderListener< T >** (p. 1839).

8.56.2.4 on_liveliness_changed()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_liveliness_changed (
              DataReader< T > & reader,
             const  dds::core::status::LivelinessChangedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::LivelinessChangedStatus** (p. 1652) status.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1839), and **dds::sub::NoOpDataReaderListener< T >** (p. 1839).

8.56.2.5 on_data_available()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_data_available (
              DataReader< T > & reader )  [pure virtual]
```

Called when one or more new data samples have been received.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1840), and **dds::sub::NoOpDataReaderListener< T >** (p. 1840).

8.56.2.6 on_subscription_matched()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_subscription_matched (
              DataReader< T > & reader,
             const  dds::core::status::SubscriptionMatchedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::SubscriptionMatchedStatus** (p. 2439) status.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1840), and **dds::sub::NoOpDataReaderListener< T >** (p. 1840).

8.56.2.7 on_sample_lost()

```
template<typename T >
virtual void  dds::sub::DataReaderListener< T >::on_sample_lost (
              DataReader< T > & reader,
             const  dds::core::status::SampleLostStatus & status )  [pure virtual]
```

Handles the **dds::core::status::SampleLostStatus** (p. 2303) status.

Implemented in **dds::sub::NoOpDataReaderListener< RequestType >** (p. 1840), and **dds::sub::NoOpDataReaderListener< T >** (p. 1840).

8.57.1 Detailed Description

<<***extension***>> *(*p. *116)* Configures DataReader-specific aspects of the RTPS protocol

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **rti::core::policy::DataReaderProtocol** (p. 1059) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **dds::core::policy::Reliability** (p. 2149) for more information on the per-DataReader/DataWriter reliability configuration. **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

dds::sub::DataReader (p. 976)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.57.2 Constructor & Destructor Documentation

8.57.2.1 DataReaderProtocol()

```
rti::core::policy::DataReaderProtocol::DataReaderProtocol ( )  [inline]
```

Creates the default policy.

8.57.3 Member Function Documentation

8.57.3.1 virtual_guid() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::virtual_guid (
            const  rti::core::Guid & the_virtual_guid )
```

<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **dds::sub::DataReader** (p. 976).

The association between a **dds::sub::DataReader** (p. 976) and its persisted state is done using the virtual GUID.

[default] rti::core::Guid::automatic() (p. 1597)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288)

8.57.3.2 virtual_guid() [2/2]

```
rti::core::Guid rti::core::policy::DataReaderProtocol::virtual_guid ( ) const
```

Getter (see setter with the same name)

8.57.3.3 rtps_object_id() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::rtps_object_id (
            uint32_t the_rtps_object_id )
```

<<***extension***>> *(p. 116)* The RTPS Object ID.

This value is used to determine the RTPS object ID of a data reader according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connext will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data reader.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connext. In those cases, the recomendation is not to use automatic object ID assigment.

[default] rti::core::policy::WireProtocol::RTPS_AUTO_ID (p. 2641)

[range] [0,0x00ffffff]

Categories

Immutable (p. 243)

8.57.3.4 rtps_object_id() [2/2]

```
uint32_t rti::core::policy::DataReaderProtocol::rtps_object_id ( ) const
```

Getter (see setter with the same name)

8.57.3.5 expects_inline_qos() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::expects_inline_qos (
            bool the_expects_inline_qos )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Specifies whether this DataReader expects inline QoS with every sample.

RTI Connext DataWriters do not match with DataReaders that set this field to true (because RTI Connext DataWriters do not support sending inline QoS), but here is how the field is meant to be used:

In RTI Connext, a **dds::sub::DataReader** (p. 976) nominally relies on **Discovery** (p. 1265) to propagate QoS on a matched **dds::pub::DataWriter** (p. 1138).

Alternatively, a **dds::sub::DataReader** (p. 976) may get information on a matched **dds::pub::DataWriter** (p. 1138) through QoS sent inline with a sample.

Asserting **rti::core::policy::DataReaderProtocol::expects_inline_qos** (p. 1062) indicates to a matching **dds::pub↩ ::DataWriter** (p. 1138) that this **dds::sub::DataReader** (p. 976) expects to receive inline QoS with every sample. The complete set of inline QoS that a **dds::pub::DataWriter** (p. 1138) may send inline is specified by the Real-Time Publish-Subscribe (RTPS) Wire Interoperability Protocol.

Because RTI Connext **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) cache **Discovery** (p. 1265) information, inline QoS are largely redundant and thus unecessary. Only for other stateless implementations whose **dds::sub::DataReader** (p. 976) does not cache **Discovery** (p. 1265) information is inline QoS necessary.

Also note that inline QoS are additional wire-payload that consume additional bandwidth and serialization and deserialization time.

[default] false

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288)

8.57.3.6 expects_inline_qos() [2/2]

```
bool rti::core::policy::DataReaderProtocol::expects_inline_qos ( ) const
```

Getter (see setter with the same name)

8.57.3.7 disable_positive_acks() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::disable_positive_acks (
            bool the_disable_positive_acks )
```

<<***extension***>> *(p. 116)* Whether the reader sends positive acknowledgements to writers.

If set to true, the reader does not send positive acknowledgments (ACKs) in response to Heartbeat messages. The reader will send negative acknowledgements (NACKs) when a Heartbeat advertises samples that it has not received.

Otherwise, if set to false (the default), the reader will send ACKs to writers that expect ACKs (**rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 1214) = false) and it will not send ACKs to writers that disable ACKs (**rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 1214) = true)

[default] false

8.57.3.8 disable_positive_acks() [2/2]

```
bool rti::core::policy::DataReaderProtocol::disable_positive_acks ( ) const
```

Getter (see setter with the same name)

8.57.3.9 propagate_dispose_of_unregistered_instances() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::propagate_dispose_of_unregistered_
instances (
            bool the_propagate_dispose_of_unregistered_instances )
```

<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) state without being in the **dds::sub::status::InstanceState::alive()** (p. 1617) state.

This field only applies to keyed readers.

When the field is set to true, the DataReader will receive dispose notifications even if the instance is not alive.

To guarantee the key availability through the usage of the API **dds::sub::DataReader::key_value** (p. 1003), this option should be used in combination with setting **rti::core::policy::DataWriterProtocol::serialize_key_with_dispose** (p. 1215) on the DataWriter to true.

[default] false

  The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

- int64_t **out_of_range_rejected_sample_count** () const

  The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

8.58.1 Detailed Description

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::datareader_protocol()** (p. 2387)

Entity:

dds::sub::DataReader (p. 976)

8.58.2 Member Function Documentation

8.58.2.1 received_sample_count()

EventCount64 rti::core::status::DataReaderProtocolStatus::received_sample_count ( ) const [inline]

The number of samples received by a DataReader.

Depending on how the rti::core::status::DataReaderProtocol was obtained this may count samples coming from a specific DataWriter or from all the DataWriters that are matched with the DataReader.

If the rti::core::status::DataReaderProtocol is obtained using the **dds::sub::DataReader::datareader_protocol_status** (p. 1013) operation then it will count samples from any DataWriter. If the **DataReaderProtocolStatus** (p. 1065) is obtained using the **dds::sub::DataReader::matched_publication_datareader_protocol_status** (p. 1013) then it will count the samples for the DataWriter specified as a parameter to the function.

Duplicate samples arriving from the DataWriter(s) (e.g. via multiple network paths) are detected prior to increasing this counter. The duplicate samples are counted by rti::core::status::DataReaderProtocol::duplicate_sample_count.

If the DataReader has specified a ContentFilter the received samples that do not pass the filter are part of this counter. The filtered samples are counted by rti::core::status::DataReaderProtocol::filtered_sample_count.

Samples rejected because they do not fit on the DataReader Queue are also part of this counter.

Note the received_sample_count counts samples received from all DataWriters and it does not necessarily match the number of samples accepted into the DataReader Queue. This is because:

- Samples can also be inserted into the DataReader Queue by lifecycle events that are locally detected like an instance becoming not alive as a result of DataWriters leaving the network.
- Samples can be filtered out due to ContentFilter or TimeFilter
- Samples can be rejected because there is no space in DataReader Queue

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

8.58.2.2 received_sample_bytes()

EventCount64 rti::core::status::DataReaderProtocolStatus::received_sample_bytes ( ) const [inline]

The number of bytes received by a DataReader.

See also

rti::core::status::DataReaderProtocol::received_sample_count

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

8.58.2.3 duplicate_sample_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::duplicate_sample_count ( ) const  [inline]
```

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

8.58.2.4 duplicate_sample_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::duplicate_sample_bytes ( ) const  [inline]
```

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

8.58.2.5 filtered_sample_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::filtered_sample_count ( ) const  [inline]
```

[DEPRECATED]. See: **rti::core::status::DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 1049) **rti::core::status::DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 1049)

8.58.2.6 filtered_sample_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::filtered_sample_bytes ( ) const  [inline]
```

[DEPRECATED]. See: **rti::core::status::DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 1049) **rti::core::status::DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 1049)

8.58.2.7 received_heartbeat_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_heartbeat_count ( ) const
[inline]
```

The number of Heartbeats from a remote DataWriter received by a local DataReader.

8.58.2.8 received_heartbeat_bytes()

EventCount64 rti::core::status::DataReaderProtocolStatus::received_heartbeat_bytes ( ) const [inline]

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

8.58.2.9 sent_ack_count()

EventCount64 rti::core::status::DataReaderProtocolStatus::sent_ack_count ( ) const [inline]

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

8.58.2.10 sent_ack_bytes()

EventCount64 rti::core::status::DataReaderProtocolStatus::sent_ack_bytes ( ) const [inline]

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

8.58.2.11 sent_nack_count()

EventCount64 rti::core::status::DataReaderProtocolStatus::sent_nack_count ( ) const [inline]

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

8.58.2.12 sent_nack_bytes()

EventCount64 rti::core::status::DataReaderProtocolStatus::sent_nack_bytes ( ) const [inline]

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

8.58.2.13 received_gap_count()

EventCount64 rti::core::status::DataReaderProtocolStatus::received_gap_count ( ) const [inline]

The number of GAPs received from remote DataWriter to this DataReader.

8.58.2.14 received_gap_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_gap_bytes ( ) const  [inline]
```

The number of bytes of GAPs received from remote DataWriter to this DataReader.

8.58.2.15 rejected_sample_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::rejected_sample_count ( ) const  [inline]
```

The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

Samples rejected by a reliable DataReader will be NACKed, and they will have to be resent by the DataWriter if they are still available in the DataWriter queue.

This counter will always be 0 when using **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157).

8.58.2.16 first_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataReaderProtocolStatus::first_available_sample_↩
sequence_number ( ) const  [inline]
```

Sequence number of the first available sample in a matched DataWriters reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

8.58.2.17 last_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataReaderProtocolStatus::last_available_sample_↩
sequence_number ( ) const  [inline]
```

Sequence number of the last available sample in a matched Datawriter's reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

8.58.2.18 last_committed_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataReaderProtocolStatus::last_committed_sample_↩
sequence_number ( ) const  [inline]
```

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.

Applicable only when retrieving matched DataWriter statuses.

For best-effort DataReaders, this is the sequence number of the latest sample received.

For reliable DataReaders, this is the sequence number of the latest sample that is available to be read or taken from the DataReader's queue.

8.58.2.19 uncommitted_sample_count()

```
int32_t rti::core::status::DataReaderProtocolStatus::uncommitted_sample_count ( ) const  [inline]
```

Number of received samples that are not yet available to be read or taken, due to being received out of order.

Applicable only when retrieving matched DataWriter statuses.

8.58.2.20 received_fragment_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::received_fragment_count ( ) const  [inline]
```

The number of DATA_FRAG messages that have been received by this DataReader.

This statistic is incremented upon the receipt of each DATA_FRAG message. Fragments from duplicate samples do not count towards this statistic. Applicable only when data is fragmented.

8.58.2.21 dropped_fragment_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::dropped_fragment_count ( ) const  [inline]
```

The number of DATA_FRAG messages that have been dropped by a DataReader.

This statistic does not include malformed fragments. Applicable only when data is fragmented.

8.58.2.22 reassembled_sample_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::reassembled_sample_count ( ) const  [inline]
```

The number of fragmented samples that have been reassembled by a DataReader.

This statistic is incremented when all of the fragments which are required to reassemble an entire sample have been received. Applicable only when data is fragmented.

8.58.2.23 sent_nack_fragment_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::sent_nack_fragment_count ( ) const  [inline]
```

The number of NACK fragments that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.58.2.24 sent_nack_fragment_bytes()

```
int64_t rti::core::status::DataReaderProtocolStatus::sent_nack_fragment_bytes ( ) const  [inline]
```

The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.58.2.25 out_of_range_rejected_sample_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::out_of_range_rejected_sample_count ( ) const
[inline]
```

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

When using **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157); if the DataReader received samples out-of-order, they are stored internally until the missing samples are received. The number of out-of-order samples that the DataReader can keep is set by **rti::core::RtpsReliableReaderProtocol::receive_window_size** (p. 2226). When the received window is full any out-of-order sample received will be dropped.

8.59.1 Detailed Description

<<***value-type***>> (p. *350*) Container of the QoS policies that a **dds::sub::DataReader** (p. 976) supports

8.59.2 DataReaderQos policies

A **DataReaderQos** (p. 1072) contains the following policies:

- **dds::core::policy::Durability** (p. 1433),
- **dds::core::policy::Deadline** (p. 1255),
- **dds::core::policy::LatencyBudget** (p. 1631),
- **dds::core::policy::Liveliness** (p. 1645),
- **dds::core::policy::Reliability** (p. 2149),
- **dds::core::policy::DestinationOrder** (p. 1258),
- **dds::core::policy::History** (p. 1602),
- **dds::core::policy::ResourceLimits** (p. 2203),
- **dds::core::policy::UserData** (p. 2591),
- **dds::core::policy::Ownership** (p. 1899),
- **dds::core::policy::TimeBasedFilter** (p. 2469),
- **dds::core::policy::ReaderDataLifecycle** (p. 2137),
- **dds::core::policy::DataRepresentation** (p. 1113),
- **dds::core::policy::TransportPriority** (p. 2552),
- **dds::core::policy::TypeConsistencyEnforcement** (p. 2563),
- **dds::core::policy::DataTag** (p. 1132),
- **rti::core::policy::DataReaderResourceLimits** (p. 1081),
- **rti::core::policy::DataReaderProtocol** (p. 1059),
- **rti::core::policy::TransportSelection** (p. 2554),
- **rti::core::policy::TransportUnicast** (p. 2556),
- **rti::core::policy::TransportMulticast** (p. 2543),
- **rti::core::policy::Property** (p. 1969),
- **rti::core::policy::Service** (p. 2350),
- **rti::core::policy::Availability** (p. 868),
- **rti::core::policy::EntityName** (p. 1530),
- **rti::core::policy::TypeSupport** (p. 2574)

To get or set policies use the **policy()** (p. 1077) getters and setters or operator << (see **examples** (p. 603)).

You must set certain members in a consistent manner:

dds::core::policy::Deadline (p. 1255) .period >= **dds::core::policy::TimeBasedFilter** (p. 2469) .minimum_↩ separation

dds::core::policy::History (p. 1602) .depth <= **dds::core::policy::ResourceLimits** (p. 2203) .max_samples_per_↩ instance

dds::core::policy::ResourceLimits (p. 2203) .max_samples_per_instance <= **dds::core::policy::ResourceLimits** (p. 2203) .max_samples **dds::core::policy::ResourceLimits** (p. 2203) .initial_samples <= **dds::core::policy::↩ ResourceLimits** (p. 2203) .max_samples

dds::core::policy::ResourceLimits (p. 2203) .initial_instances <= **dds::core::policy::ResourceLimits** (p. 2203) .max_instances

rti::core::policy::DataReaderResourceLimits (p. 1081) .initial_remote_writers_per_instance <= **rti::core::policy::↩ DataReaderResourceLimits** (p. 1081) .max_remote_writers_per_instance

rti::core::policy::DataReaderResourceLimits (p. 1081) .initial_infos <= **rti::core::policy::DataReaderResource↩ Limits** (p. 1081) .max_infos

rti::core::policy::DataReaderResourceLimits (p. 1081) .max_remote_writers_per_instance <= **rti::core::policy::↩ DataReaderResourceLimits** (p. 1081) .max_remote_writers

rti::core::policy::DataReaderResourceLimits (p. 1081) .max_samples_per_remote_writer <= **dds::core::policy::↩ ResourceLimits** (p. 2203) .max_samples

length of **dds::core::policy::UserData** (p. 2591) .value <= dds::domain::qos::DomainParticipantQos::resource_limits .reader_user_data_max_length

If any of the above are not true, **dds::sub::DataReader::qos(const dds::sub::qos::DataReaderQos&)** (p. 1008) will fail with **dds::core::InconsistentPolicyError** (p. 1610) and the **dds::sub::DataReader** (p. 976) constructors will fail with **dds::core::Error** (p. 1539)

See also

Qos Use Cases (p. 602)

Examples

Foo_subscriber.cxx.

8.59.3 Constructor & Destructor Documentation

8.59.3.1 DataReaderQos() [1/2]

```
dds::sub::qos::DataReaderQos::DataReaderQos ( )
```

Creates a **DataReaderQos** (p. 1072) with the default value for each policy.

Note

If you configure Qos in XML, obtain the default value from the default QosProvider, since it can be overriden by configuration:
```
DataReaderQos reader_qos = dds::core::QosProvider::Default().datareader_qos();
```

8.59.3.2 DataReaderQos() [2/2]

```
dds::sub::qos::DataReaderQos::DataReaderQos (
            const  dds::topic::qos::TopicQos & topic_qos )
```

Creates a **DataReaderQos** (p. 1072) with the given TopicQos.

A **dds::topic::qos::TopicQos** (p. 2509) contains a subset of the policies of a **DataReaderQos** (p. 1072). This constructor copies those common policies into this instance while initializing the policies that are only defined in **DataReaderQos** (p. 1072) to their default vaues.

Parameters

topic_qos	The TopicQos bring copied.

Example:
```
DatareaderQos reader_qos(topic.qos());
```

8.59.4 Member Function Documentation

8.59.4.1 operator=()

```
DataReaderQos & dds::sub::qos::DataReaderQos::operator= (
            const  dds::topic::qos::TopicQos & topic_qos )  [inline]
```

Copies into this **DataReaderQos** (p. 1072) those policies that are also in TopicQos.

A **dds::topic::qos::TopicQos** (p. 2509) contains a subset of the policies of a **DataReaderQos** (p. 1072). This assignment operator copies those common policies into this instance while leaving the policies that are only defined in **DataReaderQos** (p. 1072) unaltered.

Parameters

topic_qos	The TopicQos to copy the common policies from.

For example:

```
// Load a TopicQos from a Qos profile
TopicQos topic_qos = dds::core::QosProvider::Default().topic_qos("MyLibrary::MyProfile");
// Create a DataReaderQos with the default policies
DataReaderQos reader_qos = dds::core::QosProvider::Default().datareader_qos();
// Overwrite the policies that are also defined in topic_qos
reader_qos = topic_qos;
```

8.59.4.2 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::sub::qos::DataReaderQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

Policy	One of the **DataReaderQos policies** (p. 1074)

See also

Setting Qos Values (p. 603)

8.59.4.3 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::sub::qos::DataReaderQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

Policy	One of the **DataReaderQos policies** (p. 1074)

See also

Setting Qos Values (p. 603)

8.59.4.4 policy() [3/3]

```
template<typename Policy >
DataReaderQos & dds::sub::qos::DataReaderQos::policy (
            const Policy & p )  [inline]
```

Sets a policy.

See also

policy() (p. 1077)

Setting Qos Values (p. 603)

8.59.4.5 operator<<()

```
template<typename Policy >
DataReaderQos & dds::sub::qos::DataReaderQos::operator<< (
            const Policy & p )  [inline]
```

Sets a policy.

See also

policy() (p. 1077)

Setting Qos Values (p. 603)

8.59.4.6 operator>>()

```
template<typename Policy >
const  DataReaderQos & dds::sub::qos::DataReaderQos::operator>> (
            Policy & p ) const  [inline]
```

Copies the values of a policy.

Parameters

p	The destination where to copy the current value of the Policy

See also

policy() (p. 1077)

Setting Qos Values (p. 603)

8.59.5 Friends And Related Function Documentation

8.59.5.1 to_string() [1/3]

```
std::string to_string (
            const  DataReaderQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 1072)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataReaderQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataReaderQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataReaderQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.59.5.2 to_string() [2/3]

```
std::string to_string (
            const  DataReaderQos & qos,
            const  DataReaderQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 1072)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.59.5.3 to_string() [3/3]

```
std::string to_string (
            const  DataReaderQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 1072)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.59.5.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::sub::qos::DataReaderQos & qos )  [related]
```

<<***extension***>> *(*p. *354)* Prints a **dds::sub::qos::DataReaderQos** (p. 1072) to an output stream.

8.60 rti::core::policy::DataReaderResourceLimits Class Reference

<<***extension***>> *(*p. *116)* Configures the memory usage of a dds::pub::DataReader

```
#include <rti/core/policy/CorePolicy.hpp>
```

8.60.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the memory usage of a dds::pub::DataReader

DataReaders must allocate internal structures to handle the maximum number of DataWriters that may connect to it, whether or not a **dds::sub::DataReader** (p. 976) handles data fragmentation and how many data fragments that it may handle (for data samples larger than the MTU of the underlying network transport), how many simultaneous outstanding loans of internal memory holding data samples can be provided to user code, as well as others.

Most of these internal structures start at an initial size and, by default, will grow as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **dds::sub::DataReader** (p. 976). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **dds::sub::DataReader** (p. 976).

This QoS policy is an extension to the DDS standard.

Entity:

dds::sub::DataReader (p. 976)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.60.2 Constructor & Destructor Documentation

8.60.2.1 DataReaderResourceLimits()

```
rti::core::policy::DataReaderResourceLimits::DataReaderResourceLimits ( )  [inline]
```

Creates a **DataReaderResourceLimits** (p. 1081) qos policy with default values.

8.60.3 Member Function Documentation

8.60.3.1 max_remote_writers() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_writers (
            int32_t the_max_remote_writers )
```

<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.

[default] dds::core::LENGTH_UNLIMITED (p. 438)
[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_remote_writers, >= max_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers_per_instance if max_remote_writers_per_instance is not equal to **dds::core::LENGTH_UNLIMITED** (p. 438).

Note: For efficiency, set `max_remote_writers >=` **rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance** (p. 1086).

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.60.3.2 max_remote_writers() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_remote_writers ( ) const
```

Getter (see setter with the same name)

8.60.3.3 max_remote_writers_per_instance() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance (
            int32_t the_max_remote_writers_per_instance )
```

<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 1024] or **dds::core::LENGTH_UNLIMITED** (p. 438), <= max_remote_writers or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers if it is not **dds::core::LENGTH_UNLIMITED** (p. 438).

Note: For efficiency, set `max_remote_writers_per_instance <=` **rti::core::policy::DataReaderResourceLimits::max_remote_writers** (p. 1085)

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.60.3.4 max_remote_writers_per_instance() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance ( ) const
```

Getter (see setter with the same name)

8.60.3.5 max_samples_per_remote_writer() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer (
            int32_t the_max_samples_per_remote_writer )
```

<<***extension***>> *(p. 116)* The maximum number of out-of-order samples from a given remote **dds::pub::DataWriter** (p. 1138) that a **dds::sub::DataReader** (p. 976) may store when maintaining a reliable connection to the **dds::pub::DataWriter** (p. 1138).

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), <= **dds::core::policy::ResourceLimits::max_samples** (p. 2205)

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.60.3.6 max_samples_per_remote_writer() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer ( ) const
```

Getter (see setter with the same name)

References **rti::core::policy::DataWriterTransferMode::shmem_ref_settings()**.

8.60.3.7 max_infos() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_infos (
            int32_t the_max_infos )
```

<<***extension***>> *(p. 116)* The maximum number of info units that a **dds::sub::DataReader** (p. 976) can use to store **dds::sub::SampleInfo** (p. 2285).

When read/take is called on a DataReader, the DataReader passes a sequence of data samples and an associated sample info sequence. The sample info sequence contains additional information for each data sample.

max_infos determines the resources allocated for storing sample info. This memory is loaned to the application when passing a sample info sequence.

Note that sample info is a snapshot, generated when read/take is called.

max_infos should not be less than max_samples.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_infos

```

<<***extension***>> *(p. 116)* The maximum number of data samples that the application can receive from the middleware in a single call to **dds::sub::DataReader::read** (p. 996) or **dds::sub::DataReader::take** (p. 997). If more data exists in the middleware, the application will need to issue multiple read/take calls.

When reading data using listeners, the expected number of samples available for delivery in a single `take` call is typically small: usually just one, in the case of unbatched data, or the number of samples in a single batch, in the case of batched data. (See **rti::core::policy::Batch** (p. 880) for more information about this feature.) When polling for data or using a **dds::core::cond::WaitSet** (p. 2617), however, multiple samples (or batches) could be retrieved at once, depending on the data rate.

A larger value for this parameter makes the API simpler to use at the expense of some additional memory consumption.

[default] 1024

Getter (see setter with the same name)

8.60.3.23 max_fragmented_samples() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_fragmented_samples (
            int32_t the_max_fragmented_samples )
```

<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.

At any given time, a **dds::sub::DataReader** (p. 976) may store fragments for up to `max_fragmented_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different **dds::pub::DataWriter** (p. 1138) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **dds::core::policy::ResourceLimits::max_samples** (p. 2205).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 1092) is false.

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::dynamically_allocate_↩
fragmented_samples (
            bool the_dynamically_allocate_fragmented_samples )
```

<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to false, the middleware will allocate memory upfront for storing fragments for up to **rti::core::policy::DataReaderResourceLimits::initial_fragmented_samples** (p. 1093) samples. This memory may grow up to **rti::core::policy::DataReaderResourceLimits::max_fragmented_samples** (p. 1092) if needed.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 1092) is false.

[default] true

Categories

Immutable (p. 243), **Sample Memory Management** (p. 230), **Middleware Memory Management** (p. 204), **Fragmentation** (p. 191), **Sending Large Data** (p. 197)

8.60.3.32 dynamically_allocate_fragmented_samples() [2/2]

```
bool rti::core::policy::DataReaderResourceLimits::dynamically_allocate_fragmented_samples ( )
const
```

Getter (see setter with the same name)

8.60.3.33 max_total_instances() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_total_instances (
            int32_t the_max_total_instances )
```

<<***extension***>> *(*p. *116)* Maximum number of instances for which a DataReader will keep state.

The maximum number of instances actively managed by a DataReader is determined by **dds::core::policy::ResourceLimits::max_instances** (p. 2206).

These instances have associated DataWriters or samples in the DataReader's queue and are visible to the user through operations such as **dds::sub::DataReader::take** (p. 997), **dds::sub::DataReader::read** (p. 996), and **dds::sub::DataReader::key_value** (p. 1003).

The features Durable Reader State, **MultiChannel** (p. 1749) DataWriters and RTI Persistence **Service** (p. 2350) require RTI Connext to keep some internal state even for instances without DataWriters or samples in the DataReader's queue. The additional state is used to filter duplicate samples that could be coming from different DataWriter channels or from multiple executions of RTI Persistence **Service** (p. 2350).

The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or samples, is determined by max_total_instances.

When a new instance is received, RTI Connext will check the resource limit **dds::core::policy::ResourceLimits::max_instances** (p. 2206). If the limit is exceeded, RTI Connext will drop the sample with the reason LOST_BY_INSTANCES_LIMIT. If the limit is not exceeded, RTI Connext will check max_total_instances. If max_total_instances is exceeded, RTI Connext will replace an existing instance without DataWriters and samples with the new one. The application could receive duplicate samples for the replaced instance if it becomes alive again.

The max_total_instances limit is not used if **rti::core::policy::DataReaderResourceLimits::keep_minimum_state_for_instances** (p. 1101) is false, and in that case should be left at the default value.

[default] rti::core::policy::DataReaderResourceLimits::auto_max_total_instances (p. 519)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 438) or **rti::core::policy::DataReaderResourceLimits::auto_max_total_instances** (p. 519), >= **dds::core::policy::ResourceLimits::max_instances** (p. 2206)

writers_per_instance (
            int32_t the_max_remote_virtual_writers_per_instance )
```

<<***extension***>> *(p. 116)* The maximum number of virtual remote writers that can be associated with an instance.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 1024] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_remote_virtual_writers_per_instance

For unkeyed types, this value is ignored.

The features of Durable Reader State and **MultiChannel** (p. 1749) DataWriters, and RTI Persistence **Service** (p. 2350) require RTI Connext to keep some internal state per virtual writer and instance that is used to filter duplicate samples. These duplicate samples could be coming from different DataWriter channels or from multiple executions of RTI Persistence **Service** (p. 2350).

Once an association between a remote virtual writer and an instance is established, it is permanent – it will not disappear even if the physical writer incarnating the virtual writer is destroyed.

If max_remote_virtual_writers_per_instance is exceeded for an instance, RTI Connext will not associate this instance with new virtual writers. Duplicates samples from these virtual writers will not be filtered on the reader.

If you are not using Durable Reader State, **MultiChannel** (p. 1749) DataWriters or RTI Persistence **Service** (p. 2350) in your system, you can set this property to 1 to optimize resources.

8.60.3.55 autopurge_remote_not_alive_writer_delay() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::autopurge_remote_not_↩
alive_writer_delay (
            const  dds::core::Duration & d )
```

<<***extension***>> *(p. 116)* Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become not alive.

After this time elapses, the **dds::sub::DataReader** (p. 976) will purge all internal information regarding the not alive **dds::pub::DataWriter** (p. 1138).

See also

dds::core::policy::Liveliness (p. 1645) for more information on when a **dds::pub::DataWriter** (p. 1138) is considered not alive.

When set to **dds::core::Duration::automatic()** (p. 1451), this parameter is set to 10 times the value of **rti::core↩ ::policy::DiscoveryConfig::participant_liveliness_lease_duration** (p. 1279).

This QoS only applies when the **dds::sub::DataReader** (p. 976) is using **rti::core::policy::InstanceState↩ ConsistencyKind::recover_state** (p. 545) for the **dds::core::policy::Reliability::instance_state_consistency_kind** (p. 2155) QoS. When using **rti::core::policy::InstanceStateConsistencyKind::recover_state** (p. 545), a **dds::sub↩ ::DataReader** (p. 976) keeps state about all **dds::pub::DataWriter** (p. 1138) entities and the instances they were writing in order to be able to transition those instances back to their correct state if liveliness with the **dds::pub::DataWriter** (p. 1138) is recovered. This can cause unbounded memory growth if that state is never purged and **dds::pub::Data↩ Writer** (p. 1138) entities continuously come and go in a system. This QoS avoids that unbounded memory growth by setting a time at which that state will be purged.

This QoS should be set such that it is longer than the longest period of time for which a **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) are expected to be disconnected and then reconnected in your system.

An alternative to using this QoS to purge the state is to set the **rti::core::policy::DataReaderResourceLimits::max↩ _remote_writers** (p. 1085) QoS to a finite value. If that QoS is set to a finite value and the number of alive + not alive **dds::pub::DataWriter** (p. 1138) entities reaches the limit when a new **dds::pub::DataWriter** (p. 1138) is discovered, the oldest not alive **dds::pub::DataWriter** (p. 1138) will be replaced.

[default] dds::core::Duration::automatic() (p. 1451)

[range] $>$ 0 or **dds::core::Duration::automatic()** (p. 1451)

writer_delay ( ) const
```

Getter (see setter with the same name)

8.60.3.57 autopurge_remote_virtual_writer_delay() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::autopurge_remote_virtual↩
_writer_delay (
            const  dds::core::Duration & d )
```

Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a virtual **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become detached.

Determines how long the **dds::sub::DataReader** (p. 976) will maintain information regarding a virtual **dds::pub::DataWriter** (p. 1138) that has has become detached.

After this time elapses, the **dds::sub::DataReader** (p. 976) will purge all internal information regarding the **dds::pub::DataWriter** (p. 1138).

[default] dds::core::Duration::infinite() (p. 1451)

[range] >= 0 or **dds::core::Duration::infinite()** (p. 1451)

8.60.3.58 autopurge_remote_virtual_writer_delay() [2/2]

```
dds::core::Duration rti::core::policy::DataReaderResourceLimits::autopurge_remote_virtual_↩
writer_delay ( ) const
```

Getter (see setter with the same name)

8.60.3.59 lazily_allocate_batch_resources() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::lazily_allocate_batch_↩
resources (
            bool the_lazily_allocate_batch_resources )
```

<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.

By default, the middleware does not allocate memory up front to manage the batches of samples received, but instead allocates memory from the heap upon receiving the first batch of samples.

Lazily allocating batching resources helps reduce memory consumption when batches are not used, but it may introduce some latency when receiving the first batch of samples, since memory needs to be allocated from the heap. If you know that your application will be using batches, you may set this value to false if you are concerned about that latency.

[default] true

8.60.3.63 instance_replacement() [1/2]

```
const DataReaderResourceLimitsInstanceReplacementSettings & rti::core::policy::DataReaderResource↩
Limits::instance_replacement ( ) const
```

<<***extension***>> *(p. 116)* Sets the kind of instances allowed to be replaced for each instance state (**dds::sub↩ ::status::InstanceState** (p. 1615)) when a DataReader reaches **dds::core::policy::ResourceLimits::max_instances** (p. 2206).

When **dds::core::policy::ResourceLimits::max_instances** (p. 2206) is reached, a **dds::sub::DataReader** (p. 976) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kinds specified by this field.

A DataReader can choose what kinds of instances can be replaced for each **dds::sub::status::InstanceState** (p. 1615) separately. This means, for example, that a DataReader can choose to not allow replacing alive (**dds::sub::status↩ ::InstanceState::alive()** (p. 1617)) instances but allow replacement of empty disposed (**dds::sub::status::Instance↩ State::not_alive_disposed()** (p. 1617)) instances.

Only instances whose states match the specified kinds are eligible to be replaced. In addition, there must be no outstanding loans on any of the samples belonging to the instance for it to be considered for replacement.

For all kinds, a **dds::sub::DataReader** (p. 976) will replace the least-recently-updated instance satisfying that kind. An instance is considered 'updated' when a valid sample or dispose sample is received and accepted for that instance. When using **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1906), only samples that are received from the owner of the instance will cause the instance to be considered updated. An instance is not considered updated when an unregister sample is received because the unregister message simply indicates that there is one less writer that has updates for the instance, not that the instance itself was updated.

If no replaceable instance exists, the sample for the new instance will be considered lost with lost reason **rti::core↩ ::status::SampleLostState::lost_by_instances_limit()** (p. 2299) and the instance will not be asserted into the Data↩ Reader queue.

8.62 rti::sub::cond::DataReaderStatusConditionHandler< T > Class Template Reference

Realization of a **functor handler** (p. 2134) that handles the status of a **dds::sub::DataReader** (p. 976).

```
#include <DataReaderStatusConditionHandler.hpp>
```

Public Member Functions

- **DataReaderStatusConditionHandler** (**dds::sub::DataReader**< T > &reader, **dds::sub::DataReader↩ Listener**< T > *listener, const **dds::core::status::StatusMask** &listener_mask)

  Creates a new rti::core::sub::DataReaderStatusConditionHandler instance.

8.62.1 Detailed Description

template<**typename T**>
class rti::sub::cond::DataReaderStatusConditionHandler< T >

Realization of a **functor handler** (p. 2134) that handles the status of a **dds::sub::DataReader** (p. 976).

A rti::core::sub::DataReaderStatusConditionHandler demultiplexes a **dds::sub::DataReader** (p. 976) status change into the corresponding callback of a provided **dds::sub::DataReaderListener** (p. 1055) implementation.

Note that the **dds::sub::DataReaderListener** (p. 1055) notifications have different considerations than if the were made by the **dds::sub::DataReader** (p. 976) directly:

- Context: The **dds::sub::DataReaderListener** (p. 1055) callback context is the one of the thread that dispatches the **dds::core::cond::Condition** (p. 948) where this handler is set. For instance, if you attach the condition to a **rti::core::cond::AsyncWaitSet** (p. 840), the context will be one of the threads within the pool.
- Status clearing: All the **dds::sub::DataReader** (p. 976)'s enabled statuses are cleared upon condition dispatch except the **dds::core::status::StatusMask::data_available()** (p. 2383), which will not be cleared until your application reads the data.
- Exclusive Area: Restrictions depend on the context of the dipsatching thread. For instance, if the **rti::core::cond::AsyncWaitSet** (p. 840) dispatches the condition, the listener notications are free of any exclusive area restrictions.

The rti::core::sub::DataReaderStatusConditionHandler is a convenience to handle the status changes of a **dds::sub::DataReader** (p. 976). You can install a rti::core::sub::DataReaderStatusConditionHandler as the handler of a reader's **dds::core::cond::StatusCondition** (p. 2372). You can then attach it to a **dds::core::cond::WaitSet** (p. 2617) or **rti::core::cond::AsyncWaitSet** (p. 840) and receive status changes notifications through a specific **dds::sub::DataReaderListener** (p. 1055) implementation instance.

8.62.2 Constructor & Destructor Documentation

8.62.2.1 DataReaderStatusConditionHandler()

```
template<typename T >
rti::sub::cond::DataReaderStatusConditionHandler< T >::DataReaderStatusConditionHandler (
              dds::sub::DataReader< T > & reader,
              dds::sub::DataReaderListener< T > * listener,
             const  dds::core::status::StatusMask & listener_mask )  [inline]
```

Creates a new rti::core::sub::DataReaderStatusConditionHandler instance.

The created **DataReaderStatusConditionHandler** (p. 1111) can set as **functor handler** (p. 2134) in any **dds::core::cond::Condition** (p. 948) and will demultiplex the specified status changes from the specified **dds::sub::DataReader** (p. 976)

Parameters

reader	<<***in***>> *(p. 355)* The **dds::sub::DataReader** (p. 976) for which the status changes are demultiplexed to the specified `listener`
listener	<<***in***>> *(p. 355)* that receives the status changes notifications from the specified `reader`.
listener_mask	<<***in***>> *(p. 355)* Specifies which status changes from `the` reader to demultiplex to the `listener`.

Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

See also

DATA_REPRESENTATION (p. 519)

This policy has request-offer semantics for both representation and compression. For representation, a **dds::pub::↩ DataWriter** (p. 1138) may only offer a single representation. Attempting to put multiple representations in a **dds::pub↩ ::DataWriter** (p. 1138) will result in **dds::core::InconsistentPolicyError** (p. 1610). A **dds::pub::DataWriter** (p. 1138) will use its offered policy to communicate with its matched **dds::sub::DataReader** (p. 976) entities. A **dds::sub::Data↩ Reader** (p. 976) requests one or more representations. If a **dds::pub::DataWriter** (p. 1138) offers a representation that is contained within the sequence of the **dds::sub::DataReader** (p. 976), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When representations are specified in the **dds::topic::qos::TopicQos** (p. 2509), **dds::pub::qos::DataWriterQos↩ ::operator=(const dds::topic::qos::TopicQos&)** (p. 1230) copies the first element of the sequence, and **dds::sub↩ ::qos::DataReaderQos::operator=(const dds::topic::qos::TopicQos&)** (p. 1076) copies the whole sequence.

For Compression, only the **rti::core::CompressionSettings::compression_ids** (p. 945) is propagated and a **dds↩ ::pub::DataWriter** (p. 1138) may only offer a single compression id. Attempting to put multiple compression_ids in a **dds::pub::DataWriter** (p. 1138) will result in **dds::core::InconsistentPolicyError** (p. 1610).

A **dds::pub::DataWriter** (p. 1138) will use its offered compression algorithm to compress data that it sends to its matched **dds::sub::DataReader** (p. 976) entities. A **dds::sub::DataReader** (p. 976) requests zero or more compression algorithms. If a **dds::pub::DataWriter** (p. 1138) offers a representation that is contained within the algorithms requested by the **dds::sub::DataReader** (p. 976), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When compression IDs are specified in the **dds::topic::qos::TopicQos** (p. 2509), **dds::pub::qos::DataWriter↩ Qos::operator=(const dds::topic::qos::TopicQos&)** (p. 1230) copies a single compression ID (see **rti::core::↩ CompressionSettings::compression_ids** (p. 945)), and **dds::sub::qos::DataReaderQos::operator=(const dds↩ ::topic::qos::TopicQos&)** (p. 1076) copies all of the compression_ids.

8.63.2 Constructor & Destructor Documentation

8.63.2.1 DataRepresentation() [1/3]

```
dds::core::policy::DataRepresentation::DataRepresentation ( )  [inline]
```

Creates an instance with one element, **auto_id()** (p. 521).

8.63.2.2 DataRepresentation() [2/3]

```
dds::core::policy::DataRepresentation::DataRepresentation (
            const  DataRepresentationIdSeq & seq )  [inline], [explicit]
```

Creates an instance with a sequence of DataRepresentationId.

Parameters

seq	A vector containing the DataRepresentationIds to create this **DataRepresentation** (p. 1113)

8.63.2.3 DataRepresentation() [3/3]

```
dds::core::policy::DataRepresentation::DataRepresentation (
            const  DataRepresentationId * value_begin,
            const  DataRepresentationId * value_end )  [inline]
```

Creates an instance with a sequence of DataRepresentationId.

Parameters

value_begin	Beginning of a range of DataRepresentationId
value_end	End of the range

8.63.3 Member Function Documentation

8.63.3.1 create_empty()

```
static DataRepresentation dds::core::policy::DataRepresentation::create_empty ( ) [inline],
[static], [noexcept]
```

Unlike the default constructor, which returns a **DataRepresentation** (p. 1113) instance with one element, auto_id, this static methods returns an empty **DataRepresentation** (p. 1113) instance.

8.63.3.2 value() [1/3]

```
template<typename ShortIter >
DataRepresentation & dds::core::policy::DataRepresentation::value (
            ShortIter the_begin,
            ShortIter the_end ) [inline]
```

Sets the DataRepresentationId sequence.

Template Parameters

ShortIter	An input iterator of DataRepresentationId.

Parameters

the_begin	Beginning of the range
the_end	End of the range

8.63.3.3 value() [2/3]

```
DataRepresentationIdSeq dds::core::policy::DataRepresentation::value ( ) const [inline]
```

Gets the **DataRepresentation** (p. 1113).

Returns

the sequence of DataRepresentationId representing the data representations

8.63.3.4 value() [3/3]

```
DataRepresentation & dds::core::policy::DataRepresentation::value (
            const DataRepresentationIdSeq & source ) [inline]
```

Sets the data representation.

Parameters

source	The vector where the DataRepresentationId will be copied from

8.63.3.5 compression_settings() [1/3]

```
const  rti::core::CompressionSettings & compression_settings ( ) const
```

<<***extension***>> *(*p. *116)* Gets the compression settings by const reference (see setter).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.63.3.6 compression_settings() [2/3]

```
rti::core::CompressionSettings & compression_settings ( )
```

<<***extension***>> *(*p. *116)* Gets the compression settings by non-const reference (see setter)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.63.3.7 compression_settings() [3/3]

```
dds::core::policy::DataRepresentation & compression_settings (
            const  rti::core::CompressionSettings & compression_settings )
```

<<***extension***>> *(*p. *116)* Sets the compression settings.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

compression_ids:
[default] The value depends on the entity
dds::pub::DataWriter (p. 1138) and **dds::topic::Topic** (p. 2474) are set to **rti::core::CompressionIdMask::none()** (p. 942)
dds::sub::DataReader (p. 976) **rti::core::CompressionIdMask::all()** (p. 941)

writer_compression_level:
[default] The value depends on the entity
dds::pub::DataWriter (p. 1138) and **dds::topic::Topic** (p. 2474) are set to **rti::core::CompressionSettings**↩ **::compression_level_default()** (p. 945)
dds::sub::DataReader (p. 976) NOT SUPPORTED

writer_compression_threshold:
[default] The value depends on the entity
dds::pub::DataWriter (p. 1138) and **dds::topic::Topic** (p. 2474) are set to rti::core::CompressionSettings↩ ::compression_threshold_default()
dds::sub::DataReader (p. 976) NOT SUPPORTED

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator<<** (std::ostream &os, const **DataState** &s)

  Prints a data state as a readable string.

8.64.1 Detailed Description

The **DataState** (p. 1118) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1615), **ViewState** (p. 2614), and **SampleState** (p. 2316).

8.64.2 Constructor & Destructor Documentation

8.64.2.1 DataState() [1/5]

```
dds::sub::status::DataState::DataState ( )  [inline]
```

Create a **DataState** (p. 1118) with **InstanceState::any()** (p. 1618), **ViewState::any()** (p. 2616), and **SampleState::any()** (p. 2318)

Referenced by **any()**, **any_data()**, **new_data()**, and **new_instance()**.

8.64.2.2 DataState() [2/5]

```
dds::sub::status::DataState::DataState (
            const  SampleState & the_sample_state )  [inline]
```

Create a **DataState** (p. 1118) with **InstanceState::any()** (p. 1618), **ViewState::any()** (p. 2616), and the provided **SampleState** (p. 2316).

Note that the constructor is implicit, so you can use a **SampleState** (p. 2316) wherever a **DataState** (p. 1118) is expected.

8.64.2.3 DataState() [3/5]

```
dds::sub::status::DataState::DataState (
            const  ViewState & the_view_state )  [inline]
```

Create a **DataState** (p. 1118) with **InstanceState::any()** (p. 1618), **SampleState::any()** (p. 2318), and the provided **ViewState** (p. 2614).

Note that the constructor is implicit, so you can use a **ViewState** (p. 2614) wherever a **DataState** (p. 1118) is expected.

8.64.2.4 DataState() [4/5]

```
dds::sub::status::DataState::DataState (
            const  InstanceState & the_instance_state )  [inline]
```

Create a **DataState** (p. 1118) with **SampleState::any()** (p. 2318), **ViewState::any()** (p. 2616), and the provided **InstanceState** (p. 1615).

Note that the constructor is implicit, so you can use a **InstanceState** (p. 1615) wherever a **DataState** (p. 1118) is expected.

8.64.2.5 DataState() [5/5]

```
dds::sub::status::DataState::DataState (
            const  SampleState & the_sample_state,
            const  ViewState & the_view_state,
            const  InstanceState & the_instance_state )  [inline]
```

Create a **DataState** (p. 1118) with the provided **SampleState** (p. 2316), **ViewState** (p. 2614), and **InstanceState** (p. 1615).

8.64.3 Member Function Documentation

8.64.3.1 operator==()

```
bool dds::sub::status::DataState::operator== (
            const  DataState & other ) const  [inline]
```

Compare two **DataState** (p. 1118) objects for equality.

References **instance_state()**, **sample_state()**, and **view_state()**.

Referenced by **operator!=()**.

8.64.3.2 operator"!=()

```
bool dds::sub::status::DataState::operator!= (
            const  DataState & other ) const  [inline]
```

Compare two **DataState** (p. 1118) objects for inequality.

References **operator==()**.

8.64.3.3 operator<<() [1/3]

```
DataState & dds::sub::status::DataState::operator<< (
            const  SampleState & the_sample_state )  [inline]
```

Set the provided **SampleState** (p. 2316) in a **DataState** (p. 1118) object.

8.64.3.4 operator<<() [2/3]

```
DataState & dds::sub::status::DataState::operator<< (
            const  InstanceState & the_instance_state )  [inline]
```

Set the provided **InstanceState** (p. 1615) in a **DataState** (p. 1118) object.

8.64.3.5 operator<<() [3/3]

```
DataState & dds::sub::status::DataState::operator<< (
            const  ViewState & the_view_state )  [inline]
```

Set the provided **ViewState** (p. 2614) in a **DataState** (p. 1118) object.

8.64.3.6 operator>>() [1/3]

```
const  DataState & dds::sub::status::DataState::operator>> (
             SampleState & the_sample_state ) const  [inline]
```

Get the **SampleState** (p. 2316) from a **DataState** (p. 1118) object.

8.64.3.7 operator>>() [2/3]

```
const  DataState & dds::sub::status::DataState::operator>> (
             InstanceState & the_instance_state ) const  [inline]
```

Get the **InstanceState** (p. 1615) from a **DataState** (p. 1118) object.

8.64.3.8 operator>>() [3/3]

```
const  DataState & dds::sub::status::DataState::operator>> (
             ViewState & the_view_state ) const  [inline]
```

Get the **ViewState** (p. 2614) from a **DataState** (p. 1118) object.

8.64.3.9 sample_state() [1/2]

```
const  SampleState & dds::sub::status::DataState::sample_state ( ) const  [inline]
```

Get the **SampleState** (p. 2316) from a **DataState** (p. 1118) object.

Referenced by **dds::sub::find()**, and **operator==()**.

8.64.3.10 sample_state() [2/2]

```
void dds::sub::status::DataState::sample_state (
            const  SampleState & the_sample_state )  [inline]
```

Set the provided **SampleState** (p. 2316) in a **DataState** (p. 1118) object.

8.64.3.11 instance_state() [1/2]

```
const InstanceState & dds::sub::status::DataState::instance_state ( ) const [inline]
```

Get the **InstanceState** (p. 1615) from a **DataState** (p. 1118) object.

Referenced by **dds::sub::find()**, and **operator==()**.

8.64.3.12 instance_state() [2/2]

```
void dds::sub::status::DataState::instance_state (
            const InstanceState & the_instance_state ) [inline]
```

Set the provided **InstanceState** (p. 1615) in a **DataState** (p. 1118) object.

8.64.3.13 view_state() [1/2]

```
const ViewState & dds::sub::status::DataState::view_state ( ) const [inline]
```

Get the **ViewState** (p. 2614) from a **DataState** (p. 1118) object.

Referenced by **dds::sub::find()**, and **operator==()**.

8.64.3.14 view_state() [2/2]

```
void dds::sub::status::DataState::view_state (
            const ViewState & the_view_state ) [inline]
```

Set the provided **ViewState** (p. 2614) in a **DataState** (p. 1118) object.

8.64.3.15 any()

```
static DataState dds::sub::status::DataState::any ( ) [inline], [static]
```

Create a **DataState** (p. 1118) with **InstanceState::any()** (p. 1618), **ViewState::any()** (p. 2616), and **SampleState::any()** (p. 2318)

Examples

Foo_subscriber.cxx.

References **dds::sub::status::SampleState::any()**, **dds::sub::status::ViewState::any()**, **dds::sub::status::↩ InstanceState::any()**, and **DataState()**.

8.64.3.16 new_data()

```
static DataState dds::sub::status::DataState::new_data ( ) [inline], [static]
```

Create a **DataState** (p. 1118) with **InstanceState::alive()** (p. 1617), **ViewState::any()** (p. 2616), and **SampleState::not_read()** (p. 2318)

References **dds::sub::status::InstanceState::alive()**, **dds::sub::status::ViewState::any()**, **DataState()**, and **dds::sub::status::SampleState::not_read()**.

8.64.3.17 any_data()

```
static DataState dds::sub::status::DataState::any_data ( ) [inline], [static]
```

Create a **DataState** (p. 1118) with **InstanceState::alive()** (p. 1617), **ViewState::any()** (p. 2616), and **SampleState::any()** (p. 2318)

References **dds::sub::status::InstanceState::alive()**, **dds::sub::status::SampleState::any()**, **dds::sub::status::ViewState::any()**, and **DataState()**.

8.64.3.18 new_instance()

```
static DataState dds::sub::status::DataState::new_instance ( ) [inline], [static]
```

Create a **DataState** (p. 1118) with **InstanceState::alive()** (p. 1617), **ViewState::new_view()** (p. 2616), and **SampleState::any()** (p. 2318)

References **dds::sub::status::InstanceState::alive()**, **dds::sub::status::SampleState::any()**, **DataState()**, and **dds::sub::status::ViewState::new_view()**.

8.64.4 Friends And Related Function Documentation

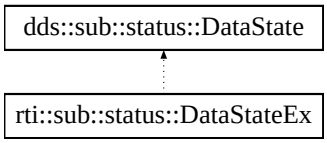
8.64.4.1 swap

```
void swap (
            DataState & left,
            DataState & right ) [friend]
```

Swap the contents of two **DataState** (p. 1118) objects.

8.64.4.2 operator<<()

```
std::ostream & operator<< (
            std::ostream & os,
            const  DataState & s )  [related]
```



Prints a data state as a readable string.

8.65 rti::sub::status::DataStateEx Class Reference

<<***extension***>> (p. *354)* <<***value-type***>> (p. *350)* An extended version of **dds::sub::status::DataState** (p. 1118) that also contains **StreamKind** (p. 2390)

Additional Inherited Members

8.65.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* An extended version of **dds::sub::status::DataState** (p. 1118) that also contains **StreamKind** (p. 2390)

DataStateEx (p. 1126) is an extension of DataState that allows setting an additional state mask: the **StreamKind** (p. 2390). It is used by rti::sub::cond::create_read_condition_ex and rti::sub::cond::create_query_condition_ex to create conditions that can filter based on the **StreamKind** (p. 2390).

A **DataStateEx** (p. 1126) contains the state masks InstanceState, ViewState and SampleState (with the same getters and setters: **instance_state()** (p. 1131), **view_state()** (p. 1130) and **sample_state()** (p. 1130)).

In addition it contains the mask **StreamKind** (p. 2390) with its getter and setter: **stream_kind()** (p. 1129).

8.65.2 Constructor & Destructor Documentation

8.65.2.1 DataStateEx() [1/4]

```
rti::sub::status::DataStateEx::DataStateEx ( )  [inline]
```

Create a **DataStateEx** (p. 1126) with InstanceState::any(), ViewState::any(), SampleState::any(), and **StreamKind↩ ::any()** (p. 2392).

8.65.2.2 DataStateEx() [2/4]

```
rti::sub::status::DataStateEx::DataStateEx (
            const  StreamKind & the_stream_kind )  [inline]
```

Create a **DataStateEx** (p. 1126) with InstanceState::any(), ViewState::any(), SampleState::any() and the provided **StreamKind** (p. 2390).

Note that the constructor is implicit, so you can use a **StreamKind** (p. 2390) wherever a **DataStateEx** (p. 1126) is expected.

8.65.2.3 DataStateEx() [3/4]

```
rti::sub::status::DataStateEx::DataStateEx (
            const  dds::sub::status::DataState & the_data_state )  [inline]
```

Create a **DataStateEx** (p. 1126) with the provided SampleState, ViewState, InstanceState, and **StreamKind::any()** (p. 2392)

The constructor is implicit, so DataState can automatically be converted to a **DataStateEx** (p. 1126) with **StreamKind↩ ::any()** (p. 2392).

Parameters

the_data_state	Contains the SampleState, ViewState and InstanceState

8.65.2.4 DataStateEx() [4/4]

```
rti::sub::status::DataStateEx::DataStateEx (
            const  dds::sub::status::DataState & the_data_state,
            const  StreamKind & the_stream_kind )  [inline]
```

Create a **DataStateEx** (p. 1126) with the provided SampleState, ViewState, InstanceState, and **StreamKind** (p. 2390).

Parameters

the_data_state	Contains the SampleState, ViewState and InstanceState
the_stream_kind	Contains the **StreamKind** (p. 2390)

8.65.3 Member Function Documentation

8.65.3.1 operator<<()

```
DataStateEx & rti::sub::status::DataStateEx::operator<< (
            const  StreamKind & the_stream_kind )  [inline]
```

Set the **StreamKind** (p. 2390).

8.65.3.2 operator>>()

```
const  DataStateEx & rti::sub::status::DataStateEx::operator>> (
             StreamKind & the_stream_kind ) const  [inline]
```

Get the **StreamKind** (p. 2390).

8.65.3.3 stream_kind() [1/2]

```
const  StreamKind & rti::sub::status::DataStateEx::stream_kind ( ) const  [inline]
```

Get the **StreamKind** (p. 2390).

Referenced by **operator==()**.

8.65.3.4 stream_kind() [2/2]

```
void rti::sub::status::DataStateEx::stream_kind (
            const  StreamKind & the_stream_kind )  [inline]
```

Set the **StreamKind** (p. 2390).

8.65.3.5 data_state()

```
const  DataState & rti::sub::status::DataStateEx::data_state ( ) const  [inline]
```

Access the view, sample and instance states.

Referenced by **operator==()**.

8.65.3.6 operator==()

```
bool rti::sub::status::DataStateEx::operator== (
            const  DataStateEx & other ) const  [inline]
```

Compare two **DataStateEx** (p. 1126) objects for equality.

References **data_state()**, and **stream_kind()**.

8.65.3.7 operator"!=()

```
bool rti::sub::status::DataStateEx::operator!= (
            const  DataStateEx & other ) const  [inline]
```

Compare two **DataStateEx** (p. 1126) objects for inequality.

8.65.3.8 sample_state() [1/2]

```
const SampleState & dds::sub::status::DataState::sample_state ( ) const  [inline]
```

Access the SampleState.

8.65.3.9 sample_state() [2/2]

```
void dds::sub::status::DataState::sample_state (
            const SampleState & the_sample_state )  [inline]
```

Access the SampleState.

8.65.3.10 view_state() [1/2]

```
const ViewState & dds::sub::status::DataState::view_state ( ) const  [inline]
```

Access the ViewState.

8.65.3.11 view_state() [2/2]

```
void dds::sub::status::DataState::view_state (
            const ViewState & the_view_state )  [inline]
```

Access the ViewState.

8.65.3.12 instance_state() [1/2]

```
const InstanceState & dds::sub::status::DataState::instance_state ( ) const  [inline]
```

Access the InstanceState.

8.65.3.13 instance_state() [2/2]

```
void dds::sub::status::DataState::instance_state (
            const InstanceState & the_instance_state )  [inline]
```

Access the InstanceState.

8.65.3.14 any()

```
static  DataState dds::sub::status::DataState::any ( )  [inline], [static]
```

Create a DataState with InstanceState::any(), ViewState::any(), and SampleState::any()

8.65.3.15 new_data()

```
static DataState dds::sub::status::DataState::new_data ( ) [inline], [static]
```

Create a DataState with InstanceState::alive(), ViewState::any(), and SampleState::not_read()

8.65.3.16 any_data()

```
static DataState dds::sub::status::DataState::any_data ( ) [inline], [static]
```

Create a DataState with InstanceState::alive(), ViewState::any(), and SampleState::any()

8.65.3.17 new_instance()

```
static DataState dds::sub::status::DataState::new_instance ( ) [inline], [static]
```

Create a DataState with InstanceState::alive(), ViewState::new_view(), and SampleState::any()

8.65.4 Friends And Related Function Documentation

8.65.4.1 swap

```
void swap (
            DataStateEx & left,
            DataStateEx & right ) [friend]
```

Swap the contents of two DataState objects.

8.66 dds::core::policy::DataTag Class Reference

Stores name-value (string) pairs that can be used to determine access permissions.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Types

- typedef std::pair< std::string, std::string > **Entry**

  *The type of the elements that **DataTag** (p. 1132) contains.*

Public Member Functions

- **DataTag** ()

  Creates a policy with an empty sequence of tags.
- template<typename EntryIter >
  DataTag (EntryIter begin, EntryIter end)

  *Creates a **DataTag** (p. 1132) container with the entries specified by an iterator range.*
- **DataTag** (std::initializer_list< **Entry** > entries)

  <<***C++11***>> *(p. 353) Creates a **DataTag** (p. 1132) container with entries from an initializer_list*
- void **set** (std::initializer_list< **Entry** > entries)

  <<***C++11***>> *(p. 353) Adds tags from an initializer_list*
- bool **exists** (const std::string &key) const

  Returns true if a tag exists.
- std::string **get** (const std::string &key) const

  Returns the value of a tag identified by a key if it exists.
- **rti::core::optional_value**< std::string > **try_get** (const std::string &key) const

  Returns the value of a tag identified by a key or an empty optional_value if it doesn't exist.
- **DataTag** & **set** (const **Entry** &tag)

  Adds or assigns a tag from a pair of strings.
- template<typename EntryIter >
  DataTag & **set** (EntryIter begin, EntryIter end)

  Adds a range of tags.
- bool **remove** (const std::string &key)

  Removes the tag identified by a key.
- size_t **size** () const

  Returns the number of tags.
- std::map< std::string, std::string > **get_all** () const

  Retrieves a copy of all the entries in a std::map.

8.66.1 Detailed Description

Stores name-value (string) pairs that can be used to determine access permissions.

Entity:

dds::sub::DataReader (p. 976) **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = N/A;
Changeable (p. 514) = **NO** (p. 514)

8.66.2 Usage

The DATA_TAG QoS policy can be used to associate a set of tags in the form of (name, value) pairs with a **dds::sub↩ ::DataReader** (p. 976) or **dds::pub::DataWriter** (p. 1138). This is similar to the **rti::core::policy::Property** (p. 1969), except for the following differences:

- Data tags are always propagated. You cannot select whether or not a particular pair should be propagated.
- Data tags are not exposed to API functions, such as **dds::pub::matched_subscription_data()** (p. 650), that receive **dds::topic::PublicationBuiltinTopicData** (p. 1977) or **dds::topic::SubscriptionBuiltinTopic↩ Data** (p. 2428) as a parameter.
- Connext passes data tags to the Access Control Security Plugin, which may use them to decide whether to allow or deny the corresponding entities.

There are helper functions to facilitate working with data tags. See the **DATA_TAG** (p. 523) page.

8.66.3 Member Typedef Documentation

8.66.3.1 Entry

```
typedef std::pair<std::string, std::string>  dds::core::policy::DataTag::Entry
```

The type of the elements that **DataTag** (p. 1132) contains.

Key/value string pairs.

8.66.4 Constructor & Destructor Documentation

8.66.4.1 DataTag() [1/3]

```
dds::core::policy::DataTag::DataTag ( )  [inline]
```

Creates a policy with an empty sequence of tags.

8.66.4.2 DataTag() [2/3]

```
template<typename EntryIter >
dds::core::policy::DataTag::DataTag (
            EntryIter begin,
            EntryIter end )  [inline]
```

Creates a **DataTag** (p. 1132) container with the entries specified by an iterator range.

See also

set(EntryIter, EntryIter) (p. 1136)

8.66.4.3 DataTag() [3/3]

```
dds::core::policy::DataTag::DataTag (
            std::initializer_list<  Entry > entries )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a **DataTag** (p. 1132) container with entries from an initializer_list

For example:
```
DataTag my_tags {{"key 1", "value 1"}, {"key 2", "value 2"}};
```

If a key is duplicated, only one entry will be inserted, with the value that comes last.

8.66.5 Member Function Documentation

8.66.5.1 set() [1/3]

```
void dds::core::policy::DataTag::set (
            std::initializer_list<  Entry > entries )  [inline]
```

<<***C++11***>> *(p. 353)* Adds tags from an initializer_list

8.66.5.2 exists()

```
bool dds::core::policy::DataTag::exists (
            const std::string & key ) const  [inline]
```

Returns true if a tag exists.

8.66.5.3 get()

```
std::string dds::core::policy::DataTag::get (
            const std::string & key ) const  [inline]
```

Returns the value of a tag identified by a key if it exists.

If the tag doesn't exist it throws **dds::core::PreconditionNotMetError** (p. 1941).

8.66.5.4 try_get()

```
rti::core::optional_value< std::string > dds::core::policy::DataTag::try_get (
            const std::string & key ) const  [inline]
```

Returns the value of a tag identified by a key or an empty optional_value if it doesn't exist.

8.66.5.5 set() [2/3]

```
DataTag & dds::core::policy::DataTag::set (
            const  Entry & tag )  [inline]
```

Adds or assigns a tag from a pair of strings.

If the key doesn't exist it adds the new entry. Otherwise it overrides its value with the new one.

Parameters

tag	`tag.first` is the key and `tag.second` is the value

8.66.5.6 set() [3/3]

```
template<typename EntryIter >
DataTag & dds::core::policy::DataTag::set (
            EntryIter begin,
            EntryIter end )  [inline]
```

Adds a range of tags.

If a key is duplicated, only one entry will remain, with the value that comes last.

Template Parameters

EntryIter	A forward iterator whose value type is **DataTag::Entry** (p. 1134), such as the iterators of a `std::map<std::string, std::string>`.

Parameters

begin	Beginning of a range of Entry
end	End of that range

8.66.5.7 remove()

```
bool dds::core::policy::DataTag::remove (
             const std::string & key )  [inline]
```

Removes the tag identified by a key.

Returns

true if the tag was removed or false if it didn't exist.

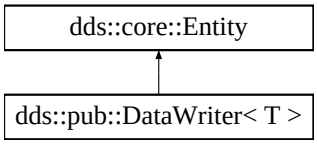
8.66.5.8 size()

```
size_t dds::core::policy::DataTag::size ( ) const  [inline]
```

Returns the number of tags.

8.66.5.9 get_all()

```
std::map< std::string, std::string > dds::core::policy::DataTag::get_all ( ) const  [inline]
```



Retrieves a copy of all the entries in a std::map.

8.67 dds::pub::DataWriter< T > Class Template Reference

<<***reference-type***>> *(p. 351)* Allows an application to publish data for a **dds::topic::Topic** (p. 2474)

`#include <dds/pub/DataWriter.hpp>`

Inheritance diagram for dds::pub::DataWriter< T >:

Public Member Functions

- **DataWriter** (const **dds::pub::Publisher** &pub, const **dds::topic::Topic**< T > &the_topic)

  *Creates a **DataWriter** (p. 1138).*
- **DataWriter** (const **dds::pub::Publisher** &pub, const **dds::topic::Topic**< T > &the_topic, const **dds::pub::qos::DataWriterQos** &the_qos, **dds::pub::DataWriterListener**< T > *the_listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())

  *Creates a **DataWriter** (p. 1138) with QoS and listener.*
- **DataWriter** (const **dds::pub::Publisher** &pub, const **dds::topic::Topic**< T > &the_topic, const **dds::pub::qos::DataWriterQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())

  *Creates a **DataWriter** (p. 1138) with QoS and listener.*
- **DataWriter** (const **dds::topic::Topic**< T > & **topic**)

  *Creates a **DataWriter** (p. 1138).*
- **DataWriter** (const **dds::topic::Topic**< T > & **topic**, const **dds::pub::qos::DataWriterQos** & **qos**)

  *Creates a **DataWriter** (p. 1138) with QoS.*
- **DataWriter** (const **dds::topic::Topic**< T > & **topic**, const **dds::pub::qos::DataWriterQos** & **qos**, std::shared_ptr< **Listener** > **listener**, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())

  *Creates a **DataWriter** (p. 1138) with QoS and listener.*
- void **write** (const T &instance_data)

  Modifies the value of a data instance.
- void **write** (const T &instance_data, const **dds::core::Time** &timestamp)

  Modifies the value of a data instance and specifies the timestamp.
- void **write** (const T &instance_data, const **dds::core::InstanceHandle** &handle)

  Modifies the value of a data instance.
- void **write** (const T &instance_data, const **dds::core::InstanceHandle** &handle, const **dds::core::Time** &source_timestamp)

  Modifies the value of a data instance and specifies the timestamp.
- void **write** (const **dds::topic::TopicInstance**< T > &topic_instance)

  *Write a **dds::topic::TopicInstance** (p. 2505).*
- void **write** (const **dds::topic::TopicInstance**< T > &topic_instance, const **dds::core::Time** &timestamp)

  Write a topic instance with time stamp.

- template<typename FWIterator >
  void **write** (const FWIterator &begin, const FWIterator &end)
- template<typename FWIterator >
  void **write** (const FWIterator &begin, const FWIterator &end, const **dds::core::Time** &timestamp)
- template<typename SamplesFWIterator , typename HandlesFWIterator >
  void **write** (const SamplesFWIterator &data_begin, const SamplesFWIterator &data_end, const Handles↩
  FWIterator &handle_begin, const HandlesFWIterator &handle_end)

  Write a series of samples and their parallel instance handles.
- template<typename SamplesFWIterator , typename HandlesFWIterator >
  void **write** (const SamplesFWIterator &data_begin, const SamplesFWIterator &data_end, const Handles↩
  FWIterator &handle_begin, const HandlesFWIterator &handle_end, const **dds::core::Time** &timestamp)

  Write a series of samples and their parallel instance handles and a timestamp.
- **DataWriter** & **operator**<< (const T &data)

  Writes a sample.
- **DataWriter** & **operator**<< (const std::pair< T, **dds::core::Time** > &data)

  Writes a sample with a timestamp.
- **DataWriter** & **operator**<< (const std::pair< T, **dds::core::InstanceHandle** > &data)

  Writes a sample with an instance handle.
- const **dds::core::InstanceHandle** **register_instance** (const T &instance_data)

  Informs RTI Connext that the application will be modifying a particular instance.
- const **dds::core::InstanceHandle** **register_instance** (const T &instance_data, const **dds::core::Time** &source_timestamp)

  Informs RTI Connext that the application will be modifying a particular instance and specifies the timestamp.
- **DataWriter** & **unregister_instance** (const **dds::core::InstanceHandle** &handle)

  Unregister an instance.
- **DataWriter** & **unregister_instance** (const **dds::core::InstanceHandle** &handle, const **dds::core::Time** &source_timestamp)

  Unregister an instance with timestamp.
- **DataWriter** & **dispose_instance** (const **dds::core::InstanceHandle** &handle)

  Requests the middleware to delete the instance identified by the instance handle.
- **DataWriter** & **dispose_instance** (const **dds::core::InstanceHandle** &the_instance_handle, const **dds**↩
  ::core::Time &source_timestamp)

  Dispose an instance with a timestamp.
- T & **key_value** (T &key_holder, const **dds::core::InstanceHandle** &handle)

  Retrieve the instance key that corresponds to an instance handle.
- **dds::topic::TopicInstance**< T > & **key_value** (**dds::topic::TopicInstance**< T > &key_holder, const **dds**↩
  ::core::InstanceHandle &handle)

  Retrieve the instance key that corresponds to an instance handle.
- **dds::core::InstanceHandle** **lookup_instance** (const T &key_holder)

  Retrieve the instance handle that corresponds to an instance key_holder.
- const **dds::pub::qos::DataWriterQos** **qos** () const

  Gets the DataWriterQos.
- void **qos** (const **dds::pub::qos::DataWriterQos** &the_qos)

  Sets the DataWriterQos.
- **DataWriter** & **operator**<< (const **dds::pub::qos::DataWriterQos** &the_qos)

  Set the DataWriterQos.
- const **DataWriter** & **operator**>> (**dds::pub::qos::DataWriterQos** &the_qos) const

  Get the DataWriterQos.

- const **dds::topic::Topic**< T > & **topic** () const

  *Get the Topic associated with this **DataWriter*** (p. *1138).*
- const **dds::pub::Publisher** & **publisher** () const

  *Get the **Publisher*** (p. *1993) that owns this **DataWriter*** (p. *1138).*
- void **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)

  *Blocks the calling thread until all data written by reliable **DataWriter*** (p. *1138) entity is acknowledged, or until timeout expires.*
- void **listener** (**DataWriterListener**< T > *l, const **dds::core::status::StatusMask** &mask)

  *Sets the **DataWriter*** (p. *1138) listener.*
- **DataWriterListener**< T > * **listener** () const

  *Returns the listener currently associated with this **DataWriter*** (p. *1138).*
- void **set_listener** (std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &event_↩ mask)

  Sets the listener associated with this writer.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)

  Sets the listener associated with this writer.
- std::shared_ptr< **Listener** > **get_listener** () const

  Returns the listener currently associated with this writer.
- const **dds::core::status::LivelinessLostStatus** **liveliness_lost_status** ()

  Get the LivelinessLostStatus.
- const **dds::core::status::OfferedDeadlineMissedStatus** **offered_deadline_missed_status** ()

  Get the OfferedDeadlineMissedStatus.
- const **dds::core::status::OfferedIncompatibleQosStatus** **offered_incompatible_qos_status** ()

  Get the OfferedIncompatibleQosStatus.
- const **dds::core::status::PublicationMatchedStatus** **publication_matched_status** ()

  Get the PublicationMatchedStatus.
- void **assert_liveliness** ()

  *Manually asserts the liveliness of this **DataWriter*** (p. *1138).*
- void **unregister_instance** (**rti::pub::WriteParams** &params)

  *<<**extension**>> (p. 354) Unregister an instance with parameters*

8.67.1 Detailed Description

template<typename T>
class dds::pub::DataWriter< T >

*<<**reference-type**>> (p. 351)* Allows an application to publish data for a **dds::topic::Topic** (p. 2474)

Template Parameters

T	The topic-type that the **DataWriter** (p. 1138) publishes

QoS:

dds::pub::qos::DataWriterQos (p. 1226)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2383), **dds::core::status::LivelinessLostStatus** (p. 1655);
dds::core::status::StatusMask::offered_deadline_missed() (p. 2379), **dds::core::status::OfferedDeadlineMissedStatus** (p. 1871);
dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::OfferedIncompatibleQosStatus** (p. 1873);
dds::core::status::StatusMask::publication_matched() (p. 2384), **dds::core::status::PublicationMatchedStatus** (p. 1990);
dds::core::status::StatusMask::reliable_reader_activity_changed() (p. 2385), **rti::core::status::ReliableReaderActivityChangedStatus** (p. 2157);
dds::core::status::StatusMask::reliable_writer_cache_changed() (p. 2385), **rti::core::status::ReliableWriterCacheChangedStatus** (p. 2159).

Listener:

dds::pub::DataWriterListener (p. 1202)

A **dds::pub::DataWriter** (p. 1138) is attached to exactly one **dds::pub::Publisher** (p. 1993), that acts as a factory for it.

A **dds::pub::DataWriter** (p. 1138) is bound to exactly one **dds::topic::Topic** (p. 2474) and therefore to exactly one data type. The **dds::topic::Topic** (p. 2474) must exist prior to the **dds::pub::DataWriter** (p. 1138)'s creation.

The following operations may be called even if the **dds::pub::DataWriter** (p. 1138) is not enabled. Other operations will fail with **dds::core::NotEnabledError** (p. 1869) if called on a disabled **dds::pub::DataWriter** (p. 1138):

- **dds::pub::DataWriter::qos(const dds::pub::qos::DataWriterQos&)** (p. 1166), **dds::pub::DataWriter::qos() const** (p. 1166), **dds::pub::DataWriter::set_listener** (p. 1169), **dds::pub::DataWriter::get_listener** (p. 1170), **dds::core::Entity::enable** (p. 1524), **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2373) and **dds::core::Entity::status_changes()** (p. 1525) **dds::pub::DataWriter::liveliness_lost_status()** (p. 1171), **dds::pub::DataWriter::offered_deadline_missed_status()** (p. 1171), **dds::pub::DataWriter::offered_incompatible_qos_status()** (p. 1171), **dds::pub::DataWriter::publication_matched_status()** (p. 1172), **dds::pub::DataWriter::reliable_writer_cache_changed_status()** (p. 1175), **dds::pub::DataWriter::reliable_reader_activity_changed_status()** (p. 1175) **dds::pub::DataWriter::service_request_accepted_status()** (p. 1178)

Several **dds::pub::DataWriter** (p. 1138) may operate in different threads. If they share the same **dds::pub::Publisher** (p. 1993), the middleware guarantees that its operations are thread-safe.

See also

Operations Allowed in Listener Callbacks (p. 1639)

8.67.2 Notes about DataWriter destruction

The deletion of the **dds::pub::DataWriter** (p. 1138) will automatically unregister all instances.

The **DataWriter** (p. 1138) destructor will not throw any exceptions even if the destruction fails. Calling **close()** (p. 1525) will throw in case of failure

DataWriter Use Cases (p. 311)

Entity Use Cases (p. 325)

Examples

Foo_publisher.cxx.

8.67.3 Constructor & Destructor Documentation

8.67.3.1 DataWriter() [1/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
            const  dds::pub::Publisher & pub,
            const  dds::topic::Topic< T > & the_topic )  [inline]
```

Creates a **DataWriter** (p. 1138).

It uses the default DataWriterQos, and sets no listener.

Parameters

pub	The publisher that this **DataWriter** (p. 1138) belongs to
the_topic	The Topic associated with this **DataWriter** (p. 1138)

See also

DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask& mask) (p. 1145)

8.67.3.2 DataWriter() [2/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
             const  dds::pub::Publisher & pub,
             const  dds::topic::Topic< T > & the_topic,
             const  dds::pub::qos::DataWriterQos & the_qos,
              dds::pub::DataWriterListener< T > * the_listener = NULL,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Creates a **DataWriter** (p. 1138) with QoS and listener.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

When a **DataWriter** (p. 1138) is created, only those transports already registered are available to the **DataWriter** (p. 1138). See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DataWriter** (p. 1138) will be created.

The given **dds::topic::Topic** (p. 2474) must have been created from the same participant as this publisher. If it was created from a different participant, this method will fail.

Parameters

pub	The publisher that this **DataWriter** (p. 1138) belongs to
the_topic	The Topic associated with this **DataWriter** (p. 1138)
the_qos	QoS to be used for creating the new Datawriter.
the_listener	The **DataWriter** (p. 1138) listener. The caller owns the listener and is responsible for deleting it only after resetting it or after deleting the **DataWriter** (p. 1138).
mask	Changes of communication status to be invoked on the listener

dds::pub::Publisher::default_datawriter_qos() (p. 1998)

dds::pub::qos::DataWriterQos::operator=(const dds::topic::qos::TopicQos&) (p. 1230) which allows assigning the contents of a TopicQos into a DataWriterQos

listener() (p. 1169)

8.67.3.3 DataWriter() [3/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
             const  dds::pub::Publisher & pub,
             const  dds::topic::Topic< T > & the_topic,
             const  dds::pub::qos::DataWriterQos & the_qos,
             std::shared_ptr<  Listener > the_listener,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Creates a **DataWriter** (p. 1138) with QoS and listener.

When a **DataWriter** (p. 1138) is created, only those transports already registered are available to the **DataWriter** (p. 1138). See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DataWriter** (p. 1138) will be created.

The given **dds::topic::Topic** (p. 2474) must have been created from the same participant as this publisher. If it was created from a different participant, this method will fail.

Parameters

pub	The publisher that this **DataWriter** (p. 1138) belongs to
the_topic	The Topic associated with this **DataWriter** (p. 1138)
the_qos	QoS to be used for creating the new Datawriter.
the_listener	A shared_ptr to the listener. See **set_listener()** (p. 1169) for more information.
mask	Indicates which status updates the listener will receive

See also

Specifying QoS on entities (p. 513) for information on setting QoS before entity creation

dds::pub::qos::DataWriterQos (p. 1226) for rules on consistency among QoS

dds::core::QosProvider::datawriter_qos() (p. 2035)

dds::pub::Publisher::default_datawriter_qos() (p. 1998)

dds::pub::qos::DataWriterQos::operator=(const dds::topic::qos::TopicQos&) (p. 1230) which allows assigning the contents of a TopicQos into a DataWriterQos

listener() (p. 1169)

8.67.3.4 DataWriter() [4/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
            const  dds::topic::Topic< T > & topic )  [inline], [explicit]
```

Creates a **DataWriter** (p. 1138).

It uses the default DataWriterQos, and sets no listener.

This constructor uses the implicit publisher to create this **DataWriter** (p. 1138) (**rti::pub::implicit_↩ publisher** (p. 738)(topic.participant())).

Parameters

topic	The Topic associated with this **DataWriter** (p. 1138)

See also

DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos↩ ::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask& mask) (p. 1145)

8.67.3.5 DataWriter() [5/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
            const  dds::topic::Topic< T > & topic,
            const  dds::pub::qos::DataWriterQos & qos )  [inline]
```

Creates a **DataWriter** (p. 1138) with QoS.

This constructor uses the implicit publisher to create this **DataWriter** (p. 1138)

Parameters

topic	The Topic associated with this **DataWriter** (p. 1138)
qos	QoS to be used for creating the new Datawriter.

See also

DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask& mask) (p. 1145)

8.67.3.6 DataWriter() [6/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
            const  dds::topic::Topic< T > & topic,
            const  dds::pub::qos::DataWriterQos & qos,
            std::shared_ptr<  Listener > listener,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Creates a **DataWriter** (p. 1138) with QoS and listener.

This constructor uses the implicit publisher to create this **DataWriter** (p. 1138)

Parameters

topic	The Topic associated with this **DataWriter** (p. 1138)
qos	QoS to be used for creating the new Datawriter.
listener	A shared_ptr to the listener. See **set_listener()** (p. 1169) for more information.
mask	Indicates which status updates the listener will receive

See also

DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask& mask) (p. 1145)

8.67.4 Member Function Documentation

8.67.4.1 write() [1/11]

```
template<typename T >
void  dds::pub::DataWriter< T >::write (
             const T & instance_data )  [inline]
```

Modifies the value of a data instance.

This operations does the same as **write(const T&, const dds::core::InstanceHandle&)** (p. 1149) except that it deduces the identity of the instance from `instance_data` (by means of the key).

Parameters

instance_data	The data sample to write.

See also

write(const T&, const dds::core::InstanceHandle&) (p. 1149)

Examples

Foo_publisher.cxx.

8.67.4.2 write() [2/11]

```
template<typename T >
void  dds::pub::DataWriter< T >::write (
             const T & instance_data,
             const  dds::core::Time & timestamp )  [inline]
```

Modifies the value of a data instance and specifies the timestamp.

See also

void **write(const T&, const dds::core::InstanceHandle&, const dds::core::Time&)** (p. 1153)

Notes about DataWriter destruction (p. 1144)

8.67.4.3 write() [3/11]

```
template<typename T >
void  dds::pub::DataWriter< T >::write (
            const T & instance_data,
            const  dds::core::InstanceHandle & handle )  [inline]
```

Modifies the value of a data instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **dds::sub::DataReader** (p. 976) objects by means of the `source_timestamp` attribute inside the **dds::sub::SampleInfo** (p. 2285). (Refer to **dds::sub::SampleInfo** (p. 2285) and **DESTINATION_ORDER** (p. 524) QoS policy for details).

As a side effect, this operation asserts liveliness on the **dds::pub::DataWriter** (p. 1138) itself, the **dds::pub::Publisher** (p. 1993) and the **dds::domain::DomainParticipant** (p. 1326).

Note that the special value **dds::core::InstanceHandle::nil()** (p. 1614) can be used for the parameter `handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `handle` is any value other than **dds::core::InstanceHandle::nil()** (p. 1614), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619).

RTI Connext will not detect the error when the handle is any value other than **dds::core::InstanceHandle::nil()** (p. 1614), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connext will treat as if the **write()** (p. 1148) operation is for the instance as indicated by the `handle`.

This operation may block if the **RELIABILITY** (p. 544) `kind` is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) and the modification would cause data to be lost or else cause one of the limits specified in the **RESOURCE_LIMITS** (p. 546) to be exceeded.

This operation will not block when using **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157). If you are using BEST_EFFORT Reliability in combination with **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019), then instead of being blocked, samples that are queued to be sent by the asynchronous publishing thread will be overwritten when the number of DDS samples that are currently queued has reached the `depth` QoS value in the **dds::core::policy::History** (p. 1602).

If **dds::core::policy::Reliability::max_blocking_time** (p. 2153) elapses before the **dds::pub::DataWriter** (p. 1138) can store the modification without exceeding the limits, the operation will fail and return **dds::core::TimeoutError** (p. 2473) for KEEP_ALL configurations.

Here is how the write operation behaves when **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607) and **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) are used:

- The send window size is determined by the **rti::core::policy::RtpsReliableWriterProtocol::max_send_window_size** (p. 2250) and **rti::core::policy::RtpsReliableWriterProtocol::min_send_window_size** (p. 2249) fields in the **rti::core::policy::DataWriterProtocol** (p. 1210). If a send window is specified (max_send_window_size is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **dds::core::policy::Reliability::max_blocking_time** (p. 2153) expires.

- Then, the **dds::pub::DataWriter** (p. 1138) will try to add the new sample to the writer history.
- If the instance associated with the sample is present in the writer history and there are `depth` (in the **HISTORY** (p. 533)) samples in the instance, the **DataWriter** (p. 1138) will replace the oldest sample of that instance independently of that sample's acknowledged status, and the write operation will return . Otherwise, no sample will be replaced and the write operation will continue.
- If the instance associated with the sample is not present in the writer history and **dds::core::policy::Resource↩ Limits::max_instances** (p. 2206) is exceeded, the **DataWriter** (p. 1138) will try to replace an existing instance (and its samples) according to the value of **rti::core::policy::DataWriterResourceLimits::instance↩ _replacement** (p. 1241) (see DataWriterResourceLimitsInstanceReplacementKind).
  - If no instance can be replaced, the write operation returns **dds::core::OutOfResourcesError** (p. 1898).
- If **dds::core::policy::ResourceLimits::max_samples** (p. 2205) is exceeded, the **DataWriter** (p. 1138) will try to drop a sample from a different instance as follows:
  - The **DataWriter** (p. 1138) will try first to remove a fully ACKed (2) sample from a different instance 'I' as long as that sample is not the last remaining sample for the instance 'I'. To find this sample, the **DataWriter** (p. 1138) starts iterating from the oldest sample in the writer history to the newest sample.
  - If no such sample is found, the **DataWriter** (p. 1138) will replace the oldest sample in the writer history.
- The sample is added to the writer history, and the write operation returns .

Here is how the write operation behaves when **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607) and **dds↩ ::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) are used:

- The send window size is determined by the **rti::core::policy::RtpsReliableWriterProtocol::max_send_↩ window_size** (p. 2250) and **rti::core::policy::RtpsReliableWriterProtocol::min_send_window_size** (p. 2249) fields in the **DATA_WRITER_PROTOCOL** (p. 521). If a send window is specified (max_send_window_size is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **dds::core::policy::Reliability::max_blocking_time** (p. 2153) expires.
  - If the max_blocking_time expires, the write operation returns **dds::core::TimeoutError** (p. 2473).
- When a sample is protocol-ACKed (1) before max_blocking_time expires, the **DataWriter** (p. 1138) will try to add the sample to the writer history as follows:
  - If the instance associated with the sample is not present in the writer history and max_instances is exceeded, the **DataWriter** (p. 1138) will try to replace an existing instance (and its samples) according to the value of **rti::core::policy::DataWriterResourceLimits::instance_replacement** (p. 1241) (see Data↩ WriterResourceLimitsInstanceReplacementKind).
    - If no instance can be replaced, the write operation returns **dds::core::OutOfResourcesError** (p. 1898).
  - If **dds::core::policy::ResourceLimits::max_samples** (p. 2205) is exceeded, the **DataWriter** (p. 1138) will go through the samples in the order in which they were added, and it will replace the first sample that is fully ACKed (2).
    - If no fully ACKed sample is found, the **DataWriter** (p. 1138) will block (3) until a sample is fully ACKed and can be replaced or **dds::core::policy::Reliability::max_blocking_time** (p. 2153) expires. If the max_blocking_time expires, the write operation will return **dds::core::TimeoutError** (p. 2473).
  - If **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) is exceeded, the **Data↩ Writer** (p. 1138) will go through the samples of the instance in the order in which they were added, and it will replace the first sample that is fully ACKed.

    - If no fully ACKed sample is found, the **DataWriter** (p. 1138) will block (3) until a sample is fully ACKed and can be replaced or the max_blocking_time expires. If the max_blocking_time expires, the write operation will return **dds::core::TimeoutError** (p. 2473).
  - The sample is added to the writer history, and the write operation returns .

If there are no instance resources left, this operation may fail with **dds::core::OutOfResourcesError** (p. 1898). Calling **dds::pub::DataWriter::unregister_instance** (p. 1160) may help freeing up some resources.

This operation will fail with **dds::core::PreconditionNotMetError** (p. 1941) if the timestamp is less than the timestamp used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp).

If an instance obtained from **dds::pub::DataWriter::get_loan** (p. 1183) is modified with this operation, then all instances modified thereafter should be from **dds::pub::DataWriter::get_loan** (p. 1183).

See **rti::core::policy::AcknowledgmentKind_def** (p. 797) for more information on the following notes:

(1) A sample in the writer history is considered "protocol ACKed" when the sample has been individually ACKed at the RTPS protocol level by each one of the DataReaders that matched the **DataWriter** (p. 1138) at the moment the sample was added to the writer queue.

- Late joiners do not change the protocol ACK state of a sample. If a sample is marked as protocol ACKed because it has been acknowledged by all the matching DataReaders and a DataReader joins later on, the historical sample is still considered protocol ACKed even if it has not been received by the late joiner.
- If a sample 'S1' is protocol ACKed and a TopicQuery is received, triggering the publication of 'S1', the sample is still considered protocol ACKed. If a sample 'S1' is not ACKed and a TopicQuery is received triggering the publication of 'S1', the **DataWriter** (p. 1138) will require that both the matching DataReaders on the live RTPS channel and the DataReader on the TopicQuery channel individually protocol ACK the sample in order to consider the sample protocol ACKed.

(2) A sample in the writer history is considered "fully ACKed" when all of the following conditions are met:

- The sample is protocol-ACKed.
- The sample has been "application-level ACKed" by all the DataReaders matching the **DataWriter** (p. 1138) that have their **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) set to **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798) or **rti::core::policy::AcknowledgmentKind_def::APPLICATION_AUTO** (p. 798). Once the sample is application-level ACKed, it cannot change its status to not ACKed after new DataReaders are matched. (Application-level ACK occurs when the application acknowledges receipt of a sample.)
- If required subscriptions are enabled (see **rti::core::policy::Availability** (p. 868)), the sample must also be ACKed by all the required subscriptions configured on the **DataWriter** (p. 1138).

(3) It is possible within a single call to the write operation for a **DataWriter** (p. 1138) to block both when the send window is full and then again when **dds::core::policy::ResourceLimits::max_samples** (p. 2205) or **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) is exceeded. This can happen because blocking on the send window only considers protocol-ACKed samples, while blocking based on resource limits considers fully-ACKed samples. In any case, the total max blocking time of a single call to the write operation will not exceed **dds::core::policy::Reliability::max_blocking_time** (p. 2153).

Parameters

instance_data	<<***in***>> *(p. 355)* The data to write.

Parameters

handle	<<***in***>> *(p. 355)* Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p. 1158), or else the special value **dds::core::InstanceHandle::nil()** (p. 1614). If `T` has a key, `handle` must represent a registered instance of type `T`. Otherwise, this method may fail with **dds::core::InvalidArgumentError** (p. 1619).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473), **dds::core::PreconditionNotMetError** (p. 1941), **dds::core::OutOfResourcesError** (p. 1898), or **dds::core::NotEnabledError** (p. 1869).

MT Safety:

It is UNSAFE to modify `instance_data` before the operation has finished. The operation is otherwise SAFE.

See also

dds::sub::DataReader (p. 976)

dds::pub::DataWriter::write(const T&,const dds::core::Time&) (p. 1149)

DESTINATION_ORDER (p. 524)

8.67.4.4 write() [4/11]

```
template<typename T >
void  dds::pub::DataWriter< T >::write (
             const T & instance_data,
             const  dds::core::InstanceHandle & handle,
             const  dds::core::Time & source_timestamp )  [inline]
```

Modifies the value of a data instance and specifies the timestamp.

Explicitly provides the timestamp that will be available to the **dds::sub::DataReader** (p. 976) objects by means of the `source_timestamp` attribute inside the **dds::sub::SampleInfo** (p. 2285). (Refer to **dds::sub::SampleInfo** (p. 2285) and **DESTINATION_ORDER** (p. 524) QoS policy for details)

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **dds::pub::DataWriter::write()** (p. 1148) operation.

This operation may block and time out (**dds::core::TimeoutError** (p. 2473)) under the same circumtances described for **dds::pub::DataWriter::write()** (p. 1148).

If there are no instance resources left, this operation may fail with **dds::core::OutOfResourcesError** (p. 1898). Calling **dds::pub::DataWriter::unregister_instance** (p. 1160) may help free up some resources.

This operation may fail with **dds::core::InvalidArgumentError** (p. 1619) under the same circumstances described for the write operation.

Parameters

instance_data	<<***in***>> *(p. 355)* The data to write.
handle	<<***in***>> *(p. 355)* Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p. 1158), or else the special value **dds::core::InstanceHandle::nil()** (p. 1614). If `T` has a key, `handle` must represent a registered instance of type `T`. Otherwise, this method may fail with **dds::core::InvalidArgumentError** (p. 1619).
source_timestamp	<<***in***>> *(p. 355)* When using **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264) the timestamp value must be greater than or equal to the timestamp value used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp) However, if it is less than the timestamp of the previous operation but the difference is less than the **dds::core::policy::DestinationOrder::source_timestamp_tolerance** (p. 1262), the timestamp of the previous operation will be used as the source timestamp of this sample. Otherwise, if the difference is greater than **dds::core::policy::DestinationOrder::source_timestamp_tolerance** (p. 1262), the function will return **dds::core::InvalidArgumentError** (p. 1619).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473), **dds::core::OutOfResourcesError** (p. 1898), or **dds::core::NotEnabledError** (p. 1869).

8.67.4.5 write() [5/11]

```
template<typename T >
void  dds::pub::DataWriter< T >::write (
            const  dds::topic::TopicInstance< T > & topic_instance )  [inline]
```

Write a **dds::topic::TopicInstance** (p. 2505).

A TopicInstance encapsulates the sample and its associated instance handle.

Parameters

topic_instance	The instance to write.

See also

write(const T&, const dds::core::InstanceHandle&) (p. 1149)

8.67.4.6 write() [6/11]

```
template<typename T >
void  dds::pub::DataWriter< T >::write (
            const  dds::topic::TopicInstance< T > & topic_instance,
            const  dds::core::Time & timestamp )  [inline]
```

Write a topic instance with time stamp.

Parameters

topic_instance	the TopicInstance to write.
timestamp	the timestamp for this sample.

            const FWIterator & end,
            const  dds::core::Time & timestamp )  [inline]
```

Write a series of samples or TopicInstances with a given timestamp

Template Parameters

FWIterator	A forward iterator. Depending on its value type this function can write data samples or TopicInstance objects.

Parameters

begin	The beginning of the range
end	The end of the range
timestamp	The timestamp to use for all samples in the range

See also

            const SamplesFWIterator & data_end,
            const HandlesFWIterator & handle_begin,
            const HandlesFWIterator & handle_end )  [inline]
```

Write a series of samples and their parallel instance handles.

Template Parameters

SamplesFWIterator	Sample forward iterator
HandlesFWIterator	InstanceHandle forward iterator

Parameters

data_begin	The beginning of the data sample range
data_end	The end of the data sample range
handle_begin	The beginning of the InstanceHandle range
handle_end	The end of the InstanceHandle range

See also

write(const T&, const dds::core::InstanceHandle&) (p. 1149)

template<typename T >
DataWriter &  dds::pub::DataWriter< T >::operator<< (
             const std::pair< T,  dds::core::InstanceHandle > & data )  [inline]
```

Writes a sample with an instance handle.

See also

write(const T&, const dds::core::InstanceHandle&) (p. 1149)

8.67.4.14 register_instance() [1/3]

```
template<typename T >
const  dds::core::InstanceHandle  dds::pub::DataWriter< T >::register_instance (
             const T & instance_data )  [inline]
```

Informs RTI Connext that the application will be modifying a particular instance.

This operation is only useful for keyed data types. Using it for non-keyed types causes no effect and returns **dds::core::InstanceHandle::nil()** (p. 1614). The operation takes as a parameter an instance (of which only the key value is examined) and returns a `handle` that can be used in successive **write()** (p. 1148) or **dispose_instance()** (p. 1162) operations.

The operation gives RTI Connext an opportunity to pre-configure itself to improve performance.

The use of this operation by an application is optional even for keyed types. If an instance has not been pre-registered, the application can call the **write()** (p. 1148) or dipose_instance() overloads that don't receive a **dds::core::InstanceHandle** (p. 1612) and RTI Connext will auto-register the instance.

For best performance, the operation should be invoked prior to calling any operation that modifies the instance, such as **dds::pub::DataWriter::write()** (p. 1148), **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 1149), **dds::pub::DataWriter::dispose_instance()** (p. 1162) and **dds::pub::DataWriter::dispose_instance(const dds::core::InstanceHandle&,const dds::core::Time&)** (p. 1163) and the handle used in conjunction with the data for those calls.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation may fail and return **dds::core::InstanceHandle::nil()** (p. 1614) if **dds::core::policy::ResourceLimits::max_instances** (p. 2206) limit has been exceeded.

The operation is **idempotent**. If it is called for an already registered instance, it just returns the already allocated handle. This may be used to lookup and retrieve the handle allocated to a given instance.

This operation can only be called after **dds::pub::DataWriter** (p. 1138) has been enabled. Otherwise, **dds::core::InstanceHandle::nil()** (p. 1614) will be returned.

Parameters

instance_data	<<***in***>> *(p. 355)* The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function.

Returns

For keyed data type, a handle that can be used in the calls that take a **dds::core::InstanceHandle** (p. 1612), such as write, dispose, unregister_instance, or return **dds::core::InstanceHandle::nil()** (p. 1614) on failure. If the instance_data is of a data type that has no keys, this function always returns **dds::core::InstanceHandle::nil()** (p. 1614).

See also

dds::pub::DataWriter::unregister_instance (p. 1160), **dds::pub::DataWriter::key_value** (p. 1164), **Relationship between registration, liveliness and ownership** (p. 1902)

8.67.4.15 register_instance() [2/3]

```
template<typename T >
const  dds::core::InstanceHandle  dds::pub::DataWriter< T >::register_instance (
             const T & instance_data,
             const  dds::core::Time & source_timestamp )  [inline]
```

Informs RTI Connext that the application will be modifying a particular instance and specifies the timestamp.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 524) QoS policy for details.

This operation may fail and return **dds::core::InstanceHandle::nil()** (p. 1614) if **dds::core::policy::ResourceLimits::max_instances** (p. 2206) limit has been exceeded.

This operation can only be called after **dds::pub::DataWriter** (p. 1138) has been enabled. Otherwise, **dds::core::InstanceHandle::nil()** (p. 1614) will be returned.

Parameters

instance_data	<<***in***>> *(p. 355)* The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function.
source_timestamp	<<***in***>> *(p. 355)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers.

Returns

For keyed data type, return a handle that can be used in the calls that take a **dds::core::InstanceHandle** (p. 1612), such as write, dispose, unregister_instance, or return **dds::core::InstanceHandle::nil()** (p. 1614) on failure. If the instance_data is of a data type that has no keys, this function always return **dds::core::InstanceHandle::nil()** (p. 1614).

See also

dds::pub::DataWriter::unregister_instance (p. 1160), **dds::pub::DataWriter::key_value** (p. 1164)

Notes about DataWriter destruction (p. 1144)

8.67.4.16 unregister_instance() [1/3]

```
template<typename T >
DataWriter &  dds::pub::DataWriter< T >::unregister_instance (
             const  dds::core::InstanceHandle & handle )  [inline]
```

Unregister an instance.

This operation is useful only for keyed data types. Using it for non-keyed types causes no effect and reports no error.

This operation should only be called on an instance that is currently registered. This includes instances that have been auto-registered by calling operations such as write or dispose as described in **dds::pub::DataWriter::register_instance** (p. 1158). Otherwise, this operation may fail with **dds::core::InvalidArgumentError** (p. 1619).

This only need be called just once per instance, regardless of how many times register_instance was called for that instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation informs RTI Connext that the **dds::pub::DataWriter** (p. 1138) is no longer going to provide any information about the instance. This operation also indicates that RTI Connext can locally remove all information regarding that instance. The application should not attempt to use the `handle` previously allocated to that instance after calling this function.

The parameter `handle` must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619).

If, after a **dds::pub::DataWriter::unregister_instance** (p. 1160), the application wants to modify (**dds::pub::DataWriter::write()** (p. 1148) or **dds::pub::DataWriter::dispose_instance()** (p. 1162)) an instance, it has to register it again, or else use the functions that don't receive a **dds::core::InstanceHandle** (p. 1612).

This operation does not indicate that the instance is deleted (that is the purpose of **dds::pub::DataWriter::dispose_instance()** (p. 1162)). The operation **dds::pub::DataWriter::unregister_instance** (p. 1160) just indicates that the **dds::pub::DataWriter** (p. 1138) no longer has anything to say about the instance. **dds::sub::DataReader** (p. 976) entities that are reading the instance may receive a sample with **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) for the instance, unless there are other **dds::pub::DataWriter** (p. 1138) objects writing that same instance.

dds::core::policy::WriterDataLifecycle::autodispose_unregistered_instances (p. 2661) controls whether instances are automatically disposed when they are unregistered.

This operation can affect the ownership of the data instance (see **OWNERSHIP** (p. 538)). If the **dds::pub::DataWriter** (p. 1138) was the exclusive owner of the instance, then calling **unregister_instance()** (p. 1160) will relinquish that ownership.

If **dds::core::policy::Reliability::kind** (p. 2153) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) and the unregistration would overflow the resource limits of this writer or of a reader, this operation may block for up to **dds::core::policy::Reliability::max_blocking_time** (p. 2153); if this writer is still unable to unregister after that period, this method will fail with **dds::core::TimeoutError** (p. 2473).

Parameters

handle	*<<**in**>> (p. 355)* represents the `instance` to be unregistered. It must represent an instance that has been registered. Otherwise, this method may fail with **dds::core::InvalidArgumentError** (p. 1619).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::pub::DataWriter::register_instance (p. 1158)

dds::pub::DataWriter::unregister_instance(const dds::core::InstanceHandle&,const dds::core::Time&) (p. 1161)

dds::pub::DataWriter::key_value (p. 1164)

Relationship between registration, liveliness and ownership (p. 1902)

8.67.4.17 unregister_instance() [2/3]

```
template<typename T >
DataWriter & dds::pub::DataWriter< T >::unregister_instance (
```

```
const  dds::core::InstanceHandle & handle,
const  dds::core::Time & source_timestamp )  [inline]
```

Unregister an instance with timestamp.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 524) QoS policy for details.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **dds::pub::DataWriter::unregister_instance** (p. 1160) operation.

This operation may block and may time out (**dds::core::TimeoutError** (p. 2473)) under the same circumtances described for the unregister_instance operation.

Parameters

handle	<<***in***>> *(p. 355)* represents the `instance` to be unregistered. It must represent an instance that has been registered. Otherwise, this method may fail with **dds::core::InvalidArgumentError** (p. 1619).
source_timestamp	<<***in***>> *(p. 355)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473) or **dds::core::NotEnabledError** (p. 1869).

See also

dds::pub::DataWriter::register_instance (p. 1158)

dds::pub::DataWriter::unregister_instance (p. 1160)

dds::pub::DataWriter::key_value (p. 1164)

8.67.4.18 dispose_instance() [1/3]

```
template<typename T >
DataWriter &  dds::pub::DataWriter< T >::dispose_instance (
              const  dds::core::InstanceHandle & handle )  [inline]
```

Requests the middleware to delete the instance identified by the instance handle.

This operation is useful only for keyed data types. Using it for non-keyed types has no effect and reports no error.

When an instance is disposed, the **dds::pub::DataWriter** (p. 1138) communicates this state change to **dds::sub::DataReader** (p. 976) objects by propagating a dispose sample. When the instance changes to a disposed state, you

can see the state change on the DataReader by looking at **dds::sub::status::DataState::instance_state()** (p. 1123) in **dds::sub::SampleInfo::state()** (p. 2289). Disposed instances have the value **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).

The resources allocated to dispose instances on the **DataWriter** (p. 1138) are not removed by default. The removal of the resources allocated to a dispose instance on the **DataWriter** (p. 1138) queue can be controlled by using the QoS **dds::core::policy::WriterDataLifecycle::autopurge_disposed_instances_delay** (p. 2664).

Likewise, on the DataReader, the removal of the resources associated with an instance in the dispose state can be controlled by using the QoS **dds::core::policy::ReaderDataLifecycle::autopurge_disposed_instances_delay** (p. 2142).

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **dds::sub::DataReader** (p. 976) objects by means of the source_timestamp attribute inside the **dds::sub::SampleInfo** (p. 2285).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the **dds::pub::DataWriter::unregister_instance** (p. 1160) operation.

This operation may block and time out (**dds::core::TimeoutError** (p. 2473)) under the same circumstances described for **dds::pub::DataWriter::write()** (p. 1148).

If there are no instance resources left, this operation may fail with **dds::core::OutOfResourcesError** (p. 1898). Calling **dds::pub::DataWriter::unregister_instance** (p. 1160) may help free up some resources.

Parameters

handle	The handle returned by a previous call to **register_instance()** (p. 1158) or **lookup_instance()** (p. 1165). If `instance_handle` doesn't correspond to an instance previously written or registered with this writer, this function fails with **dds::core::InvalidArgumentError** (p. 1619).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869).

See also

dds::pub::DataWriter::dispose_instance(const dds::core::InstanceHandle&,const dds::core::Time&) (p. 1163)

Relationship between registration, liveliness and ownership (p. 1902)

8.67.4.19 dispose_instance() [2/3]

```
template<typename T >
DataWriter &  dds::pub::DataWriter< T >::dispose_instance (
             const  dds::core::InstanceHandle & the_instance_handle,
             const  dds::core::Time & source_timestamp )  [inline]
```

Dispose an instance with a timestamp.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **dds::pub::DataWriter::dispose_instance()** (p. 1162) operation.

This operation may block and time out (**dds::core::TimeoutError** (p. 2473)) under the same circumtances described for **dds::pub::DataWriter::write()** (p. 1148).

If there are no instance resources left, this operation may fail with **dds::core::OutOfResourcesError** (p. 1898). Calling **dds::pub::DataWriter::unregister_instance** (p. 1160) may help freeing up some resources.

Parameters

the_instance_handle	<<***in***>> *(p. 355)* Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p. 1158), or else the special value **dds::core::InstanceHandle::nil()** (p. 1614). If `T` has a key, `handle` must represent a registered instance of type `T`. Otherwise, this method may fail with **dds::core::InvalidArgumentError** (p. 1619).
source_timestamp	<<***in***>> *(p. 355)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. This timestamp will be available to the **dds::sub::DataReader** (p. 976) objects by means of the `source_timestamp` attribute inside the **dds::sub::SampleInfo** (p. 2285).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869).

dds::pub::DataWriter::dispose_instance() (p. 1162)

8.67.4.20 key_value() [1/2]

```
template<typename T >
T &  dds::pub::DataWriter< T >::key_value (
             T & key_holder,
             const  dds::core::InstanceHandle & handle )  [inline]
```

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **dds::core::InvalidArgumentError** (p. 1619) if the `handle` does not correspond to an existing data-object known to the **dds::pub::DataWriter** (p. 1138).

Parameters

key_holder	<<***inout***>> *(p. 355)* a user data type specific key holder, whose `key` fields are filled by this operation. If `T` has no key, this method has no effect.

Parameters

handle	<<***in***>> *(p. 355)* the `instance` whose key is to be retrieved. If `T` *has* a key, `handle` must represent a registered instance of type T. Otherwise, this method will fail with **dds::core::InvalidArgumentError** (p. 1619). If `T` *has* a key and `handle` is **dds::core::InstanceHandle::nil()** (p. 1614), this method will fail with **dds::core::InvalidArgumentError** (p. 1619).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

Returns

A reference to `key_holder`

See also

dds::sub::DataReader::key_value (p. 1003)

8.67.4.21 key_value() [2/2]

```
template<typename T >
dds::topic::TopicInstance< T > &  dds::pub::DataWriter< T >::key_value (
              dds::topic::TopicInstance< T > & key_holder,
             const  dds::core::InstanceHandle & handle )  [inline]
```

Retrieve the instance key that corresponds to an instance handle.

See also

key_value(T&, const dds::core::InstanceHandle&) (p. 1164)

8.67.4.22 lookup_instance()

```
template<typename T >
dds::core::InstanceHandle  dds::pub::DataWriter< T >::lookup_instance (
            const T & key_holder )  [inline]
```

Retrieve the instance handle that corresponds to an instance key_holder.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason RTI Connext is unable to provide an instance handle, RTI Connext will return the special value HANDLE_NIL.

Parameters

key_holder	<<***in***>> *(*p. *355)* a user data type specific key holder.

Returns

the instance handle associated with this instance. If T has no key, this method has no effect and returns **dds::core::InstanceHandle::nil()** (p. 1614)

8.67.4.23 qos() [1/2]

```
template<typename T >
const  dds::pub::qos::DataWriterQos  dds::pub::DataWriter< T >::qos ( ) const  [inline]
```

Gets the DataWriterQos.

8.67.4.24 qos() [2/2]

```
template<typename T >
void  dds::pub::DataWriter< T >::qos (
            const  dds::pub::qos::DataWriterQos & the_qos )  [inline]
```

Sets the DataWriterQos.

This operation modifies the QoS of the **dds::pub::DataWriter** (p. 1138).

The **dds::core::policy::UserData** (p. 2591), **dds::core::policy::Deadline** (p. 1255), **dds::core::policy::LatencyBudget** (p. 1631), **dds::core::policy::OwnershipStrength** (p. 1906), **dds::core::policy::TransportPriority** (p. 2552), **dds::core::policy::Lifespan** (p. 1635) and **dds::core::policy::WriterDataLifecycle** (p. 2660) can be changed. The other policies are immutable.

Parameters

the_qos	<<***in***>> *(*p. *355)* The **dds::pub::qos::DataWriterQos** (p. 1226) to be set to. Policies must be consistent. Immutable policies cannot be changed after **dds::pub::DataWriter** (p. 1138) is enabled. The special value DATAWRITER_QOS_DEFAULT can be used to indicate that the QoS of the **dds::pub::DataWriter** (p. 1138) should be changed to match the current default **dds::pub::qos::DataWriterQos** (p. 1226) set in the **dds::pub::Publisher** (p. 1993).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::ImmutablePolicyError** (p. 1609) or **dds::core::InconsistentPolicyError** (p. 1610)

See also

dds::pub::qos::DataWriterQos (p. 1226) for rules on consistency among QoS

set_qos (abstract) (p. 1522)

Operations Allowed in Listener Callbacks (p. 1639)

8.67.4.25 operator<<() [4/4]

```
template<typename T >
DataWriter &  dds::pub::DataWriter< T >::operator<< (
            const  dds::pub::qos::DataWriterQos & the_qos )  [inline]
```

Set the DataWriterQos.

Parameters

the_qos	the new qos for this **DataWriter** (p. 1138).

See also

qos() (p. 1166)

8.67.4.26 operator>>()

```
template<typename T >
const  DataWriter &  dds::pub::DataWriter< T >::operator>> (
             dds::pub::qos::DataWriterQos & the_qos ) const  [inline]
```

Get the DataWriterQos.

Parameters

the_qos	the object to populate with the qos for this **DataWriter** (p. 1138).

See also

qos() (p. 1166)

8.67.4.27 topic()

```
template<typename T >
const  dds::topic::Topic< T > &  dds::pub::DataWriter< T >::topic ( ) const  [inline]
```

Get the Topic associated with this **DataWriter** (p. 1138).

8.67.4.28 publisher()

```
template<typename T >
const  dds::pub::Publisher &  dds::pub::DataWriter< T >::publisher ( ) const  [inline]
```

Get the **Publisher** (p. 1993) that owns this **DataWriter** (p. 1138).

8.67.4.29 wait_for_acknowledgments()

```
template<typename T >
void  dds::pub::DataWriter< T >::wait_for_acknowledgments (
            const  dds::core::Duration & max_wait )  [inline]
```

Blocks the calling thread until all data written by reliable **DataWriter** (p. 1138) entity is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable **dds::pub::DataWriter** (p. 1138) entity is acknowledged by (a) all reliable **dds::sub::DataReader** (p. 976) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged by all reliable matched data readers and by all required subscriptions; a timeout indicates that max_wait elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to wait_for_acknowledgments on a **DataWriter** (p. 1138) and a different thread writes new samples on the same **DataWriter** (p. 1138), the new samples must be acknowledged before unblocking the thread waiting on wait_for_acknowledgments.

If the **dds::pub::DataWriter** (p. 1138) does not have **dds::core::policy::Reliability** (p. 2149) kind set to RELIABLE, this operation will succeed immediately.

Parameters

max_wait	<<***in***>> *(p. 355)* Specifies maximum time to wait for acknowledgements **dds::core::Duration** (p. 1448) .

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869), **dds::core::TimeoutError** (p. 2473)

8.67.4.30 listener() [1/2]

```
template<typename T >
void  dds::pub::DataWriter< T >::listener (
             DataWriterListener< T > * l,
            const  dds::core::status::StatusMask & mask )  [inline]
```

Sets the **DataWriter** (p. 1138) listener.

[DEPRECATED] The use of **set_listener()** (p. 1169) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Parameters

l	The **DataWriterListener** (p. 1202) to set
mask	The **dds::core::status::StatusMask** (p. 2375) associated with the listener

8.67.4.31 listener() [2/2]

```
template<typename T >
DataWriterListener< T > *  dds::pub::DataWriter< T >::listener ( ) const  [inline]
```

Returns the listener currently associated with this **DataWriter** (p. 1138).

[DEPRECATED] Prefer **get_listener()** (p. 1170) instead of this function.

If there's no listener it returns NULL.

8.67.4.32 set_listener() [1/2]

```
template<typename T >
void  dds::pub::DataWriter< T >::set_listener (
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener associated with this writer.

The writer will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this writer is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the writer. If it does, the application needs to manually reset the listener or manually close this writer to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.
event_mask	A mask that indicates which status updates will be notified to the listener

8.67.4.33 set_listener() [2/2]

```
template<typename T >
void  dds::pub::DataWriter< T >::set_listener (
            std::shared_ptr<  Listener > the_listener )  [inline]
```

Sets the listener associated with this writer.

If `the_listener` is not `nullptr`, this overload is equivalent to:
`writer.set_listener(the_listener, dds::core::status::StatusMask::all());`

If `the_listener` is `nullptr`, it is equivalent to:
`writer.set_listener(nullptr, dds::core::status::StatusMask::none());`

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.

8.67.4.34 get_listener()

```
template<typename T >
std::shared_ptr< Listener > dds::pub::DataWriter< T >::get_listener ( ) const [inline]
```

Returns the listener currently associated with this writer.

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.67.4.35 liveliness_lost_status()

```
template<typename T >
const dds::core::status::LivelinessLostStatus dds::pub::DataWriter< T >::liveliness_lost_status
( ) [inline]
```

Get the LivelinessLostStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.67.4.36 offered_deadline_missed_status()

```
template<typename T >
const dds::core::status::OfferedDeadlineMissedStatus dds::pub::DataWriter< T >::offered_↩
deadline_missed_status ( ) [inline]
```

Get the OfferedDeadlineMissedStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.67.4.37 offered_incompatible_qos_status()

```
template<typename T >
const dds::core::status::OfferedIncompatibleQosStatus dds::pub::DataWriter< T >::offered_↩
incompatible_qos_status ( ) [inline]
```

Get the OfferedIncompatibleQosStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.67.4.38 publication_matched_status()

```
template<typename T >
const dds::core::status::PublicationMatchedStatus dds::pub::DataWriter< T >::publication_↩
matched_status ( ) [inline]
```

Get the PublicationMatchedStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.67.4.39 assert_liveliness()

```
template<typename T >
void dds::pub::DataWriter< T >::assert_liveliness ( ) [inline]
```

Manually asserts the liveliness of this **DataWriter** (p. 1138).

This is used in combination with the **LIVELINESS** (p. 535) policy to indicate to RTI Connext that the **dds::pub::Data↩ Writer** (p. 1138) remains active.

You only need to use this operation if the **LIVELINESS** (p. 535) setting is either **dds::core::policy::Liveliness↩ Kind_def::MANUAL_BY_PARTICIPANT** (p. 1655) or **dds::core::policy::LivelinessKind_def::MANUAL_BY_TOPIC** (p. 1655). Otherwise, it has no effect.

Note: writing data via the **dds::pub::DataWriter::write()** (p. 1148) or **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 1149) operation asserts liveliness on the **dds::pub::DataWriter** (p. 1138) itself, and its **dds↩ ::domain::DomainParticipant** (p. 1326). Consequently the use of **assert_liveliness()** (p. 1172) is only needed if the application is not writing data regularly.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::core::policy::Liveliness (p. 1645)

8.67.4.40 unregister_instance() [3/3]

```
template<typename T >
void unregister_instance (
              rti::pub::WriteParams & params )
```

<<***extension***>> *(p. 354)* Unregister an instance with parameters

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 1179)

dds::pub::DataWriter::dispose_instance(rti::pub::WriteParams&) (p. 1173)

8.67.4.41 dispose_instance() [3/3]

```
template<typename T >
void dispose_instance (
              rti::pub::WriteParams & params )
```

<<***extension***>> *(p. 354)* Dispose an instance with parameters

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 1179)

8.67.4.42 is_sample_app_acknowledged()

```
template<typename T >
bool is_sample_app_acknowledged (
            const  rti::core::SampleIdentity & sample_id )
```

<<***extension***>> *(p. 354)* Indicates if a sample is considered application-acknowledged

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This method can be used to see if a sample has been application acknowledged by all the matching DataReaders that were alive when the sample was written.

Parameters

sample_id	<<***in***>> *(p. 355)* Cannot be NULL. Sample identity.

Returns

true when the sample has been application acknowledged. Otherwise, false.

Exceptions

One	of the **Standard Exceptions** (p. 428)

Note

If the **DataWriter** (p. 1138) does not match with any DataReader that enables application acknowledgments (that is, a DataReader with **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) set to a value other than **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 797)), this method returns false.

8.67.4.43 wait_for_asynchronous_publishing()

```
template<typename T >
void wait_for_asynchronous_publishing (
            const  dds::core::Duration & max_wait )
```

<<***extension***>> *(p. 354)* Blocks the calling thread until asynchronous sending is complete.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **dds::pub::DataWriter** (p. 1138) is sent and acknowledged (if reliable) by all matched **dds::sub::DataReader** (p. 976) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; a time out indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **dds::sub::DataReader** (p. 976) is complete in addition to what **dds::pub::DataWriter::wait_for_acknowledgments** (p. 1168) provides.

If the **dds::pub::DataWriter** (p. 1138) does not have **rti::core::policy::PublishMode** (p. 2013) kind set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019) the operation will complete immediately .

Parameters

max_wait	<<***in***>> *(p. 355)* Specifies maximum time to wait for acknowledgements.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869), **dds::core::TimeoutError** (p. 2473)

8.67.4.44 reliable_writer_cache_changed_status()

```
template<typename T >
rti::core::status::ReliableWriterCacheChangedStatus reliable_writer_cache_changed_status ( )
```

<<***extension***>> *(p. 354)* Get the reliable cache status for this writer.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.67.4.45 reliable_reader_activity_changed_status()

```
template<typename T >
rti::core::status::ReliableReaderActivityChangedStatus reliable_reader_activity_changed_status ( )
```

<<***extension***>> *(p. 354)* Get the reliable reader activity changed status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.67.4.46 datawriter_cache_status()

```
template<typename T >
rti::core::status::DataWriterCacheStatus datawriter_cache_status ( )
```

<<***extension***>> *(p. 354)* Get the cache status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

8.67.4.47 datawriter_protocol_status()

```
template<typename T >
rti::core::status::DataWriterProtocolStatus datawriter_protocol_status ( )
```

<<***extension***>> *(p. 354)* Get the protocol status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

8.67.4.48 matched_subscription_datawriter_protocol_status() [1/2]

```
template<typename T >
rti::core::status::DataWriterProtocolStatus matched_subscription_datawriter_protocol_status (
            const  dds::core::InstanceHandle & subscription_handle )
```

*<<**extension**>> (p. 354)* Get the datawriter protocol status for this writer, per matched subscription identified by the subscription_handle.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters

subscription_handle	*<<**in**>> (p. 355)* Handle to a specific subscription associated with the **dds::sub::DataReader** (p. 976). Must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

8.67.4.49 matched_subscription_datawriter_protocol_status() [2/2]

```
template<typename T >
rti::core::status::DataWriterProtocolStatus matched_subscription_datawriter_protocol_status (
            const  rti::core::Locator & subscription_locator )
```

<<***extension***>> *(p. 354)* Get the datawriter protocol status for this writer, per matched subscription identified by the locator

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

Parameters

subscription_locator	<<***in***>> *(p. 355)* Locator to a specific locator associated with the DataReader. Must correspond to a locator of one or more subscriptions currently associated with the **DataWriter** (p. 1138).

8.67.4.50 service_request_accepted_status()

```
template<typename T >
rti::core::status::ServiceRequestAcceptedStatus service_request_accepted_status ( )
```

<<***extension***>> *(p. 354)* Get the service request accepted status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

8.67.4.51 flush()

```
template<typename T >
void flush ( )
```

<<***extension***>> *(*p. *354)* Flushes the batch in progress in the context of the calling thread.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

After being flushed, the batch is available to be sent on the network.

If the **dds::pub::DataWriter** (p. 1138) does not have **rti::core::policy::PublishMode** (p. 2013) kind set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019), the batch will be sent on the network immediately (in the context of the calling thread).

If the **dds::pub::DataWriter** (p. 1138) does have **rti::core::policy::PublishMode** (p. 2013) kind set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019), the batch will be sent in the context of the asynchronous publishing thread.

This operation may block in the same conditions as **dds::pub::DataWriter::write()** (p. 1148).

If this operation does block, the RELIABILITY max_blocking_time configures the maximum time the write operation may block (waiting for space to become available). If max_blocking_time elapses before the DDS_DataWriter is able to store the modification without exceeding the limits, the operation will fail with DDS_RETCODE_TIMEOUT.

MT Safety:

flush() (p. 1178) is only thread-safe with batching if **rti::core::policy::Batch::thread_safe_write** (p. 886) is TRUE.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869).

8.67.4.52 write() [11/11]

```
template<typename T >
void write (
            const T & instance_data,
             rti::pub::WriteParams & params )
```

<<***extension***>> *(*p. *354)* Write with advanced parameters

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Allows provision of the sample identity, related sample identity, source timestamp, instance handle, and publication priority contained in `params`.

This operation may block and time out (**dds::core::TimeoutError** (p. 2473)) under the same circumstances described for **dds::pub::DataWriter::write()** (p. 1148).

If there are no instance resources left, this operation may fail with **dds::core::OutOfResourcesError** (p. 1898). Calling **dds::pub::DataWriter::unregister_instance(rti::pub::WriteParams&)** (p. 1173) may help free up some resources.

This operation may fail with **dds::core::InvalidArgumentError** (p. 1619) under the same circumstances described for the **dds::pub::DataWriter::write()** (p. 1148).

Parameters

instance_data	<<***in***>> *(p. 355)* The data to write.
params	<<***inout***>> *(p. 355)* The write parameters. Note that this is an inout parameter if you activate **rti::pub::WriteParams::replace_automatic_values** (p. 2644); otherwise it won't be modified.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::TimeoutError** (p. 2473), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869).

dds::pub::DataWriter::write() (p. 1148)

dds::sub::DataReader (p. 976)

8.67.4.53 write_noexcept() [1/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
             const T & sample )  [noexcept]
```

<<***extension***>> *(p. 354)* Alternative to **write()** (p. 1148) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&)** (p. 1148) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Example:

```
auto result = writer->write_noexcept(sample);
if (!result.is_ok()) {
    if (result.get_return_code() == DDS_RETCODE_TIMEOUT) {
       // Handle timeout
    }
    // ...
}
```

Returns

The Result of the operation.

8.67.4.54 write_noexcept() [2/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
            const T & sample,
            const  dds::core::Time & timestamp )  [noexcept]
```

<<***extension***>> *(*p. *354)* Alternative to **write()** (p. 1148) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, const dds::core::Time&)** (p. 1149) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.67.4.55 write_noexcept() [3/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
            const T & sample,
            const  dds::core::InstanceHandle & instance )  [noexcept]
```

<<***extension***>> *(*p. *354)* Alternative to **write()** (p. 1148) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, const dds::core::InstanceHandle&)** (p. 1149) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.67.4.56 write_noexcept() [4/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
            const T & sample,
            const  dds::core::InstanceHandle & instance,
            const  dds::core::Time & timestamp )  [noexcept]
```

<<***extension***>> *(p. 354)* Alternative to **write()** (p. 1148) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, const dds::core::InstanceHandle&, const dds::core::Time&)** (p. 1153) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.67.4.57 write_noexcept() [5/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
            const T & instance_data,
             rti::pub::WriteParams & params )  [noexcept]
```

<<***extension***>> *(p. 354)* Alternative to **write()** (p. 1148) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, rti::pub::WriteParams&)** (p. 1179) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.67.4.58 create_data()

```
template<typename T >
T * create_data ( )
```

<<***extension***>> *(p. 354)* Create data from this writer and initialize it

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Returns

Newly created data type

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

dds::pub::DataWriter::delete_data (p. 1183)

8.67.4.59 delete_data()

```
template<typename T >
bool delete_data (
             T * sample )
```

<<***extension***>> *(p. 354)* Delete data created with **create_data()** (p. 1182).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The behavior of this API is identical to FooTypeSupport::delete_data.

Parameters

sample	<<***in***>> *(p. 355)* Cannot be NULL.

Returns

true on success.

See also

dds::pub::DataWriter::create_data (p. 1182)

8.67.4.60 get_loan()

```
template<typename T >
T * get_loan ( )
```

<<***extension***>> *(p. 354)* Get a loaned sample from this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation is supported while using **Zero Copy transfer** (p. 50) over shared memory" or \ref RTIFlatDataModule "FlatData language binding". For FlatData types, this function should be used directly if the type is final; if the type is mutable, **rti::flat::build_data()** (p. 411) should be used to obtain a sample builder to work with the loaned sample.

The loaned sample is obtained from a DataWriter-managed sample pool and is uninitialized by default. An initialized sample can be obtained by setting **rti::core::policy::DataWriterResourceLimits::initialize_writer_loaned_sample** (p. 1248) to true. The **rti::core::policy::DataWriterResourceLimits::writer_loaned_sample_allocation** (p. 1247) settings can be used to configure the DataWriter-managed sample pool.

dds::pub::DataWriter::get_loan (p. 1183) fails with **dds::core::OutOfResourcesError** (p. 1898) if **rti::core::↩ AllocationSettings::max_count** (p. 804) samples have been loaned, and none of those samples has been written with **dds::pub::DataWriter::write()** (p. 1148) or discarded via **dds::pub::DataWriter::discard_loan** (p. 1185).

Samples returned from **dds::pub::DataWriter::get_loan** (p. 1183) have an associated state. Due to the optimized nature of the write operation while using Zero Copy transfer over shared memory or FlatData language binding, this sample state is used to control when a sample is available for reuse after the write operation. The possible sample states are free, allocated, removed or serialized. A sample that has never been allocated is "free". **dds::pub::Data↩ Writer::get_loan** (p. 1183) takes a "free" or "removed" sample and makes it "allocated". When a sample is written, its state transitions from "allocated" to "serialized", and the **DataWriter** (p. 1138) takes responsibility for returning the sample back to its sample pool. The sample remains in the "serialized" state until it is removed from the **DataWriter** (p. 1138) queue. For a reliable **DataWriter** (p. 1138), the sample is removed from the **DataWriter** (p. 1138)'s queue when the sample is acknowledged by all DataReaders. For a best-effort **DataWriter** (p. 1138), the sample is removed from the queue immediately after the write operation. After the sample is removed from the **DataWriter** (p. 1138) queue, the sample is put back into the sample pool, and its state transitions from "serialized" to "removed". At this time, a new call to **dds::pub::DataWriter::get_loan** (p. 1183) may return the same sample.

A loaned sample should not be reused to write a new value after the first write operation. Instead, a new sample from **dds::pub::DataWriter::get_loan** (p. 1183) should be used to write the new value. A loaned sample that has not been written can be returned to the **DataWriter** (p. 1138)'s sample pool by using **dds::pub::DataWriter::discard_loan** (p. 1185). If the write operation fails, then the sample can be used again with a write or discard_loan operation. Disposing or unregistering an instance with loaned samples follows the same pattern. A loaned sample used successfully with a dispose or unregister operation cannot be used again. But if the dispose or unregister operation fails, the sample is available for reuse.

A **DataWriter** (p. 1138) cannot write managed samples (created with get_loan) and unmanaged samples (created in any other way) at the same time. The first call to get_loan automatically prepares this **DataWriter** (p. 1138) to work with managed samples. Calls to get_loan will fail with **dds::core::PreconditionNotMetError** (p. 1941) if an unmanaged sample was written with this **DataWriter** (p. 1138) earlier. Similarly, **dds::pub::DataWriter::write()** (p. 1148) will fail to write an unmanaged sample if get_loan was called.

Returns

a loaned sample

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::PreconditionNotMetError** (p. 1941).

8.67.4.61 discard_loan()

```
template<typename T >
void discard_loan (
            T & sample )
```

<<***extension***>> *(p. 354)* Discard a loaned sample from this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation is supported while using **Zero Copy transfer** (p. 50) over shared memory" or the **FlatData language binding** (p. 419).

A loaned sample that hasn't been written can be returned to the **DataWriter** (p. 1138) with this operation.

Parameters

sample	<<***in***>> *(p. 355)* loaned sample to be discarded.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 1179)

8.67.5 Friends And Related Function Documentation

8.67.5.1 ignore() [1/2]

```
template<typename T >
void ignore (
              dds::domain::DomainParticipant & participant,
             const  dds::core::InstanceHandle & handle )  [related]
```

Instructs RTI Connext to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the **dds::pub::Publisher** (p. 1993) (see **dds::topic::PublicationBuiltinTopicData** (p. 1977)). After this call, any data written by that publication's **dds::pub::DataWriter** (p. 1138) will be ignored.

This operation can be used to ignore local *and* remote DataWriters.

The publication (**DataWriter** (p. 1138)) to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataWriter** (p. 1138), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 2285) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 976) for the publication topic.
- To ignore a *local* **DataWriter** (p. 1138), the `handle` can be obtained by calling **dds::core::Entity::instance_handle()** (p. 1525) for the local **DataWriter** (p. 1138).

There is no way to reverse this operation.

Parameters

participant	The DomainParticipant where the publication will be ignored
handle	<<***in***>> *(p. 355)* Handle of the **dds::pub::DataWriter** (p. 1138) to be ignored.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::PublicationBuiltinTopicData (p. 1977)

dds::topic::publication_topic_name() (p. 443)

dds::sub::builtin_subscriber (p. 671)

8.67.5.2 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
              dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             FwdIterator end )  [related]
```

Instructs RTI Connext to locally ignore several publications.

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 1186);

References **dds::pub::ignore()**.

8.67.5.3 matched_subscriptions() [1/2]

```
template<typename T >
dds::core::InstanceHandleSeq matched_subscriptions (
             const  dds::pub::DataWriter< T > & writer )  [related]
```

Retrieve the list of subscriptions currently associated with a **dds::pub::DataWriter** (p. 1138).

A subscription is considered to be matching if all of the following criteria are true:

- The subscription is within the same domain as this publication.
- The subscription has a matching **dds::topic::Topic** (p. 2474).
- The subscription has compatible QoS.
- If the applications are using partitions, the subscription shares a common partition with this publication.

- The **dds::domain::DomainParticipant** (p. 1326) has not indicated that the subscription's **dds::domain::DomainParticipant** (p. 1326) should be "ignored" by means of the **dds::pub::ignore** (p. 647) API.
- If the publication is using the **rti::core::policy::MultiChannel** (p. 1749) and the subscription is using a **dds::topic::ContentFilteredTopic** (p. 954), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the writer has completed the key exchange with reader.

The handles returned list are the ones that RTI Connext uses to locally identify the corresponding matched **dds::sub::DataReader** (p. 976) entities. These handles match the ones that appear in the **dds::sub::SampleInfo::instance_handle** (p. 2290) field of the **dds::sub::SampleInfo** (p. 2285) when reading the **dds::topic::subscription_topic_name()** (p. 444) builtin topic.

This API may return the subscription handles of subscriptions that are inactive. **dds::pub::DataWriter::is_matched_subscription_active** (p. 1191) can be used to check this.

The maximum number of matches possible is configured with **rti::core::policy::DomainParticipantResourceLimits** (p. 1391). .

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::NotEnabledError** (p. 1869)

8.67.5.4 matched_subscriptions() [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_subscriptions (
            const  dds::pub::DataWriter< T > & writer,
            FwdIterator begin,
            FwdIterator end )  [related]
```

Retrieve the list of subscriptions currently associated with a **dds::pub::DataWriter** (p. 1138).

This operation is similar to **matched_subscriptions(const dds::pub::DataWriter<T>&)** (p. 1187) but it copies the instance handles into an iterator range.

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

References **dds::pub::matched_subscriptions()**.

8.67.5.5 matched_subscription_data() [1/2]

```
template<typename T >
const  dds::topic::SubscriptionBuiltinTopicData matched_subscription_data (
             const  dds::pub::DataWriter< T > & writer,
             const  dds::core::InstanceHandle & subscription_handle )  [related]
```

Retrieves information on a subscription that is currently associated with a **dds::pub::DataWriter** (p. 1138).

The subscription_handle must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138). Otherwise, the operation will fail and fail with **dds::core::InvalidArgumentError** (p. 1619). Use **dds::pub::matched_subscriptions()** (p. 648) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 1138).

The above information is also available through **dds::sub::DataReaderListener::on_data_available()** (p. 1058) (if a reader listener is installed on the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>).

When the subscription data is updated, for example when the content filter property changes, there is a small window of time in between when the **DataWriter** (p. 1138) is made aware of these changes and when they actually take effect. Taking effect in this example means that the **DataWriter** (p. 1138) will perform writer-side filtering using the new filter property values (filter expression and/or parameters).

When the **DataWriter** (p. 1138) is made aware of the changes they will first be seen in the **dds::sub::DataReaderListener::on_data_available()** (p. 1058) of the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>. When these changes are applied, they will be seen in the output of this API because this API blocks until the most recent changes known to the **DataWriter** (p. 1138) have taken effect. This API will only block when called outside of a listener callback, in order to not block the internal threads from making progress.

If application behavior depends on being made aware of information about a subscription only after it has taken effect on the **DataWriter** (p. 1138), the recommended pattern for usage of this API is to wait for subscription data to be received either through polling this API or by installing a listener on the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>. When a new sample is received by the builtin DataReader, this API may be called in a separate thread and will return the expected matched subscription data once it has been applied to the **DataWriter** (p. 1138).

Because this API blocks, it is possible for this API to time out while waiting for the changes to be applied. A timeout may happen if the DataReader's subscription data is changing rapidly, preventing the **DataWriter** (p. 1138) from returning valid information before newer data has been received, or if an application is performing a task in a listener callback, thereby preventing the middleware's threads from executing events in a timely manner.

Note: This operation does not retrieve the **dds::topic::SubscriptionBuiltinTopicData::type** (p. 2434). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 1058) (if a reader listener is installed on the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>).

Parameters

writer	The **DataWriter** (p. 1138) to which the subscription is associated
subscription_handle	<<***in***>> *(p. 355)*. Handle to a specific subscription associated with the **dds::sub::DataReader** (p. 976). Must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869), or **dds::core::TimeoutError** (p. 2473)

8.67.5.6 matched_subscription_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData matched_subscription_participant_data (
            const  dds::pub::DataWriter< T > & writer,
            const  dds::core::InstanceHandle & handle )  [related]
```

<<***extension***>> *(p. 354)* This operation retrieves the information on the discovered **dds::domain::Domain↩ Participant** (p. 1326) associated with the subscription that is currently matching with the **dds::pub::DataWriter** (p. 1138).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1941) if the subscription corresponds to the same **dds::domain↩ ::DomainParticipant** (p. 1326) that the **DataWriter** (p. 1138) belongs to. Use **dds::pub::matched_subscriptions()** (p. 648) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 1138).

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataWriter** (p. 1138) subscribes to

Parameters

writer	The writer to lookup the matched participant data of
handle	The InstanceHandle to a specific subscription. Must correspond to a subscription currently associated with the **DataWriter** (p. 1138).

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1908) of the DomainParticipant of a matched subscription of a **dds::pub::DataWriter** (p. 1138)

8.67.5.7 matched_subscriptions_locators()

```
template<typename T >
rti::core::LocatorSeq matched_subscriptions_locators (
            const  dds::pub::DataWriter< T > & writer )  [related]
```

<<***extension***>> *(p. 354)* Retrieve the list of locators for subscriptions currently associated with this **DataWriter** (p. 1138).

The locators returned are the ones that are used by the DDS implementation to communicate with the corresponding matched DataReaders.

Template Parameters

T	The topic-type that the **DataWriter** (p. 1138) publishes.

Parameters

writer	The **DataWriter** (p. 1138).

Returns

The list of locators

8.67.5.8 is_matched_subscription_active()

```
template<typename T >
bool is_matched_subscription_active (
            const  dds::pub::DataWriter< T > & writer,
            const  dds::core::InstanceHandle & handle )  [related]
```

<<***extension***>> *(p. 354)* Check if a matched subscription is active.

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

T	The topic-type that the **DataWriter** (p. 1138) publishes.

Parameters

writer	The **DataWriter** (p. 1138).
handle	The **dds::core::InstanceHandle** (p. 1612) of the matched subscription.

This API is used for querying the endpoint liveliness of a matched subscription. A matched subscription will be marked as inactive when it becomes nonprogessing (e.g., not responding to a **DataWriter** (p. 1138)'s heartbeats, or letting its internal queue fill up without taking the available data). Note that if the participant associated with the matched subscription loses liveliness, the **dds::core::InstanceHandle** (p. 1612) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1619).

Returns

A boolean indicating whether or not the matched subscription is active.

8.67.5.9 matched_subscription_data() [2/2]

```
template<typename T >
std::vector< dds::topic::SubscriptionBuiltinTopicData > matched_subscription_data (
            const dds::pub::DataWriter< T > & writer ) [related]
```

<<***extension***>> *(p. 354)* Obtain the SubscriptionBuiltinTopicData for all of the subscriptions matched with a **Data↩ Writer** (p. 1138).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

This API retrieves the matched publication data from all of the subscriptions currently matched a **DataWriter** (p. 1138).

Template Parameters

T	The topic-type that the **DataWriter** (p. 1138) publishes.

Parameters

writer	The **DataWriter** (p. 1138).

Returns

A std::vector containing all of the matched subscription data.

8.67.5.10 find() [1/2]

```
template<typename Writer , typename FwdIterator >
uint32_t find (
            const  dds::pub::Publisher & publisher,
            RTI_STRING_IN topic_name,
            FwdIterator begin,
            uint32_t max_size )  [related]
```

Retrieves the **dds::pub::DataWriter** (p. 1138) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 1138) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p. 1138) is attached to the **dds::pub::Publisher** (p. 1993) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 1138) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 1138).

This function retrieves a previously-created **DataWriter** (p. 1138) belonging to the **dds::pub::Publisher** (p. 1993) that is attached to a **dds::topic::Topic** (p. 2474) with a matching topic name. If no such **DataWriter** (p. 1138) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p. 1993) allows access to the built-in **DataWriter** (p. 1138) entities for the built-in topics

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
FwdIterator	The type of forward iterator passed to this function

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the **DataWriter** (p. 1138) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataWriter** (p. 1138) that is to be looked up.
begin	A forward iterator to the position in the destination container to insert the found **DataWriter** (p. 1138) in
max_size	Only 1 **DataWriter** (p. 1138) will be returned from this function

Returns

The number of DataWriters that were found (either 0 or 1)

8.67.5.11 find() [2/2]

```
template<typename Writer , typename BinIterator >
uint32_t find (
            const  dds::pub::Publisher & publisher,
            RTI_STRING_IN topic_name,
            BinIterator begin )  [related]
```

Retrieves the **dds::pub::DataWriter** (p. 1138) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 1138) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p. 1138) is attached to the **dds::pub::Publisher** (p. 1993) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 1138) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 1138).

This function retrieves a previously created **DataWriter** (p. 1138) belonging to the **dds::pub::Publisher** (p. 1993) that is attached to a **dds::topic::Topic** (p. 2474) with a matching topic name. If no such **DataWriter** (p. 1138) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p. 1993) allows access to the built-in **DataWriter** (p. 1138) entities for the built-in topics

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
BinIterator	BinIterator The type of back-inserting iterator passed to this function

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the **DataWriter** (p. 1138) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataWriter** (p. 1138) that is to be looked up.
begin	A back-inserting iterator to the position in the destination container to insert the found **DataWriter** (p. 1138) into

Returns

The number of DataWriters that were found (either 0 or 1)

8.67.5.12 find_datawriters() [1/2]

```
template<typename AnyDataWriterBackInsertIterator >
uint32_t find_datawriters (
              dds::pub::Publisher publisher,
             AnyDataWriterBackInsertIterator begin )  [related]
```

Retrieve all the **dds::pub::DataWriter** (p. 1138) created from this **dds::pub::Publisher** (p. 1993).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

AnyDataWriterBackInsertIterator	An iterator whose value_type is **dds::pub::AnyDataWriter** (p. 815)

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the DataWriters belong to
begin	A back-inserting iterator to the position in the destination container to insert the found DataWriters into

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 314)

8.67.5.13 find_datawriters() [2/2]

```
template<typename AnyDataWriterForwardIterator >
uint32_t find_datawriters (
              dds::pub::Publisher publisher,
             AnyDataWriterForwardIterator begin,
             uint32_t max_size )  [related]
```

Retrieve all the **dds::pub::DataWriter** (p. 1138) created from this **dds::pub::Publisher** (p. 1993).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

AnyDataWriterForwardIterator	An iterator whose `value_type` is **dds::pub::AnyDataWriter** (p. 815)

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the DataWriters belong to
begin	A forward iterator to the first position in the destination container to copy the found DataWriters into
max_size	The maximum number of DataWriters to return

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 314)

8.67.5.14 find_datawriter_by_topic_name()

```
template<typename Writer >
Writer find_datawriter_by_topic_name (
               dds::pub::Publisher publisher,
              const std::string & topic_name )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a **dds::pub::DataWriter** (p. 1138) with the given name within the **dds::pub::Publisher** (p. 1993)

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::DataWriter** (p. 1138) in the system has an entity name which is configured and stored in the <<***extension***>> *(p. 354)* EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves the **dds::pub::DataWriter** (p. 1138) within the **dds::pub::Publisher** (p. 1993) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 1138) with the same name within the **dds::pub::Publisher** (p. 1993), the operation returns the first matching occurrence.

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) that created the **DataWriter** (p. 1138) to find
topic_name	Entity name of the **DataWriter** (p. 1138) to find

Returns

The **AnyDataWriter** (p. 815) with the given name

See also

Looking up DataWriters (p. 314)

References **dds::core::null**.

8.67.5.15 find_datawriter_by_name() [1/2]

```
template<typename Writer >
Writer find_datawriter_by_name (
              dds::pub::Publisher publisher,
             const std::string & datawriter_name )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a **dds::pub::DataWriter** (p. 1138) with the given name within the **dds::pub::Publisher** (p. 1993)

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::DataWriter** (p. 1138) in the system has an entity name which is configured and stored in the <<***extension***>> *(p. 354)* EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves the **dds::pub::DataWriter** (p. 1138) within the **dds::pub::Publisher** (p. 1993) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 1138) with the same name within the **dds::pub::Publisher** (p. 1993), the operation returns the first matching occurrence.

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) that created the **DataWriter** (p. 1138) to find

Parameters

datawriter_name	Entity name of the **DataWriter** (p. 1138) to find

Returns

The WRITER with the given name

See also

Looking up DataWriters (p. 314)

References **dds::core::null**.

8.67.5.16 find_datawriter_by_name() [2/2]

```
template<typename Writer >
Writer find_datawriter_by_name (
              dds::domain::DomainParticipant participant,
             const std::string & datawriter_name )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a **dds::pub::DataWriter** (p. 1138) within the **dds::domain::DomainParticipant** (p. 1326) with the given name

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::DataWriter** (p. 1138) in the system has an entity name which is configured and stored in the Entity↩ Name policy, **ENTITY_NAME** (p. 532).

Every **dds::pub::Publisher** (p. 1993) in the system has an entity name which is also configured and stored in the EntityName policy.

This operation retrieves a **dds::pub::DataWriter** (p. 1138) within a **dds::pub::Publisher** (p. 1993) given the specified name which encodes both to the **dds::pub::DataWriter** (p. 1138) and the **dds::pub::Publisher** (p. 1993) name.

If there are several **dds::pub::DataWriter** (p. 1138) with the same name within the corresponding **dds::pub::Publisher** (p. 1993) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::pub::Publisher** (p. 1993) to which the **dds::pub::Data↩ Writer** (p. 1138) belongs and the entity name of of the **dds::pub::DataWriter** (p. 1138) itself, separated by a double colon "::". For example: MyPublisherName::MyDataWriterName

The plain name contains the **dds::pub::DataWriter** (p. 1138) name only. In this situation it is implied that the **dds::pub↩ ::DataWriter** (p. 1138) belongs to the implicit **dds::pub::Publisher** (p. 1993) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::pub::Publisher** (p. 1993) name part being "implicit". For example: the plain name "MyDataWriterName" is equivalent to specifiying the fully qualified name "implicit::MyDataWriterName"

The **dds::pub::DataWriter** (p. 1138) is only looked up within the **dds::pub::Publisher** (p. 1993) specified in the fully qualified name, or within the implicit **dds::pub::Publisher** (p. 1993) if the name was not fully qualified.

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) within which the **dds::pub::DataWriter** (p. 1138) exists
datawriter_name	**EntityName** (p. 1530) of the **DataWriter** (p. 1138) to find

Returns

The WRITER with the given name

8.69.1 Detailed Description

template<typename T>
class dds::pub::DataWriterListener< T >

The **Listener** (p. 1637) to notify status changes for a **dds::pub::DataWriter** (p. 1138).

Entity:

dds::pub::DataWriter (p. 1138)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2383), **dds::core::status::LivelinessLostStatus** (p. 1655);
dds::core::status::StatusMask::offered_deadline_missed() (p. 2379), **dds::core::status::OfferedDeadlineMissedStatus** (p. 1871);
dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::OfferedIncompatibleQosStatus** (p. 1873);
dds::core::status::StatusMask::publication_matched() (p. 2384), **dds::core::status::PublicationMatchedStatus** (p. 1990);
dds::core::status::StatusMask::reliable_reader_activity_changed() (p. 2385), **rti::core::status::ReliableReaderActivityChangedStatus** (p. 2157);
dds::core::status::StatusMask::reliable_writer_cache_changed() (p. 2385), **rti::core::status::ReliableWriterCacheChangedStatus** (p. 2159);

See also

Listener (p. 1637)

Status Kinds (p. 429)

Operations Allowed in Listener Callbacks (p. 1639)

NoOpDataWriterListener (p. 1841)

8.69.2 Member Function Documentation

8.69.2.1 on_offered_deadline_missed()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_offered_deadline_missed (
              dds::pub::DataWriter< T > & writer,
             const  dds::core::status::OfferedDeadlineMissedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::OfferedDeadlineMissedStatus** (p. 1871) status.

This callback is called when the deadline that the **dds::pub::DataWriter** (p. 1138) has committed through its **DEADLINE** (p. 523) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **dds::pub::DataWriter** (p. 1138) failed to provide data for an instance.

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current deadline missed status of locally created **dds::pub::DataWriter** (p. 1138)

Implemented in **dds::pub::NoOpDataWriterListener**< **T** > (p. 1842).

8.69.2.2 on_offered_incompatible_qos()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_offered_incompatible_qos (
              dds::pub::DataWriter< T > & writer,
             const  dds::core::status::OfferedIncompatibleQosStatus & status )  [pure virtual]
```

Handles the **dds::core::status::OfferedIncompatibleQosStatus** (p. 1873) status.

This callback is called when the **dds::pub::qos::DataWriterQos** (p. 1226) of the **dds::pub::DataWriter** (p. 1138) was incompatible with what was requested by a **dds::sub::DataReader** (p. 976). This callback is called when a **dds::pub::DataWriter** (p. 1138) has discovered a **dds::sub::DataReader** (p. 976) for the same **dds::topic::Topic** (p. 2474) and common partition, but with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 1138).

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current incompatible qos status of locally created **dds::pub::DataWriter** (p. 1138)

Implemented in **dds::pub::NoOpDataWriterListener**< **T** > (p. 1842).

8.69.2.3 on_liveliness_lost()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_liveliness_lost (
              dds::pub::DataWriter< T > & writer,
             const  dds::core::status::LivelinessLostStatus & status )  [pure virtual]
```

Handles the **dds::core::status::LivelinessLostStatus** (p. 1655) status.

This callback is called when the liveliness that the **dds::pub::DataWriter** (p. 1138) has committed through its **LIVELINESS** (p. 535) qos policy was not respected; this **dds::sub::DataReader** (p. 976) entities will consider the **dds::pub::DataWriter** (p. 1138) as no longer "alive/active". This callback will not be called when an already not alive **dds::pub::DataWriter** (p. 1138) simply remains not alive for another liveliness period.

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current liveliness lost status of locally created **dds::pub::DataWriter** (p. 1138)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1842).

8.69.2.4 on_publication_matched()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_publication_matched (
              dds::pub::DataWriter< T > & writer,
             const  dds::core::status::PublicationMatchedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::PublicationMatchedStatus** (p. 1990) status.

This callback is called when the **dds::pub::DataWriter** (p. 1138) has found a **dds::sub::DataReader** (p. 976) that matches the **dds::topic::Topic** (p. 2474), has a common partition and compatible QoS, or has ceased to be matched with a **dds::sub::DataReader** (p. 976) that was previously considered to be matched.

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current publication match status of locally created **dds::pub::DataWriter** (p. 1138)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1842).

8.69.2.5 on_reliable_writer_cache_changed()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_reliable_writer_cache_changed (
```

```
dds::pub::DataWriter< T > & writer,
const rti::core::status::ReliableWriterCacheChangedStatus & status ) [pure virtual]
```

<<***extension***>> *(p. 354)* Handles the dds::core::status::ReliableWriterCacheChangedStatus status

This listener callback is triggered when:

- The cache is empty (contains no unacknowledged samples).
- The cache is full (the number of unacknowledged samples has reached the value specified in **dds::core::policy::ResourceLimits::max_samples** (p. 2205)).
- The number of unacknowledged samples has reached **rti::core::policy::RtpsReliableWriterProtocol::high_watermark** (p. 2233) or **rti::core::policy::RtpsReliableWriterProtocol::low_watermark** (p. 2232).

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current reliable writer cache changed status of locally created **dds::pub::DataWriter** (p. 1138)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1843).

8.69.2.6 on_reliable_reader_activity_changed()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_reliable_reader_activity_changed (
dds::pub::DataWriter< T > & writer,
const rti::core::status::ReliableReaderActivityChangedStatus & status ) [pure virtual]
```

<<***extension***>> *(p. 354)* Handles the dds::core::status::ReliableReaderActivityChangedStatus status

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current reliable reader activity changed status of locally created **dds::pub::DataWriter** (p. 1138)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1843).

8.69.2.7 on_instance_replaced()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_instance_replaced (
```

```
        dds::pub::DataWriter< T > & writer,
    const  dds::core::InstanceHandle & handle )  [pure virtual]
```

<<***extension***>> *(p. 354)* Notifies when an instance is replaced in **DataWriter** (p. 1138) queue.

This callback is called when an instance is replaced by the **dds::pub::DataWriter** (p. 1138) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance using the **dds::pub::DataWriter::key_value** (p. 1164) API.

Because this callback can be called within the context of an in-progress write, dispose, or unregister call, most APIs on the **DataWriter** (p. 1138) must not be used. The only **DataWriter** (p. 1138) APIs that are safe to call within this callback are:

- **dds::pub::DataWriter::key_value** (p. 1164)
- **dds::pub::DataWriter::create_data** (p. 1182)
- **dds::pub::DataWriter::delete_data** (p. 1183)
- **dds::pub::matched_subscriptions()** (p. 648)
- **dds::pub::DataWriter::is_matched_subscription_active** (p. 1191)
- **dds::pub::DataWriter::matched_subscription_participant_data()** (p. 1190)
- **dds::pub::DataWriter::topic()** (p. 1168)
- **dds::pub::DataWriter::publisher()** (p. 1168)
- **dds::pub::DataWriter::is_sample_app_acknowledged** (p. 1173)

Parameters

writer	<<***out***>> *(p. 355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
handle	<<***out***>> *(p. 355)* Handle of the replaced instance

Implemented in **dds::pub::NoOpDataWriterListener**< **T** > (p. 1843).

8.69.2.8 on_application_acknowledgment()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_application_acknowledgment (
        dds::pub::DataWriter< T > & writer,
    const  rti::pub::AcknowledgmentInfo & acknowledgment_info )  [pure virtual]
```

<<***extension***>> *(p. 354)* Called when a sample is application-acknowledged.

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) = **rti::core::policy::AcknowledgmentKind_def::APPLICATION_AUTO** (p. 798) or **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798)

Called when a sample is application-level acknowledged. Provides identities of the sample and the acknowledging **dds::sub::DataReader** (p. 976). Also provides user-specified response data sent from the **dds::sub::DataReader** (p. 976) by the acknowledgment message.

Parameters

writer	<<***out***>> *(*p. *355)* Locally created **DataWriter** (p. 1138) that triggers the listener callback
acknowledgment_info	<<***out***>> *(*p. *355)* **rti::pub::AcknowledgmentInfo** (p. 795) of the acknowledged sample

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1843).

8.69.2.9 on_service_request_accepted()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_service_request_accepted (
              dds::pub::DataWriter< T > & writer,
             const  rti::core::status::ServiceRequestAcceptedStatus & status )  [pure virtual]
```

<<***extension***>> *(*p. *354)* Called when a sample that has been received on a the built-in service channel is intended for the **DataWriter** (p. 1138) that has installed this listener

See also

Topic Queries (p. 67)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1844).

8.69.2.10 on_sample_removed()

```
template<typename T >
virtual void  dds::pub::DataWriterListener< T >::on_sample_removed (
              dds::pub::DataWriter< T > & writer,
             const  rti::core::Cookie & cookie )  [pure virtual]
```

<<***extension***>> *(*p. *354)* Called when a sample is removed from the **DataWriter** (p. 1138) queue.

This callback is called only if the sample was written with a **rti::core::Cookie** (p. 965) with **dds::pub::DataWriter↩ ::write(const T&,rti::pub::WriteParams&)** (p. 1179), or if this writer uses **Zero Copy** (p. 50) transfer over shared memory" or **FlatData Topic-Types** (p. 419) "FlatData language binding".

Parameters

writer	<<***out***>> *(*p. *355)* Locally created **dds::pub::DataWriter** (p. 1138) that triggers the listener callback
cookie	<<***out***>> *(*p. *355)* • If this sample was written with **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179), this field contains a copy of the cookie set in **rti::pub::WriteParams** (p. 2642). • If this writer uses **Zero Copy transfer over shared memory** (p. 50) or **FlatData language binding** (p. 419), this field contains the absolute address of the sample that is removed. The address of the sample can be obtained by using **rti::core::Cookie::to_pointer** (p. 966)

8.70.1 Detailed Description

<<***extension***>> *(p. 116)* Configures aspects of an the RTPS protocol related to a **dds::pub::DataWriter** (p. 1138)

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **rti::core::policy::DataWriterProtocol** (p. 1210) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **dds::core::policy::Reliability** (p. 2149) for more information on the per-DataReader/DataWriter reliability configuration. **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.70.2 Constructor & Destructor Documentation

8.70.2.1 DataWriterProtocol()

```
rti::core::policy::DataWriterProtocol::DataWriterProtocol ( )  [inline]
```

Creates the default policy.

8.70.3 Member Function Documentation

8.70.3.1 virtual_guid() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::virtual_guid (
            const  rti::core::Guid & the_virtual_guid )
```

<<***extension***>> *(*p. *116)* The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **dds::pub::DataWriter** (p. 1138).

RTI Connext uses the virtual GUID to associate a persisted writer history to a specific **dds::pub::DataWriter** (p. 1138).

The RTI Connext Persistence **Service** (p. 2350) uses the virtual GUID to send samples on behalf of the original **dds::pub::DataWriter** (p. 1138).

[default] rti::core::Guid::automatic() (p. 1597)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Data Availability** (p. 167)

8.70.3.2 virtual_guid() [2/2]

```
rti::core::Guid rti::core::policy::DataWriterProtocol::virtual_guid ( ) const
```

Getter (see setter with the same name)

8.70.3.3 rtps_object_id() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_object_id (
            uint32_t the_rtps_object_id )
```

<<***extension***>> *(p. 116)* The RTPS Object ID.

This value is used to determine the RTPS object ID of a data writer according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connext will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data writer.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connext. In those cases, the recomendation is not to use automatic object ID assigment.

[default] rti::core::policy::WireProtocol::RTPS_AUTO_ID (p. 2641)

[range] [0,0x00ffffff]

Categories

Immutable (p. 243)

8.70.3.4 rtps_object_id() [2/2]

```
uint32_t rti::core::policy::DataWriterProtocol::rtps_object_id ( ) const
```

Getter (see setter with the same name)

8.70.3.5 push_on_write() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::push_on_write (
            bool the_push_on_write )
```

<<***extension***>> *(p. 116)* Whether to push sample out when write is called.

If set to true (the default), the writer will send a sample every time write is called. Otherwise, the sample is put into the queue waiting for a NACK from remote reader(s) to be sent out.

[default] true

Categories

Immutable (p. 243), **Reliability** (p. 222), **Data Availability** (p. 167)

8.70.3.6 push_on_write() [2/2]

```
bool rti::core::policy::DataWriterProtocol::push_on_write ( ) const
```

Getter (see setter with the same name)

8.70.3.7 disable_positive_acks() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::disable_positive_acks (
            bool the_disable_positive_acks )
```

<<***extension***>> *(*p. *116)* Controls whether or not the writer expects positive acknowledgements from matching readers.

If set to true, the writer does not expect readers to send send positive acknowledgments to the writer. Consequently, instead of keeping a sample queued until all readers have positively acknowledged it, the writer will keep a sample for at least **rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_min_sample_keep_duration** (p. 2245), after which the sample is logically considered as positively acknowledged.

If set to false (the default), the writer expects to receive positive acknowledgements from its acknowledging readers (**rti::core::policy::DataReaderProtocol::disable_positive_acks** (p. 1062) = false) and it applies the keep-duration to its non-acknowledging readers (**rti::core::policy::DataReaderProtocol::disable_positive_acks** (p. 1062) = true).

A writer with both acknowledging and non-acknowledging readers keeps a sample queued until acknowledgements have been received from all acknowledging readers and the keep-duration has elapsed for non-acknowledging readers.

[default] false

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Reliability** (p. 222)

8.70.3.8 disable_positive_acks() [2/2]

```
bool rti::core::policy::DataWriterProtocol::disable_positive_acks ( ) const
```

Getter (see setter with the same name)

8.70.3.9 disable_inline_keyhash() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::disable_inline_keyhash (
            bool the_disable_inline_keyhash )
```

<<***extension***>> *(*p. *116)* Controls whether or not a keyhash is propagated on the wire with each sample.

This field only applies to keyed writers.

With each key, RTI Connext associates an internal 16-byte representation, called a keyhash.

When this field is false, the keyhash is sent on the wire with every data instance.

When this field is true, the keyhash is not sent on the wire and the readers must compute the value using the received data.

If the *reader* is CPU bound, sending the keyhash on the wire may increase performance, because the reader does not have to get the keyhash from the data.

If the *writer* is CPU bound, sending the keyhash on the wire may decrease performance, because it requires more bandwidth (16 more bytes per sample).

Note: Setting disable_inline_keyhash to true is not compatible with using RTI Real-Time Connect or RTI Recorder.

[default] false

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193)

8.70.3.10 disable_inline_keyhash() [2/2]

```
bool rti::core::policy::DataWriterProtocol::disable_inline_keyhash ( ) const
```

Getter (see setter with the same name)

8.70.3.11 serialize_key_with_dispose() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::serialize_key_with_dispose (
            bool the_serialize_key_with_dispose )
```

<<***extension***>> *(*p. *116)* Controls whether or not the serialized key is propagated on the wire with dispose samples.

This field only applies to keyed writers.

We recommend setting this field to true if there are DataReaders where **rti::core::policy::DataReaderProtocol**↩ **::propagate_dispose_of_unregistered_instances** (p. 1063) is also true.

When setting serialize_key_with_dispose to FALSE, only a key hash is included in the dispose meta-sample sent by a DataWriter for a dispose action. If a dispose meta-sample only includes the key hash, then DataReaders must have previously received an actual data sample for the instance being disposed, in order for a DataReader to map a key hash/instance handle to actual key values.

If an actual data sample was never received for an instance and serialize_key_with_dispose is set to FALSE, then the DataReader application will not be able to determine the value of the key that was disposed, since **dds::sub::Data**↩ **Reader::key_value** (p. 1003) will not be able to map an instance handle to actual key values.

By setting serialize_key_with_dispose to TRUE, the values of the key members of a data type will be sent in the dispose meta-sample for a dispose action by the DataWriter. This allows the DataReader to map an instance handle to the values of the key members even when receiving a dispose meta-sample without previously having received a data sample for the instance.

Important: When this field is true, batching will not be compatible with RTI Connext 4.3e, 4.4b, or 4.4c. The **dds::sub**↩ **::DataReader** (p. 976) entities will receive incorrect data and/or encounter deserialization errors.

[default] false

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193)

8.70.3.12 serialize_key_with_dispose() [2/2]

```
bool rti::core::policy::DataWriterProtocol::serialize_key_with_dispose ( ) const
```

Getter (see setter with the same name)

8.70.3.13 propagate_app_ack_with_no_response() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::propagate_app_ack_with_no_response (
            bool the_propagate_app_ack_with_no_response )
```

<<***extension***>> *(p. 116)* Controls whether or not a **dds::pub::DataWriter** (p. 1138) receives **dds::pub::DataWriter↩ Listener::on_application_acknowledgment** (p. 1207) notifications with an empty or invalid response.

When this field is set to false, the callback **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207) will not be invoked if the sample being acknowledged has an empty or invalid response.

[default] true

```

Getter (see setter with the same name)

8.70.3.15 rtps_reliable_writer() [1/3]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_reliable_writer (
            const  RtpsReliableWriterProtocol & the_rtps_reliable_writer )
```

<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **dds::pub::DataWriter** (p. 1138). This parameter only has effect if both the writer and the matching reader are configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).

For details, refer to the **rti::core::policy::RtpsReliableWriterProtocol** (p. 2229)

[default] [default] See **rti::core::policy::RtpsReliableWriterProtocol** (p. 2229)

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.70.3.16 rtps_reliable_writer() [2/3]

```
const RtpsReliableWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_reliable_writer (
) const
```

Gets the reliable settings by const-reference (see setter)

8.70.3.17 rtps_reliable_writer() [3/3]

```
RtpsReliableWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_reliable_writer ( )
```

Gets the reliable settings by reference (see setter)

8.70.3.18 initial_virtual_sequence_number()

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::initial_virtual_sequence_number (
            const rti::core::SequenceNumber & the_initial_virtual_sequence_number )
```

<<***extension***>> *(*p. *116)* Determines, the initial virtual sequence number for this DataWriter.

By default, the virtual sequence number of the first sample published by a DataWriter will be 1 for DataWriters that do not use durable writer history. For durable writers, the default virtual sequence number will be the last sequence number they published in a previous execution, plus one. So, when a non-durable DataWriter is restarted and must continue communicating with the same DataReaders, its samples start over with sequence number 1. Durable DataWriters start over where the last sequence number left off, plus one.

This QoS setting allows overwriting the default initial virtual sequence number.

Normally, this parameter is not expected to be modified; however, in some scenarios when continuing communication after restarting, applications may require the DataWriter's virtual sequence number to start at something other than the value described above. An example would be to enable non-durable DataWriters to start at the last sequence number published, plus one, similar to the durable DataWriter. This property enables you to make such a configuration, if desired.

The virtual sequence number can be overwritten as well on a per sample basis by updating **rti::pub::WriteParams↩ ::identity** (p. 2646) in the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

[default] SequenceNumber_t::AUTO

  The number of GAPs sent from local DataWriter to matching remote DataReaders.
- **EventCount64 sent_gap_bytes** () const

  The number of bytes of GAPs sent from local DataWriter to matching remote DataReaders.
- **EventCount64 rejected_sample_count** () const

  [Not supported.]
- int32_t **send_window_size** () const

  Current maximum number of outstanding samples allowed in the DataWriter's queue.
- **rti::core::SequenceNumber first_available_sample_sequence_number** () const

  The sequence number of the first available sample currently queued in the local DataWriter.
- **rti::core::SequenceNumber last_available_sample_sequence_number** () const

The sequence number of the last available sample currently queued in the local DataWriter.

- **rti::core::SequenceNumber first_unacknowledged_sample_sequence_number** () const

  The sequence number of the first unacknowledged sample currently queued in the local DataWriter.
- **rti::core::SequenceNumber first_available_sample_virtual_sequence_number** () const

  The virtual sequence number of the first available sample currently queued in the local DataWriter.
- **rti::core::SequenceNumber last_available_sample_virtual_sequence_number** () const

  The virtual sequence number of the last available sample currently queued in the local DataWriter.
- **rti::core::SequenceNumber first_unacknowledged_sample_virtual_sequence_number** () const

  The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.
- **dds::core::InstanceHandle first_unacknowledged_sample_subscription_handle** () const

  The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.
- **rti::core::SequenceNumber first_unelapsed_keep_duration_sample_sequence_number** () const

  The sequence number of the first sample whose keep duration has not yet elapsed.
- int64_t **pushed_fragment_count** () const

  The number of DATA_FRAG messages that have been pushed by this DataWriter.
- int64_t **pushed_fragment_bytes** () const

  The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.
- int64_t **pulled_fragment_count** () const

  The number of DATA_FRAG messages that have been pulled from this DataWriter.
- int64_t **pulled_fragment_bytes** () const

  The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.
- int64_t **received_nack_fragment_count** () const

  The number of NACK_FRAG messages that have been received by this DataWriter.
- int64_t **received_nack_fragment_bytes** () const

  The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

8.71.1 Detailed Description

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::datawriter_protocol()** (p. 2386)

Entity:

dds::pub::DataWriter (p. 1138)

8.71.2 Member Function Documentation

8.71.2.1 pushed_sample_count()

EventCount64 `rti::core::status::DataWriterProtocolStatus::pushed_sample_count ( ) const [inline]`

The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count is the number of sends done internally, and it may be greater than the number of user writes.

For large data, counts whole samples, not fragments. The fragment count is tracked in the **rti::core::status::Data↩ WriterProtocolStatus::pushed_fragment_count** (p. 1225) statistic.

8.71.2.2 pushed_sample_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::pushed_sample_bytes ( ) const  [inline]
```

The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count of bytes corresponds to the number of sends done internally, and it may be greater than the number of user writes.

When data fragmentation is used, this statistic is incremented as fragments are written.

8.71.2.3 filtered_sample_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::filtered_sample_count ( ) const  [inline]
```

[Not supported.] The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

8.71.2.4 filtered_sample_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::filtered_sample_bytes ( ) const  [inline]
```

[Not supported.] The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-↩ Filtered Topics.

8.71.2.5 sent_heartbeat_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_heartbeat_count ( ) const  [inline]
```

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

8.71.2.6 sent_heartbeat_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_heartbeat_bytes ( ) const  [inline]
```

The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

8.71.2.7 pulled_sample_count()

EventCount64 rti::core::status::DataWriterProtocolStatus::pulled_sample_count ( ) const [inline]

The number of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **rti::core::policy::DataWriterProtocol::push_on_write** (p. 1213) is false.

When data fragmentation is used, this statistic is incremented as fragments are written.

8.71.2.8 pulled_sample_bytes()

EventCount64 rti::core::status::DataWriterProtocolStatus::pulled_sample_bytes ( ) const [inline]

The number of bytes of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **rti::core::policy::DataWriterProtocol::push_on_write** (p. 1213) is false.

When data fragmentation is used, this statistic is incremented as fragments are written.

8.71.2.9 received_ack_count()

EventCount64 rti::core::status::DataWriterProtocolStatus::received_ack_count ( ) const [inline]

The number of ACKs from a remote DataReader received by a local DataWriter.

8.71.2.10 received_ack_bytes()

EventCount64 rti::core::status::DataWriterProtocolStatus::received_ack_bytes ( ) const [inline]

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

8.71.2.11 received_nack_count()

EventCount64 rti::core::status::DataWriterProtocolStatus::received_nack_count ( ) const [inline]

The number of NACKs from a remote DataReader received by a local DataWriter.

8.71.2.12 received_nack_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::received_nack_bytes ( ) const  [inline]
```

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

8.71.2.13 sent_gap_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_gap_count ( ) const  [inline]
```

The number of GAPs sent from local DataWriter to matching remote DataReaders.

8.71.2.14 sent_gap_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_gap_bytes ( ) const  [inline]
```

The number of bytes of GAPs sent from local DataWriter to matching remote DataReaders.

8.71.2.15 rejected_sample_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::rejected_sample_count ( ) const  [inline]
```

[Not supported.]

8.71.2.16 send_window_size()

```
int32_t rti::core::status::DataWriterProtocolStatus::send_window_size ( ) const  [inline]
```

Current maximum number of outstanding samples allowed in the DataWriter's queue.

Spans the range from **rti::core::policy::RtpsReliableWriterProtocol::min_send_window_size** (p. 2249) to **rti↩ ::core::policy::RtpsReliableWriterProtocol::max_send_window_size** (p. 2250).

8.71.2.17 first_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_available_sample_↩
sequence_number ( ) const  [inline]
```

The sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.71.2.18 last_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::last_available_sample_↩
sequence_number ( ) const  [inline]
```

The sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.71.2.19 first_unacknowledged_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_unacknowledged_↩
sample_sequence_number ( ) const  [inline]
```

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.71.2.20 first_available_sample_virtual_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_available_sample_↩
virtual_sequence_number ( ) const  [inline]
```

The virtual sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.71.2.21 last_available_sample_virtual_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::last_available_sample_↩
virtual_sequence_number ( ) const  [inline]
```

The virtual sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.71.2.22 first_unacknowledged_sample_virtual_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_unacknowledged_↩
sample_virtual_sequence_number ( ) const  [inline]
```

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.71.2.23 first_unacknowledged_sample_subscription_handle()

```
dds::core::InstanceHandle rti::core::status::DataWriterProtocolStatus::first_unacknowledged_↩
sample_subscription_handle ( ) const  [inline]
```

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

Applies only for local DataWriter status.

8.71.2.24 first_unelapsed_keep_duration_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_unelapsed_keep_↩
duration_sample_sequence_number ( ) const  [inline]
```

The sequence number of the first sample whose keep duration has not yet elapsed.

Applicable only when **rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 1214) is set.

Sequence number of the first sample kept in the DataWriter's queue whose keep_duration (applied when **rti::core↩ ::policy::DataWriterProtocol::disable_positive_acks** (p. 1214) is set) has not yet elapsed.

Applies only for local DataWriter status.

8.71.2.25 pushed_fragment_count()

```
int64_t rti::core::status::DataWriterProtocolStatus::pushed_fragment_count ( ) const  [inline]
```

The number of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.71.2.26 pushed_fragment_bytes()

```
int64_t rti::core::status::DataWriterProtocolStatus::pushed_fragment_bytes ( ) const  [inline]
```

The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.71.2.27 pulled_fragment_count()

```
int64_t rti::core::status::DataWriterProtocolStatus::pulled_fragment_count ( ) const  [inline]
```

The number of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.71.2.28 pulled_fragment_bytes()

```
int64_t rti::core::status::DataWriterProtocolStatus::pulled_fragment_bytes ( ) const  [inline]
```

The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.71.2.29 received_nack_fragment_count()

```
int64_t rti::core::status::DataWriterProtocolStatus::received_nack_fragment_count ( ) const  [inline]
```

The number of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.71.2.30 received_nack_fragment_bytes()

```
int64_t rti::core::status::DataWriterProtocolStatus::received_nack_fragment_bytes ( ) const  [inline]
```

The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.72 dds::pub::qos::DataWriterQos Class Reference

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::pub::DataWriter** (p. 1138) supports

```
#include <dds/pub/qos/DataWriterQos.hpp>
```

Public Member Functions

- **DataWriterQos** ()

  *Creates a **DataWriterQos** (p. 1226) with the default value for each policy.*
- **DataWriterQos** (const **dds::topic::qos::TopicQos** &topic_qos)

  *Creates a **DataWriterQos** (p. 1226) with the policies of a given TopicQos.*
- **DataWriterQos** & **operator=** (const **dds::topic::qos::TopicQos** &topic_qos)

  *Copies into this **DataWriterQos** (p. 1226) those policies that are also in TopicQos.*
- template<typename Policy >
  const Policy & **policy** () const

  Gets a QoS policy by const reference.
- template<typename Policy >
  Policy & **policy** ()

  Gets a QoS policy by reference.
- template<typename Policy >
  DataWriterQos & **policy** (const Policy &p)

  Sets a policy.
- template<typename Policy >
  DataWriterQos & **operator**<< (const Policy &p)

  Sets a policy.
- template<typename Policy >
  const **DataWriterQos** & **operator**>> (Policy &p) const

  Copies the values of a policy.

8.72.1 Detailed Description

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::pub::DataWriter** (p. 1138) supports

8.72.2 DataWriterQos policies

A **DataWriterQos** (p. 1226) contains the following policies:

- **dds::core::policy::Durability** (p. 1433),
- **dds::core::policy::DurabilityService** (p. 1443),
- **dds::core::policy::Deadline** (p. 1255),
- **dds::core::policy::LatencyBudget** (p. 1631),
- **dds::core::policy::Liveliness** (p. 1645),
- **dds::core::policy::Reliability** (p. 2149),
- **dds::core::policy::DestinationOrder** (p. 1258),
- **dds::core::policy::History** (p. 1602),
- **dds::core::policy::ResourceLimits** (p. 2203),
- **dds::core::policy::TransportPriority** (p. 2552),
- **dds::core::policy::Lifespan** (p. 1635),
- **dds::core::policy::UserData** (p. 2591),
- **dds::core::policy::Ownership** (p. 1899),
- **dds::core::policy::OwnershipStrength** (p. 1906),
- **dds::core::policy::WriterDataLifecycle** (p. 2660),
- **dds::core::policy::DataRepresentation** (p. 1113),
- **dds::core::policy::DataTag** (p. 1132),
- **rti::core::policy::DataWriterResourceLimits** (p. 1235),
- **rti::core::policy::DataWriterProtocol** (p. 1210),
- **rti::core::policy::TransportSelection** (p. 2554),
- **rti::core::policy::TransportUnicast** (p. 2556),
- rti::core::policy::TransportEncapsulation,
- **rti::core::policy::PublishMode** (p. 2013),
- **rti::core::policy::Property** (p. 1969),
- **rti::core::policy::Service** (p. 2350),
- **rti::core::policy::Batch** (p. 880),
- **rti::core::policy::MultiChannel** (p. 1749),
- **rti::core::policy::Availability** (p. 868),
- **rti::core::policy::EntityName** (p. 1530),
- **rti::core::policy::TopicQueryDispatch** (p. 2522),

- **rti::core::policy::DataWriterTransferMode** (p. 1253),
- **rti::core::policy::TypeSupport** (p. 2574)

To get or set policies use the **policy()** (p. 1231) getters and setters or operator << (see **examples** (p. 603)).

You must set certain members in a consistent manner:

- **dds::core::policy::History** (p. 1602) .depth <= **dds::core::policy::ResourceLimits** (p. 2203) .max_samples↩ _per_instance
- **dds::core::policy::ResourceLimits** (p. 2203) .max_samples_per_instance <= **dds::core::policy::Resource↩ Limits** (p. 2203) .max_samples
- **dds::core::policy::ResourceLimits** (p. 2203) .initial_samples <= **dds::core::policy::ResourceLimits** (p. 2203) .max_samples
- **dds::core::policy::ResourceLimits** (p. 2203) .initial_instances <= **dds::core::policy::ResourceLimits** (p. 2203) .max_instances
- length of **dds::core::policy::UserData** (p. 2591) .value <= dds::domain::qos::DomainParticipantQos::resource↩ _limits .writer_user_data_max_length

If any of the above are not true, **dds::pub::DataWriter::qos(const dds::pub::qos::DataWriterQos&)** (p. 1166) and **dds::pub::Publisher::default_datawriter_qos(const dds::pub::qos::DataWriterQos&)** (p. 1998) will fail with **dds↩ ::core::InconsistentPolicyError** (p. 1610) and the **dds::pub::DataWriter** (p. 1138) constructors will fail with **dds↩ ::core::Error** (p. 1539)

Entity:

dds::pub::DataWriter (p. 1138)

See also

All QoS Policies (p. 508) allowed ranges within each Qos.

Qos Use Cases (p. 602)

Examples

Foo_publisher.cxx.

8.72.3 Constructor & Destructor Documentation

8.72.3.1 DataWriterQos() [1/2]

```
dds::pub::qos::DataWriterQos::DataWriterQos ( )
```

Creates a **DataWriterQos** (p. 1226) with the default value for each policy.

Note

If you configure Qos in XML, obtain the default value from the default QosProvider, since it can be overriden by configuration:
```
DataWriterQos writer_qos = dds::core::QosProvider::Default().datawriter_qos();
```

8.72.3.2 DataWriterQos() [2/2]

```
dds::pub::qos::DataWriterQos::DataWriterQos (
            const  dds::topic::qos::TopicQos & topic_qos )
```

Creates a **DataWriterQos** (p. 1226) with the policies of a given TopicQos.

The QoS policies that are exclusive to a **DataWriter** (p. 1138) retain their default values. A **dds::topic::qos::TopicQos** (p. 2509) contains a subset of the policies of a **DataWriterQos** (p. 1226). This constructor copies those common policies while initializing the policies that are only defined in **DataWriterQos** (p. 1226) to their default values.

Parameters

topic_qos	The TopicQos being copied.

Example:
```
DataWriterQos writer_qos(topic.qos());
```

8.72.4 Member Function Documentation

8.72.4.1 operator=()

```
DataWriterQos & dds::pub::qos::DataWriterQos::operator= (
            const  dds::topic::qos::TopicQos & topic_qos )  [inline]
```

Copies into this **DataWriterQos** (p. 1226) those policies that are also in TopicQos.

A **dds::topic::qos::TopicQos** (p. 2509) contains a subset of the policies of a **DataWriterQos** (p. 1226). This assignment operator copies those common policies into this instance while leaving the policies that are only defined in **DataWriterQos** (p. 1226) unaltered.

Parameters

topic_qos	The TopicQos to copy the common policies from.

For example:

```
// Load a TopicQos from a Qos profile
TopicQos topic_qos = dds::core::QosProvider::Default().topic_qos("MyLibrary::MyProfile");
// Create a DataWriterQos with the default policies
DataWriterQos writer_qos = dds::core::QosProvider::Default().datawriter_qos();
// Overwrite the policies that are also defined in topic_qos
writer_qos = topic_qos;
```

8.72.4.2 policy() [1/3]

```
template<typename Policy >
const Policy & dds::pub::qos::DataWriterQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

Policy	One of the **DataWriterQos policies** (p. 1228)

See also

Setting Qos Values (p. 603)

8.72.4.3 policy() [2/3]

```
template<typename Policy >
Policy & dds::pub::qos::DataWriterQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

Policy	One of the **DataWriterQos policies** (p. 1228)

See also

Setting Qos Values (p. 603)

8.72.4.4 policy() [3/3]

```
template<typename Policy >
DataWriterQos & dds::pub::qos::DataWriterQos::policy (
            const Policy & p )  [inline]
```

Sets a policy.

See also

policy() (p. 1231)

Setting Qos Values (p. 603)

8.72.4.5 operator<<()

```
template<typename Policy >
DataWriterQos & dds::pub::qos::DataWriterQos::operator<< (
            const Policy & p )  [inline]
```

Sets a policy.

See also

policy() (p. 1231)

Setting Qos Values (p. 603)

8.72.4.6 operator>>()

```
template<typename Policy >
const  DataWriterQos & dds::pub::qos::DataWriterQos::operator>> (
            Policy & p ) const  [inline]
```

Copies the values of a policy.

Parameters

p	The destination where to copy the current value of the Policy

See also

policy() (p. 1231)

Setting Qos Values (p. 603)

8.72.5 Friends And Related Function Documentation

8.72.5.1 to_string() [1/3]

```
std::string to_string (
            const  DataWriterQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 1226)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataWriterQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataWriterQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataWriterQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.72.5.2 to_string() [2/3]

```
std::string to_string (
            const  DataWriterQos & qos,
            const  DataWriterQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 1226)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.72.5.3 to_string() [3/3]

```
std::string to_string (
            const  DataWriterQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the dds::sub::qos::DataWriterQos

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
`to_string(qos, rti::core::qos_print_all);`

Returns

The string representation of the qos

8.72.5.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::pub::qos::DataWriterQos & qos )  [related]
```

<<***extension***>> *(*p. *354)* Prints a **dds::pub::qos::DataWriterQos** (p. 1226) to an output stream.

8.73 rti::core::policy::DataWriterResourceLimits Class Reference

<<***extension***>> *(*p. *116)* Configures the memory usage of a **dds::pub::DataWriter** (p. 1138)

```
#include <rti/core/policy/CorePolicy.hpp>
```

8.73.1 Detailed Description

*<<**extension**>> (p. 116)* Configures the memory usage of a **dds::pub::DataWriter** (p. 1138)

DataWriters must allocate internal structures to handle the simultaneously blocking of threads trying to call **dds::pub::DataWriter::write()** (p. 1148) on the same **dds::pub::DataWriter** (p. 1138), for the storage used to batch small samples, and for content-based filters specified by DataReaders.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **dds::pub::DataWriter** (p. 1138). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **dds::pub::DataWriter** (p. 1138).

This QoS policy is an extension to the DDS standard.

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.73.2 Constructor & Destructor Documentation

8.73.2.1 DataWriterResourceLimits()

```
rti::core::policy::DataWriterResourceLimits::DataWriterResourceLimits ( )  [inline]
```

Creates a **DataWriterResourceLimits** (p. 1235) qos policy with default values.

8.73.3 Member Function Documentation

8.73.3.1 initial_concurrent_blocking_threads() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::initial_concurrent_↩
blocking_threads (
            int32_t the_initial_concurrent_blocking_threads )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).

This value only applies if **dds::core::policy::History** (p. 1602) has its kind set to **dds::core::policy::HistoryKind_↩ def::KEEP_ALL** (p. 1607) and **dds::core::policy::Reliability::max_blocking_time** (p. 2153) is $>$ 0.

[default] 1

[range] [1, 10000], <= max_concurrent_blocking_threads

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Concurrency** (p. 164)

8.73.3.2 initial_concurrent_blocking_threads() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::initial_concurrent_blocking_threads ( ) const
```

Getter (see setter with the same name)

8.73.3.3 max_concurrent_blocking_threads() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_concurrent_blocking↩
_threads (
            int32_t the_max_concurrent_blocking_threads )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).

This value only applies if **dds::core::policy::History** (p. 1602) has its kind set to **dds::core::policy::HistoryKind_↩ def::KEEP_ALL** (p. 1607) and **dds::core::policy::Reliability::max_blocking_time** (p. 2153) is $>$ 0.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 10000] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_concurrent_blocking_threads

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Concurrency** (p. 164)

8.73.3.4 max_concurrent_blocking_threads() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::max_concurrent_blocking_threads ( ) const
```

Getter (see setter with the same name)

8.73.3.5 max_remote_reader_filters() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_remote_reader_filters
(
            int32_t the_max_remote_reader_filters )
```

<<***extension***>> *(*p. *116)* The maximum number of remote DataReaders for which the **dds::pub::DataWriter** (p. 1138) will perform content-based filtering.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [0, (2^31)-2] or **dds::core::LENGTH_UNLIMITED** (p. 438).

0: The **dds::pub::DataWriter** (p. 1138) will not perform filtering for any **dds::sub::DataReader** (p. 976).

1 to (2^31)-2: The DataWriter will filter for up to the specified number of DataReaders. In addition, the Datawriter will store the result of the filtering per sample per DataReader.

dds::core::LENGTH_UNLIMITED (p. 438): The DataWriter will filter for up to (2^31)-2 DataReaders. However, in this case, the DataWriter will not store the filtering result per sample per DataReader. Thus, if a sample is resent (such as due to a loss of reliable communication), the sample will be filtered again.

Categories

::instance_replacement ( ) const
```

Getter (see setter with the same name)

8.73.3.15 replace_empty_instances() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::replace_empty_instances (
            bool the_replace_empty_instances )
```

<<***extension***>> *(*p. *116)* Whether or not to replace empty instances during instance replacement

When a **dds::pub::DataWriter** (p. 1138) has more active instances than allowed by **dds::core::policy::Resource↩ Limits::max_instances** (p. 2206), it tries to make room by replacing an existing instance. This field configures whether empty instances (i.e. instances with no samples) may be replaced. If set true, then a **dds::pub::DataWriter** (p. 1138) will first try reclaiming empty instances, before trying to replace whatever is specified by **rti::core::policy::DataWriter↩ ResourceLimits::instance_replacement** (p. 1241).

[default] false

See also

DataWriterResourceLimitsInstanceReplacementKind

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Instance Lifecycle** (p. 193)

8.73.3.16 replace_empty_instances() [2/2]

```
bool rti::core::policy::DataWriterResourceLimits::replace_empty_instances ( ) const
```

Getter (see setter with the same name)

8.73.3.17 autoregister_instances() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::autoregister_instances (
            bool the_autoregister_instances )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Whether or not to automatically register new instances

[default] false

When set to true, it is possible to write with a non-NIL handle of an instance that is not registered: the write operation will succeed and the instance will be registered. Otherwise, that write operation would fail.

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_active_topic_queries
(
            int32_t the_max_active_topic_queries )
```

<<***extension***>> *(*p. *116)* Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.

When topic queries are enabled, the maximum number of topic queries that a **dds::pub::DataWriter** (p. 1138) can publish data samples for at the same time is limited by this value.

When the DataWriter receives one topic query above this limit, it will wait to process it until it finishes publishing all the samples for at least one of the current topic queries.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 1000000] or **dds::core::LENGTH_UNLIMITED** (p. 438)

<<***extension***>> *(p. 354)* The enumeration for DataWriter Resource Limits

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  UNREGISTERED ,
  ALIVE ,
  DISPOSED ,
  ALIVE_THEN_DISPOSED ,
  DISPOSED_THEN_ALIVE ,
  ALIVE_OR_DISPOSED }

  The underlying `enum` *type.*

8.74.1 Detailed Description

<<***extension***>> *(p. 354)* The enumeration for DataWriter Resource Limits

When **dds::core::policy::ResourceLimits::max_instances** (p. 2206) is reached, a **dds::pub::DataWriter** (p. 1138) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kind specified by **rti::core::policy::DataWriterResourceLimits::instance_replacement** (p. 1241).

Only instances whose states match the specified kinds are eligible to be replaced. In addition, an instance must have had all of its samples fully acknowledged for it to be considered replaceable.

For all kinds, a **dds::pub::DataWriter** (p. 1138) will replace the oldest instance satisfying that kind. For example, when the kind is DataWriterResourceLimitsInstanceReplacementKind::UNREGISTERED_INSTANCE_REPLACEMENT, a **dds::pub::DataWriter** (p. 1138) will remove the oldest, fully acknowledged, unregistered instance, if such an instance exists.

If no replaceable instance exists, the invoked function will either return with an appropriate out-of-resources return code, or in the case of a write, it may first block to wait for an instance to be acknowledged. Otherwise, the **dds::pub::↩ DataWriter** (p. 1138) will replace the old instance with the new instance, and invoke, if available, the **dds::pub::Data↩ WriterListener::on_instance_replaced** (p. 1206) to notify the user about an instance being replaced.

A **dds::pub::DataWriter** (p. 1138) checks for replaceable instances in the following order, stopping once a replaceable instance is found:

- If **rti::core::policy::DataWriterResourceLimits::replace_empty_instances** (p. 1242) is true, a **dds::pub::↩ DataWriter** (p. 1138) first tries replacing instances that have no samples. These empty instances can be unregistered, disposed, or alive.
- Next, a **dds::pub::DataWriter** (p. 1138) tries replacing unregistered instances. Since an unregistered instance indicates that the **dds::pub::DataWriter** (p. 1138) is done modifying it, unregistered instances are replaced before instances of any other state (alive, disposed). This is the same as the DataWriterResourceLimitsInstance↩ ReplacementKind::UNREGISTERED_INSTANCE_REPLACEMENT kind.
- Then, a **dds::pub::DataWriter** (p. 1138) tries replacing what is specified by **rti::core::policy::DataWriter↩ ResourceLimits::instance_replacement** (p. 1241). With unregistered instances already checked, this leaves alive and disposed instances. When both alive and disposed instances may be replaced, the kind specifies whether the particular order matters (e.g., DISPOSED_THEN_ALIVE, ALIVE_THEN_DISPOSED) or not (ALIVE_OR_DISPOSED).

QoS:

rti::core::policy::DataWriterResourceLimits (p. 1235)

8.74.2 Member Enumeration Documentation

8.74.2.1 type

`enum` **`rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind_def::type`**

The underlying `enum` type.

Enumerator

UNREGISTERED	Allows a **dds::pub::DataWriter** (p. 1138) to reclaim unregistered acknowledged instances. By default, all instance replacement kinds first attempt to reclaim an unregistered, acknowledged instance. Used in **rti::core::policy::DataWriterResourceLimits::instance_replacement** (p. 1241) **[default]**
ALIVE	Allows a **dds::pub::DataWriter** (p. 1138) to reclaim alive, acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **dds::pub::DataWriter** (p. 1138) to reclaim an alive, acknowledged instance, where an alive instance is a registered, non-disposed instance. The least recently registered or written alive instance will be reclaimed.
DISPOSED	Allows a **dds::pub::DataWriter** (p. 1138) to reclaim disposed acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **dds::pub::DataWriter** (p. 1138) to reclaim a disposed, acknowledged instance. The least recently disposed instance will be reclaimed.
ALIVE_THEN_DISPOSED	Allows a **dds::pub::DataWriter** (p. 1138) first to reclaim an alive, acknowledged instance, and then, if necessary, a disposed, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **dds::pub::DataWriter** (p. 1138) to first try reclaiming an alive, acknowledged instance. If no instance is reclaimable, then it tries reclaiming a disposed, acknowledged instance. The least recently used (i.e., registered, written, or disposed) instance will be reclaimed.
DISPOSED_THEN_ALIVE	Allows a **dds::pub::DataWriter** (p. 1138) first to reclaim a disposed, acknowledged instance, and then, if necessary, an alive, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a **dds::pub::DataWriter** (p. 1138) to first try reclaiming a disposed, acknowledged instance. If no instance is reclaimable, then it tries reclaiming an alive, acknowledged instance. The least recently used (i.e., disposed, registered, or written) instance will be reclaimed.
ALIVE_OR_DISPOSED	Allows a **dds::pub::DataWriter** (p. 1138) to reclaim a either an alive acknowledged instance or a disposed acknowledged instance. When an unregistered acknowledged instance is not available to reclaim, this kind allows a **dds::pub::DataWriter** (p. 1138) to reclaim either an alive, acknowledged instance or a disposed, acknowledged instance. If both instance kinds are available to reclaim, the **dds::pub::DataWriter** (p. 1138) will reclaim the least recently used (i.e. disposed, registered, or written) instance.

8.75 rti::core::DataWriterShmemRefTransferModeSettings Class Reference

<<***extension***>> *(p. 354)* Configures aspects of the shared memory reference transfer mode related to a DataWriter

`#include <rti/core/PolicySettings.hpp>`

Public Member Functions

- **DataWriterShmemRefTransferModeSettings** ()

8.77 dds::core::policy::Deadline Class Reference

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Deadline** ()
  Creates the default deadline, with an infinite period.
- **Deadline** (const **dds::core::Duration** &d)
  Creates a deadline policy with the specified period.
- **Deadline** & **period** (const **dds::core::Duration** &the_period)
  Sets the duration of the deadline period.
- const **dds::core::Duration period** () const
  Getter (see setter with the same name)

8.77.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

A **dds::sub::DataReader** (p. 976) expects a new sample updating the value of each instance at least once every `period`. That is, `period` specifies the maximum expected elapsed time between arriving data samples.

A **dds::pub::DataWriter** (p. 1138) indicates that the application commits to write a new value (using the **dds::pub::DataWriter** (p. 1138)) for each instance managed by the **dds::pub::DataWriter** (p. 1138) at least once every `period`.

This QoS can be used during system integration to ensure that applications have been coded to meet design specifications.

It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions to prevent total system failure when data is not received in time. For topics on which data is not expected to be periodic, `period` should be set to an infinite value.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::offered_deadline_missed() (p. 2379), **dds::core::status::StatusMask::requested_deadline_missed()** (p. 2380), **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380), **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **YES** (p. 514)

8.77.2 Usage

This policy is useful for cases where a **dds::topic::Topic** (p. 2474) is expected to have each instance updated periodically. On the publishing side this setting establishes a contract that the application must meet. On the subscribing side the setting establishes a minimum requirement for the remote publishers that are expected to supply the data values.

When RTI Connext 'matches' a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976) it checks whether the settings are compatible (i.e., *offered deadline* $<=$ *requested deadline*); if they are not, the two entities are informed (via the **Listener** (p. 1637) or **dds::core::cond::Condition** (p. 948) mechanism) of the incompatibility of the QoS settings and communication will not occur.

Assuming that the reader and writer ends have compatible settings, the fulfilment of this contract is monitored by RTI Connext and the application is informed of any violations by means of the proper **Listener** (p. 1637) or **dds::core::cond::Condition** (p. 948).

8.77.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered period* <= *requested period* holds.

8.77.4 Consistency

The setting of the **DEADLINE** (p. 523) policy must be set consistently with that of the **TIME_BASED_FILTER** (p. 547).

For these two policies to be consistent the settings must be such that *deadline period* >= *minimum_separation*.

An attempt to set these policies in an inconsistent manner will result in **dds::core::InconsistentPolicyError** (p. 1610) in **set_qos (abstract)** (p. 1522), or the **dds::core::Entity** (p. 1520) will not be created.

For a **dds::sub::DataReader** (p. 976), the **DEADLINE** (p. 523) policy and **dds::core::policy::TimeBasedFilter** (p. 2469) may interact such that even though the **dds::pub::DataWriter** (p. 1138) is writing samples fast enough to fulfill its commitment to its own deadline, the **dds::sub::DataReader** (p. 976) may see violations of its deadline. This happens because RTI Connext will drop any samples received within the **dds::core::policy::TimeBasedFilter**↩ **::minimum_separation** (p. 2472). To avoid triggering the **dds::sub::DataReader** (p. 976)'s deadline, even though the matched **dds::pub::DataWriter** (p. 1138) is meeting its own deadline, set the two QoS parameters so that:

reader deadline >= *reader minimum_separation + writer deadline*

See **dds::core::policy::TimeBasedFilter** (p. 2469) for more information about the interactions between deadlines and time-based filters.

8.78.1 Detailed Description

Controls the logical order of updates to the same instance by a **dds::pub::Publisher** (p. 1993).

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::StatusMask↩ ::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.78.2 Usage

When multiple DataWriters send data for the same topic, the order in which data from different DataWriters are received by the applications of different DataReaders may be different. So different DataReaders may not receive the same "last" value when DataWriters stop sending data.

This QoS policy controls how each subscriber resolves the final value of a data instance that is written by multiple **dds↩ ::pub::DataWriter** (p. 1138) entities (which may be associated with different **dds::pub::Publisher** (p. 1993) entities) running on different nodes.

This QoS can be used to create systems that have the property of "eventual consistency." Thus intermediate states across multiple applications may be inconsistent, but when DataWriters stop sending changes to the same topic, all applications will end up having the same state.

This QoS policy can be set for both DataWriters and DataReaders.

For the DataReader:

The default setting, **dds::core::policy::DestinationOrderKind_def::BY_RECEPTION_TIMESTAMP** (p. 1264), indicates that (assuming the **OWNERSHIP_STRENGTH** (p. 539) policy allows it) the latest received value for the instance should be the one whose value is kept. That is, data will be delivered by a **dds::sub::DataReader** (p. 976) in the order in which it was *received* (which may lead to inconsistent final values).

For **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264), if the scope is set to **rti::core::policy::DestinationOrderScopeKind_def::INSTANCE** (p. 1265) (default), within each instance, the sample's source timestamp shall be used to determine the most recent information. This is the only setting that, in the case of concurrent same-strength DataWriters updating the same instance, ensures that all DataReaders end up with the same final value for the instance. If a DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped. The SAMPLE_REJECTED status or the SAMPLE_LOST status will not be updated.

If scope is set to **rti::core::policy::DestinationOrderScopeKind_def::TOPIC** (p. 1265), the ordering is enforced per topic across all instances.

In addition, a DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than source_timestamp_tolerance. Otherwise, the DDS sample is dropped. The SAMPLE_REJECTED status or the SAMPLE_LOST status will not be updated.

For the DataWriter:

For the default setting, **dds::core::policy::DestinationOrderKind_def::BY_RECEPTION_TIMESTAMP** (p. 1264), the DataWriter will not enforce source timestamp ordering when writing samples using the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179) or **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 1149) API. The source timestamp of a new sample can be older than the source timestamp of the previous samples.

When using **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264), If scope is set to **rti::core::policy::DestinationOrderScopeKind_def::INSTANCE** (p. 1265) (default), when writing a sample, the sample's timestamp must not be older than the timestamp of the previously written DDS sample for the same instance. If, however, the timestamp is older than the timestamp of the previously written DDS sample—but the difference is less than the source_timestamp_tolerance—the DDS sample will use the previously written DDS sample's timestamp as its timestamp. Otherwise, if the difference is greater than the tolerance, the write will fail with retcode **dds::core::InvalidArgumentError** (p. 1619).

If scope is set to **rti::core::policy::DestinationOrderScopeKind_def::TOPIC** (p. 1265), a new sample timestamp must not be older than the timestamp of the previously written DDS sample, across all instances. (The ordering is enforced across all instances.)

8.78.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind* $>=$ *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **dds::core::policy::DestinationOrder::kind** (p. 1261) are considered ordered such that **dds::core::policy::DestinationOrderKind_def::BY_RECEPTION_TIMESTAMP** (p. 1264) $<$ **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264)

8.78.4 Constructor & Destructor Documentation

8.78.4.1 DestinationOrder() [1/2]

```
dds::core::policy::DestinationOrder::DestinationOrder ( )  [inline]
```

Creates the default policy.

8.78.4.2 DestinationOrder() [2/2]

```
dds::core::policy::DestinationOrder::DestinationOrder (
            dds::core::policy::DestinationOrderKind the_kind )  [inline], [explicit]
```

Creates a policy with the specified destination order kind.

8.78.5 Member Function Documentation

8.78.5.1 kind() [1/2]

```
DestinationOrder & dds::core::policy::DestinationOrder::kind (
            dds::core::policy::DestinationOrderKind the_kind )  [inline]
```

Sets the destination order kind.

[default] dds::core::policy::DestinationOrderKind_def::BY_RECEPTION_TIMESTAMP (p. 1264),

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Applied Per-Instance** (p. 287), **Sample Ordering** (p. 234)

8.78.5.2 kind() [2/2]

```
dds::core::policy::DestinationOrderKind dds::core::policy::DestinationOrder::kind ( ) const  [inline]
```

Getter (see the setter with the same name)

8.78.5.3 SourceTimestamp()

```
static DestinationOrder dds::core::policy::DestinationOrder::SourceTimestamp ( ) [inline], [static]
```

Creates a **DestinationOrder** (p. 1258) with DestinationOrderKind::BY_SOURCE_TIMESTAMP.

8.78.5.4 ReceptionTimestamp()

```
static DestinationOrder dds::core::policy::DestinationOrder::ReceptionTimestamp ( ) [inline],
[static]
```

Creates a **DestinationOrder** (p. 1258) with DestinationOrderKind::BY_RECEPTION_TIMESTAMP.

References **dds::core::Duration::from_millisecs()**.

8.78.5.5 scope() [1/2]

```
dds::core::policy::DestinationOrder & scope (
            rti::core::policy::DestinationOrderScopeKind the_scope )
```

<<***extension***>> *(*p. *116)* Sets the destination order scope

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Indicates if tolerance check and the current sample's timestamp is computed based on instance or topic basis.
[default] rti::core::policy::DestinationOrderScopeKind_def::INSTANCE (p. 1265)

Categories

Immutable (p. 243), **Applied Per-Instance** (p. 287), **Sample Ordering** (p. 234)

8.78.5.6 scope() [2/2]

```
rti::core::policy::DestinationOrderScopeKind scope ( ) const
```

<<***extension***>> *(*p. *116)* Getter (see the setter with the same name)

8.78.5.7 source_timestamp_tolerance() [1/2]

```
dds::core::policy::DestinationOrder & source_timestamp_tolerance (
            const  dds::core::Duration & ms )
```

<<***extension***>> *(*p. *116)* Sets the allowed tolerance between source timestamps of consecutive samples.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

When a **dds::pub::DataWriter** (p. 1138) sets **dds::core::policy::DestinationOrderKind_def** (p. 1263) to **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264), when writing a sample, its timestamp must not be less than the timestamp of the previously written sample. However, if it is less than the timestamp of the previously written sample but the difference is less than this tolerance, the sample will use the previously written sample's timestamp as its timestamp. Otherwise, if the difference is greater than this tolerance, the write will fail.

When a **dds::sub::DataReader** (p. 976) sets **dds::core::policy::DestinationOrderKind_def** (p. 1263) to **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264), the **dds::sub::DataReader** (p. 976) will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than this tolerance. Otherwise, the sample is dropped.

[default] 100 milliseconds for **dds::pub::DataWriter** (p. 1138), 30 seconds for **dds::sub::DataReader** (p. 976) and when default-constructed

Categories

Immutable (p. 243), **Applied Per-Instance** (p. 287), **Sample Ordering** (p. 234)

8.78.5.8 source_timestamp_tolerance() [2/2]

```

<<***extension***>> *(*p. *116)* Getter (see the setter with the same name)

8.79 dds::core::policy::DestinationOrderKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) DestinationOrderKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  BY_RECEPTION_TIMESTAMP ,
  BY_SOURCE_TIMESTAMP }

  The underlying `enum` *type.*

8.79.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) DestinationOrderKind.

8.79.2 Member Enumeration Documentation

8.79.2.1 type

`enum` **dds::core::policy::DestinationOrderKind_def::type**

The underlying `enum` type.

Enumerator

BY_RECEPTION_TIMESTAMP	**[default]** Indicates that data is ordered based on the reception time at each **dds::sub::Subscriber** (p. 2410). Since each subscriber may receive the data at different times there is no guarantee that the changes will be seen in the same order. Consequently, it is possible for each subscriber to end up with a different final value for the data.
BY_SOURCE_TIMESTAMP	Indicates that data is ordered based on a time-stamp placed at the source (by RTI Connext or by the application). In any case this guarantees a consistent final value for the data in all subscribers. Note: If Batching is needed along with **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264) and **rti::core::policy::DestinationOrderScopeKind_def::INSTANCE** (p. 1265), then the **rti::core::policy::Batch::source_timestamp_resolution** (p. 885) and **rti::core::policy::Batch::thread_safe_write** (p. 886) setting of **rti::core::policy::Batch** (p. 880) should be set to **dds::core::Duration::zero()** (p. 1450) and true respectively.

8.80 rti::core::policy::DestinationOrderScopeKind_def Struct Reference

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) DestinationOrderScopeKind

`#include <PolicyKind.hpp>`

Public Types

- enum **type** {
  INSTANCE ,
  TOPIC }

  The underlying `enum` type.

8.80.1 Detailed Description

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) DestinationOrderScopeKind

8.80.2 Member Enumeration Documentation

8.80.2.1 type

`enum` **`rti::core::policy::DestinationOrderScopeKind_def::type`**

The underlying `enum` type.

Enumerator

INSTANCE	**[default]** Indicates that data is ordered on a per instance basis if used along with **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same instance. The tolerance check is also applied per instance.
TOPIC	Indicates that data is ordered on a per topic basis if used along with **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same topic. The tolerance check is also applied per topic.

8.81 rti::test::DisableMonitoringLibraryGuard Struct Reference

RAII scope guard to temporarily disable monitoring library.

`#include <utilities.hpp>`

8.81.1 Detailed Description

RAII scope guard to temporarily disable monitoring library.

This class disables monitoring on the DomainParticipantFactory for the duration of its lifetime and restores the original settings when destroyed.

8.82 rti::core::policy::Discovery Class Reference

<<***extension***>> *(p. 116)* Configures entity discovery

`#include <rti/core/policy/CorePolicy.hpp>`

Public Member Functions

- **Discovery** ()

  ***[DEPRECATED]** (p. **296**) <<**extension**>> (p. 116) Whether to automatically enable endpoint discovery for all the remote participants.*
- bool **enable_endpoint_discovery** () const

  Getter (see setter with the same name)

8.82.1 Detailed Description

*<<**extension**>> (p. 116)* Configures entity discovery

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.82.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

See also

NDDS_DISCOVERY_PEERS (p. 559)

rti::core::policy::DiscoveryConfig (p. 1271)

8.82.3 Constructor & Destructor Documentation

8.82.3.1 Discovery()

```
rti::core::policy::Discovery::Discovery ( )
```

Creates the default policy.

8.82.4 Member Function Documentation

8.82.4.1 enabled_transports() [1/2]

```
Discovery & rti::core::policy::Discovery::enabled_transports (
            const  dds::core::StringSeq & the_enabled_transports )
```

Sets the transports (by their aliases) available for the discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138)).

Also determines the unicast addresses on which the **Discovery** (p. 1265) mechanism will listen for meta-traffic. These along with the `domain_id` and `participant_id` determine the unicast locators on which the **Discovery** (p. 1265) mechanism can receive meta-data.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 548). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence. All the transports available to the DomainParticipant are available for use by the **Discovery** (p. 1265) mechanism.

[range] Sequence of non-null,non-empty strings.

Categories

Immutable (p. 243), **Transports** (p. 237), **Discovery** (p. 177)

8.82.4.2 enabled_transports() [2/2]

```
dds::core::StringSeq rti::core::policy::Discovery::enabled_transports ( ) const
```

Getter (see setter with the same name)

8.82.4.3 initial_peers() [1/2]

```
Discovery & rti::core::policy::Discovery::initial_peers (
            const  dds::core::StringSeq & the_initial_peers )
```

Sets the initial list of peers that the discovery mechanism will contact to announce this DomainParticipant.

As part of the participant discovery phase, the **dds::domain::DomainParticipant** (p. 1326) will announce itself to the domain by sending participant DATA messages. The initial_peers specifies the initial list of peers that will be contacted. A remote **dds::domain::DomainParticipant** (p. 1326) is discovered by receiving participant announcements from a remote peer. When the new remote **dds::domain::DomainParticipant** (p. 1326) has been added to the participant's database, the endpoint discovery phase commences and information about the DataWriters and DataReaders is exchanged.

Each element of this list must be a peer descriptor in the proper format (see **Peer Descriptor Format** (p. 560)).

[default] builtin.udpv4://239.255.0.1, builtin.udpv4://127.0.0.1, builtin.shmem:// (See also **NDDS_DISCOVERY_PEERS** (p. 559))

[range] Sequence of arbitrary length.

See also

Peer Descriptor Format (p. 560)

dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string) (p. 1352)()

Categories

Immutable (p. 243), **Transports** (p. 237), **Discovery Isolation** (p. 183), **Discovery** (p. 177)

8.82.4.4 initial_peers() [2/2]

```
dds::core::StringSeq rti::core::policy::Discovery::initial_peers ( ) const
```

Getter (see setter with the same name)

8.82.4.5 multicast_receive_addresses() [1/2]

```
Discovery & rti::core::policy::Discovery::multicast_receive_addresses (
            const  dds::core::StringSeq & the_multicast_receive_addresses )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the DomainParticipant.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. 561)).

The `domain_id` determines the multicast port on which the **Discovery** (p. 1265) mechanism can receive meta-data.

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268), starting at element 0. They will be stored in the order they appear NDDS_DISCOVERY_PEERS.

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268).

[default] builtin.udpv4://239.255.0.1 (See also **NDDS_DISCOVERY_PEERS** (p. 559))

[range] Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also

Address Format (p. 561)

8.82.4.6 multicast_receive_addresses() [2/2]

```
dds::core::StringSeq rti::core::policy::Discovery::multicast_receive_addresses ( ) const
```

Getter (see setter with the same name)

8.82.4.7 metatraffic_transport_priority() [1/2]

```
Discovery & rti::core::policy::Discovery::metatraffic_transport_priority (
            int32_t the_metatraffic_transport_priority )
```

<<***extension***>> *(*p. *116)* The transport priority to use for the **Discovery** (p. 1265) meta-traffic.

The discovery metatraffic will be sent by the built-in **dds::pub::DataWriter** (p. 1138) using this transport priority.

[default] 0

[range] [0, MAX_UINT]

Categories

Immutable (p. 243), **Transports** (p. 237), **Concurrency** (p. 164), **Discovery** (p. 177)

8.82.4.8 metatraffic_transport_priority() [2/2]

```
int32_t rti::core::policy::Discovery::metatraffic_transport_priority ( ) const
```

Getter (see setter with the same name)

8.82.4.9 accept_unknown_peers() [1/2]

```
Discovery & rti::core::policy::Discovery::accept_unknown_peers (
            bool the_accept_unknown_peers )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Whether to accept a new participant that is not in the initial peers list.

If false, the participant will only communicate with those in the initial peers list and those added via **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1352)().

If true, the participant will also communicate with all discovered remote participants.

Note: If accept_unknown_peers is false and shared memory is disabled, applications on the same node will *not* communicate if only 'localhost' is specified in the peers list. If shared memory is disabled or 'shmem://' is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS_DISCOVERY_PEERS** (p. 559).

[default] true

Categories

Immutable (p. 243), **Transports** (p. 237), **Discovery Isolation** (p. 183), **Discovery** (p. 177)

8.82.4.10 accept_unknown_peers() [2/2]

```
bool rti::core::policy::Discovery::accept_unknown_peers ( ) const
```

Getter (see setter with the same name)

8.82.4.11 enable_endpoint_discovery() [1/2]

```
Discovery & rti::core::policy::Discovery::enable_endpoint_discovery (
            bool the_enable_endpoint_discovery )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.

If true, endpoint discovery will automatically occur for every discovered remote participant.

If false, endpoint discovery will be initially disabled and manual activation is required for each discovered participant by calling **dds::domain::DomainParticipant::resume_endpoint_discovery** (p. 1356).

[default] true

8.83.1 Detailed Description

*<<**extension**>> (p. 116)* Configures the discovery mechanism

*<<**extension**>> (p. 116)* This QoS policy controls the amount of delay in discovering entities in the system and the amount of discovery traffic in the network.

The amount of network traffic required by the discovery process can vary widely, based on how your application has chosen to configure the middleware's network addressing (e.g., unicast vs. multicast, multicast TTL, etc.), the size of the system, whether all applications are started at the same time or whether start times are staggered, and other factors. Your application can use this policy to make tradeoffs between discovery completion time and network bandwidth utilization. In addition, you can introduce random back-off periods into the discovery process to decrease the probability of network contention when many applications start simultaneously.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.83.2 Constructor & Destructor Documentation

8.83.2.1 DiscoveryConfig()

```
rti::core::policy::DiscoveryConfig::DiscoveryConfig ( )  [inline]
```

Creates the default policy.

8.83.3 Member Function Documentation

8.83.3.1 participant_liveliness_lease_duration() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration (
            const  dds::core::Duration & the_participant_liveliness_lease_duration )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* The liveliness lease duration for the participant.

This is the same as the expiration time of the DomainParticipant as defined in the RTPS protocol.

If the participant has not refreshed its own liveliness to other participants at least once within this period, it may be considered as stale by other participants in the network.

Should be strictly greater than **rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period** (p. 1279).

[default] 100 seconds

[range] [1 nanosec,1 year], > participant_liveliness_assert_period

Categories

Immutable (p. 243), **Discovery** (p. 177), **Liveliness** (p. 199), **Discovery Metadata** (p. 288)

8.83.3.2 participant_liveliness_lease_duration() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration ( )
const
```

Getter (see setter with the same name)

8.83.3.3 participant_liveliness_assert_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period (
            const  dds::core::Duration & the_participant_liveliness_assert_period )
```

<<***basic***>> (p. *104)* <<***extension***>> (p. *116)* The period to assert liveliness for the participant.

The period at which the participant will refresh its liveliness to all the peers.

Should be strictly less than **rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration** (p. 1279).

[default] 30 seconds

[range] [1 nanosec,1 year], < participant_liveliness_lease_duration

Categories

Immutable (p. 243), **Discovery** (p. 177), **Liveliness** (p. 199)

8.83.3.4 participant_liveliness_assert_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period ( )
const
```

Getter (see setter with the same name)

8.83.3.5 participant_announcement_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_announcement_period (
            const  dds::core::Duration & the_participant_announcement_period )
```

<<***basic***>> (p. *104)* <<***extension***>> (p. *116)* The period at which a participant announces itself to potential peers when using the Simple Participant **Discovery** (p. 1265) Protocol 2.0 (SPDP2).

The **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) list **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1352) API are used to configure a set of potential peers that a DomainParticipant may discover. The **rti::core::policy::DiscoveryConfig::participant_announcement_period** (p. 1280) configures how frequently a DomainParticipant will announce itself to the subset of the configured potential peers that it has not matched with yet. Once a DomainParticipant matches with a DomainParticipant at one of configured potential peer locators, it will no longer announce itself to that locator at this period unless liveliness is lost.

This QoS policy is only supported when using the Simple Participant **Discovery** (p. 1265) Protocol 2.0 (SPDP2). Setting this value when using the Simple Participant **Discovery** (p. 1265) Protocol (SPDP) or other participant discovery protocols is not supported and will result in an error.

[default] dds::core::Duration::automatic() (p. 1451) (Takes the value of **rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period** (p. 1279))

[range] [1 nanosec,1 year]

Categories

Immutable (p. 243), **Discovery** (p. 177)

8.83.3.6 participant_announcement_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::participant_announcement_period ( ) const
```

Getter (see setter with the same name)

8.83.3.7 remote_participant_purge_kind() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::remote_participant_purge_kind (
            RemoteParticipantPurgeKind the_remote_participant_purge_kind )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

Most users will not need to change this value from its default, RemoteParticipantPurgeKind::LIVELINESS_BASED↩ _REMOTE_PARTICIPANT_PURGE. However, RemoteParticipantPurgeKind::NO_REMOTE_PARTICIPANT_PURGE may be a good choice if the following conditions apply:

1. **Discovery** (p. 1265) communication with a remote participant may be lost while data communication remains intact. Such will not typically be the case if discovery takes place over the Simple **Discovery** (p. 1265) Protocol, but may be the case if the RTI Enterprise **Discovery** (p. 1265) **Service** (p. 2350) is used.
2. Extensive and prolonged lack of discovery communication between participants is not expected to be common, either because participant loss itself is expected to be rare, or because participants may be lost sporadically but will typically return again.
3. Maintaining inter-participant liveliness is problematic, perhaps because a participant has no writers with the appropriate **dds::core::policy::LivelinessKind_def** (p. 1654).

[default] RemoteParticipantPurgeKind::LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE

Categories

Immutable (p. 243), **Discovery** (p. 177), **Liveliness** (p. 199)

8.83.3.8 remote_participant_purge_kind() [2/2]

```
RemoteParticipantPurgeKind rti::core::policy::DiscoveryConfig::remote_participant_purge_kind ( )
const
```

Getter (see setter with the same name)

8.83.3.9 max_liveliness_loss_detection_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::max_liveliness_loss_detection_period (
            const  dds::core::Duration & the_max_liveliness_loss_detection_period )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

Notification of the loss of liveliness of a remote entity may come more quickly than this duration, depending on the liveliness contract between the local and remote entities and the capabilities of the discovery mechanism in use. For example, a **dds::sub::DataReader** (p. 976) will learn of the loss of liveliness of a matched **dds::pub::DataWriter** (p. 1138) within the reader's offered liveliness lease duration.

Shortening this duration will increase the responsiveness of entities to communication failures. However, it will also increase the CPU usage of the application, as the liveliness of remote entities will be examined more frequently.

[default] 60 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 243), **Discovery** (p. 177), **Liveliness** (p. 199)

8.83.3.10 max_liveliness_loss_detection_period() [2/2]

8.83.3.67 default_domain_announcement_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::default_domain_announcement_period (
            const  dds::core::Duration & the_default_domain_announcement_period )
```

<<***extension***>> *(p. 116)* The period to announce a participant to the default domain 0.

The period at which a participant will announce itself to the default domain 0 using the default UDPv4 multicast group address for discovery traffic on that domain.

For domain 0, the default discovery multicast address is 239.255.0.1:7400.

To disable announcement to the default domain, set this period to **dds::core::Duration::infinite()** (p. 1451).

When this period is set to a value other than **dds::core::Duration::infinite()** (p. 1451) and **rti::core::policy::↩ DiscoveryConfig::ignore_default_domain_announcements** (p. 1301) is set to false, you can get information about participants running in different domains by creating a participant in domain 0 and implementing the on_data_available callback in the **dds::topic::ParticipantBuiltinTopicData** (p. 1908) built-in DataReader's listener.

You can learn the domain ID associated with a participant by looking at the field **dds::topic::ParticipantBuiltinTopic↩ Data::domain_id** (p. 1914).

[default] 30 seconds

[range] [1 nanosec,1 year] or **dds::core::Duration::infinite()** (p. 1451)

See also

Getter (see setter with the same name)

8.83.3.85 locator_reachability_lease_duration() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration (
            const  dds::core::Duration & the_locator_reachability_lease_duration )
```

<<***extension***>> *(p. 116)* The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

For the purpose of this explanation, we will use 'local' to refer to the DomainParticipant in which we configure locator_reachability_lease_duration and 'remote' to refer to the other DomainParticipants communicating with the local DomainParticipant.

This setting configures a timeout announced to the remote DomainParticipants. This timeout is used by the remote DomainParticipants as the maximum period by which a remote locator must be asserted by the local DomainParticipant (through a REACHABILITY PING message) before considering this locator as "unreachable" from the local Domain↩ Participant.

When a remote DomainParticipant detects that one of its locators is not reachable from the local DomainParticipant, it will notify the local DomainParticipant of this event. From that moment on, and until notified otherwise, the local DomainParticipant will not send RTPS messages to remote DomainParticipants using this locator.

If this value is set to **dds::core::Duration::infinite()** (p. 1451), the local DomainParticipant will send RTPS messages to a remote DomainParticipant on the locators announced by the remote DomainParticipant, regardless of whether or not the remote DomainParticipant can be reached using these locators.

[default] dds::core::Duration::infinite() (p. 1451)

[range] [1 nanosec,1 year] or **dds::core::Duration::infinite()** (p. 1451)

8.83.3.86 locator_reachability_lease_duration() [2/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::endpoint_type_object_lb_serialization_↩
threshold (
            int32_t the_endpoint_type_object_lb_serialization_threshold )
```

<<***extension***>> *(p. 116)* Controls when/if the TypeObject v1 is compressed when propagated in Simple Endpoint **Discovery** (p. 1265).

Minimum size (in bytes) of the serialized TypeObject v1 that will trigger the serialization of a compressed TypeObject v1 (known as TypeObjectLb) instead of the regular TypeObject v1.

For example, setting this property to 1000 will trigger the serialization of the TypeObjectLb for TypeObject v1s whose serialized size is greater than 1000 Bytes.

The sentinel value -1 disables TypeObject v1 compression.

If **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) is also enabled, this threshold does not affect compression of TypeObject v2s in TypeLookup **Service** (p. 2350) messages.

[default] 0. The default value 0 enables TypeObject v1 compression by always sending TypeObjectLb.

[range] [-1, 2147483647]

8.83.3.100 dns_tracker_polling_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::dns_tracker_polling_period (
            const  dds::core::Duration & the_dns_tracker_polling_period )
```

<<***extension***>> *(*p. *116)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

RTI Connext allows the use of hostnames instead of IP addresses when configuring initial peers for specific transports (e.g.: UDPv4 and UDPv6). The DNS tracker keeps the IP addresses of these hostnames updated. The DNS tracker builds a list of hostnames from the initial peers of a DomainParticipant, queries the DNS for those hostnames, and updates the resolved IP addresses when the IP addresses change. The frequency of these queries is defined by the DNS tracker polling period.

RTI Connext keeps information regarding the hostnames of peers if they are part of the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268). The information regarding peers added through the **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1352) operation is kept only if the DNS tracker has been enabled before adding a peer.

The DNS tracker is useful in situations where the IP address of an as-yet undiscovered peer may change. For example, if the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) of a participant is set to "hostname1" and the IP address associated with "hostname1" changes after the participant is created, the participant has no way of knowing about that change unless it queries the DNS again.

When two participants have already discovered each other, any IP address change is communicated directly between the participants and there is no need for the DNS tracker. In other words, they do not wait for the DNS tracker polling period to update the IP address–the change is communicated immediately between the participants so that communication can continue uninterrupted.

The value should be (but is not required to be) set to a value that is less than the **rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period** (p. 1279) (if using SPDP) or **rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period** (p. 1279) (is using SPDP2) so that multiple participant announcements are not sent to an outdated IP address.

When the period is set to **dds::core::Duration::infinite()** (p. 1451), the tracker is disabled.

[default] 20 seconds

8.83.3.114 participant_configuration_writer_publish_mode() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_configuration_writer_publish_↩
mode (
            const  PublishMode & the_participant_configuration_writer_publish_mode )
```

<<***extension***>> *(p. 116)* Publish mode policy for the built-in participant configuration writer.

Determines whether the **Discovery** (p. 1265) built-in participant configuration **dds::pub::DataWriter** (p. 1138) publishes data synchronously or asynchronously and how.

Categories

Immutable (p. 243), **Discovery** (p. 177), **Flow Control** (p. 188)

8.83.3.115 participant_configuration_writer_publish_mode() [2/3]

```
const  PublishMode & rti::core::policy::DiscoveryConfig::participant_configuration_writer_publish↩
_mode ( ) const
```

Getter (see setter with the same name)

8.83.3.116 participant_configuration_writer_publish_mode() [3/3]

```
PublishMode & rti::core::policy::DiscoveryConfig::participant_configuration_writer_publish_mode (
)
```

Getter (see setter with the same name)

8.83.3.117 request_types_filter() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::request_types_filter (
            const  rti::core::optional_value< std::string > & the_request_types_filter )
```

<<***extension***>> *(p. 116)* Topic name pattern for requesting all types via Type Lookup **Service** (p. 2350).

When using TypeObject v2 (enabled via **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321)), this field configures a topic name pattern. Any remote endpoint whose topic name matches this pattern will have all of its types requested by the Type Lookup **Service** (p. 2350), even if no matching local endpoint exists.

By default, the Type Lookup **Service** (p. 2350) only requests unknown types when a matching local endpoint exists. This setting allows you to proactively retrieve type information for remote endpoints matching specific topic names, which can be useful for applications where types are discovered on the wire (such as those using Dynamic Data).

This is a regex string, so you can use regex syntax to match multiple topic names (including wildcards).

If this is NULL or an empty string, the middleware will only request types for remote endpoints that have a matching local endpoint.

If you are using **dds::core::xtypes::DynamicData** (p. 1461) and relying on discovering types on the wire, you should set this to a value that matches the topic names of your remote endpoints to ensure that you receive type information for those endpoints.

[default] NULL

Categories

Immutable (p. 243), **Discovery** (p. 177)

8.83.3.118 request_types_filter() [2/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::request_types_filter (
            const char * the_request_types_filter )
```

Setter accepting `const char *` (see other setter)

8.83.3.119 request_types_filter() [3/3]

```
rti::core::optional_value< std::string > rti::core::policy::DiscoveryConfig::request_types_filter ( ) const
```

Getter (see setter with the same name)

8.84 rti::core::policy::DiscoveryConfigBuiltinChannelKindMask Class Reference

<<***extension***>> *(p. 354)* A mask that selects the built-in channels to be used

`#include <PolicyKind.hpp>`

Inherits std::bitset< 16 >.

Public Types

- typedef std::bitset< 16 > **MaskType**
  The base type, std::bitset.

Public Member Functions

- **DiscoveryConfigBuiltinChannelKindMask** ()=default
  Creates an empty mask.
- **DiscoveryConfigBuiltinChannelKindMask** (uint64_t mask)
  Creates a mask from the bits in an integer.
- **DiscoveryConfigBuiltinChannelKindMask** (const **MaskType** &mask)
  Creates a mask from a std::bitset.

Static Public Member Functions

- static **DiscoveryConfigBuiltinChannelKindMask** **all** ()
  All the bits are set, indicating that all channels are enabled.
- static **DiscoveryConfigBuiltinChannelKindMask** **none** ()
  No bits are set, indicating that all channels are disabled.
- static **DiscoveryConfigBuiltinChannelKindMask** **service_request** ()
  Set the bits to enable the service request channel (which is the default setting).
- static **DiscoveryConfigBuiltinChannelKindMask** **type_lookup_service** ()
  Set the bits to enable the typelookup service channel.
- static **DiscoveryConfigBuiltinChannelKindMask** **type_lookup_service_request** ()
  Set the bits to enable the typelookup service request channel.
- static **DiscoveryConfigBuiltinChannelKindMask** **type_lookup_service_reply** ()
  Set the bits to enable the typelookup service reply channel.

8.84.1 Detailed Description

<<***extension***>> *(p. 354)* A mask that selects the built-in channels to be used

8.84.2 Member Typedef Documentation

8.84.2.1 MaskType

```
typedef std::bitset<16>  rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::MaskType
```

The base type, std::bitset.

8.84.3 Constructor & Destructor Documentation

8.84.3.1 DiscoveryConfigBuiltinChannelKindMask() [1/3]

```
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::DiscoveryConfigBuiltinChannelKindMask (
) [default]
```

Creates an empty mask.

Referenced by **all()**, **none()**, **service_request()**, **type_lookup_service()**, **type_lookup_service_reply()**, and **type_lookup_service_request()**.

8.84.3.2 DiscoveryConfigBuiltinChannelKindMask() [2/3]

```
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::DiscoveryConfigBuiltinChannelKindMask (
            uint64_t mask ) [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.84.3.3 DiscoveryConfigBuiltinChannelKindMask() [3/3]

```
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::DiscoveryConfigBuiltinChannelKindMask (
            const MaskType & mask ) [inline], [explicit]
```

Creates a mask from a std::bitset.

8.84.4 Member Function Documentation

8.84.4.1 service_request()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel↩
KindMask::service_request ( ) [inline], [static]
```

Set the bits to enable the service request channel (which is the default setting).

Enables the ServiceRequest channel, which is required by the TopicQuery and locator reachability features. Disabling the ServiceRequest channel reduces resource consumption including network bandwidth, CPU utilization, and memory.

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.84.4.2 type_lookup_service()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel↩
KindMask::type_lookup_service ( ) [inline], [static]
```

Set the bits to enable the typelookup service channel.

Enables both the Type Lookup **Service** (p. 2350) Request channel and Type Lookup **Service** (p. 2350) Reply channel.

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.84.4.3 type_lookup_service_request()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel↩
KindMask::type_lookup_service_request ( ) [inline], [static]
```

Set the bits to enable the typelookup service request channel.

Enables the Type Lookup **Service** (p. 2350) Request channel.

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.84.4.4 type_lookup_service_reply()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel↩
KindMask::type_lookup_service_reply ( ) [inline], [static]
```

Set the bits to enable the typelookup service reply channel.

Enables the Type Lookup **Service** (p. 2350) Reply channel.

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.85 rti::core::policy::DiscoveryConfigBuiltinPluginKindMask Class Reference

<<***extension***>> *(p. 354)* A mask that selects the built-in discovery plugins to be used

```
#include <PolicyKind.hpp>
```

Inherits std::bitset< 5 >.

Public Types

- typedef std::bitset< 5 > **MaskType**
  The base type, std::bitset.

Public Member Functions

- **DiscoveryConfigBuiltinPluginKindMask** ()
  Creates an empty mask.
- **DiscoveryConfigBuiltinPluginKindMask** (uint64_t mask)
  Creates a mask from the bits in an integer.
- **DiscoveryConfigBuiltinPluginKindMask** (const **MaskType** &mask)
  Creates a mask from a std::bitset.

Static Public Member Functions

- static const **DiscoveryConfigBuiltinPluginKindMask** **none** ()
  No bits are set.
- static const **DiscoveryConfigBuiltinPluginKindMask** **SPDP** ()
  *Simple Participant **Discovery** (p. 1265) Protocol.*
- static const **DiscoveryConfigBuiltinPluginKindMask** **SEDP** ()
  *Simple Endpoint **Discovery** (p. 1265) Protocol.*
- static const **DiscoveryConfigBuiltinPluginKindMask** **SPDP2** ()
  *Simple Participant **Discovery** (p. 1265) Protocol 2.0.*
- static const **DiscoveryConfigBuiltinPluginKindMask** **DPSE** ()
  Dynamic Participant discovery, Static Endpoint discovery.
- static const **DiscoveryConfigBuiltinPluginKindMask** **SDP** ()
  Simple discovery plugin (default).
- static const **DiscoveryConfigBuiltinPluginKindMask** **SDP2** ()
  Simple discovery plugin 2.0.

8.85.1 Detailed Description

<<***extension***>> *(p. 354)* A mask that selects the built-in discovery plugins to be used

8.85.2 Member Typedef Documentation

8.85.2.1 MaskType

```
typedef std::bitset<5>  rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::MaskType
```

The base type, std::bitset.

8.85.3 Constructor & Destructor Documentation

8.85.3.1 DiscoveryConfigBuiltinPluginKindMask() [1/3]

```
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::DiscoveryConfigBuiltinPluginKindMask ( )
[inline]
```

Creates an empty mask.

Referenced by **DPSE()**, **none()**, **SDP()**, **SDP2()**, **SEDP()**, **SPDP()**, and **SPDP2()**.

8.85.3.2 DiscoveryConfigBuiltinPluginKindMask() [2/3]

```
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::DiscoveryConfigBuiltinPluginKindMask (
            uint64_t mask )  [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.85.3.3 DiscoveryConfigBuiltinPluginKindMask() [3/3]

```
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::DiscoveryConfigBuiltinPluginKindMask (
            const  MaskType & mask )  [inline]
```

Creates a mask from a std::bitset.

8.85.4 Member Function Documentation

8.85.4.1 none()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::none ( ) [inline], [static]
```

No bits are set.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.85.4.2 SPDP()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::SPDP ( ) [inline], [static]
```

Simple Participant **Discovery** (p. 1265) Protocol.

Enables the first phase of the Simple **Discovery** (p. 1265) Protocol (SDP), in which DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant declaration messages, also known as participant DATA submessages or participant announcements.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.85.4.3 SEDP()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::SEDP ( ) [inline], [static]
```

Simple Endpoint **Discovery** (p. 1265) Protocol.

Enables the second phase of the Simple **Discovery** (p. 1265) Protocol (SDP), in which the information (GUID, QoS, etc.) about your application's DataReaders and DataWriters is exchanged by sending publication/subscription declarations in DATA messages, also known as publication DATAs and subscription DATAs.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.85.4.4 SPDP2()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::SPDP2 ( ) [inline], [static]
```

Simple Participant **Discovery** (p. 1265) Protocol 2.0.

Enables the Simple Participant **Discovery** (p. 1265) Protocol 2.0, in which a DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant bootstrap messages. These bootstrap messages contain only a subset of the information in the Simple Participant **Discovery** (p. 1265) Protocol (SPDP) participant announcements that is required to match two participants and bootstrap the system. The DomainParticpant's full configuration is then sent reliably with participant configuration announcements. Two DomainParticipants that use SPDP2 will maintain liveliness using liveliness participant messages.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.85.4.5 DPSE()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::DPSE ( ) [inline], [static]
```

Dynamic Participant discovery, Static Endpoint discovery.

Enables static endpoint discovery for a DomainParticipant. In this type of discovery, information from remote endpoints is extracted from a local DDS-XML file instead of being received over the network, reducing the number of exchanged packets and consequently reducing bandwidth consumption used for discovery. Using this value in **DiscoveryConfig↩ BuiltinPluginKindMask** (p. 1322) requires the 'librtilbedisc' library (included in the RTI Connext Professional bundles) to be reachable (PATH, LD_LIBRARY_PATH or DYLD_LIBRARY_PATH).

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.85.4.6 SDP()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::SDP ( ) [inline], [static]
```

Simple discovery plugin (default).

It is equivalent to SPDP + SEDP.

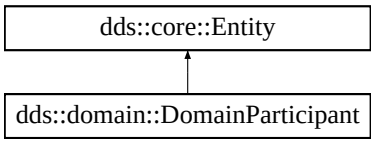
References **DiscoveryConfigBuiltinPluginKindMask()**.

8.85.4.7 SDP2()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↩
PluginKindMask::SDP2 ( ) [inline], [static]
```

Simple discovery plugin 2.0.

It is equivalent to SPDP2 + SEDP.



References **DiscoveryConfigBuiltinPluginKindMask()**.

8.86 dds::domain::DomainParticipant Class Reference

<<***reference-type***>> *(*p. *351)* Container for all **dds::core::Entity** (p. 1520) objects.

`#include <dds/domain/DomainParticipant.hpp>`

Inheritance diagram for dds::domain::DomainParticipant:

Public Types

- typedef **DomainParticipantListener** **Listener**

  *The **Listener** (*p. *1637) type that DomainParticipants use.*

Public Member Functions

- **DomainParticipant** (int32_t the_domain_id)

  *Create a new **DomainParticipant** (*p. *1326) with default Qos.*
- **DomainParticipant** (int32_t the_domain_id, const **dds::domain::qos::DomainParticipantQos** &the_↩qos, **dds::domain::DomainParticipantListener** ∗the_listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())

  *Create a new **DomainParticipant** (*p. *1326).*
- **DomainParticipant** (int32_t the_domain_id, const **dds::domain::qos::DomainParticipantQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status↩::StatusMask::all**())

  *Create a new **DomainParticipant** (*p. *1326).*
- void **listener** (**Listener** ∗l, const **dds::core::status::StatusMask** &mask)

  *Register a listener with the **DomainParticipant** (*p. *1326).*
- **Listener** ∗ **listener** () const

  *Get the **DomainParticipant** (*p. *1326) listener.*

- void **set_listener** (std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &event_↩ mask)

  Sets the listener associated with this participant.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)

  Sets the listener associated with this participant.
- std::shared_ptr< **Listener** > **get_listener** () const

  Returns the listener currently associated with this participant.
- const **dds::domain::qos::DomainParticipantQos** **qos** () const

  *Gets the current QoS policies of this **DomainParticipant** (p. 1326).*
- void **qos** (const **dds::domain::qos::DomainParticipantQos** &the_qos)

  *Set the DomainParticipantQos setting for this **DomainParticipant** (p. 1326) instance.*
- **DomainParticipant** & **operator**<< (const **dds::domain::qos::DomainParticipantQos** &the_qos)

  Equivalent to set_qos(the_qos)
- const **DomainParticipant** & **operator**>> (**dds::domain::qos::DomainParticipantQos** &the_qos) const

  Equivalent to `get_qos()`
- int32_t **domain_id** () const

  Get the unique domain identifier.
- void **assert_liveliness** ()

  *Manually assert the liveliness of the **DomainParticipant** (p. 1326).*
- void **property** (const std::string &property_name, const std::string &value, bool propagate)

  *Set the value for a property that applies to a **DomainParticipant** (p. 1326).*
- bool **contains_entity** (const **dds::core::InstanceHandle** &a_handle)

  *Check whether or not the given handle represents an Entity that was created from the **DomainParticipant** (p. 1326).*
- **dds::core::Time** **current_time** ()

  Get the current time.
- **dds::pub::qos::PublisherQos** **default_publisher_qos** () const

  *Get the current default **dds::pub::qos::PublisherQos** (p. 2007).*
- **DomainParticipant** & **default_publisher_qos** (const **dds::pub::qos::PublisherQos** &the_qos)

  *Set the default **dds::pub::qos::PublisherQos** (p. 2007) for this **DomainParticipant** (p. 1326).*
- **dds::sub::qos::SubscriberQos** **default_subscriber_qos** () const

  *Get the current default **dds::sub::qos::SubscriberQos** (p. 2423).*
- **DomainParticipant** & **default_subscriber_qos** (const **dds::sub::qos::SubscriberQos** &the_qos)

  *Set the default **dds::sub::qos::SubscriberQos** (p. 2423) for this **DomainParticipant** (p. 1326).*
- **dds::topic::qos::TopicQos** **default_topic_qos** () const

  *Get the current default **dds::topic::qos::TopicQos** (p. 2509).*
- **DomainParticipant** & **default_topic_qos** (const **dds::topic::qos::TopicQos** &the_qos)

  *Set the default **dds::topic::qos::TopicQos** (p. 2509) for this **DomainParticipant** (p. 1326).*
- void **close_contained_entities** ()

  *<<**extension**>> (p. 354) Closes all the entities created from this **DomainParticipant** (p. 1326)*
- **dds::pub::qos::DataWriterQos** **default_datawriter_qos** () const

  *<<**extension**>> (p. 354) Get the current default **dds::pub::qos::DataWriterQos** (p. 1226).*
- void **default_datawriter_qos** (const **::dds::pub::qos::DataWriterQos** & **qos**)

  *<<**extension**>> (p. 354) Set the default **dds::pub::qos::DataWriterQos** (p. 1226) for this **DomainParticipant** (p. 1326).*
- **dds::sub::qos::DataReaderQos** **default_datareader_qos** () const

  *<<**extension**>> (p. 354) Get the current default **dds::sub::qos::DataReaderQos** (p. 1072).*
- void **default_datareader_qos** (const **::dds::sub::qos::DataReaderQos** & **qos**)

<<**extension**>> (p. 354) *Set the default* **dds::sub::qos::DataReaderQos** (p. 1072) *for this* **DomainParticipant** (p. 1326).

- void **register_contentfilter** (const **rti::topic::CustomFilter**< rti::topic::ContentFilterBase > &custom_filter, const std::string &filter_name)

  <<**extension**>> (p. 354) *Register a content filter which can be used to create a* **dds::topic::ContentFilteredTopic** (p. 954).
- void **unregister_contentfilter** (const std::string &filter_name)

  <<**extension**>> (p. 354) *Unregister a content filter previously registered with* **dds::domain::DomainParticipant::register_contentfilter(const rti::topic::CustomFilter<rti::topic::ContentFilterBase>& custom_filter, const std::string& filter_name)** (p. 1349).
- void **unregister_type** (const std::string &name)

  <<**extension**>> (p. 354) *Unregister a type that has previously been registered to this* **dds::domain::DomainParticipant** (p. 1326).
- bool **is_type_registered** (const std::string &name) const

  <<**extension**>> (p. 354) *Check if a type has previously been registered to this* **dds::domain::DomainParticipant** (p. 1326).
- void **add_peer** (const std::string &peer_descr_string)

  <<**extension**>> (p. 354) *Attempt to contact one or more additional peer participants.*
- void **remove_peer** (const std::string &peer_descr_string)

  <<**extension**>> (p. 354) *Remove one or more peer participants from the list of peers with which this* **dds::domain::DomainParticipant** (p. 1326) *will try to communicate.*
- **dds::core::Duration dns_tracker_polling_period** () const

  Retrieves the frequency used by the DNS tracker thread to query the DNS service.
- void **dns_tracker_polling_period** (const **dds::core::Duration** &polling_period)

  Configures the frequency in which the DNS tracker queries the DNS service.
- void **resume_endpoint_discovery** (const **dds::core::InstanceHandle** &remote_participant_handle)

  <<**extension**>> (p. 354) *Initiates endpoint discovery with the remote* **dds::domain::DomainParticipant** (p. 1326) *identified by its InstanceHandle.*
- void **delete_durable_subscription** (const **rti::core::EndpointGroup** &group)

  <<**extension**>> (p. 354) *Deletes an existing Durable Subscription on all Persistence Services.*
- void **register_durable_subscription** (const **rti::core::EndpointGroup** &group, const std::string &topic_name)

  <<**extension**>> (p. 354) *Registers a Durable Subscription on the specified* **dds::topic::Topic** (p. 2474) *on all Persistence Services.*
- **rti::core::status::DomainParticipantProtocolStatus participant_protocol_status** ()

  <<**extension**>> (p. 354) *Get the protocol status for this participant*
- rti::core::int64 **time_until_license_expiration** () const

  <<**extension**>> (p. 354) *Retrieve the remaining time until the license validated for this* **DomainParticipant** (p. 1326) *expires, with seconds precision.*

Static Public Member Functions

- static void **participant_factory_qos** (const **dds::domain::qos::DomainParticipantFactoryQos** & **qos**)

  Set the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378).
- static **dds::domain::qos::DomainParticipantFactoryQos participant_factory_qos** ()

  Get the current **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378).
- static void **finalize_participant_factory** ()

  Finalize the DomainParticipantFactory.
- static **dds::domain::qos::DomainParticipantQos default_participant_qos** ()

  Get the current DomainParticipantQos for this instance.
- static void **default_participant_qos** (const **dds::domain::qos::DomainParticipantQos** & **qos**)

  Set the DomainParticipantQos.

Related Functions

(Note that these are not member functions.)

8.86.1 Detailed Description

<<***reference-type***>> *(p. 351)* Container for all **dds::core::Entity** (p. 1520) objects.

- It acts as a container for all other **dds::core::Entity** (p. 1520) objects.
- It acts as a *factory* for the **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::topic::Topic** (p. 2474) and MultiTopic **dds::core::Entity** (p. 1520) objects.
- It represents the participation of the application on a communication plane that isolates applications running on the same set of physical computers from each other. A domain establishes a virtual network linking all applications that share the same `domainId` and isolating them from applications running on different domains. In this way, several independent distributed applications can coexist in the same physical network without interfering, or even being aware of each other.
- It provides administration services in the domain, offering operations that allow the application to ignore locally any information about a given participant (**dds::domain::ignore** (p. 635)), publication (**dds::pub::ignore** (p. 647)), subscription (**dds::sub::ignore()** (p. 667)) or topic (**dds::topic::ignore()** (p. 693)()).

The following operations may be called even if the **dds::domain::DomainParticipant** (p. 1326) is not enabled. Operations NOT in this list will fail with **dds::core::NotEnabledError** (p. 1869) \ if called on a disabled **DomainParticipant** (p. 1326).

- **dds::core::Entity::enable** (p. 1524),
- **dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)** (p. 1337), **dds::domain::DomainParticipant::qos() const** (p. 1336),
- **dds::domain::DomainParticipant::set_listener** (p. 1335), **dds::domain::DomainParticipant::get_listener** (p. 1336),
- The constructors of **rti::pub::FlowController** (p. 1572), **dds::topic::Topic** (p. 2474), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410).
- **dds::domain::DomainParticipant::default_topic_qos** (p. 1344), **dds::domain::DomainParticipant::default_topic_qos()** (p. 1344), **dds::domain::DomainParticipant::default_publisher_qos** (p. 1342), **dds::domain::DomainParticipant::default_publisher_qos()** (p. 1342), **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1343), **dds::domain::DomainParticipant::default_subscriber_qos** (p. 1343), **dds::domain::DomainParticipant::default_datareader_qos** (p. 1348), **dds::domain::DomainParticipant::default_datareader_qos()** (p. 1348), **dds::domain::DomainParticipant::default_datawriter_qos** (p. 1346), **dds::domain::DomainParticipant::default_datawriter_qos()** (p. 1346), ;
- Operations for looking up topics: **dds::topic::find()** (p. 694);
- Operations that access status: **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2373), **dds::core::Entity::status_changes()** (p. 1525).

QoS:

dds::domain::qos::DomainParticipantQos (p. 1384)

Status:

Status Kinds (p. 429)

Listener:

DomainParticipantListener (p. 1382)

dds::core::QosProvider::create_participant_from_config (p. 2046) to create a **DomainParticipant** (p. 1326) from an XML definition

Participant Use Cases (p. 306)

Entity Use Cases (p. 325)

Examples

Foo.hpp, **Foo_publisher.cxx**, and **Foo_subscriber.cxx**.

8.86.2 Member Typedef Documentation

8.86.2.1 Listener

```
typedef DomainParticipantListener dds::domain::DomainParticipant::Listener
```

The **Listener** (p. 1637) type that DomainParticipants use.

8.86.3 Constructor & Destructor Documentation

8.86.3.1 DomainParticipant() [1/3]

```
dds::domain::DomainParticipant::DomainParticipant (
            int32_t the_domain_id )  [inline], [explicit]
```

Create a new **DomainParticipant** (p. 1326) with default Qos.

Same as **DomainParticipant(int32_t, const dds::domain::qos::DomainParticipantQos&, dds::domain::Domain↩ ParticipantListener∗, const dds::core::status::StatusMask&)** (p. 1332) except that it uses **the default Domain↩ ParticipantQos** (p. 1522)

8.86.3.2 DomainParticipant() [2/3]

```
dds::domain::DomainParticipant::DomainParticipant (
            int32_t the_domain_id,
            const  dds::domain::qos::DomainParticipantQos & the_qos,
             dds::domain::DomainParticipantListener * the_listener = NULL,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a new **DomainParticipant** (p. 1326).

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

The **DomainParticipant** (p. 1326) signifies that the application intends to join the Domain identified by the domain_id argument.

Parameters

the_domain↩ _id	the id of the domain joined by this **DomainParticipant** (p. 1326). **[range]** [>=0], and does not violate guidelines stated in **rti::core::RtpsWellKnownPorts** (p. 2258).
the_qos	The QoS settings for this **DomainParticipant** (p. 1326). See also set_qos().
the_listener	The listener (NULL by default)
mask	Changes of communication status to be invoked on the listener.

Precondition

The specified QoS policies must be consistent or the operation will fail and no **dds::domain::DomainParticipant** (p. 1326) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **rti::core::policy::WireProtocol** (p. 2630)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

Unsafe. On VxWorks, none of the following is safe until the first **dds::domain::DomainParticipant** (p. 1326) has been created or **dds::core::QosProvider::Default()** (p. 2036) has been obtained for the first time:

- creating several **dds::domain::DomainParticipant** (p. 1326) in parallel;
- calling **dds::core::QosProvider::Default()** (p. 2036) from two or more threads in parallel;
- creating a **dds::domain::DomainParticipant** (p. 1326) and calling **dds::core::QosProvider::Default()** (p. 2036) in parallel.

dds::core::QosProvider (p. 2025)

dds::domain::DomainParticipant::default_participant_qos() (p. 1341)

dds::domain::DomainParticipant::set_listener (p. 1335)

8.86.3.3 DomainParticipant() [3/3]

```
dds::domain::DomainParticipant::DomainParticipant (
             int32_t the_domain_id,
             const  dds::domain::qos::DomainParticipantQos & the_qos,
             std::shared_ptr<  Listener > the_listener,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a new **DomainParticipant** (p. 1326).

The **DomainParticipant** (p. 1326) signifies that the application intends to join the Domain identified by the domain_id argument.

Parameters

the_domain_id	the id of the domain joined by this **DomainParticipant** (p. 1326). **[range]** [>=0], and does not violate guidelines stated in **rti::core::RtpsWellKnownPorts** (p. 2258).
the_qos	The QoS settings for this **DomainParticipant** (p. 1326). See also set_qos().
the_listener	A shared_ptr to the listener. See **set_listener()** (p. 1335) for more information.
mask	Changes of communication status to be invoked on the listener.

Precondition

The specified QoS policies must be consistent or the operation will fail and no **dds::domain::DomainParticipant** (p. 1326) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **rti::core::policy::WireProtocol** (p. 2630)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

Unsafe. On VxWorks, none of the following is safe until the first **dds::domain::DomainParticipant** (p. 1326) has been created or **dds::core::QosProvider::Default()** (p. 2036) has been obtained for the first time:

- creating several **dds::domain::DomainParticipant** (p. 1326) in parallel;
- calling **dds::core::QosProvider::Default()** (p. 2036) from two or more threads in parallel;
- creating a **dds::domain::DomainParticipant** (p. 1326) and calling **dds::core::QosProvider::Default()** (p. 2036) in parallel.

NDDS_DISCOVERY_PEERS (p. 559)

dds::core::QosProvider (p. 2025)

dds::domain::DomainParticipant::default_participant_qos() (p. 1341)

dds::domain::DomainParticipant::set_listener (p. 1335)

8.86.4 Member Function Documentation

8.86.4.1 listener() [1/2]

```
void dds::domain::DomainParticipant::listener (
              Listener * l,
             const  dds::core::status::StatusMask & mask )  [inline]
```

Register a listener with the **DomainParticipant** (p. 1326).

[DEPRECATED] The use of **set_listener()** (p. 1335) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

8.86.4.2 listener() [2/2]

```
Listener * dds::domain::DomainParticipant::listener ( ) const  [inline]
```

Get the **DomainParticipant** (p. 1326) listener.

[DEPRECATED] Prefer **get_listener()** (p. 1336) instead of this function.

Returns

The existing listener attached to the **DomainParticipant** (p. 1326) or NULL if no listener has been set.

8.86.4.3 set_listener() [1/2]

```
void dds::domain::DomainParticipant::set_listener (
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener associated with this participant.

The **DomainParticipant** (p. 1326) will hold the `shared_ptr`, ensuring that the listener is not deleted at least until this **DomainParticipant** (p. 1326) is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the participant. If it does, the application needs to manually reset the listener or manually close this participant to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.
event_mask	A mask that indicates which status updates will be notified to the listener

MT Safety:

Unsafe. This method is not synchronized with the listener callbacks, so it is possible to set a new listener on a participant when the old listener is in a callback.

Care should therefore be taken not to delete any listener that has been set on an enabled participant unless some application-specific means are available of ensuring that the old listener cannot still be in use.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

set_listener (abstract) (p. 1523)

8.86.4.4 set_listener() [2/2]

```
void dds::domain::DomainParticipant::set_listener (
            std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this participant.

If `the_listener` is not `nullptr`, this overload is equivalent to:
```
participant.set_listener(the_listener,
dds::core::status::StatusMask::all());
```

If `the_listener` is `nullptr`, it is equivalent to:
```
participant.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.

8.86.4.5 get_listener()

```
std::shared_ptr< Listener > dds::domain::DomainParticipant::get_listener ( ) const [inline]
```

Returns the listener currently associated with this participant.

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.86.4.6 qos() [1/2]

```
const  dds::domain::qos::DomainParticipantQos dds::domain::DomainParticipant::qos ( ) const  [inline]
```

Gets the current QoS policies of this **DomainParticipant** (p. 1326).

Returns

The current QoS policies.

8.86.4.7 qos() [2/2]

```
void dds::domain::DomainParticipant::qos (
            const  dds::domain::qos::DomainParticipantQos & the_qos )  [inline]
```

Set the DomainParticipantQos setting for this **DomainParticipant** (p. 1326) instance.

Parameters

the_qos	Set of policies to be applied to the **DomainParticipant** (p. 1326). Immutable policies cannot be changed after this entity has been enabled.

Exceptions

dds::core::ImmutablePolicyError (p. *1609*)	if `the_qos` contains a different value for an immutable policy.
dds::core::InconsistentPolicyError (p. *1610*)	if some policies are inconsistent.
dds::core::NotAllowedBySecurityError (p. *1868*)	if the security extensions do not allow some policies.

See also

dds::domain::qos::DomainParticipantQos (p. 1384) for rules on consistency among QoS policies

set_qos (abstract) (p. 1522)

default_participant_qos() (p. 1341)

dds::core::QosProvider::participant_qos() (p. 2031)

8.86.4.8 operator<<()

```
DomainParticipant & dds::domain::DomainParticipant::operator<< (
            const  dds::domain::qos::DomainParticipantQos & the_qos )  [inline]
```

Equivalent to set_qos(the_qos)

8.86.4.9 operator>>()

```
const DomainParticipant & dds::domain::DomainParticipant::operator>> (
            dds::domain::qos::DomainParticipantQos & the_qos ) const [inline]
```

Equivalent to `get_qos()`

Parameters

the_qos	the new qos for this **DomainParticipant** (p. 1326).

8.86.4.10 domain_id()

```
int32_t dds::domain::DomainParticipant::domain_id ( ) const [inline]
```

Get the unique domain identifier.

This operation retrieves the domain id used to create the **dds::domain::DomainParticipant** (p. 1326). The domain id identifies the DDS domain to which the **dds::domain::DomainParticipant** (p. 1326) belongs. Each DDS domain represents a separate data 'communication plane' isolated from other domains.

Returns

the domain id

8.86.4.11 assert_liveliness()

```
void dds::domain::DomainParticipant::assert_liveliness ( ) [inline]
```

Manually assert the liveliness of the **DomainParticipant** (p. 1326).

This is used in combination with the **dds::core::policy::Liveliness** (p. 1645) to indicate to RTI Connext that the entity remains active.

You need to use this operation if the **dds::domain::DomainParticipant** (p. 1326) contains **dds::pub::DataWriter** (p. 1138) entities with the **dds::core::policy::Liveliness::kind** (p. 1649) set to **dds::core::policy::LivelinessKind↩ _def::MANUAL_BY_PARTICIPANT** (p. 1655) and it only affects the liveliness of those **dds::pub::DataWriter** (p. 1138) entities. Otherwise, it has no effect.

Note: writing data via the **dds::pub::DataWriter::write()** (p. 1148) or **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 1149) operation asserts liveliness on the **dds::pub::DataWriter** (p. 1138) itself and its **dds↩ ::domain::DomainParticipant** (p. 1326). Consequently the use of **assert_liveliness()** (p. 1338) is only needed if the application is not writing data regularly.

8.86.4.12 property()

```
void dds::domain::DomainParticipant::property (
            const std::string & property_name,
            const std::string & value,
            bool propagate )  [inline]
```

Set the value for a property that applies to a **DomainParticipant** (p. 1326).

Warning

This method is not implemented in all APIs and it's intended only for testing purposes. You should use **dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)** (p. 1337) instead.

Parameters

property_name	*<<**in**>> (p. 355).* Name of the property that you want to set.
value	*<<**in**>> (p. 355).* New value for the property.
propagate	*<<**in**>> (p. 355).* Indicates if the property will be propagated or not.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

dds::pub::DataWriter::set_property

dds::sub::DataReader::set_property

dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&) (p. 1337)

8.86.4.13 contains_entity()

```
bool dds::domain::DomainParticipant::contains_entity (
            const  dds::core::InstanceHandle & a_handle )  [inline]
```

Check whether or not the given handle represents an Entity that was created from the **DomainParticipant** (p. 1326).

This operation checks whether or not the given `a_handle` represents an **dds::core::Entity** (p. 1520) that was created from the **dds::domain::DomainParticipant** (p. 1326). The containment applies recursively. That is, it applies both to entities (TopicDescription, **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410)) created directly using the **dds::domain::DomainParticipant** (p. 1326) as well as entities created using a contained **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) as the factory, and so forth.

The `instance` handle for an **dds::core::Entity** (p. 1520) may be obtained from built-in topic data, from various statuses, or from the operation **dds::core::Entity::instance_handle()** (p. 1525).

Parameters

a_handle	<<*in*>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of the **dds::core::Entity** (p. 1520) to be checked.

Returns

true if **dds::core::Entity** (p. 1520) is contained by the **dds::domain::DomainParticipant** (p. 1326), or false otherwise.

8.86.4.14 current_time()

```
dds::core::Time dds::domain::DomainParticipant::current_time ( )  [inline]
```

Get the current time.

The current value of the time that RTI Connext uses to time-stamp **dds::pub::DataWriter** (p. 1138) and to set the reception-timestamp for the data updates that it receives.

Exceptions

One	of the **Standard Exceptions** (p. 428)

Returns

The current time

8.86.4.15 participant_factory_qos() [1/2]

```
static void dds::domain::DomainParticipant::participant_factory_qos (
            const  dds::domain::qos::DomainParticipantFactoryQos & qos )  [inline], [static]
```

Set the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378).

Parameters

qos	The DomainParticipantFactoryQos to set.

8.86.4.16 participant_factory_qos() [2/2]

```
static dds::domain::qos::DomainParticipantFactoryQos dds::domain::DomainParticipant::participant↩
_factory_qos ( ) [inline], [static]
```

Get the current **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378).

Returns

The current DomainParticipantFactoryQos

8.86.4.17 finalize_participant_factory()

```
static void dds::domain::DomainParticipant::finalize_participant_factory ( ) [inline], [static]
```

Finalize the DomainParticipantFactory.

The DomainParticipantFactory is a singleton that the C++ API uses implicitly to create participants. RTI Connext provides this operation for users who want to release memory used by the participant factory.

Warning

This method uses a static variable. To avoid undefined behavior in the order of destruction it shouldn't be called in the destructor of a type for which other global or static variables exist.

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.86.4.18 default_participant_qos() [1/2]

```
static dds::domain::qos::DomainParticipantQos dds::domain::DomainParticipant::default_participant↩
_qos ( ) [inline], [static]
```

Get the current DomainParticipantQos for this instance.

Returns

The current DomainParticipantQos

See also

Default QoS (p. 1522)

8.86.4.19 default_participant_qos() [2/2]

```
static void dds::domain::DomainParticipant::default_participant_qos (
            const dds::domain::qos::DomainParticipantQos & qos ) [inline], [static]
```

Set the DomainParticipantQos.

The UserData and EntityFactory policies can be changed. The other policies are immutable.

Parameters

qos	The DomainParticipantQos to set.

See also

Default QoS (p. 1522)

8.86.4.20 default_publisher_qos() [1/2]

```
dds::pub::qos::PublisherQos dds::domain::DomainParticipant::default_publisher_qos ( ) const  [inline]
```

Get the current default **dds::pub::qos::PublisherQos** (p. 2007).

The retrieved qos will match the set of values specified on the last successful call to **default_publisher_qos(const dds::pub::qos::PublisherQos& qos)** (p. 1342), or else, if the call was never made, the RTI Connext default values for the **dds::pub::qos::PublisherQos** (p. 2007).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no PublisherQos is specified when a **dds::pub::Publisher** (p. 1993) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the Publisher.

MT Safety:

UNSAFE. It is not safe to retrieve the default publisher QoS from a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_publisher_qos** (p. 1342)

Returns

The current default PublisherQos

8.86.4.21 default_publisher_qos() [2/2]

```
DomainParticipant & dds::domain::DomainParticipant::default_publisher_qos (
            const  dds::pub::qos::PublisherQos & the_qos )  [inline]
```

Set the default **dds::pub::qos::PublisherQos** (p. 2007) for this **DomainParticipant** (p. 1326).

This set of default values will be used for a newly created **dds::pub::Publisher** (p. 1993) if no **dds::pub::qos::PublisherQos** (p. 2007) is specified when constructing the Publisher.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1610)

MT Safety:

UNSAFE. It is not safe to set the default publisher QoS for a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_publisher_qos** (p. 1342), **dds::domain::DomainParticipant::default_publisher_qos()** (p. 1342) or creating a Publisher with default QoS values.

Parameters

the_qos	The PublisherQos to set.

Returns

This **DomainParticipant** (p. 1326) instance

Exceptions

One	of the standard **Exceptions** (p. 427), or **dds::core::InconsistentPolicyError** (p. 1610)

8.86.4.22 default_subscriber_qos() [1/2]

dds::sub::qos::SubscriberQos dds::domain::DomainParticipant::default_subscriber_qos ( ) const [inline]

Get the current default **dds::sub::qos::SubscriberQos** (p. 2423).

The retrieved qos will match the set of values specified on the last successful call to **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1343), or dds::domain::DomainParticipant::set_default_subscriber_qos_with_profile, or else, if the call was never made, the default values listed in **dds::sub::qos::SubscriberQos** (p. 2423).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no SubscriberQos is specified when a **dds::sub::Subscriber** (p. 2410) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the Subscriber.

MT Safety:

UNSAFE. It is not safe to retrieve the default Subscriber QoS from a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1343).

See also

dds::sub::Subscriber::Subscriber (p. 2413)

Returns

The current default SubscriberQos

8.86.4.23 default_subscriber_qos() [2/2]

```
DomainParticipant & dds::domain::DomainParticipant::default_subscriber_qos (
            const  dds::sub::qos::SubscriberQos & the_qos )  [inline]
```

Set the default **dds::sub::qos::SubscriberQos** (p. 2423) for this **DomainParticipant** (p. 1326).

This set of default values will be used for a newly created **dds::sub::Subscriber** (p. 2410) when the qos parameter is not specified

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1610)

MT Safety:

UNSAFE. It is not safe to set the default Subscriber QoS for a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1343), **dds::domain::DomainParticipant::default_subscriber_qos** (p. 1343) or calling **dds::sub::Subscriber::Subscriber** (p. 2413) with SUBSCRIBER_QOS_DEFAULT as the `qos` parameter.

Parameters

the_qos	The SubscriberQos to set.

Exceptions

One	of the standard **Exceptions** (p. 427), or **dds::core::InconsistentPolicyError** (p. 1610)

8.86.4.24 default_topic_qos() [1/2]

```
dds::topic::qos::TopicQos dds::domain::DomainParticipant::default_topic_qos ( ) const  [inline]
```

Get the current default **dds::topic::qos::TopicQos** (p. 2509).

The retrieve d qos will match the set of values specified on the last successful call to **default_topic_qos(const dds::topic::qos::TopicQos& qos)** (p. 1345), or else, if the call was never made, the RTI Connext default values for the **dds::topic::qos::TopicQos** (p. 2509).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no TopicQos is specified when a **dds::topic::Topic** (p. 2474) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the Topic.

MT Safety:

UNSAFE. It is not safe to retrieve the default Topic QoS from a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_topic_qos** (p. 1344)

Returns

The current default TopicQos

8.86.4.25 default_topic_qos() [2/2]

```
DomainParticipant & dds::domain::DomainParticipant::default_topic_qos (
            const  dds::topic::qos::TopicQos & the_qos )  [inline]
```

Set the default **dds::topic::qos::TopicQos** (p. 2509) for this **DomainParticipant** (p. 1326).

This set of default values will be used for a newly created **dds::topic::Topic** (p. 2474) if no **dds::topic::qos::TopicQos** (p. 2509) is specified when constructing the Topic.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1610)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_topic_qos** (p. 1344), **dds::domain::DomainParticipant::default_topic_qos()** (p. 1344) or creating a Topic with default QoS values.

Parameters

the_qos	The TopicQos to set.

Returns

This **DomainParticipant** (p. 1326) instance

Exceptions

One	of the standard **Exceptions** (p. 427), or **dds::core::InconsistentPolicyError** (p. 1610)

8.86.4.26 close_contained_entities()

```
void close_contained_entities ( )
```

<<***extension***>> *(p. 354)* Closes all the entities created from this **DomainParticipant** (p. 1326)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Calling this function explicitly is not necessary to close a **DomainParticipant** (p. 1326).

This operation closes all contained **dds::pub::Publisher** (p. 1993) (including an implicit Publisher, if one exists), **dds::sub::Subscriber** (p. 2410) (including implicit Subscriber), **dds::topic::Topic** (p. 2474), **dds::topic::ContentFilteredTopic** (p. 954), and MultiTopic objects.

Prior to closing each contained entity, this operation will recursively call the corresponding **close_contained_entities()** (p. 1345) operation on each contained entity (if applicable). This pattern is applied recursively. In this manner the operation **close_contained_entities()** (p. 1345) on the **dds::domain::DomainParticipant** (p. 1326) will end up recursively closing all the entities contained in the **dds::domain::DomainParticipant** (p. 1326), including the **dds::pub::DataWriter** (p. 1138), **dds::sub::DataReader** (p. 976), as well as the **dds::sub::cond::QueryCondition** (p. 2059), **dds::sub::cond::ReadCondition** (p. 2133), and **rti::sub::TopicQuery** (p. 2516) objects belonging to the contained **dds::sub::DataReader** (p. 976).

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1941) if any of the contained entities is in a state where it cannot be closed .

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::PreconditionNotMetError** (p. 1941).

8.86.4.27 default_datawriter_qos() [1/2]

```
dds::pub::qos::DataWriterQos default_datawriter_qos ( ) const
```

<<***extension***>> *(p. 354)* Get the current default **dds::pub::qos::DataWriterQos** (p. 1226).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The retrieved qos will match the set of values specified on the last successful call to **default_datawriter_qos(const ::dds::pub::qos::DataWriterQos& qos)** (p. 1347), or else, if the call was never made, the RTI Connext default values for the **dds::pub::qos::DataWriterQos** (p. 1226).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no DataWriterQos is specified when a **dds::pub::DataWriter** (p. 1138) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the DataWriter.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataWriterQoS from a DomainPartipant while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datawriter_qos** (p. 1346).

Returns

The current default DataWriterQos

8.86.4.28 default_datawriter_qos() [2/2]

```
void default_datawriter_qos (
            const  ::dds::pub::qos::DataWriterQos & qos )
```

*<<**extension**>> (p. 354)* Set the default **dds::pub::qos::DataWriterQos** (p. 1226) for this **DomainParticipant** (p. 1326).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This set of default values will be used for a newly created **dds::pub::DataWriter** (p. 1138) if no **dds::pub::qos::DataWriterQos** (p. 1226) is specified when constructing the DataWriter.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1610)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datawriter_qos** (p. 1346) or **dds::domain::DomainParticipant::default_datawriter_qos()** (p. 1346) or creating a DataWriter with default QoS values.

Parameters

qos	The DataWriterQos to set.

Exceptions

One	of the standard **Exceptions** (p. 427), or **dds::core::InconsistentPolicyError** (p. 1610)

8.86.4.29 default_datareader_qos() [1/2]

```
dds::sub::qos::DataReaderQos default_datareader_qos ( ) const
```

<<***extension***>> *(p. 354)* Get the current default **dds::sub::qos::DataReaderQos** (p. 1072).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The retrieved qos will match the set of values specified on the last successful call to **default_datareader_qos(const ::dds::sub::qos::DataReaderQos& qos)** (p. 1348), or else, if the call was never made, the RTI Connext default values for the **dds::sub::qos::DataReaderQos** (p. 1072).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no DataReaderQos is specified when a **dds::sub::DataReader** (p. 976) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the DataReader.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataReader QoS from a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datareader_qos** (p. 1348).

Returns

The current default DataReaderQos

8.86.4.30 default_datareader_qos() [2/2]

```
void default_datareader_qos (
            const  ::dds::sub::qos::DataReaderQos & qos )
```

<<***extension***>> *(p. 354)* Set the default **dds::sub::qos::DataReaderQos** (p. 1072) for this **DomainParticipant** (p. 1326).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This set of default values will be used for a newly created **dds::sub::DataReader** (p. 976) if no **dds::sub::qos::DataReaderQos** (p. 1072) is specified when constructing the DataReader.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1610)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a **DomainParticipant** (p. 1326) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datareader_qos** (p. 1348) or **dds::domain::DomainParticipant::default_datareader_qos()** (p. 1348). or creating a DataReader with default QoS values.

Parameters

qos	The DataReaderQos to set.

Exceptions

One	of the standard **Exceptions** (p. 427), or **dds::core::InconsistentPolicyError** (p. 1610)

8.86.4.31 register_contentfilter()

```
void register_contentfilter (
            const  rti::topic::CustomFilter< rti::topic::ContentFilterBase > & custom_filter,
            const std::string & filter_name )
```

<<***extension***>> *(p. 354)* Register a content filter which can be used to create a **dds::topic::ContentFilteredTopic** (p. 954).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

DDS specifies a SQL-like content filter for use by content filtered topics. If this filter does not meet your filtering requirements, you can register a custom filter.

To use a custom filter, it must be registered in the following places:

- In any application that uses the custom filter to create a **dds::topic::ContentFilteredTopic** (p. 954) and the corresponding **dds::sub::DataReader** (p. 976).
- In each application that writes the data to the applications mentioned above.

For example, suppose Application A on the subscription side creates a Topic named X and a ContentFilteredTopic named filteredX (and a corresponding DataReader), using a previously registered content filter, myFilter. With only that, you will have filtering at the subscription side. If you also want to perform filtering in any application that publishes Topic X, then you also need to register the same definition of the ContentFilter myFilter in that application.

Each `filter_name` can only be used to registered a content filter once with a **dds::domain::DomainParticipant** (p. 1326).

See also

dds::domain::DomainParticipant::unregister_contentfilter(const std::string & filter_name) (p. 1350)

Parameters

custom_filter	A custom filter
filter_name	Name of the filter. The name must be unique within the **DomainParticipant** (p. 1326) and must not exceed 255 characters.

Exceptions

One	of the standard **Exceptions** (p. 427)

See also

Creating Custom Content Filters (p. 333)

8.86.4.32 unregister_contentfilter()

```
void unregister_contentfilter (
            const std::string & filter_name )
```

<<***extension***>> *(p. 354)* Unregister a content filter previously registered with **dds::domain::DomainParticipant::register_contentfilter(const rti::topic::CustomFilter<rti::topic::ContentFilterBase>& custom_filter, const std::string& filter_name)** (p. 1349).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

A `filter_name` can be unregistered only if it has been previously registered to the **dds::domain::Domain↩ Participant** (p. 1326) with **dds::domain::DomainParticipant::register_contentfilter(const rti::topic::CustomFilter < rti::topic::ContentFilterBase > & custom_filter, const std::string & filter_name)** (p. 1349).

The unregistration of filter is not allowed if there are any existing **dds::topic::ContentFilteredTopic** (p. 954) objects that are using the filter. If the operation is called on a filter with existing **dds::topic::ContentFilteredTopic** (p. 954) objects attached to it, this operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

If there are still existing discovered **dds::sub::DataReader** (p. 976) s with the same `filter_name` and the filter's compile method of the filter have previously been called on the discovered **dds::sub::DataReader** (p. 976) s, finalize method of the filter will be called on those discovered **dds::sub::DataReader** (p. 976) s before the content filter is unregistered. This means filtering will now be performed on the application that is creating the **dds::sub::DataReader** (p. 976).

Parameters

filter_name	Name of the filter to unregister.

Exceptions

One	of the standard **Exceptions** (p. 427), or **dds::core::PreconditionNotMetError** (p. 1941)

8.86.4.33 unregister_type()

```
void unregister_type (
            const std::string & name )
```

<<***extension***>> *(p. 354)* Unregister a type that has previously been registered to this **dds::domain::Domain↩ Participant** (p. 1326).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Parameters

name	The name of the type to unregister

8.86.4.34 is_type_registered()

```
bool is_type_registered (
            const std::string & name ) const
```

<<***extension***>> *(*p. *354)* Check if a type has previously been registered to this **dds::domain::DomainParticipant** (p. 1326).

Parameters

name	The name of the type to check

Returns

bool true if it is registered, false otherwise

8.86.4.35 add_peer()

```
void add_peer (
            const std::string & peer_descr_string )
```

<<***extension***>> *(*p. *354)* Attempt to contact one or more additional peer participants.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Add the given peer description to the list of peers with which this **dds::domain::DomainParticipant** (p. 1326) will try to communicate.

This method may be called at any time after this **dds::domain::DomainParticipant** (p. 1326) has been created (before or after it has been enabled).

If this method is called after **dds::core::Entity::enable** (p. 1524), an attempt will be made to contact the new peer(s) immediately.

If this method is called *before* the **DomainParticipant** (p. 1326) is enabled, the peer description will simply be added to the list that was populated by **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial↩_peers)** (p. 1268); the first attempted contact will take place after this **dds::domain::DomainParticipant** (p. 1326) is enabled.

Any peers added with the add_peer operation are equivalent to entries in the initial_peers list. Therefore, the participant will only discover remote participants using the newly added peer descriptor if a remote participant exists at that location and is configured to accept new peers (i.e., **rti::core::policy::Discovery::accept_unknown_peers** (p. 1270) is set to true). If multiple remote participants exist at that location (for example, if add_peer is called with a multicast address), the participant may discover multiple remote participants.

To be informed of the exact remote participants that are discovered, regardless of which peers this **dds::domain::DomainParticipant** (p. 1326) *attempts* to discover, use the built-in participant topic: **dds::topic::participant_topic_name()** (p. 441).

To remove specific peer locators, you may use **dds::domain::DomainParticipant::remove_peer(const std::string & peer_descr_string)** (p. 1353). If a peer is removed, the add_peer operation will add it back to the list of peers.

To stop communicating with a peer **dds::domain::DomainParticipant** (p. 1326) that has been discovered, use **dds::domain::ignore** (p. 635).

Adding a peer description with this method has no effect on the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) that may be subsequently retrieved with **dds::domain::DomainParticipant::qos() const** (p. 1336)() (because **rti::core::policy::Discovery** (p. 1265) is immutable).

Parameters

peer_descr_string	New peer descriptor to be added. The format is specified in **Peer Descriptor Format** (p. 560).

Exceptions

One	of the standard **Exceptions** (p. 427)

8.86.4.36 remove_peer()

```
void remove_peer (
            const std::string & peer_descr_string )
```

*<<**extension**>> (p. 354)* Remove one or more peer participants from the list of peers with which this **dds::domain::DomainParticipant** (p. 1326) will try to communicate.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This method may be called any time after this **dds::domain::DomainParticipant** (p. 1326) has been enabled

Calling this method has the following effects:

- If a **dds::domain::DomainParticipant** (p. 1326) was already discovered, it will be locally removed along with all its entities.
- Any further requests coming from a **dds::domain::DomainParticipant** (p. 1326) located on any of the removed peers will be ignored.
- All the locators contained in the peer description will be removed from the peer list. The local **dds::domain::DomainParticipant** (p. 1326) will stop sending announcement to those locators.

If remote participants located on a peer that was previously removed are discovered, they will be ignored untill the related peer is added back by using **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1352).

Removing a peer description with this method has no effect on the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) that may be subsequently retrieved with **dds::domain::DomainParticipant::qos() const** (p. 1336)() (because **rti::core::policy::Discovery** (p. 1265) is immutable).

Parameters

peer_descr_string	Peer descriptor to be removed. The format is specified in **Peer Descriptor Format** (p. 560).

Exceptions

One	of the standard **Exceptions** (p. 427)

8.86.4.37 dns_tracker_polling_period() [1/2]

```
dds::core::Duration dns_tracker_polling_period ( ) const
```

Retrieves the frequency used by the DNS tracker thread to query the DNS service.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The DNS tracker queries the DNS for hostnames specified in the initial peers of a **DomainParticipant** (p. 1326). The frequency of these queries is defined by **rti::core::policy::DiscoveryConfig::dns_tracker_polling_period** (p. 1311). If the value returned is **dds::core::Duration::infinite()** (p. 1451), the DNS tracker is disabled.

Returns

The DNS polling period

Exceptions

One	of the standard **Exceptions** (p. 427)

See also

rti::core::policy::DiscoveryConfig::dns_tracker_polling_period (p. 1311)

8.86.4.38 dns_tracker_polling_period() [2/2]

```
void dns_tracker_polling_period (
            const  dds::core::Duration & polling_period )
```

Configures the frequency in which the DNS tracker queries the DNS service.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This API allows you to change the frequency of the polling period for the DNS tracker. The range of accepted values, in seconds, goes from 1 second to 1 year. **dds::core::Duration::infinite()** (p. 1451) is also accepted as a valid value. If the duration is set to **dds::core::Duration::infinite()** (p. 1451), the DNS tracker is disabled.

Modifying the DNS tracker polling period through this has no effect on the **rti::core::policy::DiscoveryConfig::dns_↩ tracker_polling_period** (p. 1311) when it is retrieved with **dds::domain::DomainParticipant::qos() const** (p. 1336)().

Parameters

polling_period	Polling period to be configured.

Exceptions

One	of the standard **Exceptions** (p. 427)

See also

rti::core::policy::DiscoveryConfig::dns_tracker_polling_period (p. 1311)

dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string) (p. 1352)

8.86.4.39 resume_endpoint_discovery()

```
void resume_endpoint_discovery (
            const  dds::core::InstanceHandle & remote_participant_handle )
```

<<***extension***>> *(p. 354)* Initiates endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1326) identified by its InstanceHandle.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

If the operation completes successfully, the **dds::domain::DomainParticipant** (p. 1326) will initiate endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1326) provided as a parameter.

When **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1271) is set to false, this operation allows the RTI Connext application to select for which remote DomainParticipants endpoint discovery is performed. By disabling endpoint discovery, the **DomainParticipant** (p. 1326) will not store any state about remote endpoints and will not send local endpoint information to remote DomainParticipants.

If **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1271) is set to true, endpoint discovery will automatically occur for every discovered **dds::domain::DomainParticipant** (p. 1326). In this case, invoking this operation will have no effect and will return successfully.

When **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1271) is set to false, you have two options after a remote **dds::domain::DomainParticipant** (p. 1326) is discovered:

- Call this operation to enable endpoint discovery. After invoking this operation, the **dds::domain::DomainParticipant** (p. 1326) will start to exchange endpoint information so that matching and communication can occur with the remote **dds::domain::DomainParticipant** (p. 1326).
- Call the **dds::domain::ignore** (p. 635) operation to permanently ignore endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1326).

Setting **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1271) to false enables application-level authentication use cases, in which a **dds::domain::DomainParticipant** (p. 1326) will initiate endpoint discovery with a remote **dds::domain::DomainParticipant** (p. 1326) after successful authentication at the application level.

The `remote_participant_handle` paremeter is the one that appears in the **dds::sub::SampleInfo** (p. 2285) retrieved when reading the data samples available for the built-in ParticipantBuiltinTopicDataDataReader.

If the specified remote **dds::domain::DomainParticipant** (p. 1326) is not in the database of discovered DomainParticipants or has been previously ignored, this operation will fail with **dds::core::Error** (p. 1539).

This operation can be called multiple times on the same remote participant. If endpoint discovery has already been resumed, successive calls will have no effect and will return successfully.

Parameters

remote_participant_handle	<<***in***>> *(p. 355)* Handle of a discovered **dds::domain::DomainParticipant** (p. 1326) for which endpoint discovery is to be resumed.

Exceptions

One	of the **Standard Exceptions** (p. 428),or **dds::core::NotEnabledError** (p. 1869)

See also

rti::core::policy::Discovery (p. 1265)

8.86.4.40 delete_durable_subscription()

```
void delete_durable_subscription (
            const  rti::core::EndpointGroup & group )
```

<<***extension***>> *(p. 354)* Deletes an existing Durable Subscription on all Persistence Services.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The Persistence Service will delete the Durable Subscription and the quorum of the existing samples will be considered satisfied.

Parameters

group	<<***in***>> *(p. 355)* **rti::core::EndpointGroup** (p. 1515) specifying the Durable Subscription name. Quorum is not required for this operation.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.86.4.41 register_durable_subscription()

```
void register_durable_subscription (
            const  rti::core::EndpointGroup & group,
            const std::string & topic_name )
```

<<***extension***>> *(p. 354)* Registers a Durable Subscription on the specified **dds::topic::Topic** (p. 2474) on all Persistence Services.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

If you need to receive all samples published on a **dds::topic::Topic** (p. 2474), including the ones published while a **dds::sub::DataReader** (p. 976) is inactive or before it may be created, create a Durable Subscription using this method.

In this way, the Persistence Service will ensure that all the samples on that **dds::topic::Topic** (p. 2474) are retained until they are acknowledged by at least *N* DataReaders belonging to the Durable Subscription where *N* is the quorum count.

If the same Durable Subscription is created on a different **dds::topic::Topic** (p. 2474), the Persistence Service will implicitly delete the previous Durable Subscription and create a new one on the new **dds::topic::Topic** (p. 2474).

Parameters

group	<<***in***>> *(p. 355)* **rti::core::EndpointGroup** (p. 1515) The Durable Subscription name and quorum.
topic_name	<<***in***>> *(p. 355)* The topic name for which the Durable Subscription is created.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.86.4.42 participant_protocol_status()

```
rti::core::status::DomainParticipantProtocolStatus participant_protocol_status ( )
```

<<***extension***>> *(p. 354)* Get the protocol status for this participant

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

8.86.4.43 time_until_license_expiration()

```
rti::core::int64 time_until_license_expiration ( ) const
```

<<***extension***>> *(p. 354)* Retrieve the remaining time until the license validated for this **DomainParticipant** (p. 1326) expires, with seconds precision.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation reports, with seconds precision, the remaining time until the license validated for this **dds::domain::↩ DomainParticipant** (p. 1326) expires. If the license does not expire, the reported value is the maximum value representable by a signed 64-bit integer . If the license is already expired, the reported value is zero.

Note: This operation is only available in license-managed RTI Connext distributions.

Exceptions

One	of the **Standard Exceptions** (p. 428)

Returns

Remaining time until license expiration, in seconds.

8.86.5 Friends And Related Function Documentation

8.86.5.1 ignore() [1/2]

```
void ignore (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & handle )  [related]
```

Instructs RTI Connext to locally ignore a remote **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

From the time of this call onwards, RTI Connext will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **dds::domain::DomainParticipant** (p. 1326).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **dds::topic::ParticipantBuiltinTopicData** (p. 1908) to provide access control.

Application data can be associated with a **dds::domain::DomainParticipant** (p. 1326) by means of the **USER_DATA** (p. 554) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The **dds::domain::DomainParticipant** (p. 1326) to ignore is identified by the handle argument. This `handle` is the one that appears in the **dds::sub::SampleInfo** (p. 2285) retrieved when reading the data-samples available for the built-in **dds::sub::DataReader** (p. 976) to the **dds::domain::DomainParticipant** (p. 1326) topic. The built-in **dds::sub::DataReader** (p. 976) is read with the same **dds::sub::DataReader::read** (p. 996) and **dds::sub::DataReader::take** (p. 997) operations used for any **dds::sub::DataReader** (p. 976).

Parameters

participant	The **DomainParticipant** (p. 1326) for which the remote entity will be ignored.
handle	The **dds::core::InstanceHandle** (p. 1612) of the remote entity that will be ignored.

8.86.5.2 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            FwdIterator end )  [related]
```

Instructs RTI Connext to locally ignore a group of remote **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

The series of entities whose instance handles are made available via the provided iterators will be ignored.

Parameters

participant	The **DomainParticipant** (p. 1326) for which the remote entity will be ignored
begin	The begin iterator for the series of InstanceHandles to ignore
end	The end iterator for the series of InstanceHandles to ignore

See also

ignore(const dds::domain::DomainParticipant& participant, const dds::core::InstanceHandle& handle) (p. 1359)

References **dds::domain::ignore()**.

8.86.5.3 discovered_participants() [1/2]

```
dds::core::InstanceHandleSeq discovered_participants (
            const  dds::domain::DomainParticipant & participant )  [related]
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

This operation retrieves the list of **dds::domain::DomainParticipant** (p. 1326) entities that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **dds::domain::ignore** (p. 635) operation. When using **rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::SPDP2** (p. 1324), this list only includes **dds::domain::DomainParticipant** (p. 1326) entities that the application has received configuration information from.

Parameters

participant	The **DomainParticipant** (p. 1326) where to look up the discovered participants

Returns

The list of `InstanceHandles` that can be passed to **dds::domain::discovered_participant_data** (p. 638).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

8.86.5.4 discovered_participants() [2/2]

```
template<typename FwdIterator >
FwdIterator discovered_participants (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            FwdIterator end )  [related]
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandleSeq** (p. 619)

This overload copies the instance handles into an iterator range.

Parameters

participant	The participant whose discovered participants are looked up
begin	The begin iterator where to copy the instance handles
end	One past the last position where instance handles are copied

References **dds::domain::discovered_participants()**.

8.86.5.5 discovered_participant_data()

```
dds::topic::ParticipantBuiltinTopicData discovered_participant_data (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & participant_handle )  [related]
```

Retrieves the information about one participant discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

This operation retrieves information on a **dds::domain::DomainParticipant** (p. 1326) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 635) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 1326). Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Use the operation **dds::domain::discovered_participants** (p. 637) to find the **dds::domain::DomainParticipant** (p. 1326) entities that are currently discovered.

MT Safety:

Safe.

Parameters

participant	The **DomainParticipant** (p. 1326) where to look up the information
participant_handle	<<***in***>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of **dds::domain::DomainParticipant** (p. 1326).

Returns

The participant information about `participant_handle`

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::ParticipantBuiltinTopicData (p. 1908)

dds::domain::discovered_participants (p. 637)

8.86.5.6 find()

```
DomainParticipant find (
            int32_t domain_id )  [related]
```

Locates an existing **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/domain/find.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

If no such **DomainParticipant** (p. 1326) exists, the operation will return **dds::core::null** (p. 438).

If multiple DomainParticipants belonging to that domain id exist, then the operation will return one of them. It is not specified which one.

Parameters

domain_id	The domain id of the **DomainParticipant** (p. 1326) to find

8.86.5.7 banish_ignored_participants()

```
void banish_ignored_participants (
            const  dds::domain::DomainParticipant & participant )  [related]
```

<<***extension***>> *(p. 354)* Prevents ignored remote DomainParticipants from receiving traffic from the local **DomainParticipant** (p. 1326).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

This method complements **dds::domain::ignore** (p. 635): ignore_participant prevents the local **dds::domain::DomainParticipant** (p. 1326) from processing traffic from the remote **DomainParticipant** (p. 1326), while this method prevents already ignored remote DomainParticipants from processing traffic from the local **DomainParticipant** (p. 1326).

Note: this method is currently only supported when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941), **dds::core::NotEnabledError** (p. 1869)

See also

dds::domain::ignore (p. 635)

8.86.5.8 discovered_participant_subject_name()

```
rti::core::optional_value< std::string > discovered_participant_subject_name (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & participant_handle )  [related]
```

<<***extension***>> *(p. 354)* Returns **rti::core::policy::EntityName::name** (p. 1531) for the specified **Domain↩ Participant** (p. 1326).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

This operation retrieves the **rti::core::policy::EntityName::name** (p. 1531) of a **dds::domain::DomainParticipant** (p. 1326) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 635) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 1326). If the `participant↩ _handle` is **dds::core::InstanceHandle::nil()** (p. 1614) or is not a valid **dds::core::InstanceHandle** (p. 1612) for a **DomainParticipant** (p. 1326), then the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). If the `participant_handle` corresponds to a **DomainParticipant** (p. 1326) that has not been discovered, then the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Use the operation **dds::domain::discovered_participants** (p. 637) to find the **dds::domain::DomainParticipant** (p. 1326) entities that are currently discovered.

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

participant	The **DomainParticipant** (p. 1326) that has discovered the discovered participant.
participant_handle	<<***in***>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of **dds::domain::DomainParticipant** (p. 1326).

Returns

The **rti::core::policy::EntityName::name** (p. 1531) for the `participant_handle`

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869)

See also

rti::core::policy::EntityName::name (p. 1531)

dds::domain::discovered_participants (p. 637)

8.86.5.9 discovered_participants_from_subject_name()

```
dds::core::InstanceHandleSeq discovered_participants_from_subject_name (
            const  dds::domain::DomainParticipant & participant,
            const  rti::core::optional_value< std::string > & subject_name )  [related]
```

<<***extension***>> *(p. 354)* Returns a list of discovered **DomainParticipant** (p. 1326) entities that have the given **rti::core::policy::EntityName::name** (p. 1531).

`#include <rti/domain/discovery.hpp>`

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

This operation retrieves the same list as **dds::domain::discovered_participants** (p. 637), except this list contains only the participants that have the given **rti::core::policy::EntityName::name** (p. 1531).

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

participant	The **DomainParticipant** (p. 1326) whose discovered participants this operation will look up.
subject_name	<<***in***>> *(p. 355)* The **rti::core::policy::EntityName::name** (p. 1531) by which to filter the list.

Returns

The list of `InstanceHandles` corresponding to participants with the given **rti::core::policy::EntityName↩ ::name** (p. 1531).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

8.86.5.10 find_participant_by_name()

```
dds::domain::DomainParticipant find_participant_by_name (
            const std::string & participant_name )  [related]
```

<<***extension***>> *(p. 354)* Locates an existing **dds::domain::DomainParticipant** (p. 1326) by name.

Note

`#include <rti/domain/find.hpp>` This function is in the **`rti::domain`** (p. 727) namespace

If no such **DomainParticipant** (p. 1326) exists, the operation will return **dds::core::null** (p. 438).

8.86.5.11 find_participants() [1/2]

```
template<typename ParticipantFwdIterator >
uint32_t find_participants (
            ParticipantFwdIterator begin,
            uint32_t max_size )  [related]
```

<<***extension***>> *(p. 354)* Retrieves all the participants created by the application up to a maximum number.

Note

`#include <rti/domain/find.hpp>` This function is in the **`rti::domain`** (p. 727) namespace

If no such **DomainParticipant** (p. 1326) exists, the operation will return **dds::core::null** (p. 438).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

ParticipantFwdIterator	A forward iterator whose value type is **dds::domain::DomainParticipant** (p. 1326)

Parameters

begin	The iterator where to begin adding DomainParticipants.
max_size	The maximum number of elements to add

Returns

The number of elements added

8.86.5.12 find_participants() [2/2]

```
template<typename ParticipantFwdIterator >
uint32_t find_participants (
             ParticipantFwdIterator begin )  [related]
```

<<***extension***>> *(p. 354)* Retrieves all the participants created by the application.

Note

`#include <rti/domain/find.hpp>` This function is in the **`rti::domain`** (p. 727) namespace

If no such **DomainParticipant** (p. 1326) exists, the operation will return **dds::core::null** (p. 438).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

ParticipantFwdIterator	A forward iterator whose value type is **dds::domain::DomainParticipant** (p. 1326)

Parameters

begin	The iterator where to begin adding DomainParticipants.

Returns

The number of elements added

8.86.5.13 find_type()

```
const  dds::core::xtypes::DynamicType & find_type (
             const  dds::domain::DomainParticipant & participant,
             const std::string & type_name )  [related]
```

<<***extension***>> *(p. 354)* Retrieves a type registered with this participant

`#include <rti/domain/find.hpp>`

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

Every data type used in a **DomainParticipant** (p. 1326) has a registered type name, which in most cases is the same as the type's name (the name used to define the type), but it can be different.

Types are registered by the creation of a **dds::topic::Topic** (p. 2474), whose constructors optionally receive a registered type name different from the type's name.

Types can also be registered when parsing an XML configuration and calling **dds::core::QosProvider::create_participant_from_config()** (p. 2046).

Parameters

participant	The **DomainParticipant** (p. 1326) where the type is registered
type_name	The name used to register the type in this participant

Returns

If `type_name` exists in this `participant`, this function returns the DynamicType describing the type. It can be cast down to **dds::core::xtypes::StructType** (p. 2400) or **dds::core::xtypes::UnionType** (p. 2584), depending on whether the type is a struct or a union.

Exceptions

dds::core::Error *(p. 1539)*	If the type doesn't exist or the operation fails for any other reason

Example:

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic1(participant, "Foo Topic"); // registered as "Foo"
dds::topic::Topic<Foo> topic2(participant, "MyFoo Topic", "MyFoo"); // registered as "MyFoo"
```

```
const auto& type1 = rti::domain::find_type(participant, "Foo");
const auto& type2 = rti::domain::find_type(participant, "MyFoo");
std::cout « type1 « std::endl;
std::cout « type2 « std::endl;
assert(type1 == type2); // Same type registered with different names
// Cast to StructType to access more information about the type
const auto& type1_struct =
        static_cast<const dds::core::xtypes::StructType&>(type1);
std::cout « type1_struct.member(0).name() « std::endl;
```

8.86.5.14 register_type() [1/2]

```
void register_type (
              dds::domain::DomainParticipant & participant,
             const std::string & name,
             const  dds::core::xtypes::DynamicType & type,
             const  rti::core::xtypes::DynamicDataTypeSerializationProperty & serialization_↩
property =  rti::core::xtypes::DynamicDataTypeSerializationProperty::DEFAULT )  [related]
```

<<***extension***>> *(*p. *354)* Registers a DynamicType with specific serialization properties

Typically you don't need to call this function, since the topic constructor takes care of that automatically. You do need to call this function before creating the topic if you want to change the default data-serialization property.

Calling this function also allows to change the registered name of the type, which by default is `type.name()`.

Parameters

participant	The participant where to register this type
name	The name to use to register this type
type	The type definition
serialization_property	The data-serialization property

See also

dds::core::xtypes::DynamicType (p. 1504)

dds::core::xtypes::DynamicData (p. 1461)

Examples

Foo.hpp.

8.86.5.15 register_type() [2/2]

```
template<typename T >
void register_type (
```

```
            const std::string & registered_type_name =  dds::topic::topic_type_name<T>::value()
) [related]
```

<<***extension***>> *(p. 354)* Registers a User-Generated Type with RTI Connext. This function is used along with XML Application Creation.

When using XML Application creation, you must use this function to register any user-generated types with RTI Connext before creating your system.

When you don't use XML Application creation, you don't typically need to call this function, since the topic constructor takes care of that automatically.

Template Parameters

T	The user-generated type that is being registered

Parameters

registered_type_name	The name to use when registering the type. This is the name that will be used in your XML configuration file to refer to the type.

dds::domain::DomainParticipant::create_participant_from_config

XML Application Creation (p. 342)

8.87 rti::domain::DomainParticipantConfigParams Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration.

```
#include "rti/domain/DomainParticipantConfigParams.hpp"
```

Public Member Functions

- **DomainParticipantConfigParams** (int32_t the_domain_id= **DOMAIN_ID_USE_XML_CONFIG**, const std↩ ::string &the_participant_name= **ENTITY_NAME_USE_XML_CONFIG**, const std::string &the_participant_qos↩ _library_name= **QOS_ELEMENT_NAME_USE_XML_CONFIG**, const std::string &the_participant_qos_profile↩ _name= **QOS_ELEMENT_NAME_USE_XML_CONFIG**, const std::string &the_domain_entity_qos_library_↩ name= **QOS_ELEMENT_NAME_USE_XML_CONFIG**, const std::string &the_domain_entity_qos_profile_name= **QOS_ELEMENT_NAME_USE_XML_CONFIG**)

  *Create a **DomainParticipantConfigParams** (p. 1371) object with the specified values.*
- int32_t **domain_id** () const

  Get the domain id.
- **DomainParticipantConfigParams** & **domain_id** (int32_t the_domain_id)

Set the domain id from which the DomainParticipant is created.

- std::string **participant_name** () const

  Get the participant name.

- **DomainParticipantConfigParams** & **participant_name** (const std::string &the_participant_name)

  Set the name assigned to the DomainParticipant.

- std::string **participant_qos_library_name** () const

  Get the participant qos library name.

- **DomainParticipantConfigParams** & **participant_qos_library_name** (const std::string &the_participant_qos↩ _library_name)

  Set the QoS library name containing the QoS profile from which the DDS_DomainParticipant is created.

- std::string **participant_qos_profile_name** () const

  Get the participant qos profile name.

- **DomainParticipantConfigParams** & **participant_qos_profile_name** (const std::string &the_participant_qos↩ _profile_name)

  Set the QoS profile name from which the DomainParticipant is created.

- std::string **domain_entity_qos_library_name** () const

  Get the domain entity qos library name.

- **DomainParticipantConfigParams** & **domain_entity_qos_library_name** (const std::string &the_domain_↩ entity_qos_library_name)

  Set the QoS library name containing the QoS profile from which the all the entities defined under the participant configuration are created.

- std::string **domain_entity_qos_profile_name** () const

  Get the domain entity qos profile name.

- **DomainParticipantConfigParams** & **domain_entity_qos_profile_name** (const std::string &the_domain_↩ entity_qos_profile_name)

  Set the QoS profile name from which the all the entities defined under the participant configuration are created.

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE const std::string **ENTITY_NAME_USE_XML_CONFIG**

  Special value to be used to indicate that a participant should be created with an autogenerated entity name.

- static OMG_DDS_API_CLASS_VARIABLE const std::string **QOS_ELEMENT_NAME_USE_XML_CONFIG**

  Special value to be used to indicate that entities should be created from the QoS profile specified in the participant configuration.

- static OMG_DDS_API_CLASS_VARIABLE const int32_t **DOMAIN_ID_USE_XML_CONFIG**

  Special value to be used to indicate that a participant should be created using the domain ID specified in the participant configuration.

8.87.1 Detailed Description

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration.

See also

dds::core::QosProvider::create_participant_from_config (p. 2046)

8.87.2 Constructor & Destructor Documentation

8.87.2.1 DomainParticipantConfigParams()

```
rti::domain::DomainParticipantConfigParams::DomainParticipantConfigParams (
            int32_t the_domain_id =  DOMAIN_ID_USE_XML_CONFIG,
            const std::string & the_participant_name =  ENTITY_NAME_USE_XML_CONFIG,
            const std::string & the_participant_qos_library_name =  QOS_ELEMENT_NAME_USE_XML_↩
CONFIG,
            const std::string & the_participant_qos_profile_name =  QOS_ELEMENT_NAME_USE_XML_↩
CONFIG,
            const std::string & the_domain_entity_qos_library_name =  QOS_ELEMENT_NAME_USE_XML_↩
CONFIG,
            const std::string & the_domain_entity_qos_profile_name =  QOS_ELEMENT_NAME_USE_XML_↩
CONFIG )  [inline]
```

Create a **DomainParticipantConfigParams** (p. 1371) object with the specified values.

All parameters are optional. If ommitted, the value for that parameter will be retrieved from the xml configuration.

Parameters

the_domain_id	Domain ID from which the DomainParticipant is created.
the_participant_name	The name assigned to the DomainParticipant
the_participant_qos_library_name	QoS library name containing the QoS profile from which the DDS_DomainParticipant is created.
the_participant_qos_profile_name	QoS profile name from which the DomainParticipant is created.
the_domain_entity_qos_library_name	QoS library name containing the QoS profile from which the all the entities defined under the participant configuration are created.
the_domain_entity_qos_profile_name	QoS profile name from which the all the entities defined under the participant configuration are created.

8.87.3 Member Function Documentation

8.87.3.1 domain_id() [1/2]

```
int32_t rti::domain::DomainParticipantConfigParams::domain_id ( ) const  [inline]
```

Get the domain id.

See also

domain_id(int32_t) (p. 1373)

8.87.3.2 domain_id() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::domain_id (
            int32_t the_domain_id )  [inline]
```

Set the domain id from which the DomainParticipant is created.

Allows overriding the domain ID defined in the configuration for the participant to be created. If the special value DOMAIN_ID_USE_XML_CONFIG is specified then the ID in the configuration will be used.

8.87.3.3 participant_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::participant_name ( ) const  [inline]
```

Get the participant name.

See also

participant_name(const std::string&) (p. 1374)

8.87.3.4 participant_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::participant_name (
            const std::string & the_participant_name )  [inline]
```

Set the name assigned to the DomainParticipant.

This is the name the name that will be set in the dds::domain::qos::DomainParticipantQos::participant_name. It allows overriding the participant name that is generated automatically.

When this member is lexicographically equal to the special value ENTITY_NAME_USE_XML_CONFIG then an automatically generated name will be assigned.

8.87.3.5 participant_qos_library_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::participant_qos_library_name ( ) const
[inline]
```

Get the participant qos library name.

See also

participant_qos_library_name(const std::string&) (p. 1374)

8.87.3.6 participant_qos_library_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::participant_qos_↩
library_name (
            const std::string & the_participant_qos_library_name )  [inline]
```

Set the QoS library name containing the QoS profile from which the DDS_DomainParticipant is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **dds::domain::DomainParticipant** (p. 1326).

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **rti::domain::DomainParticipantConfigParams::participant_qos_profile_name** (p. 1375) will be ignored.

8.87.3.7 participant_qos_profile_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::participant_qos_profile_name ( ) const
[inline]
```

Get the participant qos profile name.

See also

participant_qos_profile_name(const std::string&) (p. 1375)

8.87.3.8 participant_qos_profile_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::participant_qos_↩
profile_name (
            const std::string & the_participant_qos_profile_name )  [inline]
```

Set the QoS profile name from which the DomainParticipant is created.

Allows overriding the QoS defined in the configuration for the participant to be created.This value only affects to the **dds::domain::DomainParticipant** (p. 1326).

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **rti::domain::DomainParticipantConfigParams::participant_qos_library_name** (p. 1374) will be ignored.

8.87.3.9 domain_entity_qos_library_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::domain_entity_qos_library_name ( ) const
[inline]
```

Get the domain entity qos library name.

See also

domain_entity_qos_library_name(const std::string&) (p. 1376)

8.87.3.10 domain_entity_qos_library_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::domain_entity_qos_↩
library_name (
            const std::string & the_domain_entity_qos_library_name )  [inline]
```

Set the QoS library name containing the QoS profile from which the all the entities defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the DomainEntity.

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **rti::domain::DomainParticipantConfigParams::domain_entity_qos_profile_name** (p. 1376) will be ignored.

8.87.3.11 domain_entity_qos_profile_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::domain_entity_qos_profile_name ( ) const
[inline]
```

Get the domain entity qos profile name.

See also

DomainParticipantConfigParams (p. 1371)& **domain_entity_qos_profile_name(const std::string&)** (p. 1376)

8.87.3.12 domain_entity_qos_profile_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::domain_entity_qos_↩
profile_name (
            const std::string & the_domain_entity_qos_profile_name )  [inline]
```

Set the QoS profile name from which the all the entities defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the DomainEntity.

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **rti::domain::DomainParticipantConfigParams::domain_entity_qos_library_name** (p. 1375) will be ignored.

8.87.4 Member Data Documentation

8.87.4.1 ENTITY_NAME_USE_XML_CONFIG

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::domain::DomainParticipantConfigParams::ENTITY_↩
NAME_USE_XML_CONFIG  [static]
```

Special value to be used to indicate that a participant should be created with an autogenerated entity name.

8.87.4.2 QOS_ELEMENT_NAME_USE_XML_CONFIG

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::domain::DomainParticipantConfigParams::QOS_↩
ELEMENT_NAME_USE_XML_CONFIG  [static]
```

Special value to be used to indicate that entities should be created from the QoS profile specified in the participant configuration.

8.87.4.3 DOMAIN_ID_USE_XML_CONFIG

```
OMG_DDS_API_CLASS_VARIABLE const int32_t rti::domain::DomainParticipantConfigParams::DOMAIN_ID_↩
USE_XML_CONFIG  [static]
```

Special value to be used to indicate that a participant should be created using the domain ID specified in the participant configuration.

8.88 dds::domain::qos::DomainParticipantFactoryQos Class Reference

<<***value-type***>> *(p. 350)* Container of the QoS policies that do not apply to a specific entity

```
#include "dds/domain/qos/DomainParticipantFactoryQos.hpp"
```

Public Member Functions

- template<typename POLICY >

Qos Use Cases (p. 602)

8.88.2 Member Function Documentation

8.88.2.1 policy() [1/2]

```
template<typename POLICY >
const POLICY & dds::domain::qos::DomainParticipantFactoryQos::policy ( ) const
```

Gets a QoS policy by const reference.

See also

policy() (p. 1379)

8.88.2.2 policy() [2/2]

```
template<typename POLICY >
POLICY & dds::domain::qos::DomainParticipantFactoryQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

Policy	One of the DomainParticipantFactory QoS policies: • **dds::core::policy::EntityFactory** (p. 1527), • **rti::core::policy::SystemResourceLimits** (p. 2443)

Note

In other language APIs the **DomainParticipantFactoryQos** (p. 1378) also contains the policies to configure the loading of Qos profiles in XML (ProfileQosPolicy) and the logging configuration. These are configured through **dds::core::QosProvider** (p. 2025) and **rti::config::Logger** (p. 1683) respectively.

See also

DDSQosModule_set_qos

8.88.3 Friends And Related Function Documentation

8.88.3.1 to_string() [1/3]

```
std::string to_string (
            const  DomainParticipantFactoryQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantFactoryQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantFactoryQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantFactoryQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.88.3.2 to_string() [2/3]

```
std::string to_string (
            const  DomainParticipantFactoryQos & qos,
            const  DomainParticipantFactoryQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.88.3.3 to_string() [3/3]

```
std::string to_string (
            const  DomainParticipantFactoryQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

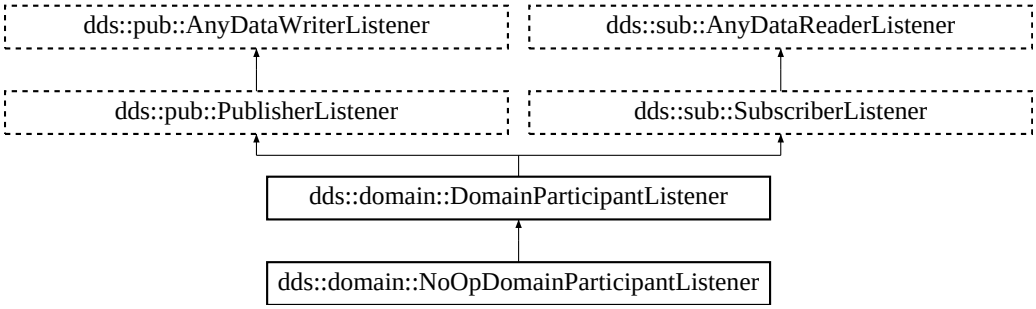
For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.88.3.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::domain::qos::DomainParticipantFactoryQos & qos )  [related]
```



<<***extension***>> *(p. 354)* Prints a dds::sub::qos::DomainParticipantFactoryQos to an output stream.

8.89 dds::domain::DomainParticipantListener Class Reference

The listener class for a **DomainParticipant** (p. 1326).

```
#include "dds/domain/DomainParticipantListener.hpp"
```

Inheritance diagram for dds::domain::DomainParticipantListener:

Public Member Functions

- virtual void **on_invalid_local_status_advance_notice** (**DomainParticipant** &participant, const **rti::core**↩ **::status::InvalidLocalAdvanceNoticeStatus** &status)=0

  <<***extension***>> *(p. 354) Notifies that the identity of the local* ***DomainParticipant*** *(p. 1326) is about to expire.*

8.89.1 Detailed Description

The listener class for a **DomainParticipant** (p. 1326).

8.89.2 Member Function Documentation

8.89.2.1 on_invalid_local_status_advance_notice()

```
virtual void dds::domain::DomainParticipantListener::on_invalid_local_status_advance_notice (
             DomainParticipant & participant,
            const  rti::core::status::InvalidLocalAdvanceNoticeStatus & status )  [pure virtual]
```

<<***extension***>> *(*p. *354)* Notifies that the identity of the local **DomainParticipant** (p. 1326) is about to expire.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849).

8.90 rti::core::status::DomainParticipantProtocolStatus Class Reference

```
#include <Status.hpp>
```

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- int64_t **corrupted_rtps_message_count** () const

  The number of corrupted RTPS messages detected by the domain participant.
- int64_t **corrupted_rtps_message_count_change** () const

  The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.
- **dds::core::Time last_corrupted_message_timestamp** () const

  The timestamp when the last corrupted RTPS message was detected by the domain participant.

8.90.1 Detailed Description

Entity:

dds::domain::DomainParticipant (p. 1326) The corrupted messages are detected by validating the received CRC. The participant protocol status can be obtained by enabling **rti::core::policy::WireProtocol::compute_crc** (p. 2640) and **rti::core::policy::WireProtocol::check_crc** (p. 2640) at the publishing and subscribing application respectively.

8.90.2 Member Function Documentation

8.90.2.1 corrupted_rtps_message_count()

```
int64_t rti::core::status::DomainParticipantProtocolStatus::corrupted_rtps_message_count ( ) const
[inline]
```

The number of corrupted RTPS messages detected by the domain participant.

Counts the corrupted RTPS messages received by the participant. It includes messages belonging to discovery and user traffic.

8.90.2.2 corrupted_rtps_message_count_change()

```
int64_t rti::core::status::DomainParticipantProtocolStatus::corrupted_rtps_message_count_change (
) const  [inline]
```

The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.

8.90.2.3 last_corrupted_message_timestamp()

```
 dds::core::Time rti::core::status::DomainParticipantProtocolStatus::last_corrupted_message_↩
timestamp ( ) const  [inline]
```

The timestamp when the last corrupted RTPS message was detected by the domain participant.

8.91 dds::domain::qos::DomainParticipantQos Class Reference

<<***value-type***>> *(*p. *350)* Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1326) supports

8.91.1 Detailed Description

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1326) supports

8.91.2 DomainParticipantQos Policies

A **DomainParticipantQos** (p. 1384) contains the following policies:

- **dds::core::policy::UserData** (p. 2591),
- **dds::core::policy::EntityFactory** (p. 1527),
- **rti::core::policy::WireProtocol** (p. 2630),
- **rti::core::policy::TransportBuiltin** (p. 2533),
- **rti::core::policy::TransportUnicast** (p. 2556),
- **rti::core::policy::Discovery** (p. 1265),
- **rti::core::policy::DomainParticipantResourceLimits** (p. 1391),
- **rti::core::policy::Event** (p. 1541),
- **rti::core::policy::ReceiverPool** (p. 2144),
- **rti::core::policy::Database** (p. 969),
- **rti::core::policy::DiscoveryConfig** (p. 1271),
- **rti::core::policy::Property** (p. 1969),
- **rti::core::policy::EntityName** (p. 1530),
- **rti::core::policy::TransportMulticastMapping** (p. 2547)

- **rti::core::policy::Service** (p. 2350)
- rti::core::policy::Partition

To get or set policies use the **policy()** (p. 1387) getters and setters or operator << (see **examples** (p. 603)).

Certain members must be set in a consistent manner:

Length of dds::domain::qos::DomainParticipantQos::user_data .value <= dds::domain::qos::DomainParticipantQos↩ ::resource_limits .participant_user_data_max_length

For dds::domain::qos::DomainParticipantQos::discovery_config .publication_writer high_watermark <= dds::domain::qos::DomainParticipantQos::resource_limits .local_writer_allocation .max_count heartbeats_per_max_samples <= dds::domain::qos::DomainParticipantQos::resource_limits .local_writer_allocation.↩ max_count

For dds::domain::qos::DomainParticipantQos::discovery_config .suscription_writer high_watermark <= dds::domain::qos::DomainParticipantQos::resource_limits .local_reader_allocation.max_↩ count heartbeats_per_max_samples <= dds::domain::qos::DomainParticipantQos::resource_limits .local_reader↩ _allocation.max_count

If any of the above are not true, **dds::domain::DomainParticipant::qos(const dds::domain::qos::Domain↩ ParticipantQos&)** (p. 1337) and dds::domain::DomainParticipant::set_qos_with_profile and **dds::domain::Domain↩ Participant::default_participant_qos()** (p. 1341) will fail with **dds::core::InconsistentPolicyError** (p. 1610), and the **dds::domain::DomainParticipant** (p. 1326) constructors will fail with **dds::core::Error** (p. 1539)

Entity:

dds::domain::DomainParticipant (p. 1326)

8.91.3 Constructor & Destructor Documentation

8.91.3.1 DomainParticipantQos()

```
dds::domain::qos::DomainParticipantQos::DomainParticipantQos ( )
```

Creates a **DomainParticipantQos** (p. 1384) with the default value for each policy.

8.91.4 Member Function Documentation

8.91.4.1 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::domain::qos::DomainParticipantQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

Policy	One of the **DomainParticipantQos Policies** (p. 1385)

See also

Setting Qos Values (p. 603)

8.91.4.2 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::domain::qos::DomainParticipantQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

Policy	One of the **DomainParticipantQos Policies** (p. 1385)

See also

Setting Qos Values (p. 603)

8.91.4.3 policy() [3/3]

```
template<typename Policy >
DomainParticipantQos & dds::domain::qos::DomainParticipantQos::policy (
            const Policy & p )  [inline]
```

Sets a policy.

policy() (p. 1387)

Setting Qos Values (p. 603)

8.91.4.5 operator>>()

```
template<typename Policy >
const  DomainParticipantQos & dds::domain::qos::DomainParticipantQos::operator>> (
            Policy & p ) const  [inline]
```

Copies the values of a policy.

Parameters

p	The destination where to copy the current value of the Policy

See also

policy() (p. 1387)

Setting Qos Values (p. 603)

8.91.5 Friends And Related Function Documentation

8.91.5.1 to_string() [1/3]

```
std::string to_string (
            const  DomainParticipantQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.91.5.2 to_string() [2/3]

```
std::string to_string (
            const  DomainParticipantQos & qos,
            const  DomainParticipantQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.91.5.3 to_string() [3/3]

```
std::string to_string (
            const  DomainParticipantQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(*p. *354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.91.5.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::domain::qos::DomainParticipantQos & qos )  [related]
```

<<***extension***>> *(*p. *354)* Prints a dds::sub::qos::DomainParticipantQos to an output stream.

8.92 rti::core::policy::DomainParticipantResourceLimits Class Reference

<<***extension***>> *(p. 116)* Configures the memory usage of certain **dds::domain::DomainParticipant** (p. 1326) resources

```
#include <rti/core/policy/CorePolicy.hpp>
```

  Getter (see setter with the same name)

8.92.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the memory usage of certain **dds::domain::DomainParticipant** (p. 1326) resources

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as DataWriters/DataReaders), as well as parameters used by the internal database to size the hash tables it uses.

By default, a **dds::domain::DomainParticipant** (p. 1326) is allowed to dynamically allocate memory as needed as users create local Entities such as **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) or as the participant discovers new applications to store their information. By setting fixed values for the maximum parameters in this Qos↩ Policy, you can bound the memory that can be allocated by a DomainParticipant. In addition, by setting the initial values to the maximum values, you can reduce the amount of memory allocated by DomainParticipants after the initialization period. Notice that memory can still be allocated dynamically after the initialization period. For example, when a new local **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976) is created, the initial memory required for its queue is allocated dynamically.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the **dds::core::policy::Partition** (p. 1923), the maximum length of data store in the **dds::core::policy::UserData** (p. 2591) and **dds::core::policy::GroupData** (p. 1591), and many others can be changed from their defaults using this QoS policy. However, it is important that all DomainParticipants that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one **dds::domain::DomainParticipant** (p. 1326) to another, a **dds::domain::DomainParticipant** (p. 1326) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is **rti::core::policy::DomainParticipant↩ ResourceLimits::type_object_max_serialized_length** (p. 1419).

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.92.2 Member Function Documentation

8.92.2.1 local_writer_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↩
writer_allocation (
            const  AllocationSettings & settings )
```

<<***extension***>> *(*p. *116)* Allocation settings applied to local DataWriters.

[default] initial_count = 16; max_count = **dds::core::LENGTH_UNLIMITED** (p. 438); incremental_count = -1

8.92.2.79 type_code_max_serialized_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::type_code↩
_max_serialized_length (
            int32_t max_length )
```

[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Maximum size of serialized string for type code.

This parameter is an alternative to **rti::core::policy::DomainParticipantResourceLimits::type_object_max_↩ serialized_length** (p. 1419) for limiting the size of the type code that a **dds::domain::DomainParticipant** (p. 1326) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in large type codes. So it is common for users to set this parameter to a large value, if used (by default, it is set to 0). However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter.

Note: TypeObject v2 is now the standard, and default, method of exchanging type information in RTI Connext. It is recommended to keep **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) in **rti::core::policy::DiscoveryConfig::enabled_builtin_channels** (p. 1294) enabled in DomainParticipants requiring type information.

[default] 0

[range] [0,0xffff]

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Type System** (p. 240)

8.92.2.80 type_code_max_serialized_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::type_code_max_serialized_length ( )
const
```

Getter (see setter with the same name)

8.92.2.81 type_object_max_serialized_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::type_↩
object_max_serialized_length (
            int32_t max_length )
```

<<***extension***>> *(*p. *116)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.

Type codes contain complete information about a data structure, including all member names; as a result, complex data structures can produce large type codes. This parameter limits the size of the resulting TypeObject v1 that a DomainParticipant is able to propagate.

If this parameter is set to a value between 1 and 0x7fffffff, the DomainParticipant will propagate TypeObject v1 for types that don't exceed the specified size. If **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup↩ _service** (p. 1321) is also enabled, both TypeObject v1 and TypeObject v2 will be propagated (TypeObject v2s are not subject to this size limit).

If set to rti::core::LENGTH_AUTO, the DomainParticipant will not propagate TypeObject v1. If **rti::core::policy::↩ DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) is also enabled, only TypeObject v2 will be propagated.

If explicitly set to 0, the DomainParticipant won't propagate any TypeObject (neither TypeObject v1 nor TypeObject v2), regardless of whether **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) is enabled.

Note: TypeObject v2 is now the standard, and default, method of exchanging type information in RTI Connext. It is recommended to enable **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) in **rti::core::policy::DiscoveryConfig::enabled_builtin_channels** (p. 1294) in DomainParticipants requiring type validation.

[default] rti::core::LENGTH_AUTO

[range] [0,0x7fffffff], or rti::core::LENGTH_AUTO

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204), **Type System** (p. 240)

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::type_↩
object_max_deserialized_length (
            int32_t max_length )
```

<<***extension***>> *(*p. *116)* The maximum number of bytes that a deserialized TypeObject v1 can consume.

This parameter limits the size of the TypeObject v1 that a DomainParticipant is able to store.

Setting this field to 0 disables the ability of a DomainParticipant to receive TypeObject v1.

If **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) is also enabled, the DomainParticipant will always send/receive TypeObject v2 (deserialized TypeObject v2s are not subject to this size limit), but will only receive TypeObject v1 if this parameter is set to a value greater than 0.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [0,0x7fffffff] or **dds::core::LENGTH_UNLIMITED** (p. 438)

Getter (see setter with the same name)

8.92.2.87 serialized_type_object_dynamic_allocation_threshold() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::serialized↩
_type_object_dynamic_allocation_threshold (
            int32_t threshold )
```

<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.

Above this threshold, the memory for a TypeObject v1 is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

The effective threshold value used by the middleware is determined as follows:

- If **rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length** (p. 1419) is rti↩ ::core::LENGTH_AUTO or 0, the effective threshold is 0 (no pre-allocated buffers).
- If this threshold is set to rti::core::LENGTH_AUTO and **rti::core::policy::DomainParticipantResourceLimits↩ ::type_object_max_serialized_length** (p. 1419) is set to a specific value, the effective threshold is min(type_↩ object_max_serialized_length, 8192).
- If the specified threshold exceeds type_object_max_serialized_length, it is automatically capped and adjusted down to match the maximum serialized length.

If **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::type_lookup_service** (p. 1321) is also enabled, this threshold does not affect memory allocation of TypeObject v2s.

[default] rti::core::LENGTH_AUTO

8.93.1 Detailed Description

Specifies whether a **dds::pub::DataWriter** (p. 1138) will store and deliver previously published data samples to late-joining **dds::sub::DataReader** (p. 976) entities.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::StatusMask↩ ::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

See also

DURABILITY_SERVICE (p. 531)

8.93.2 Usage

It is possible for a **dds::pub::DataWriter** (p. 1138) to start publishing data before all (or any) **dds::sub::DataReader** (p. 976) entities have joined the network.

Moreover, a **dds::sub::DataReader** (p. 976) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **dds::sub::DataReader** (p. 976) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Connext will maintain internally. That is, RTI Connext may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 529) policy is set to **dds::core::policy::DurabilityKind_def::VOLATILE** (p. 1442).

8.93.2.1 Transient and Persistent Durability

For the purpose of implementing the DURABILITY QoS kind TRANSIENT or PERSISTENT, RTI Connext behaves *as if* for each Topic that has **dds::core::policy::Durability::kind** (p. 1437) of **dds::core::policy::DurabilityKind_def↩ ::TRANSIENT** (p. 1442) or **dds::core::policy::DurabilityKind_def::PERSISTENT** (p. 1442) there is a corresponding "built-in" **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) configured with the same DURABILITY kind. In other words, it is *as if* somewhere in the system, independent of the original **dds::pub::DataWriter** (p. 1138), there is a built-in durable **dds::sub::DataReader** (p. 976) subscribing to that Topic and a built-in durable DataWriter re-publishing it as needed for the new subscribers that join the system. This functionality is provided by the *RTI Persistence Service*.

The Persistence Service can configure itself based on the QoS of your application's **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) entities. For each transient or persistent **dds::topic::Topic** (p. 2474), the built-in fictitious Persistence Service **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) have their QoS configured from the QoS of your application's **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) entities that communicate on that **dds::topic::Topic** (p. 2474).

For a given **dds::topic::Topic** (p. 2474), the usual request/offered semantics apply to the matching between any **dds::pub::DataWriter** (p. 1138) in the domain that writes the **dds::topic::Topic** (p. 2474) and the built-in transient/persistent **dds::sub::DataReader** (p. 976) for that **dds::topic::Topic** (p. 2474); similarly for the built-in transient/persistent **dds::pub::DataWriter** (p. 1138) for a **dds::topic::Topic** (p. 2474) and any **dds::sub::DataReader** (p. 976) for the **dds::topic::Topic** (p. 2474). As a consequence, a **dds::pub::DataWriter** (p. 1138) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **dds::sub::DataReader** (p. 976) that has an incompatible QoS will not get data from it.

Incompatibilities between local **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) entities and the corresponding fictitious built-in transient/persistent entities cause the **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381) and **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380) to change and the corresponding **Listener** (p. 1637) invocations and/or signaling of **dds::core::cond::Condition** (p. 948) objects as they would with your application's own entities.

The value of **dds::core::policy::DurabilityService::service_cleanup_delay** (p. 1445) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (instance_state = NOT_ALIVE_DISPOSED),

and

1. All samples for the disposed instance have been acknowledged, including the dispose sample itself,

and

1. A time interval longer that **dds::core::policy::DurabilityService::service_cleanup_delay** (p. 1445) has elapsed since the moment RTI Connext detected that the previous two conditions were met. (Note: Only values of zero or **dds::core::Duration::infinite()** (p. 1451) are currently supported for the service_cleanup_delay)

The utility of **dds::core::policy::DurabilityService::service_cleanup_delay** (p. 1445) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the service_cleanup_delay will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

8.93.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind >= requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that **dds::core::policy::DurabilityKind_def::VOLATILE** (p. 1442) < **dds::core::policy::DurabilityKind_def::TRANSIENT_LOCAL** (p. 1442) < **dds::core::policy::DurabilityKind_def::TRANSIENT** (p. 1442) < **dds::core::policy::DurabilityKind_def::PERSISTENT** (p. 1442).

8.93.4 Constructor & Destructor Documentation

8.93.4.1 Durability() [1/2]

```
dds::core::policy::Durability::Durability ( )  [inline]
```

Creates the default **Durability** (p. 1433).

8.93.5.2 kind() [2/2]

```
dds::core::policy::DurabilityKind dds::core::policy::Durability::kind ( ) const  [inline]
```

Getter (see setter with the same name)

8.93.5.3 Volatile()

```
static  Durability dds::core::policy::Durability::Volatile ( )  [inline], [static]
```

Creates a **Durability** (p. 1433) instance with volatile kind.

8.93.5.4 TransientLocal()

```
static  Durability dds::core::policy::Durability::TransientLocal ( )  [inline], [static]
```

Creates a **Durability** (p. 1433) instance with trasient-local kind.

8.93.5.5 Transient()

```
static  Durability dds::core::policy::Durability::Transient ( )  [inline], [static]
```

Creates a **Durability** (p. 1433) instance with trasient kind.

8.93.5.6 Persistent()

```
static  Durability dds::core::policy::Durability::Persistent ( )  [inline], [static]
```

Creates a **Durability** (p. 1433) instance with persistent kind.

8.93.5.7 direct_communication() [1/2]

```
dds::core::policy::Durability & direct_communication (
            bool the_direct_communication )
```

<<***extension***>> *(*p. *116)* Indicates whether or not a transient or persistent **dds::sub::DataReader** (p. 976) should receive samples directly from a transient or persistent **dds::pub::DataWriter** (p. 1138)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

When direct_communication is set to true, a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) will receive samples from both the original **dds::pub::DataWriter** (p. 1138) configured with TRANSIENT or PERSISTENT durability and the **dds::pub::DataWriter** (p. 1138) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **dds::pub::DataWriter** (p. 1138) and the persistence service, the middleware will discard the duplicate.

When direct_communication is set to false, a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) will only receive samples from the **dds::pub::DataWriter** (p. 1138) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] true

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Durability** (p. 184), **Data Availability** (p. 167)

8.93.5.8 direct_communication() [2/2]

```
bool direct_communication ( ) const
```

<<***extension***>> *(*p. *116)* Getter (see setter with the same name)

8.93.5.9 writer_depth() [1/2]

```
dds::core::policy::Durability & writer_depth (
            int32_t the_writer_depth )
```

<<***extension***>> *(p. 116)* Indicates the number of samples a durable DataWriter will send to a late joining DataReader.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The default value, **rti::core::policy::auto_writer_depth()** (p. 531), makes this parameter equal to the following:

- **dds::core::policy::History::depth** (p. 1605) if the history kind is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607).
- **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) in the **dds::core::policy::ResourceLimits** (p. 2203) if the history kind is **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607).

The `writer_depth` must be <= **dds::core::policy::History::depth** (p. 1605).

`writer_depth` applies only to non-volatile DataWriters (those for which the kind is TRANSIENT_LOCAL, TRANSIENT, or PERSISTENT).

When **rti::core::policy::Batch::enable** (p. 882) is set to true, `writer_depth` acts as a minimum number of samples per instance that will be sent to late joiners, as opposed to the maximum. As long as a batch contains a single sample that falls within the `writer_depth` for the instance to which it belongs, then the entire batch will be sent. This means that batches sent to late-joining DataReaders may contain more samples per instance than is specified by the `writer_depth` QoS setting.

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the `writer_depth`, not the **dds::core::policy::History::depth** (p. 1605).

Setting `writer_depth` on the DataReader side will be ignored.

[default] rti::core::policy::auto_writer_depth() (p. 531)

Categories

Immutable (p. 243), **Durability** (p. 184), **Applied Per-Instance** (p. 287), **Data Availability** (p. 167)

8.93.5.10 writer_depth() [2/2]

```
int32_t writer_depth ( ) const
```

<<***extension***>> *(p. 116)* Getter (see setter with the same name)

8.93.5.11 storage_settings() [1/3]

```
dds::core::policy::Durability & storage_settings (
            const  rti::core::PersistentStorageSettings & the_storage_settings )
```

<<***extension***>> *(p. 116)* Used to configure durable writer history and durable reader state.

By default, durable writer history and durable reader state are disabled. This means that a DataWriter will not persist its historical cache and a DataReader will not persist its state.

To enable durable writer history and durable reader state set **rti::core::PersistentStorageSettings::enable** (p. 1929) to true.

Enumerator

VOLATILE	**[default]** RTI Connext does not need to keep any samples of data instances on behalf of any **dds::sub::DataReader** (p. 976) that is unknown by the **dds::pub::DataWriter** (p. 1138) at the time the instance is written. In other words, RTI Connext will only attempt to provide the data to existing subscribers. This option does not require RTI Persistence Service.
TRANSIENT_LOCAL	RTI Connext will attempt to keep some samples so that they can be delivered to any potential late-joining **dds::sub::DataReader** (p. 976). Which particular samples are kept depends on other QoS such as **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203). RTI Connext is only required to keep the data in memory of the **dds::pub::DataWriter** (p. 1138) that wrote the data. Data is not required to survive the **dds::pub::DataWriter** (p. 1138). For this setting to be effective, you must also set the **dds::core::policy::Reliability::kind** (p. 2153) to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157). This option does not require RTI Persistence Service.
TRANSIENT	RTI Connext will attempt to keep some samples so that they can be delivered to any potential late-joining **dds::sub::DataReader** (p. 976). Which particular samples are kept depends on other QoS such as **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203). RTI Connext is only required to keep the data in memory and not in permanent storage. Data is not tied to the lifecycle of the **dds::pub::DataWriter** (p. 1138). Data will survive the **dds::pub::DataWriter** (p. 1138). This option requires RTI Persistence Service.
PERSISTENT	Data is kept on permanent storage, so that they can outlive a system session. This option requires RTI Persistence Service.

8.95 dds::core::policy::DurabilityService Class Reference

Configures the external RTI Persistence Service used by persistent and transient DataWriters.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **DurabilityService** ()

  Creates the default policy.
- **DurabilityService** (const **dds::core::Duration** &the_service_cleanup_delay, **dds::core::policy::HistoryKind** the_history_kind, int32_t the_history_depth, int32_t the_max_samples, int32_t the_max_instances, int32_t the_max_samples_per_instance)

  Creates an instance with all the parameters set.

8.95.1 Detailed Description

Configures the external RTI Persistence Service used by persistent and transient DataWriters.

Entity:

dds::topic::Topic (p. 2474), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

See also

DURABILITY (p. 529)

HISTORY (p. 533)

RESOURCE_LIMITS (p. 546)

8.95.2 Usage

When a DataWriter's **dds::core::policy::Durability::kind** (p. 1437) is **dds::core::policy::DurabilityKind_def::↩ PERSISTENT** (p. 1442) or **dds::core::policy::DurabilityKind_def::TRANSIENT** (p. 1442), an external service, the *RTI Persistence Service*, is used to store and possibly forward the data sent by the **dds::pub::DataWriter** (p. 1138) to **dds::sub::DataReader** (p. 976) objects that are created *after* the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **dds::pub::DataWriter** (p. 1138), such as how much data to store. For example, it configures the **DURABILITY** (p. 529), **HISTORY** (p. 533), and the **RESOURCE_LIMITS** (p. 546) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

8.95.3 Constructor & Destructor Documentation

8.95.3.1 DurabilityService() [1/2]

```
dds::core::policy::DurabilityService::DurabilityService ( )  [inline]
```

Creates the default policy.

8.95.3.2 DurabilityService() [2/2]

```
dds::core::policy::DurabilityService::DurabilityService (
            const  dds::core::Duration & the_service_cleanup_delay,
             dds::core::policy::HistoryKind the_history_kind,
            int32_t the_history_depth,
            int32_t the_max_samples,
            int32_t the_max_instances,
            int32_t the_max_samples_per_instance )  [inline]
```

Creates an instance with all the parameters set.

8.95.4 Member Function Documentation

8.95.4.1 service_cleanup_delay() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::service_cleanup_delay (
            const  dds::core::Duration & d )  [inline]
```

<<***spec***>> *(p. 112)* Controls when the service is able to remove all information regarding a data instances.

When the service cleanup delay is set to 0, disposed instances will be completely removed from the service. Only values of 0 and **dds::core::Duration::infinite()** (p. 1451) are currently supported.

[default] 0

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Durability** (p. 184), **Instance Lifecycle** (p. 193), **Data Availability** (p. 167)

8.95.4.2 service_cleanup_delay() [2/2]

```
dds::core::Duration dds::core::policy::DurabilityService::service_cleanup_delay ( ) const  [inline]
```

Getter (see setter with the same name)

8.95.4.3 history_kind() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::history_kind (
             dds::core::policy::HistoryKind the_kind )  [inline]
```

<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.

[default] dds::core::policy::HistoryKind_def::KEEP_LAST (p. 1607)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Durability** (p. 184), **Applied Per-Instance** (p. 287), **Sample Memory Management** (p. 230)

8.95.4.4 history_kind() [2/2]

```
dds::core::policy::HistoryKind dds::core::policy::DurabilityService::history_kind ( ) const  [inline]
```

Getter (see setter with the same name)

8.95.4.5 history_depth() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::history_depth (
            int32_t the_depth )  [inline]
```

<<***spec***>> *(*p. *112)* Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1439) when recouping durable data.

If the **dds::core::policy::History::depth** (p. 1605) is set to a value lower than this value, **dds::core::policy::History::depth** (p. 1605) will be set equal to the value of this field.

[default] rti::core::policy::auto_writer_depth() (p. 531) (1)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Durability** (p. 184), **Applied Per-Instance** (p. 287), **Sample Memory Management** (p. 230)

8.96.1 Detailed Description

*<<**value-type**>> (p. 350)* Represents a time interval

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.96.2 Constructor & Destructor Documentation

8.96.2.1 Duration() [1/3]

```
dds::core::Duration::Duration ( )
```

Create a **Duration** (p. 1448) elapsing zero seconds.

8.96.2.2 Duration() [2/3]

```
dds::core::Duration::Duration (
            int32_t sec,
            uint32_t nanosec = 0 )  [explicit]
```

Create a duration elapsing a specific amount of time.

Parameters

sec	The number of seconds to represent
nanosec	The number of nanoseconds to represent

8.96.2.3 Duration() [3/3]

```
template<typename Rep , typename Period >
dds::core::Duration::Duration (
            const std::chrono::duration< Rep, Period > & duration )  [inline]
```

<<***C++11***>> *(p. 353)* <<***extension***>> *(p. 354)* Allow implicit creation from std::chrono::duration

For example:

```
dds::core::cond::WaitSet waitset;
// ...
waitset.wait(std::chrono::seconds(1) + std::chrono::milliseconds(250));
```

8.96.3 Member Function Documentation

8.96.3.1 zero()

```
static Duration dds::core::Duration::zero ( ) [static]
```

Returns a zero duration.

Returns

Duration() (p. 1450)

8.96.3.2 infinite()

```
static Duration dds::core::Duration::infinite ( ) [static]
```

Special value that represents an infinite **Duration** (p. 1448).

8.96.3.3 automatic()

```
static Duration dds::core::Duration::automatic ( ) [static]
```

Special value that indicates that RTI Connext will automatically assign a value.

8.96.3.4 from_microsecs()

```
static Duration dds::core::Duration::from_microsecs (
            uint64_t microseconds ) [static]
```

Create a **Duration** (p. 1448) elapsing a specific number of microseconds.

Parameters

microseconds	The number of microseconds to construct the object from

Returns

A newly constructed **Duration** (p. 1448) object

8.96.3.5 from_millisecs()

```
static Duration dds::core::Duration::from_millisecs (
            uint64_t milliseconds ) [static]
```

Create a **Duration** (p. 1448) elapsing a specific number of milliseconds.

Parameters

milliseconds	The number of milliseconds to construct the object from

Returns

A newly constructed **Duration** (p. 1448) object

Referenced by **dds::core::policy::DestinationOrder::ReceptionTimestamp()**.

8.96.3.6 from_secs()

```
static Duration dds::core::Duration::from_secs (
            double seconds ) [static]
```

Create a **Duration** (p. 1448) elapsing a specific number of seconds.

Parameters

seconds	The number of seconds to construct the object from

Returns

A newly constructed **Duration** (p. 1448) object

8.96.3.7 sec() [1/2]

```
int32_t dds::core::Duration::sec ( ) const
```

Get the number of seconds represented by this **Duration** (p. 1448) object.

Returns

The number of seconds (excluding the nanoseconds)

8.96.3.8 sec() [2/2]

```
void dds::core::Duration::sec (
            int32_t s )
```

Set the number of seconds represented by this **Duration** (p. 1448) object.

Parameters

s	The number of seconds to set

8.96.3.9 nanosec() [1/2]

```
uint32_t dds::core::Duration::nanosec ( ) const
```

Get the number of nanoseconds represented by this **Duration** (p. 1448) object.

Returns

The number of nanoseconds (excluding the seconds)

8.96.3.10 nanosec() [2/2]

```
void dds::core::Duration::nanosec (
            uint32_t ns )
```

Set the number of nanoseconds represented by this **Duration** (p. 1448) object.

Parameters

ns	The number of nanoseconds to set

8.96.3.11 compare()

```
int dds::core::Duration::compare (
            const  Duration & that ) const
```

Compare two **Duration** (p. 1448) objects.

Parameters

that	The **Duration** (p. 1448) object to compare with this **Duration** (p. 1448).

Returns

int The result of the comparison can be: -1 if this **Duration** (p. 1448) is less than other; 0 if they are equal; 1 if this **Duration** (p. 1448) is greater than other

8.96.3.12 operator>()

```
bool dds::core::Duration::operator> (
            const  Duration & that ) const
```

Check if this **Duration** (p. 1448) is greater than another.

Parameters

that	The **Duration** (p. 1448) to compare with this **Duration** (p. 1448).

Returns

bool false if this **Duration** (p. 1448) is less than or equal to the other object, true otherwise.

8.96.3.13 operator>=()

```
bool dds::core::Duration::operator>= (
            const  Duration & that ) const
```

Check if this **Duration** (p. 1448) is greater than or equal another.

Parameters

that	The **Duration** (p. 1448) to compare with this **Duration** (p. 1448).

Returns

bool false if this **Duration** (p. 1448) is less than to the other object, true otherwise.

8.96.3.14 operator==()

```
bool dds::core::Duration::operator== (
            const  Duration & that ) const
```

Check if this **Duration** (p. 1448) is equal to another.

Parameters

that	The **Duration** (p. 1448) to compare with this **Duration** (p. 1448).

Returns

bool false if this **Duration** (p. 1448) is not equal to the other object, true otherwise.

8.96.3.15 operator"!=()

```
bool dds::core::Duration::operator!= (
            const  Duration & other ) const
```

Check if this **Duration** (p. 1448) is not equal to another.

Parameters

other	The **Duration** (p. 1448) to compare with this **Duration** (p. 1448).

Returns

bool false if this **Duration** (p. 1448) is equal to the other object, true otherwise.

8.96.3.16 operator<=()

```
bool dds::core::Duration::operator<= (
            const  Duration & that ) const
```

Check if this **Duration** (p. 1448) is less than or equal another.

Parameters

that	The **Duration** (p. 1448) to compare with this **Duration** (p. 1448).

Returns

bool false if this **Duration** (p. 1448) is greater than to the other object, true otherwise.

8.96.3.17 operator<()

```
bool dds::core::Duration::operator< (
            const  Duration & that ) const
```

Check if this **Duration** (p. 1448) is less than another.

Parameters

that	The **Duration** (p. 1448) to compare with this **Duration** (p. 1448).

Returns

bool false if this **Duration** (p. 1448) is greater than or equal to the other object, true otherwise.

8.96.3.18 operator+=()

```
Duration & dds::core::Duration::operator+= (
            const  Duration & a_ti )
```

Add a **Duration** (p. 1448) to this **Duration** (p. 1448).

Parameters

a_ti	The **Duration** (p. 1448) to add

Returns

Duration (p. 1448)& This **Duration** (p. 1448), with the added **Duration** (p. 1448)

8.96.3.19 operator-=()

```
Duration & dds::core::Duration::operator-= (
            const  Duration & a_ti )
```

Subtract a **Duration** (p. 1448) from this **Duration** (p. 1448).

Parameters

a↩ _ti	The **Duration** (p. 1448) to subtract

Returns

Duration (p. 1448)& This **Duration** (p. 1448), after the subtraction

8.96.3.20 operator+()

```
Duration dds::core::Duration::operator+ (
            const  Duration & other ) const
```

Add two **Duration** (p. 1448) objects.

Parameters

other	The other **Duration** (p. 1448) to add to this one

Returns

The result of the addition

8.96.3.21 operator-()

```
Duration dds::core::Duration::operator- (
            const  Duration & other ) const
```

Subtract a **Duration** (p. 1448).

Parameters

other	The **Duration** (p. 1448) to subract from this one

Returns

The result of the subtraction

8.96.3.22 to_nanosecs()

```
uint64_t dds::core::Duration::to_nanosecs ( ) const
```

Returns this **Duration** (p. 1448) in nanoseconds.

Returns

the **Duration** (p. 1448) in nanoseconds

8.96.3.23 to_millisecs()

```
uint64_t dds::core::Duration::to_millisecs ( ) const
```

Returns this **Duration** (p. 1448) in milliseconds.

Returns

the **Duration** (p. 1448) in milliseconds

8.96.3.24 to_microsecs()

```
uint64_t dds::core::Duration::to_microsecs ( ) const
```

Returns this **Duration** (p. 1448) in microseconds.

Returns

the **Duration** (p. 1448) in microseconds

8.96.3.25 to_secs()

```
double dds::core::Duration::to_secs ( ) const
```

Returns this **Duration** (p. 1448) in seconds.

Returns

the **Duration** (p. 1448) in seconds

8.96.3.26 to_chrono()

```
std::chrono::nanoseconds dds::core::Duration::to_chrono ( ) const  [inline]
```

<<***C++11***>> *(p. 353)* <<***extension***>> *(p. 354)* Converts to std::chrono::nanoseconds

Returns

The **Duration** (p. 1448) in nanoseconds.

8.96.4 Friends And Related Function Documentation

8.96.4.1 operator*() [1/2]

```
Duration operator* (
            uint32_t lhs,
            const  Duration & rhs )  [related]
```

Multiply a **Duration** (p. 1448) object by an unsigned integer.

Parameters

lhs	The unsigned integer to multiply the **Duration** (p. 1448) object by
rhs	The **Duration** (p. 1448) object to multiply

Returns

Duration (p. 1448) The result of the multiplication

8.96.4.2 operator*() [2/2]

```
Duration operator* (
            const  Duration & lhs,
            uint32_t rhs )  [related]
```

Multiply a **Duration** (p. 1448) object by an unsigned integer.

Parameters

lhs	The **Duration** (p. 1448) object to multiply
rhs	The unsigned integer to multiply the **Duration** (p. 1448) object by

Returns

Duration (p. 1448) The result of the multiplication

8.96.4.3 operator/()

```
Duration operator/ (
            const  Duration & lhs,
            uint32_t rhs )  [related]
```

Divide a **Duration** (p. 1448) object by an unsigned integer.

Parameters

lhs	The dividend
rhs	The divisor

Returns

Duration (p. 1448) The result of dividing the two **Duration** (p. 1448) objects

8.96.4.4 swap()

```
void swap (
             Duration & lhs,
             Duration & rhs )  [related]
```

Swap the contents of two **Duration** (p. 1448) objects.

Parameters

lhs	One of the **Duration** (p. 1448) objects
rhs	One of the **Duration** (p. 1448) objects

Examples

Foo.hpp.

Referenced by **dds::core::basic_string< CharType, Allocator >::basic_string()**, and **dds::core::basic_string< CharType, Allocator >::operator=()**.

8.97 rti::topic::dynamic_type< TopicType > Struct Template Reference

Provides a DynamicType that represents an IDL-generated type.

`#include <rti/topic/TopicTraits.hpp>`

8.97.1 Detailed Description

template<typename TopicType>
struct rti::topic::dynamic_type< TopicType >

Provides a DynamicType that represents an IDL-generated type.

This type is specialized for **IDL-generated types** (p. 606) to provide a **`get()`** (p. 820) function whose return type is a const reference to a concrete subclass of **dds::core::xtypes::DynamicType** (p. 1504), such as **dds::core::xtypes::StructType** (p. 2400), **dds::core::xtypes::UnionType** (p. 2584), **dds::core::xtypes::EnumType** (p. 1535).

For example, given the following IDL type **`Foo`** (p. 1588):

```
struct Foo {
    long x;
};
```

You can obtain its DynamicType (in this case a StructType) as follows:

```
const dds::core::xtypes::StructType& foo_dynamic = rti::topic::dynamic_type<Foo>::get();
std::cout « foo_dynamic.name() « std::endl; // Output: Foo
```

Note that if the type is an IDL alias such as the following:

```
typedef Foo Bar;
```

Then `rti::topic::dynamic_type<Bar>` resolves to `rti::topic::dynamic_type<Foo>`, both returning the same `StructType`. If you want to explicitly access the `AliasType` use the special tag type `Bar_AliasTag_t`:

```
const dds::core::xtypes::AliasType& bar_dynamic = rti::topic::dynamic_type<Bar_AliasTag_t>::get();
std::cout « bar_dynamic.name() « std::endl; // Output: Bar
```

8.98.1 Detailed Description

*<<**value-type**>> (p. 350)* A data sample of any complex data type, which can be inspected and manipulated reflectively.

DynamicData (p. 1461) allows manipulating a data sample whose type is unknown at compilation time. A **DynamicData** (p. 1461) object is created by passing its **DynamicType** (p. 1504), which can be a **StructType** (p. 2400), a **UnionType** (p. 2584), **ArrayType** (p. 828), **SequenceType** (p. 2344) or **AliasType** (p. 801). **DynamicData** (p. 1461) is a valid topic-type, so you can instantiate a Topic<DynamicData> (using the constructor that receives a **DynamicType** (p. 1504)), and then a DataReader<DynamicData> or a DataWriter<DynamicData>.

Several overloaded versions of the function **value()** (p. 1468) allow reading or writing the value of a member **by name or index** (p. 1465). Another set of functions, **loan_value()** (p. 1475), can access a non-primitive member (for reading and writing) without making a copy. For primitive arrays and sequences **DynamicData** (p. 1461) also provides a way to get or set all the values at once, using **set_values()** (p. 1474) and **get_values()** (p. 1471).

A number of other functions allow querying information about the sample and its type.

Applications that use both statically typed data and **DynamicData** (p. 1461) can benefit from the conversion between them, using rti::core::xtypes::convert().

For examples on how to use **DynamicData** (p. 1461), see **Using DynamicData** (p. 611).

8.98.2 Member Names and Indexes

As mentioned before, to access a member you need to specify its name or its index. Depending on the **DynamicType** (p. 1504) of the **DynamicData** (p. 1461) sample, the name may apply or not and the index can mean different things. This table summarizes that:

DynamicType (p. 1504) of the sample	Can access by name?	What does index mean?
StructType (p. 2400)	Yes	The position of the member in the type (starting at 1)
UnionType (p. 2584)	Yes	The value of the label that selects a member, see **get_discriminator()** (p. 1478)
ArrayType (p. 828)	No	The position of the element in the array (1 to **ArrayType::total_element_count()** (p. 832))
SequenceType (p. 2344)	No	The position of the element in the sequence (1 to **member_count()** (p. 1483)) or past **member_count()** (p. 1483) to increase the length of the sequence.
Any other type	N/A	N/A

For example, given the following IDL description of a type:

```
struct Foo {
    long x;
    long y;
};
```

If we have a **DynamicData** (p. 1461) `sample` representing data of that type, we can access the member `y` in two different ways:

```
sample.value("y", 33); // Set value to 33
sample.value(2, 33); // Same effect
```

Accessing a member by index can be more efficient, so when accessing a member repeatedly it may be beneficial to obtain its index first:

```
const uint32_t y_index = sample.member_index("y");
while (...) {
    int32_t y_value = sample.value<int32_t>(y_index);
    // ...
}
```

For an example on how to access a union member, see **get_discriminator()** (p. 1478), and for more examples, including how to access elements in a collection see **Using DynamicData** (p. 611).

8.98.2.1 Hierarchical Member Names

It is possible to refer to a nested member in a type without first having to use the **loan_value()** (p. 1475) API. You can do this by using a hierarchical name. A hierarchical member name is a concatenation of member names separated by the '.' character. The hierarchical name describes the complete path from a top-level type to the nested member. For example, in the following type:

```
struct MyNestedType {
    char theChar;
    octet theOctetArray[10];
    long long theMultidimensionalArray[4][6][12];
    sequence<long> myArrayOfSeq[8];
};
struct MyType {
    MyNestedType theNestedType;
```

```
};
```

any **DynamicData** (p. 1461) API that receives a member name will accept "theNestedType.theChar" to refer to the char member in MyNestedType:

```
char my_char = myDynamicData.value<char>("theNestedType.theChar");
```

In order to access the value of `theChar` without using a hierarchical name, you would have to first bind to theNested↩ Type and then get the value:

```
auto member = myDynamicData.loan_value("theNestedType");
char my_char = member.get().value<char>("theChar");
```

As you can see, using a hierarchical member name removes the need to call the **loan_value()** (p. 1475) API, and allows for access to nested members at any depth directly from the top-level type.

The member name can also contain indexes to address members in arrays and sequences. For example, to set the third member in the array `theOctetArray`, you can pass in "theNestedType.theOctetArray[2]" as the member name. The index values when used as part of the member name are 0-based.

For multi-dimensional arrays, the indexes for each dimension should be listed comma-separated in between brackets. For example, to address a member of `theMultidimensionalArray`, the member name should be something like "theNestedType.theMultidimensionalArray[3,2,5]".

In complex types with arrays and sequences that contain other arrays and sequences, the hierarchical name may include multiple index values, one right after another. For example, in MyNestedType, `myArrayOfSeq` is an array of sequences. In order to set the third member of the sequence in the fourth member of the array, the member name would be "myNestedType.myArrayOfSeq[3][2]".

8.98.3 Exceptions accessing a member

The different **DynamicData** (p. 1461) functions that access members may throw the following exceptions:

- **dds::core::InvalidArgumentError** (p. 1619) when attempting to **get** the value a member that doesn't exist in the type, is optional and is not set, or is part of a union and not currently selected (see get_discriminator). Attempting to **set** an unset optional member or an unselected union member is legal and will set the optional member or change the active union member.
- **dds::core::IllegalOperationError** (p. 1608) when attempting to get or set a member of the wrong type–that is, when the **DynamicType** (p. 1504) of that member doesn't match the template type `T` of the function. For example assumming that `my_string_member` is a string, the two following statements are illegal:

```
data.value("my_string_member", 3);
int v = data.value<int>("my_string_member");
```

8.98.3.1 Performance Considerations

By default, a **DynamicData** (p. 1461) object stores its content in an implementation-specific representation that allows getting and setting its fields by name or ID.

When a sample is received, the CDR-formatted data is deserialized into this buffer.

When a sample is published, the data is serialized into CDR from the buffer and sent to the network.

However, there are scenarios where **DynamicData** (p. 1461) is used for purposes that don't involve manipulating the object's content directly. Two common examples are:

- Recording/Replaying: Storing samples in persistent storage for later analysis or replay.
- Bridging: Transferring samples from one domain to another by transmitting samples received with a DynamicDataReader to another domain using a DynamicDataWriter.

RTI provides dedicated services, namely RTI Recording Service and RTI Routing Service, to address these use cases. However, in certain situations, you might be unable to utilize these services.

For scenarios where inspecting or modifying the content of **DynamicData** (p. 1461) fields is unnecessary, **DynamicData** (p. 1461) offers a high-performance method to configure a DataReader to avoid deserializing incoming samples into the internal representation. Additionally, the **DynamicData** (p. 1461) API provides a method to link a CDR-formatted serialization buffer directly with a **DynamicData** (p. 1461) object, facilitating direct transmission without converting the data from the internal representation to CDR.

To skip the deserialization of a **DynamicData** (p. 1461) object on the DataReader side, you can set the field DynamicDataTypeSerializationProperty_t::skip_deserialization to true.

Once a sample is received, you can access the serialized buffer directly by using the **dds::core::xtypes::DynamicData::get_cdr_buffer** (p. 1481). This buffer can be stored in persistent storage in a Recording/Replaying use case.

To link a serialization buffer directly with a **DynamicData** (p. 1461) object, you can use the **dds::core::xtypes::DynamicData::set_cdr_buffer** (p. 1482) method. This method allows you to set the buffer that will be used to serialize the **DynamicData** (p. 1461) object when it is published.

Using DynamicData (p. 611)

8.98.4 Constructor & Destructor Documentation

8.98.4.1 DynamicData() [1/2]

```
dds::core::xtypes::DynamicData::DynamicData (
            const  dds::core::xtypes::DynamicType & type )
```

Creates a **DynamicData** (p. 1461) instance for a type.

Uses default DynamicDataProperty.

Precondition

!is_primitive(type) – a **DynamicData** (p. 1461) object cannot encapsulate a primitive type.

Parameters

type	The type of this data sample

8.98.4.2 DynamicData() [2/2]

```
dds::core::xtypes::DynamicData::DynamicData (
            const  dds::core::xtypes::DynamicType & type,
            const DynamicDataProperty & property )
```

Creates a **DynamicData** (p. 1461) instance for a type with specific memory-management.

Precondition

!is_primitive(type) – a **DynamicData** (p. 1461) object cannot encapsulate a primitive type.

Parameters

type	The type of this data sample
property	Memory-management configuration

8.98.5 Member Function Documentation

8.98.5.1 value() [1/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::value (
            const std::string & name,
            const T & v )
```

Sets the value of a member by member name.

Template Parameters

T	The type of the member to set. The possible types are: • The types accepted by **PrimitiveType**<**T**> (p. 1959) • `std::string` (or **dds::core::string** (p. 435)), • **DynamicData** (p. 1461), when the member type is a nested struct or union. In this case you can use **loan_value()** (p. 1475) as well. • If the type of the member is an enumeration, use `int32_t`.

Note

If the member type is a collection type, use loan_value for collections of complex types or set_values for collections of primitive types.

For examples on how to set member values, see **Publishing data using DynamicData** (p. 611).

If the member is optional and unset, this function will set it. To unset it again, see **clear_optional_member()** (p. 1480).

It is not always possible to rely on inferring the type `T` based on the argument `v`. For example, if the member being set is a short, this statement will throw an exception, because `T` is deduced as `int`:

```
sample.value("my_short", 10);
```

There are two ways to specify that the member is a `short`:

```
sample.value<short>("my_short", 10);
sample.value("my_short", (short) 10);
```

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465). This function also allows to access nested members
v	The value to set for that member

Exceptions

See	**Exceptions accessing a member** (p. 1466)

See also

member_exists(const std::string&) const (p. 1483)

Publishing data using DynamicData (p. 611)

8.98.5.2 value() [2/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::value (
            uint32_t index,
            const T & v )
```

Sets the value of a member by member index.

Parameters

index	The position of the member in the type, see **Member Names and Indexes** (p. 1465).
v	The value to set for that member

Exceptions

See	**Exceptions accessing a member** (p. 1466)

See also

value(const std::string&, const T&) (p. 1468)

8.98.5.3 value() [3/4]

```
template<typename T >
T dds::core::xtypes::DynamicData::value (
            const std::string & name ) const
```

Gets the value of a member by member name.

Template Parameters

T	The type of the member. See **value(const std::string&, const T&)** (p. 1468)

For examples on how to get member values, see **Subscribing to data using DynamicData** (p. 612).

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

Returns

The value of that member

Exceptions

See	**Exceptions accessing a member** (p. 1466)

See also

value(const std::string&, const T&) (p. 1468)

8.98.5.4 value() [4/4]

```
template<typename T >
T dds::core::xtypes::DynamicData::value (
            uint32_t index ) const
```

Gets the value of a member by member index.

Template Parameters

T	The type of the member. See **value(const std::string&, const T&)** (p. 1468)

For examples on how to get member values, see **Subscribing to data using DynamicData** (p. 612).

Parameters

index	The position of the member in the type, see **Member Names and Indexes** (p. 1465).

Returns

The value of that member

8.98.5.5 get_values() [1/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::get_values (
            const std::string & name,
            std::vector< T > & out_array ) const
```

Obtains the values of an array or sequence member by member name.

This function reuses an existing vector

Template Parameters

T	The element type of the array or sequence. These are the possible types: • The primitive types `char`, `(u)int8_t`, `(u)int16_t`, `DDS_Long`, `DDS_UnsignedLong`, `DDS_LongLong`, `DDS_UnsignedLongLong`, `float`, `double`. The types `int` and `unsigned int` may be used instead of `DDS_Long` and `DDS_UnsignedLong` except in some platforms (VxWorks). • If the element type is an enumeration, use `int32_t`. • If the element type is `bool`, use `uint8_t`.

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).
out_array	A vector containing the values of that array or sequence. The vector will be resized accordingly.

8.98.5.6 get_values() [2/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::get_values (
            uint32_t index,
            std::vector< T > & out_array ) const
```

Obtains the values of an array or sequence member by member index.

This function reuses an existing vector

Template Parameters

T	The element type of the array or sequence. (See **get_values(const std::string&, std::vector<T>&) const** (p. 1471))

Parameters

index	The position of the array or sequence member in the type, see **Member Names and Indexes** (p. 1465).
out_array	A vector containing the values of that array or sequence. The vector will be resized accordingly.

See also

Member Names and Indexes (p. 1465)

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1471)

8.98.5.7 get_values() [3/4]

```
template<typename T >
std::vector< T > dds::core::xtypes::DynamicData::get_values (
            uint32_t index ) const
```

Obtains the values of an array or sequence member by member index.

This function returns a new vector.

Template Parameters

T	The element type of the array or sequence. (See **get_values(const std::string&, std::vector<T>&) const** (p. 1471))

Parameters

index	The position of the array or sequence member in the type

Returns

A vector containing the values of that array or sequence.

See also

Member Names and Indexes (p. 1465)

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1471)

8.98.5.8 get_values() [4/4]

```
template<typename T >
std::vector< T > dds::core::xtypes::DynamicData::get_values (
            const std::string & name ) const
```

Obtains the values of an array or sequence member by member name.

This function returns a new vector.

Template Parameters

T	The element type of the array or sequence. (See **get_values(const std::string&, std::vector<T>&) const** (p. 1471))

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

Returns

A vector containing the values of that array or sequence.

See also

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1471)

8.98.5.9 set_values() [1/2]

```
template<typename T >
void dds::core::xtypes::DynamicData::set_values (
            uint32_t index,
            const std::vector< T > & v )
```

Sets the values of an array or sequence member by member index.

Template Parameters

T	The element type of the array or sequence. (See **get_values(const std::string&, std::vector<T>&) const** (p. 1471))

Parameters

index	The position of the array or sequence member in the type
v	A vector containing the values to be set for that array or sequence.

See also

Member Names and Indexes (p. 1465)

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1471)

8.98.5.10 set_values() [2/2]

```
template<typename T >
void dds::core::xtypes::DynamicData::set_values (
```

```
            const std::string & name,
            const std::vector< T > & v )
```

Sets the values of an array or sequence member by member name.

Template Parameters

T	The element type of the array or sequence. (See **get_values(const std::string&, std::vector<T>&) const** (p. 1471))

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).
v	A vector containing the values to be set for that array or sequence.

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1471)

8.98.5.11 loan_value() [1/4]

```
LoanedDynamicData dds::core::xtypes::DynamicData::loan_value (
            const std::string & name )
```

Gets a view of a complex member.

This function returns a new LoanedDynamicData instance that provides a view of a complex member (a struct or a union).

Only a single member of a given **DynamicData** (p. 1461) object may be loaned at a time. However, members of members may be recursively loaned to any depth. Furthermore, while the outer object has a bound member, it may only be modified through that bound member. That is, after loaning this member, the outer object disables all calls to set **value()** (p. 1468) until the loan is returned.

This method, as opposed to **value<DynamicData>()** (p. 1468) doesn't make a copy; it provides a view of the member so changes to the loaned member change the outer object.

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

Returns

The object to access the complex member

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::xtypes::LoanedDynamicData (p. 1656)

Using DynamicData (p. 611).

8.98.5.12 loan_value() [2/4]

```
LoanedDynamicData dds::core::xtypes::DynamicData::loan_value (
            uint32_t index )
```

Gets a view of a complex member.

This function returns a new LoanedDynamicData instance that provides a view of a complex member (a struct or a union).

Parameters

index	The position of the member in the type, see **Member Names and Indexes** (p. 1465).

Returns

The object to access the complex member

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

loan_value(const std::string&) (p. 1475)

rti::core::xtypes::LoanedDynamicData (p. 1656)

Member Names and Indexes (p. 1465)

8.98.5.13 loan_value() [3/4]

```
LoanedDynamicData & dds::core::xtypes::DynamicData::loan_value (
            LoanedDynamicData & data,
            const std::string & name )
```

Gets a view of a complex member.

This function reuses a LoanedDynamicData instance, returning its previous loan.

Parameters

data	The object to access the complex member
name	The member name, see **Member Names and Indexes** (p. 1465).

See also

loan_value(const std::string&) (p. 1475)

rti::core::xtypes::LoanedDynamicData (p. 1656)

8.98.5.14 loan_value() [4/4]

```
LoanedDynamicData & dds::core::xtypes::DynamicData::loan_value (
            LoanedDynamicData & data,
            uint32_t mid )
```

Gets a view of a complex member.

This function reuses a LoanedDynamicData instance, returning its previous loan.

Parameters

data	The object to access the complex member
mid	The position of the member in the type, see **Member Names and Indexes** (p. 1465).

See also

loan_value(const std::string&) (p. 1475)

rti::core::xtypes::LoanedDynamicData (p. 1656)

8.98.5.15 discriminator_value()

```
uint32_t dds::core::xtypes::DynamicData::discriminator_value ( ) const
```

Deprecated. Use **get_discriminator()** (p. 1478) instead. Obtains the value of the union discriminator (**UnionType** (p. 2584) only)

Use the value that this function returns in any function expecting a member index to access the active member in this union.

For example, given the following IDL Union:
```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

If we have a **DynamicData** (p. 1461) `sample` of that type whose active member is "y", we can access it as follows:
```
std::string y_value = sample.value<std::string>(sample.discriminator_value());
y_value = sample.value<std::string>("y"); // Same effect
y_value = sample.value<std::string>(3); // Same effect
```

If you set a different member, the discriminator value automatically changes:
```
sample.value("x", 10);
assert (sample.discriminator_value() == 1);
```

Precondition

type() (p. 1482).kind() == TypeKind::UNION_TYPE – Only applies to samples of a **UnionType** (p. 2584).

Returns

The value of this sample's discriminator.

8.98.5.16 get_discriminator()

```
int32_t dds::core::xtypes::DynamicData::get_discriminator ( ) const
```

Obtains the value of the union discriminator (**UnionType** (p. 2584) only)

Use the value that this function returns in any function expecting a member index to access the active member in this union.

For example, given the following IDL Union:
```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

If we have a **DynamicData** (p. 1461) `sample` of that type whose active member is "y", we can access it as follows:
```
std::string y_value = sample.value<std::string>(sample.get_discriminator());
y_value = sample.value<std::string>("y"); // Same effect
y_value = sample.value<std::string>(3); // Same effect
```

If you set a different member, the discriminator value automatically changes:
```
sample.value("x", 10);
assert (sample.get_discriminator() == 1);
```

Precondition

type() (p. 1482).kind() == TypeKind::UNION_TYPE – Only applies to samples of a **UnionType** (p. 2584).

Returns

The value of this sample's discriminator.

8.98.5.17 set_discriminator()

```
void dds::core::xtypes::DynamicData::set_discriminator (
            int32_t disc )
```

Sets the value of the union discriminator (**UnionType** (p. 2584) only)

If the discriminator value identifies the same member in the union, the previously set value for the member is preserved and only the discriminator value is updated. If the discriminator value identifies a different member in the union, the previously set member in the union will be finalized and the identified member will be initialized to its default value. If the discriminator doesn't identify any member in the union, then the previously set member will be finalized and the discriminator will be set to the provided value.

For example, given the following IDL Union:

```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

We can set the active member to "y" as follows:

```
// Set the discriminator to 2 and select member "y"
sample.set_discriminator(2);
assert (sample.get_discriminator() == 2);
y_value = sample.value<std::string>("y");
y_value = sample.value<std::string>(2);
// Set "y" to a value
sample.value<std::string>(2, "hello")
```

Setting the discriminator to 3 also selects "y" and preserves the previous value.

```
sample.set_discriminator(3);
assert (sample.get_discriminator() == 3);
assert (sample.value<std::string>("y") == "hello");
```

Setting the discriminator to a new value that selects a different member, "x", finalizes the previous member's value and initializes the new member to its default.

```
sample.set_discriminator(1);
assert (sample.value<int32_t>("x") == 0);
y_value = sample.value<std::string>("y"); // throws an exception
```

The discriminator can also be set to a value that does not select any member.

```
sample.set_discriminator(100);
assert (sample.get_discriminator() == 100);
assert (sample.member_count() == 0);
```

Precondition

type() (p. 1482).kind() == TypeKind::UNION_TYPE – Only applies to samples of a **UnionType** (p. 2584).

8.98.5.18 clear_all_members()

```
void dds::core::xtypes::DynamicData::clear_all_members ( )
```

Clear the contents of all data members of this object, including key members.

MT Safety:

UNSAFE.

Exceptions

One	of the **Standard Exceptions** (p. 428)

This API is not supported when the **DynamicData** (p. 1461) object is in CDR format and will fail with **dds::core::PreconditionNotMetError** (p. 1941). See **dds::core::xtypes::DynamicData::is_cdr** (p. 1481) for more information.

See also

dds::core::xtypes::DynamicData::clear_optional_member (p. 1480)

8.98.5.19 clear_optional_member() [1/2]

```
void dds::core::xtypes::DynamicData::clear_optional_member (
            const std::string & name )
```

Clear the contents of a single optional data member of this object.

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

8.98.5.20 clear_optional_member() [2/2]

```
void dds::core::xtypes::DynamicData::clear_optional_member (
            uint32_t index )
```

Clear the contents of a single optional data member of this object.

Parameters

index	The position of the member in the type, see **Member Names and Indexes** (p. 1465).

8.98.5.21 clear_member() [1/2]

```
void dds::core::xtypes::DynamicData::clear_member (
            const std::string & name )
```

Clear the contents of a single data member of this object.

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

8.98.5.22 clear_member() [2/2]

```
void dds::core::xtypes::DynamicData::clear_member (
            uint32_t index )
```

Clear the contents of a single data member of this object.

Parameters

index	The position of the member in the type, see **Member Names and Indexes** (p. 1465).

8.98.5.23 is_cdr()

```
bool dds::core::xtypes::DynamicData::is_cdr ( ) const
```

Determines if this **DynamicData** (p. 1461) sample is represented as CDR.

This method returns true if the **DynamicData** (p. 1461) object is using CDR as its data representation, and false otherwise.

When the **DynamicData** (p. 1461) object is using CDR as its data representation, many of the **DynamicData** (p. 1461) APIs cannot be used. The **DynamicData** (p. 1461) object will use CDR as its data representation when DynamicData↩ TypeSerializationProperty_t::skip_deserialization has been set to true or **dds::core::xtypes::DynamicData::set_cdr↩ _buffer** (p. 1482) has been used to associate a CDR buffer with the **DynamicData** (p. 1461) object. See each functions's documentation for whether or not the function is supported for **DynamicData** (p. 1461) objects in CDR format.

See also

dds::core::xtypes::DynamicData::get_cdr_buffer (p. 1481)

dds::core::xtypes::DynamicData::set_cdr_buffer (p. 1482)

DynamicDataTypeSerializationProperty_t::skip_deserialization

8.98.5.24 get_cdr_buffer()

```
std::pair< const char *, uint32_t > dds::core::xtypes::DynamicData::get_cdr_buffer ( ) const
```

Gets the CDR buffer of this **DynamicData** (p. 1461) sample.

This method returns the CDR buffer associated with a **DynamicData** (p. 1461) object.

If the **DynamicData** (p. 1461) object is not using CDR as its data representation, this method will throw an exception.

To configure a **DynamicData** (p. 1461) DataReader to not deserialize the incoming samples and keep the data in CDR format, you must set the configuration option DynamicDataTypeSerializationProperty_t::skip_deserialization to true.

MT Safety:

UNSAFE.

Parameters

length	<<***out***>> *(p. 355)* CDR buffer length.

Exceptions

One	of the **Standard Exceptions** (p. 428)

Returns

The buffer

8.98.5.25 set_cdr_buffer()

```
void dds::core::xtypes::DynamicData::set_cdr_buffer (
            const char * buffer,
            uint32_t length )
```

Sets the CDR buffer of this **DynamicData** (p. 1461) sample.

Parameters

buffer	The buffer to set
length	The size of the buffer

8.98.5.26 type()

```
const  dds::core::xtypes::DynamicType & dds::core::xtypes::DynamicData::type ( ) const
```

Gets the data type of this **DynamicData** (p. 1461).

8.98.5.27 type_kind()

```
 dds::core::xtypes::TypeKind dds::core::xtypes::DynamicData::type_kind ( ) const
```

Gets the data type kind of this **DynamicData** (p. 1461).

Returns

this->**type()** (p. 1482).kind().

8.98.5.28 member_count()

```
uint32_t dds::core::xtypes::DynamicData::member_count ( ) const
```

Get the number of members in this sample.

For objects of type **ArrayType** (p. 828) or **SequenceType** (p. 2344), this method returns the number of elements in the collection.

For objects of type kind **StructType** (p. 2400), it returns the number of fields in the sample, which will always be the same as the number of fields in the type.

8.98.5.29 member_exists() [1/2]

```
bool dds::core::xtypes::DynamicData::member_exists (
             const std::string & name ) const
```

Indicates whether a member exists in this sample.

If the member doesn't exist in the type, this function returns false. In all other cases, it provides the same result as **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497), which is retrieved with **member_info()** (p. 1484)).

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

8.98.5.30 member_exists() [2/2]

```
bool dds::core::xtypes::DynamicData::member_exists (
            uint32_t index ) const
```

Indicates whether a member exists in this sample.

If the member doesn't exist in the type, this function returns false. In all other cases, it provides the same result as **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497), which is retrieved with **member_info()** (p. 1484)).

Parameters

index	The member index, see **Member Names and Indexes** (p. 1465).

8.98.5.31 member_exists_in_type() [1/2]

```
bool dds::core::xtypes::DynamicData::member_exists_in_type (
            const std::string & name ) const
```

Indicates whether a member with a particular name exists in **type()** (p. 1482)

8.98.5.32 member_exists_in_type() [2/2]

```
bool dds::core::xtypes::DynamicData::member_exists_in_type (
            uint32_t index ) const
```

Indicates whether a member of a particular index exists in **type()** (p. 1482)

8.98.5.33 info()

```
DynamicDataInfo dds::core::xtypes::DynamicData::info ( ) const
```

Returns information about this sample.

8.98.5.34 member_info() [1/2]

```
rti::core::xtypes::DynamicDataMemberInfo dds::core::xtypes::DynamicData::member_info (
            const std::string & name ) const
```

Returns information about a member.

Precondition

this->**type_kind()** (p. 1483) must be **dds::core::xtypes::TypeKind_def::ARRAY_TYPE** (p. 2573), **dds::core::xtypes::TypeKind_def::SEQUENCE_TYPE** (p. 2573), **dds::core::xtypes::TypeKind_def::STRUCTURE_TYPE** (p. 2574), or **dds::core::xtypes::TypeKind_def::UNION_TYPE** (p. 2574)

When `name` identifies a field in a struct or union:

- If the specified member is not defined in the type, this function throws **dds::core::InvalidArgumentError** (p. 1619).
- If the specified member is defined in the type but doesn't exist in this data sample, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) set to false.
- If the specified member is defined in the type and exists in this data sample, **rti::core::xtypes::DynamicDataMemberInfo::member_exists** (p. 1497) is true.

When `name` identifies a sequence element, such as `"my_sequence[i]"`:

- If `i` is greater than the sequence's maximum length, this function throws **dds::core::InvalidArgumentError** (p. 1619).
- If `i` is greater than the sequence's current length but smaller than its maximum length, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) set to false.
- If `i` is smaller than or equal to the current length, **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) is true.

When `name` identifies an array element, such as `"my_array[i]`, this function either throws when the `i` is out of bounds or else returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) set to true.

The **rti::core::xtypes::DynamicDataMemberInfo** (p. 1495) returned will contain information about the identified member, including its type, whether it exists in this sample, and other metadata.

The bounds for strings and collections are not provided in the returned **rti::core::xtypes::DynamicDataMemberInfo** (p. 1495). To access that information you must query the **dds::core::xtypes::DynamicType** (p. 1504) of the member's type.

The **dds::core::xtypes::DynamicType** (p. 1504) of a **DynamicData** (p. 1461) object can be accessed using **dds::core::xtypes::DynamicData::type()** (p. 1482). You must iterate through the **dds::core::xtypes::DynamicType** (p. 1504) to locate the members **dds::core::xtypes::DynamicType** (p. 1504). Once obtained, you can query the bounds using the following APIs:

- For strings and sequences: **dds::core::xtypes::UnidimensionalCollectionType::bounds()** (p. 2577)
- For arrays: **dds::core::xtypes::ArrayType::dimension_count()** (p. 832) and **dds::core::xtypes::ArrayType::dimension()** (p. 832)

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

Returns

Information about the member.

Exceptions

dds::core::InvalidArgumentError *(p. 1619)*	if the member doesn't exist in the type, or **Standard Exceptions** (p. 428).

8.98.5.35 member_info() [2/2]

```
rti::core::xtypes::DynamicDataMemberInfo dds::core::xtypes::DynamicData::member_info (
            uint32_t index ) const
```

Returns information about a member.

Precondition

this->**type_kind()** (p. 1483) must be **dds::core::xtypes::TypeKind_def::ARRAY_TYPE** (p. 2573), **dds::core::xtypes::TypeKind_def::SEQUENCE_TYPE** (p. 2573), or **dds::core::xtypes::TypeKind_def::STRUCTURE_TYPE** (p. 2574), **dds::core::xtypes::TypeKind_def::UNION_TYPE** (p. 2574)

When this sample represents a struct and `index` is the position of the member in the type definition, or when the sample represents a union and `index` is the discriminator value:

- If the specified member is not defined in the type, this function throws **dds::core::InvalidArgumentError** (p. 1619).
- If the specified member is defined in the type but doesn't exist in this data sample, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) set to false.
- If the specified member is defined in the type and exists in this data sample, **rti::core::xtypes::DynamicDataMemberInfo::member_exists** (p. 1497) is true.

When this sample represents a sequence and `index` is the 1-based element index:

- If `index` is greater than the sequence's maximum length, this function throws **dds::core::InvalidArgumentError** (p. 1619).
- If `index` is greater than the sequence's current length but smaller than its maximum length, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) set to false.

- If `index` is smaller than or equal to the current length, **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) is true.

When this sample represents an array this function either throws **dds::core::InvalidArgumentError** (p. 1619) when the index is out of bounds or else returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1497) set to true.

The **rti::core::xtypes::DynamicDataMemberInfo** (p. 1495) returned will contain information about the identified member, including its type, whether it exists in this sample, and other metadata.

The bounds for strings and collections are not provided in the returned **rti::core::xtypes::DynamicDataMemberInfo** (p. 1495). To access that information you must query the **dds::core::xtypes::DynamicType** (p. 1504) of the member's type.

The **dds::core::xtypes::DynamicType** (p. 1504) of a **DynamicData** (p. 1461) object can be accessed using **dds::core::xtypes::DynamicData::type()** (p. 1482). You must iterate through the **dds::core::xtypes::DynamicType** (p. 1504) to locate the members **dds::core::xtypes::DynamicType** (p. 1504). Once obtained, you can query the bounds using the following APIs:

- For strings and sequences: **dds::core::xtypes::UnidimensionalCollectionType::bounds()** (p. 2577)
- For arrays: **dds::core::xtypes::ArrayType::dimension_count()** (p. 832) and **dds::core::xtypes::ArrayType::dimension()** (p. 832)

Parameters

index	The member index, see **Member Names and Indexes** (p. 1465).

Returns

DynamicDataMemberInfo Information about the member.

Exceptions

dds::core::InvalidArgumentError *(p. 1619)*	if the member doesn't exist in the type or the element with this index doesn't exist in this sequence. See also **Standard Exceptions** (p. 428).

8.98.5.36 member_index()

```
uint32_t dds::core::xtypes::DynamicData::member_index (
            const std::string & name ) const
```

Translates from member name to member index.

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

Returns

The member index for the member with that name

Exceptions

See	**Exceptions accessing a member** (p. 1466)

8.98.5.37 is_member_key() [1/2]

```
bool dds::core::xtypes::DynamicData::is_member_key (
            const std::string & name ) const
```

Returns whether a member is a key.

Parameters

name	The member name, see **Member Names and Indexes** (p. 1465).

Exceptions

See	**Exceptions accessing a member** (p. 1466)

8.98.5.38 is_member_key() [2/2]

```
bool dds::core::xtypes::DynamicData::is_member_key (
            uint32_t index ) const
```

Returns whether a member is a key.

Parameters

index	The member index, see **Member Names and Indexes** (p. 1465).

Exceptions

See	**Exceptions accessing a member** (p. 1466)

8.98.5.39 member_type() [1/2]

```
dds::core::xtypes::DynamicType dds::core::xtypes::DynamicData::member_type (
            const std::string & name ) const
```

Returns the type of a member.

8.98.5.40 member_type() [2/2]

```
dds::core::xtypes::DynamicType dds::core::xtypes::DynamicData::member_type (
            uint32_t index ) const
```

Returns the type of a member.

8.98.5.41 from_string()

```
void dds::core::xtypes::DynamicData::from_string (
            RTI_STRING_IN str,
             rti::topic::PrintFormatKind format_kind = rti::topic::PrintFormatKind::JSON )  [inline]
```

Populates this **DynamicData** (p. 1461) object from a JSON string representation.

This method takes a JSON string representing a data sample of this type, and uses it to populate this **DynamicData** (p. 1461).

Parameters

str	<<***in***>> *(p. 355).* The JSON string representation
format_kind	<<***in***>> *(p. 355).* Must be set to PrintFormatKind::JSON_PRINT_FORMAT, the only currently supported format.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898)

Referenced by **rti::topic::from_string()**.

8.98.6 Friends And Related Function Documentation

8.98.6.1 to_cdr_buffer()

```
std::vector< char > & to_cdr_buffer (
            std::vector< char > & buffer,
            const  DynamicData & sample,
             dds::core::policy::DataRepresentationId representation_id =  dds::core::policy::↩
DataRepresentation::auto_id() )  [related]
```

<<***extension***>> *(*p. *354)* Serializes a **DynamicData** (p. 1461) sample into CDR format

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Parameters

buffer	The output buffer, which will be resized to the correct size
sample	The sample to serialize
representation↩ _id	The data representation used to serialize the data

Returns

A reference to `buffer`

Examples

Foo.hpp.

8.98.6.2 from_cdr_buffer()

```
DynamicData & from_cdr_buffer (
             DynamicData & sample,
            const std::vector< char > & buffer )  [related]
```

<<***extension***>> *(*p. *354)* Creates a **DynamicData** (p. 1461) sample by deserializing a CDR buffer'

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Parameters

sample	The sample to deserialize.
buffer	The buffer containing the CDR data

Returns

A reference to `sample`

Examples

Foo.hpp.

8.98.6.3 convert() [1/2]

```
template<typename TopicType >
TopicType convert (
            const  DynamicData & sample )  [related]
```

<<***extension***>> *(p. 354)* Creates a typed sample from a **DynamicData** (p. 1461) sample.

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

This function is useful when an application uses **DynamicData** (p. 1461) and regular typed Topics at the same time.

For example, given this IDL type:

```
struct Foo {
    long x;
};
```

We can convert from **Foo** (p. 1588) and **DynamicData** (p. 1461):

```
using dds::core::xtypes::DynamicData;
// Receive a DynamicData sample
dds::sub::DataReader<DynamicData> reader = // ...;
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
assert (samples.size() > 0);
// Create a Foo sample
const DynamicData& dynamic_data = samples[0].data();
assert (rti::core::xtypes::can_convert<Foo>(dynamic_data));
Foo typed_data = rti::core::xtypes::convert<Foo>(dynamic_data);
assert (typed_data.x() == dynamic_data.value<int32_t>("x"));
```

Precondition

can_convert<TopicType>(sample), otherwise the behavior is undefined.

Template Parameters

TopicType	An IDL topic-type

Parameters

sample	The **DynamicData** (p. 1461) sample to convert to type `TopicType`

Returns

An instance of `TopicType` containing the data in `sample`.

8.98.6.4 convert() [2/2]

```
template<typename TopicType >
DynamicData convert (
            const TopicType & sample )  [related]
```

<<***extension***>> *(p. 354)* Creates a **DynamicData** (p. 1461) sample from a typed sample

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

TopicType	An IDL topic-type

Parameters

sample	The typed sample to convert to **DynamicData** (p. 1461)

Returns

A new **DynamicData** (p. 1461) object whose type is rti::topic::dynamic_type<TopicType> and contains the data from `sample`

8.98.6.5 can_convert()

```
template<typename TopicType >
bool can_convert (
            const  DynamicData & sample )  [related]
```

<<***extension***>> *(p. 354)* Determines if the **DynamicType** (p. 1504) of this sample is equal to the **DynamicType** (p. 1504) of `TopicType`

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

TopicType	An IDL topic-type

Returns

True if the **DynamicType** (p. 1504) of TopicType is the same as this sample's and therefore it is possible to create an instance of `TopicType` from this **DynamicData** (p. 1461) object.

See also

convert() (p. 1491)

8.98.6.6 get_tuple()

```
template<typename...  Types>
std::tuple< Types...  > get_tuple (
            const  dds::core::xtypes::DynamicData & data )  [related]
```

<<***C++11***>> *(p. 353)* <<***experimental***>> *(p. 355)* <<***extension***>> *(p. 354)* Retrieves all the values of a **DynamicData** (p. 1461) object into an std::tuple at once

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

See also

Manipulating data reflectively using C++ tuples (p. 612)

8.98.6.7 set_tuple()

```
template<typename... Types>
void set_tuple (
             dds::core::xtypes::DynamicData & data,
            const std::tuple< Types... > & value ) [related]
```

<<***C++11***>> (p. *353)* <<***experimental***>> (p. *355)* <<***extension***>> (p. *354)* Assigns the values of a std::tuple to a **DynamicData** (p. 1461) object at once

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

See also

Manipulating data reflectively using C++ tuples (p. 612)

DynamicData::info()

8.99.2 Member Function Documentation

8.99.2.1 member_count()

```
int32_t rti::core::xtypes::DynamicDataInfo::member_count ( ) const
```

The number of members of this sample.

8.99.2.2 stored_size()

```
int32_t rti::core::xtypes::DynamicDataInfo::stored_size ( ) const
```

The number of bytes currently used to store the data of this sample.

8.100 rti::core::xtypes::DynamicDataMemberInfo Class Reference

Contains information about a DynamicData member.

```
#include <DynamicDataMemberInfo.hpp>
```

Public Member Functions

- uint32_t **member_index** () const
  The member index.
- const **dds::core::string** & **member_name** () const
  The member name.
- **dds::core::xtypes::TypeKind** **member_kind** () const
  The type kind of this member.
- uint32_t **element_count** () const
  The number of elements in this member.
- **dds::core::xtypes::TypeKind** **element_kind** () const
  If this member is a collection, this function returns the type kind of its elements.
- bool **member_exists** () const
  Indicates if this member is present in this sample.

8.100.1 Detailed Description

Contains information about a DynamicData member.

See also

dds::core::xtypes::DynamicData::member_info() (p. 1484)

8.100.2 Member Function Documentation

8.100.2.1 member_index()

```
uint32_t rti::core::xtypes::DynamicDataMemberInfo::member_index ( ) const
```

The member index.

See also

Member Names and Indexes (p. 1465).

8.100.2.2 member_name()

```
const  dds::core::string & rti::core::xtypes::DynamicDataMemberInfo::member_name ( ) const
```

The member name.

See also

Member Names and Indexes (p. 1465).

8.100.2.3 member_kind()

```
dds::core::xtypes::TypeKind rti::core::xtypes::DynamicDataMemberInfo::member_kind ( ) const
```

The type kind of this member.

This a convenience function, equivalent to looking up the member's DynamicType::kind().

See also

dds::core::xtypes::DynamicData::type() (p. 1482)

dds::core::xtypes::DynamicType::kind() (p. 1506)

8.100.2.4 element_count()

```
uint32_t rti::core::xtypes::DynamicDataMemberInfo::element_count ( ) const
```

The number of elements in this member.

Only applies to members of ArrayType and SequenceType. For any other type this is always zero.

8.100.2.5 element_kind()

```
dds::core::xtypes::TypeKind rti::core::xtypes::DynamicDataMemberInfo::element_kind ( ) const
```

If this member is a collection, this function returns the type kind of its elements.

This function provides the same information as **dds::core::xtypes::CollectionType::content_type()** (p. 939).

See also

dds::core::xtypes::DynamicData::type() (p. 1482)
dds::core::xtypes::CollectionType::content_type() (p. 939)

8.100.2.6 member_exists()

```
bool rti::core::xtypes::DynamicDataMemberInfo::member_exists ( ) const
```

Indicates if this member is present in this sample.

A member that is defined in a type may not exist in a sample of that type in the following situations

- The member is optional and is unset
- Being part of a union, the discriminator doesn't select this member
- When getting the information about a sequence element, with index `i`, and `i` is greater than the current sequence length but smaller than its maximum length.

8.101.2 Member Function Documentation

8.101.2.1 buffer_initial_size() [1/2]

```
int32_t rti::core::xtypes::DynamicDataProperty::buffer_initial_size ( ) const  [inline]
```

Getter (see setter with the same name)

8.101.2.2 buffer_initial_size() [2/2]

```
DynamicDataProperty & rti::core::xtypes::DynamicDataProperty::buffer_initial_size (
            int32_t value )  [inline]
```

Sets the initial size of the buffer.

Parameters

value	The new initial size of the buffer

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The initial buffer size will be set to the minimum amount of space required to hold the overhead required by the DynamicData internal representation (about 100 bytes) in addition to the minimum deserialized size of

a sample. The minimum deserialized size of a sample assumes that all strings are allocated to their default values, sequences are left to length 0, and all optional members are unset.

If set to any value other than 0: The underlying buffer will be allocated to the provided size plus the overhead required by the DynamicData internal representation (about 100 bytes). If the provided size plus the overhead is less than the size used when buffer_initial_size is left to 0, then the default value is used.

See also

rti::core::xtypes::DynamicDataProperty::buffer_max_size (p. 1499)

8.101.2.3 buffer_max_size() [1/2]

```
int32_t rti::core::xtypes::DynamicDataProperty::buffer_max_size ( ) const  [inline]
```

Getter (see setter with the same name)

8.101.2.4 buffer_max_size() [2/2]

```
DynamicDataProperty & rti::core::xtypes::DynamicDataProperty::buffer_max_size (
            int32_t value )  [inline]
```

Sets the maximum size of the buffer.

Parameters

value	The new maximum size of the buffer

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

A DynamicData object will grow to this size from the initial size as needed. The buffer_max_size includes all overhead that is required for the internal DynamicData representation and therefore represents a hard upper limit on the size of the underlying DynamicData buffer.

If set to -1 (default): The buffer will grow unbounded to the size required to fit all members.

If set to any value other than -1: The buffer will not grow beyond this size. If setting a member's values requires the buffer to grow beyond this maximum, the member will fail to be set. If the buffer is required to grow beyond this maximum during deserialization, the sample will fail to be deserialized. The buffer_max_size cannot be smaller than the buffer_initial_size.

```
rti::core::xtypes::DynamicDataTypeSerializationProperty::DynamicDataTypeSerializationProperty (
            int32_t the_max_size_serialized,
            int32_t the_min_size_serialized,
            bool the_trim_to_size,
            bool the_skip_deserialization = false )  [inline]
```

Specifies all the serialization parameters.

8.102.3 Member Function Documentation

8.102.3.1 max_size_serialized() [1/2]

```
uint32_t rti::core::xtypes::DynamicDataTypeSerializationProperty::max_size_serialized ( ) const
[inline]
```

Getter (see setter with the same name)

8.102.3.2 max_size_serialized() [2/2]

```
 DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↩
::max_size_serialized (
            uint32_t value )  [inline]
```

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's **dds::core::xtypes::DynamicType** (p. 1504), whichever is smaller.

8.102.3.3 min_size_serialized() [1/2]

```
uint32_t rti::core::xtypes::DynamicDataTypeSerializationProperty::min_size_serialized ( ) const
[inline]
```

Getter (see setter with the same name)

8.102.3.4 min_size_serialized() [2/2]

```
DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↩
::min_size_serialized (
            uint32_t value )  [inline]
```

This value is used to set the sizes of certain internal middleware buffers.

Default: 0xFFFFFFFF, a sentinel that indicates that this value must be equal to the value specified in max_size_↩ serialized.

8.102.3.5 trim_to_size() [1/2]

```
bool rti::core::xtypes::DynamicDataTypeSerializationProperty::trim_to_size ( ) const  [inline]
```

Getter (see setter with the same name)

8.102.3.6 trim_to_size() [2/2]

```
DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↩
::trim_to_size (
            bool value )  [inline]
```

This property only applies to DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The buffer will not be reallocated unless the deserialized size of the incoming sample is greater than the current buffer size.

If set to 1: The buffer of a DynamicData object obtained from the DDS sample pool will be freed and re-allocated for each sample to just fit the size of the deserialized data of the incoming sample. The newly allocated size will not be smaller than **rti::core::xtypes::DynamicDataProperty::buffer_initial_size** (p. 1498).

8.102.3.7 skip_deserialization() [1/2]

```
bool rti::core::xtypes::DynamicDataTypeSerializationProperty::skip_deserialization ( ) const  [inline]
```

Getter (see setter with the same name)

8.102.3.8 skip_deserialization() [2/2]

```
 DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↩
::skip_deserialization (
            bool value )  [inline]
```

Setting this member to true boosts the performance for use cases in which the application does not require accessing the value of the different members of the received DynamicData object. Those use cases include recording, replaying, and bridging. You can access the CDR buffer of a DynamicData object by calling the method **dds::core::xtypes::↩ DynamicData::get_cdr_buffer** (p. 1481). This configuration option is only available in C, Traditional C++, Modern C++, and Python language bindings.

When this option is set to true, many of the DynamicData APIs cannot be used to access or manipulate the received DynamicData object. See each functions's documentation for whether or not the function is supported for DynamicData objects in CDR format.

  <<***extension***>> (p. *354) Creates the string representation of this **DynamicType** (*p. *1504) to a string.*

8.103.1 Detailed Description

<<***value-type***>> *(p. 350)* Represents a runtime type.

A **DynamicType** (p. 1504) is a mechanism for representing a type at runtime. DynamicTypes allow the reflective manipulation of data (**DynamicData** (p. 1461)) and the inspection of the type information about discovered readers and writers.

You can obtain a **DynamicType** (p. 1504) in a few different ways:

1. Creating one by instantiating a subclass of **dds::core::xtypes::DynamicType** (p. 1504) instance, such as **dds::core::xtypes::StructType** (p. 2400) and adding members to it. For example:
```
using namespace dds::core::xtypes;
StructType point_type("Point");
point_type.add_member(Member("x", PrimitiveType<double>()));
point_type.add_member(Member("y", PrimitiveType<double>()));
```
2. From an IDL-generated type, using the **rti::topic::dynamic_type** (p. 1461) trait type. <<***extension***>> *(p. 354)*
3. From an XML description, using **dds::core::QosProvider::type()** (p. 2044).
4. Constructing it using tuples. <<***C++11***>> *(p. 353)* <<***experimental***>> *(p. 355)* <<***extension***>> *(p. 354)*
5. From a discovered DataReader or DataWriter, using the **built-in topics** (p. 46).

For examples, see **DynamicType and DynamicData Use Cases** (p. 609)

This an abstract base class of all the types. This class contains all of the internal state—derived classes don't add any new state. That means that it is safe to copy a **DynamicType** (p. 1504) without slicing.

To downcast a **DynamicType** (p. 1504) into a concrete class, you can check its **kind()** (p. 1506) and then apply a static_cast to the appropriate class.

For example, let's assume we have the following IDL type:
```
struct Bar {
    long x;
};
struct Foo {
    Bar bar;
    long y;
};
```

We obtain the type of **Foo** (p. 1588) and want to know the type of its member `bar`:
```
// Get the DynamicType of the IDL-generated type Foo
const StructType& foo_type = rti::topic::dynamic_type<Foo>::get();
// Get the type of its member bar
const DynamicType& bar_type = foo_type.member("bar").type();
// Check type kind and downcast
if (bar_type.kind() == TypeKind::STRUCTURE_TYPE) {
    const StructType& bar_struct = static_cast<const StructType&>(bar_type);
}
```

See also

dds::core::xtypes::DynamicData (p. 1461), the class that represents data samples for a **DynamicType** (p. 1504)

dds::topic::SubscriptionBuiltinTopicData::type() (p. 2434) and **dds::topic::PublicationBuiltinTopicData::type()** (p. 1985) to obtain the **type** (p. 2044) of a remote subscription or publication

rti::topic::dynamic_type (p. 1461) to obtain the equivalent **DynamicType** (p. 1504) of an IDL-generated **type** (p. 2044)

DynamicType and DynamicData Use Cases (p. 609)

8.103.2 Member Function Documentation

8.103.2.1 kind()

```
dds::core::xtypes::TypeKind dds::core::xtypes::DynamicType::kind ( ) const
```

Gets the type kind.

8.103.2.2 name()

```
std::string dds::core::xtypes::DynamicType::name ( ) const
```

Gets the name.

8.103.2.3 is_assignable_from()

```
bool dds::core::xtypes::DynamicType::is_assignable_from (
            const  DynamicType & from ) const
```

Checks if this type is assignable from another type.

If this type is assignable from the `from` type, it means that it is possible, in a structural way, to set the contents of an object of this type to the contents of an object of type `from` (or a subset of those contents) without leading to incorrect interpretations of that information.

For additional information on type assignability, refer to the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

MT Safety:

SAFE.

Parameters

from	<<***in***>> *(p. 355)* The type to check assignability from.

Returns

true if this type is assignable from `from`. Otherwise, false.

8.103.3 Friends And Related Function Documentation

8.103.3.1 is_primitive_type()

```
bool is_primitive_type (
            const  DynamicType & t )  [related]
```

Determines if a **DynamicType** (p. 1504) is a **PrimitiveType** (p. 1959).

8.103.3.2 is_constructed_type()

```
bool is_constructed_type (
            const  DynamicType & t )  [related]
```

Determines if a **DynamicType** (p. 1504) is a constructed type.

This includes **EnumType** (p. 1535), **AliasType** (p. 801), collection types and aggregation types.

See also

is_collection_type (p. 1507)

is_aggregation_type (p. 1507)

8.103.3.3 is_collection_type()

```
bool is_collection_type (
            const  DynamicType & t )  [related]
```

Determines if a **DynamicType** (p. 1504) is a **CollectionType** (p. 939).

This includes **ArrayType** (p. 828), **SequenceType** (p. 2344), **StringType** (p. 2399), and **WStringType** (p. 2665).

8.103.3.4 is_aggregation_type()

```
bool is_aggregation_type (
            const  DynamicType & t )  [related]
```

Determines if a **DynamicType** (p. 1504) is an aggregation type.

This includes **StructType** (p. 2400) and **UnionType** (p. 2584).

8.103.3.5 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const  DynamicType & type )  [related]
```

<<***extension***>> *(p. 354)* Converts the **DynamicType** (p. 1504) to a string.

This operator writes the **DynamicType** (p. 1504) type to the ostream out using default values for **DynamicTypePrint↩ FormatProperty** (p. 1509) and returns a reference to out.

8.103.3.6 print_idl()

```
void print_idl (
            const  DynamicType & type,
            unsigned int indent = 0 )  [related]
```

<<***extension***>> *(p. 354)* Prints the IDL representation of this **DynamicType** (p. 1504) to the standard output

8.103.3.7 to_string() [1/2]

```
std::ostream & to_string (
            std::ostream & out,
            const  DynamicType & type,
            const  rti::core::xtypes::DynamicTypePrintFormatProperty & format = DynamicTypePrintFormatProperty()
)  [related]
```

<<***extension***>> *(p. 354)* Writes the string representation of this **DynamicType** (p. 1504) to an output stream.

Parameters

out	The output stream to which the string representation of the **DynamicType** (p. 1504) should be printed.
type	The **DynamicType** (p. 1504) to be printed.
format	The **DynamicTypePrintFormatProperty** (p. 1509) used to define the format of the string.

Returns

A reference to out.

8.103.3.8 to_string() [2/2]

```
std::string to_string (
            const  DynamicType & type,
```

```
            const rti::core::xtypes::DynamicTypePrintFormatProperty & format = DynamicTypePrintFormatProperty()
) [related]
```

<<***extension***>> *(p. 354)* Creates the string representation of this **DynamicType** (p. 1504) to a string.

Parameters

type	The **DynamicType** (p. 1504) to be printed.
format	The **DynamicTypePrintFormatProperty** (p. 1509) used to define the format of the string.

Returns

The string representation of the **DynamicType** (p. 1504).

8.104 rti::core::xtypes::DynamicTypePrintFormatProperty Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings.

```
#include <rti/core/xtypes/DynamicTypePrintFormat.hpp>
```

Public Member Functions

- **DynamicTypePrintFormatProperty** (unsigned int indent_in=0, bool print_ordinals_in=false, const **DynamicTypePrintKind** print_kind_in= **rti::core::xtypes::DynamicTypePrintKind::idl**, bool print_complete_type_in=false)

  Initializes the properties.
- unsigned int **indent** () const

  Get the value of indent.
- **DynamicTypePrintFormatProperty** & **indent** (unsigned int value)

  Set the amount of additional indent to be included when converting a DynamicType to a string.
- bool **print_ordinals** () const

  Get the value of print_ordinals.
- **DynamicTypePrintFormatProperty** & **print_ordinals** (bool value)

  Set whether or not to print ordinal values when printing EnumTypes.
- **DynamicTypePrintKind** **print_kind** () const

  Get the value of print_kind.
- **DynamicTypePrintFormatProperty** & **print_kind** (**DynamicTypePrintKind** value)

  Sets the format to use when printing the TypeCode.
- bool **print_complete_type** () const

  Get the value of print_complete_type.
- **DynamicTypePrintFormatProperty** & **print_complete_type** (bool value)

  Set whether or not to print the complete type.

8.104.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings.

See also

rti::core::xtypes::to_string

8.104.2 Constructor & Destructor Documentation

8.104.2.1 DynamicTypePrintFormatProperty()

```
rti::core::xtypes::DynamicTypePrintFormatProperty::DynamicTypePrintFormatProperty (
            unsigned int indent_in = 0,
            bool print_ordinals_in = false,
            const  DynamicTypePrintKind print_kind_in =  rti::core::xtypes::DynamicTypePrint↩
Kind::idl,
            bool print_complete_type_in = false )  [inline], [explicit]
```

Initializes the properties.

8.104.3 Member Function Documentation

8.104.3.1 indent() [1/2]

```
unsigned int rti::core::xtypes::DynamicTypePrintFormatProperty::indent ( ) const  [inline]
```

Get the value of indent.

See also

indent(unsigned int value) (p. 1510)

8.104.3.2 indent() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::indent (
            unsigned int value )  [inline]
```

Set the amount of additional indent to be included when converting a DynamicType to a string.

Configures how much additional indent is applied when converting a TypeCode to a string. This value acts as a total offset on the string, increasing the indent applied to all elements by the same amount. With an indent of 0, a string representation of a TypeCode may appear as:

```
struct myType {
    long x;
};
```

Using an indent of 1, the same TypeCode would be printed as:

```
    struct myType {
        long x;
    };
```

I.e., the entire structure is indented.

Parameters

value	The value to set for indent

8.104.3.3 print_ordinals() [1/2]

```
bool rti::core::xtypes::DynamicTypePrintFormatProperty::print_ordinals ( ) const  [inline]
```

Get the value of print_ordinals.

See also

print_ordinals(bool value) (p. 1511)

8.104.3.4 print_ordinals() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::print_↩
ordinals (
            bool value )  [inline]
```

Set whether or not to print ordinal values when printing EnumTypes.

When set to true, the ordinal value of each enumerator within an enum will be printed, otherwise only non-default ordinals are printed. Take for example the following enum:

```
enum myEnum {
    RED,
    GREEN = 3,
    BLUE,
};
```

When print_ordinals is set to false it would be printed as:

```
enum myEnum {
    RED,
    GREEN = 3,
    BLUE,
};
```

But with print_ordinals set to true it would be printed as:

```
enum myEnum {
    RED = 0,
    GREEN = 3,
    BLUE = 4,
};
```

Parameters

value	The value to set for print_ordinals

8.104.3.5 print_kind() [1/2]

```
DynamicTypePrintKind rti::core::xtypes::DynamicTypePrintFormatProperty::print_kind ( ) const
```

[inline]

Get the value of print_kind.

See also

print_kind(DynamicTypePrintKind value) (p. 1513)

8.104.3.6 print_kind() [2/2]

DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::print_kind (**DynamicTypePrintKind** *value*) [inline]

Sets the format to use when printing the TypeCode.

When print_kind is DDS_TYPE_CODE_PRINT_KIND_IDL, the type will be printed in IDL format. For example:

```
struct Foo {
    float32 bar;
};
```

When print_kind is DDS_TYPE_CODE_PRINT_KIND_XML, the type will be printed in XML format. For example:

```
<struct name="Foo">
    <member name="bar" type="float32"/>
</struct>
```

Parameters

value	The value to set for print_kind

8.104.3.7 print_complete_type() [1/2]

bool rti::core::xtypes::DynamicTypePrintFormatProperty::print_complete_type ( ) const [inline]

Get the value of print_complete_type.

See also

print_complete_type(bool value) (p. 1513)

8.104.3.8 print_complete_type() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::print_↩
complete_type (
            bool value )  [inline]
```

Set whether or not to print the complete type.

When print_complete_type is true, the complete type will be printed. When print_complete_type is false, only the top level will be printed.

Take for example the following types:

```
struct Foo {
    float32 member;
};
struct Bar {
    Foo foo;
};
```

When print_complete_type is false, this is printed as:

```
struct Bar {
    Foo foo;
};
```

When print_complete_type is true, this is printed as:

```
struct Foo {
    float32 member;
};
struct Bar {
    Foo foo;
};
```

Parameters

value	The value to set for print_complete_type

8.105 rti::core::EndpointGroup Class Reference

<<***extension***>> *(p. 354)* Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **EndpointGroup** (const std::string &the_role_name, int32_t the_quorum_count)

  Creates an instance with a role name and a quorum.
- std::string **role_name** () const

  Getter (see setter with the same name)
- **EndpointGroup** & **role_name** (const std::string &the_role_name)

  Defines the role name of the endpoint group.
- int32_t **quorum_count** () const

  Getter (see setter with the same name)
- **EndpointGroup** & **quorum_count** (int32_t the_quorum_count)

  Defines the minimum number of members that satisfies the endpoint group.

8.105.1 Detailed Description

<<***extension***>> *(p. 354)* Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

8.105.2 Constructor & Destructor Documentation

8.105.2.1 EndpointGroup()

```
rti::core::EndpointGroup::EndpointGroup (
            const std::string & the_role_name,
            int32_t the_quorum_count )  [inline]
```

Creates an instance with a role name and a quorum.

8.105.3 Member Function Documentation

8.105.3.1 role_name() [1/2]

```
std::string rti::core::EndpointGroup::role_name ( ) const  [inline]
```

Getter (see setter with the same name)

8.105.3.2 role_name() [2/2]

```
EndpointGroup & rti::core::EndpointGroup::role_name (
            const std::string & the_role_name )  [inline]
```

Defines the role name of the endpoint group.

If used in the **rti::core::policy::Availability** (p. 868) on a **dds::pub::DataWriter** (p. 1138), it specifies the name that identifies a Durable Subcription.

The role name can be at most 255 characters in length.

8.105.3.3 quorum_count() [1/2]

```
int32_t rti::core::EndpointGroup::quorum_count ( ) const  [inline]
```

Getter (see setter with the same name)

8.105.3.4 quorum_count() [2/2]

```
EndpointGroup & rti::core::EndpointGroup::quorum_count (
            int32_t the_quorum_count )  [inline]
```

Defines the minimum number of members that satisfies the endpoint group.

If used in the **rti::core::policy::Availability** (p. 868) on a **dds::pub::DataWriter** (p. 1138), it specifies the number of DataReaders that must acknowledge a sample before the sample is considered to be acknowledged by the Durable Subscription.

8.106 rti::topic::trust::EndpointTrustAlgorithmInfo Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins algorithm information associated with the discovered endpoint.

```
#include <rti/topic/trust/EndpointTrustAlgorithmInfo.hpp>
```

Public Member Functions

- **EndpointTrustAlgorithmInfo** ()=default

  Create an instance with the default Trust Algorithm Info associated with the discovered endpoint.
- **EndpointTrustInterceptorAlgorithmInfo interceptor** () const

  Get the Trust Plugins algorithms for interception of data and metadata exchanged by the endpoint.

8.106.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins algorithm information associated with the discovered endpoint.

8.106.2 Constructor & Destructor Documentation

8.106.2.1 EndpointTrustAlgorithmInfo()

```
rti::topic::trust::EndpointTrustAlgorithmInfo::EndpointTrustAlgorithmInfo ( )  [default]
```

Create an instance with the default Trust Algorithm Info associated with the discovered endpoint.

The meaning of this field may vary depending on what Trust Plugins the endpoint is using.

8.106.3 Member Function Documentation

8.106.3.1 interceptor()

```
EndpointTrustInterceptorAlgorithmInfo rti::topic::trust::EndpointTrustAlgorithmInfo::interceptor
( ) const  [inline]
```

Get the Trust Plugins algorithms for interception of data and metadata exchanged by the endpoint.

8.107 rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins interception algorithm information associated with the discovered endpoint.

```
#include <rti/topic/trust/EndpointTrustInterceptorAlgorithmInfo.hpp>
```

Public Member Functions

- **EndpointTrustInterceptorAlgorithmInfo** ()=default

  Create an instance with the default Trust Interceptor Algorithm Info associated with the discovered endpoint.
- uint32_t **required_mask** () const

  Get the Trust Plugins algorithms used for interception of data and metadata exchanged by the endpoint.
- uint32_t **supported_mask** () const

  Get the Trust Plugins algorithms supported for interception of data and metadata exchanged by the endpoint.

8.107.1 Detailed Description

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Trust Plugins interception algorithm information associated with the discovered endpoint.

8.107.2 Constructor & Destructor Documentation

8.107.2.1 EndpointTrustInterceptorAlgorithmInfo()

```
rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo::EndpointTrustInterceptorAlgorithmInfo (
) [default]
```

Create an instance with the default Trust Interceptor Algorithm Info associated with the discovered endpoint.

The meaning of this field may vary depending on what Trust Plugins the endpoint is using.

8.107.3 Member Function Documentation

8.107.3.1 required_mask()

```
uint32_t rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo::required_mask ( ) const [inline]
```

Get the Trust Plugins algorithms used for interception of data and metadata exchanged by the endpoint.

8.107.3.2 supported_mask()

```
uint32_t rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo::supported_mask ( ) const [inline]
```

Get the Trust Plugins algorithms supported for interception of data and metadata exchanged by the endpoint.

8.108 rti::topic::trust::EndpointTrustProtectionInfo Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins Protection information associated with the discovered endpoint.

`#include <rti/topic/trust/EndpointTrustProtectionInfo.hpp>`

Public Member Functions

- **EndpointTrustProtectionInfo** ()=default

  Create an instance with the default Trust Plugins Protection Info associated with the discovered endpoint.
- uint32_t **bitmask** () const

  Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.
- uint32_t **plugin_bitmask** () const

  Internal plugin information that is opaque to DDS.

8.108.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins Protection information associated with the discovered endpoint.

8.108.2 Constructor & Destructor Documentation

8.108.2.1 EndpointTrustProtectionInfo()

`rti::topic::trust::EndpointTrustProtectionInfo::EndpointTrustProtectionInfo ( ) [default]`

Create an instance with the default Trust Plugins Protection Info associated with the discovered endpoint.

The meaning of this field may vary depending on what Trust Plugins the endpoint is using.

8.108.3 Member Function Documentation

8.108.3.1 bitmask()

```
uint32_t rti::topic::trust::EndpointTrustProtectionInfo::bitmask ( ) const  [inline]
```

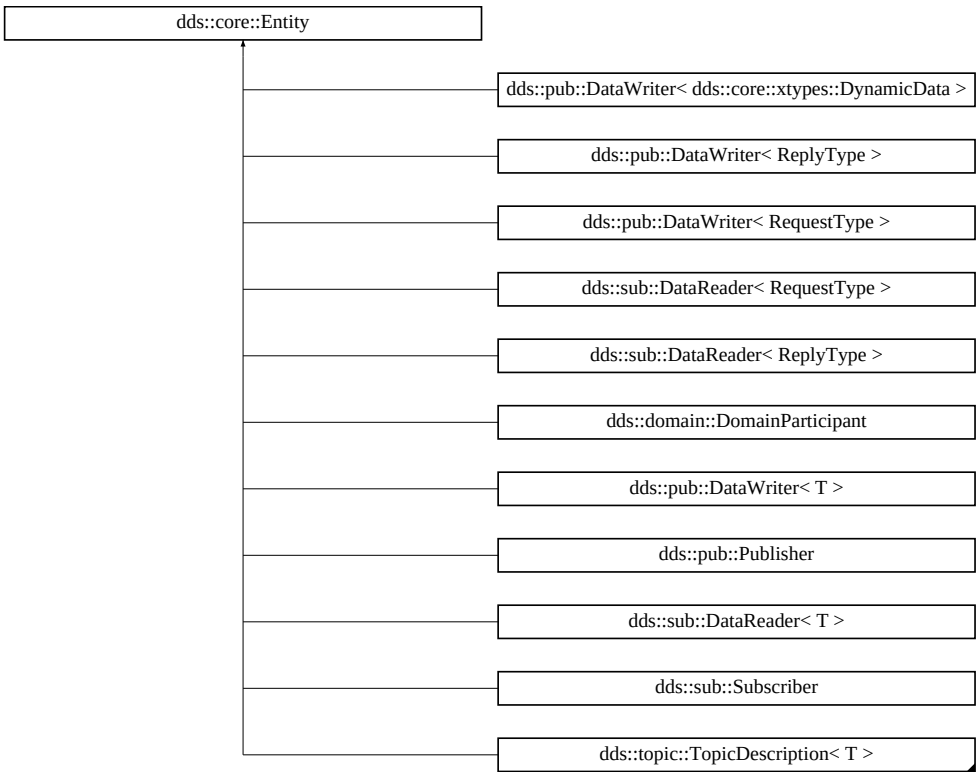
Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.108.3.2 plugin_bitmask()

```
uint32_t rti::topic::trust::EndpointTrustProtectionInfo::plugin_bitmask ( ) const  [inline]
```

Internal plugin information that is opaque to DDS.



The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.109 dds::core::Entity Class Reference

<<***reference-type***>> *(p. 351)* This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.

`#include <dds/core/Entity.hpp>`

Inheritance diagram for dds::core::Entity:

Public Member Functions

- void **enable** ()

  Enables this entity (if it was created disabled)
- const **dds::core::status::StatusMask status_changes** ()

  Retrieves the list of communication statuses that are triggered.
- const **dds::core::InstanceHandle instance_handle** () const

  Get the instance handle that represents this entity.
- void **close** ()

  Forces the destruction of this entity.
- void **retain** ()

  Disables the automatic destruction of this entity.

Related Functions

(Note that these are not member functions.)

- template<typename TO , typename FROM >
  TO **polymorphic_cast** (const FROM &from)

  *Downcasts an **Entity** (p. 1520) to a subclass.*

8.109.1 Detailed Description

<<***reference-type***>> *(p. 351)* This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.

Note

Entity (p. 1520) and its subclasses provides all the functions of a <<***reference-type***>> *(p. 351)*, including **close()** (p. 1525) and **retain()** (p. 1526).

See also

Entity Use Cases (p. 325)

All operations except for set_qos(), get_qos(), set_listener(), get_listener() and **enable()** (p. 1524), may return the value **dds::core::NotEnabledError** (p. 1869).

QoS:

All QoS Policies (p. 508)

Status:

Status Kinds (p. 429)

Listener:

Listener (p. 1637)

8.109.2 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Connext. Note that these are not member functions of **dds::core::Entity** (p. 1520), but members of each of the derived classes.

8.109.2.1 set_qos (abstract)

This operation sets the QoS policies of the **dds::core::Entity** (p. 1520). For example, see **dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)** (p. 1337).

Precondition

Certain policies are immutable (see **All QoS Policies** (p. 508)): they can only be set at **dds::core::Entity** (p. 1520) creation time or before the entity is enabled. If `set_qos()` is invoked after the **dds::core::Entity** (p. 1520) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return **dds::core::ImmutablePolicyError** (p. 1609).

Certain values of QoS policies can be incompatible with the settings of the other policies. The `set_qos()` operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return **dds::core::InconsistentPolicyError** (p. 1610).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the set_qos operation will fail and return **dds::core::UnsupportedError** (p. 2590).

Postcondition

The existing set of policies is only changed if the `set_qos()` operation succeeds.

Possible exceptions thrown in addition to **Standard Exceptions** (p. 428) : **dds::core::ImmutablePolicyError** (p. 1609), **dds::core::InconsistentPolicyError** (p. 1610), **dds::core::NotAllowedBySecurityError** (p. 1868).

8.109.2.1.1 Default QoS When you create an **Entity** (p. 1520) the Qos parameter is optional. When you don't specify it the *default QoS* applies. Applications can configure this default value.

If the application does nothing explicit to specify the *default QoS*, the default RTI Connext values will be used whenever an entity is created. Each of the QoS policies and their defaults can be found here: **All QoS Policies** (p. 508).

```
// Create a participant with default QoS

dds::domain::DomainParticipant dp_default_qos(0);

// Create a participant with specific QoS

dds::domain::qos::DomainParticipantQos participant_qos;

// Set some values in participant_qos

...

dds::domain::DomainParticipant dp_custom_qos(0, participant_qos);
```

For each entity, there are `default_*_qos` member functions that allow an application to set the default QoS values for all entities that are created from that entity. For example, **dds::domain::DomainParticipant::default_subscriber_qos** (p. 1343) sets the default **dds::sub::qos::SubscriberQos** (p. 2423) that will be used for each **dds::sub::Subscriber** (p. 2410) that is created from that DomainParticipant.

```
dds::domain::DomainParticipant participant(0);
// Set the default qos for any subscriber that is created from this participant
dds::sub::qos::SubscriberQos subscriber_qos;
// Set some values in subscriber_qos
subscriber_qos.policy<dds::core::policy::Partition>(...);
// or get it from a QosProvider:
subscriber_qos = dds::core::QosProvider::Default().subscriber_qos(...);
participant.default_subscriber_qos(subscriber_qos);
```

See also

dds::core::QosProvider (p. 2025)

8.109.2.2 get_qos (abstract)

This operation allows access to the existing set of QoS policies for the **dds::core::Entity** (p. 1520). For example, see **dds::domain::DomainParticipant::qos() const** (p. 1336)

8.109.2.3 set_listener (abstract)

This operation installs a **Listener** (p. 1637) on the **dds::core::Entity** (p. 1520). The listener will only be invoked on the changes of communication status indicated by the specified `mask`.

There are two components involved when setting up listeners: the listener itself and the mask. Both of these can be NULL.

Listeners for some Entities derive from the Connext DDS Listeners for related Entities. This means that the derived **Listener** (p. 1637) has all of the methods of its parent class. You can install Listeners at all levels of the object hierarchy. At the top is the DomainParticipantListener; only one can be installed in a DomainParticipant. Then every Subscriber and Publisher can have their own **Listener** (p. 1637). Finally, each Topic, DataReader and DataWriter can have their own listeners. All are optional.

Suppose, however, that an **Entity** (p. 1520) does not install a **Listener** (p. 1637), or installs a **Listener** (p. 1637) that does not have particular communication status selected in the bitmask. In this case, if/when that particular status changes for that **Entity** (p. 1520), the corresponding **Listener** (p. 1637) for that **Entity** (p. 1520)'s parent is called. Status changes are "propagated" from child **Entity** (p. 1520) to parent **Entity** (p. 1520) until a **Listener** (p. 1637) is found that is registered for that status. Connext DDS will give up and drop the status-change event only if no Listeners have been installed in the object hierarchy to be called back for the specific status.

The following table describes the effect of different combinations of Listeners and Status Bit Masks considering the hierarchical processing.

Table 8.512 Effect of Different Combinations of Listeners and Status Bit Masks

	No Bits Set in Mask	Some/All Bits Set in Mask
Listener (p. 1637) is Specified	Connext DDS finds the next most relevant listener for the changed status	For the statuses that are enabled in the mask, the most relevant listener will be called. The 'statusChangedFlag' for the relevant status is reset
Listener (p. 1637) is NULL	Connext DDS behaves as if the listener is not installed and finds the next most relevant listener for that status	Connext DDS behaves as if the listener is installed, but the callback is doing nothing. This is called a "nil" listener

Postcondition

Only one listener can be attached to each **dds::core::Entity** (p. 1520). If a listener was already set, the operation `set_listener()` will replace it with the new one. Consequently, if the value NULL is passed for the listener parameter to the set_listener operation, any existing listener will be removed.

8.109.2.4 get_listener (abstract)

This operation allows access to the existing **Listener** (p. 1637) attached to the **dds::core::Entity** (p. 1520).

If no listener is installed on the **dds::core::Entity** (p. 1520), this operation will return NULL.

8.109.3 Member Function Documentation

8.109.3.1 enable()

```
void dds::core::Entity::enable ( )  [inline]
```

Enables this entity (if it was created disabled)

This operation enables the **Entity** (p. 1520). **Entity** (p. 1520) objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 532) QoS policy on the corresponding factory for the **dds::core::Entity** (p. 1520).

By default, **ENTITY_FACTORY** (p. 532) is set so that it is not necessary to explicitly call **dds::core::Entity::enable** (p. 1524) on newly created entities.

The **dds::core::Entity::enable** (p. 1524) operation is idempotent. Calling enable on an already enabled **Entity** (p. 1520) returns OK and has no effect.

If a **dds::core::Entity** (p. 1520) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2373)
- **Entity** (p. 1520) constructors
- **dds::core::Entity::status_changes()** (p. 1525) and other get status operations (although the status of a disabled entity never changes)
- find operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **dds::core::NotEnabledError** (p. 1869).

It is legal to delete an **dds::core::Entity** (p. 1520) that has not been enabled .

Entities created from a factory **Entity** (p. 1520) that is disabled are created disabled, regardless of the setting of the **dds::core::policy::EntityFactory** (p. 1527).

Calling enable on an **Entity** (p. 1520) whose factory **Entity** (p. 1520) is not enabled will fail and return **dds::core::PreconditionNotMetError** (p. 1941).

If **dds::core::policy::EntityFactory::autoenable_created_entities** (p. 1529) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **dds::pub::Publisher** (p. 1993) will enable all its contained **dds::pub::DataWriter** (p. 1138) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value` == FALSE.

Exceptions

One	of the **Standard Exceptions** (p. 428), **Standard Exceptions** (p. 428) or **dds::core::PreconditionNotMetError** (p. 1941).

8.109.3.2 status_changes()

```
const dds::core::status::StatusMask dds::core::Entity::status_changes ( ) [inline]
```

Retrieves the list of communication statuses that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the get_∗_status() method.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the get_status_changes operation will be empty.

The list of statuses returned by the get_status_changes operation refers to the status that are triggered on the **Entity** (p. 1520) itself and does not include statuses that apply to contained entities.

Returns

list of communication statuses in the **dds::core::Entity** (p. 1520) that are triggered.

See also

Status Kinds (p. 429)

8.109.3.3 instance_handle()

```
const dds::core::InstanceHandle dds::core::Entity::instance_handle ( ) const [inline]
```

Get the instance handle that represents this entity.

This operation returns the **dds::core::InstanceHandle** (p. 1612) that represents the **dds::core::Entity** (p. 1520).

Returns

the instance handle associated with this entity.

8.109.3.4 close()

```
void dds::core::Entity::close ( )  [inline]
```

Forces the destruction of this entity.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

See also

Reference types (p. 351)

8.109.3.5 retain()

```
void dds::core::Entity::retain ( )  [inline]
```

Disables the automatic destruction of this entity.

See also

Reference types (p. 351)

8.109.4 Friends And Related Function Documentation

8.109.4.1 polymorphic_cast()

```
template<typename TO , typename FROM >
TO polymorphic_cast (
             const FROM & from )  [related]
```

Downcasts an **Entity** (p. 1520) to a subclass.

Note

- Header: <dds/core/ref_traits.hpp>
- Namespace: **dds::core** (p. 616)

Template Parameters

TO	The type to cast to
FROM	The type to cast from

Parameters

from	The object to cast to type `TO`

Returns

A reference to the same object `from`, but cast to the type `TO`. Both objects share ownership of the underlying entity.

For example:

```
using namespace dds::core;
using namespace dds::domain;
DomainParticipant participant(0);
Entity entity = participant; // Assignment to base
DomainParticipant participant2 = polymorphic_cast<DomainParticipant>(entity);
assert (participant == participant2); // Same reference
```

8.110 dds::core::policy::EntityFactory Class Reference

Configures a **dds::core::Entity** (p. 1520) that acts as factory of other entities.

`#include <dds/core/policy/CorePolicy.hpp>`

Public Member Functions

- **TEntityFactory** ()

  Default policy.
- **TEntityFactory** (bool the_auto_enable)

  Specifies whether the entity acting as a factory automatically enables the instances it creates.
- **TEntityFactory** & **autoenable_created_entities** (bool on)

  Specifies whether the entity acting as a factory automatically enables the instances it creates.
- bool **autoenable_created_entities** () const

  Getter (see setter with the same name)

Static Public Member Functions

- static **TEntityFactory** **AutoEnable** ()

  Creates `EntityFactory(true)`
- static **TEntityFactory** **ManuallyEnable** ()

  Creates `EntityFactory(false)`

8.110.1 Detailed Description

Configures a **dds::core::Entity** (p. 1520) that acts as factory of other entities.

Entity:

DomainParticipantFactory, **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **YES** (p. 514)

8.110.2 Usage

This policy controls the behavior of the **dds::core::Entity** (p. 1520) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Connext uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **dds::sub::DataReader** (p. 976) is created in an enabled state, its existence is immediately propagated for discovery and the **dds::sub::DataReader** (p. 976) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **dds::sub::DataReader** (p. 976), and thus, it may not be desireable for the **dds::sub::DataReader** (p. 976) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled, too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

UserData (p. 2591)

8.110.3 Member Function Documentation

8.110.3.1 TEntityFactory() [1/2]

```
dds::core::policy::EntityFactory::TEntityFactory ( )  [inline]
```

Default policy.

8.110.3.2 TEntityFactory() [2/2]

```
dds::core::policy::EntityFactory::TEntityFactory (
            bool the_auto_enable )  [inline], [explicit]
```

Specifies whether the entity acting as a factory automatically enables the instances it creates.

8.110.3.3 autoenable_created_entities() [1/2]

```
TEntityFactory & dds::core::policy::EntityFactory::autoenable_created_entities (
            bool on )  [inline]
```

Specifies whether the entity acting as a factory automatically enables the instances it creates.

8.110.3.4 autoenable_created_entities() [2/2]

```
bool dds::core::policy::EntityFactory::autoenable_created_entities ( ) const  [inline]
```

Getter (see setter with the same name)

8.110.3.5 AutoEnable()

```
static  TEntityFactory dds::core::policy::EntityFactory::AutoEnable ( )  [inline], [static]
```

Creates `EntityFactory(true)`

8.110.3.6 ManuallyEnable()

```
static  TEntityFactory dds::core::policy::EntityFactory::ManuallyEnable ( )  [inline], [static]
```

Creates `EntityFactory(false)`

8.111 rti::core::policy::EntityName Class Reference

<<***extension***>> *(p. 116)* Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader.

`#include <rti/core/policy/CorePolicy.hpp>`

Public Member Functions

- **EntityName** ()
  Creates the default policy (no name)
- **EntityName** (const std::string &the_name)
  Creates an instance that specifies an entity name.
- **EntityName** & **name** (const **rti::core::optional_value**< std::string > &the_name)
  Sets the entity name.
- **EntityName** & **name** (const char *the_name)
  Sets the entity name.
- **rti::core::optional_value**< std::string > **name** () const
  Gets the entity name.
- **EntityName** & **role_name** (const **rti::core::optional_value**< std::string > &the_name)
  Specifies an entity role name.
- **EntityName** & **role_name** (const char *the_name)
  Sets the role name.
- **rti::core::optional_value**< std::string > **role_name** () const
  Gets the entity role name.

8.111.1 Detailed Description

<<***extension***>> *(p. 116)* Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader.

Except for the Publisher and Subscriber, these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

dds::domain::DomainParticipant (p. 1326), **dds::sub::Subscriber** (p. 2410), **dds::pub::Publisher** (p. 1993), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO;
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.111.2 Usage

The name and role name can be at most 255 characters in length.

8.111.3 Constructor & Destructor Documentation

8.111.3.1 EntityName() [1/2]

```
rti::core::policy::EntityName::EntityName ( )  [inline]
```

Creates the default policy (no name)

8.111.3.2 EntityName() [2/2]

```
rti::core::policy::EntityName::EntityName (
            const std::string & the_name )  [inline], [explicit]
```

Creates an instance that specifies an entity name.

8.111.4 Member Function Documentation

8.111.4.1 name() [1/3]

```
EntityName & rti::core::policy::EntityName::name (
            const  rti::core::optional_value< std::string > & the_name )
```

Sets the entity name.

Parameters

the_name	An optional string. An unset value indicates that this entity should have no name. A set value will set a name. The string can't exceed 255 characters.

[default] Unset (no name)

8.111.4.2 name() [2/3]

```
EntityName & rti::core::policy::EntityName::name (
            const char * the_name )
```

Sets the entity name.

Parameters

the_name	Can't exceed 255 characters.

8.111.4.3 name() [3/3]

```
rti::core::optional_value< std::string > rti::core::policy::EntityName::name ( ) const
```

Gets the entity name.

Returns

An optional string. An unset value indicates that the entity has not been assigned a name.

8.111.4.4 role_name() [1/3]

```
EntityName & rti::core::policy::EntityName::role_name (
            const  rti::core::optional_value< std::string > & the_name )
```

Specifies an entity role name.

With Durable Subscriptions this name is used to specify to which Durable Subscription the DataReader belongs.

With Collaborative DataWriters this name is used to specify to which endpoint group the DataWriter belongs.

Parameters

the_name	An optional string. An unset value indicates that the Entity will have no role name (the default). The string can't exceed 255 characters.

[default] Unset (no role name)

8.111.4.5 role_name() [2/3]

```
EntityName & rti::core::policy::EntityName::role_name (
            const char * the_name )
```

Sets the role name.

See also

role_name(const rti::core::optional_value<std::string>&) (p. 1532)

8.111.4.6 role_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::policy::EntityName::role_name ( ) const
```

Gets the entity role name.

Returns

An optional string. An unset value indicates that the entity has not been assigned a role name.

8.112 dds::core::xtypes::EnumMember Class Reference

<<***value-type***>> *(*p. *350)* Represents a **EnumType** (p. 1535) member

`#include "dds/core/xtypes/MemberType.hpp"`

Public Member Functions

- **EnumMember** (const std::string & **name**, int32_t **ordinal**)
- const **dds::core::string** & **name** () const

  Gets the name.
- **dds::core::string** & **name** ()

  Gets the member name.
- **EnumMember** & **name** (const **dds::core::string** &value)

  Sets the name.
- int32_t **ordinal** () const

  Gets the ordinal.
- **EnumMember** & **ordinal** (int32_t the_ordinal)

  Sets the ordinal.

8.112.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents a **EnumType** (p. 1535) member

Encapsulates the name and value (ordinal) of an IDL `enum` type

8.112.2 Constructor & Destructor Documentation

8.112.2.1 EnumMember()

```
dds::core::xtypes::EnumMember::EnumMember (
            const std::string & name,
            int32_t ordinal )
```

Creates a **EnumMember** (p. 1533) with a name and value (ordinal)

8.112.3 Member Function Documentation

8.112.3.1 name() [1/3]

```
const  dds::core::string & dds::core::xtypes::EnumMember::name ( ) const
```

Gets the name.

8.112.3.2 name() [2/3]

```
 dds::core::string & dds::core::xtypes::EnumMember::name ( )
```

Gets the member name.

8.112.3.3 name() [3/3]

```
 EnumMember & dds::core::xtypes::EnumMember::name (
            const  dds::core::string & value )
```

Sets the name.

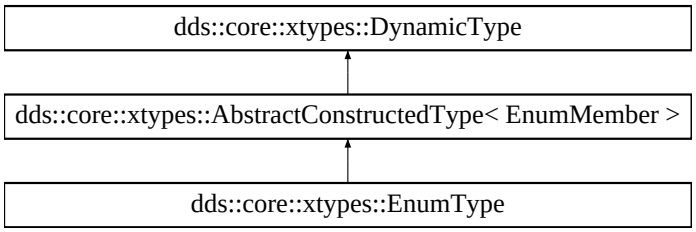
8.112.3.4 ordinal() [1/2]

```
int32_t dds::core::xtypes::EnumMember::ordinal ( ) const
```

Gets the ordinal.

8.112.3.5 ordinal() [2/2]

```
EnumMember & dds::core::xtypes::EnumMember::ordinal (
            int32_t the_ordinal )
```



Sets the ordinal.

8.113 dds::core::xtypes::EnumType Class Reference

<<***value-type***>> *(*p. *350)* Represents an IDL `enum` type

`#include <dds/core/xtypes/EnumType.hpp>`

Inheritance diagram for dds::core::xtypes::EnumType:

Public Member Functions

- **EnumType** (const std::string & **name**)
  Creates an empty enum type.
- template<typename Container >
  EnumType (const std::string &the_name, const Container &the_members)
  Creates an enum with the members in a container.
- template<typename MemberIter >
  EnumType (const std::string &the_name, MemberIter begin, MemberIter end)
  Creates a enum with the members in an iterator range.
- **EnumType** (const std::string &the_name, std::initializer_list< **EnumMember** > the_members)
  Creates an enum with the members in an initializer_list.
- **MemberIndex find_member_by_ordinal** (int32_t ordinal) const
  Gets the index of the member with this ordinal value.
- **EnumType** & **add_member** (const **EnumMember** & **member**)
  Adds a member at the end.
- template<typename Container >
  EnumType & **add_members** (const Container &the_members)
  Adds all the members of a container at the end.
- **EnumType** & **add_members** (std::initializer_list< **EnumMember** > the_members)
  Adds all the members of an initializer_list at the end.
- template<typename MemberIter >
  EnumType & **add_members** (MemberIter begin, MemberIter end)
  Adds all the members in an iterator range at the end.

Additional Inherited Members

8.113.1 Detailed Description

<<***value-type***>> *(p. 350)* Represents an IDL `enum` type

Examples

Foo.hpp.

8.113.2 Constructor & Destructor Documentation

8.113.2.1 EnumType() [1/4]

```
dds::core::xtypes::EnumType::EnumType (
            const std::string & name )
```

Creates an empty enum type.

Members can be added after creation.

Parameters

name	The name of the type

8.113.2.2 EnumType() [2/4]

```
template<typename Container >
dds::core::xtypes::EnumType::EnumType (
            const std::string & the_name,
            const Container & the_members )  [inline]
```

Creates an enum with the members in a container.

Template Parameters

Container	A container that provides the member functions **begin()** (p. 1669) and **end()** (p. 1670) to iterate over **EnumMember** (p. 1533) elements.

Parameters

the_name	The name of the type
the_members	A container with the members for this enum type

8.113.2.3 EnumType() [3/4]

```
template<typename MemberIter >
dds::core::xtypes::EnumType::EnumType (
            const std::string & the_name,
            MemberIter begin,
            MemberIter end )  [inline]
```

Creates a enum with the members in an iterator range.

Template Parameters

MemberIter	A forward iterator of **EnumMember** (p. 1533) elements

Parameters

the_name	The name of the type
begin	The beginning of the range of EnumMembers
end	The end of the range of EnumMembers

8.113.2.4 EnumType() [4/4]

```
dds::core::xtypes::EnumType::EnumType (
            const std::string & the_name,
            std::initializer_list<  EnumMember > the_members )
```

Creates an enum with the members in an initializer_list.

Parameters

the_name	The name of the type
the_members	An ininitalizer_list of EnumMembers

8.113.3 Member Function Documentation

8.113.3.1 find_member_by_ordinal()

```
MemberIndex dds::core::xtypes::EnumType::find_member_by_ordinal (
            int32_t ordinal ) const
```

Gets the index of the member with this ordinal value.

Returns

The index (which can be passed to member(uint32_t) of the member with this ordinal value or INVALID_INDEX if that ordinal doesn't exist

8.113.3.2 add_member()

```
EnumType & dds::core::xtypes::EnumType::add_member (
            const  EnumMember & member )
```

Adds a member at the end.

8.113.3.3 add_members() [1/3]

```
template<typename Container >
EnumType & dds::core::xtypes::EnumType::add_members (
            const Container & the_members )  [inline]
```

Adds all the members of a container at the end.

8.113.3.4 add_members() [2/3]

```
EnumType & dds::core::xtypes::EnumType::add_members (
            std::initializer_list<  EnumMember > the_members )
```

Adds all the members of an initializer_list at the end.

8.113.3.5 add_members() [3/3]

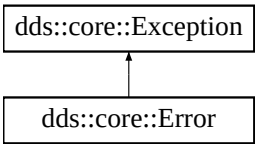
```
template<typename MemberIter >
EnumType & dds::core::xtypes::EnumType::add_members (
            MemberIter begin,
            MemberIter end )  [inline]
```

Adds all the members in an iterator range at the end.

8.114 rti::test::EnvVarToken Class Reference

`#include <utilities.hpp>`

8.114.1 Detailed Description



This class is used to create or modify an environment variable. If the variable didn't exist previously, the environment variable will be set and it will last as long as the life of this instance. If the variable already existed, this class will change its value to the provided one during the lifetime of this instance. After destruction, it will return to its previous value.

8.115 dds::core::Error Class Reference

A generic, unspecified **Error** (p. 1539).

`#include <Exception.hpp>`

Inheritance diagram for dds::core::Error:

Public Member Functions

- **Error** ()

  *Create an **Error** (p. 1539) exception with no message.*
- **Error** (const std::string &msg)

  *Create an **Error** (p. 1539) exception with a message.*
- virtual const char * **what** () const throw ()

  *Access the message contained in this **Error** (p. 1539) exception.*

8.115.1 Detailed Description

A generic, unspecified **Error** (p. 1539).

Inherits also from `std::exception`

8.115.2 Constructor & Destructor Documentation

8.115.2.1 Error() [1/2]

```
dds::core::Error::Error ( )
```

Create an **Error** (p. 1539) exception with no message.

8.115.2.2 Error() [2/2]

```
dds::core::Error::Error (
            const std::string & msg )  [explicit]
```

Create an **Error** (p. 1539) exception with a message.

Parameters

msg	The message to create the **Error** (p. 1539) with.

8.115.3 Member Function Documentation

8.115.3.1 what()

```
virtual const char * dds::core::Error::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **Error** (p. 1539) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.116 rti::core::policy::Event Class Reference

<<***extension***>> *(*p. *116)* Configures the thread in a DomainParticipant that handles timed events.

`#include <rti/core/policy/CorePolicy.hpp>`

Public Member Functions

- **Event** ()
  Creates the default policy.

  <<***extension***>> *(*p. *116) The maximum number of events.*
- int32_t **max_count** () const
  Getter (see setter with the same name)

8.116.1 Detailed Description

<<***extension***>> *(*p. *116)* Configures the thread in a DomainParticipant that handles timed events.

In a **dds::domain::DomainParticipant** (p. 1326), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **dds::domain::DomainParticipant** (p. 1326) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **dds::domain::DomainParticipant** (p. 1326) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.116.2 Constructor & Destructor Documentation

8.116.2.1 Event() [1/2]

```
rti::core::policy::Event::Event ( )  [inline]
```

Creates the default policy.

8.116.2.2 Event() [2/2]

```
rti::core::policy::Event::Event (
            const  rti::core::ThreadSettings & the_thread,
            int32_t the_initial_count,
            int32_t the_max_count )
```

Creates an instance with all the parameters set.

8.116.3 Member Function Documentation

8.116.3.1 thread() [1/3]

```
Event & rti::core::policy::Event::thread (
            const  rti::core::ThreadSettings & the_thread )
```

<<***extension***>> *(p. 116)* **Event** (p. 1541) thread QoS.

There is only one event thread.

Priority:
[default] The actual value depends on your architecture:
For Windows: -2
For Linux: OS default priority
For a complete list of platform specific values, please refer to `Platform Notes`.

Stack Size:
[default] The actual value depends on your architecture:
For Windows: OS default stack size
For Linux: OS default stack size
For a complete list of platform specific values, please refer to `Platform Notes`.

Mask:
[default] mask = **rti::core::ThreadSettingsKindMask::floating_point()** (p. 2456) | **rti::core::ThreadSettingsKind↩ Mask::stdio()** (p. 2456)

```
virtual const char * dds::core::Exception::what ( ) const throw ( )   [pure virtual]
```

Get a description of the error.

Implemented in **dds::core::Error** (p. 1540), **dds::core::AlreadyClosedError** (p. 806), **dds::core::IllegalOperationError** (p. 1608), **dds::core::NotAllowedBySecurityError** (p. 1868), **dds::core::ImmutablePolicyError** (p. 1609), **dds::core::InconsistentPolicyError** (p. 1610), **dds::core::InvalidArgumentError** (p. 1619), **dds::core::NotEnabledError** (p. 1869), **dds::core::OutOfResourcesError** (p. 1899), **dds::core::PreconditionNotMetError** (p. 1942), **dds::core::TimeoutError** (p. 2473), **dds::core::UnsupportedError** (p. 2590), **dds::core::InvalidDowncastError** (p. 1620), **dds::core::NullReferenceError** (p. 1870), **rti::queuing::NoMatchingQueueException** (p. 1836), **dds::rpc::RemoteUnknownOperationError** (p. 2167), **dds::rpc::RemoteUnsupportedOperationError** (p. 2168), **dds::rpc::RemoteInvalidArgumentError** (p. 2162), **dds::rpc::RemoteOutOfResourcesError** (p. 2163), and **dds::rpc::RemoteUnknownExceptionError** (p. 2166).

8.119 rti::topic::ExpressionProperty Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Provides additional information about the filter expression passed to the writer_compile method of **rti::topic::WriterContentFilter** (p. 2652)

```
#include <rti/topic/ContentFilter.hpp>
```

Public Member Functions

- **ExpressionProperty** ()

  *Create a default **ExpressionProperty** (p. 1547) with key_only_filter = false and writer_side_filter_optimization = false.*
- **ExpressionProperty** (bool the_key_only_filter, bool the_writer_side_filter_optimization)

  *Create an **ExpressionProperty** (p. 1547) with the provided key_only_filter, and writer_side_filter_optimization.*
- bool **key_only_filter** () const

  Get the value of key_only_filter.
- **ExpressionProperty** & **key_only_filter** (bool the_key_only_filter)

  Set the value for key_only_filter, indicating if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.
- bool **writer_side_filter_optimization** () const

  Get the value of writer_side_filter_optimization.
- **ExpressionProperty** & **writer_side_filter_optimization** (bool the_writer_side_filter_optimization)

  Set the value for writer_side_filter_optimization, indicating if the filter implementation can cache the filtering result for the provided expression.

8.119.1 Detailed Description

*<<**extension**>>* *(p. 354)* *<<**value-type**>>* *(p. 350)* Provides additional information about the filter expression passed to the writer_compile method of **rti::topic::WriterContentFilter** (p. 2652)

It is used by the filter implementation to indicate to the middleware whether or not the **WriterContentFilter** (p. 2652) will cache the result of filter evaluation.

See also

rti::topic::WriterContentFilter (p. 2652)

8.119.2 Constructor & Destructor Documentation

8.119.2.1 ExpressionProperty() [1/2]

```
rti::topic::ExpressionProperty::ExpressionProperty ( )  [inline]
```

Create a default **ExpressionProperty** (p. 1547) with key_only_filter = false and writer_side_filter_optimization = false.

8.119.2.2 ExpressionProperty() [2/2]

```
rti::topic::ExpressionProperty::ExpressionProperty (
            bool the_key_only_filter,
            bool the_writer_side_filter_optimization )  [inline]
```

Create an **ExpressionProperty** (p. 1547) with the provided key_only_filter, and writer_side_filter_optimization.

Parameters

the_key_only_filter	The value for key_only_filter
the_writer_side_filter_optimization	The value for writer_side_filter_optimization

8.119.3 Member Function Documentation

8.119.3.1 key_only_filter() [1/2]

```
bool rti::topic::ExpressionProperty::key_only_filter ( ) const  [inline]
```

Get the value of key_only_filter.

See also

key_only_filter(bool the_key_only_filter) (p. 1549)

8.119.3.2 key_only_filter() [2/2]

```
ExpressionProperty & rti::topic::ExpressionProperty::key_only_filter (
            bool the_key_only_filter )  [inline]
```

Set the value for key_only_filter, indicating if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.

When this field is set to true, it indicates to RTI Connext that the filter expression is based only on key fields.

Parameters

the_key_only_filter	The value to set for key_only_filter

8.119.3.3 writer_side_filter_optimization() [1/2]

```
bool rti::topic::ExpressionProperty::writer_side_filter_optimization ( ) const  [inline]
```

Get the value of writer_side_filter_optimization.

See also

writer_side_filter_optimization(bool the_writer_side_filter_optimization) (p. 1549)

8.119.3.4 writer_side_filter_optimization() [2/2]

```
ExpressionProperty & rti::topic::ExpressionProperty::writer_side_filter_optimization (
            bool the_writer_side_filter_optimization )  [inline]
```

Set the value for writer_side_filter_optimization, indicating if the filter implementation can cache the filtering result for the provided expression.

When this field is set to true, RTI Connext will do no caching or explicit filter evaluation for the associated **dds::sub::↩ DataReader** (p. 976). Instead, it will rely on the filter implementation to provide appropriate results.

Parameters

the_writer_side_filter_optimization	The value to set for writer_side_filter_optimization

8.120 rti::topic::extensibility< TopicType > Struct Template Reference

<<***extension***>> *(p. 354)* Indicates the extensibility kind of a topic-type

`#include <rti/topic/TopicTraits.hpp>`

8.120.1 Detailed Description

template<typename TopicType>
struct rti::topic::extensibility< TopicType >

<<***extension***>> *(p. 354)* Indicates the extensibility kind of a topic-type

This trait type is specialized for **IDL-generated types** (p. 606) provide a member `kind` of type **dds::core::xtypes::ExtensibilityKind** (p. 633).

For example, given the following IDL type, **Foo** (p. 1588):

```
struct Foo {
    long x;
}; //@Extensibility MUTABLE_EXTENSIBILITY
```

You can obtain its extensility kind:

```
assert (rti::topic::extensibility<Foo>::kind
     == dds::core::xtypes::ExtensibilityKind::MUTABLE);
```

8.121 dds::core::xtypes::ExtensibilityKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) ExtensibilityKind.

`#include <Annotations.hpp>`

Public Types

- enum **type** {
  FINAL ,
  EXTENSIBLE ,
  MUTABLE }

8.121.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) ExtensibilityKind.

8.121.2 Member Enumeration Documentation

8.121.2.1 type

enum **dds::core::xtypes::ExtensibilityKind_def::type**

The underlying enum type

Enumerator

FINAL	Specifies that a type has FINAL extensibility. A type may be final, indicating that the range of its possible values is strictly defined. In particular, it is not possible to add elements to members of collection or aggregated types while maintaining type assignability. The following types are always final: • **dds::core::xtypes::TypeKind_def::ARRAY_TYPE** (p. 2573) • All primitive types
EXTENSIBLE	Specifies that a type has EXTENSIBLE extensibility. A type may be appendable (formerly called extensible), indicating that two types, where one contains all of the elements/members of the other plus additional elements/members appended to the end, may remain assignable.
MUTABLE	Specifies that a type has MUTABLE extensibility. A type may be mutable, indicating that two types may differ from one another in the additional, removal, and/or transposition of elements/members while remaining assignable. The following types are always mutable: • **dds::core::xtypes::TypeKind_def::SEQUENCE_TYPE** (p. 2573) • **dds::core::xtypes::TypeKind_def::STRING_TYPE** (p. 2574) • **dds::core::xtypes::TypeKind_def::WSTRING_TYPE** (p. 2574)

8.122 dds::core::external< T > Class Template Reference

A managed reference to an object.

`#include <dds/core/External.hpp>`

Public Types

- using **shared_ptr** = std::shared_ptr< T >

  The smart pointer that external<T> uses.

Public Member Functions

- **external** () OMG_NOEXCEPT

  Creates an empty shared object.
- **external** (T *p, bool locked=false)

  Creates a new shared object with the managed object `p`.
- **external** (**shared_ptr** p)

  Creates an `external` instance that shares the managed object and reference counting with an existing `shared_ptr`.
- **external** (const **external** &other)

  Creates a shared object from an existing shared object.
- ~**external** ()

  Destroys the managed object if this is the last shared object pointing to it.
- **external** & **operator=** (const **external** &other)

  Assigns another external, depending on the locked state.
- T & **operator*** () OMG_NOEXCEPT

  Obtains a reference to the managed object.
- const T & **operator*** () const OMG_NOEXCEPT

  Obtains a const reference to the managed object.
- T * **get** () OMG_NOEXCEPT

  Obtains a pointer to the managed object.
- const T * **get** () const OMG_NOEXCEPT

  Obtains a const pointer to the managed object.
- **shared_ptr** **get_shared_ptr** ()

  Obtains a `shared_ptr` to the managed object.
- T * **operator->** () OMG_NOEXCEPT

  Allows accessing members of the managed object.
- const T * **operator->** () const OMG_NOEXCEPT

  Allows accessing members of the managed object.
- bool **operator==** (const **external**< T > &other) const OMG_NOEXCEPT

  Returns whether two shared objects manage the same object or are both empty.
- bool **operator!=** (const **external**< T > &other) const

  Returns whether two shared objects do not manage the same object.
- RTI_EXPLICIT_CONVERSION **operator bool** () const OMG_NOEXCEPT

  Checks if there is a managed object (is not null) or not (is null)
- bool **is_locked** () const

  Indicates whether the managed object is locked or not.

Friends

- void **swap** (**external**< T > &a, **external**< T > &b) OMG_NOEXCEPT

  Swaps the managed objects and the locked state.

8.122.1 Detailed Description

template<**typename T**>
class dds::core::external< **T** >

A managed reference to an object.

Template Parameters

T	The type of the object this external<T> manages

Members of an **IDL** (p. 606) type marked with the @Shared or @external tag map to this C++ type. External members can share the same object when publishing different data samples. This can make more efficient the publication of large objects by saving extra copies.

This class behaves like a std::shared_ptr, except when the object is in "locked" state.

Objects of this class created with any of the constructors documented here behave like a std::shared_ptr<T>. Objects that the middleware returns in a LoanedSample (for example, from **dds::sub::DataReader::take** (p. 997)) are in a "locked" state and its contents can't be shared or modified. When assigning a sample with locked external members into another one where those members are not locked, the contents are copied, not shared. Modifying a locked object is not allowed. This special behavior prevents applications from corrupting loaned memory.

See also

Working with IDL types (p. 606)

8.122.2 Constructor & Destructor Documentation

8.122.2.1 external() [1/4]

```
template<typename T >
dds::core::external< T >::external ( )  [inline]
```

Creates an empty shared object.

8.122.2.2 external() [2/4]

```
template<typename T >
dds::core::external< T >::external (
            T * p,
            bool locked = false )  [inline]
```

Creates a new shared object with the managed object p.

Parameters

p	The pointer to manage
locked	Should always be false except in objects created internally by the middleware.

8.122.2.3 external() [3/4]

```
template<typename T >
dds::core::external< T >::external (
              shared_ptr p )  [inline]
```

Creates an external instance that shares the managed object and reference counting with an existing shared_ptr.

This constructor is implicit to allow the direct usage of shared_ptr.

For example:

```
shared_ptr<MyResource> resource(new MyResource);
// pass resource directly to a data-type with a my_resource external
// member whose setter expects an external<MyResource>.
sample1.my_resource(resource);
sample2.my_resource(resource);
// ...
writer.write(sample1);
writer.write(sample2);
```

8.122.2.4 external() [4/4]

```
template<typename T >
dds::core::external< T >::external (
             const  external< T > & other )  [inline]
```

Creates a shared object from an existing shared object.

In general, the new shared object shares ownership with other. Only if other.is_locked(), then the new shared object is allocated and its contents copied from other.

Postcondition

if !other.**is_locked()** (p. 1557), then *this == other. If other.is_locked, then *(*this) == *other but *this != other.

8.122.2.5 ~external()

```
template<typename T >
dds::core::external< T >::~ external ( )  [inline]
```

Destroys the managed object if this is the last shared object pointing to it.

8.122.3 Member Function Documentation

8.122.3.1 operator=()

```
template<typename T >
external &  dds::core::external< T >::operator= (
             const  external< T > & other )  [inline]
```

Assigns another external, depending on the locked state.

Depending on whether `this` or `other` are locked the behavior varies:

- If `this->`**is_locked()** (p. 1557) this operation throws **dds::core::PreconditionNotMet↩ Error** (p. 1941)
- If `other.is_locked()` it performs a deep copy of `*other`
- In any other case, after the assignment, `*this` and `other` share the same reference to the underlying object, that is, a `shared_ptr` assignment.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if this->**is_locked()** (p. 1557)

References **dds::core::external< T >::is_locked()**.

8.122.3.2 operator*() [1/2]

```
template<typename T >
T &  dds::core::external< T >::operator* ( )  [inline]
```

Obtains a reference to the managed object.

8.122.3.3 operator*() [2/2]

```
template<typename T >
const T &  dds::core::external< T >::operator* ( ) const  [inline]
```

Obtains a const reference to the managed object.

8.122.3.4 get() [1/2]

```
template<typename T >
T * dds::core::external< T >::get ( ) [inline]
```

Obtains a pointer to the managed object.

Warning

The returned pointer may become invalid if this is destroyed

8.122.3.5 get() [2/2]

```
template<typename T >
const T * dds::core::external< T >::get ( ) const [inline]
```

Obtains a const pointer to the managed object.

Warning

The returned pointer may become invalid if this is destroyed

8.122.3.6 get_shared_ptr()

```
template<typename T >
shared_ptr dds::core::external< T >::get_shared_ptr ( ) [inline]
```

Obtains a `shared_ptr` to the managed object.

The returned shared_ptr shares the same reference count.

Exceptions

dds::core::IllegalOperationError *(p. 1608)*	if **`is_locked()`** (p. 1557).

8.122.3.7 operator->() [1/2]

```
template<typename T >
T * dds::core::external< T >::operator-> ( ) [inline]
```

Allows accessing members of the managed object.

8.122.3.8 operator->() [2/2]

```
template<typename T >
const T *  dds::core::external< T >::operator-> ( ) const  [inline]
```

Allows accessing members of the managed object.

8.122.3.9 operator==()

```
template<typename T >
bool  dds::core::external< T >::operator== (
            const  external< T > & other ) const  [inline]
```

Returns whether two shared objects manage the same object or are both empty.

8.122.3.10 operator"!=()

```
template<typename T >
bool  dds::core::external< T >::operator!= (
            const  external< T > & other ) const  [inline]
```

Returns whether two shared objects do not manage the same object.

8.122.3.11 operator bool()

```
template<typename T >
RTI_EXPLICIT_CONVERSION  dds::core::external< T >::operator bool ( ) const  [inline]
```

Checks if there is a managed object (is not null) or not (is null)

8.122.3.12 is_locked()

```
template<typename T >
bool  dds::core::external< T >::is_locked ( ) const  [inline]
```

Indicates whether the managed object is locked or not.

Referenced by **dds::core::external< T >::operator=()**.

8.122.4 Friends And Related Function Documentation

8.122.4.1 swap

```
template<typename T >
void swap (
              external< T > & a,
              external< T > & b )  [friend]
```

Swaps the managed objects and the locked state.

8.123 dds::topic::Filter Class Reference

Defines the filter to create a **ContentFilteredTopic** (p. 954).

```
#include <dds/topic/Filter.hpp>
```

Public Member Functions

- **Filter** (const std::string &filter_expression)

  Creates a filter with a expression with no parameters.
- template<typename FwdIterator >
  Filter (const std::string &filter_expression, const FwdIterator &params_begin, const FwdIterator &params_end)

  Creates a filter with an expression that contains parameters.
- **Filter** (const std::string &query_expression, const std::vector< std::string > &params)

  Creates a filter with an expression that contains parameters.
- const std::string & **expression** () const

  Gets the filter expression.
- const_iterator **begin** () const

  Provides the begin iterator to the parameter list.
- const_iterator **end** () const

  The end iterator to the parameter list.
- iterator **begin** ()

Provides the begin iterator to the parameter list.

- iterator **end** ()

  The end iterator to the parameter list.

- template<typename FwdITerator >
  Filter & **parameters** (const FwdITerator &the_begin, const FwdITerator the_end)

  Modifies the parameters.

- **Filter** & **add_parameter** (const std::string &param)

  Appends a parameter.

- size_t **parameters_length** () const

  Gets the number of parameters.

- std::string **name** () const

  <<***extension***>> (p. *354) Gets the filter name*

- **dds::topic::Filter** & **name** (const std::string &the_name)

  <<***extension***>> (p. *354) Sets a filter name*

8.123.1 Detailed Description

Defines the filter to create a **ContentFilteredTopic** (p. 954).

Contains the filter expression and optionally the expression parameters. It also contains the filter name, which allows selecting the filter class to use–by default it's the built-in SQL filter.

8.123.2 Constructor & Destructor Documentation

8.123.2.1 Filter() [1/3]

```
dds::topic::Filter::Filter (
            const std::string & filter_expression )  [inline]
```

Creates a filter with a expression with no parameters.

See also

Queries and Filters Syntax (p. 84)

8.123.2.2 Filter() [2/3]

```
template<typename FwdIterator >
dds::topic::Filter::Filter (
            const std::string & filter_expression,
            const FwdIterator & params_begin,
            const FwdIterator & params_end )  [inline]
```

Creates a filter with an expression that contains parameters.

Template Parameters

FwdIterator	A forwar iterator whose value type is std::string (or convertible to)

Parameters

filter_expression	The filter expression
params_begin	The beginning of the range of expression parameters
params_end	The end of the range (the number of parameter to create a **ContentFilteredTopic** (p. 954) can't exceed 100)

See also

Queries and Filters Syntax (p. 84)

8.123.2.3 Filter() [3/3]

```
dds::topic::Filter::Filter (
            const std::string & query_expression,
            const std::vector< std::string > & params )  [inline]
```

Creates a filter with an expression that contains parameters.

Parameters

query_expression	The query expression
params	The expression parameters (the number of parameter to create a **ContentFilteredTopic** (p. 954) can't exceed 100)

See also

Queries and Filters Syntax (p. 84)

8.123.3 Member Function Documentation

8.123.3.1 expression()

```
const std::string & dds::topic::Filter::expression ( ) const  [inline]
```

Gets the filter expression.

8.123.3.2 begin() [1/2]

```
const_iterator dds::topic::Filter::begin ( ) const  [inline]
```

Provides the begin iterator to the parameter list.

8.123.3.3 end() [1/2]

```
const_iterator dds::topic::Filter::end ( ) const  [inline]
```

The end iterator to the parameter list.

8.123.3.4 begin() [2/2]

```
iterator dds::topic::Filter::begin ( )  [inline]
```

Provides the begin iterator to the parameter list.

8.123.3.5 end() [2/2]

```
iterator dds::topic::Filter::end ( )  [inline]
```

The end iterator to the parameter list.

8.123.3.6 parameters()

```
template<typename FwdITerator >
Filter & dds::topic::Filter::parameters (
            const FwdITerator & the_begin,
            const FwdITerator the_end )  [inline]
```

Modifies the parameters.

8.123.3.7 add_parameter()

```
Filter & dds::topic::Filter::add_parameter (
            const std::string & param )  [inline]
```

Appends a parameter.

8.123.3.8 parameters_length()

```
size_t dds::topic::Filter::parameters_length ( ) const  [inline]
```

Gets the number of parameters.

8.123.3.9 name() [1/2]

```
std::string name ( ) const
```

<<***extension***>> *(*p. *354)* Gets the filter name

Returns

The name of the filter, or an empty string when using the default SQL filter.

8.123.3.10 name() [2/2]

```
dds::topic::Filter & name (
            const std::string & the_name )
```

<<***extension***>> *(*p. *354)* Sets a filter name

You can use one of the built-in filters (**rti::topic::sql_filter_name** (p. 49) and **rti::topic::stringmatch_filter_name** (p. 49)), or a custom filter, which you need to register using **dds::domain::DomainParticipant::register_contentfilter()** (p. 1349).

[default] Empty string (equivalent to **rti::topic::sql_filter_name** (p. 49))

8.124 rti::topic::FilterSampleInfo Class Reference

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Provides meta information associated with the sample.

```
#include <rti/topic/FilterSampleInfo.hpp>
```

Public Member Functions

- **rti::core::SampleIdentity related_sample_identity** () const
  Get the related sample identity of the sample being filtered.
- **rti::core::Guid related_source_guid** () const
  Get the related source GUID of the sample being filtered.
- **rti::core::Guid related_reader_guid** () const
  Get the related reader GUID of the sample being filtered.
- **rti::core::SampleIdentity sample_identity** () const
  Get the sample identity of the sample being filtered.
- **rti::core::Guid source_guid** () const
  Get the source GUID of the sample being filtered.
- int32_t **priority** () const
  Get the priority of the sample being filtered.

8.124.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Provides meta information associated with the sample.

This can be used by a content filter to perform filtering on meta data.

8.124.2 Member Function Documentation

8.124.2.1 related_sample_identity()

```
rti::core::SampleIdentity rti::topic::FilterSampleInfo::related_sample_identity ( ) const  [inline]
```

Get the related sample identity of the sample being filtered.

The value of this field identifies another sample that is logically related to the one that is written. For example, the **dds::pub::DataWriter** (p. 1138) created by a Replier uses this field to associate the identity of the request sample with a response sample.

The related_sample_identity can be set using the field **rti::pub::WriteParams::related_sample_identity** (p. 2646) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

Default value **rti::core::SampleIdentity::unknown()** (p. 2284) denotes a sample not associated with any other sample.

A **dds::sub::DataReader** (p. 976) can inspect the related sample identity of a received sample by accessing the fields **dds::sub::SampleInfo::related_original_publication_virtual_guid** (p. 2292) and **dds::sub::SampleInfo::related_↩ original_publication_virtual_sequence_number** (p. 2292).

8.124.2.2 related_source_guid()

```
rti::core::Guid rti::topic::FilterSampleInfo::related_source_guid ( ) const  [inline]
```

Get the related source GUID of the sample being filtered.

The related_source_guid can be set by using the field **rti::pub::WriteParams::related_source_guid** (p. 2651) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

Default value **rti::core::Guid::unknown()** (p. 1597) denotes a sample as lacking a related data source.

A **dds::sub::DataReader** (p. 976) can inspect the related_source_guid of a received sample by accessing the field **dds::sub::SampleInfo::related_source_guid** (p. 2294).

8.124.2.3 related_reader_guid()

```
rti::core::Guid rti::topic::FilterSampleInfo::related_reader_guid ( ) const  [inline]
```

Get the related reader GUID of the sample being filtered.

The related_reader_guid can be set by using the field **rti::pub::WriteParams::related_reader_guid** (p. 2651) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

Default value **rti::core::Guid::unknown()** (p. 1597) denotes a sample without an associated DataReader.

A **dds::sub::DataReader** (p. 976) can inspect the related_reader_guid of a received sample by accessing the field **dds::sub::SampleInfo::related_source_guid** (p. 2294).

8.124.2.4 sample_identity()

```
rti::core::SampleIdentity rti::topic::FilterSampleInfo::sample_identity ( ) const  [inline]
```

Get the sample identity of the sample being filtered.

The value of this field uniquely identifies a sample within its source DataWriter.

The identity of a sample can be set by using the field **rti::pub::WriteParams::identity** (p. 2646) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

Default value **rti::core::SampleIdentity::unknown()** (p. 2284) can be used to let the DataWriter assign a default identity to a sample. In this case, sample_identity.writer_guid will be set to the GUID of the DataWriter, while sample_identity.↩ sequence_number will be set to the next sequence number to be written by the DataWriter.

A **dds::sub::DataReader** (p. 976) can inspect the identity of a received sample by accessing the fields **dds↩ ::sub::SampleInfo::original_publication_virtual_guid** (p. 2291) and **dds::sub::SampleInfo::original_publication↩ _virtual_sequence_number** (p. 2291).

8.124.2.5 source_guid()

```
rti::core::Guid rti::topic::FilterSampleInfo::source_guid ( ) const  [inline]
```

Get the source GUID of the sample being filtered.

The source_guid can be set by using the field **rti::pub::WriteParams::source_guid** (p. 2650) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

Default value **rti::core::Guid::unknown()** (p. 1597) denotes a sample without a logical data source associated with it.

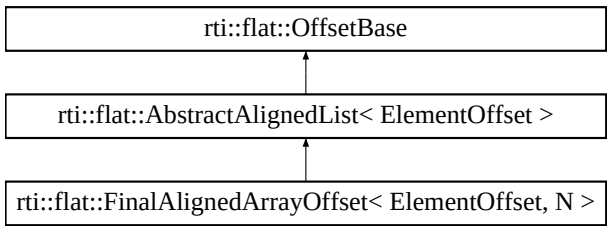
A **dds::sub::DataReader** (p. 976) can inspect the logical data source of a sample by accessing the field **dds::sub::SampleInfo::source_guid** (p. 2293).

8.124.2.6 priority()

```
int32_t rti::topic::FilterSampleInfo::priority ( ) const  [inline]
```

Get the priority of the sample being filtered.

To use publication priorities, the **rti::core::policy::PublishMode** (p. 2013) must be set for asynchronous publishing and the **dds::pub::DataWriter** (p. 1138) must use a **rti::pub::FlowController** (p. 1572) with a FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST



For Multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

8.125 rti::flat::FinalAlignedArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of final elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::FinalAlignedArrayOffset< ElementOffset, N >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)

  Gets the Offset to an element.

Additional Inherited Members

8.125.1 Detailed Description

template<typename ElementOffset, unsigned int N>
class rti::flat::FinalAlignedArrayOffset< ElementOffset, N >

Offset to an array of final elements.

Template Parameters

ElementOffset	A final struct Offset, such as **MyFlatFinalOffset** (p. 1759).
N	The array bound. For multidimensional arrays, `N` is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

The following code shows how to use a **FinalAlignedArrayOffset** (p. 1565) to initialize an array member with **MyFlat↩ MutableBuilder** (p. 1763):

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto array_offset = builder.add_my_final_array();
for (MyFlatFinalOffset element_offset : array_offset) {
    element_offset.my_primitive(3);
    // ...
}
// Or access an element directly:
auto element_offset = array_offset.get_element(3);
element_offset.my_primitive(3);
```

A more efficient way to access a final array, provided it complies with the required preconditions, is through **rti::flat↩ ::plain_cast()** (p. 417).

FinalArrayOffset (p. 1567) and **FinalAlignedArrayOffset** (p. 1565) provide the same interface, but have different implementation details. **FinalArrayOffset** (p. 1567) is used when the array member is part of a final type too, whereas **FinalAlignedArrayOffset** (p. 1565) corresponds to an array inside a mutable type.

A **FinalAlignedArrayOffset** (p. 1565) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 417)).

See also

MutableArrayOffset (p. 1755) encapsulates arrays of variable-size elements

8.125.2 Member Function Documentation

8.125.2.1 get_element()

```
template<typename ElementOffset , unsigned int N>
ElementOffset  rti::flat::FinalAlignedArrayOffset< ElementOffset, N >::get_element (
            unsigned int i )  [inline]
```

Gets the Offset to an element.

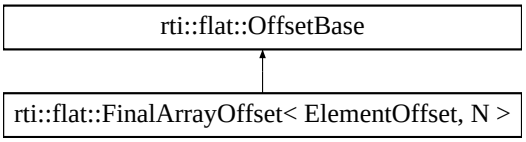
Parameters

i	The zero-based index to the element

Returns

The Offset to the element in the i-th position

See also



rti::flat::plain_cast() (p. 417) for a method to access **all** (p. 699) the elements at once

8.126 rti::flat::FinalArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of final elements.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::FinalArrayOffset< ElementOffset, N >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)

  Gets the Offset to an element.

8.126.1 Detailed Description

template<typename ElementOffset, unsigned int N>
class rti::flat::FinalArrayOffset< ElementOffset, N >

Offset to an array of final elements.

Template Parameters

ElementOffset	A final struct Offset, such as **MyFlatFinalOffset** (p. 1759).
N	The array bound. For multidimensional arrays, N is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

FinalArrayOffset (p. 1567) and **FinalAlignedArrayOffset** (p. 1565) provide the same interface, but have different implementation details. **FinalArrayOffset** (p. 1567) is used when the array member is part of a final type too, whereas **FinalAlignedArrayOffset** (p. 1565) corresponds to an array inside a mutable type.

A **FinalArrayOffset** (p. 1567) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 417)).

8.126.2 Member Function Documentation

8.126.2.1 get_element()

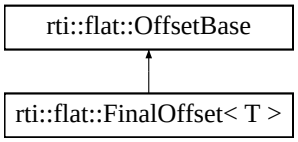
```
template<typename ElementOffset , unsigned int N>
ElementOffset  rti::flat::FinalArrayOffset< ElementOffset, N >::get_element (
             unsigned int i )  [inline]
```

Gets the Offset to an element.

Parameters

i	The zero-based index to the element

Returns



The Offset to the element in the i-th position

8.127 rti::flat::FinalOffset< T > Class Template Reference

The base class of all Offsets to a final struct type.

```
#include <Offset.hpp>
```

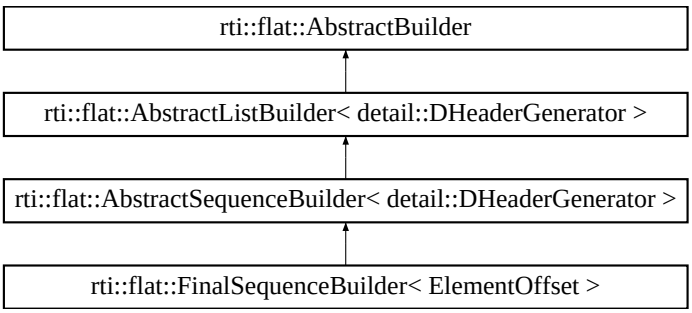
Inheritance diagram for rti::flat::FinalOffset< T >:

Additional Inherited Members

8.127.1 Detailed Description

template<typename T>
class rti::flat::FinalOffset< T >

The base class of all Offsets to a final struct type.



This class contains only implementation details; all the public accessors are defined in the generated type (**MyFlat↩ FinalOffset** (p. 1759)).

8.128 rti::flat::FinalSequenceBuilder< ElementOffset > Class Template Reference

Builds a sequence member of fixed-size elements.

`#include <SequenceBuilders.hpp>`

Inheritance diagram for rti::flat::FinalSequenceBuilder< ElementOffset >:

Public Member Functions

- ElementOffset **add_next** ()
  Adds the next element.
- **FinalSequenceBuilder** & **add_n** (unsigned int count)
  Adds a number of elements at once.
- **Offset finish** ()
  Finishes building the sequence.

Additional Inherited Members

8.128.1 Detailed Description

template<typename ElementOffset>
class rti::flat::FinalSequenceBuilder< ElementOffset >

Builds a sequence member of fixed-size elements.

Template Parameters

ElementOffset	The Offset type for the elements of the sequence

To add an element, call **add_next()** (p. 1570) and use the ElementOffset it returns to initialize the element's values. An empty sequence can be built by calling **finish()** (p. 1570) without any call to **add_next()** (p. 1570).

This class doesn't enforce the sequence bound set in IDL.

The following example uses a **FinalSequenceBuilder** (p. 1569) to initialize a sequence member of **MyFlatMutable↩ Builder** (p. 1763) with two elements:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto seq_builder = builder.build_my_final_seq();
MyFlatFinalOffset element = seq_builder.add_next();
element.my_primitive(1);
// ... continue initializing the first element
element = seq_builder.add_next();
element.my_primitive(2);
// ... continue initializing the second element

seq_builder.finish();
```

If the element type meets certain requirements, **rti::flat::plain_cast()** (p. 417) provides a more efficient way to initialize a sequence of final elements.

8.128.2 Member Function Documentation

8.128.2.1 add_next()

```
template<typename ElementOffset >
ElementOffset  rti::flat::FinalSequenceBuilder< ElementOffset >::add_next ( )  [inline]
```

Adds the next element.

Returns

The Offset that can be used to set the element values

8.128.2.2 add_n()

```
template<typename ElementOffset >
FinalSequenceBuilder &  rti::flat::FinalSequenceBuilder< ElementOffset >::add_n (
            unsigned int count )  [inline]
```

Adds a number of elements at once.

This is an alternative to **add_next()** (p. 1570).

To initialize the elements, call **finish()** (p. 1570) and use the Offset it returns to access the elements.

8.128.2.3 finish()

```
template<typename ElementOffset >
Offset rti::flat::FinalSequenceBuilder< ElementOffset >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

discard() (p. 784)

8.129 rti::flat::flat_type_traits< T > Struct Template Reference

Given a **Sample** (p. 2274), an Offset or a Builder, it allows obtaining the other types.

8.129.1 Detailed Description

template<typename T>
struct rti::flat::flat_type_traits< T >

Given a **Sample** (p. 2274), an Offset or a Builder, it allows obtaining the other types.

Template Parameters

T	One of the following: • A **Sample** (p. 2274) type, such as **MyFlatMutable** (p. 413) • An Offset type, such as **MyFlatMutableOffset** (p. 1770) • A Builder type, such as **MyFlatMutableBuilder** (p. 1763)

Given `T`, this type provides the following typedefs:

- `flat_type_traits<T>::offset`, T's related offset type (undefined if T itself is an Offset)
- `flat_type_traits<T>::builder`, T's related builder type (undefined if T itself is a Builder, or the topic-type is not mutable)
- `flat_type_traits<T>::flat_type`, T's related **Sample** (p. 2274) type (undefined if T itself is a **Sample** (p. 2274) type)

- `flat_type_traits<T>::plain_type`, T's equivalent definition as a plain (non-FlatData) type.

For example, for `T` = **MyFlatMutable** (p. 413), **flat_type_traits** (p. 1571) is defined as follows:

```
template <>
 struct flat_type_traits<MyFlatMutable> {
     typedef MyFlatMutablePlainHelper plain_type;
     typedef MyFlatMutableOffset offset;
     typedef MyFlatMutableBuilder builder;
 };
```

Or if `T` = **MyFlatMutableOffset** (p. 1770):

```
template <>
struct flat_type_traits<MyFlatMutableOffset> {
      typedef MyFlatMutable flat_type;
      typedef MyFlatMutablePlainHelper plain_type;
      typedef MyFlatMutableBuilder builder;
};
```

rti::flat::plain_cast() (p. 417)

8.130 rti::pub::FlowController Class Reference

*<<**extension**>> (p. 354) <<**reference-type**>> (p. 351)* A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 1138) instances are allowed to write data.

`#include <FlowController.hpp>`

Inheritance diagram for rti::pub::FlowController:

Public Member Functions

- **FlowController** (**dds::domain::DomainParticipant** the_participant, const std::string &the_name, const **FlowControllerProperty** &the_property= **FlowControllerProperty**())

  *Creates a **FlowController** (p. 1572) with specific properties.*
- std::string **name** () const

  *Gets the name of this **FlowController** (p. 1572).*
- **dds::domain::DomainParticipant participant** () const

  *Gets the participant associated to this **FlowController** (p. 1572).*
- **FlowControllerProperty property** () const

  *Gets the configuration of this **FlowController** (p. 1572).*
- void **property** (const **FlowControllerProperty** &prop) const

  *Gets the configuration of this **FlowController** (p. 1572).*

- void **trigger_flow** ()

  *Provides an external way to trigger a **FlowController** (p. 1572).*
- void **retain** ()

  Disables the automatic destruction of this object.
- void **close** ()

  Manually destroys this object.
- bool **closed** () const

  *Returns true if this **FlowController** (p. 1572) has been closed.*

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE const std::string **DEFAULT_NAME**

  *Name that identifies the built-in default **FlowController** (p. 1572).*
- static OMG_DDS_API_CLASS_VARIABLE const std::string **FIXED_RATE_NAME**

  *Name that identifies the built-in fixed-rate **FlowController** (p. 1572).*
- static OMG_DDS_API_CLASS_VARIABLE const std::string **ON_DEMAND_NAME**

  *Name that identifies the built-in on-demand **FlowController** (p. 1572).*

Related Functions

(Note that these are not member functions.)

- **FlowController find_flow_controller** (**dds::domain::DomainParticipant participant**, const std::string & **name**)

  *Retrieves an existing **FlowController** (p. 1572).*

8.130.1 Detailed Description

*<<**extension**>> (p. 354) <<**reference-type**>> (p. 351)* A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 1138) instances are allowed to write data.

Note

A **FlowController** (p. 1572) provides all the functions of a *<<**reference-type**>> (p. 351)*, including **close()** (p. 1576) and **retain()** (p. 1576).

8.130.2 Constructor & Destructor Documentation

8.130.2.1 FlowController()

```
rti::pub::FlowController::FlowController (
              dds::domain::DomainParticipant the_participant,
             const std::string & the_name,
             const  FlowControllerProperty & the_property =  FlowControllerProperty() )  [inline]
```

Creates a **FlowController** (p. 1572) with specific properties.

Parameters

the_participant	The DomainParticipant where this **FlowController** (p. 1572) exists
the_name	Name to refer to this **FlowController** (p. 1572)
the_property	Determines how to shape the network traffic

The created **rti::pub::FlowController** (p. 1572) is associated with a **dds::pub::DataWriter** (p. 1138) via **rti::core↩ ::policy::PublishMode::flow_controller_name** (p. 2016). A single **FlowController** (p. 1572) may service multiple DataWriters instances, even if they belong to a different **dds::pub::Publisher** (p. 1993). The `property` determines how the **FlowController** (p. 1572) shapes the network traffic.

Precondition

The specified `property` must be consistent, or the operation will fail and no **rti::pub::FlowController** (p. 1572) will be created.

See also

rti::pub::FlowControllerProperty (p. 1577) for rules on consistency among **property** (p. 1574)

8.130.3 Member Function Documentation

8.130.3.1 name()

```
std::string rti::pub::FlowController::name ( ) const  [inline]
```

Gets the name of this **FlowController** (p. 1572).

8.130.3.2 participant()

```
dds::domain::DomainParticipant rti::pub::FlowController::participant ( ) const  [inline]
```

Gets the participant associated to this **FlowController** (p. 1572).

8.130.3.3 property() [1/2]

```
FlowControllerProperty rti::pub::FlowController::property ( ) const  [inline]
```

Gets the configuration of this **FlowController** (p. 1572).

8.130.3.4 property() [2/2]

```
void rti::pub::FlowController::property (
            const  FlowControllerProperty & prop ) const  [inline]
```

Gets the configuration of this **FlowController** (p. 1572).

This operation modifies the property of the **rti::pub::FlowController** (p. 1572).

Once a **rti::pub::FlowController** (p. 1572) has been instantiated, only the **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) can be changed. The **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) is immutable.

A new **FlowControllerTokenBucketProperty::period** (p. 1587) only takes effect at the next scheduled token distribution time (as determined by its previous value).

Parameters

prop	<<***in***>> *(p. 355)* The new **rti::pub::FlowControllerProperty** (p. 1577). Property must be consistent. Immutable fields cannot be changed after **rti::pub::FlowController** (p. 1572) has been created.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::ImmutablePolicyError** (p. 1609), or **dds::core::InconsistentPolicyError** (p. 1610).

See also

rti::pub::FlowControllerProperty (p. 1577) for rules on consistency among **property** (p. 1574) values.

8.130.3.5 trigger_flow()

```
void rti::pub::FlowController::trigger_flow ( )  [inline]
```

Provides an external way to trigger a **FlowController** (p. 1572).

Typically, a **rti::pub::FlowController** (p. 1572) uses an internal trigger to periodically replenish its tokens. The period by which this trigger is called is determined by the **FlowControllerTokenBucketProperty::period** (p. 1587) property setting.

This function provides an additional, external trigger to the **rti::pub::FlowController** (p. 1572). This trigger adds **FlowControllerTokenBucketProperty::tokens_added_per_period** (p. 1585) tokens each time it is called (subject to the other property settings of the **rti::pub::FlowController** (p. 1572)).

An *on-demand* **rti::pub::FlowController** (p. 1572) can be created with a **dds::core::Duration::infinite()** (p. 1451) as **FlowControllerTokenBucketProperty::period** (p. 1587), in which case the only trigger source is external (i.e. the **FlowController** (p. 1572) is solely triggered by the user on demand).

rti::pub::FlowController::trigger_flow (p. 1575) can be called on both strict *on-demand* **FlowController** (p. 1572) and hybrid **FlowController** (p. 1572) (internally and externally triggered).

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.130.3.6 retain()

```
void rti::pub::FlowController::retain ( )  [inline]
```

Disables the automatic destruction of this object.

Disables the automatic destruction of the underlying **FlowController** (p. 1572) when when there are no more references to it. After that it can be looked up using **rti::pub::find_flow_controller** (p. 750)

To delete a retained object, manually call **close()** (p. 1576)

8.130.3.7 close()

```
void rti::pub::FlowController::close ( )  [inline]
```

Manually destroys this object.

Destroys the object referenced by this **FlowController** (p. 1572) reference.

After closing it, any calls to this object through this or other references throw **dds::core::AlreadyClosedError** (p. 806).

See also

retain() (p. 1576)

8.130.3.8 closed()

```
bool rti::pub::FlowController::closed ( ) const  [inline]
```

Returns true if this **FlowController** (p. 1572) has been closed.

The **FlowController** (p. 1572) may have been closed either by calling **close()** (p. 1576) or by closing the related DomainParticipant.

8.130.4 Friends And Related Function Documentation

8.130.4.1 find_flow_controller()

```
FlowController find_flow_controller (
            dds::domain::DomainParticipant participant,
           const std::string & name )  [related]
```

Retrieves an existing **FlowController** (p. 1572).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Parameters

participant	The DomainParticipant associated to the **FlowController** (p. 1572)
name	The name used to create the **FlowController** (p. 1572) or the name of one of the built-in FlowControllers (**FlowController::DEFAULT_NAME** (p. 58), **FlowController::FIXED_RATE_NAME** (p. 59), **FlowController::ON_DEMAND_NAME** (p. 60))

Returns

The flow controller with that name in that participant or an empty reference (equals to **dds::core::null** (p. 438)) if it doesn't exist

8.131.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Configures a **FlowController** (p. 1572)

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **dds::pub::DataWriter** (p. 1138) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the **rti::pub::FlowController** (p. 1572), and do not depend on the number of **dds::pub::DataWriter** (p. 1138) instances the **rti::pub::FlowController** (p. 1572) is servicing. For instance, the specified flow rate does *not* double simply because two **dds::pub::DataWriter** (p. 1138) instances are waiting to write.

Entity:

rti::pub::FlowController (p. 1572)

Properties:

RxO (p. 514) = N/A

Changeable (p. 514) = **NO** (p. 514) for **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579), **YES** (p. 514) for **rti::pub::FlowControllerProperty::token_bucket** (p. 1579). However, the special value of **dds::core::Duration::infinite()** (p. 1451) as **FlowControllerTokenBucketProperty::period** (p. 1587) is strictly used to create an *on-demand* **rti::pub::FlowController** (p. 1572). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

8.131.2 Constructor & Destructor Documentation

8.131.2.1 FlowControllerProperty() [1/2]

```
rti::pub::FlowControllerProperty::FlowControllerProperty ( )  [inline]
```

Creates a **FlowControllerProperty** (p. 1577) with earliest-deadline-first scheduling policy and default token-bucket configuration.

8.131.2.2 FlowControllerProperty() [2/2]

```
rti::pub::FlowControllerProperty::FlowControllerProperty (

<<***extension***>> *(*p. *354)* Kinds of flow controller shceduling policy

`#include <FlowController.hpp>`

Public Types

- enum **type** {
  ROUND_ROBIN ,
  EARLIEST_DEADLINE_FIRST ,
  HIGHEST_PRIORITY_FIRST }

  The underlying `enum` *type.*

8.132.1 Detailed Description

<<***extension***>> *(*p. *354)* Kinds of flow controller shceduling policy

Samples written by an asynchronous **dds::pub::DataWriter** (p. 1138) are not sent in the context of the **dds::pub::↩ DataWriter::write()** (p. 1148) call. Instead, the middleware puts the samples in a queue for future processing. The **rti↩ ::pub::FlowController** (p. 1572) associated with each asynchronous DataWriter instance determines when the samples are actually sent.

Each **rti::pub::FlowController** (p. 1572) maintains a separate FIFO queue for each unique destination (remote application). Samples written by asynchronous **dds::pub::DataWriter** (p. 1138) instances associated with the flow controller, are placed in the queues that correspond to the intended destinations of the sample.

When tokens become available, a flow controller must decide which queue(s) to grant tokens first. This is determined by the flow controller's scheduling policy. Once a queue has been granted tokens, it is serviced by the asynchronous publishing thread. The queued up samples will be coalesced and sent to the corresponding destination. The number of samples sent depends on the data size and the number of tokens granted.

QoS:

rti::pub::FlowControllerProperty (p. 1577)

See also

rti::pub::FlowControllerSchedulingPolicy (p. 58) The safe enumeration for this **type** (p. 1581)

8.132.2 Member Enumeration Documentation

8.132.2.1 type

`enum` **rti::pub::FlowControllerSchedulingPolicy_def::type**

The underlying `enum` type.

Enumerator

ROUND_ROBIN	Indicates to flow control in a round-robin fashion. Whenever tokens become available, the flow controller distributes the tokens uniformly across all of its (non-empty) destination queues. No destinations are prioritized. Instead, all destinations are treated equally and are serviced in a round-robin fashion.
EARLIEST_DEADLINE_FIRST	Indicates to flow control in an earliest-deadline-first fashion. A sample's deadline is determined by the time it was written plus the latency budget of the DataWriter at the time of the write call (as specified in the **dds::core::policy::LatencyBudget** (p. 1631)). The relative priority of a flow controller's destination queue is determined by the earliest deadline across all samples it contains. When tokens become available, the **rti::pub::FlowController** (p. 1572) distributes tokens to the destination queues in order of their deadline priority. In other words, the queue containing the sample with the earliest deadline is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal deadline value, the corresponding destination queues are serviced in a round-robin fashion. Hence, under the default **dds::core::policy::LatencyBudget::duration** (p. 1633) setting, an `EDF_FLOW_CONTROLLER_SCHED_POLICY` **rti::pub::FlowController** (p. 1572) preserves the order in which the user calls **dds::pub::DataWriter::write()** (p. 1148) across the DataWriters associated with the flow controller. Since the **dds::core::policy::LatencyBudget** (p. 1631) is mutable, a sample written second may contain an earlier deadline than the sample written first if the **dds::core::policy::LatencyBudget::duration** (p. 1633) value is sufficiently decreased in between writing the two samples. In that case, if the first sample is not yet written (still in queue waiting for its turn), it inherits the priority corresponding to the (earlier) deadline from the second sample. In other words, the priority of a destination queue is always determined by the earliest deadline among all samples contained in the queue. This priority inheritance approach is required in order to both honor the updated **dds::core::policy::LatencyBudget::duration** (p. 1633) and adhere to the **dds::pub::DataWriter** (p. 1138) in-order data delivery guarantee. **[default]** for **dds::pub::DataWriter** (p. 1138)

Enumerator

HIGHEST_PRIORITY_FIRST	Indicates to flow control in a highest-priority-first fashion. Determines the next destination queue to service as determined by the publication priority of the **dds::pub::DataWriter** (p. 1138), channel of multi-channel DataWriter, or individual sample. The relative priority of a flow controller's destination queue is determined by the highest publication priority of all samples it contains. When tokens become available, the **rti::pub::FlowController** (p. 1572) distributes tokens to the destination queues in order of their publication priority. In other words, the queue containing the sample with the highest publication priority is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal publication priority, the corresponding destination queues are serviced in a round-robin fashion. This priority inheritance approach is required in order to both honor the designated publication priority and adhere to the **dds::pub::DataWriter** (p. 1138) in-order data delivery guarantee.

  Sets the maximum number of bytes allowed to send for each token available.

8.133.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Configures a **FlowController** (p. 1572) based on a tocken-bucket mechanism

rti::pub::FlowController (p. 1572) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same token(s). In other words, each token can only contribute to a single network packet.

Entity:

rti::pub::FlowController (p. 1572)

Properties:

RxO (p. 514) = N/A

Changeable (p. 514) = **YES** (p. 514). However, the special value of **dds::core::Duration::infinite()** (p. 1451) as **Flow↩ ControllerTokenBucketProperty::period** (p. 1587) is strictly used to create an *on-demand* **rti::pub::FlowController** (p. 1572). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

8.133.2 Constructor & Destructor Documentation

8.133.2.1 FlowControllerTokenBucketProperty()

```
rti::pub::FlowControllerTokenBucketProperty::FlowControllerTokenBucketProperty (
            int32_t max_tokens =  dds::core::LENGTH_UNLIMITED,
            int32_t tokens_added_per_period =  dds::core::LENGTH_UNLIMITED,
            int32_t tokens_leaked_per_period = 0,
            const  dds::core::Duration & period =  dds::core::Duration(1, 0),
            int32_t bytes_per_token =  dds::core::LENGTH_UNLIMITED )
```

Initializes the properties.

8.133.3 Member Function Documentation

8.133.3.1 max_tokens() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::max_tokens ( ) const
```

Gets the max_tokens.

See also

max_tokens(int32_t) (p. 1585)

8.133.3.2 max_tokens() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::max_tokens (
            int32_t value )
```

Sets the maximum number of tokens that can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **FlowControllerTokenBucketProperty::bytes_per_token** (p. 1587), determines the maximum allowable data burst.

Use **dds::core::LENGTH_UNLIMITED** (p. 438) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1,**dds::core::LENGTH_UNLIMITED** (p. 438)]

Returns

∗this

8.133.3.3 tokens_added_per_period() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::tokens_added_per_period ( ) const
```

Gets the tokens_added_per_period.

See also

tokens_added_per_period(int32_t) (p. 1586)

8.133.3.4 tokens_added_per_period() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::tokens_added_↩
per_period (
            int32_t value )
```

Sets the number of tokens added to the token bucket per specified period.

rti::pub::FlowController (p. 1572) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **dds::pub::DataWriter** (p. 1138) instances based on the **rti::pub::Flow↩ ControllerProperty::scheduling_policy** (p. 1579).

Use **dds::core::LENGTH_UNLIMITED** (p. 438) to add the maximum number of tokens allowed by **FlowController↩ TokenBucketProperty::max_tokens** (p. 1585).

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1,**dds::core::LENGTH_UNLIMITED** (p. 438)]

Returns

∗this

8.133.3.5 tokens_leaked_per_period() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::tokens_leaked_per_period ( ) const
```

Gets the tokens_leaked_per_period.

See also

tokens_leaked_per_period(int32_t) (p. 1586)

8.133.3.6 tokens_leaked_per_period() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::tokens_leaked_↩
per_period (
            int32_t value )
```

Sets the number of tokens removed from the token bucket per specified period.

rti::pub::FlowController (p. 1572) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **dds::core::LENGTH_UNLIMITED** (p. 438) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

[range] [0,**dds::core::LENGTH_UNLIMITED** (p. 438)]

Returns

∗this

8.133.3.7 period() [1/2]

```
dds::core::Duration rti::pub::FlowControllerTokenBucketProperty::period ( ) const
```

Gets the period.

See also

period(const dds::core::Duration&) (p. 1587)

8.133.3.8 period() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::period (
            const  dds::core::Duration & value )
```

Sets the period for adding tokens to and removing tokens from the bucket.

rti::pub::FlowController (p. 1572) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **dds::core::Duration::infinite()** (p. 1451) can be used to create an *on-demand* **rti::pub::Flow↩ Controller** (p. 1572), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **rti::pub::FlowController::trigger_flow** (p. 1575). This external trigger adds **FlowControllerTokenBucket↩ Property::tokens_added_per_period** (p. 1585) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [1 nanosec, 1 year] or **dds::core::Duration::infinite()** (p. 1451)

Returns

∗this

8.133.3.9 bytes_per_token() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::bytes_per_token ( ) const
```

Gets the bytes_per_token.

See also

bytes_per_token(int32_t) (p. 1588)

8.133.3.10 bytes_per_token() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::bytes_per_token
(
            int32_t value )
```

Sets the maximum number of bytes allowed to send for each token available.

rti::pub::FlowController (p. 1572) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each **dds::pub::DataWriter** (p. 1138). That is, in cases where **Flow↩ ControllerTokenBucketProperty::bytes_per_token** (p. 1587) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of **rti::pub::FlowControllerProperty::scheduling_↩ policy** (p. 1579)).

Where fragmentation is required, the fragment size will be **FlowControllerTokenBucketProperty::bytes_per_token** (p. 1587) or the minimum largest message size across all transports installed with the **dds::pub::DataWriter** (p. 1138), whichever is less.

Use **dds::core::LENGTH_UNLIMITED** (p. 438) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **dds::pub::DataWriter** (p. 1138) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1024,**dds::core::LENGTH_UNLIMITED** (p. 438)]

Returns

∗this

8.134 Foo Class Reference

An example topic-type.

8.134.1 Detailed Description

An example topic-type.

This API documentation uses the type **Foo** (p. 1588) as a hypothetical **IDL-generated** (p. 606) **topic-type** (p. 444) for many code examples.

It is also used as a synonym of the template parameter of classes like DataWriter<T>.

Examples

Foo.hpp, and **Foo.idl**.

dds::sub::GenerationCount::GenerationCount (
            int32_t disposed_count,
            int32_t no_writers_count )  [inline]
```

Create a **GenerationCount** (p. 1589) object with the provided disposed_count and no_writers count.

8.135.3 Member Function Documentation

8.135.3.1 disposed()

```
int32_t dds::sub::GenerationCount::disposed ( ) const  [inline]
```

Get the disposed generation count.

The disposed generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) to **dds::sub::status::InstanceState::alive()** (p. 1617). The counter is reset when the instance resource is reclaimed (removed from the **DataReader** (p. 976) cache).

See also

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 2287)
Interpretation of the SampleInfo counters and ranks (p. 2288)

8.135.3.2 no_writers()

```
int32_t dds::sub::GenerationCount::no_writers ( ) const  [inline]
```

Get the no_writers generation count.

The no writers generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) to **dds::sub::status::InstanceState::alive()** (p. 1617). The counter is reset when the instance resource is reclaimed (removed from the **DataReader** (p. 976) cache).

- **dds::core::ByteSeq** & **value** (**dds::core::ByteSeq** &dst) const

  *Sets the value for this **GroupData** (p. 1591).*
- const uint8_t * **begin** () const

  Beginning of the range of bytes.
- const uint8_t * **end** () const

  End of the range of bytes.

8.136.1 Detailed Description

Entity:

dds::pub::Publisher (p. 1993), **dds::sub::Subscriber** (p. 2410)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **YES** (p. 514)

See also

dds::sub::builtin_subscriber (p. 671)

8.136.2 Usage

The additional information is attached to a **dds::pub::Publisher** (p. 1993) or **dds::sub::Subscriber** (p. 2410). This extra data is not used by RTI Connext itself. When a remote application discovers the **dds::pub::Publisher** (p. 1993) or **dds::sub::Subscriber** (p. 2410), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the **dds::core::policy::TopicData** (p. 2500) and **dds::core::policy::UserData** (p. 2591), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with **dds::sub::DataReaderListener** (p. 1055), **dds::pub::DataWriterListener** (p. 1202) and operations such as **dds::pub::ignore** (p. 647) and **dds::sub::ignore** (p. 667), this QoS policy can help an application to define and enforce its own security policies. For example, an application can implement matching policies similar to those of the **dds::core::policy::Partition** (p. 1923), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **rti::core::policy::DomainParticipantResourceLimits::publisher_group_data_max_length** (p. 1415) and **rti↩ ::core::policy::DomainParticipantResourceLimits::subscriber_group_data_max_length** (p. 1415).

            OCTET_ITER the_begin,
            OCTET_ITER the_end )  [inline]
```

Sets the value for this **GroupData** (p. 1591).

8.136.4.2 value() [2/3]

```
const  dds::core::ByteSeq dds::core::policy::GroupData::value ( ) const  [inline]
```

Getter (see setter with the same name)

8.136.4.3 value() [3/3]

```
 dds::core::ByteSeq & dds::core::policy::GroupData::value (
             dds::core::ByteSeq & dst ) const  [inline]
```

Sets the value for this **GroupData** (p. 1591).

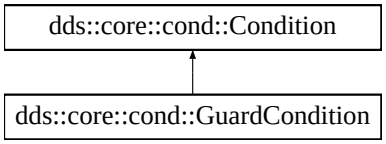
8.136.4.4 begin()

```
const uint8_t * dds::core::policy::GroupData::begin ( ) const  [inline]
```

Beginning of the range of bytes.

8.136.4.5 end()

```
const uint8_t * dds::core::policy::GroupData::end ( ) const  [inline]
```



End of the range of bytes.

8.137 dds::core::cond::GuardCondition Class Reference

<<***reference-type***>> *(p. 351)* A condition whose trigger value is under the control of the application.

`#include <dds/core/cond/GuardCondition.hpp>`

Inheritance diagram for dds::core::cond::GuardCondition:

Public Member Functions

- template<typename Functor >
  void **handler** (const Functor &func)

  Registers a custom handler with this condition.
- void **reset_handler** ()

  Resets the handler for this condition.
- void **trigger_value** (bool value)

  Manually sets the trigger value.

8.137.1 Detailed Description

<<***reference-type***>> *(p. 351)* A condition whose trigger value is under the control of the application.

The **dds::core::cond::GuardCondition** (p. 1594) provides a way for an application to manually wake up a **dds::core::cond::WaitSet** (p. 2617). This is accomplished by attaching the **dds::core::cond::GuardCondition** (p. 1594) to the **dds::core::cond::WaitSet** (p. 2617) and then setting the `trigger_value` by means of the **dds::core::cond::GuardCondition::trigger_value()** (p. 1595) operation.

See also

dds::core::cond::WaitSet (p. 2617)

8.137.2 Member Function Documentation

8.137.2.1 handler()

```
template<typename Functor >
void dds::core::cond::GuardCondition::handler (
             const Functor & func )  [inline]
```

Registers a custom handler with this condition.

For information about condition handlers, see **this ReadCondition constructor** (p. 2134)

Parameters

func	The handler to be registered with this condition. This argument is copied.

MT Safety:

It is not safe to call **handler()** (p. 1594) or **reset_handler()** (p. 1595) in parallel. It is not safe to call **handler()** (p. 1594) or **reset_handler()** (p. 1595) at the same time as **trigger_value()** (p. 1595). It is not safe to call **handler()** (p. 1594) or **reset_handler()** (p. 1595) while this condition is attached to a **WaitSet** (p. 2617) that is being dispatched.

8.137.2.2 reset_handler()

```
void dds::core::cond::GuardCondition::reset_handler ( )  [inline]
```

Resets the handler for this condition.

After the invocation of this method no handler will be registered with this condition.

MT Safety:

It is not safe to call **handler()** (p. 1594), **reset_handler()** (p. 1595) or **trigger_value()** (p. 1595) concurrently.

8.137.2.3 trigger_value()

```
void dds::core::cond::GuardCondition::trigger_value (
             bool value )  [inline]
```

Manually sets the trigger value.

Setting the trigger value to true causes the activation of the condition in a **WaitSet** (p. 2617).

MT Safety:

Safe in all situations except when **trigger_value()** (p. 1595) is called in parallel to **handler()** (p. 1594) or **reset_↩ handler()** (p. 1595).

  *Creates a **History** (p. 1602) with HistoryKind::KEEP_ALL.*
- static **History KeepLast** (uint32_t **depth**)
  *Creates a **History** (p. 1602) with HistoryKind::KEEP_LAST and the specified depth.*

8.140.1 Detailed Description

Specifies how much historical data a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976) can store.

This QoS policy specifies how much data must to stored by RTI Connext for a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976). It controls whether RTI Connext should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the **dds::pub::DataWriter** (p. 1138) on behalf of existing **dds::sub::DataReader** (p. 976) entities. The behavior with regards to a **dds::sub::DataReader** (p. 976) entities discovered after a sample is written is controlled by the **DURABILITY** (p. 529) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Connext.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

See also

dds::core::policy::Reliability (p. 2149)

dds::core::policy::History (p. 1602)

8.140.2 Usage

This policy controls the behavior of RTI Connext when the value of an instance changes before it is finally communicated to **dds::sub::DataReader** (p. 976) entities.

When a **dds::pub::DataWriter** (p. 1138) sends data, or a **dds::sub::DataReader** (p. 976) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with **dds::core::policy::Reliability** (p. 2149) by controlling whether RTI Connext guarantees that *all* of the sent data is received (**dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607)) or if only the last N data values sent are guaranteed to be received (**dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607))–this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **dds::core::policy::Durability** (p. 1433) to receive previously published data is controlled by **dds::core::policy::Durability::writer_depth** (p. 1439), not by the **History** (p. 1602) QoS policy.

Note that the **History** (p. 1602) QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **dds::core::policy::ResourceLimits** (p. 2203).

If `kind` is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607) (the default), then RTI Connext will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of `depth` regulates the maximum number of values (up to and including the most current one) RTI Connext will maintain and deliver until the samples are fully acknowledged. After N values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length *N*.

For keyed-data, there is different behavior on the publishing and subscribing sides associated with how invalid samples representing the disposal of or unregistration from an instance affect history.

On the publishing side, unregistering from or disposing of an instance creates an invalid sample that is accounted for in the history depth. This means that an invalid sample may replace a value that is currently being stored in the writer queue.

On the subscribing side, however, invalid samples do not count towards history depth and will not replace a value that is being stored in the reader queue.

On both the publishing and subscribing sides, there can only ever be one invalid sample per-instance and that one sample can be in different states depending on whether the instance has been disposed, unregistered, or both.

The default (and most common setting) for `depth` is 1, indicating that only the most recent value should be delivered.

If `kind` is **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607), then RTI Connext will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Connext can use to keep this history are limited by the settings of the **RESOURCE_LIMITS** (p. 546). If the limit is reached, then the behavior of RTI Connext will depend on the **RELIABILITY** (p. 544). If the **Reliability** (p. 2149) `kind` is **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157), then the old values will be discarded. If **Reliability** (p. 2149) `kind` is RELIABLE, then RTI Connext will block the **dds::pub::DataWriter** (p. 1138) until it can deliver the necessary old values to all subscribers.

8.140.3 Consistency

This QoS policy's `depth` must be consistent with the **RESOURCE_LIMITS** (p. 546) `max_samples_per_↩ instance`. For these two QoS to be consistent, they must verify that *depth <= max_samples_per_instance*.

8.140.5.4 depth() [2/2]

```
History & dds::core::policy::History::depth (
            int32_t the_depth )  [inline]
```

Sets the history depth.

<<***basic***>> *(*p. *104)* <<***spec***>> *(*p. *112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607)

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE_LIMITS** (p. 546) policy. That is:

depth <= **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207)

When the `kind` is **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607), the depth has no effect. Its implied value is `infinity` (in practice limited by the settings of the **RESOURCE_LIMITS** (p. 546) policy).

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the **dds::core::policy::Durability::writer_depth** (p. 1439), not this depth.

[default] 1

[range] [1,100 million], <= **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207)

Categories

Immutable (p. 243), **Applied Per-Instance** (p. 287), **Reliability** (p. 222), **Data Availability** (p. 167)

8.140.5.5 KeepAll()

```
static History dds::core::policy::History::KeepAll ( ) [inline], [static]
```

Creates a **History** (p. 1602) with HistoryKind::KEEP_ALL.

8.140.5.6 KeepLast()

```
static History dds::core::policy::History::KeepLast (
            uint32_t depth ) [inline], [static]
```

Creates a **History** (p. 1602) with HistoryKind::KEEP_LAST and the specified depth.

8.141 dds::core::policy::HistoryKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) HistoryKind.

`#include <PolicyKind.hpp>`

Public Types

- enum **type** {
  KEEP_LAST ,
  KEEP_ALL }
  The underlying `enum` type.

8.141.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) HistoryKind.

8.141.2 Member Enumeration Documentation

8.141.2.1 type

`enum` **dds::core::policy::HistoryKind_def::type**

The underlying `enum` type.

Enumerator

KEEP_LAST	**[default]** Keep the last `depth` samples. On the publishing side, RTI Connext will only attempt to keep the most recent `depth` samples of each instance of data (identified by its key) managed by the **dds::pub::DataWriter** (p. 1138). Invalid samples representing a disposal or unregistration of an instance count towards the depth and may replace other DDS samples currently in the DataWriter queue for the same instance. On the subscribing side, the **dds::sub::DataReader** (p. 976) will only attempt to keep the most recent `depth` samples received for each instance (identified by its key) until the application takes them via the **dds::sub::DataReader** (p. 976) 's **take() (**p. **1024)** operation. Invalid samples representing a disposal or unregistration of an instance do not count towards the history depth and will not replace other DDS samples currently in the DataReader queue for the same instance.
KEEP_ALL	Keep *all* the samples. On the publishing side, RTI Connext will attempt to keep all samples (representing each value written) of each instance of data (identified by its key) managed by the **dds::pub::DataWriter** (p. 1138) until they can be delivered to all subscribers. On the subscribing side, RTI Connext will attempt to keep all samples of each instance of data (identified by its key) managed by the **dds::sub::DataReader** (p. 976). These samples are kept until the application takes them from RTI Connext via the **take() (**p. **1024)** operation.

8.142 rti::core::policy::IgnoredEntityReplacementKind_def Struct Reference

<<***extension***>> *(*p. *354)* The enumeration for **DomainParticipantResourceLimits** (p. 1391) ignored entity replacement kinds

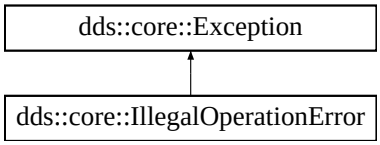
8.142.2 Member Enumeration Documentation

8.142.2.1 type

`enum` **rti::core::policy::IgnoredEntityReplacementKind_def::type**



The underlying `enum` type.

8.143 dds::core::IllegalOperationError Class Reference

Indicates that an operation was called under improper circumstances.

`#include <Exception.hpp>`

Inheritance diagram for dds::core::IllegalOperationError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **IllegalOperationError** (p. 1608) exception.*

8.143.1 Detailed Description

Indicates that an operation was called under improper circumstances.

Inherits also from `std::logic_error`

An operation was invoked on an inappropriate object or at an inappropriate time. This return code is similar to **dds::core::PreconditionNotMetError** (p. 1941), except that there is no precondition that could be changed to make the operation succeed.

8.143.2 Member Function Documentation

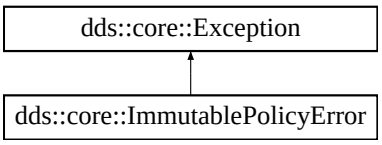
8.143.2.1 what()

```
virtual const char * dds::core::IllegalOperationError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **IllegalOperationError** (p. 1608) exception.

Returns

The message.



Implements **dds::core::Exception** (p. 1547).

8.144 dds::core::ImmutablePolicyError Class Reference

Indicates that the application attempted to modify an immutable QoS policy.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::ImmutablePolicyError:

Public Member Functions

- virtual const char * **what** () const throw ()
  *Access the message contained in this **ImmutablePolicyError** (p. 1609) exception.*

8.144.1 Detailed Description

Indicates that the application attempted to modify an immutable QoS policy.

Inherits also from `std::logic_error`

8.144.2 Member Function Documentation

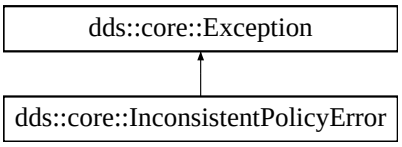
8.144.2.1 what()

```
virtual const char * dds::core::ImmutablePolicyError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **ImmutablePolicyError** (p. 1609) exception.

Returns

The message.



Implements **dds::core::Exception** (p. 1547).

8.145 dds::core::InconsistentPolicyError Class Reference

Indicates that the application specified a set of QoS policies that are not consistent with each other.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::InconsistentPolicyError:

Public Member Functions

- virtual const char * **what** () const throw ()
  *Access the message contained in this **NotEnabledError** (p. 1869) exception.*

8.145.1 Detailed Description

Indicates that the application specified a set of QoS policies that are not consistent with each other.

Inherits also from `std::logic_error`

8.145.2 Member Function Documentation

8.145.2.1 what()

```
virtual const char * dds::core::InconsistentPolicyError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **NotEnabledError** (p. 1869) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.146 dds::core::status::InconsistentTopicStatus Class Reference

Information about the status **dds::core::status::StatusMask::inconsistent_topic()** (p. 2379)

```
#include <TStatus.hpp>
```

Public Member Functions

- int32_t **total_count** () const

  *Total cumulative count of the pairs (**dds::sub::DataReader** (p. 976),**dds::pub::DataWriter** (p. 1138)) whose topic names match the **dds::topic::Topic** (p. 2474) to which this status is attached and whose types are inconsistent according to the rules defined in **dds::core::policy::TypeConsistencyEnforcement** (p. 2563).*
- int32_t **total_count_change** () const

  *The incremental number of inconsistent pairs (**dds::sub::DataReader** (p. 976),**dds::pub::DataWriter** (p. 1138)) for the **dds::topic::Topic** (p. 2474) to which this status is attached, that have been discovered since the last time this status was read.*

8.146.1 Detailed Description

Information about the status **dds::core::status::StatusMask::inconsistent_topic()** (p. 2379)

Entity:

dds::topic::Topic (p. 2474)

Listener:

TopicListener

Every time a **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) with the same **dds::topic::Topic** (p. 2474) do not match because the type-consistency enforcement policy fails, the inconsistent topic status is updated for the **dds::topic::Topic** (p. 2474).

See also

dds::core::policy::TypeConsistencyEnforcement (p. 2563)

8.146.2 Member Function Documentation

8.146.2.1 total_count()

```
int32_t dds::core::status::InconsistentTopicStatus::total_count ( ) const  [inline]
```

Total cumulative count of the pairs (**dds::sub::DataReader** (p. 976),**dds::pub::DataWriter** (p. 1138)) whose topic names match the **dds::topic::Topic** (p. 2474) to which this status is attached and whose types are inconsistent according to the rules defined in **dds::core::policy::TypeConsistencyEnforcement** (p. 2563).

8.146.2.2 total_count_change()

```
int32_t dds::core::status::InconsistentTopicStatus::total_count_change ( ) const  [inline]
```

The incremental number of inconsistent pairs (**dds::sub::DataReader** (p. 976),**dds::pub::DataWriter** (p. 1138)) for the **dds::topic::Topic** (p. 2474) to which this status is attached, that have been discovered since the last time this status was read.

8.147 dds::core::InstanceHandle Class Reference

<<***value-type***>> *(p. 350)* Handle to identify different instances of the same **dds::topic::Topic** (p. 2474) of a certain type.

```
#include <dds/core/InstanceHandle.hpp>
```

Public Member Functions

- **InstanceHandle** (const **dds::core::null_type** &null_handle)

  Create a nil instance handle.
- bool **operator==** (const **dds::core::null_type** &) const

  *Returns **is_nil()** (p. 1614)*
- bool **is_nil** () const

  *Check if this **InstanceHandle** (p. 1612) represents the nil **InstanceHandle** (p. 1612).*

Static Public Member Functions

- static **InstanceHandle** **nil** ()

  Returns the nil instance handle.

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator**<< (std::ostream &os, const **dds::core::InstanceHandle** &h)
  Prints an instance handle.

8.147.1 Detailed Description

<<***value-type***>> *(*p. *350)* Handle to identify different instances of the same **dds::topic::Topic** (p. 2474) of a certain type.

Handle to identify different instances of the same **dds::topic::Topic** (p. 2474) of a certain type.

  *Creates a not_alive_no_writers **InstanceState** (p. 1615) object.*
- static const **InstanceState** **not_alive_mask** ()
  *Creates an **InstanceState** (p. 1615) object representing any not alive state.*
- static const **InstanceState** **any** ()
  *Creates an **InstanceState** (p. 1615) object representing any instance state.*

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator<<** (std::ostream &os, const **InstanceState** &s)
  Prints an instance state as a readable string.

8.148.1 Detailed Description

Indicates if the samples are from a live **dds::pub::DataWriter** (p. 1138) or not.

For each instance, the middleware internally maintains an instance state. The instance state can be:

- **dds::sub::status::InstanceState::alive()** (p. 1617) indicates that (a) samples have been received for the instance, (b) there are live **dds::pub::DataWriter** (p. 1138) entities writing the instance, and (c) the instance has not been explicitly disposed (or else more samples have been received after it was disposed).

- **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) indicates the instance was explicitly disposed by a **dds::pub::DataWriter** (p. 1138) by means of the dispose operation.

- **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) indicates the instance has been declared as not-alive by the **dds::sub::DataReader** (p. 976) because it detected that there are no live **dds::pub::DataWriter** (p. 1138) entities writing that instance.

The precise behavior events that cause the instance state to change depends on the setting of the OWNERSHIP QoS:

- If **OWNERSHIP** (p. 538) is set to **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1906), then the instance state becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) only if the **dds::pub::DataWriter** (p. 1138) that "owns" the instance explicitly disposes it. The instance state becomes **dds::sub::status::InstanceState::alive()** (p. 1617) again only if the **dds::pub::DataWriter** (p. 1138) that owns the instance writes it.

- If **OWNERSHIP** (p. 538) is set to **dds::core::policy::OwnershipKind_def::SHARED** (p. 1906), then the instance state becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) if any **dds::pub::DataWriter** (p. 1138) explicitly disposes the instance. The instance state becomes **dds::sub::status::InstanceState::alive()** (p. 1617) as soon as any **dds::pub::DataWriter** (p. 1138) writes the instance again.

The instance state available in the **dds::sub::SampleInfo** (p. 2285) is a snapshot of the instance state of the instance at the time the collection was obtained (i.e. at the time read or take was called). The instance state is therefore the same for all samples in the returned collection that refer to the same instance.

For example, you can check if an instance is disposed as follows:

```
for (auto sample : reader.take()) {
    if (sample.info().state().instance_state() ==
            dds::sub::status::InstanceState::not_alive_disposed()) {
        // ...
    }
}
```

8.148.2 Member Typedef Documentation

8.148.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT >  dds::sub::status::InstanceState::MaskType
```

An std::bitset of InstanceStates.

8.148.3 Constructor & Destructor Documentation

8.148.3.1 InstanceState()

```
dds::sub::status::InstanceState::InstanceState (
            const  MaskType & other )  [inline]
```

Create an **InstanceState** (p. 1615) from MaskType.

Parameters

other	The MaskType to create the **InstanceState** (p. 1615) with

8.148.4 Member Function Documentation

8.148.4.1 alive()

```
static const  InstanceState dds::sub::status::InstanceState::alive ( )  [inline], [static]
```

Creates an alive **InstanceState** (p. 1615) object.

The instance is currently in existence.

Referenced by **dds::sub::status::DataState::any_data()**, **dds::sub::status::DataState::new_data()**, and **dds::sub::status::DataState::new_instance()**.

8.148.4.2 not_alive_disposed()

```
static const  InstanceState dds::sub::status::InstanceState::not_alive_disposed ( )  [inline],
[static]
```

Creates a not_alive_disposed **InstanceState** (p. 1615) object.

Indicates that the instance has been disposed by a DataWriter.

8.148.4.3 not_alive_no_writers()

```
static const  InstanceState dds::sub::status::InstanceState::not_alive_no_writers ( )  [inline],
[static]
```

Creates a not_alive_no_writers **InstanceState** (p. 1615) object.

Indicates that none of the DataWriters that are currently alive (according to the **dds::core::policy::Liveliness** (p. 1645) policy) are writing the instance.

8.148.4.4 not_alive_mask()

```
static const  InstanceState dds::sub::status::InstanceState::not_alive_mask ( )  [inline], [static]
```

Creates an **InstanceState** (p. 1615) object representing any not alive state.

This is equivalent to **not_alive_disposed()** (p. 1617) | **not_alive_no_writers()** (p. 1617)

8.148.4.5 any()

```
static const  InstanceState dds::sub::status::InstanceState::any ( )  [inline], [static]
```

Creates an **InstanceState** (p. 1615) object representing any instance state.

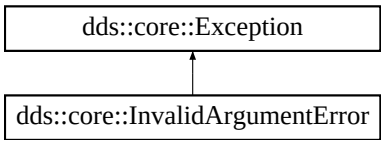
This is equivalent to **not_alive_mask()** (p. 1618) | **alive()** (p. 1617).

Referenced by **dds::sub::status::DataState::any()**.

8.148.5 Friends And Related Function Documentation

8.148.5.1 operator<<()

```
std::ostream & operator<< (
            std::ostream & os,
            const  InstanceState & s )  [related]
```



Prints an instance state as a readable string.

8.149 dds::core::InvalidArgumentError Class Reference

Indicates that the application passed an illegal parameter value into an operation.

`#include <Exception.hpp>`

Inheritance diagram for dds::core::InvalidArgumentError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **InvalidArgumentError** (p. 1619) exception.*

8.149.1 Detailed Description

Indicates that the application passed an illegal parameter value into an operation.

Inherits also from `std::invalid_argument`

8.149.2 Member Function Documentation

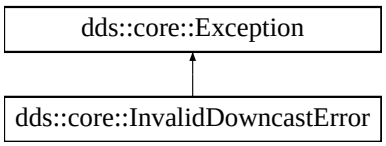
8.149.2.1 what()

```
virtual const char * dds::core::InvalidArgumentError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **InvalidArgumentError** (p. 1619) exception.

Returns

The message.



Implements **dds::core::Exception** (p. 1547).

8.150 dds::core::InvalidDowncastError Class Reference

Indicates that a downcast was incorrect.

`#include <Exception.hpp>`

Inheritance diagram for dds::core::InvalidDowncastError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **InvalidDowncastError** (p. 1620) exception.*

8.150.1 Detailed Description

Indicates that a downcast was incorrect.

Inherits also from `std::runtime_error`

See also

dds::core::polymorphic_cast (p. 620)

dds::pub::AnyDataWriter::get() (p. 819)

8.150.2 Member Function Documentation

8.150.2.1 what()

```
virtual const char * dds::core::InvalidDowncastError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **InvalidDowncastError** (p. 1620) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.151 rti::core::status::InvalidLocalAdvanceNoticeStatus Class Reference

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::invalid_local_advance_↩ notice()** (p. 2388)

`#include <Status.hpp>`

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **dds::core::Time expiration_time** () const
  The time when the local artifact will expire.
- unsigned int **expiration_code** () const
  The reason (a numeric code) for the local artifact to expire.
- const char * **expiration_message** () const
  *A descriptive message for the **rti::core::status::InvalidLocalAdvanceNoticeStatus::expiration_code** (p. 1621) code.*

8.151.1 Detailed Description

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::invalid_local_advance_↩ notice()** (p. 2388)

Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

8.151.2 Member Function Documentation

8.151.2.1 expiration_time()

```
dds::core::Time rti::core::status::InvalidLocalAdvanceNoticeStatus::expiration_time ( ) const
[inline]
```

The time when the local artifact will expire.

8.151.2.2 expiration_code()

```
unsigned int rti::core::status::InvalidLocalAdvanceNoticeStatus::expiration_code ( ) const  [inline]
```

The reason (a numeric code) for the local artifact to expire.

8.151.2.3 expiration_message()

```
const char * rti::core::status::InvalidLocalAdvanceNoticeStatus::expiration_message ( ) const
[inline]
```

A descriptive message for the **rti::core::status::InvalidLocalAdvanceNoticeStatus::expiration_code** (p. 1621) code.

8.152 dds::topic::is_topic_type< T > Struct Template Reference

Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2474).

```
#include <TopicTraits.hpp>
```

Inherits dds::core::false_type.

8.152.1 Detailed Description

template<typename T>
struct dds::topic::is_topic_type< T >

Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2474).

When a type T meets this requirement the is_topic_type<T> inherits from `dds::core::true_type` and defines a member constant `is_topic_type<T>::value` that is true. For all other types it inherits from `dds::core::false_type` and defines `value` to false.

Types **generated by rtiddsgen** (p. 606) (except for those annotated with `@nested`), **dds::core::xtypes::DynamicData** (p. 1461) and the **Builtin types** (p. 50) all meet this requirement.

Attempting to instantiate a dds::topic::Topic<Foo> if is_topic_type<Foo>::value is false results in a compilation error.

8.153 rti::request::IsReplyRelatedPredicate< T > Class Template Reference

Functor to match replies by their related request.

```
#include <util.hpp>
```

Public Member Functions

- **IsReplyRelatedPredicate** (const **rti::core::SampleIdentity** &related_request_id)
  Creates the predicate with the request id to match.
- bool **operator()** (**dds::sub::Sample**< T > sample)
  Determines if a reply is related to the request id this object contains.
- bool **operator()** (**rti::sub::LoanedSample**< T > sample)
  Determines if a reply is related to the request id this object contains.
- bool **operator()** (**dds::sub::SampleInfo** sample_info)
  Determines if a reply info is related to the request id this object contains.

8.153.1 Detailed Description

template<typename T>
class rti::request::IsReplyRelatedPredicate< T >

Functor to match replies by their related request.

Useful for C++ standard algorithms like `std::find_if()`

See also

Correlating requests and replies (p. 346)

8.153.2 Constructor & Destructor Documentation

8.153.2.1 IsReplyRelatedPredicate()

```
template<typename T >
rti::request::IsReplyRelatedPredicate< T >::IsReplyRelatedPredicate (
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Creates the predicate with the request id to match.

8.153.3 Member Function Documentation

8.153.3.1 operator()() [1/3]

```
template<typename T >
bool  rti::request::IsReplyRelatedPredicate< T >::operator() (
             dds::sub::Sample< T > sample )  [inline]
```

Determines if a reply is related to the request id this object contains.

References **dds::sub::Sample< T >::info()**, and **dds::sub::SampleInfo::related_original_publication_virtual_↩ sample_identity()**.

8.153.3.2 operator()() [2/3]

```
template<typename T >
bool  rti::request::IsReplyRelatedPredicate< T >::operator() (
              rti::sub::LoanedSample< T > sample )  [inline]
```

Determines if a reply is related to the request id this object contains.

References **rti::sub::LoanedSample< T >::info()**, and **dds::sub::SampleInfo::related_original_publication_virtual_sample_identity()**.

8.153.3.3 operator()() [3/3]

```
template<typename T >
bool  rti::request::IsReplyRelatedPredicate< T >::operator() (
              dds::sub::SampleInfo sample_info )  [inline]
```

Determines if a reply info is related to the request id this object contains.

References **dds::sub::SampleInfo::related_original_publication_virtual_sample_identity()**.

8.154 rti::sub::IsValidData< T > Struct Template Reference

<<***extension***>> *(*p. *354)* A functor that returns true when a sample has valid data.

```
#include <LoanedSamplesImpl.hpp>
```

Public Types

- typedef LoanedSamples< T >::value_type **sample_type**

  LoanedSample *(*p. *1659) type.*

Public Member Functions

- bool **operator()** (const **sample_type** &sample)

  Returns true if this sample contains valid data.

8.154.1 Detailed Description

template<typename T>
struct rti::sub::IsValidData< T >

<<***extension***>> *(p. 354)* A functor that returns true when a sample has valid data.

This functor is useful in algorithms that iterate on LoanedSamples. For example:

```
LoanedSamples<Foo> samples = reader.take();
std::cout « "Valid sample count: "
         « std::count_if(samples.begin(), samples.end(), IsValidData<Foo>());
```

A similar utility is the iterator **valid_data()** (p. 766).

dds::sub::LoanedSamples (p. 1663)

valid_data() (p. 766)

8.154.2 Member Typedef Documentation

8.154.2.1 sample_type

```
template<typename T >
typedef LoanedSamples<T>::value_type  rti::sub::IsValidData< T >::sample_type
```

LoanedSample (p. 1659) type.

8.154.3 Member Function Documentation

8.154.3.1 operator()()

```
template<typename T >
bool  rti::sub::IsValidData< T >::operator() (
            const  sample_type & sample )  [inline]
```

Returns true if this sample contains valid data.

That is, if `sample.info()`.valid().

8.155 dds::core::KeyedBytesTopicType Class Reference

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

`#include <dds/core/BuiltinTopicTypes.hpp>`

Public Member Functions

- **KeyedBytesTopicType** ()
  Creates a sample with an empty array of bytes and an empty string.
- **KeyedBytesTopicType** (const std::string &the_key, const std::vector< uint8_t > &the_value)
  Creates a sample with the given key and bytes.
- const **dds::core::string** & **key** () const
  Gets the key.
- **dds::core::string** & **key** ()
  Gets the key.
- void **key** (const **dds::core::string** &the_value)
  Sets the key.
- **operator std::vector< uint8_t >** () const
  Conversion to std::vector by obtaining the bytes.
- std::vector< uint8_t > **value** () const
  Gets the bytes.
- void **value** (const std::vector< uint8_t > &the_value)
  Sets the bytes.
- uint8_t & **operator[ ]** (uint32_t index)
  Accesses the bytes by index.
- uint8_t **operator[ ]** (uint32_t index) const
  Accesses the bytes by index.
- int32_t **length** () const
  Get the number of bytes.

8.155.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

8.155.2 Constructor & Destructor Documentation

8.155.2.1 KeyedBytesTopicType() [1/2]

`dds::core::KeyedBytesTopicType::KeyedBytesTopicType ( ) [inline]`

Creates a sample with an empty array of bytes and an empty string.

8.155.2.2 KeyedBytesTopicType() [2/2]

```
dds::core::KeyedBytesTopicType::KeyedBytesTopicType (
            const std::string & the_key,
            const std::vector< uint8_t > & the_value )  [inline]
```

Creates a sample with the given key and bytes.

8.155.3 Member Function Documentation

8.155.3.1 key() [1/3]

```
const  dds::core::string & dds::core::KeyedBytesTopicType::key ( ) const  [inline]
```

Gets the key.

8.155.3.2 key() [2/3]

```
 dds::core::string & dds::core::KeyedBytesTopicType::key ( )  [inline]
```

Gets the key.

8.155.3.3 key() [3/3]

```
void dds::core::KeyedBytesTopicType::key (
            const  dds::core::string & the_value )  [inline]
```

Sets the key.

8.157 dds::core::policy::LatencyBudget Class Reference

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **LatencyBudget** ()
  Creates a latency budget with zero duration.
- **LatencyBudget** (const **dds::core::Duration** &the_duration)
  Creates an instance with the specified duration.
- **LatencyBudget** & **duration** (const **dds::core::Duration** &the_duration)
  Sets the duration of the maximum acceptable delay.
- const **dds::core::Duration duration** () const
  Getter (see setter with the same name)

8.157.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

This policy is a *hint* to a DDS implementation; it can be used to change how it processes and sends data that has low latency requirements. The DDS specification does not mandate whether or how this policy is used.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::StatusMask↩ ::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **YES** (p. 514)

See also

rti::core::policy::PublishMode (p. 2013)

rti::pub::FlowController (p. 1572)

8.157.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero `duration`, RTI Connext can optimize its internal operation.

RTI Connext uses it in conjunction with **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019) **dds::pub::DataWriter** (p. 1138) instances associated with a FlowControllerSchedulingPolicy_def::EARLIEST_↩ DEADLINE_FIRST **rti::pub::FlowController** (p. 1572) only. Together with the time of write, **dds::core::policy↩ ::LatencyBudget::duration** (p. 1633) determines the deadline of each individual sample. RTI Connext uses this information to prioritize the sending of asynchronously published data; see **rti::core::policy::AsynchronousPublisher** (p. 832).

8.157.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered duration* <= *requested duration* evaluates to 'TRUE'.

8.157.4 Constructor & Destructor Documentation

8.157.4.1 LatencyBudget() [1/2]

```
dds::core::policy::LatencyBudget::LatencyBudget ( )  [inline]
```

Creates a latency budget with zero duration.

8.157.4.2 LatencyBudget() [2/2]

```
dds::core::policy::LatencyBudget::LatencyBudget (
            const  dds::core::Duration & the_duration )  [inline], [explicit]
```

Creates an instance with the specified duration.

8.157.5 Member Function Documentation

8.157.5.1 duration() [1/2]

```
LatencyBudget & dds::core::policy::LatencyBudget::duration (
            const  dds::core::Duration & the_duration )  [inline]
```

Sets the duration of the maximum acceptable delay.

[default] 0 (meaning minimize the delay)

```
const  dds::core::Duration dds::core::policy::LatencyBudget::duration ( ) const  [inline]
```

Getter (see setter with the same name)

8.158 rti::config::LibraryVersion Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* The version of a single library shipped as part of an RTI Connext distribution.

`#include <rti/config/Version.hpp>`

Public Member Functions

- int32_t **major_version** () const

  Get the major version of a single RTI Connext library.
- int32_t **minor_version** () const

  Get the minor version of a single RTI Connext library.
- char **release_version** () const

  Get the release letter of a single RTI Connext library.
- int32_t **build_version** () const

  Get the build number of a single RTI Connext library.

8.158.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* The version of a single library shipped as part of an RTI Connext distribution.

RTI Connext is comprised of a number of separate libraries. Although RTI Connext as a whole has a version, the individual libraries each have their own versions as well. It may be necessary to check these individual library versions when seeking technical support.

8.158.2 Member Function Documentation

8.158.2.1 major_version()

`int32_t rti::config::LibraryVersion::major_version ( ) const`

Get the major version of a single RTI Connext library.

8.158.2.2 minor_version()

`int32_t rti::config::LibraryVersion::minor_version ( ) const`

Get the minor version of a single RTI Connext library.

8.158.2.3 release_version()

```
char rti::config::LibraryVersion::release_version ( ) const
```

Get the release letter of a single RTI Connext library.

8.158.2.4 build_version()

```
int32_t rti::config::LibraryVersion::build_version ( ) const
```

Get the build number of a single RTI Connext library.

8.159 dds::core::policy::Lifespan Class Reference

Specifies how long the data written by a **dds::pub::DataWriter** (p. 1138) is considered valid.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Lifespan** ()
  Creates the default policy with an infinite lifespan.
- **Lifespan** (const **dds::core::Duration** &d)
  Creates a policy with the specified lifespan duration.
- **Lifespan** & **duration** (const **dds::core::Duration** &d)
  Sets the maximum duration for which the data is valid.
- const **dds::core::Duration** **duration** () const
  Getter (see setter with the same name)

8.159.1 Detailed Description

Specifies how long the data written by a **dds::pub::DataWriter** (p. 1138) is considered valid.

Each data sample written by the **dds::pub::DataWriter** (p. 1138) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the **dds::sub↩ ::DataReader** (p. 976) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the **dds::pub::DataWriter** (p. 1138)'s cache is computed by adding the duration specified by this QoS policy to the time when the sample is added to the **dds::pub::DataWriter** (p. 1138)'s cache. This timestamp is not necessarily equal to the sample's source timestamp that can be provided by the user using the **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 1149) or **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179) API.

The expiration time of each sample from the **dds::sub::DataReader** (p. 976)'s cache is computed by adding the duration to the reception timestamp.

See also

dds::pub::DataWriter::write() (p. 1148)

dds::pub::DataWriter::write(const T&,const dds::core::Time&) (p. 1149)

Entity:

dds::topic::Topic (p. 2474), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **YES** (p. 514)

8.159.2 Usage

The **Lifespan** (p. 1635) QoS policy can be used to control how much data is stored by RTI Connext. Even if it is configured to store "all" of the data sent or received for a topic (see **dds::core::policy::History** (p. 1602)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have 'expired.'

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

8.159.4.2 duration() [2/2]

```
const  dds::core::Duration dds::core::policy::Lifespan::duration ( ) const  [inline]
```

Getter (see setter with the same name)

8.160 Listener Class Reference

Entity listeners.

```
#include <dds/dds.hpp>
```

8.160.1 Detailed Description

Entity listeners.

Note

This type doesn't exist in the API, it just represents the concept that all subclasses of **dds::core::Entity** (p. 1520) have an associated listener type. The actual listener types are:

- **dds::domain::DomainParticipantListener** (p. 1382)
- **dds::topic::TopicListener** (p. 2508)
- **dds::sub::SubscriberListener** (p. 2422)
- **dds::pub::PublisherListener** (p. 2006)
- **dds::sub::DataReaderListener** (p. 1055)
- **dds::pub::DataWriterListener** (p. 1202)

Listeners provide a way for RTI Connext to asynchronously alert the application when there are relevant status changes.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **Listener** (p. 1637) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **dds::core::Entity** (p. 1520).

8.160.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 429)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is `on_<communication_status>()`, which takes a parameter of type `<communication_status>` as listed in **Status Kinds** (p. 429).

- `on_<communication_status>` is available on the relevant **dds::core::Entity** (p. 1520) as well as those that embed it, as expressed in the following figure:

listener processing. The most *specific* relevant enabled listener is called."

- When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Connext which operations are enabled within the listener (cf. operation **dds::core::Entity** (p. 1520) set_listener()).

- When a plain communication status changes, RTI Connext triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **dds::domain::DomainParticipant** (p. 1326)) and to set dedicated behaviors only where needed.

8.160.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- First, RTI Connext tries to trigger the dds::sub::SubscriberListener::on_data_on_readers with a parameter of the related **dds::sub::Subscriber** (p. 2410);

- If this does not succeed (there is no listener or the operation is not enabled), RTI Connext tries to trigger **dds::sub::DataReaderListener::on_data_available** (p. 1058) on all the related **dds::sub::DataReaderListener** (p. 1055) objects, with a parameter of the related **dds::sub::DataReader** (p. 976).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding **dds::sub::DataReader** (p. 976) objects by calling **dds::sub::find** (p. 672) on the related **dds::sub::Subscriber** (p. 2410) and then get the data by calling **dds::sub::DataReader::read** (p. 996) or **dds::sub::DataReader::take** (p. 997) on the returned **dds::sub::DataReader** (p. 976) objects), or it wants to treat each **dds::sub::DataReader** (p. 976) independently and it may choose the second option (and then get the data by calling **dds::sub::DataReader::read** (p. 996) or **dds::sub::DataReader::take** (p. 997) on the related **dds::sub::DataReader** (p. 976)).

Note that if dds::sub::SubscriberListener::on_data_on_readers is called, RTI Connext will *not* try to call **dds::sub::DataReaderListener::on_data_available** (p. 1058). However, an application can force a call to the **dds::sub::DataReader** (p. 976) objects that have data by calling **dds::sub::Subscriber::notify_datareaders** (p. 2414).

8.160.4 How to set a listener

Listeners can be set in the Entity constructor, or the `set_listener()` function (for example, **dds::sub::DataReader::set_listener()** (p. 1006)).

These functions expect a `std::shared_ptr`. The Entity keeps a reference to the `std::shared_ptr` so the listener cannot be deleted until the Entity is destroyed or the listener is reset with `set_listener(nullptr)`.

Warning

It is not recommended to keep a reference to an Entity inside of its listener because it creates a cycle that prevents the destruction of both objects. If you need to keep a reference, make sure you call `entity.set_listener(nullptr)` or `entity.**close()** (p. 1024)` explicitly.

8.160.5 Operations Allowed in Listener Callbacks

See `Restricted Operations in Listener Callbacks`, in the Core Libraries User's Manual.

8.160.6 Best Practices with Listeners

Note that all the issues described below are avoided by using **dds::core::cond::WaitSet** (p. 2617).

Avoid blocking or performing a lot of processing in Listener (p. **1637) callbacks**

Listeners are invoked by internal threads that perform critical functions within the middleware and need to run in a timely manner. By default, Connext DDS creates a few threads to use to receive data and only a single thread to handle periodic events.

Because of this, user applications installing Listeners should never block in a **Listener** (p. 1637) callback. There are several negative consequences of blocking in a listener callback:

- The application may lose data for the DataReader the listener is installed on, because the receive thread is not removing it from the socket buffer and it gets overwritten.
- The application may receive strictly reliable data with a delay, because the receive thread is not removing it from the socket buffer and if it gets overwritten it must be re-sent.
- The application may lose or delay data for other DataReaders, because by default all DataReaders created with the same DomainParticipant share the same threads.
- The application may not be notified of periodic events on time

If the application needs to make a blocking call when data is available, or when another event occurs, the application should use **dds::core::cond::WaitSet** (p. 2617).

Avoid taking application mutexes/semaphores in Listener (p. **1637) callbacks**

Taking application mutexes/sempahores within a **Listener** (p. 1637) callback may lead to unexpected deadlock scenarios.

When a **Listener** (p. 1637) callback is invoked the EA (Exclusive Area) of the Entity 'E' to which the callback applies is taken by the middleware.

If the application takes an application mutex 'M' within a critical section in which the application makes DDS calls affecting 'E', this may lead to following deadlock:

The middleware thread is within the entity EA trying to acquire the mutex 'M'. At the same time, the application thread has acquired 'M' and is blocked trying to acquire the entity EA.

Do not write data with a DataWriter within the on_data_available callback

Avoid writing data with a DataWriter within the **dds::sub::DataReaderListener::on_data_available()** (p. 1058) callback. If the write operation blocks because e.g. the send window is full, this will lead to a deadlock.

Do not call wait_for_acknowledgements within the on_data_available callback

Do not call the **dds::pub::DataWriter::wait_for_acknowledgments** (p. 1168) within the **dds::sub::DataReader↩ Listener::on_data_available()** (p. 1058) callback. This will lead to deadlock.

8.161.1 Detailed Description

template<typename Entity, typename Listener = typename Entity::Listener>
class rti::core::ListenerBinder< Entity, Listener >

<<***reference-type***>> *(p. 351)* Automatically manages the association of an Entity and a **Listener** (p. 1637)

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

Note

A **ListenerBinder** (p. 1641) provides all the functions of a <<***reference-type***>> *(p. 351)* except **close()** (p. 1024) and retain().

Ties the association listener/Entity to the existence of references to this type–that is, the constructor sets the listener; when the last reference is destroyed, the entity's listener is unset. Depending on how this type is created, the listener may also be deleted:

- **`rti::core::bind_listener()`** (p. 708) creates a **ListenerBinder** (p. 1641) that doesn't own the listener and won't delete it
- **`rti::core::bind_and_manage_listener()`** (p. 709) creates a **ListenerBinder** (p. 1641) that owns the listener and will delete it.

The goal is to simplify the destruction of an Entity by the application, which otherwise would have to reset the listener or close the Entity explicitly.

Example:

```
class MyListener : public DataReaderListener<Foo> { ... };
void f()
{
    MyListener listener;
    dds::sub::DataReader<Foo> my_reader(subscriber, topic);
    {
        auto scoped_listener = rti::core::bind_listener(
                my_reader,
                listener,
                dds::core::status::StatusMask::data_available());
       // my_reader has a listener
       // ...
    } // After this, my_reader doesn't have a listener
} // my_reader destroyed; if we hadn't used a ListenerBinder,
  // my_reader would not have been destroyed
```

To create a **ListenerBinder** (p. 1641) use **rti::core::bind_listener()** (p. 708) or **rti::core::bind_and_manage_listener()** (p. 709). To retrieve the listener use **ListenerBinder::listener()** (p. 1643); to retrieve the entity, use **ListenerBinder**↩ **::entity()** (p. 1643).

If the Entity changes its listener while references to this **ListenerBinder** (p. 1641) still exist, the **ListenerBinder** (p. 1641) will not reset the listener.

Template Parameters

Entity	A subclass of **dds::core::Entity** (p. 1520)
Listener *(p. 1637)*	The listener type, by default `Entity::Listener`

See also

Reference types (p. 351), for an explanation of how reference types work and the reasons why an Entity may be retained.

8.161.2 Member Function Documentation

8.161.2.1 get() [1/2]

```
template<typename Entity , typename  Listener = typename Entity::Listener>
Listener *  rti::core::ListenerBinder< Entity,  Listener >::get ( )  [inline]
```

(Deprecated) Use **listener()** (p. 1643)

8.161.2.2 get() [2/2]

```
template<typename Entity , typename  Listener = typename Entity::Listener>
const  Listener *  rti::core::ListenerBinder< Entity,  Listener >::get ( ) const  [inline]
```

(Deprecated) Use **listener()** (p. 1643)

8.161.2.3 listener() [1/2]

```
template<typename Entity , typename  Listener = typename Entity::Listener>
Listener *  rti::core::ListenerBinder< Entity,  Listener >::listener ( )  [inline]
```

Retrieves the listener.

Returns

The listener.

8.161.2.4 listener() [2/2]

```
template<typename Entity , typename  Listener = typename Entity::Listener>
const  Listener *  rti::core::ListenerBinder< Entity,  Listener >::listener ( ) const  [inline]
```

Retrieves the listener.

8.161.2.5 entity()

```
template<typename Entity , typename  Listener = typename Entity::Listener>
Entity  rti::core::ListenerBinder< Entity,  Listener >::entity ( ) const  [inline]
```

Retrieves the Entity associated with the listener.

8.161.3 Friends And Related Function Documentation

8.161.3.1 bind_listener() [1/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_listener (
             Entity entity,
              Listener * the_listener,
              dds::core::status::StatusMask mask )  [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

The **ListenerBinder** (p. 1641) created from this function does not delete the listener, it simply sets the listener back to NULL in the Entity. The application is responsible for the life-cycle of the listener.

To also delete the listener when all references go out of scope, see **bind_and_manage_listener()** (p. 1644).

```
MyListener my_listener;
dds::sub::DataReader<Foo> reader(subscriber, topic);
// reader will have no listener after scoped_listener (and any other
// references created from scoped_listener) go out of scope--note that
// my_listener is a stack variable so scoped_listener should not delete it
auto scoped_listener = bind_listener(
    reader, &my_listener, dds::core::status::StatusMask::data_available());
```

8.161.3.2 bind_listener() [2/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_listener (
             Entity entity,
              Listener * the_listener )  [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

See also

bind_listener(Entity, Listener*, dds::core::status::StatusMask) (p. 1644)

8.161.3.3 bind_and_manage_listener() [1/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_and_manage_listener (
             Entity entity,
              Listener * the_listener,
              dds::core::status::StatusMask mask )  [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

Example:

```
dds::sub::DataReader<Foo> reader(subscriber, topic);
// The instance of MyListener we are creating and attaching to reader will be
// unset and deleted when scoped_listener (and any other references create
from
// scoped_listener) go out of scope
auto scoped_listener = bind_and_manage_listener(
    reader, new MyListener(),
dds::core::status::StatusMask::data_available());
```

See also

bind_listener() (p. 1644)

8.161.3.4 bind_and_manage_listener() [2/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_and_manage_listener (
             Entity entity,
              Listener * the_listener )  [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

  *Creates a **Liveliness** (p. 1645) instance with LivelinessKind::MANUAL_BY_TOPIC and the specified lease duration (infinite by default)*

8.162.1 Detailed Description

Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 976)'s to detect when **dds::pub::↩ DataWriter** (p. 1138)'s become disconnected.

The liveliness status of a **dds::pub::DataWriter** (p. 1138) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 538) policy. The application is also informed via **Listener** (p. 1637) when an **dds↩ ::pub::DataWriter** (p. 1138) is no longer alive.

A **dds::pub::DataWriter** (p. 1138) commits to signalling its liveliness at intervals not to exceed the **dds::core::policy↩ ::Liveliness::lease_duration** (p. 1649) configured on the **dds::pub::DataWriter** (p. 1138). The rate at which the **dds↩ ::pub::DataWriter** (p. 1138) will signal its liveliness is defined by **dds::core::policy::Liveliness::assertions_per_↩ lease_duration** (p. 1651).

The **dds::sub::DataReader** (p. 976) lease_duration specifies the maximum period at which matching DataWriters must have their liveliness asserted.

In addition, in the subscribing application Connext DDS uses an internal thread that wakes up at the period set by the DataReader's lease_duration to see if a DataWriter lease_duration has been violated.

Important: The DataReader lease_duration only configures how often a DataReader will check the liveliness of the matching DataWriters. The DataWriter lease_duration configures the period at which a DataWriter must assert its liveliness and is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

Listeners are used to notify a **dds::sub::DataReader** (p. 976) of loss of liveliness and **dds::pub::DataWriter** (p. 1138) of violations to the liveliness contract. The on_liveliness_lost() callback is only called *once*, after the first time the lease_duration is exceeded (when the **dds::pub::DataWriter** (p. 1138) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected DataWriters.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2383), **dds::core::status::LivelinessLostStatus** (p. 1655);
dds::core::status::StatusMask::liveliness_changed() (p. 2383), **dds::core::status::LivelinessChanged↩ Status** (p. 1652);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2381), **dds::core::status::StatusMask↩ ::offered_incompatible_qos()** (p. 2380)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.162.2 Usage

This policy controls the mechanism and parameters used by RTI Connext to ensure that particular DataWriters on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 538) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The **dds::core::policy::LivelinessKind_def::AUTOMATIC** (p. 1655) liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Connext takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a **dds↩ ::domain::DomainParticipant** (p. 1326) is running and the link connecting it to remote participants remains connected, the entities within the **dds::domain::DomainParticipant** (p. 1326) will be considered alive. This requires the lowest overhead.

The manual settings (**dds::core::policy::LivelinessKind_def::MANUAL_BY_PARTICIPANT** (p. 1655), **dds::core::policy::LivelinessKind_def::MANUAL_BY_TOPIC** (p. 1655)) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding **dds::core::Entity** (p. 1520) is still alive. The action can be explicit by calling the **dds::pub::DataWriter::assert_liveliness** (p. 1172) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting **dds::core::policy::LivelinessKind_def::MANUAL_BY_PARTICIPANT** (p. 1655) requires only that one **dds::core::Entity** (p. 1520) within a participant is asserted to be alive to deduce all other **dds::core::Entity** (p. 1520) objects within the same **dds::domain::DomainParticipant** (p. 1326) are also alive.

- The setting **dds::core::policy::LivelinessKind_def::MANUAL_BY_TOPIC** (p. 1655) requires that at least one instance within the **dds::pub::DataWriter** (p. 1138) is asserted.

Changes in **LIVELINESS** (p. 535) must be detected by the Service with a time-granularity greater or equal to the **dds::core::policy::Liveliness::lease_duration** (p. 1649). This ensures that the value of the **dds::core::status::LivelinessChangedStatus** (p. 1652) is updated at least once during each lease_duration and the related Listeners and **dds::core::cond::WaitSet** (p. 2617) s are notified within a lease_duration from the time the **LIVELINESS** (p. 535) changed.

8.162.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered kind >= requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **dds::core::policy::LivelinessKind_def** (p. 1654) kind are considered ordered such that: **dds::core::policy::LivelinessKind_def::AUTOMATIC** (p. 1655) < **dds::core::policy::LivelinessKind_def::MANUAL_BY_PARTICIPANT** (p. 1655) < **dds::core::policy::LivelinessKind_def::MANUAL_BY_TOPIC** (p. 1655).

- the inequality *offered* `lease_duration` *<= requested* `lease_duration` evaluates to true.

Relationship between registration, liveliness and ownership (p. 1902)

8.162.4 Constructor & Destructor Documentation

8.162.4.1 Liveliness() [1/2]

```
dds::core::policy::Liveliness::Liveliness ( )  [inline]
```

Creates an automatic liveliness policy with infinite lease duration.

8.162.4.2 Liveliness() [2/2]

```
dds::core::policy::Liveliness::Liveliness (
             dds::core::policy::LivelinessKind the_kind,
            const  dds::core::Duration & the_lease_duration )  [inline]
```

Creates an instance with the specified liveliness kind and lease duration.

8.162.5 Member Function Documentation

8.162.5.1 kind() [1/2]

```
Liveliness & dds::core::policy::Liveliness::kind (
             dds::core::policy::LivelinessKind the_kind )  [inline]
```

Sets the liveliness kind.

[default] dds::core::policy::LivelinessKind_def::AUTOMATIC (p. 1655)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Matching** (p. 293), **Liveliness** (p. 199)

8.162.5.2 kind() [2/2]

```
dds::core::policy::LivelinessKind dds::core::policy::Liveliness::kind ( ) const  [inline]
```

Getter (see the setter with the same name)

8.162.5.3 lease_duration() [1/2]

```
Liveliness & dds::core::policy::Liveliness::lease_duration (
            const  dds::core::Duration & the_lease_duration )  [inline]
```

Sets the duration within which a **dds::core::Entity** (p. 1520) must be asserted or else it is considered not alive.

*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The duration within which a **dds::pub::DataWriter** (p. 1138) must be asserted, or else it is assumed to be not alive.

For a DataWriter, the lease_duration specifies a timeout by which liveliness must be asserted for the DataWriter, or the DataWriter will be considered inactive or not alive.

For a DataReader, the lease_duration specifies the maximum period at which the DataReader will check to see if the matching DataWriters are still alive according to the DataWriters lease_duration value.

Important: The DataWriter lease_duration is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

Writer-side filtering is disabled if the writer's lease_duration is set to a finite value.

[default] dds::core::Duration::infinite() (p. 1451)

[range] [0,1 year] or **dds::core::Duration::infinite()** (p. 1451)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Matching** (p. 293), **Liveliness** (p. 199)

8.162.5.4 lease_duration() [2/2]

```
dds::core::Duration dds::core::policy::Liveliness::lease_duration ( ) const  [inline]
```

Getter (see the setter with the same name)

8.162.5.5 Automatic()

```
static  Liveliness dds::core::policy::Liveliness::Automatic ( )  [inline], [static]
```

Creates a **Liveliness** (p. 1645) instance with LivelinessKind::AUTOMATIC.

8.162.5.6 ManualByParticipant()

```
static Liveliness dds::core::policy::Liveliness::ManualByParticipant (
            const dds::core::Duration & lease = dds::core::Duration::infinite() ) [inline],
[static]
```

Creates a **Liveliness** (p. 1645) instance with LivelinessKind::MANUAL_BY_PARTICIPANT and the specified lease duration (infinite by default)

8.162.5.7 ManualByTopic()

```
static Liveliness dds::core::policy::Liveliness::ManualByTopic (
            const dds::core::Duration & lease = dds::core::Duration::infinite() ) [inline],
[static]
```

Creates a **Liveliness** (p. 1645) instance with LivelinessKind::MANUAL_BY_TOPIC and the specified lease duration (infinite by default)

8.162.5.8 assertions_per_lease_duration() [1/2]

```
dds::core::policy::Liveliness & assertions_per_lease_duration (
            int32_t value )
```

<<***extension***>> *(p. 116)* The number of assertions to send during the lease duration

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This field only applies to a **dds::pub::DataWriter** (p. 1138) and is not considered during QoS compatibility checks.

The default value is 3. A higher value will make the liveliness mechanism more robust against packet losses, but it will also increase the network traffic.

[default] 3

[range] [2, 100 million]

Categories

8.163.1 Detailed Description

Information about the status **dds::core::status::StatusMask::liveliness_changed()** (p. 2383)

The **dds::sub::DataReaderListener::on_liveliness_changed** (p. 1057) callback may be invoked for the following reasons:

- The liveliness of any **dds::pub::DataWriter** (p. 1138) matching this DataReader (as defined by the **dds::core::policy::LivelinessKind_def** (p. 1654) setting) is lost.
- A DataWriter's liveliness is recovered after being lost.
- A new matching DataWriter has been discovered.
- A matching DataWriter has been deleted.
- A QoS Policy has changed such that a DataWriter that matched this DataReader before no longer matches (such as a change to the **dds::core::policy::Partition** (p. 1923)). In this case, RTI Connext will no longer keep track of the DataWriter's liveliness. Furthermore, consider two scenarios:

  - DataWriter was alive when it and DataReader stopped matching: **dds::core::status::Liveliness↩ ChangedStatus::alive_count** (p. 1653) will decrease (since there's one less matching alive DataWriter) and **dds::core::status::LivelinessChangedStatus::not_alive_count** (p. 1653) will remain the same (since the DataWriter is still alive).
  - DataWriter was not alive when it and DataReader stopped matching: **dds::core::status::Liveliness↩ ChangedStatus::alive_count** (p. 1653) will remain the same (since the matching DataWriter was not alive) and **dds::core::status::LivelinessChangedStatus::not_alive_count** (p. 1653) will decrease (since there's one less not-alive matching DataWriter).

    Note: There are several ways that a DataWriter and DataReader can become incompatible after the Data↩ Writer has lost liveliness. For example, when the **dds::core::policy::LivelinessKind_def** (p. 1654) is set to DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS, it is possible that the DataWriter has not asserted its liveliness in a timely manner, and then a QoS change occurs on the DataWriter or DataReader that makes the entities incompatible.

- A QoS Policy (such as the **dds::core::policy::Partition** (p. 1923)) has changed such that a DataWriter that was unmatched with the DataReader now matches.

8.163.2 Member Function Documentation

8.163.2.1 alive_count()

```
int32_t dds::core::status::LivelinessChangedStatus::alive_count ( ) const  [inline]
```

The total count of currently alive **dds::pub::DataWriter** (p. 1138) entities that write the **dds::topic::Topic** (p. 2474) that this **dds::sub::DataReader** (p. 976) reads.

8.163.2.2 not_alive_count()

```
int32_t dds::core::status::LivelinessChangedStatus::not_alive_count ( ) const  [inline]
```

The total count of currently not_alive **dds::pub::DataWriter** (p. 1138) entities that write the **dds::topic::Topic** (p. 2474) that this **dds::sub::DataReader** (p. 976) reads.

8.163.2.3 alive_count_change()

```
int32_t dds::core::status::LivelinessChangedStatus::alive_count_change ( ) const  [inline]
```

The change in the alive_count since the last time the listener was called or the status was read.

8.163.2.4 not_alive_count_change()

```
int32_t dds::core::status::LivelinessChangedStatus::not_alive_count_change ( ) const  [inline]
```

The change in the not_alive_count since the last time the listener was called or the status was read.

Note that a positive not_alive_count_change means one of the following:

- The DomainParticipant containing the matched DataWriter has lost liveliness or has been deleted.
- The matched DataWriter has lost liveliness or has been deleted.

8.163.2.5 last_publication_handle()

```
const  dds::core::InstanceHandle dds::core::status::LivelinessChangedStatus::last_publication_↩
handle ( ) const  [inline]
```

This **InstanceHandle** (p. 1612) can be used to look up which remote **dds::pub::DataWriter** (p. 1138) was the last to cause this DataReader's status to change, using **dds::sub::DataReader::matched_publication_data** (p. 1033).

It's possible that the DataWriter has been purged from the discovery database. (See the "Discovery Overview" section of the User's Manual.) If so, the **dds::sub::DataReader::matched_publication_data** (p. 1033) method will not be able to return information about the DataWriter. In this case, the only way to get information about the lost DataWriter is if you cached the information previously.

8.164 dds::core::policy::LivelinessKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) LivelinessKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  AUTOMATIC ,
  MANUAL_BY_PARTICIPANT ,
  MANUAL_BY_TOPIC }
  The underlying enum type.

8.164.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) LivelinessKind.

8.164.2 Member Enumeration Documentation

8.164.2.1 type

```
enum  dds::core::policy::LivelinessKind_def::type
```

The underlying enum type.

Enumerator

AUTOMATIC	**[default]** The infrastructure will automatically signal liveliness for the **dds::pub::DataWriter** (p. 1138) (s) at least as often as required by the **dds::pub::DataWriter** (p. 1138) (S) `lease_duration`. A **dds::pub::DataWriter** (p. 1138) with this setting does not need to take any specific action in order to be considered 'alive.' The **dds::pub::DataWriter** (p. 1138) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.
MANUAL_BY_PARTICIPANT	RTI Connext will assume that as long as at least one **dds::pub::DataWriter** (p. 1138) belonging to the **dds::domain::DomainParticipant** (p. 1326) (or the **dds::domain::DomainParticipant** (p. 1326) itself) has asserted its liveliness, then the other DataWriters belonging to that same **dds::domain::DomainParticipant** (p. 1326) are also alive. The user application takes responsibility to signal liveliness to RTI Connext either by calling **dds::domain::DomainParticipant::assert_liveliness** (p. 1338), or by calling **dds::pub::DataWriter::assert_liveliness** (p. 1172), or **dds::pub::DataWriter::write()** (p. 1148) on any **dds::pub::DataWriter** (p. 1138) belonging to the **dds::domain::DomainParticipant** (p. 1326).
MANUAL_BY_TOPIC	RTI Connext will only assume liveliness of the **dds::pub::DataWriter** (p. 1138) if the application has asserted liveliness of that **dds::pub::DataWriter** (p. 1138) itself. The user application takes responsibility to signal liveliness to RTI Connext using the **dds::pub::DataWriter::assert_liveliness** (p. 1172) method, or by writing some data.

8.165 dds::core::status::LivelinessLostStatus Class Reference

Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2383)

`#include <TStatus.hpp>`

Public Member Functions

- int32_t **total_count** () const

  *Total cumulative number of times that a previously-alive **dds::pub::DataWriter** (p. 1138) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.*
- int32_t **total_count_change** () const

  The incremental changes in total_count since the last time the listener was called or the status was read.

8.165.1 Detailed Description

Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2383)

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

The liveliness that the **dds::pub::DataWriter** (p. 1138) has committed through its **dds::core::policy::Liveliness** (p. 1645) was not respected; thus **dds::sub::DataReader** (p. 976) entities will consider the **dds::pub::DataWriter** (p. 1138) as no longer "alive/active".

8.165.2 Member Function Documentation

8.165.2.1 total_count()

```
int32_t dds::core::status::LivelinessLostStatus::total_count ( ) const  [inline]
```

Total cumulative number of times that a previously-alive **dds::pub::DataWriter** (p. 1138) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **dds::pub::DataWriter** (p. 1138) simply remains not alive for another liveliness period.

8.165.2.2 total_count_change()

```
int32_t dds::core::status::LivelinessLostStatus::total_count_change ( ) const  [inline]
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.166 rti::core::xtypes::LoanedDynamicData Class Reference

<<***move-only-type***>> *(p. 353)* Gives temporary access to a member of another DynamicData object.

```
#include <DynamicDataImpl.hpp>
```

  Obtains the loaned DynamicData object representing a member of DynamicData object.
- const DynamicData & **get** () const

  Obtains the loaned DynamicData object representing a member of DynamicData object.
- **operator DynamicData &** ()

  Conversion to DynamicData for convenience.
- **operator const DynamicData &** () const

  Conversion to DynamicData for convenience.
- **LoanedDynamicData** (**LoanedDynamicData** &&other) OMG_NOEXCEPT

  *<<**C++11**>> (p. 353) Move constructor.*
- **LoanedDynamicData** & **operator=** (**LoanedDynamicData** &&other) OMG_NOEXCEPT

  *<<**C++11**>> (p. 353) Move-assignment operator.*

8.166.1 Detailed Description

*<<**move-only-type**>> (p. 353)* Gives temporary access to a member of another DynamicData object.

This type can only be instantiated through **dds::core::xtypes::DynamicData::loan_value** (p. 1475). This type can't be copied. It can be moved *<<**C++11**>> (p. 353)*.

An instance of this type contains a direct reference to a member of another DynamicData object, retrieved with **get()** (p. 1658). That object can be both inspected or modified and has to be eventually returned.

There are three ways to return the loan:

1. Letting the destructor do it
2. Calling **return_loan()** (p. 1658)
3. Reusing this object to obtain another loan (see **dds::core::xtypes::DynamicData::loan_value(LoanedDynamicData&,uint32_t)** (p. 1477))

dds::core::xtypes::DynamicData::loan_value (p. 1475)

Using DynamicData (p. 611)

8.166.2 Constructor & Destructor Documentation

8.166.2.1 ~LoanedDynamicData()

```
rti::core::xtypes::LoanedDynamicData::~LoanedDynamicData ( )
```

Returns the loan if it has not been returned with **return_loan()** (p. 1658)

8.166.2.2 LoanedDynamicData()

```
rti::core::xtypes::LoanedDynamicData::LoanedDynamicData (
            LoanedDynamicData && other )  [inline]
```

<<***C++11***>> *(p. 353)* Move constructor.

A **LoanedDynamicData** (p. 1656) can only be moved, not copied.

8.166.3 Member Function Documentation

8.166.3.1 return_loan()

```
void rti::core::xtypes::LoanedDynamicData::return_loan ( )
```

Explicitly returns the loan.

8.166.3.2 get() [1/2]

```
DynamicData & rti::core::xtypes::LoanedDynamicData::get ( )  [inline]
```

Obtains the loaned DynamicData object representing a member of DynamicData object.

The object can be modified and the changes will take effect in the DynamicData object that contains this one.

8.166.3.3 get() [2/2]

```
const DynamicData & rti::core::xtypes::LoanedDynamicData::get ( ) const  [inline]
```

Obtains the loaned DynamicData object representing a member of DynamicData object.

8.166.3.4 operator DynamicData &()

```
rti::core::xtypes::LoanedDynamicData::operator DynamicData & ( )  [inline]
```

Conversion to DynamicData for convenience.

8.166.3.5 operator const DynamicData &()

```
rti::core::xtypes::LoanedDynamicData::operator const DynamicData & ( ) const  [inline]
```

Conversion to DynamicData for convenience.

8.166.3.6 operator=()

```
LoanedDynamicData & rti::core::xtypes::LoanedDynamicData::operator= (
            LoanedDynamicData && other )  [inline]
```

<<***C++11***>> *(*p. *353)* Move-assignment operator.

Since copying a **LoanedDynamicData** (p. 1656) is disabled, only the move-assignment operator is allowed.

This operation returns the loan that `*this` currently holds.

For example:

```
LoanedDynamicData member = sample.loan_value(1);
member = sample.loan_value(2);
```

  *Copies the contents of a **rti::sub::LoanedSample** (p. 1659) into a **dds::sub::Sample** (p. 2270).*
- template<typename T >
  std::ostream & **operator**<< (std::ostream &out, const **LoanedSample**< T > &sample)
  Calls the operator on the data or prints [invalid data].

8.167.1 Detailed Description

template<typename T>
class rti::sub::LoanedSample< T >

The element type of a **dds::sub::LoanedSamples** (p. 1663) collection.

This class encapsulates loaned, read-only data and SampleInfo from a DataReader.

LoanedSample (p. 1659) instances are always the element of a **dds::sub::LoanedSamples** (p. 1663) collection and have to be returned through that collection. A **LoanedSample** (p. 1659) instance is a lightweight handle to data owned by the DataReader from where you received a LoanedSamples collection.

This type is not exactly a reference type, value type or move-only type. Copying a **LoanedSample** (p. 1659) simply creates a new handle to the same loaned data.

The difference between **LoanedSample** (p. 1659) and **dds::sub::Sample** (p. 2270) is that the latter is a **value type** (p. 350) that the application owns. A Sample can be constructed by copying the data and meta-data referenced by a **LoanedSample** (p. 1659).

In most cases the only thing applications care about is that the elements of a **dds::sub::LoanedSamples** (p. 1663) collection have two methods, **data()** (p. 1661) and **info()** (p. 1661). For example:

```
dds::sub::LoanedSamples<Foo> samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        std::cout « sample.data() « std::endl;
    }
}
```

```
template<typename T >
typedef T  rti::sub::LoanedSample< T >::DataType
```

The data type.

8.167.2.2 InfoType

```
template<typename T >
typedef  dds::sub::SampleInfo  rti::sub::LoanedSample< T >::InfoType
```

dds::sub::SampleInfo (p. 2285)

8.167.3 Member Function Documentation

8.167.3.1 data()

```
template<typename T >
const  DataType &  rti::sub::LoanedSample< T >::data ( ) const  [inline]
```

Gets the data.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !info().valid().

References **rti::sub::LoanedSample< T >::info()**.

Referenced by **rti::sub::LoanedSample< T >::operator const DataType &()**, **rti::sub::LoanedSample< T >::operator<<()**, and **rti::sub::LoanedSample< T >::operator==()**.

8.167.3.2 info()

```
template<typename T >
const  InfoType &  rti::sub::LoanedSample< T >::info ( ) const  [inline]
```

Gets the sample info.

Referenced by **rti::sub::LoanedSample< T >::data()**, **rti::request::IsReplyRelatedPredicate< T >::operator()()**, **rti::sub::LoanedSample< T >::operator<<()**, and **rti::sub::LoanedSample< T >::operator==()**.

8.167.3.3 operator const DataType &()

```
template<typename T >
rti::sub::LoanedSample< T >::operator const  DataType & ( ) const  [inline]
```

Allows implicit conversion to the data type.

One use of this conversion operator is to simplify the usage of generic algorithms that iterate on a LoanedSamples collection.

For example, the following example copies all the data of in a LoanedSamples collection into a vector of the data type. The call to `std::copy` works as-is thanks to this conversion.

```
LoanedSamples<KeyedType> samples = reader.take();
std::vector<KeyedType> data_vector;
std::copy(samples.begin(), samples.end(), std::back_inserter(data_vector));
```

Note: the example above may throw **dds::core::PreconditionNotMetError** (p. 1941) if any of the samples has invalid data. See **valid_data()** (p. 766) to iterate only over samples with valid data.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if `!info`().valid().

References **rti::sub::LoanedSample< T >::data()**.

8.167.3.4 operator==()

```
template<typename T >
bool  rti::sub::LoanedSample< T >::operator== (
            const  LoanedSample< T > & other ) const  [inline]
```

Compares the data and info.

References **rti::sub::LoanedSample< T >::data()**, and **rti::sub::LoanedSample< T >::info()**.

8.167.4 Friends And Related Function Documentation

8.167.4.1 copy_to_sample()

```
template<typename T >
dds::sub::Sample< T > copy_to_sample (
            const  rti::sub::LoanedSample< T > & ls )  [related]
```

Copies the contents of a **rti::sub::LoanedSample** (p. 1659) into a **dds::sub::Sample** (p. 2270).

Example:

```
dds::sub::LoanedSamples<Foo> samples = reader.take();
std::vector<Sample<Foo> > sample_vector;
std::transform(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(sample_vector),
    rti::sub::copy_to_sample<Foo>);
```

8.167.4.2 operator<<()

```
template<typename T >
std::ostream & operator<< (
            std::ostream & out,
            const  LoanedSample< T > & sample )  [related]
```

Calls the operator on the data or prints [invalid data].

References **rti::sub::LoanedSample< T >::data()**, **rti::sub::LoanedSample< T >::info()**, and **dds::sub::SampleInfo::valid()**.

8.168 dds::sub::LoanedSamples< T > Class Template Reference

  *<<**extension**>> (p. 354) Returns an iterator that skips invalid samples*

8.168.1 Detailed Description

template<typename T>
class dds::sub::LoanedSamples< T >

<<***move-only-type***>> *(p. 353)* Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 976).

Template Parameters

T	The topic-type. It has to match the type of the **DataReader** (p. 976).

This STL-like container encapsulates a collection of loaned, read-only data samples (**data** (p. 1661) and **info** (p. 1661)) from a **DataReader** (p. 976).

To obtain a **LoanedSamples** (p. 1663) you need to call one of the read/take operations from a **DataReader** (p. 976). The samples have to be eventually returned to the **DataReader** (p. 976). The destructor takes care of that, and the **return_loan()** (p. 1667) function lets you do it explicitly if needed.

As a move-only type copying a **LoanedSamples** (p. 1663) is not allowed. If you want to have more than one reference to a collection of loaned sample, see **SharedSamples** (p. 2362). If you need to return a **LoanedSamples** (p. 1663) from a function or assign it to another variable, use `dds::core::move()` (or `std::move()` <<***C++11***>> *(p. 353)*).

Iterators and overloaded subscript operators let you access the samples in this container, which are of the type **rti::sub::LoanedSample** (p. 1659).

This code demonstrates how to access the info and data of each sample in a **DataReader** (p. 976):

```
auto samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        std::cout « sample.data() « std::endl;
    }
}
```

8.168.2 Member Typedef Documentation

8.168.2.1 iterator

```
template<typename T >
typedef SampleIterator<T>  dds::sub::LoanedSamples< T >::iterator
```

The iterator type.

8.168.3 Constructor & Destructor Documentation

8.168.3.1 LoanedSamples() [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T >::LoanedSamples ( )  [default]
```

Creates an empty **LoanedSamples** (p. 1663) object.

8.168.3.2 ~LoanedSamples()

```
template<typename T >
dds::sub::LoanedSamples< T >::~ LoanedSamples ( )  [inline], [noexcept]
```

Automatically returns the loan to the **DataReader** (p. 976).

See also

return_loan (p. 1667)

8.168.3.3 LoanedSamples() [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T >::LoanedSamples (
             LoanedSamples< T > && other )  [inline]
```

<<***C++11***>> *(p. 353)* Moves the loan from an existing **LoanedSamples** (p. 1663) to a new one

References **dds::sub::LoanedSamples< T >::swap()**.

8.168.4 Member Function Documentation

8.168.4.1 operator[]()

```
template<typename T >
value_type  dds::sub::LoanedSamples< T >::operator[] (
             size_t index )  [inline]
```

Provides access to the underlying LoanedSample object in array-like syntax.

Parameters

index	The index of the **Sample** (p. 2270). Allowed values are from 0 to **length()** (p. 1667)-1.

Returns

A LoanedSample object that refers to data and **SampleInfo** (p. 2285) at the specified `index`.

8.168.4.2 length()

```
template<typename T >
unsigned int  dds::sub::LoanedSamples< T >::length ( ) const  [inline]
```

Gets the number of samples in this collection.

8.168.4.3 return_loan()

```
template<typename T >
void  dds::sub::LoanedSamples< T >::return_loan ( )  [inline]
```

Returns the samples to the **DataReader** (p. 976).

Note

Explicitly calling return_loan is optional, since the destructor does it implicitly.

This operation tells the **dds::sub::DataReader** (p. 976) that the application is done accessing the collection of samples.

It is not necessary for an application to return the loans immediately after the call to read or take. However, as these buffers correspond to internal resources, the application should not retain them indefinitely.

8.168.4.4 return_loan_noexcept()

```
template<typename T >
bool  dds::sub::LoanedSamples< T >::return_loan_noexcept ( )  [inline], [noexcept]
```

Returns the samples to the **DataReader** (p. 976) (noexcept version)

This operation has the same behavior as **return_loan()** (p. 1667) but returns false in case of error and doesn't throw exceptions.

8.168.4.5 begin() [1/2]

```
template<typename T >
iterator  dds::sub::LoanedSamples< T >::begin ( )  [inline]
```

Gets an iterator to the first sample.

Referenced by **dds::sub::LoanedSamples< T >::begin()**.

8.168.4.6 end() [1/2]

```
template<typename T >
iterator  dds::sub::LoanedSamples< T >::end ( )  [inline]
```

Gets an iterator to one past the last sample.

Referenced by **dds::sub::LoanedSamples< T >::end()**.

8.168.4.7 begin() [2/2]

```
template<typename T >
const_iterator  dds::sub::LoanedSamples< T >::begin ( ) const  [inline]
```

Gets an iterator to the first sample.

8.168.4.8 end() [2/2]

```
template<typename T >
const_iterator  dds::sub::LoanedSamples< T >::end ( ) const  [inline]
```

Gets an iterator to one past the last sample.

8.168.4.9 swap()

```
template<typename T >
void  dds::sub::LoanedSamples< T >::swap (
              LoanedSamples< T > & other ) throw ( )   [inline]
```

Swap two **LoanedSamples** (p. 1663) containers.

Referenced by **dds::sub::LoanedSamples< T >::LoanedSamples()**.

8.168.5 Friends And Related Function Documentation

8.168.5.1 move()

```
template<typename T >
LoanedSamples< T > move (
              LoanedSamples< T > & ls )  [related]
```

Creates a new **LoanedSamples** (p. 1663) instance by moving the contents of an existing one.

This function existed to provide move semantics before C++11, but is now deprecated in favor of std::move.

[DEPRECATED] Use std::move and the move constructor of **LoanedSamples** (p. 1663) instead. For example:

```
LoanedSamples<Foo> samples1 = reader.take();
LoanedSamples<Foo> samples2 = std::move(samples1);
```

Parameters

ls	The **LoanedSamples** (p. 1663) object that transfers its ownership of the contained samples into the returned object. After this call, `ls` is empty.

Returns

A new **LoanedSamples** (p. 1663) object, the new loan owner, with the same contents as `ls` had.

             LoanedSamples< T > & ls )  [related]
```

See also

LoanedSamples::end() (p. 1668)

References **dds::sub::LoanedSamples< T >::end()**.

8.168.5.5 end() [2/2]

```
template<typename T >
LoanedSamples< T >::const_iterator end (
            const  LoanedSamples< T > & ls )  [related]
```

See also

LoanedSamples::end() (p. 1668)

References **dds::sub::LoanedSamples< T >::end()**.

8.168.5.6 swap()

```
template<typename T >
void swap (
              LoanedSamples< T > & ls1,
              LoanedSamples< T > & ls2 ) throw( )   [related]
```

See also

LoanedSamples::swap() (p. 1668)

8.168.5.7 valid_data() [1/2]

```
template<typename T >
ValidLoanedSamples< T > valid_data (
              LoanedSamples< T > && samples )  [related]
```

<<***C++11***>> *(p. 353)* <<***extension***>> *(p. 354)* Returns a collection that provides access only to samples with valid data

Template Parameters

T	The topic-type. It has to match the type of the **DataReader** (p. 976).

This function transforms a **LoanedSamples** (p. 1663) collection into another collection whose iterators only access valid-data samples, skipping any sample such that !sample.info().valid().

This operation is O(1) and will not copy the data samples or allocated any additional memory.

The typical way to use this function is to directly call it on the return value of a **read()** (p. 661)/take() operation and use it in a for-loop. For example:

```
auto valid_samples = rti::sub::valid_data(reader.read());
for (auto sample : valid_samples) {
    // no need to check sample.info().valid()
    std::cout « sample.data() « std::endl;
}
```

Parameters

samples	The collection of **LoanedSamples** (p. 1663) to transform into a ValidLoanedSamples. It must be an rvalue, so valid actual parameters are the result of one of the read/take operations:
	`auto vs = rti::sub::valid_data(reader.take());`
	Or an `std::move'd` existing collection:
	`auto ls = reader.take(); auto vs = rti::sub::valid_data(std::move(ls));`
	`// 'ls' is now invalid and can't be further used`

Returns

A forward-iterable collection that provides access only to samples with valid data. Note that this collection doesn't provide random access.

Postcondition

`samples` is invalid cannot be used after this call

See also

rti::sub::valid_data(const SampleIterator<T>&) (p. 767), which applies to an **iterator** (p. 1665) rather to the whole collection

Reading data samples (p. 318)

8.168.5.8 valid_data() [2/2]

```
template<typename T >
ValidSampleIterator< T > valid_data (
             const SampleIterator< T > & sample_iterator )  [related]
```

<<***extension***>> *(p. 354)* Returns an iterator that skips invalid samples

Given a regular sample iterator, this functions creates another iterator `it` that behaves exactly the same except that `it++` moves to the next valid sample (or to the end of the collection). That is, if `it` doesn't point to the end of the collection, `it->info.valid()` is always true.

This is useful when your application doesn't need to deal with samples containing meta-information only.

For example, the following code copies all the data in a **LoanedSamples** (p. 1663) collection skipping any invalid samples (otherwise, attempting to copy the data from an invalid sample would throw an exception, see rti::sub::Loaned↩ Sample::operator const DataType& ()).

```
dds::sub::LoanedSamples<KeyedType> samples = reader.take();
std::vector<KeyedType> data_vector;
std::copy(
     rti::sub::valid_data(samples.begin()),
     rti::sub::valid_data(samples.end()),
     std::back_inserter(data_vector));
```

Note that `valid_data`(samples.begin()) won't point to the first element if that element is not a valid sample.

A similar utility is the functor **rti::sub::IsValidData** (p. 1624).

8.169.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

8.169.2 Constructor & Destructor Documentation

8.169.2.1 Locator()

```
rti::core::Locator::Locator (
            const rti::core::LocatorKind::type the_kind,
            uint32_t the_port,
            const  dds::core::ByteSeq & the_address )  [inline]
```

Construct a **Locator** (p. 1673) with the provided kind, port and address.

8.169.3 Member Function Documentation

8.169.3.1 kind() [1/2]

```
rti::core::LocatorKind::type rti::core::Locator::kind ( ) const  [inline]
```

Get the kind associated with this **Locator** (p. 1673).

The kind of locator.

If the Locator_t kind is Locator_t::KIND_UDPv4, the address contains an IPv4 address. In this case, the leading 12 octets of the Locator_t::address must be zero. The last 4 octets of Locator_t::address are used to store the IPv4 address.

If the Locator_t kind is Locator_t::KIND_UDPv6, the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the Locator_t::address field.

See also

rti::core::LocatorKind_def (p. 1681)

8.169.3.2 kind() [2/2]

```
Locator & rti::core::Locator::kind (
            const rti::core::LocatorKind::type the_kind )  [inline]
```

Set the kind associated with this **Locator** (p. 1673).

See also

rti::core::LocatorKind_def (p. 1681)

8.169.3.3 port() [1/2]

```
uint32_t rti::core::Locator::port ( ) const  [inline]
```

Get the port number associated with this **Locator** (p. 1673).

8.169.3.4 port() [2/2]

```
Locator & rti::core::Locator::port (
            uint32_t the_port )  [inline]
```

Set the port number associated with this **Locator** (p. 1673).

8.169.3.5 address() [1/2]

```
dds::core::ByteSeq rti::core::Locator::address ( ) const  [inline]
```

Get the IP address associated with this **Locator** (p. 1673).

8.169.3.6 address() [2/2]

```
Locator & rti::core::Locator::address (
            const  dds::core::ByteSeq & the_address )  [inline]
```

Set the address associated with this **Locator** (p. 1673) object.

8.169.3.7 Invalid()

```
static  Locator rti::core::Locator::Invalid ( )  [inline], [static]
```

Construct an invalid locator.

Since this class doesn't provide a default constructor if you don't know the values of a **Locator** (p. 1673) at the moment of construction use this function explicitly to obtain an invalid object to be filled out.

8.169.4 Friends And Related Function Documentation

8.169.4.1 LocatorSeq

```
typedef std::vector< Locator>  LocatorSeq  [related]
```

A sequence of **rti::core::Locator** (p. 1673).

8.170 rti::core::policy::LocatorFilter Class Reference

<<***extension***>> *(p. 116)* Configures how the **dds::topic::PublicationBuiltinTopicData** (p. 1977) reports the configuration of a **MultiChannel** (p. 1749) DataWriter.

```

```

Public Types

- typedef **rti::core::LocatorFilterElement Filter**

  *A **LocatorFilter** (p. 1676) policy is a collection of **LocatorFilterElement** (p. 1678).*
- typedef std::vector< **Filter** > **FilterSeq**

  A vector of Filter.

Public Member Functions

- **LocatorFilter** ()

  Creates the default policy.
- **LocatorFilter** (const **FilterSeq** &the_locator_filters, const std::string &the_filter_name= **rti::topic::stringmatch_filter_name**())

  Creates an instance with a sequence of filters and a filter name.
- **LocatorFilter** & **locator_filters** (const **FilterSeq** &the_locator_filters)

  Sets the locator filters.
- **FilterSeq locator_filters** () const

  Gets the locator filters.
- **LocatorFilter** & **filter_name** (const std::string &the_filter_name)

  Sets the filter name.
- std::string **filter_name** () const

  Gets the filter name.

8.170.1 Detailed Description

<<***extension***>> *(p. 116)* Configures how the **dds::topic::PublicationBuiltinTopicData** (p. 1977) reports the configuration of a **MultiChannel** (p. 1749) DataWriter.

Entity:

dds::topic::PublicationBuiltinTopicData (p. 1977)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.170.2 Member Typedef Documentation

8.170.2.1 Filter

```
typedef  rti::core::LocatorFilterElement  rti::core::policy::LocatorFilter::Filter
```

A **LocatorFilter** (p. 1676) policy is a collection of **LocatorFilterElement** (p. 1678).

8.170.2.2 FilterSeq

```
typedef std::vector< Filter>  rti::core::policy::LocatorFilter::FilterSeq
```

A vector of Filter.

8.170.3 Constructor & Destructor Documentation

8.170.3.1 LocatorFilter() [1/2]

```
rti::core::policy::LocatorFilter::LocatorFilter ( )  [inline]
```

Creates the default policy.

8.170.3.2 LocatorFilter() [2/2]

```
rti::core::policy::LocatorFilter::LocatorFilter (
            const  FilterSeq & the_locator_filters,
            const std::string & the_filter_name =  rti::topic::stringmatch_filter_name() )  [inline]
```

Creates an instance with a sequence of filters and a filter name.

8.170.4 Member Function Documentation

8.170.4.1 locator_filters() [1/2]

```
LocatorFilter & rti::core::policy::LocatorFilter::locator_filters (
            const  FilterSeq & the_locator_filters )
```

Sets the locator filters.

A sequence length of zero indicates the **rti::core::policy::MultiChannel** (p. 1749) is not in use.

[default] Empty sequence.

8.170.4.2 locator_filters() [2/2]

```
FilterSeq rti::core::policy::LocatorFilter::locator_filters ( ) const
```

Gets the locator filters.

8.170.4.3 filter_name() [1/2]

```
LocatorFilter & rti::core::policy::LocatorFilter::filter_name (
            const std::string & the_filter_name )
```

Sets the filter name.

The following builtin filters are supported: **rti::topic::sql_filter_name** (p. 49) and **rti::topic::stringmatch_filter_name** (p. 49).

[default] rti::topic::stringmatch_filter_name (p. 49)

References **rti::topic::stringmatch_filter_name()**.

8.170.4.4 filter_name() [2/2]

```
std::string rti::core::policy::LocatorFilter::filter_name ( ) const
```

Gets the filter name.

8.171 rti::core::LocatorFilterElement Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Specifies the configuration of an individual channel within a MultiChannel DataWriter.

```
#include <LocatorFilter.hpp>
```

Public Member Functions

- **LocatorFilterElement** (const std::string &the_filter_expression, const rti::core::LocatorSeq &the_locators)

  Creates an instance with the provided filter_expression and locators.
- rti::core::LocatorSeq **locators** () const

  Get the locators associated with this filter.
- **LocatorFilterElement** & **locators** (const LocatorSeq &the_locators)

  Set the locators associated with this LocatorFilterImpl.
- std::string **filter_expression** () const

  Get the filter expression.
- **LocatorFilterElement** & **filter_expression** (const std::string &the_expression)

  Set the filter expression.

8.171.1 Detailed Description

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Specifies the configuration of an individual channel within a MultiChannel DataWriter.

See also

dds::core::policy::LocatorFilter

8.171.2 Constructor & Destructor Documentation

8.171.2.1 LocatorFilterElement()

```
rti::core::LocatorFilterElement::LocatorFilterElement (
            const std::string & the_filter_expression,
            const rti::core::LocatorSeq & the_locators )  [inline]
```

Creates an instance with the provided filter_expression and locators.

Parameters

the_filter_expression	A logical expression used to determine the data that will be published in the channel.
the_locators	Sequence containing from one to four **rti::core::Locator** (p. 1673)

8.171.3 Member Function Documentation

8.171.3.1 locators() [1/2]

```
rti::core::LocatorSeq rti::core::LocatorFilterElement::locators ( ) const  [inline]
```

Get the locators associated with this filter.

The locators are a sequence containing from one to four **rti::core::Locator** (p. 1673), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

8.171.3.2 locators() [2/2]

```
LocatorFilterElement & rti::core::LocatorFilterElement::locators (
            const LocatorSeq & the_locators )  [inline]
```

Set the locators associated with this LocatorFilterImpl.

8.171.3.3 filter_expression() [1/2]

```
std::string rti::core::LocatorFilterElement::filter_expression ( ) const  [inline]
```

Get the filter expression.

8.171.3.4 filter_expression() [2/2]

```
LocatorFilterElement & rti::core::LocatorFilterElement::filter_expression (
            const std::string & the_expression )  [inline]
```

Set the filter expression.

The filter expression is a logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

The syntax of the expression will depend on the value of **rti::core::policy::LocatorFilter::filter_name** (p. 1678)

See also

Queries and Filters Syntax (p. 84)

[default] NULL (invalid value)

8.172 rti::core::LocatorKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) LocatorKind.

`#include <Locator.hpp>`

Public Types

- enum **type** {
  INVALID = NDDS_TRANSPORT_CLASSID_INVALID ,
  ANY = NDDS_TRANSPORT_CLASSID_ANY ,
  UDPv4 = NDDS_TRANSPORT_CLASSID_UDPv4 ,
  UDPv4_WAN = NDDS_TRANSPORT_CLASSID_UDPv4_WAN ,
  SHMEM = NDDS_TRANSPORT_CLASSID_SHMEM ,
  SHMEM_510 = NDDS_TRANSPORT_CLASSID_SHMEM_510 ,
  INTRA = NDDS_TRANSPORT_CLASSID_INTRA ,
  UDPv6 = NDDS_TRANSPORT_CLASSID_UDPv6 ,

  The underlying `enum` type.

8.173.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) LogCategory.

8.173.2 Member Enumeration Documentation

8.173.2.1 type

`enum` **rti::config::LogCategory_def::type**

The underlying `enum` type.

Enumerator

platform	Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connext is running are in this category.

Enumerator

communication	Log messages pertaining to data serialization and deserialization and network traffic are in this category.
database	Log messages pertaining to the internal database in which RTI Connext objects are stored are in this category.
entities	Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)
api	Log messages pertaining to the API layer of RTI Connext (such as method argument validation) are in this category.
discovery	Log messages pertaining to discovery are in this category.
security	Log messages pertaining to security are in this category. These messages include any messages logged by RTI Connext components even if they are not related to the Security Plugins.
user	Log messages that are generated by the user using the following log APIs: **rti::config::Logger::emergency** (p. 1689), **rti::config::Logger::alert** (p. 1689), **rti::config::Logger::critical** (p. 1689), **rti::config::Logger::error** (p. 1689), **rti::config::Logger::warning** (p. 1690), **rti::config::Logger::notice** (p. 1690), **rti::config::Logger::informational** (p. 1690), **rti::config::Logger::debug** (p. 1690).
all_categories	Log messages pertaining to all categories in RTI Connext.

8.174 rti::config::Logger Class Reference

The singleton type used to configure RTI Connext logging.

```
#include <rti/config/Logger.hpp>
```

Public Member Functions

- **Verbosity verbosity** ()

  Get the verbosity at which RTI Connext is currently logging diagnostic information.
- **Verbosity verbosity_by_category** (**LogCategory** category)

  Get the verbosity at which RTI Connext is currently logging diagnostic information in the given category.
- void **verbosity** (**Verbosity** verbosity)

  Set the verbosity at which RTI Connext will log diagnostic information.
- void **verbosity_by_category** (**LogCategory** category, **Verbosity verbosity**)

  Set the verbosity at which RTI Connext will log diagnostic information in the given category.
- FILE * **output_file** ()

  Get the file to which the logged output is redirected.
- void **output_file** (FILE *out)

  Set the file to which the logged output is redirected.
- void **output_file** (const char *file_name)

  Set the name of the file to which the logged output is redirected.
- void **output_file_set** (const char *file_preffix, const char *file_suffix, int max_bytes, int max_files= **dds::core**↩ **::LENGTH_UNLIMITED**)

Configure a set of files to redirect the logged output.

- void **output_handler** (std::function< void(const **LogMessage** &)> handler)

  Redirects RTI Connext logging to a function.

- void **reset_output_handler** ()

  Resets a previously set output handler.

- **PrintFormat print_format** ()

  *Get the current message format for the log level **rti::config::LogLevel_def::EXCEPTION** (p. 1693).*

- void **print_format** (**PrintFormat** print_format)

  *Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **rti::config::LogLevel_def::FATAL_ERROR** (p. 1693). When the **Activity Context** (p. 449) is printed, the user can select the information that will be part of the **Activity Context** (p. 449) by using the API **rti::config::activity_context::set_attribute_mask()** (p. 450).*

- **PrintFormat print_format_by_log_level** (**LogLevel** log_level)

  Get the current message format, by log level, that RTI Connext is using to log diagnostic information.

- void **print_format_by_log_level** (**PrintFormat print_format**, **LogLevel** log_level)

  *Set the message format, by log level, that RTI Connext will use to log diagnostic information. When the **Activity Context** (p. 449) is printed, the user can select the information that will be part of the **Activity Context** (p. 449) by using the API **rti::config::activity_context::set_attribute_mask()** (p. 450).*

- void **emergency** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::emergency** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **alert** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::alert** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **critical** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::critical** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **error** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::error** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **warning** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::warning** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **notice** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::notice** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **informational** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::informational** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **debug** (const char *msg)

  *Logs message with **rti::config::SyslogLevel::debug** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **emergency** (std::string_view msg)

  *Logs message with **rti::config::SyslogLevel::emergency** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **alert** (std::string_view msg)

  *Logs message with **rti::config::SyslogLevel::alert** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **critical** (std::string_view msg)

  *Logs message with **rti::config::SyslogLevel::critical** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **error** (std::string_view msg)

  *Logs message with **rti::config::SyslogLevel::error** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **warning** (std::string_view msg)

  *Logs message with **rti::config::SyslogLevel::warning** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **notice** (std::string_view msg)

  *Logs message with **rti::config::SyslogLevel::notice** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..*

- void **informational** (std::string_view msg)

Logs message with ***rti::config::SyslogLevel::informational*** *(p. 458) and* ***rti::config::LogCategory_def::user*** *(p. 1683)..*

- void **debug** (std::string_view msg)

  Logs message with ***rti::config::SyslogLevel::debug*** *(p. 458) and* ***rti::config::LogCategory_def::user*** *(p. 1683)..*

Static Public Member Functions

- static **Logger** & **instance** ()

  Get the singleton instance of this type.

8.174.1 Detailed Description

The singleton type used to configure RTI Connext logging.

8.174.2 Member Function Documentation

8.174.2.1 instance()

```
static Logger & rti::config::Logger::instance ( ) [inline], [static]
```

Get the singleton instance of this type.

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

Referenced by **rti::config::ScopedLoggerVerbosity::ScopedLoggerVerbosity()**, and **rti::config::Scoped↩ LoggerVerbosity::∼ScopedLoggerVerbosity()**.

8.174.2.2 verbosity() [1/2]

```
Verbosity rti::config::Logger::verbosity ( )
```

Get the verbosity at which RTI Connext is currently logging diagnostic information.

The default verbosity if **rti::config::Logger::verbosity** (p. 1685) is never called is **rti::config::Verbosity_def↩ ::exception** (p. 2614).

If **rti::config::Logger::verbosity_by_category** (p. 1685) has been used to set different verbosities for different categories of messages, this method will return the maximum verbosity of all categories.

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

Referenced by **rti::config::ScopedLoggerVerbosity::ScopedLoggerVerbosity()**, and **rti::config::Scoped↩ LoggerVerbosity::∼ScopedLoggerVerbosity()**.

8.174.2.3 verbosity_by_category() [1/2]

```
Verbosity rti::config::Logger::verbosity_by_category (
            LogCategory category )
```

Get the verbosity at which RTI Connext is currently logging diagnostic information in the given category.

The default verbosity if **rti::config::Logger::verbosity** (p. 1685) and **rti::config::Logger::verbosity_by_category** (p. 1685) are never called is **rti::config::Verbosity_def::exception** (p. 2614).

8.174.2.4 verbosity() [2/2]

```
void rti::config::Logger::verbosity (
            Verbosity verbosity )
```

Set the verbosity at which RTI Connext will log diagnostic information.

Note: Logging at high verbosities will be detrimental to your application's performance. Your default setting should typically remain at **rti::config::Verbosity_def::warning** (p. 2614) or below. (The default verbosity if you never set it is **rti::config::Verbosity_def::exception** (p. 2614).)

8.174.2.5 verbosity_by_category() [2/2]

```
void rti::config::Logger::verbosity_by_category (
            LogCategory category,
            Verbosity verbosity )
```

Set the verbosity at which RTI Connext will log diagnostic information in the given category.

8.174.2.6 output_file() [1/3]

```
FILE * rti::config::Logger::output_file ( )
```

Get the file to which the logged output is redirected.

If no output file has been registered through **rti::config::Logger::output_file** (p. 1686), this method will return NULL. In this case, logged output will on most platforms go to standard out as if through printf.

8.174.2.7 output_file() [2/3]

```
void rti::config::Logger::output_file (
            FILE * out )
```

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

For better performance when log messages are generated frequently, the log messages are not flushed into a file immediately after they are generated. In other words, while writing a log message, RTI Connext only calls the function fwrite() (see https://pubs.opengroup.org/onlinepubs/009695399/functions/fwrite.html); it does not call the function fflush() (see https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html). If your application requires a different flushing behavior, you may use **rti::config::Logger::output_handler** (p. 1687) to configure a custom logging device.

8.174.2.8 output_file() [3/3]

```
void rti::config::Logger::output_file (
            const char * file_name )
```

Set the name of the file to which the logged output is redirected.

The name may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

See **rti::config::Logger::output_file** (p. 1686) for the flushing behavior.

8.174.2.9 output_file_set()

```
void rti::config::Logger::output_file_set (
            const char * file_preffix,
            const char * file_suffix,
            int max_bytes,
            int max_files = dds::core::LENGTH_UNLIMITED )
```

Configure a set of files to redirect the logged output.

The logged output will be redirected to a set of files whose names are configured with a prefix and a suffix. The maximum number of bytes configures how many bytes to write into a file before opening the next file. After reaching the maximum number of files, the first one is overwritten.

For example, if the prefix is '**Foo** (p. 1588)', the suffix is '.txt', the max number of bytes is 1GB, and the max number of files is 3, the logger will create (at most) these files: Foo1.txt, Foo2.txt, and Foo3.txt. It will write to Foo1.txt, and after writing 1GB, it will move on to Foo2.txt, then to Foo3.txt, then to Foo1.txt again, and so on.

To stop logging to these files and redirect the output to the platform-specific location, pass NULL, NULL, 0, 0.

See **rti::config::Logger::output_file** (p. 1686) for the flushing behavior.

8.174.2.10 output_handler()

```
void rti::config::Logger::output_handler (
            std::function< void(const LogMessage &)> handler ) [inline]
```

Redirects RTI Connext logging to a function.

When a handler is set, log messages stop being directed to the standard output and are passed to the handler.

To direct logging back to the standard output, use **reset_output_handler()** (p. 1688).

Parameters

handler	A function or function object capable of receiving a `const` **LogMessage** (p. 1693) `&` argument, the log message.

The following example sets a handler that saves all log messages in a vector:

```
std::vector<std::string> saved_logs;
Logger::instance().output_handler([&saved_logs](const LogMessage& message) {
    saved_logs.push_back(message.text); // message is copied as a std::string
});
```

The `char *` in the **LogMessage** (p. 1693) is only valid within the callback.

8.174.2.11 reset_output_handler()

```
void rti::config::Logger::reset_output_handler ( )  [inline]
```

Resets a previously set output handler.

Directs RTI Connext logging back to the standard output.

8.174.2.12 print_format() [1/2]

```
PrintFormat rti::config::Logger::print_format ( )
```

Get the current message format for the log level **rti::config::LogLevel_def::EXCEPTION** (p. 1693).

Use rti::config::Logger::get_print_format_by_log_level to retrieve the format for other log levels.

If **rti::config::Logger::print_format** (p. 1688) is never called, the default format is **PrintFormat_def::DEFAULT** (p. 1961).

8.174.2.13 print_format() [2/2]

```
void rti::config::Logger::print_format (
              PrintFormat print_format )
```

Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **rti::config::LogLevel_def::FATAL_ERROR** (p. 1693). When the **Activity Context** (p. 449) is printed, the user can select the information that will be part of the **Activity Context** (p. 449) by using the API **rti::config::activity_context::set_attribute_mask()** (p. 450).

8.174.2.14 print_format_by_log_level() [1/2]

```
PrintFormat rti::config::Logger::print_format_by_log_level (
            LogLevel log_level )
```

Get the current message format, by log level, that RTI Connext is using to log diagnostic information.

If **rti::config::Logger::print_format** (p. 1688) is never called, the default format is **PrintFormat_def::DEFAULT** (p. 1961).

8.174.2.15 print_format_by_log_level() [2/2]

```
void rti::config::Logger::print_format_by_log_level (
            PrintFormat print_format,
            LogLevel log_level )
```

Set the message format, by log level, that RTI Connext will use to log diagnostic information. When the **Activity Context** (p. 449) is printed, the user can select the information that will be part of the **Activity Context** (p. 449) by using the API **rti::config::activity_context::set_attribute_mask()** (p. 450).

8.174.2.16 emergency() [1/2]

```
void rti::config::Logger::emergency (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::emergency** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.17 alert() [1/2]

```
void rti::config::Logger::alert (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::alert** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.18 critical() [1/2]

```
void rti::config::Logger::critical (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::critical** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.19 error() [1/2]

```
void rti::config::Logger::error (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::error** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.20 warning() [1/2]

```
void rti::config::Logger::warning (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::warning** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.21 notice() [1/2]

```
void rti::config::Logger::notice (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::notice** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.22 informational() [1/2]

```
void rti::config::Logger::informational (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::informational** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.23 debug() [1/2]

```
void rti::config::Logger::debug (
            const char * msg )
```

Logs message with **rti::config::SyslogLevel::debug** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.24 emergency() [2/2]

```
void rti::config::Logger::emergency (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::emergency** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.25 alert() [2/2]

```
void rti::config::Logger::alert (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::alert** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.26 critical() [2/2]

```
void rti::config::Logger::critical (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::critical** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.27 error() [2/2]

```
void rti::config::Logger::error (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::error** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.28 warning() [2/2]

```
void rti::config::Logger::warning (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::warning** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.29 notice() [2/2]

```
void rti::config::Logger::notice (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::notice** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.30 informational() [2/2]

```
void rti::config::Logger::informational (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::informational** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.174.2.31 debug() [2/2]

```
void rti::config::Logger::debug (
            std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::debug** (p. 458) and **rti::config::LogCategory_def::user** (p. 1683)..

8.175 rti::config::LogLevel_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) LogLevel;.

```
#include <rti/config/Logger.hpp>
```

Public Types

- enum **type** {
  FATAL_ERROR ,
  EXCEPTION ,
  WARNING ,
  STATUS_LOCAL ,
  STATUS_REMOTE ,
  STATUS_ALL }

  The underlying `enum` *type.*

8.175.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) LogLevel;.

8.175.2 Member Enumeration Documentation

8.175.2.1 type

enum **rti::config::LogLevel_def::type**

The underlying enum type.

Enumerator

FATAL_ERROR	The message describes a fatal error. A fatal error indicates an unrecoverable situation in the functioning of RTI Connext. Error messages with this log level usually indicate a violation of an internal invariant or a segfault, and may include the function call stack where the fatal error happened.
EXCEPTION	The message describes an error. An error indicates a non-fatal problem in the functioning of RTI Connext. Errors are usually recoverable and will not stop application execution, although they may prevent some features from working properly. The most common cause of non-fatal errors is incorrect configuration and incorrect arguments.
WARNING	The message describes a warning. A warning indicates that RTI Connext is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
STATUS_LOCAL	The message contains information about the lifecycles of local RTI Connext objects will be logged.
STATUS_REMOTE	The message contains information about the lifecycles of remote RTI Connext objects will be logged.
STATUS_ALL	The message contains debug information that might be relevant to your application.

8.176 rti::config::LogMessage Struct Reference

A log message's input parameter to an output handler, including the text and additional information.

#include <rti/config/Logger.hpp>

Public Attributes

- **LogLevel level**

The log level of this message.

- const char * **text**

  The text of this message.

- bool **is_security_message**

  Indicates if the message is a security-related message.

- bool **is_license_message**

  Indicates if the message is a license-related message.

- unsigned int **message_id**

  A numeric code that identifies a specific log message.

- **dds::core::Duration timestamp**

  The time when the log message was printed.

- **LogFacility facility**

  The Facility associated with the log message.

8.176.1 Detailed Description

A log message's input parameter to an output handler, including the text and additional information.

This struct passed to the handler set in **Logger::output_handler()** (p. 1687).

8.176.2 Member Data Documentation

8.176.2.1 level

```
LogLevel rti::config::LogMessage::level
```

The log level of this message.

8.176.2.2 text

```
const char* rti::config::LogMessage::text
```

The text of this message.

8.176.2.3 is_security_message

```
bool rti::config::LogMessage::is_security_message
```

Indicates if the message is a security-related message.

A "security-related message" is a log message that meets any of the following:

- A security event logged with the RTI Security Plugins Logging Plugin.
- Any regular message coming from the RTI Security Plugins.
- RTI TLS Support log messages related to OpenSSL (e.g., SSL handshake failures or certificate validation failures).

8.176.2.4 is_license_message

```
bool rti::config::LogMessage::is_license_message
```

Indicates if the message is a license-related message.

When using a licensed version of RTI Connext (such as the RTI Connext Express edition), certain messages related to the license, such as the trial expiration date or license limitations, are logged when a DomainParticipant is created. This flag indicates whether the message is one of those license-related messages.

8.176.2.5 message_id

```
unsigned int rti::config::LogMessage::message_id
```

A numeric code that identifies a specific log message.

8.176.2.6 timestamp

```
dds::core::Duration rti::config::LogMessage::timestamp
```

The time when the log message was printed.

8.176.2.7 facility

```
LogFacility rti::config::LogMessage::facility
```

The Facility associated with the log message.

8.177 rti::core::LongDouble Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Encapsulates an IDL `long double`

`#include <LongDouble.hpp>`

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **LongDouble** ()
  Creates a long double with value 0.
- char **operator[ ]** (size_t i) const
  Access a byte (0 to 15)
- char & **operator[ ]** (size_t i)
  Access a byte (0 to 15)

8.177.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Encapsulates an IDL `long double`

Since the representation of a C++ `long double` is not portable, this class encapsulates an **IDL** (p. 606) 16-byte `long double`.

8.177.2 Constructor & Destructor Documentation

8.177.2.1 LongDouble()

```
rti::core::LongDouble::LongDouble ( )  [inline]
```

Creates a long double with value 0.

8.177.3 Member Function Documentation

8.177.3.1 operator[]() [1/2]

```
char rti::core::LongDouble::operator[] (
            size_t i ) const  [inline]
```

Access a byte (0 to 15)

8.177.3.2 operator[]() [2/2]

```
char & rti::core::LongDouble::operator[] (
            size_t i )  [inline]
```

Access a byte (0 to 15)

8.178 dds::sub::DataReader< T >::ManipulatorSelector Class Reference

A **Selector** (p. 2320) class enabling the streaming API.

`#include <TDataReader.hpp>`

Public Member Functions

- **ManipulatorSelector** & **operator**>> (**dds::sub::LoanedSamples**< T > &samples)

  *Streaming operator taking a **LoanedSamples** (p. 1663) object.*
- **ManipulatorSelector** & **operator**>> (bool(*manipulator)(**ReadModeDummyType**))

  Streaming operator taking in a stream manipulator that will determine whether the samples will be read or taken.
- template<typename Functor >
  ManipulatorSelector & **operator**>> (Functor f)

  Streaming operator taking in a Functor.

8.178.1 Detailed Description

template<typename T>
class dds::sub::DataReader< T >::ManipulatorSelector

A **Selector** (p. 2320) class enabling the streaming API.

Similar to the **Selector** (p. 2320) class, the **ManipulatorSelector** (p. 1697) class is used by the **DataReader** (p. 976) to compose read and take operations using the streaming operator >>.

A **ManipulatorSelector** (p. 1697) has an associated **DataReader** (p. 976) and configures the behavior of the read or take operation performed by that **DataReader** (p. 976).

The **ManipulatorSelector** (p. 1697) works by using a number of functions which configure the stream:

- **read(dds::sub::ReadModeDummyType)** (p. 1024)
- **take(dds::sub::ReadModeDummyType)** (p. 1024)
- **dds::sub::max_samples(uint32_t n)** (p. 662)
- **dds::sub::content(const dds::sub::Query& query)** (p. 663)
- **dds::sub::condition(const dds::sub::cond::ReadCondition& condition)** (p. 663)
- **dds::sub::state(const dds::sub::status::DataState& s)** (p. 664)
- **dds::sub::instance(const dds::core::InstanceHandle& h)** (p. 665)
- **dds::sub::next_instance(const dds::core::InstanceHandle& h)** (p. 665)

The above functions all return functors. You do not and should not use these functors directly:

- dds::sub::functors::MaxSamplesManipulatorFunctor
- dds::sub::functors::ContentFilterManipulatorFunctor
- dds::sub::functors::ConditionManipulatorFunctor
- dds::sub::functors::StateFilterManipulatorFunctor
- dds::sub::functors::InstanceManipulatorFunctor
- dds::sub::functors::NextInstanceManipulatorFunctor

For example, to perform a read of at most 5 unread samples:

```
LoanedSamples<Foo> samples;
reader » read
       » max_samples(5)
       » state(dds::sub::status::DataState::new_data())
       » samples;
```

8.178.2 Member Function Documentation

8.178.2.1 operator>>() [1/3]

```
template<typename T >
ManipulatorSelector &  dds::sub::DataReader< T >::ManipulatorSelector>> (
              dds::sub::LoanedSamples< T > & samples )  [inline]
```

Streaming operator taking a **LoanedSamples** (p. 1663) object.

This operator allows you to direct the outcome of a string of stream operators into a **LoanedSamples** (p. 1663) object.

Parameters

samples	The **LoanedSamples** (p. 1663) container to fill with the read/taken samples.

8.178.2.2 operator>>() [2/3]

```
template<typename T >
ManipulatorSelector &  dds::sub::DataReader< T >::ManipulatorSelector>> (
             bool(*)( ReadModeDummyType) manipulator )  [inline]
```

Streaming operator taking in a stream manipulator that will determine whether the samples will be read or taken.

The provided manipulator for this operator will be either **dds::sub::read** (p. 661) or **dds::sub::take** (p. 662).

Parameters

manipulator	Either **dds::sub::read** (p. 661) or **dds::sub::take** (p. 662)

See also

dds::sub::read(dds::sub::ReadModeDummyType) (p. 661)

dds::sub::take(dds::sub::ReadModeDummyType) (p. 662)

8.178.2.3 operator>>() [3/3]

```
template<typename T >
template<typename Functor >
```

```
ManipulatorSelector & dds::sub::DataReader< T >::ManipulatorSelector::operator>> (
            Functor f ) [inline]
```

Streaming operator taking in a Functor.

There are a number of functions which return the Functors that this operator expects:

- **dds::sub::max_samples(uint32_t n)** (p. 662)
- **dds::sub::content(const dds::sub::Query& query)** (p. 663)
- **dds::sub::condition(const dds::sub::cond::ReadCondition& condition)** (p. 663)
- **dds::sub::state(const dds::sub::status::DataState& s)** (p. 664)
- **dds::sub::instance(const dds::core::InstanceHandle& h)** (p. 665)
- **dds::sub::next_instance(const dds::core::InstanceHandle& h)** (p. 665)

Parameters

f	A Functor that is returned from one of the above functions

Returns

ManipulatorSelector (p. 1697)&

8.179 rti::sub::ManipulatorSelector< T > Class Template Reference

```
#include <SelectorImpl.hpp>
```

Inherits rti::sub::DefaultSelector< T >.

8.179.1 Detailed Description

template<typename T>
class rti::sub::ManipulatorSelector< T >

Selector class enabling the streaming API.

8.180 dds::core::xtypes::Member Class Reference

<<***value-type***>> *(p. 350)* Represents a **StructType** (p. 2400) member

```
#include "dds/core/xtypes/MemberType.hpp"
```

Public Member Functions

- **Member** (const std::string & **name**, const DynamicTypeImpl & **type**)

  Creates a member consisting of a name and a type.
- **Member** (const std::string &the_name, DynamicTypeImpl &&the_type)

  *<<**C++11**>> (p. 353) Creates a member consisting of a name and a type.*
- const **dds::core::string** & **name** () const

  Gets the member name.
- **dds::core::string** & **name** ()

  Gets the member name.
- const **DynamicType** & **type** ()

  Gets the member type.
- bool **has_id** () const

  Indicates it the member has an ID annotation.
- int32_t **get_id** () const

  Returns the ID annotation of this member.
- bool **is_pointer** () const

  *<<**extension**>> (p. 354) Indicates if this member is a pointer*
- bool **is_key** () const

  Checks if a member is a key.
- bool **is_optional** () const

  Checks if a member is optional.
- bool **is_must_understand** () const

  Checks if a member is marked as "must understand".
- bool **is_bitset** () const

  Checks if a member is a bitset.
- bool **has_bitbound** () const

  Unsupported, always returns false.
- int32_t **get_bitbound** () const

  Unsupported, always returns 32.
- **Member** & **name** (const **dds::core::string** &value)

  Sets the member name.
- **Member** & **key** (bool value)

  Sets the key annotation of a member.
- **Member** & **optional** (bool value)

  Sets the optional annotation of a member.
- **Member** & **must_understand** (bool value)

  Sets the "must understand" annotation of a member.
- **Member** & **id** (int32_t value)

  Sets the ID annotation of a member.
- **Member** & **pointer** (bool value)

  *<<**extension**>> (p. 354) Makes a member a pointer*

Static Public Attributes

- static const int32_t **INVALID_ID**

  The special ID of a member without the ID annotation.

8.180.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents a **StructType** (p. 2400) member

Encapsulates the name and type of a **StructType** (p. 2400) member along with several IDL annotations (key, optional, bitset, bitbound, id).

8.180.2 Constructor & Destructor Documentation

8.180.2.1 Member() [1/2]

```
dds::core::xtypes::Member::Member (
            const std::string & name,
            const DynamicTypeImpl & type )
```

Creates a member consisting of a name and a type.

8.180.2.2 Member() [2/2]

```
dds::core::xtypes::Member::Member (
            const std::string & the_name,
            DynamicTypeImpl && the_type )  [inline]
```

<<***C++11***>> *(*p. *353)* Creates a member consisting of a name and a type.

The type is moved.

8.180.3 Member Function Documentation

8.180.3.1 name() [1/3]

```
const  dds::core::string & dds::core::xtypes::Member::name ( ) const
```

Gets the member name.

8.180.3.2 name() [2/3]

```
dds::core::string & dds::core::xtypes::Member::name ( )
```

Gets the member name.

8.180.3.3 type()

```
const  DynamicType & dds::core::xtypes::Member::type ( )
```

Gets the member type.

8.180.3.4 has_id()

```
bool dds::core::xtypes::Member::has_id ( ) const
```

Indicates it the member has an ID annotation.

True if this member has been annotated explicitly with an ID. False if the has a default-assigned ID.

8.180.3.5 get_id()

```
int32_t dds::core::xtypes::Member::get_id ( ) const
```

Returns the ID annotation of this member.

If **has_id()** (p. 1703) is true, this returns the value of the ID annotation. Otherwise it returns INVALID_ID.

8.180.3.6 is_pointer()

```
bool dds::core::xtypes::Member::is_pointer ( ) const
```

<<***extension***>> *(p. 354)* Indicates if this member is a pointer

8.180.3.7 is_key()

```
bool dds::core::xtypes::Member::is_key ( ) const
```

Checks if a member is a key.

This corresponds to the @Key IDL member annotation

8.180.3.8 is_optional()

```
bool dds::core::xtypes::Member::is_optional ( ) const
```

Checks if a member is optional.

This corresponds to the @Optional IDL member annotation

8.180.3.9 is_must_understand()

```
bool dds::core::xtypes::Member::is_must_understand ( ) const
```

Checks if a member is marked as "must understand".

This corresponds to the @must_understand IDL member annotation.

8.180.3.10 is_bitset()

```
bool dds::core::xtypes::Member::is_bitset ( ) const
```

Checks if a member is a bitset.

8.180.3.11 has_bitbound()

```
bool dds::core::xtypes::Member::has_bitbound ( ) const
```

Unsupported, always returns false.

8.180.3.12 get_bitbound()

```
int32_t dds::core::xtypes::Member::get_bitbound ( ) const
```

Unsupported, always returns 32.

8.180.3.13 name() [3/3]

```
Member & dds::core::xtypes::Member::name (
            const  dds::core::string & value )
```

Sets the member name.

8.180.3.14 key()

```
Member & dds::core::xtypes::Member::key (
            bool value )
```

Sets the key annotation of a member.

Postcondition

If **optional()** (p. 1705) was true and key is set to true, **optional()** (p. 1705) becomes false, because a member can't be both a key and optional.

[default] false

8.180.3.15 optional()

```
Member & dds::core::xtypes::Member::optional (
            bool value )
```

Sets the optional annotation of a member.

Postcondition

If **key()** (p. 1704) was true and optional is set to true, **key()** (p. 1704) becomes false, because a member can't be both a key and optional.

[default] false

8.180.3.16 must_understand()

```
Member & dds::core::xtypes::Member::must_understand (
            bool value )
```

Sets the "must understand" annotation of a member.

[default] false

8.180.3.17 id()

```
Member & dds::core::xtypes::Member::id (
            int32_t value )
```

Sets the ID annotation of a member.

[default] Automatically assigned as the ID of the previous member plus one previous member

8.180.3.18 pointer()

```
Member & dds::core::xtypes::Member::pointer (
            bool value )
```

<<***extension***>> *(*p. *354)* Makes a member a pointer

[default] false

8.180.4 Member Data Documentation

8.180.4.1 INVALID_ID

```
const int32_t dds::core::xtypes::Member::INVALID_ID  [static]
```

The special ID of a member without the ID annotation.

8.181 rti::core::policy::Monitoring Class Reference

<<***extension***>> *(*p. *116)* Configures the use of the RTI **Monitoring** (p. 1706) Library 2.0 to collect and distribute RTI Connext telemetry data.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Monitoring** ()

  Creates the default policy (monitoring is disabled).
- **Monitoring** & **enable** (bool the_enable)

  <<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116) Enables the collection and distribution of telemetry data for an RTI Connext application using RTI **Monitoring** (*p. *1706) Library 2.0.*
- bool **enable** () const

  Getter (see setter with the same name).
- **Monitoring** & **application_name** (const **rti::core::optional_value**< std::string > &the_application_name)

  Sets the name of the resource that represents this RTI Connext application.
- **Monitoring** & **application_name** (const char *the_application_name)

  Sets the name of the resource that represents this RTI Connext application.
- **rti::core::optional_value**< std::string > **application_name** () const

  Getter (see setter with the same name).
- **Monitoring** & **distribution_settings** (const **MonitoringDistributionSettings** &the_distribution_settings)

  <<***extension***>> *(*p. *116) Configures the distribution of telemetry data.*
- const **MonitoringDistributionSettings** & **distribution_settings** () const

Gets the distribution settings by const-reference (see setter).

- **MonitoringDistributionSettings** & **distribution_settings** ()

  Gets the distribution settings by reference (see setter).

- **Monitoring** & **telemetry_data** (const **MonitoringTelemetryData** &the_telemetry_data)

  *<<**extension**>> (p. 116) Configures the telemetry data that will be distributed.*

- const **MonitoringTelemetryData** & **telemetry_data** () const

  Gets the telemetry data by const-reference (see setter).

- **MonitoringTelemetryData** & **telemetry_data** ()

  Gets the telemetry data by reference (see setter).

Static Public Member Functions

- static **Monitoring** **Enabled** ()

  *Returns an instance that enables **Monitoring** (p. 1706) with default settings.*

- static **Monitoring** **Disabled** ()

  *Returns an instance that disables **Monitoring** (p. 1706).*

8.181.1 Detailed Description

*<<**extension**>> (p. 116)* Configures the use of the RTI **Monitoring** (p. 1706) Library 2.0 to collect and distribute RTI Connext telemetry data.

8.181.2 Constructor & Destructor Documentation

8.181.2.1 Monitoring()

```
rti::core::policy::Monitoring::Monitoring ( )  [inline]
```

Creates the default policy (monitoring is disabled).

8.181.3 Member Function Documentation

8.181.3.1 Enabled()

```
static  Monitoring rti::core::policy::Monitoring::Enabled ( )  [inline], [static]
```

Returns an instance that enables **Monitoring** (p. 1706) with default settings.

8.181.3.2 Disabled()

```
static  Monitoring rti::core::policy::Monitoring::Disabled ( )  [inline], [static]
```

Returns an instance that disables **Monitoring** (p. 1706).

8.181.3.3 enable() [1/2]

```
Monitoring & rti::core::policy::Monitoring::enable (
            bool the_enable )
```

*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI **Monitoring** (p. 1706) Library 2.0.

RTI **Monitoring** (p. 1706) Library 2.0 is **automatically enabled** under the following conditions:

- For RTI Connext applications that link with the RTI Connext shared libraries as long as the rtimonitoring2 shared library is in the library search path. There is no need to link with rtimonitoring2.
- For RTI Connext applications that link with the RTI Connext static libraries, including rtimonitoring2, as long as the application calls the API **RTI_Monitoring_initialize** (p. 599).

RTI **Monitoring** (p. 1706) Library 2.0 is **not automatically enabled** for RTI Connext RTI DDS Ping, RTI DDS Spy, RTI Monitor, RTI Admin Console nor RTI Observability Collector **Service** (p. 2350).

You can override the default behavior and control whether RTI **Monitoring** (p. 1706) Library 2.0 is enabled or disabled in two ways in order of precedence:

- **Environment variable:** Set `RTI_MONITORING2_ENABLE` to `true` or `false`. This is the simplest way to enable or disable the library without modifying your application or its configuration.
- **QoS policy:** Set this field to true or false programmatically or via XML.

The environment variable should not be changed at runtime. If you need to **enable** or **disable** RTI **Monitoring** (p. 1706) Library 2.0 at runtime, use this field instead.

Note: Enabling and disabling RTI **Monitoring** (p. 1706) Library 2.0 while DDS Entities are being created or deleted is not a safe operation. The entities created while RTI **Monitoring** (p. 1706) Library 2.0 is being enabled may not be monitored.

Categories

Mutable (p. 280), **Debuggability** (p. 172)

8.181.3.4 enable() [2/2]

```
bool rti::core::policy::Monitoring::enable ( ) const
```

Getter (see setter with the same name).

8.181.3.5 application_name() [1/3]

```
Monitoring & rti::core::policy::Monitoring::application_name (
            const  rti::core::optional_value< std::string > & the_application_name )
```

Sets the name of the resource that represents this RTI Connext application.

Parameters

the_application_name	An optional string. An unset value indicates that the application name will be automatically assigned. A set value will set an application name.

[default] Unset

When this member is set to a value, the resource identifier representing this application will be:

/applications/<application_name>

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The application_name should be unique across the RTI Connext system; however, RTI **Monitoring** (p. 1706) Library 2.0 does not currently enforce uniqueness.

When this member is not set, RTI **Monitoring** (p. 1706) Library 2.0 will automatically assign a resource identifier with this format:

/applications/<host_name:process_id:uuid>

Categories

Mutable (p. 280), **Debuggability** (p. 172)

8.181.3.6 application_name() [2/3]

```
Monitoring & rti::core::policy::Monitoring::application_name (
            const char * the_application_name )
```

Sets the name of the resource that represents this RTI Connext application.

Parameters

the_application_name	The application name. Cannot be NULL.

When this member is set to a value, the resource identifier representing this application will be:

/applications/<application_name>

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The application_name should be unique across the RTI Connext system; however, RTI **Monitoring** (p. 1706) Library 2.0 does not currently enforce uniqueness.

When this member is not set, RTI **Monitoring** (p. 1706) Library 2.0 will automatically assign a resource identifier with this format:

/applications/<host_name:process_id:uuid>

- **rti::core::optional_value**< std::string > **participant_qos_profile_name** () const

  Getter (see setter with the same name).
- **MonitoringDedicatedParticipantSettings** & **collector_initial_peers** (const **dds::core::StringSeq** &the_collector_initial_peers)

  Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the ***rti::core::MonitoringDistributionSettings::dedicated_participant*** *(p. 1719).*
- **dds::core::StringSeq collector_initial_peers** () const

  Getter (see setter with the same name)

8.182.1 Detailed Description

<<***extension***>> *(p. 354)* Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.

8.182.2 Constructor & Destructor Documentation

8.182.2.1 MonitoringDedicatedParticipantSettings()

```
rti::core::MonitoringDedicatedParticipantSettings::MonitoringDedicatedParticipantSettings ( )
[inline]
```

Creates an instance with the default settings.

8.182.3 Member Function Documentation

8.182.3.1 enable() [1/2]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↩
::enable (
            bool the_enable )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Enables the use of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.

Setting this value to false is not currently supported.

[default] true

Categories

Mutable (p. 280), **Debuggability** (p. 172), **QoS Profile Management** (p. 220)

8.182.3.2 enable() [2/2]

```
bool rti::core::MonitoringDedicatedParticipantSettings::enable ( ) const
```

Getter (see setter with the same name).

8.182.3.3 domain_id() [1/2]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↩
::domain_id (
            int32_t the_domain_id )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).

By default, the RTI Monitoring Library 2.0 DomainParticipant is created in domain 101 with the domain tag 'RTI_o11y'. The domain tag provides further isolation in case the application also uses domain 101.

The domain ID can be changed using this field. Changing the domain tag is not recommended. However, if you need to change it, you must do so by configuring the domain tag in the **dds::domain::qos::DomainParticipantQos** (p. 1384) of the profile set in **rti::core::MonitoringDedicatedParticipantSettings::participant_qos_profile_name** (p. 1714).

[default] 101

Categories

Mutable (p. 280), **Debuggability** (p. 172), **Discovery** (p. 177), **Discovery Isolation** (p. 183)

8.182.3.4 domain_id() [2/2]

```
int32_t rti::core::MonitoringDedicatedParticipantSettings::domain_id ( ) const
```

Getter (see setter with the same name).

8.182.3.5 participant_qos_profile_name() [1/3]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↩
::participant_qos_profile_name (
            const  rti::core::optional_value< std::string > & the_participant_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1326) that will be used to distribute telemetry data.

Parameters

the_participant_qos_profile_name	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 479).

[default] Unset

If not set (the default value) then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↩ monitoring2()** (p. 479).

Categories

Mutable (p. 280), **Debuggability** (p. 172), **QoS Profile Management** (p. 220)

8.182.3.6 participant_qos_profile_name() [2/3]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↩
::participant_qos_profile_name (
            const char * the_participant_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1326) that will be used to distribute telemetry data.

Parameters

the_participant_qos_profile_name	The profile name. Cannot be NULL.

If not set (the default value) then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↩ monitoring2()** (p. 479).

Categories

Mutable (p. 280), **Debuggability** (p. 172), **QoS Profile Management** (p. 220)

8.182.3.7 participant_qos_profile_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::MonitoringDedicatedParticipantSettings↩
::participant_qos_profile_name ( ) const
```

Getter (see setter with the same name).

8.182.3.8 collector_initial_peers() [1/2]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↩
::collector_initial_peers (
            const  dds::core::StringSeq & the_collector_initial_peers )
```

Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistributionSettings::dedicated_participant** (p. 1719).

Parameters

the_collector_initial_peers	The initial peers.

These initial peers should correspond with the RTI Observability Collector Service with which RTI Monitoring Library 2.0 has to communicate. The collector_initial_peers works the same as initial_peers for other DomainParticipants, except that it allows you to easily specify the initial peer(s) for the RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326), which may have different initial peer(s) than those used by your application.

If no collector_initial_peers are specified, or if it is explicitly set to an empty list, the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) list of **rti::core::MonitoringDedicatedParticipantSettings::participant_qos_profile_name** (p. 1714) will be used as the initial peers of **rti::core::MonitoringDistributionSettings::dedicated_participant** (p. 1719).

[default] An empty sequence.

See also

rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers) (p. 1268) for further information about initial peers.

8.183.1 Detailed Description

<<***extension***>> *(*p. *354)* Configures the distribution of telemetry data.

8.183.2 Constructor & Destructor Documentation

8.183.2.1 MonitoringDistributionSettings()

```
rti::core::MonitoringDistributionSettings::MonitoringDistributionSettings ( )  [inline]
```

Creates an instance with the default settings.

8.183.3 Member Function Documentation

8.183.3.1 publisher_qos_profile_name() [1/3]

```
MonitoringDistributionSettings & rti::core::MonitoringDistributionSettings::publisher_qos_↩
profile_name (
            const  rti::core::optional_value< std::string > & the_publisher_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the Publishers that distribute telemetry data.

Parameters

the_publisher_qos_profile_name	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 479).

[default] Unset

There is one Publisher for each telemetry data **dds::topic::Topic** (p. 2474): MONITORING_PERIODIC_TOPIC_NAME, MONITORING_EVENT_TOPIC_NAME, and MONITORING_LOGGING_TOPIC_NAME.

If not set (the default value) then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↩ monitoring2()** (p. 479).

  Getter (see setter with the same name)

8.184.1 Detailed Description

<<***extension***>> *(p. 354)* Configures the distribution of event metrics.

Event metrics are provided to RTI Monitoring Library 2.0 when they change.

For example, if the liveliness of a **dds::pub::DataWriter** (p. 1138) is lost, a matching **dds::sub::DataReader** (p. 976) will push the new value of **dds::core::status::LivelinessChangedStatus** (p. 1652) to RTI Monitoring Library 2.0 so that the liveliness status change can be distributed.

There are three kinds of event metrics:

- **Configuration metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to QoS policies.
- **Status metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to the event statuses such as **dds::core::status::LivelinessChangedStatus** (p. 1652).
- **Resource metrics:** Provided to RTI Monitoring Library 2.0 when a resource (such as **dds::pub::DataWriter** (p. 1138)) is created or deleted.

The event metrics that will be distributed for an observable resource can be configured with **rti::core::MonitoringTelemetryData::metrics** (p. 1745).

8.184.2 Constructor & Destructor Documentation

8.184.2.1 MonitoringEventDistributionSettings()

```
rti::core::MonitoringEventDistributionSettings::MonitoringEventDistributionSettings ( )  [inline]
```

Creates an instance with the default settings.

8.184.3 Member Function Documentation

8.184.3.1 concurrency_level() [1/2]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::concurrency_level (
            uint32_t the_concurrency_level )
```

<<***extension***>> *(p. 116)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the event metrics pushed to RTI Monitoring Library 2.0 will be stored in a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for event metrics, each queue protected by its own mutex. Each resource (e.g, a **dds::sub::DataReader** (p. 976)) will be associated with one of the queues when the resource is registered with RTI Monitoring Library 2.0. Therefore, all the event metrics for a single resource always go to the same queue.

The event metrics for two resources associated with different event queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The event metrics added to the event queues are processed by a single thread configured using **rti::core::MonitoringEventDistributionSettings::thread** (p. 1726).

[default] 5

[range] [1, 100]

Categories

Mutable (p. 280), **Concurrency** (p. 164), **Debuggability** (p. 172)

8.184.3.2 concurrency_level() [2/2]

```
uint32_t rti::core::MonitoringEventDistributionSettings::concurrency_level ( ) const
```

Getter (see setter with the same name).

8.184.3.3 datawriter_qos_profile_name() [1/3]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::datawriter_qos_profile_name (
            const  rti::core::optional_value< std::string > & the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes event metrics.

Parameters

the_datawriter_qos_profile_name	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 479).

[default] Unset

The **dds::pub::DataWriter** (p. 1138) Topic is MONITORING_EVENT_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↩ monitoring2()** (p. 479).

[default] null

Categories

8.185.1 Detailed Description

<<***extension***>> (p. *354*) Configures the distribution of log messages.

Log messages are pushed into RTI Monitoring Library 2.0 and published by the logging thread.

The logging thread only publishes a log message with a Syslog level smaller than or equal to the forwarding level of the **rti::config::LogFacility** (p. 459) associated with the log message.

The default value of the forwarding level for all facilities is **rti::config::SyslogVerbosity::warning** (p. 458). This value can be changed with the **rti::core::MonitoringTelemetryData::logs** (p. 1746) QoS Policy or by sending a command to RTI Monitoring Library 2.0.

In this release, commands can only be sent from the RTI Observability Dashboards.

RTI Monitoring Library 2.0 can be configured to keep a history of log messages for later distribution when a log snapshot is requested by a RTI Observability Collector Service.

The log messages maintained in the history are the last 'n' messages published by the logging thread (where 'n' is the value of **rti::core::MonitoringLoggingDistributionSettings::max_historical_logs** (p. 1729)).

8.185.2 Constructor & Destructor Documentation

8.185.2.1 MonitoringLoggingDistributionSettings()

```
rti::core::MonitoringLoggingDistributionSettings::MonitoringLoggingDistributionSettings ( )  [inline]
```

Creates an instance with the default settings.

8.185.3 Member Function Documentation

8.185.3.1 concurrency_level() [1/2]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::concurrency_level (
            uint32_t the_concurrency_level )
```

<<***extension***>> *(*p. *116)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the log messages pushed to RTI Monitoring Library 2.0 will be stored into a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for log messages, each queue protected by its own mutex.

The log messages generated by a single thread will always be pushed to the same queue. The log messages for two threads associated with different log queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The log messages added to the log queues are processed and published by a single thread configured using **rti::core::MonitoringLoggingDistributionSettings::thread** (p. 1731).

[default] 5

```

Public Member Functions

- **MonitoringLoggingForwardingSettings** & **middleware_forwarding_level** (const **rti::config::Syslog↩ Verbosity** &middleware_forwarding_level)

  *Sets the forwarding log level for **rti::config::LogFacility::middleware** (*p. *459). Log messages with **rti::config::Log↩ Facility::middleware** (*p. *459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity middleware_forwarding_level** () const

  Gets the middleware forwarding level by const-reference (see setter).
- **MonitoringLoggingForwardingSettings** & **security_event_forwarding_level** (const **rti::config::Syslog↩ Verbosity** &security_event_forwarding_level)

  *Sets the forwarding log level for **rti::config::LogFacility::security_event** (*p. *459). Log messages with **rti::config::Log↩ Facility::security_event** (*p. *459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity security_event_forwarding_level** () const

  Gets the security event forwarding level by const-reference (see setter).
- **MonitoringLoggingForwardingSettings** & **service_forwarding_level** (const **rti::config::SyslogVerbosity** &service_forwarding_level)

  *Sets the forwarding log level for **rti::config::LogFacility::service** (*p. *459). Log messages with **rti::config::LogFacility↩ ::service** (*p. *459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity service_forwarding_level** () const

  Gets the service forwarding level by const-reference (see setter).
- **MonitoringLoggingForwardingSettings** & **user_forwarding_level** (const **rti::config::SyslogVerbosity** &user_forwarding_level)

  *Sets the forwarding log level for **rti::config::LogFacility::user** (*p. *459). Log messages with **rti::config::LogFacility↩ ::user** (*p. *459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity user_forwarding_level** () const

  Gets the user forwarding level by const-reference (see setter).

8.186.1 Detailed Description

<<***extension***>> *(*p. *354)* Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 459).

8.186.2 Member Function Documentation

8.186.2.1 middleware_forwarding_level() [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::middleware_forwarding_level (
            const  rti::config::SyslogVerbosity & middleware_forwarding_level )
```

Sets the forwarding log level for **rti::config::LogFacility::middleware** (p. 459). Log messages with **rti::config::LogFacility::middleware** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

middleware_forwarding_level	**rti::config::SyslogVerbosity** (p. 458) level.

[default] rti::config::SyslogVerbosity::warning (p. 458)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **rti::config::Verbosity_def::warning** (p. 2614), may affect performance due to the large amount of messages produced.

Categories

Mutable (p. 280), **Debuggability** (p. 172), **Logging** (p. 201)

8.186.2.2 middleware_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::middleware_forwarding_level ( ) const
```

Gets the middleware forwarding level by const-reference (see setter).

8.186.2.3 security_event_forwarding_level() [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::security_event_forwarding_level (
            const  rti::config::SyslogVerbosity & security_event_forwarding_level )
```

Sets the forwarding log level for **rti::config::LogFacility::security_event** (p. 459). Log messages with **rti::config::LogFacility::security_event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

security_event_forwarding_level	**rti::config::SyslogVerbosity** (p. 458) level.

[default] rti::config::SyslogVerbosity::warning (p. 458)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **rti::config::Verbosity_def::warning** (p. 2614), may affect performance due to the large amount of messages produced.

Categories

Mutable (p. 280), **Debuggability** (p. 172), **Logging** (p. 201), **Security** (p. 235)

8.186.2.4 security_event_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::security_event_forwarding_level ( ) const
```

Gets the security event forwarding level by const-reference (see setter).

8.186.2.5 service_forwarding_level() [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::service_forwarding_level (
            const  rti::config::SyslogVerbosity & service_forwarding_level )
```

Sets the forwarding log level for **rti::config::LogFacility::service** (p. 459). Log messages with **rti::config::LogFacility::service** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

service_forwarding_level	**rti::config::SyslogVerbosity** (p. 458) level.

[default] rti::config::SyslogVerbosity::warning (p. 458)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **rti::config::Verbosity_def::warning** (p. 2614), may affect performance due to the large amount of messages produced.

Categories

Mutable (p. 280), **Debuggability** (p. 172), **Logging** (p. 201)

8.186.2.6 service_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::service_forwarding_
level ( ) const
```

Gets the service forwarding level by const-reference (see setter).

8.186.2.7 user_forwarding_level() [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::user_
forwarding_level (
            const  rti::config::SyslogVerbosity & user_forwarding_level )
```

Sets the forwarding log level for **rti::config::LogFacility::user** (p. 459). Log messages with **rti::config::LogFacility::user** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

user_forwarding_level	**rti::config::SyslogVerbosity** (p. 458) level.

[default] rti::config::SyslogVerbosity::warning (p. 458)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **rti::config::Verbosity_def::warning** (p. 2614), may affect performance due to the large amount of messages produced.

Categories

Mutable (p. 280), **Debuggability** (p. 172), **Logging** (p. 201)

8.186.2.8 user_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::user_forwarding_
level ( ) const
```

Gets the user forwarding level by const-reference (see setter).

8.187 rti::core::MonitoringMetricSelection Class Reference

<<***extension***>> *(p. 354)* Configures event and periodic metrics collection and distribution for a specific set of observable resources.

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **MonitoringMetricSelection** ()=default

  Creates an instance with the default settings.
- **MonitoringMetricSelection** & **resource_selection** (const std::string &the_resource_selection)

  An expression pattern that selects a subset of resources by matching the pattern to the resource names. ***rti::core::MonitoringMetricSelection::enabled_metrics_selection*** *(p. 1738) and* ***rti::core::MonitoringMetricSelection::disabled_metrics_selection*** *(p. 1739) are applied to this subset of resources.*
- std::string **resource_selection** () const

  Getter (see setter with the same name).
- **MonitoringMetricSelection** & **enabled_metrics_selection** (const **dds::core::StringSeq** &the_enabled_metrics_selection)

  Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by ***rti::core::MonitoringMetricSelection::resource_selection*** *(p. 1737).*
- **dds::core::StringSeq enabled_metrics_selection** () const

  Getter (see setter with the same name)
- **MonitoringMetricSelection** & **disabled_metrics_selection** (const **dds::core::StringSeq** &the_disabled_metrics_selection)

  Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should not be collected and distributed for the observable resources selected by ***rti::core::MonitoringMetricSelection::resource_selection*** *(p. 1737).*
- **dds::core::StringSeq disabled_metrics_selection** () const

  Getter (see setter with the same name)

8.187.1 Detailed Description

<<***extension***>> *(p. 354)* Configures event and periodic metrics collection and distribution for a specific set of observable resources.

8.187.2 Constructor & Destructor Documentation

8.187.2.1 MonitoringMetricSelection()

```
rti::core::MonitoringMetricSelection::MonitoringMetricSelection ( )  [default]
```

Creates an instance with the default settings.

8.187.3 Member Function Documentation

8.187.3.1 resource_selection() [1/2]

```
MonitoringMetricSelection & rti::core::MonitoringMetricSelection::resource_selection (
            const std::string & the_resource_selection )
```

An expression pattern that selects a subset of resources by matching the pattern to the resource names. **rti::core::MonitoringMetricSelection::enabled_metrics_selection** (p. 1738) and **rti::core::MonitoringMetricSelection::disabled_metrics_selection** (p. 1739) are applied to this subset of resources.

Parameters

the_resource_selection	A string.

Examples of resource expression patterns:

- /applications/myApp/domain_participants/myParticipant
- /applications/∗/domain_participants/∗/subscribers/∗
- /applications/myApp/domain_participants/GUID(1234.5678.4321.8765)
- //myEntity

The first expression refers to a DomainParticipant named "myParticipant" that belongs to an application named "myApp". The second expression applies to all the Subscribers in the system (resource name wildcards follow the POSIX fnmatch syntax). The third expression refers to a DomainParticipant with a specific resource GUID in the "myApp" application. The last expression uses the XPath "//" operator. It matches observable resources named "myEntity" no matter where they are located in the resource hiearchy.

See the Telemetry Data / Resources chapter of the RTI Connext Observability Framework documentation for further information on the observable resource names and expression patterns.

Categories

Mutable (p. 280), **Debuggability** (p. 172)

8.187.3.2 resource_selection() [2/2]

```
std::string rti::core::MonitoringMetricSelection::resource_selection ( ) const
```

Getter (see setter with the same name).

8.187.3.3 enabled_metrics_selection() [1/2]

```
MonitoringMetricSelection & rti::core::MonitoringMetricSelection::enabled_metrics_selection (
            const  dds::core::StringSeq & the_enabled_metrics_selection )
```

Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **rti::core::MonitoringMetricSelection::resource_selection** (p. 1737).

This sequence is evaluated first, followed by **rti::core::MonitoringMetricSelection::disabled_metrics_selection** (p. 1739). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_*
- dds_application_*

The first pattern refers to a specific DataWriter metric (**dds::core::policy::Durability::writer_depth** (p. 1439)). The second pattern refers to all the DataReader **dds::core::policy::Reliability** (p. 2149) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connext Observability Framework documentation for further information on the metric names and metric patterns.

Categories

Mutable (p. 280), **Debuggability** (p. 172)

8.187.3.4 enabled_metrics_selection() [2/2]

```
dds::core::StringSeq rti::core::MonitoringMetricSelection::enabled_metrics_selection ( ) const
```

Getter (see setter with the same name)

8.187.3.5 disabled_metrics_selection() [1/2]

```
MonitoringMetricSelection & rti::core::MonitoringMetricSelection::disabled_metrics_selection (
            const  dds::core::StringSeq & the_disabled_metrics_selection )
```

Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should not be collected and distributed for the observable resources selected by **rti::core::MonitoringMetricSelection::resource_selection** (p. 1737).

This sequence is evaluated after **rti::core::MonitoringMetricSelection::enabled_metrics_selection** (p. 1738). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_*
- dds_application_*

The first pattern refers to a specific DataWriter metric (**dds::core::policy::Durability::writer_depth** (p. 1439)). The second pattern refers to all the DataReader **dds::core::policy::Reliability** (p. 2149) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connext Observability Framework documentation for further information on the metric names and metric patterns.

  Getter (see setter with the same name).
- **MonitoringPeriodicDistributionSettings** & **polling_period** (const **dds::core::Duration** &the_polling_period)

  *<<**basic**>> (p. 104) <<**extension**>> (p. 116) Period at which the periodic metric thread polls and publishes the periodic metrics.*
- **dds::core::Duration polling_period** () const

  Getter (see setter with the same name)

8.188.1 Detailed Description

*<<**extension**>> (p. 354)* Configures the distribution of periodic metrics.

Periodic metrics change often, and they are polled and published periodically by a thread created by RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 obtains periodic metrics by polling the current value of periodic statuses such as **rti::core↩ ::status::DataWriterProtocolStatus** (p. 1219).

The periodic metrics that will be distributed for an observable resource can be configured with **rti::core::Monitoring↩ TelemetryData::metrics** (p. 1745).

8.188.2 Constructor & Destructor Documentation

8.188.2.1 MonitoringPeriodicDistributionSettings()

```
rti::core::MonitoringPeriodicDistributionSettings::MonitoringPeriodicDistributionSettings ( )
[inline]
```

Creates an instance with the default settings.

8.188.3 Member Function Documentation

8.188.3.1 datawriter_qos_profile_name() [1/3]

```
MonitoringPeriodicDistributionSettings & rti::core::MonitoringPeriodicDistributionSettings↩
::datawriter_qos_profile_name (
            const  rti::core::optional_value< std::string > & the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes periodic metrics.

Parameters

the_datawriter_qos_profile_name	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 479).

[default] Unset

The **dds::pub::DataWriter** (p. 1138) Topic is MONITORING_PERIODIC_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↩ monitoring2()** (p. 479).

[default] null

Categories

Mutable (p. 280), **Debuggability** (p. 172), **QoS Profile Management** (p. 220)

8.188.3.2 datawriter_qos_profile_name() [2/3]

```
MonitoringPeriodicDistributionSettings & rti::core::MonitoringPeriodicDistributionSettings↩
::datawriter_qos_profile_name (
            const char * the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes periodic metrics.

Parameters

the_datawriter_qos_profile_name	The profile name. Cannot be NULL.

The **dds::pub::DataWriter** (p. 1138) Topic is MONITORING_PERIODIC_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↩ monitoring2()** (p. 479).

[default] null

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **MonitoringTelemetryData** & **metrics** (const **MonitoringMetricSelectionSeq** &the_metrics)

  *Sets the sequence of **rti::core::MonitoringMetricSelection** (p. 1736) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.*
- **MonitoringMetricSelectionSeq** **metrics** () const

  Gets the metrics (see setter).
- **MonitoringTelemetryData** & **logs** (const **MonitoringLoggingForwardingSettings** &the_logs)

  *Sets the **rti::core::MonitoringLoggingForwardingSettings** (p. 1733) containing the **rti::config::SyslogVerbosity** (p. 458) levels that will be forwarded for the different **rti::config::LogFacility** (p. 459).*
- const **MonitoringLoggingForwardingSettings** & **logs** () const

  Gets the metrics by const-reference (see setter).
- **MonitoringLoggingForwardingSettings** & **logs** ()

  Gets the metrics by reference (see setter).

8.189.1 Detailed Description

<<***extension***>> *(p. 354)* Configures the telemetry data that will be distributed.

8.189.2 Member Function Documentation

8.189.2.1 metrics() [1/2]

```
MonitoringTelemetryData & rti::core::MonitoringTelemetryData::metrics (
            const  MonitoringMetricSelectionSeq & the_metrics )
```

Sets the sequence of **rti::core::MonitoringMetricSelection** (p. 1736) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.

Parameters

the_metrics	sequence of **rti::core::MonitoringMetricSelection** (p. 1736).

The different **rti::core::MonitoringMetricSelection** (p. 1736) in the sequence are evaluated in order.

[default] An empty sequence, meaning that no metrics will be collected and distributed for any observable resource.

See also

rti::core::MonitoringEventDistributionSettings (p. 1722) and **rti::core::MonitoringPeriodicDistribution↩ Settings** (p. 1740) for further information on how RTI Monitoring Library 2.0 distributes **metrics** (p. 1745).

- **rti::core::optional_value**< std::string > **addresses** () const

  Getter (see setter with the same name)
- **MulticastMapping** & **topic_expression** (const std::string &the_topic_expression)

  <<***extension***>> *(*p. *116) A regular expression that will be used to map topic names to corresponding multicast receive addresses.*
- **rti::core::optional_value**< std::string > **topic_expression** () const

  Getter (see setter with the same name)
- **MulticastMapping** & **mapping_function** (const TransportMulticastMappingFunction &the_mappings)

  <<***extension***>> *(*p. *116) Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.*
- const TransportMulticastMappingFunction & **mapping_function** () const

  Getter (see setter with the same name)

8.190.1 Detailed Description

<<***extension***>> *(*p. *116)* Type representing a list of multicast mapping elements.

A multicast mapping element specifies a string containing a list of IP addresses, a topic expression and a mapping function.

QoS:

rti::core::policy::TransportMulticastMapping (p. 2547)

8.190.2 Member Function Documentation

8.190.2.1 addresses() [1/2]

```
MulticastMapping & rti::core::policy::MulticastMapping::addresses (
            const std::string & the_addresses )
```

<<***extension***>> *(*p. *116)* A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive *multicast* traffic for the entity with a topic that matches the **rti::core::policy::MulticastMapping::topic_↩ expression** (p. 1748).

The string must contain IPv4 or IPv6 addresses separated by commas. For example: "239.255.100.1,239.255.100.↩ 2,239.255.100.3"

You may specify ranges of addresses by enclosing the start address and the end address in square brackets. For example: "[239.255.100.1,239.255.100.3]"

You may combine the two approaches. For example:

"239.255.200.1,[239.255.100.1,239.255.100.3], 239.255.200.3"

IPv4 addresses must be specified in Dot-decimal notation.

IPv6 addresses must be specified using 8 groups of 16-bit hexadecimal values separated by colons. For example: FF00:0000:0000:0000:0202:B3FF:FE1E:8329

Leading zeroes can be skipped. For example: "FF00:0:0:0:202:B3FF:FE1E:8329"

You may replace a consecutive number of zeroes with a double colon, but only once within an address. For example: "FF00::202:B3FF:FE1E:8329"

[default] NULL

8.190.2.2 addresses() [2/2]

```
rti::core::optional_value< std::string > rti::core::policy::MulticastMapping::addresses ( )
const
```

Getter (see setter with the same name)

8.190.2.3 topic_expression() [1/2]

```
MulticastMapping & rti::core::policy::MulticastMapping::topic_expression (
            const std::string & the_topic_expression )
```

<<***extension***>> *(*p. *116)* A regular expression that will be used to map topic names to corresponding multicast receive addresses.

A topic name must match the expression before a corresponding address is assigned.

[default] NULL

8.190.2.4 topic_expression() [2/2]

```
rti::core::optional_value< std::string > rti::core::policy::MulticastMapping::topic_expression (
) const
```

Getter (see setter with the same name)

8.190.2.5 mapping_function() [1/2]

```
MulticastMapping & rti::core::policy::MulticastMapping::mapping_function (
            const TransportMulticastMappingFunction & the_mappings )
```

<<***extension***>> *(*p. *116)* Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.

This function is optional. If not specified, the middleware will use a hash function to perform the mapping.

8.190.2.6 mapping_function() [2/2]

```
const TransportMulticastMappingFunction & rti::core::policy::MulticastMapping::mapping_function (
) const
```

Getter (see setter with the same name)

8.191 rti::core::policy::MultiChannel Class Reference

<<***extension***>> *(*p. *116)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **MultiChannel** ()

  Creates the default policy.
- **MultiChannel** (const **rti::core::ChannelSettingsSeq** &the_channels, const std::string &the_filter_name= **rti::topic::stringmatch_filter_name**())

  Creates an instance with the specified channels and filter name.
- **MultiChannel** & **channels** (const **rti::core::ChannelSettingsSeq** &the_channels)

  *<<**extension**>> (p. 116) A sequence of **rti::core::ChannelSettings** (p. 921) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.*
- **rti::core::ChannelSettingsSeq channels** () const

  Getter (see the setter with the same name)
- **MultiChannel** & **filter_name** (const std::string &the_filter_name)

  *<<**extension**>> (p. 116) Name of the filter class used to describe the filter expressions of a **MultiChannel** (p. 1749) DataWriter.*
- std::string **filter_name** () const

  Getter (see the setter with the same name)

8.191.1 Detailed Description

*<<**extension**>> (p. 116)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **dds::pub::DataWriter** (p. 1138) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.191.2 Usage

By using this QoS, a **dds::pub::DataWriter** (p. 1138) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the fields within the data. When your application's code calls **dds::pub::DataWriter::write()** (p. 1148), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded.

In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

8.191.3 Constructor & Destructor Documentation

8.191.3.1 MultiChannel() [1/2]

```
rti::core::policy::MultiChannel::MultiChannel ( )  [inline]
```

Creates the default policy.

8.191.3.2 MultiChannel() [2/2]

```
rti::core::policy::MultiChannel::MultiChannel (
            const  rti::core::ChannelSettingsSeq & the_channels,
            const std::string & the_filter_name =  rti::topic::stringmatch_filter_name() )  [inline]
```

Creates an instance with the specified channels and filter name.

8.191.4 Member Function Documentation

8.191.4.1 channels() [1/2]

```
MultiChannel & rti::core::policy::MultiChannel::channels (
            const  rti::core::ChannelSettingsSeq & the_channels )
```

<<***extension***>> *(*p. *116)* A sequence of **rti::core::ChannelSettings** (p. 921) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **rti::core::policy::MultiChannel** (p. 1749) is not in use.

The sequence length cannot be greater than **rti::core::policy::DomainParticipantResourceLimits::channel_seq_↩ max_length** (p. 1423).

[default] Empty sequence.

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Data Availability** (p. 167)

8.191.4.2 channels() [2/2]

```
rti::core::ChannelSettingsSeq rti::core::policy::MultiChannel::channels ( ) const
```

Getter (see the setter with the same name)

8.191.4.3 filter_name() [1/2]

```
MultiChannel & rti::core::policy::MultiChannel::filter_name (
            const std::string & the_filter_name )
```

<<***extension***>> *(*p. *116)* Name of the filter class used to describe the filter expressions of a **MultiChannel** (p. 1749) DataWriter.

The following builtin filters are supported:

- **rti::topic::sql_filter_name** (p. 49)
- **rti::topic::stringmatch_filter_name** (p. 49)

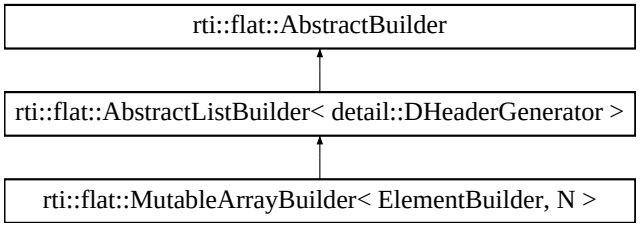
[default] rti::topic::stringmatch_filter_name (p. 49)

Categories

Immutable (p. 243), **Discovery Metadata** (p. 288), **Data Availability** (p. 167), **Content Filtering** (p. 165)

8.191.4.4 filter_name() [2/2]

```
std::string rti::core::policy::MultiChannel::filter_name ( ) const
```



Getter (see the setter with the same name)

8.192 rti::flat::MutableArrayBuilder< ElementBuilder, N > Class Template Reference

Builds an array member of variable-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::MutableArrayBuilder< ElementBuilder, N >:

Public Types

- typedef **MutableArrayOffset**< typename ElementBuilder::Offset, N > **Offset**
  The related Offset type.

Public Member Functions

- ElementBuilder **build_next** ()
  Begins building the next element.
- **Offset finish** ()
  Finishes building the array.

Additional Inherited Members

8.192.1 Detailed Description

template<typename ElementBuilder, unsigned int N>
class rti::flat::MutableArrayBuilder< ElementBuilder, N >

Builds an array member of variable-size elements.

Template Parameters

ElementBuilder	The Builder type for the elements of the array
N	The array bound; the exact number of elements this array builder must build. For multidimensional arrays, N is the product of each dimension bound.

Each element of this array needs to be built using the ElementBuilder returned by **build_next()** (p. 1754). N elements exactly must be built. Unlike a sequence Builder, it is not possible to finish an array with less than N elements.

This example shows how to use a **MutableArrayBuilder** (p. 1753) to build an array member of **MyFlatMutableBuilder** (p. 1763):

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto array_builder = builder.build_my_mutable_array();
for (int i = 0; i < 10; i++) {
    FlatMutableBarBuilder element_builder = array_builder.build_next();
    // ... build element
    element_builder.finish();
}
array_builder.finish();
```

Note that Builder types are not necessary for arrays of fixed-size elements, since they are added at once (see **MyFlat↩ MutableBuilder::add_my_final_array()** (p. 1768)).

8.192.2 Member Typedef Documentation

8.192.2.1 Offset

```
template<typename ElementBuilder , unsigned int N>
typedef MutableArrayOffset<typename ElementBuilder::Offset, N> rti::flat::MutableArrayBuilder<
ElementBuilder, N >::Offset
```

The related Offset type.

8.192.3 Member Function Documentation

8.192.3.1 build_next()

```
template<typename ElementBuilder , unsigned int N>
ElementBuilder rti::flat::MutableArrayBuilder< ElementBuilder, N >::build_next ( ) [inline]
```

Begins building the next element.

Before calling **build_next()** (p. 1754) to create a new element, the element Builder returned by a previous call to build↩ _next must have been finished.

References **rti::flat::AbstractListBuilder< detail::DHeaderGenerator >::element_count()**.

8.192.3.2 finish()

```
template<typename ElementBuilder , unsigned int N>
Offset  rti::flat::MutableArrayBuilder< ElementBuilder, N >::finish ( )  [inline]
```

Finishes building the array.

Precondition

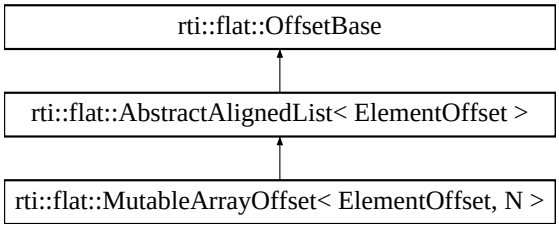
build_next() (p. 1754) must have been succesfully called N times exactly.

Returns

The Offset to the member that has been built.

See also

discard() (p. 784)



References **rti::flat::AbstractListBuilder< detail::DHeaderGenerator >::element_count()**.

8.193 rti::flat::MutableArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of variable-size elements.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::MutableArrayOffset< ElementOffset, N >:

- ElementOffset **get_element** (unsigned int i)

  Gets the Offset to an element.

Additional Inherited Members

8.193.1 Detailed Description

template<typename ElementOffset, unsigned int N>
class rti::flat::MutableArrayOffset< ElementOffset, N >

Offset to an array of variable-size elements.

Template Parameters

ElementOffset	An Offset for a type of variable size, such as a mutable struct (**MyFlatMutableOffset** (p. 1770)), union, or **StringOffset** (p. 2394).
N	The array bound. For multidimensional arrays, `N` is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

See also

FinalArrayOffset (p. 1567) encapsulates arrays of fixed-size elements

8.193.2 Member Function Documentation

8.193.2.1 get_element()

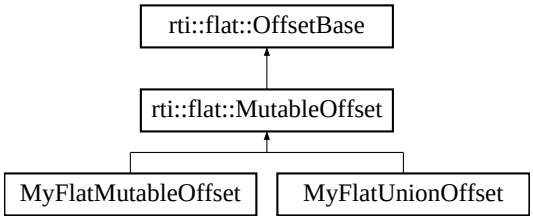
```
template<typename ElementOffset , unsigned int N>
ElementOffset  rti::flat::MutableArrayOffset< ElementOffset, N >::get_element (
             unsigned int i )  [inline]
```

Gets the Offset to an element.

Parameters

i	The zero-based index to the element

Returns



The Offset to the element in the i-th position

8.194 rti::flat::MutableOffset Class Reference

The base class of all Offsets to a final struct type.

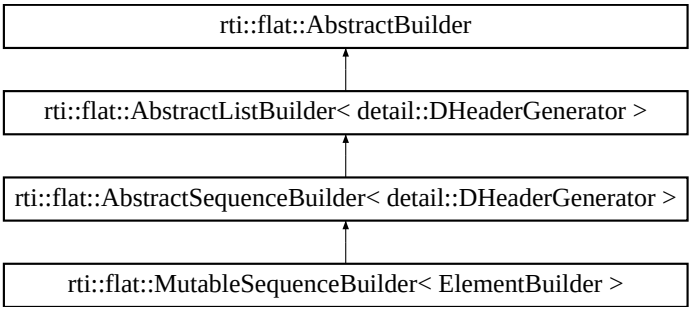
`#include <Offset.hpp>`

Inheritance diagram for rti::flat::MutableOffset:

Additional Inherited Members

8.194.1 Detailed Description

The base class of all Offsets to a final struct type.



This class contains only implementation details; all the public accessors are defined in the generated type (**MyFlat↩ MutableOffset** (p. 1770)).

8.195 rti::flat::MutableSequenceBuilder< ElementBuilder > Class Template Reference

Builds a sequence member of variable-size elements.

`#include <SequenceBuilders.hpp>`

Inheritance diagram for rti::flat::MutableSequenceBuilder< ElementBuilder >:

Public Types

- typedef **SequenceOffset**< typename ElementBuilder::Offset > **Offset**
  The related Offset type.

Public Member Functions

- ElementBuilder **build_next** ()
  Begins building the next element.
- **Offset finish** ()
  Finishes building the sequence.

Additional Inherited Members

8.195.1 Detailed Description

template<typename ElementBuilder>
class rti::flat::MutableSequenceBuilder< ElementBuilder >

Builds a sequence member of variable-size elements.

Template Parameters

ElementBuilder	The Builder type for the elements of the sequence

To build the elements use the ElementBuilder returned by **build_next()** (p. 1758). An empty sequence can be built by calling **finish()** (p. 1758) without any call to **build_next()** (p. 1758).

This class doesn't enforce the sequence bound set in IDL.

The following example uses a **MutableSequenceBuilder** (p. 1757) to initialize a sequence member of **MyFlatMutable↩ Builder** (p. 1763) with two elements:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto seq_builder = builder.build_my_mutable_seq();
auto element_builder = seq_builder.build_next();
// ... build the first element
element_builder.finish();
element_builder = seq_builder.build_next();
// ... build the second element
element_builder.finish();

seq_builder.finish();
```

8.195.2 Member Typedef Documentation

8.195.2.1 Offset

```
template<typename ElementBuilder >
typedef  SequenceOffset<typename ElementBuilder::Offset>  rti::flat::MutableSequenceBuilder<
ElementBuilder >::Offset
```

The related Offset type.

8.195.3 Member Function Documentation

8.195.3.1 build_next()

```
template<typename ElementBuilder >
ElementBuilder  rti::flat::MutableSequenceBuilder< ElementBuilder >::build_next ( )  [inline]
```

Begins building the next element.

Before calling **build_next()** (p. 1758) to create a new element, the application must have called **finish()** (p. 1758) on the previous element Builder.

8.195.3.2 finish()

```
template<typename ElementBuilder >
Offset rti::flat::MutableSequenceBuilder< ElementBuilder >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

discard() (p. 784)

8.196 MyFlatFinalOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData final IDL struct.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatFinalOffset:

Public Types

- typedef MyFlatFinalConstOffset **ConstOffset**

  The equivalent read-only Offset type.

Public Member Functions

- **MyFlatFinalOffset** ()

  Creates a null Offset.
- int32_t **my_primitive** () const

  Retrieves the value for a primitive member.
- FlatFinalBar::ConstOffset **my_complex** () const

  Retrieves a const Offset to a complex member.
- const **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **my_primitive_array** () const

  Retrieves a const Offset to a primitive array.
- **rti::flat::FinalArrayOffset**< FlatFinalBar::ConstOffset, 10 > **my_complex_array** () const

  Retrieves a const Offset to a complex array.
- bool **my_primitive** (int32_t value)

  Sets the value for a primitive member.
- FlatFinalBar::Offset **my_complex** ()

  Retrieves a non-const Offset to a complex member.
- **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **my_primitive_array** ()

  Retrieves a non-const Offset to a primitive array.
- **rti::flat::FinalArrayOffset**< FlatFinalBar::Offset, 10 > **my_complex_array** ()

  Retrieves a non-const Offset to a complex array.

8.196.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData final IDL struct.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatFinal** (p. 413).

It provides accessors for each of its members. Accessors can return other Offsets or primitive values.

An Offset to a final type may meet the requirements to be cast to its equivalent plain C++ type (see **rti::flat::plain_cast()** (p. 417)).

8.196.2 Member Typedef Documentation

8.196.2.1 ConstOffset

`typedef MyFlatFinalConstOffset` **`MyFlatFinalOffset::ConstOffset`**

The equivalent read-only Offset type.

Each Offset for a user type has an equivalent const Offset that doesn't provide the methods to modify the Sample. For example, when reading data from a **dds::sub::DataReader** (p. 976), a const Sample's Sample::root() function returns a const Offset.

8.196.3 Constructor & Destructor Documentation

8.196.3.1 MyFlatFinalOffset()

```
MyFlatFinalOffset::MyFlatFinalOffset ( )  [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1876)

8.196.4 Member Function Documentation

8.196.4.1 my_primitive() [1/2]

```
int32_t MyFlatFinalOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

8.196.4.2 my_complex() [1/2]

```
FlatFinalBar::ConstOffset MyFlatFinalOffset::my_complex ( ) const
```

Retrieves a const Offset to a complex member.

FlatFinalBar is another arbitrary user-defined final FlatData type.

8.196.4.3 my_primitive_array() [1/2]

```
const  rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatFinalOffset::my_primitive_array ( )
const
```

Retrieves a const Offset to a primitive array.

8.196.4.4 my_complex_array() [1/2]

```
rti::flat::FinalArrayOffset< FlatFinalBar::ConstOffset, 10 > MyFlatFinalOffset::my_complex_array
( ) const
```

Retrieves a const Offset to a complex array.

8.196.4.5 my_primitive() [2/2]

```
bool MyFlatFinalOffset::my_primitive (
            int32_t value )
```

Sets the value for a primitive member.

8.196.4.6 my_complex() [2/2]

```
FlatFinalBar::Offset MyFlatFinalOffset::my_complex ( )
```

Retrieves a non-const Offset to a complex member.

FlatFinalBar is another arbitrary user-defined final FlatData type.

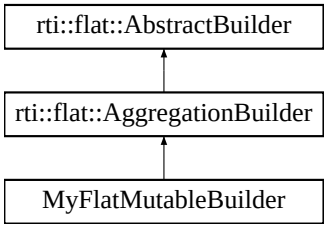
8.196.4.7 my_primitive_array() [2/2]

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatFinalOffset::my_primitive_array ( )
```

Retrieves a non-const Offset to a primitive array.

8.196.4.8 my_complex_array() [2/2]

```
rti::flat::FinalArrayOffset< FlatFinalBar::Offset, 10 > MyFlatFinalOffset::my_complex_array ( )
```



Retrieves a non-const Offset to a complex array.

8.197 MyFlatMutableBuilder Class Reference

Represents the Builder for an arbitrary user-defined mutable type.

`#include <Builder.hpp>`

Inheritance diagram for MyFlatMutableBuilder:

Public Types

- typedef **MyFlatMutableOffset Offset**
  The related offset type.

Public Member Functions

- **MyFlatMutableBuilder** ()
  Creates an invalid Builder.
- **MyFlatMutableBuilder** (unsigned char ∗buffer, int32_t size, bool initialize_members=false)
  Construct a Builder with an arbitrary buffer.
- **Offset finish** ()
  Finishes building a member.
- **MyFlatMutable** ∗ **finish_sample** ()
  Finishes building a sample.
- bool **add_my_primitive** (int32_t value)
  Adds a primitive member.
- bool **add_my_optional_primitive** (int32_t value)
  Adds a primitive member.
- **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **add_my_primitive_array** ()
  Adds a primitive array member.
- **rti::flat::PrimitiveSequenceBuilder**< int32_t > **build_my_primitive_seq** ()
  Begins building a primitive-sequence member.
- **MyFlatFinalOffset add_my_final** ()
  Adds a final complex member.
- **rti::flat::FinalAlignedArrayOffset**< **MyFlatFinalOffset**, 10 > **add_my_final_array** ()
  Adds an array member of final complex elements.
- **rti::flat::FinalSequenceBuilder**< **MyFlatFinalOffset** > **build_my_final_seq** ()
  Begins building a sequence member of final complex elements.
- FlatMutableBarBuilder **build_my_mutable** ()

Begins building a mutable complex member.

- **rti::flat::MutableArrayBuilder**< FlatMutableBarBuilder, 10 > **build_my_mutable_array** ()

  Begins building an array member of mutable complex elements.
- **rti::flat::MutableSequenceBuilder**< FlatMutableBarBuilder > **build_my_mutable_seq** ()

  Begins building a sequence member of mutable complex elements.
- **rti::flat::StringBuilder build_my_string** ()

  Begins building a string member.
- **rti::flat::MutableSequenceBuilder**< **rti::flat::StringBuilder** > **build_my_string_seq** ()

  Begins building a sequence member of string elements.

Additional Inherited Members

8.197.1 Detailed Description

Represents the Builder for an arbitrary user-defined mutable type.

This example type represents the **Builder** (p. 409) type that **rtiddsgen** would generate for **MyFlatMutable** (p. 413) and allows creating a sample or a member of that type.

The most common way to create a Builder is **rti::flat::build_data()** (p. 411), which obtains a managed sample from a **dds::pub::DataWriter** (p. 1138) as described in **Publishing FlatData** (p. 420). It is also possible to create a Builder with an arbitrary buffer using the constructor that receives the buffer and its size.

When a Builder is created, the type is empty–it doesn't contain any members. The Builder provides functions to create each member. There are two kind of functions: `add` functions and `build` functions.

8.197.1.1 Adding fixed-size members

Fixed-size members are "added", and the corresponding function is called **`add_<member_name>`**. "Add" functions directly place the member in the buffer, and return an **Offset** (p. 414) that allows setting its values.

By default, after calling `add_<member_name>` the member values are uninitialized. This behavior can be changed by creating the writer with **rti::core::policy::DataWriterResourceLimits::initialize_writer_loaned_sample** (p. 1248); this is however not recommended in general because of the performance impact for large types.

```
MyFlatMutableBuilder builder = ...;
MyFinalFooOffset member_offset = builder.add_my_final();
member_offset.my_primitive(10);
// ... add/build more members
```

8.197.1.2 Building variable-size members

Variable-size members are "built", and the function is called **`build_<member_name>`**. "Build" functions return another **Builder** (p. 409) to build the member.

```
MyFlatMutableBuilder builder = ...;
auto member_builder = builder.build_my_mutable();
// ... use member_builder
member_builder.finish();
// ... add/build more members
```

While a member is being built, the parent Builder is a **bound** state, which prevents any changes to it until the member has been finished by calling `member_builder.finish()`. In particular, the member Builder must be finished before adding or building any other member, or before finishing `builder`.

8.197.1.3 Choosing which members are included

The `add/build` function for each member can be called one or zero times. That is, all members are optional, even those without the `@optional` IDL annotation. However `@key` member must be added or **dds::pub::DataWriter::write()** (p. 1148) will fail.

FlatData samples received by **dds::sub::DataReader** (p. 976) will not contain the members that were not added/built– the corresponding member getters return a null Offset. A **dds::sub::DataReader** (p. 976) for an equivalent non-FlatData (plain) definition of this type will assign default values to any non-optional members that were not present in the sample when written.

It is not permitted to add a member more than once, but builders don't enforce this. Trying to build/add a member more than once may cause the Builder to overflow (see **Builder Error Management** (p. 410)). If it doesn't, it may be possible to write and read the data samples, but the duplicate members will be ignored.

FlatData Builders (p. 409)

8.197.2 Member Typedef Documentation

8.197.2.1 Offset

```
typedef MyFlatMutableOffset MyFlatMutableBuilder::Offset
```

The related offset type.

8.197.3 Constructor & Destructor Documentation

8.197.3.1 MyFlatMutableBuilder() [1/2]

```
MyFlatMutableBuilder::MyFlatMutableBuilder ( ) [inline]
```

Creates an invalid Builder.

Postcondition

!is_valid()

Note

Top-level builders are created with **rti::flat::build_data()** (p. 411), and member builders are created with the corresponding `build_<member>` function.

8.197.3.2 MyFlatMutableBuilder() [2/2]

```
MyFlatMutableBuilder::MyFlatMutableBuilder (
            unsigned char * buffer,
            int32_t size,
            bool initialize_members = false )  [inline]
```

Construct a Builder with an arbitrary buffer.

Note

The recommended way to create a Builder is **rti::flat::build_data()** (p. 411) as described in **Publishing FlatData** (p. 420). This constructor provides an alternative option to use an arbitrary data buffer.

Parameters

buffer	The buffer that will be used to build the data sample
size	The size of the buffer
initialize_members	Whether fixed-size elements added to this Builder will be initialized to their default values or will be left uninitialized (more efficient).

If the sample being built overflows the buffer size, the add/build operations will fail. See **Builder Error Management** (p. 410).

8.197.4 Member Function Documentation

8.197.4.1 finish()

```
Offset MyFlatMutableBuilder::finish ( )
```

Finishes building a member.

Returns

The Offset to the member (normally it can be ignored)

Precondition

is_nested() (p. 784). That is, this object must be a member Builder, not a sample Builder.

8.197.4.2 finish_sample()

```
MyFlatMutable * MyFlatMutableBuilder::finish_sample ( )
```

Finishes building a sample.

Precondition

!is_nested() (p. 784). That is, this object must be a sample Builder, not a member Builder.

Postcondition

!is_valid() (p. 784). That is, this Builder can no longer be used.

Returns

The sample, ready to be written.

This function completes and returns the sample built with this Builder.

See also

rti::flat::build_data() (p. 411), the function to create a **dds::pub::DataWriter** (p. 1138)-managed sample Builder.

8.197.4.3 add_my_primitive()

```
bool MyFlatMutableBuilder::add_my_primitive (
            int32_t value )
```

Adds a primitive member.

8.197.4.4 add_my_optional_primitive()

```
bool MyFlatMutableBuilder::add_my_optional_primitive (
            int32_t value )
```

Adds a primitive member.

8.197.4.5 add_my_primitive_array()

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableBuilder::add_my_primitive_array ( )
```

Adds a primitive array member.

Returns

The Offset to the array, which can be used to set its values.

8.197.4.6 build_my_primitive_seq()

```
rti::flat::PrimitiveSequenceBuilder< int32_t > MyFlatMutableBuilder::build_my_primitive_seq ( )
```

Begins building a primitive-sequence member.

8.197.4.7 add_my_final()

```
MyFlatFinalOffset MyFlatMutableBuilder::add_my_final ( )
```

Adds a final complex member.

Returns

The Offset to the member, which can be used to set its values.

8.197.4.8 add_my_final_array()

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinalOffset, 10 > MyFlatMutableBuilder::add_my_↩
final_array ( )
```

Adds an array member of final complex elements.

Returns

The Offset to the array, which can be used to set its values.

8.197.4.9 build_my_final_seq()

```
rti::flat::FinalSequenceBuilder< MyFlatFinalOffset > MyFlatMutableBuilder::build_my_final_seq (
)
```

Begins building a sequence member of final complex elements.

8.197.4.10 build_my_mutable()

```
FlatMutableBarBuilder MyFlatMutableBuilder::build_my_mutable ( )
```

Begins building a mutable complex member.

FlatMutableBar represents another arbitrary mutable FlatData type.

8.197.4.11 build_my_mutable_array()

```
rti::flat::MutableArrayBuilder< FlatMutableBarBuilder, 10 > MyFlatMutableBuilder::build_my_↩
mutable_array ( )
```

Begins building an array member of mutable complex elements.

8.197.4.12 build_my_mutable_seq()

```
rti::flat::MutableSequenceBuilder< FlatMutableBarBuilder > MyFlatMutableBuilder::build_my_↩
mutable_seq ( )
```

Begins building a sequence member of mutable complex elements.

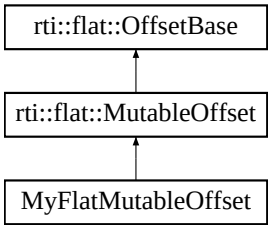
8.197.4.13 build_my_string()

```
rti::flat::StringBuilder MyFlatMutableBuilder::build_my_string ( )
```

Begins building a string member.

8.197.4.14 build_my_string_seq()

rti::flat::MutableSequenceBuilder< **rti::flat::StringBuilder** > MyFlatMutableBuilder::build_my_↩
string_seq ( )



Begins building a sequence member of string elements.

8.198 MyFlatMutableOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.

`#include <Offset.hpp>`

Inheritance diagram for MyFlatMutableOffset:

Public Types

- typedef MyFlatMutableConstOffset **ConstOffset**

  The equivalent read-only Offset type.

Public Member Functions

- **MyFlatMutableOffset** ()

  Creates a null Offset.
- int32_t **my_primitive** () const

  Retrieves the value for a primitive member.
- **rti::flat::PrimitiveConstOffset**< int32_t > **my_optional_primitive** () const

  Retrieves a const Offset to an optional primitive.
- const **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **my_primitive_array** () const

  Retrieves a const Offset to a primitive array.
- const **rti::flat::PrimitiveSequenceOffset**< int32_t > **my_primitive_seq** () const

  Retrieves a const Offset to a primitive sequence.
- **MyFlatFinal::ConstOffset** **my_final** () const

  Retrieves a const Offset to a complex member.
- **rti::flat::FinalAlignedArrayOffset**< **MyFlatFinal::ConstOffset**, 10 > **my_final_array** () const

  Retrieves a const Offset to a complex array.
- **rti::flat::SequenceOffset**< **MyFlatFinal::ConstOffset** > **my_final_seq** () const

Retrieves a const Offset to a complex sequence.

- FlatMutableBar::ConstOffset **my_mutable** () const

  Retrieves a const Offset to a complex member.
- **rti::flat::MutableArrayOffset**< FlatMutableBar::ConstOffset, 10 > **my_mutable_array** () const

  Retrieves a const Offset to a complex array.
- **rti::flat::SequenceOffset**< FlatMutableBar::ConstOffset > **my_mutable_seq** () const

  Retrieves a const Offset to a complex sequence.
- const **rti::flat::StringOffset** **my_string** () const

  Retrieves a const Offset to a string.
- **rti::flat::SequenceOffset**< const **rti::flat::StringOffset** > **my_string_seq** () const

  Retrieves a const Offset to a sequence of strings.
- bool **my_primitive** (int32_t value)

  Sets the value of a primitive member.
- **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **my_primitive_array** ()

  Retrieves a non-const Offset to a primitive array.
- **rti::flat::PrimitiveSequenceOffset**< int32_t > **my_primitive_seq** ()

  Retrieves a non-const Offset to a primitive sequence.
- **MyFlatFinal::Offset** **my_final** ()

  Retrieves a non-const Offset to a complex member.
- **rti::flat::FinalAlignedArrayOffset**< **MyFlatFinal::Offset**, 10 > **my_final_array** ()

  Retrieves a non-const Offset to a complex array.
- **rti::flat::SequenceOffset**< **MyFlatFinal::Offset** > **my_final_seq** ()

  Retrieves a non-const Offset to a complex sequence.
- FlatMutableBar::Offset **my_mutable** ()

  Retrieves a non-const Offset to a complex member.
- **rti::flat::MutableArrayOffset**< FlatMutableBar::Offset, 10 > **my_mutable_array** ()

  Retrieves a non-const Offset to a complex array.
- **rti::flat::SequenceOffset**< FlatMutableBar::Offset > **my_mutable_seq** ()

  Retrieves a non-const Offset to a complex sequence.
- **rti::flat::StringOffset** **my_string** ()

  Retrieves a non-const Offset to a string.
- **rti::flat::SequenceOffset**< **rti::flat::StringOffset** > **my_string_seq** ()

  Retrieves a non-const Offset to a sequence of strings.

8.198.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatMutable** (p. 413).

It provides accessors for each of its members. Accessors can return other Offsets or primitive values.

8.198.2 Member Typedef Documentation

8.198.2.1 ConstOffset

```
typedef MyFlatMutableConstOffset  MyFlatMutableOffset::ConstOffset
```

The equivalent read-only Offset type.

Each Offset for a user type has an equivalent const Offset that doesn't allow modifying the underlying Sample. For example, when reading data from a **dds::sub::DataReader** (p. 976), a const Sample's Sample::root() function returns a const Offset.

8.198.3 Constructor & Destructor Documentation

8.198.3.1 MyFlatMutableOffset()

```
MyFlatMutableOffset::MyFlatMutableOffset ( )  [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1876)

8.198.4 Member Function Documentation

8.198.4.1 my_primitive() [1/2]

```
int32_t MyFlatMutableOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

Returns

The value of the member or its default value if this member doesn't exist in this Sample.

8.198.4.2 my_optional_primitive()

```
rti::flat::PrimitiveConstOffset< int32_t > MyFlatMutableOffset::my_optional_primitive ( ) const
```

Retrieves a const Offset to an optional primitive.

Unlike the non-optional **my_primitive()** (p. 1772), which accesses the integer directly, for an optional primitive it is possible to check whether it exists or not. If it doesn't exist, the Offset this function returns will be null (**is_null()** (p. 1876)).

8.198.4.3 my_primitive_array() [1/2]

```
const rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableOffset::my_primitive_array ( )
const
```

Retrieves a const Offset to a primitive array.

8.198.4.4 my_primitive_seq() [1/2]

```
const rti::flat::PrimitiveSequenceOffset< int32_t > MyFlatMutableOffset::my_primitive_seq ( )
const
```

Retrieves a const Offset to a primitive sequence.

8.198.4.5 my_final() [1/2]

```
MyFlatFinal::ConstOffset MyFlatMutableOffset::my_final ( ) const
```

Retrieves a const Offset to a complex member.

8.198.4.6 my_final_array() [1/2]

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinal::ConstOffset, 10 > MyFlatMutableOffset::my_↩
final_array ( ) const
```

Retrieves a const Offset to a complex array.

8.198.4.7 my_final_seq() [1/2]

```
rti::flat::SequenceOffset< MyFlatFinal::ConstOffset > MyFlatMutableOffset::my_final_seq ( )
const
```

Retrieves a const Offset to a complex sequence.

8.198.4.8 my_mutable() [1/2]

```
FlatMutableBar::ConstOffset MyFlatMutableOffset::my_mutable ( ) const
```

Retrieves a const Offset to a complex member.

FlatMutableBar is another arbitrary user-defined mutable FlatData type.

8.198.4.9 my_mutable_array() [1/2]

```
rti::flat::MutableArrayOffset< FlatMutableBar::ConstOffset, 10 > MyFlatMutableOffset::my_↩
mutable_array ( ) const
```

Retrieves a const Offset to a complex array.

8.198.4.10 my_mutable_seq() [1/2]

```
rti::flat::SequenceOffset< FlatMutableBar::ConstOffset > MyFlatMutableOffset::my_mutable_seq ( )
const
```

Retrieves a const Offset to a complex sequence.

8.198.4.11 my_string() [1/2]

```
const rti::flat::StringOffset MyFlatMutableOffset::my_string ( ) const
```

Retrieves a const Offset to a string.

8.198.4.12 my_string_seq() [1/2]

```
rti::flat::SequenceOffset< const  rti::flat::StringOffset > MyFlatMutableOffset::my_string_seq (
) const
```

Retrieves a const Offset to a sequence of strings.

8.198.4.13 my_primitive() [2/2]

```
bool MyFlatMutableOffset::my_primitive (
            int32_t value )
```

Sets the value of a primitive member.

8.198.4.14 my_primitive_array() [2/2]

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableOffset::my_primitive_array ( )
```

Retrieves a non-const Offset to a primitive array.

8.198.4.15 my_primitive_seq() [2/2]

```
rti::flat::PrimitiveSequenceOffset< int32_t > MyFlatMutableOffset::my_primitive_seq ( )
```

Retrieves a non-const Offset to a primitive sequence.

8.198.4.16 my_final() [2/2]

```
MyFlatFinal::Offset MyFlatMutableOffset::my_final ( )
```

Retrieves a non-const Offset to a complex member.

8.198.4.17 my_final_array() [2/2]

rti::flat::FinalAlignedArrayOffset< **MyFlatFinal::Offset**, 10 > MyFlatMutableOffset::my_final_↩
array ( )

Retrieves a non-const Offset to a complex array.

8.198.4.18 my_final_seq() [2/2]

rti::flat::SequenceOffset< **MyFlatFinal::Offset** > MyFlatMutableOffset::my_final_seq ( )

Retrieves a non-const Offset to a complex sequence.

8.198.4.19 my_mutable() [2/2]

FlatMutableBar::Offset MyFlatMutableOffset::my_mutable ( )

Retrieves a non-const Offset to a complex member.

FlatMutableBar is another arbitrary user-defined mutable FlatData type.

8.198.4.20 my_mutable_array() [2/2]

rti::flat::MutableArrayOffset< FlatMutableBar::Offset, 10 > MyFlatMutableOffset::my_mutable_↩
array ( )

Retrieves a non-const Offset to a complex array.

8.198.4.21 my_mutable_seq() [2/2]

rti::flat::SequenceOffset< FlatMutableBar::Offset > MyFlatMutableOffset::my_mutable_seq ( )

Retrieves a non-const Offset to a complex sequence.

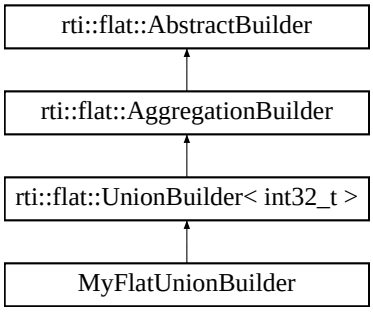
8.198.4.22 my_string() [2/2]

```
rti::flat::StringOffset MyFlatMutableOffset::my_string ( )
```

Retrieves a non-const Offset to a string.

8.198.4.23 my_string_seq() [2/2]

```
rti::flat::SequenceOffset< rti::flat::StringOffset > MyFlatMutableOffset::my_string_seq ( )
```



Retrieves a non-const Offset to a sequence of strings.

8.199 MyFlatUnionBuilder Class Reference

Represents the Builder for an arbitrary user-defined mutable IDL union.

`#include <Builder.hpp>`

Inheritance diagram for MyFlatUnionBuilder:

Public Types

- typedef **MyFlatUnionOffset Offset**
  The related offset type.

Public Member Functions

- **MyFlatUnionBuilder** ()
  Creates an invalid Builder.
- **Offset finish** ()
  Finishes building a member.
- **MyFlatUnion** * **finish_sample** ()
  Finishes building a sample.
- bool **add_my_primitive** (int32_t value)
  Adds a primitive member.
- **MyFlatMutableBuilder build_my_mutable** (int32_t discriminator=1)
  Builds a mutable-struct member.
- **MyFlatFinal::Offset add_my_final** ()
  Adds a final-struct member.

Additional Inherited Members

8.199.1 Detailed Description

Represents the Builder for an arbitrary user-defined mutable IDL union.

This example type represents the **Builder** (p. 409) type that **rtiddsgen** would generate for **MyFlatUnion** (p. 413) and allows creating a sample or a member of that type.

Union builders are similar to struct builders (see **MyFlatMutableBuilder** (p. 1763)), except that they only allow adding/building **one member**.

"Add" and "build" functions automatically set the discriminator value that in the IDL definition selects that member. If more than one discriminator value selects a member, the add/build function allows picking one.

8.199.2 Member Typedef Documentation

8.199.2.1 Offset

```
typedef MyFlatUnionOffset MyFlatUnionBuilder::Offset
```

The related offset type.

8.199.3 Constructor & Destructor Documentation

8.199.3.1 MyFlatUnionBuilder()

```
MyFlatUnionBuilder::MyFlatUnionBuilder ( ) [inline]
```

Creates an invalid Builder.

Postcondition

!is_valid()

Note

Top-level builders are created with **rti::flat::build_data()** (p. 411), and member builders are created with the corresponding `build_<member>` function.

8.199.4 Member Function Documentation

8.199.4.1 finish()

```
Offset MyFlatUnionBuilder::finish ( )
```

Finishes building a member.

See also

MyMutableBuilder::finish()

8.199.4.2 finish_sample()

```
MyFlatUnion * MyFlatUnionBuilder::finish_sample ( )
```

Finishes building a sample.

See also

MyMutableBuilder::finish_sample()

8.199.4.3 add_my_primitive()

```
bool MyFlatUnionBuilder::add_my_primitive (
            int32_t value )
```

Adds a primitive member.

This function automatically selects the discriminator 0, which corresponds to the member 'my_primitive' (see **MyFlat↩ Union** (p. 413))

8.199.4.4 build_my_mutable()

```
MyFlatMutableBuilder MyFlatUnionBuilder::build_my_mutable (
            int32_t discriminator = 1 )
```

Builds a mutable-struct member.

Parameters

discriminator	Allows selecting one of the possible discriminator values for this member: 1 or 2. This argument is optional: if not specified it selects the first 'case' label in the IDL definition (1).

Returns

The Builder to build this member

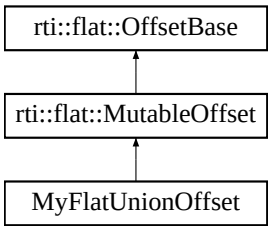
8.199.4.5 add_my_final()

```
MyFlatFinal::Offset MyFlatUnionBuilder::add_my_final ( )
```

Adds a final-struct member.

Returns

The Offset to the member, which can be used to set its values.



This function automatically selects the discriminator value 3, which corresponds to the member 'my_final' (see **MyFlat↩ Union** (p. 413)).

8.200 MyFlatUnionOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatUnionOffset:

Public Types

- typedef MyFlatUnionConstOffset **ConstOffset**

  The equivalent read-only Offset type.

Public Member Functions

- **MyFlatUnionOffset** ()

  Creates a null Offset.
- int32_t **_d** () const

  Retrieves the union discriminator.
- int32_t **my_primitive** () const

  Retrieves the value for a primitive member.
- **MyFlatMutable::ConstOffset my_mutable** () const

  Retrieves a const Offset to a complex member.
- **MyFlatFinal::ConstOffset my_final** () const

  Retrieves a const Offset to a complex member.
- bool **my_primitive** (int32_t value)

  Sets the value for a primitive member.
- **MyFlatMutable::Offset my_mutable** ()

  Retrieves a non-const Offset to a complex member.
- **MyFlatFinal::Offset my_final** ()

  Retrieves a non-const Offset to a complex member.

8.200.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatUnion** (p. 413).

It provides accessors for each of its members, plus the discriminator **_d()** (p. 1782). Accessors can return other Offsets or primitive values.

Given a union, only one member, the one identified by **_d()** (p. 1782), can exist at a time. The discriminator cannot be modified.

8.200.2 Member Typedef Documentation

8.200.2.1 ConstOffset

```
typedef MyFlatUnionConstOffset MyFlatUnionOffset::ConstOffset
```

The equivalent read-only Offset type.

8.200.3 Constructor & Destructor Documentation

8.200.3.1 MyFlatUnionOffset()

```
MyFlatUnionOffset::MyFlatUnionOffset ( )  [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1876)

8.200.4 Member Function Documentation

8.200.4.1 _d()

```
int32_t MyFlatUnionOffset::_d ( ) const
```

Retrieves the union discriminator.

Returns

The union discriminator, which identifies which field this union contains.

In this example:

- 0 selects **my_primitive()** (p. 1782)
- 1 and 2 select **my_mutable()** (p. 1783)
- 3 selects my_final

Any other discriminator value indicates that no member or an unknown member follows.

Note that the discriminator cannot be modified, since that would potentially change the size of this Sample by selecting a different member. The discriminator is selected during the building of a Sample (see MyUnionBuilder).

8.200.4.2 my_primitive() [1/2]

```
int32_t MyFlatUnionOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

Returns

The value of my_primitive if this member is selected by **_d()** (p. 1782)
or its default value otherwise.

8.200.4.3 my_mutable() [1/2]

```
MyFlatMutable::ConstOffset MyFlatUnionOffset::my_mutable ( ) const
```

Retrieves a const Offset to a complex member.

Returns

The Offset to the 'my_mutable' member if selected by **_d()** (p. 1782), or a **null Offset** (p. 416) otherwise

8.200.4.4 my_final() [1/2]

```
MyFlatFinal::ConstOffset MyFlatUnionOffset::my_final ( ) const
```

Retrieves a const Offset to a complex member.

Returns

The Offset to the 'my_final' member if selected by **_d()** (p. 1782), or a **null Offset** (p. 416) otherwise

8.200.4.5 my_primitive() [2/2]

```
bool MyFlatUnionOffset::my_primitive (
            int32_t value )
```

Sets the value for a primitive member.

Precondition

_d() (p. 1782) must select 'my_primitive', otherwise this function returns false.

Returns

true if my_primitive was set or false if the operation failed.

8.200.4.6 my_mutable() [2/2]

```
MyFlatMutable::Offset MyFlatUnionOffset::my_mutable ( )
```

Retrieves a non-const Offset to a complex member.

Returns

The Offset to the 'my_mutable' member if selected by **_d()** (p. 1782), or a **null Offset** (p. 416) otherwise

8.200.4.7 my_final() [2/2]

```
MyFlatFinal::Offset MyFlatUnionOffset::my_final ( )
```

Retrieves a non-const Offset to a complex member.

Returns

The Offset to the 'my_final' member if selected by **_d()** (p. 1782), or a **null Offset** (p. 416) otherwise

8.201 NDDS_Transport_Address_t Struct Reference

Addresses are stored individually as network-ordered bytes.

`#include <transport_common_user.h>`

Public Attributes

- unsigned char **network_ordered_value** [NDDS_TRANSPORT_ADDRESS_LENGTH]

8.201.1 Detailed Description

Addresses are stored individually as network-ordered bytes.

RTI Connext addresses are numerically stored in a transport independent manner. RTI Connext uses a IPv6-compatible format, which means that the data structure to hold an **NDDS_Transport_Address_t** (p. 1784) is the same size as a data structure needed to hold an IPv6 address.

In addition, the functions provided to translate a string representation of an RTI Connext address to a value assumes that the string presentation follows the IPv6 address presentation as specified in RFC 2373.

An **NDDS_Transport_Address_t** (p. 1784) always stores the address in network-byte order (which is Big Endian).

For example, IPv4 multicast address of 225.0.0.0 is represented by

{{0,0,0,0, 0,0,0,0, 0,0,0,0, 0xE1,0,0,0}} regardless of endianness,

where 0xE1 is the 13th byte of the structure (`network_ordered_value`[12]).

8.201.2 Member Data Documentation

8.201.2.1 network_ordered_value

```
unsigned char NDDS_Transport_Address_t::network_ordered_value[NDDS_TRANSPORT_ADDRESS_LENGTH]
```

network-byte ordered (i.e., bit 0 is the most significant bit and bit 128 is the least significant bit).

8.202 NDDS_Transport_Interface_t Struct Reference

Storage for the description of a network interface used by a Transport Plugin.

```
#include <transport_common.h>
```

Public Attributes

- **NDDS_Transport_ClassId_t transport_classid**

  The transport classid of the interface.
- **NDDS_Transport_Address_t address**

  An unicast address that uniquely identifies this interface in the network specified by the transport class.
- **NDDS_Transport_Interface_Status_t status**

  The state of the interface.
- RTI_UINT16 **rank**

  Rank of the interface. Used when allow_interfaces_list Qos is set. A rank value will be assigned to each of the interfaces that match the allow_interfaces_list filter allowing an endpoint to prioritize some interfaces upon others.

8.202.1 Detailed Description

Storage for the description of a network interface used by a Transport Plugin.

8.202.2 Member Data Documentation

8.202.2.1 transport_classid

```
NDDS_Transport_ClassId_t NDDS_Transport_Interface_t::transport_classid
```

The transport classid of the interface.

8.202.2.2 address

NDDS_Transport_Address_t NDDS_Transport_Interface_t::address

An unicast address that uniquely identifies this interface in the network specified by the transport class.

8.202.2.3 status

NDDS_Transport_Interface_Status_t NDDS_Transport_Interface_t::status

The state of the interface.

8.202.2.4 rank

RTI_UINT16 NDDS_Transport_Interface_t::rank

Rank of the interface. Used when allow_interfaces_list Qos is set. A rank value will be assigned to each of the interfaces that match the allow_interfaces_list filter allowing an endpoint to prioritize some interfaces upon others.

8.203 NDDS_Transport_Property_t Struct Reference

Base configuration structure that must be inherited by derived Transport Plugin classes.

#include <transport_interface_user.h>

Public Attributes

- **NDDS_Transport_ClassId_t classid**

  The Transport-Plugin Class ID.
- RTI_INT32 **address_bit_count**

  Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.
- RTI_INT32 **properties_bitmap**

  A bitmap that defines various properties of the transport to the RTI Connext core.
- RTI_INT32 **gather_send_buffer_count_max**

  Specifies the maximum number of buffers that RTI Connext can pass to the `send()` method of a transport plugin.
- RTI_INT32 **message_size_max**

  The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.
- char ** **allow_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length` > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

- RTI_INT32 **allow_interfaces_list_length**

  Number of elements in the `allow_interfaces_list`*.*
- char ** **deny_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length` *> 0), deny the use of these interfaces.*
- RTI_INT32 **deny_interfaces_list_length**

  Number of elements in the `deny_interfaces_list`*.*
- char ** **allow_multicast_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length` *> 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.*
- RTI_INT32 **allow_multicast_interfaces_list_length**

  Number of elements in the `allow_multicast_interfaces_list`*.*
- char ** **deny_multicast_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length` *> 0), deny the use of those interfaces for multicast.*
- RTI_INT32 **deny_multicast_interfaces_list_length**

  Number of elements in `deny_multicast_interfaces_list`*.*
- struct **NDDS_Transport_UUID transport_uuid**

  Univocally identifies a transport plugin.
- char * **thread_name_prefix**

  Prefix used to name the transport threads.
- RTI_INT32 **max_interface_count**

  Maximum number of addresses from the `allow_interfaces_list` *that will be announced.*

8.203.1 Detailed Description

Base configuration structure that must be inherited by derived Transport Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Connext. The RTI Connext core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

WARNING: The transport properties of an instance of a Transport Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

8.203.2 Member Data Documentation

8.203.2.1 classid

NDDS_Transport_ClassId_t NDDS_Transport_Property_t::classid

The Transport-Plugin Class ID.

The transport plugin sets the value for this field.

Class IDs below **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 370) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

Invariant

The `classid` is invariant for the lifecycle of a transport plugin.

8.203.2.2 address_bit_count

RTI_INT32 NDDS_Transport_Property_t::address_bit_count

Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.

The transport plugin sets the value for this field.

A transport plugin should define the range of addresses that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected. The sign of this field determines whether the count of bits starts on the most significant bit (negative sign) or on the least significant bit (positive sign).

For example, for an address range of 0-255, the address_bit_count should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

See also

Transport Class Attributes (p. 77)

8.203.2.3 properties_bitmap

```
RTI_INT32 NDDS_Transport_Property_t::properties_bitmap
```

A bitmap that defines various properties of the transport to the RTI Connext core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Connext tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also

NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (p. 370)

8.203.2.4 gather_send_buffer_count_max

```
RTI_INT32 NDDS_Transport_Property_t::gather_send_buffer_count_max
```

Specifies the maximum number of buffers that RTI Connext can pass to the `send()` method of a transport plugin.

The transport plugin `send()` API supports a gather-send concept, where the `send()` call can take several discontiguous buffers, assemble and send them in a single message. This enables RTI Connext to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Connext from trying to gather too many buffers into a send call for the transport plugin.

RTI Connext requires all transport-plugin implementations to support a gather-send of least a minimum number of buffers. This minimum number is defined to be **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_↩ COUNT_MIN** (p. 371).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the `send()` call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the receive_rEA() call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Connext layer.

8.203.2.5 message_size_max

```
RTI_INT32 NDDS_Transport_Property_t::message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this property. In any case, this value must be set before the transport plugin is registered, so that RTI Connext can properly use the plugin.

For information about the default value for different transports, see the `Core Libraries User's Manual`.

8.203.2.6 allow_interfaces_list

```
char** NDDS_Transport_Property_t::allow_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length` > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that Domain↩ Participant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.∗, 192.168.∗, 192.∗, ether0

The left-to-right order of this list matters if you are using the max_interface_count to limit the allowable interfaces further. See `max_interface_count`.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **dds::domain::Domain↩ Participant** (p. 1326) is deleted.

[default] empty list that represents all available interfaces.

See also

NDDS_Transport_Property_t::max_interface_count (p. 1793)

8.203.2.7 allow_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_interfaces_list_length
```

Number of elements in the `allow_interfaces_list`.

By default, `allow_interfaces_list_length` = 0, i.e. an empty list.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.203.2.8 deny_interfaces_list

```
char** NDDS_Transport_Property_t::deny_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length` > 0), deny the use of these interfaces.

This "black" list is applied *after* the `allow_interfaces_list` and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that Domain↩ Participant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.∗, 192.168.∗, 192.∗, ether0

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **dds::domain::Domain↩ Participant** (p. 1326) is deleted.

[default] empty list that represents no denied interfaces.

8.203.2.9 deny_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_interfaces_list_length
```

Number of elements in the `deny_interfaces_list`.

By default, `deny_interfaces_list_length` = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.203.2.10 allow_multicast_interfaces_list

```
char** NDDS_Transport_Property_t::allow_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length` > 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the `allow_interfaces_list` "white" list *and* the `deny_interfaces_list` "black" list.

After `allow_multicast_interfaces_list`, the `deny_multicast_interfaces_list` is applied. Multicast output will be sent and may be received over the interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast. It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **dds::domain::DomainParticipant** (p. 1326) is deleted.

[default] empty list that represents all available interfaces.

8.203.2.11 allow_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_multicast_interfaces_list_length
```

Number of elements in the `allow_multicast_interfaces_list`.

By default, `allow_multicast_interfaces_list_length` = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.203.2.12 deny_multicast_interfaces_list

```
char** NDDS_Transport_Property_t::deny_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length` > 0), deny the use of those interfaces for multicast.

This "black" list is applied after `allow_multicast_interfaces_list` and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **dds::domain::DomainParticipant** (p. 1326) is deleted.

[default] empty list that represents no denied interfaces.

8.203.2.13 deny_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_multicast_interfaces_list_length
```

Number of elements in `deny_multicast_interfaces_list`.

By default, `deny_multicast_interfaces_list_length` = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.203.2.14 transport_uuid

```
struct NDDS_Transport_UUID NDDS_Transport_Property_t::transport_uuid
```

Univocally identifies a transport plugin.

It represents the prefix of the participant GUID.

8.203.2.15 thread_name_prefix

```
char* NDDS_Transport_Property_t::thread_name_prefix
```

Prefix used to name the transport threads.

This field is optional.

The maximum size of this string is 8 characters.

If "thread_name_prefix" is not set by the user, RTI Connext creates the following prefix: 'r' + 'Tr' + participant identifier + '\0'.

Where 'r' indicates this is a thread from RTI, 'Tr' indicates the thread is related to a transport, and participant identifier contains 5 characters as follows:

If participant_name is set: The participant identifier will be the first 3 characters and the last 2 characters of the participant_name.

If participant_name is not set, then the identifier is computed as domain_id (3 characters) followed by participant_id (2 characters).

If participant_name is not set and the participant_id is set to -1 (defalt value), then the participant identifier is computed as the last 5 digits of the rtps_instance_id in the participant GUID.

8.203.2.16 max_interface_count

```
RTI_INT32 NDDS_Transport_Property_t::max_interface_count
```

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

By default, `max_interface_count` = LENGTH_UNLIMITED: all the interfaces are announced.

This feature is useful if you want to control the network interfaces on which your DomainParticipants receive data. For example, if you have one wired and one wireless interface both up and running, and `max_interface_count` is set to 1, the DomainParticipant will receive data over the interface you list first in the `allow_interfaces_list` -for example, the wired one.

RTI Connext selects the preferred interface(s) by iterating over the list of allowed interfaces until the first `max_↩ interfaces_count` of active interfaces encountered are announced. The order of iteration is left to right as specified in the `allow_interfaces_list` setting.

This setting applies only if the `allow_interfaces_list` is not empty.

The `max_interface_count` setting does not consider end-to-end connectivity to select interfaces. The decision is based purely on whether interfaces are up or down in a node. Therefore, this feature is not intended to be used in the following scenarios:

- A DomainParticipant is not reachable by other DomainParticipants in all the interfaces in the `allow_↩ interfaces_list`. This could occur if the DomainParticipant is in different subnets, and some of these subnets cannot be reached by other DomainParticipants.
- End-to-end connectivity issues lead to situations in which the interfaces selected after applying `max_↩ interface_count` cannot be reached by other DomainParticipants.

For UDPv4 and UDPv6 transports, this feature also affects multicast traffic by limiting the interfaces over which a DomainParticipant sends multicast traffic. The (allow/deny)_multicast_interfaces_list applies to the interfaces selected by using the `max_interfaces_count` property.

Note: If a pattern string in the `allow_interfaces_list` matches multiple interface addresses, and `max_↩ interface_count` is set to a finite value, the order for the matching allowed interfaces is decided based on the order in which the operating system provides these interfaces.

[default] LENGTH_UNLIMITED

`struct` **`NDDS_Transport_Property_t`** `NDDS_Transport_Shmem_Property_t::parent`

Generic properties of all transport plugins.

8.204.2.2 received_message_count_max

`RTI_INT32 NDDS_Transport_Shmem_Property_t::received_message_count_max`

Number of messages that can be buffered in the receive queue.

This does not guarantee that the Transport-Plugin will actually be able to buffer `received_message_count_max` messages of the maximum size set in **NDDS_Transport_Property_t::message_size_max** (p. 1789). The total number of bytes that can be buffered for a transport plug-in is actually controlled by `receive_buffer_size`.

See also

NDDS_Transport_Property_t (p. 1786), **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_↩ MAX_DEFAULT** (p. 384)

8.204.2.3 receive_buffer_size

```
RTI_INT32 NDDS_Transport_Shmem_Property_t::receive_buffer_size
```

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue. The actual number of bytes allocated is:

```
size = receive_buffer_size + message_size_max +
       received_message_count_max * fixedOverhead
```

where `fixedOverhead` is some small number of bytes used by the queue data structure. The following rules are noted:

- `receive_buffer_size` < `message_size_max` * `received_message_count_max`, then the transport plugin will not be able to store `received_message_count_max` messages of size `message_size_max`.

- `receive_buffer_size` > `message_size_max` * `received_message_count_max`, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then `receive_buffer_size` should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the `receive_buffer_size` to 100 K bytes. This allows the user to optimize the memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

NOTE, the queue will always be able to hold 1 message of `message_size_max` bytes, no matter what the value of receive_buffer_size is.

Configurable IPv4/UDP Transport-Plugin properties.

#include <transport_udpv4.h>

Public Attributes

- struct **NDDS_Transport_Property_t parent**
  Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
  Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
  Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**
  Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**
  Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**
  Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**
  Prevents the transport plugin from putting multicast packets onto the loopback interface.

- RTI_INT32 **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonup_interfaces**

  [DEPRECATED] *Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- RTI_INT32 **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**

  [DEPRECATED] *Prevents the transport plugin from doing a zero copy.*
- RTI_INT32 **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**

  Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**

  Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**

  Set low value of output range to IPv4 TOS.
- RTI_INT32 **transport_priority_mapping_high**

  Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**

  Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**

  Controls whether or not to reuse multicast receive resources.
- RTI_INT32 **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**

  Disables detection of network interface changes.
- RTI_UINT32 **join_multicast_group_timeout**

  [Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.
- char * **public_address**

  Public IP address associated with the transport instantiation.
- RTI_INT32 **port_offset**

  Port offset to allow multiple instances of UDPv4 transports in the same ***dds::domain::DomainParticipant*** *(*p. *1326)**.*

8.206.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

Transport_Support::set_builtin_transport_property()

8.206.2 Member Data Documentation

8.206.2.1 parent

`struct` **NDDS_Transport_Property_t** NDDS_Transport_UDPv4_Property_t::parent

Generic properties of all transport plugins.

8.206.2.2 send_socket_buffer_size

RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1789). Its maximum value is dependent on the operating system.

By default, it will be set to UDPv4Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- UDPv4Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the default value.
- UDPv4Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. RTI Connext will use the OS default.
- UDPv4Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the send buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

8.206.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1789). Its maximum value is dependent on the operating system.

By default, it will be set to UDPv4Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- UDPv4Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the default value.
- UDPv4Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. RTI Connext will use the OS default.
- UDPv4Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the receive buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

8.206.2.4 unicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

8.206.2.5 multicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use all the network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

8.206.2.6 multicast_ttl

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

8.206.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connext will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

8.206.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

8.206.2.9 ignore_nonup_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_Property_t::disable_interface_tracking** (p. 1807) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

8.206.2.10 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

8.206.2.11 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connext will use the zero-copy API if offered by the OS.

8.206.2.12 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

8.206.2.13 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **dds::domain::DomainParticipant::participant_protocol_status** (p. 1358).

[default] 1 (enabled)

8.206.2.14 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 1805) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 1805) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 550)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

8.206.2.15 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 1804) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 1805) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

8.206.2.16 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 1804) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 1805) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

8.206.2.17 send_ping

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

8.206.2.18 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

8.206.2.19 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

8.206.2.20 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

Setting this to 0 (FALSE) prevents multicast crosstalk by uniquely configuring a port and creating a receive thread for each multicast group address.

[default] 1.

8.206.2.21 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1789) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↩ _max, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 1789)

8.206.2.22 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connext application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connext 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

8.206.2.23 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

On Windows, a network interface may be detected before it is allowed to join a multicast group address. This property adjusts how much time (milliseconds) to wait for the ADD_MEMBERSHIP multicast operation to succeed before withdrawing.

[default] 5000

8.206.2.24 public_address

```
char* NDDS_Transport_UDPv4_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **dds::domain::DomainParticipant** (p. 1326) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **rti::core::RtpsWellKnownPorts** (p. 2258)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **dds::domain::DomainParticipant** (p. 1326) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] null (the transport uses the IP addresses obtained from the NICs)

8.206.2.25 port_offset

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv4 transports in the same **dds::domain::DomainParticipant** (p. 1326).

By default, it is not possible to have multiple instances of the UDPv4 transport in the same **dds::domain::Domain↩ Participant** (p. 1326). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv4 transport in the same **dds::domain::DomainParticipant** (p. 1326).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

[default] 0

8.207 NDDS_Transport_UDPv4_WAN_Property_t Struct Reference

Configurable IPv4/UDP WAN Transport-Plugin properties.

`#include <transport_udpv4.h>`

Public Attributes

- struct **NDDS_Transport_Property_t parent**

  Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**

  Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonup_interfaces**

  ***[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- RTI_INT32 **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing a zero copy.*
- RTI_INT32 **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**

  Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**

  Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**

  Set low value of output range to IPv4 TOS.
- RTI_INT32 **transport_priority_mapping_high**

  Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**

  Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**

  Disables detection of network interface changes.
- char * **public_address**

  Public IP address associated with the transport instantiation.
- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo** * **comm_ports_list**

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

- RTI_INT32 **comm_ports_list_length**

  Number of elements in the ***NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list*** *(p. 1816).*

- RTI_INT32 **port_offset**

  Port offset to allow coexistence with built-in UDPv4 transport.

- RTI_UINT32 **binding_ping_period**

  Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

8.207.1 Detailed Description

Configurable IPv4/UDP WAN Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

Transport_Support::set_builtin_transport_property()

8.207.2 Member Data Documentation

8.207.2.1 parent

`struct` **NDDS_Transport_Property_t** `NDDS_Transport_UDPv4_WAN_Property_t::parent`

Generic properties of all transport plugins.

8.207.2.2 send_socket_buffer_size

`RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size`

Size in bytes of the send buffer of a socket used for sending.

See also

NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size (p. 1800)

8.207.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

See also

NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size (p. 1800)

8.207.2.4 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

8.207.2.5 ignore_nonup_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking** (p. 1815) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

8.207.2.6 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

8.207.2.7 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connext will use the zero-copy API if offered by the OS.

8.207.2.8 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

This property is not supported on Windows when using the Real-Time WAN Transport. The send sockets cannot be configured to be non-blocking because Windows does not provide a way to configure a socket to only be non-blocking for send operations but not receive operations.

8.207.2.9 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **dds::domain::DomainParticipant::participant_protocol↩ _status** (p. 1358).

[default] 1 (enabled)

8.207.2.10 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 1814) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 1814) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 550)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

8.207.2.11 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 1813) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 1814) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

8.207.2.12 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 1813) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 1814) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

8.207.2.13 send_ping

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

8.207.2.14 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

8.207.2.15 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

8.207.2.16 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1789) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↩ _max, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 1789)

8.207.2.17 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connext application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connext 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

8.207.2.18 public_address

```
char* NDDS_Transport_UDPv4_WAN_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary for the Real-Time WAN Transport associated with an external **dds::domain::DomainParticipant** (p. 1326) (publicly reachable) in order to support the two communication scenarios shown in the Figure below.

For an external **dds::domain::DomainParticipant** (p. 1326) behind a NAT-enabled router, this address is the public IP address of the router.

When this property is set, the DomainParticipant will announce PUBLIC+UUID locators to other DomainParticipants. These locators are reachable locators because they contain this public IP address.

For additional information on Real-Time WAN Transport locators, see the `Core Libraries User's Manual`.

with a Participant that has a Public Address"

[default] null (the transport will announce UUID locators)

8.207.2.19 comm_ports_list

struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo*** NDDS_Transport_UDPv4_WAN_Property_t::comm_↩ports_list

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

Array containing the mapping between "RTPS ports", "UDP receive host ports", and "UDP receive public ports".

When the transport is configured using properties, the port mapping array is provided using a JSON string.

For example:

```
{
    "default": {"host": 8192, "public": 9678},
    "mappings": [
        {"rtps": 1234, "host": 9999, "public": 5678},
        {"rtps": 1235, "host": 9990, "public": 5679},
    ]
}
```

It is also possible to configure the mapping with XML:

```
<transport_builtin>
    <udpv4_wan>
        <comm_ports>
            <default>
                <host>8192</host>
                <public>9678</public>
            </default>
            <mappings>
                <element>
                    <rtps>1234</rtps>
                    <host>9999</host>
                    <public>5678</public>
                </element>
                <element>
                    <rtps>1235</rtps>
                    <host>9990</host>
                    <public>5679</public>
                </element>
            </mappings>
        </comm_ports>
    </udpv4_wan>
<transport_builtin>
```

For additional information on how to set the value of this property, see the `Core Libraries User's Manual`.

[default] NULL (The UDP ports used for communications will be derived from the RTPS ports associated with the locators for the DomainParticipant and its Endpoints (DataWriters and DataReaders)).

8.207.2.20 comm_ports_list_length

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list_length
```

Number of elements in the **NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list** (p. 1816).

[default] 0

8.207.2.21 port_offset

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::port_offset
```

Port offset to allow coexistence with built-in UDPv4 transport.

This property allows using the built-in UDPv4 transport and the Real-Time WAN Transport at the same time.

```
<transport_builtin>

    <mask>UDPv4_WAN|UDPv4</mask>

</transport_builtin>
```

When the UDP ports used by Real-Time WAN Transport are not explicitly set, they are calculated as follows: RTPS port + port_offset.

[default] 125

8.207.2.22 binding_ping_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::binding_ping_period
```

Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

Configures the period in milliseconds at which BINDING_PING messages are sent by a local transport instance to a remote transport instance. For example, 1000 means to send BINDING_PING messages every second.

BINDING_PING messages are used on the sending side to open NAT bindings from a local transport instance to a remote transport instance and they are sent periodically to keep the bindings open.

On the receiving side, BINDING_PINGS are used to calculate the public IP transport address of an UUID locator. This address will be used to send data to the locator.

For additional information on the role of BINDING_PING, see the Core Libraries User's Manual.

From a configuration point of view, and to avoid communication disruptions, the period at which a transport instance sends BINDING_PING messages should be smaller than the NAT binding session timeout. This timeout depends on the NAT router configuration.

[default] 1000 (1 sec)

8.208 NDDS_Transport_UDPv6_Property_t Struct Reference

Configurable IPv6/UDP Transport-Plugin properties.

```
#include <transport_udpv6.h>
```

Public Attributes

- struct **NDDS_Transport_Property_t parent**

  Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**

  Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**

  Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**

  Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**

  Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**

  Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing zero copy.*
- RTI_INT32 **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **enable_v4mapped**

  Specify whether UDPv6 transport will process IPv4 addresses.
- RTI_UINT32 **transport_priority_mask**

  Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**

  Set low value of output range to IPv6 TCLASS.
- RTI_INT32 **transport_priority_mapping_high**

  Set high value of output range to IPv6 TCLASS.
- RTI_INT32 **send_ping**

  Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.
- RTI_UINT32 **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**

Controls whether or not to reuse multicast receive resources.

- RTI_INT32 **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.

- RTI_INT32 **disable_interface_tracking**

  Disables detection of network interface changes.

- RTI_UINT32 **join_multicast_group_timeout**

  [Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

- char * **public_address**

  Public IP address associated with the transport instantiation.

- RTI_INT32 **port_offset**

  *Port offset to allow multiple instances of UDPv6 transports in the same **dds::domain::DomainParticipant** (p. 1326).*

8.208.1 Detailed Description

Configurable IPv6/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

Transport_Support::set_builtin_transport_property()

8.208.2 Member Data Documentation

8.208.2.1 parent

`struct` **`NDDS_Transport_Property_t`** `NDDS_Transport_UDPv6_Property_t::parent`

Generic properties of all transport plugins.

8.208.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1789). Its maximum value is dependent on the operating system.

By default, it will be set to UDPv6Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- UDPv6Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the default value.
- UDPv6Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. RTI Connext will use the OS default.
- UDPv6Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the send buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

8.208.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1789). Its maximum value is dependent on the operating system.

By default, it will be set to UDPv6Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- UDPv6Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the default value.
- UDPv6Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. RTI Connext will use the OS default.
- UDPv6Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the receive buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

8.208.2.4 unicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

8.208.2.5 multicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

8.208.2.6 multicast_ttl

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

8.208.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connext will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

8.208.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows.

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

8.208.2.9 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- **1**: Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

8.208.2.10 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Connext will use the zero copy API if offered by the OS.

8.208.2.11 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS.

8.208.2.12 enable_v4mapped

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::enable_v4mapped
```

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

[default] 0.

8.208.2.13 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with **NDDS_↩ Transport_UDPv6_Property_t::transport_priority_mapping_low** (p. 1825) and **NDDS_Transport_UDPv6_↩ Property_t::transport_priority_mapping_high** (p. 1825) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 550)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

[default] 0.

8.208.2.14 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p. 1824) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p. 1825) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0.

8.208.2.15 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p. 1824) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p. 1825) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0xff.

8.208.2.16 send_ping

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_ping
```

Configures whether to send PING messages.

See also

NDDS_Transport_UDPv4_Property_t::send_ping (p. 1805)

8.208.2.17 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.

See also

NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection (p. 1806)

8.208.2.18 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

See also

NDDS_Transport_UDPv4_Property_t::interface_poll_period (p. 1806)

8.208.2.19 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

See also

NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource (p. 1806)

8.208.2.20 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1789) plus this overhead is larger than the UDPv6 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↩ _max, to 65535 minus this overhead.

[default] 48.

See also

NDDS_Transport_Property_t::message_size_max (p. 1789)

8.208.2.21 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

See also

NDDS_Transport_UDPv4_Property_t::disable_interface_tracking (p. 1807)

8.208.2.22 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

See also

NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout (p. 1807)

8.208.2.23 public_address

```
char* NDDS_Transport_UDPv6_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **dds::domain::DomainParticipant** (p. 1326) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **rti::core::RtpsWellKnownPorts** (p. 2258)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **dds::domain::DomainParticipant** (p. 1326) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] null (the transport uses the IP addresses obtained from the NICs)

8.208.2.24 port_offset

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv6 transports in the same **dds::domain::DomainParticipant** (p. 1326).

By default, it is not possible to have multiple instances of the UDPv6 transport in the same **dds::domain::Domain↩ Participant** (p. 1326). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv6 transport in the same **dds::domain::DomainParticipant** (p. 1326).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

[default] 0

8.209 NDDS_Transport_UUID Struct Reference

Unequivocally identifies a transport plugin instance.

`#include <transport_common.h>`

8.209.1 Detailed Description

Unequivocally identifies a transport plugin instance.

Public Member Functions

- **dds::core::StringSeq transports** () const
  Get the list of transports to capture.
- **NetworkCaptureParams** & **transports** (const **dds::core::StringSeq** &transports_in)
  Set the list of transports to capture.
- **ContentKindMask dropped_content** () const
  Get the type of contents to exclude from the capture file.
- **NetworkCaptureParams** & **dropped_content** (**ContentKindMask** dropped_content_in)
  Set the type of contents to exclude from the capture file.
- **TrafficKindMask traffic** () const
  Get the traffic direction to capture.
- **NetworkCaptureParams** & **traffic** (**TrafficKindMask** traffic_in)
  Set the traffic direction to capture.
- bool **parse_encrypted_content** () const
  Get whether Network Capture will parse encrypted contents.
- **NetworkCaptureParams** & **parse_encrypted_content** (bool parse_encrypted_content_in)
  Set whether Network Capture will parse encrypted contents.
- const **rti::core::ThreadSettings** & **checkpoint_thread_settings** () const
  Get the properties of the checkpoint thread.
- **NetworkCaptureParams** & **checkpoint_thread_settings** (const **rti::core::ThreadSettings** &checkpoint_↩ thread_settings_in)
  Set the properties of the checkpoint thread.
- int32_t **frame_queue_size** () const
  Get the size of the frame queue (Bytes).
- **NetworkCaptureParams** & **frame_queue_size** (int32_t frame_queue_size_in)
  Set the size of the frame queue.

8.210.1 Detailed Description

<<***extension***>> *(p. 354)* Input parameters for starting Network Capture.

8.210.2 Member Function Documentation

8.210.2.1 transports() [1/2]

```
dds::core::StringSeq rti::util::network_capture::NetworkCaptureParams::transports ( ) const
```

Get the list of transports to capture.

Returns

List of transports to capture.

8.210.2.2 transports() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::transports (
            const  dds::core::StringSeq & transports_in )
```

Set the list of transports to capture.

Network Capture will only save RTPS frames if the associated transport protocol is part of this sequence.

[default] Empty sequence initializer. This means that by default all transports will be captured.

Parameters

transports_in	The sequence of transports that we want to capture traffic from.

Returns

The Network Capture's parameter instance.

8.210.2.3 dropped_content() [1/2]

```
ContentKindMask rti::util::network_capture::NetworkCaptureParams::dropped_content ( ) const
```

Get the type of contents to exclude from the capture file.

Returns

Contents to exclude from the capture file.

8.210.2.4 dropped_content() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::dropped_content (
            ContentKindMask dropped_content_in )
```

Set the type of contents to exclude from the capture file.

It accepts values from **network_capture::ContentKindMask** (p. 962) .

We can choose to exclude user data or encrypted content from the capture file.

[default] No content is excluded - **network_capture::ContentKindMask::default_mask()** (p. 964).

Parameters

dropped_content_in	The mask of contents to exclude from the capture.

Returns

The Network Capture's parameter instance.

8.210.2.5 traffic() [1/2]

```
TrafficKindMask rti::util::network_capture::NetworkCaptureParams::traffic ( ) const
```

Get the traffic direction to capture.

Returns

Traffic direction to capture.

8.210.2.6 traffic() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::traffic (
            TrafficKindMask traffic_in )
```

Set the traffic direction to capture.

It accepts values from **network_capture::TrafficKindMask** (p. 2529) .

[default] Capture both inbound and outbound traffic - **network_capture::TrafficKindMask::default_mask()** (p. 2532).

Parameters

traffic↩ _in	The mask with the traffic directions that we want to capture.

Returns

The Network Capture's parameter instance.

8.210.2.7 parse_encrypted_content() [1/2]

```
bool rti::util::network_capture::NetworkCaptureParams::parse_encrypted_content ( ) const
```

Get whether Network Capture will parse encrypted contents.

Returns

Whether Network Capture will parse encrypted contents.

8.210.2.8 parse_encrypted_content() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::parse_encrypted_content
(
            bool parse_encrypted_content_in )
```

Set whether Network Capture will parse encrypted contents.

Network Capture supports decryption of RTPS messages and submessages. It does not support decryption of the user data payload (<data_protection_kind> tag in the GovernanceDocument).

[default] false

Parameters

parse_encrypted_content_in	Boolean indicating whether to parse or not encrypted content.

Returns

The Network Capture's parameter instance.

8.210.2.9 checkpoint_thread_settings() [1/2]

```
const rti::core::ThreadSettings & rti::util::network_capture::NetworkCaptureParams::checkpoint_thread_settings ( ) const
```

Get the properties of the checkpoint thread.

Returns

Properties of the checkpoint thread.

8.210.2.10 checkpoint_thread_settings() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::checkpoint_thread_settings (
            const rti::core::ThreadSettings & checkpoint_thread_settings_in )
```

Set the properties of the checkpoint thread.

The checkpoint thread is a per-participant thread responsible for reading frames from a queue and saving them to disk (as soon as they are produced).

The members that can be configured are:

- **rti::core::ThreadSettings::mask** (p. 2450). Default value of (rti::core::ThreadSettingsKindMask::THREAD_SETTINGS_PRIORITY_ENFORCE | **rti::core::ThreadSettingsKindMask::stdio()** (p. 2456)).
- **rti::core::ThreadSettings::priority** (p. 2450). Platform-dependent - Consult `Platform Notes` for additional details.
- **rti::core::ThreadSettings::stack_size** (p. 2451). Platform-dependent - Consult `Platform Notes` for additional details.

Parameters

checkpoint_thread_settings_in	Properties of the checkpoint thread that we want to set.

Returns

The Network Capture's parameter instance.

8.210.2.11 frame_queue_size() [1/2]

```
int32_t rti::util::network_capture::NetworkCaptureParams::frame_queue_size ( ) const
```

Get the size of the frame queue (Bytes).

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

Returns

Size of the frame queue (Bytes).

8.210.2.12 frame_queue_size() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::frame_queue_size (
            int32_t frame_queue_size_in )
```

Set the size of the frame queue.

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

Parameters

frame_queue_size_in	Size of the frame queue in Bytes.

Returns

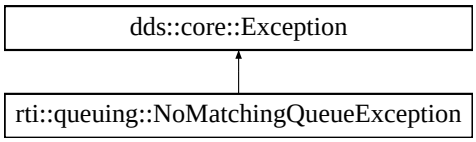
The Network Capture's parameter instance.

8.211 rti::topic::no_compile_data_t Struct Reference

The type to specify as the CompileData template parameter to your **ContentFilter** (p. 950) if your compile function does not return any data.

```
#include <rti/topic/ContentFilter.hpp>
```

8.211.1 Detailed Description



The type to specify as the CompileData template parameter to your **ContentFilter** (p. 950) if your compile function does not return any data.

8.212 rti::queuing::NoMatchingQueueException Class Reference

The entity lost matching with all the Queuing Service.

```
#include <QueueSupport.hpp>
```

Inheritance diagram for rti::queuing::NoMatchingQueueException:

Public Member Functions

- const char * **what** () const throw ()

  *Access the message contained in this **NoMatchingQueueException** (p. 1835) exception.*

8.212.1 Detailed Description

The entity lost matching with all the Queuing Service.

Only operations related with sending samples or waiting for acknowledgements can throw this exception.

8.212.2 Member Function Documentation

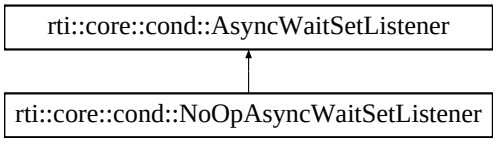
8.212.2.1 what()

```
const char * rti::queuing::NoMatchingQueueException::what ( ) const throw ( )   [inline], [virtual]
```

Access the message contained in this **NoMatchingQueueException** (p. 1835) exception.

Returns

The message.



Implements **dds::core::Exception** (p. 1547).

8.213 rti::core::cond::NoOpAsyncWaitSetListener Class Reference

A convenience implementation of **AsyncWaitSetListener** (p. 856) where all methods are overridden to do nothing.

```
#include <AsyncWaitSetListener.hpp>
```

Inheritance diagram for rti::core::cond::NoOpAsyncWaitSetListener:

Public Member Functions

- virtual void **on_thread_spawned** (ThreadId)
  No-op.
- virtual void **on_thread_deleted** (ThreadId)
  No-op.
- virtual void **on_wait_timeout** (ThreadId)
  No-op.

8.213.1 Detailed Description

A convenience implementation of **AsyncWaitSetListener** (p. 856) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.213.2 Member Function Documentation

8.213.2.1 on_thread_spawned()

```
virtual void rti::core::cond::NoOpAsyncWaitSetListener::on_thread_spawned (
            ThreadId  )  [inline], [virtual]
```

No-op.

Implements **rti::core::cond::AsyncWaitSetListener** (p. 857).

8.213.2.2 on_thread_deleted()

```
virtual void rti::core::cond::NoOpAsyncWaitSetListener::on_thread_deleted (
            ThreadId  )  [inline], [virtual]
```

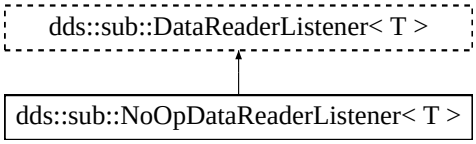
No-op.

Implements **rti::core::cond::AsyncWaitSetListener** (p. 857).

8.213.2.3 on_wait_timeout()

```
virtual void rti::core::cond::NoOpAsyncWaitSetListener::on_wait_timeout (
            ThreadId  )  [inline], [virtual]
```

No-op.



Implements **rti::core::cond::AsyncWaitSetListener** (p. 857).

8.214 dds::sub::NoOpDataReaderListener< T > Class Template Reference

A convenience implementation of **DataReaderListener** (p. 1055) where all methods are overridden to do nothing.

`#include "dds/sub/DataReaderListener.hpp"`

Inheritance diagram for dds::sub::NoOpDataReaderListener< T >:

Public Member Functions

- virtual void **on_requested_deadline_missed** (**DataReader**< T > &, const **dds::core::status::Requested↩ DeadlineMissedStatus** &)

  No-op.
- virtual void **on_requested_incompatible_qos** (**DataReader**< T > &, const **dds::core::status::Requested↩ IncompatibleQosStatus** &)

  No-op.
- virtual void **on_sample_rejected** (**DataReader**< T > &, const **dds::core::status::SampleRejectedStatus** &)

  No-op.
- virtual void **on_liveliness_changed** (**DataReader**< T > &, const **dds::core::status::LivelinessChanged↩ Status** &)

  No-op.
- virtual void **on_data_available** (**DataReader**< T > &)

  No-op.
- virtual void **on_subscription_matched** (**DataReader**< T > &, const **dds::core::status::Subscription↩ MatchedStatus** &)

  No-op.
- virtual void **on_sample_lost** (**DataReader**< T > &, const **dds::core::status::SampleLostStatus** &)

  No-op.

8.214.1 Detailed Description

template<**typename T**>
class dds::sub::NoOpDataReaderListener< **T** >

A convenience implementation of **DataReaderListener** (p. 1055) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.214.2 Member Function Documentation

8.214.2.1 on_requested_deadline_missed()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_requested_deadline_missed (
              DataReader< T > & ,
             const  dds::core::status::RequestedDeadlineMissedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 1057).

8.214.2.2 on_requested_incompatible_qos()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_requested_incompatible_qos (
              DataReader< T > & ,
             const  dds::core::status::RequestedIncompatibleQosStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 1057).

8.214.2.3 on_sample_rejected()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_sample_rejected (
              DataReader< T > & ,
             const  dds::core::status::SampleRejectedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 1057).

8.214.2.4 on_liveliness_changed()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_liveliness_changed (
              DataReader< T > & ,
             const  dds::core::status::LivelinessChangedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 1057).

8.214.2.5 on_data_available()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_data_available (
              DataReader< T > &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 1058).

8.214.2.6 on_subscription_matched()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_subscription_matched (
              DataReader< T > & ,
             const  dds::core::status::SubscriptionMatchedStatus &  )  [inline], [virtual]
```

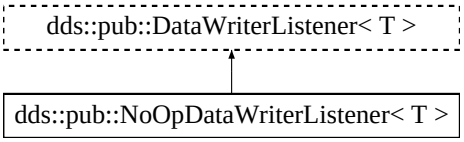
No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 1058).

8.214.2.7 on_sample_lost()

```
template<typename T >
virtual void  dds::sub::NoOpDataReaderListener< T >::on_sample_lost (
              DataReader< T > & ,
             const  dds::core::status::SampleLostStatus &  )  [inline], [virtual]
```

No-op.



Implements **dds::sub::DataReaderListener< T >** (p. 1058).

8.215 dds::pub::NoOpDataWriterListener< T > Class Template Reference

A convenience implementation of **DataWriterListener** (p. 1202) where all methods are overridden to do nothing.

`#include "dds/pub/DataWriterListener.hpp"`

Inheritance diagram for dds::pub::NoOpDataWriterListener< T >:

Public Member Functions

8.215.1 Detailed Description

template<**typename T**>
class dds::pub::NoOpDataWriterListener< **T** >

A convenience implementation of **DataWriterListener** (p. 1202) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.215.2 Member Function Documentation

8.215.2.1 on_offered_deadline_missed()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_offered_deadline_missed (
              dds::pub::DataWriter< T > & ,
             const  dds::core::status::OfferedDeadlineMissedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener**< **T** > (p. 1203).

8.215.2.2 on_offered_incompatible_qos()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_offered_incompatible_qos (
              dds::pub::DataWriter< T > & ,
             const  dds::core::status::OfferedIncompatibleQosStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener**< **T** > (p. 1204).

8.215.2.3 on_liveliness_lost()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_liveliness_lost (
              dds::pub::DataWriter< T > & ,
             const  dds::core::status::LivelinessLostStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener**< **T** > (p. 1204).

8.215.2.4 on_publication_matched()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_publication_matched (
              dds::pub::DataWriter< T > & ,
             const  dds::core::status::PublicationMatchedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener< T >** (p. 1205).

8.215.2.5 on_reliable_writer_cache_changed()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_reliable_writer_cache_changed (
              dds::pub::DataWriter< T > & ,
             const  rti::core::status::ReliableWriterCacheChangedStatus &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1205).

8.215.2.6 on_reliable_reader_activity_changed()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_reliable_reader_activity_changed (
              dds::pub::DataWriter< T > & ,
             const  rti::core::status::ReliableReaderActivityChangedStatus &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1206).

8.215.2.7 on_instance_replaced()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_instance_replaced (
              dds::pub::DataWriter< T > & ,
             const  dds::core::InstanceHandle &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1206).

8.215.2.8 on_application_acknowledgment()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_application_acknowledgment (
              dds::pub::DataWriter< T > & ,
             const  rti::pub::AcknowledgmentInfo &  )  [inline], [virtual]
```

<<***extension***>> *(*p. *354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1207).

8.215.2.9 on_service_request_accepted()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_service_request_accepted (
              dds::pub::DataWriter< T > & ,
             const  rti::core::status::ServiceRequestAcceptedStatus &  )  [inline], [virtual]
```

<<***extension***>> *(*p. *354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1209).

8.215.2.10 on_destination_unreachable()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_destination_unreachable (
              dds::pub::DataWriter< T > & ,
             const  dds::core::InstanceHandle & ,
             const  rti::core::Locator &  )  [inline], [virtual]
```

<<***extension***>> *(*p. *354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1202).

8.215.2.11 on_data_request()

```
template<typename T >
virtual void *  dds::pub::NoOpDataWriterListener< T >::on_data_request (
              dds::pub::DataWriter< T > & ,
             const  rti::core::Cookie &  )  [inline], [virtual]
```

<<***extension***>> *(*p. *354)* No-op

Implements **dds::pub::DataWriterListener< T >** (p. 1202).

8.215.2.12 on_data_return()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_data_return (
              dds::pub::DataWriter< T > & ,
             void * ,
             const  rti::core::Cookie &  )  [inline], [virtual]
```

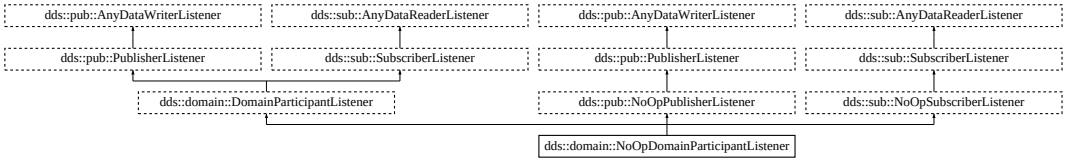
<<***extension***>> *(*p. *354)* No-op

Implements **dds::pub::DataWriterListener**< **T** > (p. 1202).

8.215.2.13 on_sample_removed()

```
template<typename T >
virtual void  dds::pub::NoOpDataWriterListener< T >::on_sample_removed (
              dds::pub::DataWriter< T > & ,
             const  rti::core::Cookie &  )  [inline], [virtual]
```

<<***extension***>> *(*p. *354)* No-op



Implements **dds::pub::DataWriterListener**< **T** > (p. 1209).

8.216 dds::domain::NoOpDomainParticipantListener Class Reference

A convenience implementation of **DomainParticipantListener** (p. 1382) where all methods are overridden to do nothing.

```
#include "dds/domain/DomainParticipantListener.hpp"
```

Inheritance diagram for dds::domain::NoOpDomainParticipantListener:

8.216.1 Detailed Description

A convenience implementation of **DomainParticipantListener** (p. 1382) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.216.2 Member Function Documentation

8.216.2.1 on_offered_deadline_missed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_offered_deadline_missed (
              dds::pub::AnyDataWriter & ,
             const  ::dds::core::status::OfferedDeadlineMissedStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1853).

8.216.2.2 on_offered_incompatible_qos()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_offered_incompatible_qos (
              dds::pub::AnyDataWriter & ,
             const  ::dds::core::status::OfferedIncompatibleQosStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1854).

8.216.2.3 on_liveliness_lost()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_liveliness_lost (
             dds::pub::AnyDataWriter & ,
            const  ::dds::core::status::LivelinessLostStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1854).

8.216.2.4 on_publication_matched()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_publication_matched (
             dds::pub::AnyDataWriter & ,
            const  ::dds::core::status::PublicationMatchedStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1854).

8.216.2.5 on_reliable_writer_cache_changed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_reliable_writer_cache_changed (
             dds::pub::AnyDataWriter & ,
            const  rti::core::status::ReliableWriterCacheChangedStatus &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1854).

8.216.2.6 on_reliable_reader_activity_changed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_reliable_reader_activity_changed (
             dds::pub::AnyDataWriter & ,
            const  rti::core::status::ReliableReaderActivityChangedStatus &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1855).

8.216.2.7 on_sample_removed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_sample_removed (
             dds::pub::AnyDataWriter & ,
            const  rti::core::Cookie &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1855).

8.216.2.8 on_instance_replaced()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_instance_replaced (
             dds::pub::AnyDataWriter & ,
            const  dds::core::InstanceHandle &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1855).

8.216.2.9 on_application_acknowledgment()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_application_acknowledgment (
             dds::pub::AnyDataWriter & ,
            const  rti::pub::AcknowledgmentInfo &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1855).

8.216.2.10 on_service_request_accepted()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_service_request_accepted (
             dds::pub::AnyDataWriter & ,
            const  rti::core::status::ServiceRequestAcceptedStatus &  )  [inline], [virtual]
```

<<***extension***>> *(p. 354)* No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1856).

8.216.2.11 on_invalid_local_status_advance_notice()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_invalid_local_status_advance_notice (
             DomainParticipant & ,
            const  rti::core::status::InvalidLocalAdvanceNoticeStatus &  )  [inline], [virtual]
```

<<***extension***>> *(*p. *354)* No-op

Implements **dds::domain::DomainParticipantListener** (p. 1382).

8.216.2.12 on_data_on_readers()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_data_on_readers (
             dds::sub::Subscriber &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1865).

8.216.2.13 on_requested_deadline_missed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_requested_deadline_missed (
             dds::sub::AnyDataReader & ,
            const  dds::core::status::RequestedDeadlineMissedStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1865).

8.216.2.14 on_requested_incompatible_qos()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_requested_incompatible_qos (
             dds::sub::AnyDataReader & ,
            const  dds::core::status::RequestedIncompatibleQosStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1865).

8.216.2.15 on_sample_rejected()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_sample_rejected (
              dds::sub::AnyDataReader & ,
             const  dds::core::status::SampleRejectedStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1865).

8.216.2.16 on_liveliness_changed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_liveliness_changed (
              dds::sub::AnyDataReader & ,
             const  dds::core::status::LivelinessChangedStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1866).

8.216.2.17 on_data_available()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_data_available (
              dds::sub::AnyDataReader &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1866).

8.216.2.18 on_subscription_matched()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_subscription_matched (
              dds::sub::AnyDataReader & ,
             const  dds::core::status::SubscriptionMatchedStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1866).

8.216.2.19 on_sample_lost()

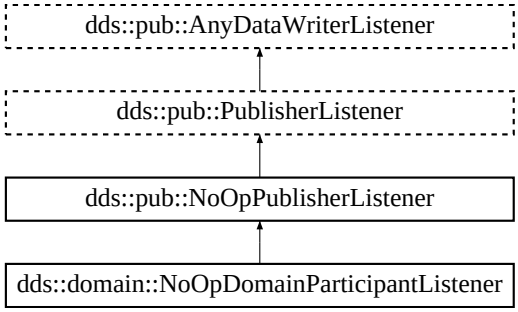
```
virtual void dds::domain::NoOpDomainParticipantListener::on_sample_lost (
              dds::sub::AnyDataReader & ,
             const  dds::core::status::SampleLostStatus &  )  [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1866).

8.216.2.20 on_inconsistent_topic()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_inconsistent_topic (
              dds::topic::AnyTopic & ,
             const  dds::core::status::InconsistentTopicStatus &  )  [inline], [virtual]
```



No-op.

8.217 dds::pub::NoOpPublisherListener Class Reference

A convenience implementation of **PublisherListener** (p. 2006) where all methods are overridden to do nothing.

```
#include <dds/pub/PublisherListener.hpp>
```

Inheritance diagram for dds::pub::NoOpPublisherListener:

8.217.1 Detailed Description

A convenience implementation of **PublisherListener** (p. 2006) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.217.2 Member Function Documentation

8.217.2.1 on_offered_deadline_missed()

```
virtual void dds::pub::NoOpPublisherListener::on_offered_deadline_missed (
             dds::pub::AnyDataWriter & ,
            const  ::dds::core::status::OfferedDeadlineMissedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 822).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1847).

8.217.2.2 on_offered_incompatible_qos()

```
virtual void dds::pub::NoOpPublisherListener::on_offered_incompatible_qos (
             dds::pub::AnyDataWriter & ,
            const  ::dds::core::status::OfferedIncompatibleQosStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 822).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1847).

8.217.2.3 on_liveliness_lost()

```
virtual void dds::pub::NoOpPublisherListener::on_liveliness_lost (
             dds::pub::AnyDataWriter & ,
            const  ::dds::core::status::LivelinessLostStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 822).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1847).

8.217.2.4 on_publication_matched()

```
virtual void dds::pub::NoOpPublisherListener::on_publication_matched (
             dds::pub::AnyDataWriter & ,
            const  ::dds::core::status::PublicationMatchedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 823).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848).

8.217.2.5 on_reliable_writer_cache_changed()

```
virtual void dds::pub::NoOpPublisherListener::on_reliable_writer_cache_changed (
              dds::pub::AnyDataWriter & ,
             const  rti::core::status::ReliableWriterCacheChangedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 823).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848).

8.217.2.6 on_reliable_reader_activity_changed()

```
virtual void dds::pub::NoOpPublisherListener::on_reliable_reader_activity_changed (
              dds::pub::AnyDataWriter & ,
             const  rti::core::status::ReliableReaderActivityChangedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 823).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848).

8.217.2.7 on_sample_removed()

```
virtual void dds::pub::NoOpPublisherListener::on_sample_removed (
              dds::pub::AnyDataWriter & ,
             const  rti::core::Cookie &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 823).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848).

8.217.2.8 on_instance_replaced()

```
virtual void dds::pub::NoOpPublisherListener::on_instance_replaced (
              dds::pub::AnyDataWriter & ,
             const  dds::core::InstanceHandle &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 824).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849).

8.217.2.9 on_application_acknowledgment()

```
virtual void dds::pub::NoOpPublisherListener::on_application_acknowledgment (
             dds::pub::AnyDataWriter & ,
            const  rti::pub::AcknowledgmentInfo &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 824).

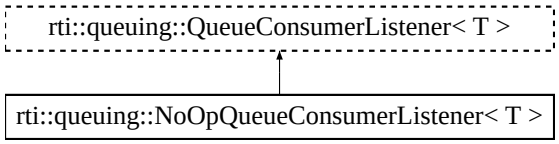
Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849).

8.217.2.10 on_service_request_accepted()

```
virtual void dds::pub::NoOpPublisherListener::on_service_request_accepted (
             dds::pub::AnyDataWriter & ,
            const  rti::core::status::ServiceRequestAcceptedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p. 824).



Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849).

8.218 rti::queuing::NoOpQueueConsumerListener< T > Class Template Reference

A listener with an empty implementation of all methods.

`#include <QueueConsumerListener.hpp>`

Inheritance diagram for rti::queuing::NoOpQueueConsumerListener< T >:

Public Member Functions

- virtual void **on_sample_available** (**QueueConsumer**< T > &)

  User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueConsumer**< T > &, const **dds::core::status::SubscriptionMatchedStatus** &)

  User callback.

8.218.1 Detailed Description

template<typename T>
class rti::queuing::NoOpQueueConsumerListener< T >

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.218.2 Member Function Documentation

8.218.2.1 on_sample_available()

```
template<typename T >
virtual void  rti::queuing::NoOpQueueConsumerListener< T >::on_sample_available (
              QueueConsumer< T > &  )  [inline], [virtual]
```

User callback.

This callback is invoked whenever the **QueueConsumer** (p. 2063) has received at least one sample. Any operation to get samples i.e. QueueConsumer::take_sample) can be called within this context.

See also

dds::sub::DataReaderListener::on_data_available (p. 1058)

Implements **rti::queuing::QueueConsumerListener< T >** (p. 2076).

8.218.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void  rti::queuing::NoOpQueueConsumerListener< T >::on_shared_reader_queue_matched (
              QueueConsumer< T > & ,
             const  dds::core::status::SubscriptionMatchedStatus &  )  [inline], [virtual]
```

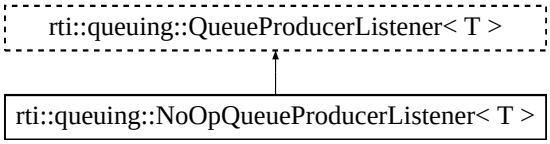
User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **Queue↩ Consumer** (p. 2063), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::SubscriptionMatchedStatus (p. 2439)

dds::sub::DataReaderListener::on_subscription_matched (p. 1058)



Implements **rti::queuing::QueueConsumerListener< T >** (p. 2077).

8.219 rti::queuing::NoOpQueueProducerListener< T > Class Template Reference

A listener with an empty implementation of all methods.

`#include <QueueProducerListener.hpp>`

Inheritance diagram for rti::queuing::NoOpQueueProducerListener< T >:

Public Member Functions

- virtual void **on_sample_acknowledged** (**QueueProducer**< T > &, const **rti::pub::AcknowledgmentInfo** &)
  User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueProducer**< T > &, const **dds::core::status::PublicationMatchedStatus** &)
  User callback.

8.219.1 Detailed Description

template<**typename T**>
class rti::queuing::NoOpQueueProducerListener< **T** >

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.219.2 Member Function Documentation

8.219.2.1 on_sample_acknowledged()

```
template<typename T >
virtual void  rti::queuing::NoOpQueueProducerListener< T >::on_sample_acknowledged (
              QueueProducer< T > & ,
             const  rti::pub::AcknowledgmentInfo &  )  [inline], [virtual]
```

User callback.

This callback is invoked whenever Queuing Service acknowledges a sample sent by the **QueueProducer** (p. 2080).

See also

AcknowledgmentInfo

Implements **rti::queuing::QueueProducerListener**< **T** > (p. 2091).

8.219.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void  rti::queuing::NoOpQueueProducerListener< T >::on_shared_reader_queue_matched (
              QueueProducer< T > & ,
             const  dds::core::status::PublicationMatchedStatus &  )  [inline], [virtual]
```

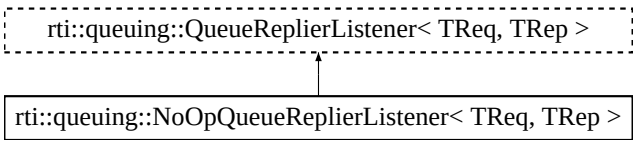
User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **Queue↩ Producer** (p. 2080), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::PublicationMatchedStatus (p. 1990)

dds::pub::DataWriterListener::on_publication_matched (p. 1205)



Implements **rti::queuing::QueueProducerListener< T >** (p. 2091).

8.220 rti::queuing::NoOpQueueReplierListener< TReq, TRep > Class Template Reference

A listener with an empty implementation of all methods.

```
#include <rti/queuing/QueueReplierListener.hpp>
```

Public Member Functions

- virtual void **on_reply_acknowledged** (**QueueReplier**< TReq, TRep > &, const **rti::pub::Acknowledgment↩ Info** &)

  User callback.
- virtual void **on_request_available** (**QueueReplier**< TReq, TRep > &)

  User callback.
- virtual void **on_request_shared_reader_queue_matched** (**QueueReplier**< TReq, TRep > &, const **dds↩ ::core::status::SubscriptionMatchedStatus** &)

  User callback.
- virtual void **on_reply_shared_reader_queue_matched** (**QueueReplier**< TReq, TRep > &, const **dds::core↩ ::status::PublicationMatchedStatus** &)

  User callback.

8.220.1 Detailed Description

template<typename TReq, typename TRep>
class rti::queuing::NoOpQueueReplierListener< TReq, TRep >

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.220.2 Member Function Documentation

8.220.2.1 on_reply_acknowledged()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_reply_acknowledged (
              QueueReplier< TReq, TRep > & producer,
             const  rti::pub::AcknowledgmentInfo & info )  [inline], [virtual]
```

User callback.

See also

QueueProducerListener::on_sample_acknowledged (p. 2091)

Implements **rti::queuing::QueueReplierListener< TReq, TRep >** (p. 2108).

8.220.2.2 on_request_available()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_request_available (
              QueueReplier< TReq, TRep > & requester )  [inline], [virtual]
```

User callback.

See also

QueueConsumerListener::on_sample_available (p. 2076)

Implements **rti::queuing::QueueReplierListener< TReq, TRep >** (p. 2108).

8.220.2.3 on_request_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_request_shared_reader_↩
queue_matched (
              QueueReplier< TReq, TRep > & requester,
             const  dds::core::status::SubscriptionMatchedStatus & status )  [inline], [virtual]
```

User callback.

See also

QueueConsumerListener::on_shared_reader_queue_matched (p. 2077)

Implements **rti::queuing::QueueReplierListener< TReq, TRep >** (p. 2108).

8.221.1 Detailed Description

template<typename TReq, typename TRep>
class rti::queuing::NoOpQueueRequesterListener< TReq, TRep >

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.221.2 Member Function Documentation

8.221.2.1 on_request_acknowledged()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_request_acknowledged (
              QueueRequester< TReq, TRep > & ,
             const  rti::pub::AcknowledgmentInfo &  )  [inline], [virtual]
```

User callback.

See also

QueueProducerListener::on_sample_acknowledged (p. 2091)

Implements **rti::queuing::QueueRequesterListener< TReq, TRep >** (p. 2127).

8.221.2.2 on_reply_available()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_reply_available (
              QueueRequester< TReq, TRep > &  )  [inline], [virtual]
```

User callback.

See also

QueueConsumerListener::on_sample_available (p. 2076)

Implements **rti::queuing::QueueRequesterListener< TReq, TRep >** (p. 2127).

8.221.2.3 on_request_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_request_shared_reader_↩
queue_matched (
              QueueRequester< TReq, TRep > & ,
             const  dds::core::status::PublicationMatchedStatus &  )  [inline], [virtual]
```

User callback.

See also

QueueProducerListener::on_shared_reader_queue_matched (p. 2091)

Implements **rti::queuing::QueueRequesterListener< TReq, TRep >** (p. 2127).

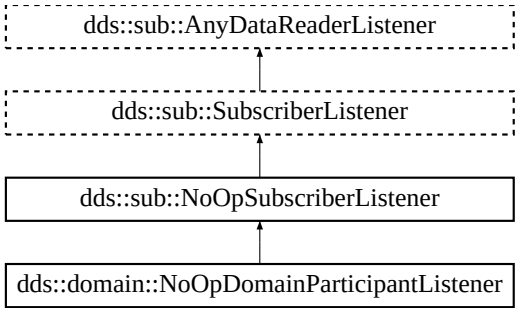
8.221.2.4 on_reply_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void  rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_reply_shared_reader_↩
queue_matched (
              QueueRequester< TReq, TRep > & ,
             const  dds::core::status::SubscriptionMatchedStatus &  )  [inline], [virtual]
```

User callback.

See also

QueueConsumerListener::on_shared_reader_queue_matched (p. 2077)



Implements **rti::queuing::QueueRequesterListener< TReq, TRep >** (p. 2128).

8.222 dds::sub::NoOpSubscriberListener Class Reference

A convenience implementation of **SubscriberListener** (p. 2422) where all methods are overridden to do nothing.

`#include <dds/sub/SubscriberListener.hpp>`

Inheritance diagram for dds::sub::NoOpSubscriberListener:

Public Member Functions

- virtual void **on_data_on_readers** (**Subscriber** &)

  No-op.
- virtual void **on_requested_deadline_missed** (**AnyDataReader** &, const **dds::core::status::Requested↩ DeadlineMissedStatus** &)

  No-op.
- virtual void **on_requested_incompatible_qos** (**AnyDataReader** &, const **dds::core::status::Requested↩ IncompatibleQosStatus** &)

  No-op.
- virtual void **on_sample_rejected** (**AnyDataReader** &, const **dds::core::status::SampleRejectedStatus** &)

  No-op.
- virtual void **on_liveliness_changed** (**AnyDataReader** &, const **dds::core::status::LivelinessChangedStatus** &)

  No-op.
- virtual void **on_data_available** (**AnyDataReader** &)

  No-op.
- virtual void **on_subscription_matched** (**AnyDataReader** &, const **dds::core::status::Subscription↩ MatchedStatus** &)

  No-op.
- virtual void **on_sample_lost** (**AnyDataReader** &, const **dds::core::status::SampleLostStatus** &)

  No-op.

8.222.1 Detailed Description

A convenience implementation of **SubscriberListener** (p. 2422) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.222.2 Member Function Documentation

8.222.2.1 on_data_on_readers()

```
virtual void dds::sub::NoOpSubscriberListener::on_data_on_readers (
             Subscriber &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::SubscriberListener** (p. 2422).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1850).

8.222.2.2 on_requested_deadline_missed()

```
virtual void dds::sub::NoOpSubscriberListener::on_requested_deadline_missed (
             AnyDataReader & ,
            const  dds::core::status::RequestedDeadlineMissedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 813).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1850).

8.222.2.3 on_requested_incompatible_qos()

```
virtual void dds::sub::NoOpSubscriberListener::on_requested_incompatible_qos (
             AnyDataReader & ,
            const  dds::core::status::RequestedIncompatibleQosStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 813).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1850).

8.222.2.4 on_sample_rejected()

```
virtual void dds::sub::NoOpSubscriberListener::on_sample_rejected (
             AnyDataReader & ,
            const  dds::core::status::SampleRejectedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 813).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1850).

8.222.2.5 on_liveliness_changed()

```
virtual void dds::sub::NoOpSubscriberListener::on_liveliness_changed (
             AnyDataReader & ,
            const  dds::core::status::LivelinessChangedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 814).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1851).

8.222.2.6 on_data_available()

```
virtual void dds::sub::NoOpSubscriberListener::on_data_available (
             AnyDataReader &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 814).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1851).

8.222.2.7 on_subscription_matched()

```
virtual void dds::sub::NoOpSubscriberListener::on_subscription_matched (
             AnyDataReader & ,
            const  dds::core::status::SubscriptionMatchedStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 814).

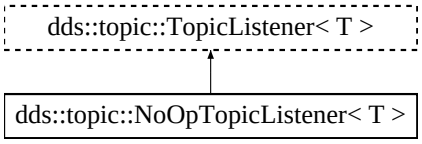
Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1851).

8.222.2.8 on_sample_lost()

```
virtual void dds::sub::NoOpSubscriberListener::on_sample_lost (
              AnyDataReader & ,
             const  dds::core::status::SampleLostStatus &  )  [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 814).



Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1851).

8.223 dds::topic::NoOpTopicListener< T > Class Template Reference

A convenience implementation of **TopicListener** (p. 2508) where all methods are overridden to do nothing.

```
#include <dds/topic/TopicListener.hpp>
```

Inheritance diagram for dds::topic::NoOpTopicListener< T >:

Public Member Functions

- virtual void **on_inconsistent_topic** (**Topic**< T > &, const **dds::core::status::InconsistentTopicStatus** &)
  No-op.

8.223.1 Detailed Description

template<**typename T**>
class dds::topic::NoOpTopicListener< T >

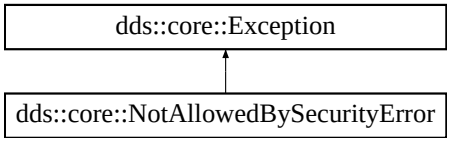
A convenience implementation of **TopicListener** (p. 2508) where all methods are overridden to do nothing.

8.223.2 Member Function Documentation

8.223.2.1 on_inconsistent_topic()

```
template<typename T >
virtual void  dds::topic::NoOpTopicListener< T >::on_inconsistent_topic (
              Topic< T > & ,
             const  dds::core::status::InconsistentTopicStatus &  )  [inline], [virtual]
```

No-op.



Implements **dds::topic::TopicListener< T >** (p. 2509).

8.224 dds::core::NotAllowedBySecurityError Class Reference

Indicates that an operation on the DDS API fails because the security plugins do not allow it.

`#include <Exception.hpp>`

Inheritance diagram for dds::core::NotAllowedBySecurityError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **NotAllowedBySecurityError** (p. 1868) exception.*

8.224.1 Detailed Description

Indicates that an operation on the DDS API fails because the security plugins do not allow it.

Inherits also from `std::logic_error`

An operation on the DDS API that fails because the security plugins do not allow it.

8.224.2 Member Function Documentation

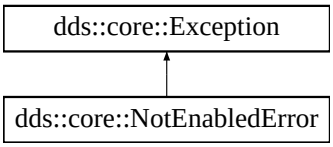
8.224.2.1 what()

```
virtual const char * dds::core::NotAllowedBySecurityError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **NotAllowedBySecurityError** (p. 1868) exception.

Returns

The message.



Implements **dds::core::Exception** (p. 1547).

8.225 dds::core::NotEnabledError Class Reference

A **NotEnabledError** (p. 1869) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1520) that is not yet enabled.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::NotEnabledError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **NotEnabledError** (p. 1869) exception.*

8.225.1 Detailed Description

A **NotEnabledError** (p. 1869) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1520) that is not yet enabled.

Inherits also from `std::logic_error`

8.225.2 Member Function Documentation

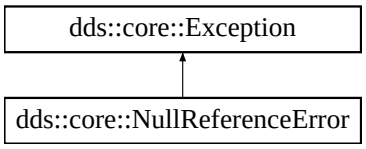
8.225.2.1 what()

```
virtual const char * dds::core::NotEnabledError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **NotEnabledError** (p. 1869) exception.

Returns

The message.



Implements **dds::core::Exception** (p. 1547).

8.226 dds::core::NullReferenceError Class Reference

Indicates an attempt to access a null object.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::NullReferenceError:

Public Member Functions

- virtual const char * **what** () const throw ()
  Get a description of the error.

8.226.1 Detailed Description

Indicates an attempt to access a null object.

8.226.2 Member Function Documentation

8.226.2.1 what()

```
virtual const char * dds::core::NullReferenceError::what ( ) const throw ( )   [virtual]
```

Get a description of the error.

Implements **dds::core::Exception** (p. 1547).

8.227 rti::core::xtypes::octet_tag_t Struct Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A special template type to obtain an IDL octet DynamicType from primitive_type

```
#include <Octet.hpp>
```

8.227.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A special template type to obtain an IDL octet DynamicType from primitive_type

Use this tag type as the template type for **dds::core::xtypes::primitive_type** (p. 634)<T> when creating a DynamicType for an IDL octet type. For example:

```
using namespace dds::core::xtypes;
StructType my_struct("MyStruct");
my_struct.add_member(Member("octet_member", primitive_type<rti::core::xtypes::octet_tag_t>()));
my_struct.add_member(Member("uint8_member", primitive_type<uint8_t>()));
```

8.228 dds::core::status::OfferedDeadlineMissedStatus Class Reference

Information about the status **dds::core::status::StatusMask::offered_deadline_missed()** (p. 2379)

```
#include <TStatus.hpp>
```

Public Member Functions

- int32_t **total_count** () const

  *Total cumulative count of the number of times the **dds::pub::DataWriter** (p. 1138) failed to write within its offered deadline.*
- int32_t **total_count_change** () const

  The incremental changes in total_count since the last time the listener was called or the status was read.
- const **dds::core::InstanceHandle last_instance_handle** () const

  *Handle to the last instance in the **dds::pub::DataWriter** (p. 1138) for which an offered deadline was missed.*

8.228.1 Detailed Description

Information about the status **dds::core::status::StatusMask::offered_deadline_missed()** (p. 2379)

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

The deadline that the **dds::pub::DataWriter** (p. 1138) has committed through its **dds::core::policy::Deadline** (p. 1255) was not respected for a specific instance.

8.228.2 Member Function Documentation

8.228.2.1 total_count()

```
int32_t dds::core::status::OfferedDeadlineMissedStatus::total_count ( ) const  [inline]
```

Total cumulative count of the number of times the **dds::pub::DataWriter** (p. 1138) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the `total_count` will be incremented by one.

8.228.2.2 total_count_change()

```
int32_t dds::core::status::OfferedDeadlineMissedStatus::total_count_change ( ) const  [inline]
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.228.2.3 last_instance_handle()

```
const  dds::core::InstanceHandle dds::core::status::OfferedDeadlineMissedStatus::last_instance_↩
handle ( ) const  [inline]
```

Handle to the last instance in the **dds::pub::DataWriter** (p. 1138) for which an offered deadline was missed.

8.229 dds::core::status::OfferedIncompatibleQosStatus Class Reference

Information about the status **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380)

`#include <TStatus.hpp>`

Public Member Functions

- int32_t **total_count** () const

  *Total cumulative number of times the concerned **dds::pub::DataWriter** (p. 1138) discovered a **dds::sub::DataReader** (p. 976) for the same **dds::topic::Topic** (p. 2474), common partition with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 1138).*
- int32_t **total_count_change** () const

  The incremental changes in total_count since the last time the listener was called or the status was read.
- **dds::core::policy::QosPolicyId last_policy_id** () const

  *The **dds::core::policy::QosPolicyId** (p. 514) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- const **dds::core::policy::QosPolicyCountSeq policies** () const

  *A list containing for each policy the total number of times that the concerned **dds::pub::DataWriter** (p. 1138) discovered a **dds::sub::DataReader** (p. 976) for the same **dds::topic::Topic** (p. 2474) and common partition with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 1138).*

8.229.1 Detailed Description

Information about the status **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380)

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

The qos policy value was incompatible with what was requested.

8.229.2 Member Function Documentation

8.229.2.1 total_count()

```
int32_t dds::core::status::OfferedIncompatibleQosStatus::total_count ( ) const  [inline]
```

Total cumulative number of times the concerned **dds::pub::DataWriter** (p. 1138) discovered a **dds::sub::DataReader** (p. 976) for the same **dds::topic::Topic** (p. 2474), common partition with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 1138).

8.229.2.2 total_count_change()

```
int32_t dds::core::status::OfferedIncompatibleQosStatus::total_count_change ( ) const  [inline]
```

The incremental changes in total_count since the last time the listener was called or the status was read.

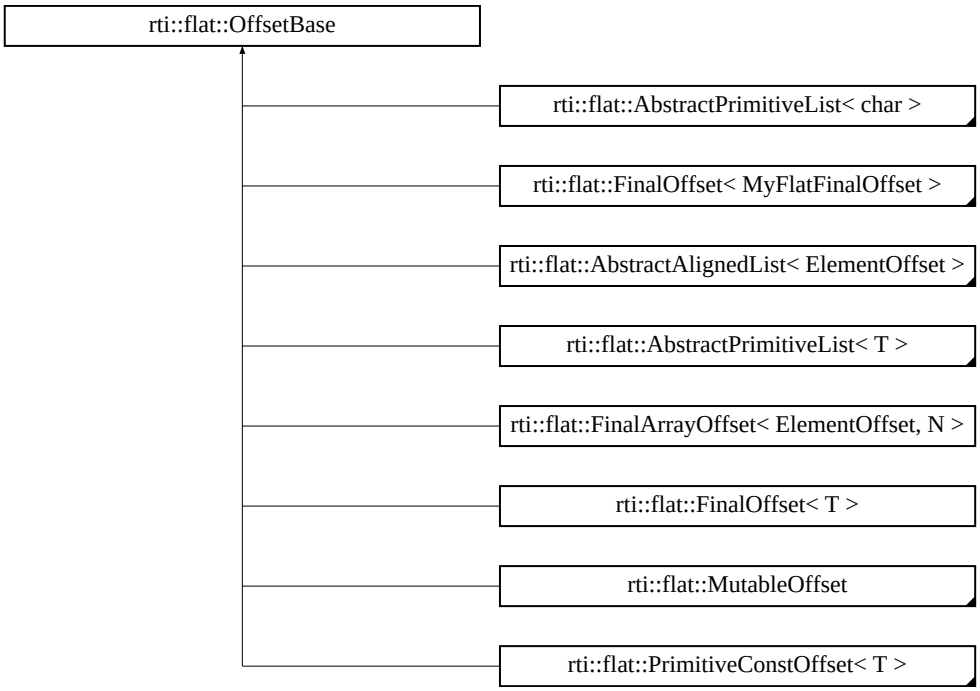
8.229.2.3 last_policy_id()

```
dds::core::policy::QosPolicyId dds::core::status::OfferedIncompatibleQosStatus::last_policy_id (
) const  [inline]
```

The **dds::core::policy::QosPolicyId** (p. 514) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

8.229.2.4 policies()

```
const  dds::core::policy::QosPolicyCountSeq dds::core::status::OfferedIncompatibleQosStatus↩
::policies ( ) const  [inline]
```



A list containing for each policy the total number of times that the concerned **dds::pub::DataWriter** (p. 1138) discovered a **dds::sub::DataReader** (p. 976) for the same **dds::topic::Topic** (p. 2474) and common partition with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 1138).

8.230 rti::flat::OffsetBase Class Reference

Base class of all Offset types.

`#include <Offset.hpp>`

Inheritance diagram for rti::flat::OffsetBase:

Public Member Functions

- bool **is_null** () const

  Indicates whether this Offset doesn't point to a valid element.
- bool **is_cpp_compatible** () const

  *Indicates whether **rti::flat::plain_cast()** (p. 417) is possible.*
- const unsigned char * **get_buffer** () const

  Gets this member's position in the buffer.
- offset_t **get_buffer_size** () const

  Gets the size, in bytes, of this member in the buffer.

Friends

- bool **operator<** (const **OffsetBase** &s1, const **OffsetBase** &s2)

  Compares two Offsets.
- bool **operator>** (const **OffsetBase** &s1, const **OffsetBase** &s2)

  Compares two Offsets.

- bool **operator<=** (const **OffsetBase** &s1, const **OffsetBase** &s2)

  Compares two Offsets.
- bool **operator>=** (const **OffsetBase** &s1, const **OffsetBase** &s2)

  Compares two Offsets.
- bool **operator==** (const **OffsetBase** &s1, const **OffsetBase** &s2)

  Determines if two offets point to the same position.
- bool **operator!=** (const **OffsetBase** &s1, const **OffsetBase** &s2)

  Determines if two offets point to different positions.

8.230.1 Detailed Description

Base class of all Offset types.

See also

FlatData Offsets (p. 414)

8.230.2 Member Function Documentation

8.230.2.1 is_null()

```
bool rti::flat::OffsetBase::is_null ( ) const  [inline]
```

Indicates whether this Offset doesn't point to a valid element.

Comparing this object with `nullptr` is equivalent to calling **is_null()** (p. 1876). For example:

```
MyFlatMutableOffset my_mutable = ...;
auto my_final_member = my_mutable.my_final();
if (my_final_member.is_null()) { ...member doesn't exist... }
// alternative syntax:
if (my_final_member == nullptr) {...}
```

See also

Offset Error Management (p. 416)

Referenced by **get_buffer()**.

8.230.2.2 is_cpp_compatible()

```
bool rti::flat::OffsetBase::is_cpp_compatible ( ) const  [inline]
```

Indicates whether **rti::flat::plain_cast()** (p. 417) is possible.

Returns

True only if the data pointed to by this Offset can be **rti::flat::plain_cast()** (p. 417)

See also

rti::flat::plain_cast() (p. 417) for the requirements that a **type** (p. 2044) needs to meet

8.230.2.3 get_buffer()

```
const unsigned char * rti::flat::OffsetBase::get_buffer ( ) const  [inline]
```

Gets this member's position in the buffer.

Note

This function should be used for debugging purposes only. To access the data in this Offset use the Offset accessor methods or, if this type allows it, **rti::flat::plain_cast()** (p. 417).

Returns the position within the **Sample** (p. 2274)'s buffer that this Offset points to.

See also

get_buffer_size() (p. 1877)

References **is_null()**.

Referenced by **rti::flat::StringOffset::get_string()**.

8.230.2.4 get_buffer_size()

```
offset_t rti::flat::OffsetBase::get_buffer_size ( ) const  [inline]
```

Gets the size, in bytes, of this member in the buffer.

Returns the number of bytes that this member comprises after the position returned by get_buffer().

Referenced by **rti::flat::AbstractAlignedList< ElementOffset >::begin()**, and **rti::flat::AbstractAlignedList< ElementOffset >::end()**.

8.230.3 Friends And Related Function Documentation

8.230.3.1 operator<

```
bool operator< (
            const  OffsetBase & s1,
            const  OffsetBase & s2 )  [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position smaller than s2's.

8.230.3.2 operator>

```
bool operator> (
            const  OffsetBase & s1,
            const  OffsetBase & s2 )  [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position greater than s2's.

8.230.3.3 operator<=

```
bool operator<= (
            const  OffsetBase & s1,
            const  OffsetBase & s2 )  [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position equal to or smaller than s2's.

8.230.3.4 operator>=

```
bool operator>= (
            const  OffsetBase & s1,
            const  OffsetBase & s2 )  [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position equal to or greater than s2's.

8.230.3.5 operator==

```
bool operator== (
            const  OffsetBase & s1,
            const  OffsetBase & s2 )  [friend]
```

Determines if two offets point to the same position.

Returns

True if s1 points to the same position as s2.

8.230.3.6 operator"!=

```
bool operator!= (
            const  OffsetBase & s1,
            const  OffsetBase & s2 )  [friend]
```

Determines if two offets point to different positions.

Returns

True if s1 points to a different position than s2.

8.231 dds::core::optional< T > Class Template Reference

<<***value-type***>> *(*p. *350)* Represents an object that may not contain a valid value

```
#include <dds/core/Optional.hpp>
```

Public Member Functions

- **optional** () OMG_NOEXCEPT

  Create an unset optional object.

Friends

- void **swap** (**optional**< T > &left, **optional**< T > &right) OMG_NOEXCEPT

  Swaps the underlying objects.

Related Functions

(Note that these are not member functions.)

- template<typename T >
  bool **operator==** (const **optional**< T > &a, const **optional**< T > &b)

  Compares two optional values.
- template<typename T >
  bool **operator!=** (const **optional**< T > &a, const **optional**< T > &b)

  Compares two optional values.
- template<typename T >
  bool **operator==** (const **optional**< T > &optional_value, const T & **value**)

  Compares an optional member and a value of the underlying type.
- template<typename T >
  bool **operator==** (const T & **value**, const **optional**< T > &optional_value)

  Compares an optional member and a value of the underlying type.
- template<typename T >
  bool **operator!=** (const **optional**< T > &optional_value, const T & **value**)

  Compares an optional member and a value of the underlying type.
- template<typename T >
  bool **operator!=** (const T & **value**, const **optional**< T > &optional_value)

  Compares an optional member and a value of the underlying type.
- template<typename T >
  std::ostream & **operator**<< (std::ostream &out, const **optional**< T > & **optional**)

  Applies `operator<<` *to* `*optional` *or to the string* `"NULL"` *if* `!optional`**`.has_value()`** (p. *1884*).

8.231.1 Detailed Description

template<typename T>
class dds::core::optional< T >

<<***value-type***>> (p. *350*) Represents an object that may not contain a valid value

Template Parameters

T	The type of the actual object this `optional<T>` wraps

Members of an **IDL** (p. 606) type marked with the `@optional` tag map to this C++ type.

When an optional value has a valid value **has_value()** (p. 1884) returns true and `operator*` returns a reference

to the actual object of type T. Otherwise **has_value()** (p. 1884) returns false and `operator*` throws **dds::core::↩ PreconditionNotMetError** (p. 1941). To assing a value you can use the assignment operator.

An optional object has full **value-type semantics** (p. 350); copying an optional value copies the underlying object if it exists.

This type's API is similar to that of `std::optional`.

Working with IDL types (p. 606)

Examples

Foo.hpp.

8.231.2 Constructor & Destructor Documentation

8.231.2.1 optional() [1/5]

```
template<typename T >
dds::core::optional< T >::optional ( )  [inline]
```

Create an unset optional object.

Postcondition

!has_value()

8.231.2.2 optional() [2/5]

```
template<typename T >
dds::core::optional< T >::optional (
            const T & value )  [inline]
```

Create an optional object with a copy of a value.

Postcondition

has_value() (p. 1884) && *(*this) == value

8.231.2.3 optional() [3/5]

```
template<typename T >
dds::core::optional< T >::optional (
            T && value )  [inline]
```

<<**C++11**>> *(p. 353)* Create an optional object moving a value

Postcondition

has_value() (p. 1884)

8.231.2.4 optional() [4/5]

```
template<typename T >
dds::core::optional< T >::optional (
            bool condition,
            const T & value )  [inline]
```

Create an optional member conditionally set or unset.

Parameters

condition	If true creates an optional member with `value` otherwise it creates an unset optional member
value	The value to set if condition is true

Postcondition

has_value() (p. 1884) == condition

8.231.2.5 optional() [5/5]

```
template<typename T >
dds::core::optional< T >::optional (
            bool condition,
            T && value )  [inline]
```

<<**C++11**>> *(p. 353)* Creates an optional member conditionally set or unset by moving a value.

Moves the value rather than copying it.

See also

optional(bool, const T&) (p. 1883)

8.231.2.6 ~optional()

```
template<typename T >
dds::core::optional< T >::~ optional ( )  [inline]
```

Destroys the underlying object if it exists.

8.231.3 Member Function Documentation

8.231.3.1 set() [1/2]

```
template<typename T >
void  dds::core::optional< T >::set (
            const T & value )  [inline]
```

Assigns a copy of an object.

[DEPRECATED] Use `operator=` instead.

8.231.3.2 set() [2/2]

```
template<typename T >
void  dds::core::optional< T >::set (
            T && value )  [inline]
```

<<***C++11***>> *(p. 353)* Assigns an object by moving it

[DEPRECATED] Use `operator=` instead.

8.231.3.3 is_set()

```
template<typename T >
bool  dds::core::optional< T >::is_set ( ) const  [inline]
```

Checks if this optional instance contains a valid object.

[DEPRECATED] Use **`has_value()`** (p. 1884)

8.231.3.4 has_value()

```
template<typename T >
bool  dds::core::optional< T >::has_value ( ) const  [inline]
```

Checks if this optional instance contains a valid object.

If `my_optional.has_value()` is `true`, then `*my_optional` returns a valid object

Referenced by **dds::core::optional< T >::operator<<()**, and **dds::core::optional< T >::operator==()**.

8.231.3.5 operator bool()

```
template<typename T >
dds::core::optional< T >::operator bool ( ) const  [inline], [explicit]
```

<<***C++11***>> *(p. 353)* Returns **has_value()** (p. 1884)

8.231.3.6 reset()

```
template<typename T >
void  dds::core::optional< T >::reset ( )  [inline]
```

Destroys the underlying object and leaves this optional with an invalid (unset) value.

Postcondition

!has_value()

8.231.3.7 value() [1/2]

```
template<typename T >
const T &  dds::core::optional< T >::value ( ) const  [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

8.231.3.8 value() [2/2]

```
template<typename T >
T &  dds::core::optional< T >::value ( )  [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

8.231.3.9 get() [1/2]

```
template<typename T >
const T &  dds::core::optional< T >::get ( ) const  [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use **value()** (p. 1886) or `operator*`

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

Referenced by **dds::core::optional< T >::operator<<()**, and **dds::core::optional< T >::operator==()**.

8.231.3.10 get() [2/2]

```
template<typename T >
T &  dds::core::optional< T >::get ( )  [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use **value()** (p. 1886) or `operator*`

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

8.231.3.11 get_ptr() [1/2]

```
template<typename T >
const T *  dds::core::optional< T >::get_ptr ( ) const  [inline]
```

Returns &**get()** (p. 1886) if the object is initialized or NULL otherwise.

[DEPRECATED]

8.231.3.12 get_ptr() [2/2]

```
template<typename T >
T *  dds::core::optional< T >::get_ptr ( )  [inline]
```

Returns &**get()** (p. 1886) if the object is initialized or NULL otherwise.

[DEPRECATED]

8.231.3.13 operator*() [1/2]

```
template<typename T >
const T &  dds::core::optional< T >::operator* ( ) const  [inline]
```

Get the value, without checking if it exists

Precondition

has_value() (p. 1884), otherwise this operation has undefined behavior. See **value()** (p. 1886).

8.231.3.14 operator*() [2/2]

```
template<typename T >
T &  dds::core::optional< T >::operator* ( )  [inline]
```

Get the value, without checking if it exists

Precondition

has_value() (p. 1884), otherwise this operation has undefined behavior. See **value()** (p. 1886).

8.231.3.15 operator->() [1/2]

```
template<typename T >
const T *  dds::core::optional< T >::operator-> ( ) const  [inline]
```

Get the value.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value()

8.231.3.16 operator->() [2/2]

```
template<typename T >
T *  dds::core::optional< T >::operator-> ( )  [inline]
```

Get the value.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value()

8.231.3.17 operator=() [1/4]

```
template<typename T >
optional< T > &  dds::core::optional< T >::operator= (
             const  optional< T > & other )  [inline]
```

Assignment operator.

Copies *other if it exists.

8.231.3.18 operator=() [2/4]

```
template<typename T >
optional< T > &  dds::core::optional< T >::operator= (
              optional< T > && other )  [inline]
```

<<***C++11***>> *(p. 353)* Move-assignment operator

Moves *other if it exists.

8.231.3.19 operator=() [3/4]

```
template<typename T >
optional< T > &  dds::core::optional< T >::operator= (
             const T & value )  [inline]
```

Assign a (valid) value.

Parameters

value	The value to assign to this optional member

Postcondition

```
*(*this) == value
```

8.231.3.20 operator=() [4/4]

```
template<typename T >
optional< T > &  dds::core::optional< T >::operator= (
            T && value )  [inline]
```

Assign a (valid) value by moving an object.

Parameters

value	The value to move into this optional member

Postcondition

has_value() (p. 1884)

8.231.4 Friends And Related Function Documentation

8.231.4.1 swap

```
template<typename T >
void swap (
              optional< T > & left,
              optional< T > & right )  [friend]
```

Swaps the underlying objects.

This operation is always O(1).

8.231.4.2 operator==() [1/3]

```
template<typename T >
bool operator== (
            const  optional< T > & a,
            const  optional< T > & b )  [related]
```

Compares two optional values.

Returns

true if both are unset or both are set and `*a == *b`.

Examples

Foo.hpp.

References **dds::core::optional< T >::get()**, and **dds::core::optional< T >::has_value()**.

8.231.4.3 operator"!=() [1/3]

```
template<typename T >
bool operator!= (
            const  optional< T > & a,
            const  optional< T > & b )  [related]
```

Compares two optional values.

Returns

false if both are unset or both are set and `*a == *b`.

Examples

Foo.hpp.

8.231.4.4 operator==() [2/3]

```
template<typename T >
bool operator== (
            const  optional< T > & optional_value,
            const T & value )  [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return true if `optional_value` is set and `*optional_value == value`

References **dds::core::optional< T >::get()**, and **dds::core::optional< T >::has_value()**.

8.231.4.5 operator==() [3/3]

```
template<typename T >
bool operator== (
            const T & value,
            const  optional< T > & optional_value )  [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return true if optional_value is set and `*optional_value == value`

8.231.4.6 operator"!=() [2/3]

```
template<typename T >
bool operator!= (
            const  optional< T > & optional_value,
            const T & value )  [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return false if optional_value is set and `*optional_value == value`

8.231.4.7 operator"!=() [3/3]

```
template<typename T >
bool operator!= (
            const T & value,
            const  optional< T > & optional_value )  [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return false if optional_value is set and `*optional_value == value`

8.231.4.8 operator<<()

```
template<typename T >
std::ostream & operator<< (
            std::ostream & out,
            const  optional< T > & optional )  [related]
```

Applies operator<< to *optional or to the string "NULL" if !optional.**has_value()** (p. 1884).

References **dds::core::optional< T >::get()**, and **dds::core::optional< T >::has_value()**.

8.232 rti::core::optional_value< T > Class Template Reference

<<***extension***>> *(p. 354)* Represents a value that can be initialized or not

```
#include <OptionalValue.hpp>
```

8.232.1 Detailed Description

template<**typename T**>
class rti::core::optional_value< **T** >

<<***extension***>> *(p. 354)* Represents a value that can be initialized or not

This class is similar to **dds::core::optional** (p. 1879) and `std::optional`.

They have different implementations. **dds::core::optional** (p. 1879) is only used in IDL-generated types, while **rti::core::optional_value** (p. 1892) is used in parts of the API.

8.232.2 Constructor & Destructor Documentation

8.232.2.1 optional_value() [1/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value ( )  [inline]
```

Creates an uninitialized value.

8.232.2.2 optional_value() [2/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value (
            const T & value )  [inline]
```

Creates an instance with a value.

8.232.2.3 optional_value() [3/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value (
            bool condition,
            const T & value )  [inline]
```

Conditionally creates an instance that can be uninitialized or initialized with a value.

Parameters

condition	If it is true it assigns `value`, otherwise this **optional_value** (p. 1892) is uninitialized
value	The value to use if `condition` is true.

References **rti::core::optional_value< T >::value()**.

8.232.2.4 optional_value() [4/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value (
            const  optional_value< T > & other )  [inline]
```

Copy constructor.

This **optional_value** (p. 1892) will be initialized only if `other` is initialized.

References **rti::core::optional_value< T >::get()**, and **rti::core::optional_value< T >::has_value()**.

8.232.3 Member Function Documentation

8.232.3.1 is_set()

```
template<typename T >
bool  rti::core::optional_value< T >::is_set ( ) const  [inline]
```

Returns true only if the value is initialized.

[DEPRECATED] Use **has_value()** (p. 1894)

8.232.3.2 has_value()

```
template<typename T >
bool  rti::core::optional_value< T >::has_value ( ) const  [inline]
```

Returns true only if the value is initialized.

Referenced by **rti::core::optional_value< T >::optional_value()**, and **rti::core::optional_value< T >::value()**.

8.232.3.3 operator bool()

```
template<typename T >
rti::core::optional_value< T >::operator bool ( ) const  [inline], [explicit]
```

<<***C++11***>> *(p. 353)* Returns **has_value()** (p. 1894)

8.232.3.4 reset()

```
template<typename T >
void  rti::core::optional_value< T >::reset ( )  [inline]
```

After calling this function, this **optional_value** (p. 1892) is not set.

8.232.3.5 value() [1/2]

```
template<typename T >
const T &  rti::core::optional_value< T >::value ( ) const  [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

References **rti::core::optional_value< T >::has_value()**.

Referenced by **rti::core::optional_value< T >::get()**, **rti::core::optional_value< T >::operator->()**, and **rti::core::optional_value< T >::optional_value()**.

8.232.3.6 value() [2/2]

```
template<typename T >
T &  rti::core::optional_value< T >::value ( )  [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

References **rti::core::optional_value< T >::has_value()**.

8.232.3.7 get() [1/2]

```
template<typename T >
const T &  rti::core::optional_value< T >::get ( ) const  [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use **value()** (p. 1895) or `operator*`

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

References **rti::core::optional_value< T >::value()**.

Referenced by **rti::core::optional_value< T >::optional_value()**.

8.232.3.8 get() [2/2]

```
template<typename T >
T &  rti::core::optional_value< T >::get ( )  [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use **value()** (p. 1895) or `operator*`

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value().

References **rti::core::optional_value< T >::value()**.

8.232.3.9 operator*() [1/2]

```
template<typename T >
const T &  rti::core::optional_value< T >::operator* ( ) const  [inline]
```

Get the value, without checking if it exists

Precondition

has_value() (p. 1894), otherwise this operation has undefined behavior. See **value()** (p. 1895).

8.232.3.10 operator*() [2/2]

```
template<typename T >
T &  rti::core::optional_value< T >::operator* ( )  [inline]
```

Get the value, without checking if it exists

Precondition

has_value() (p. 1894), otherwise this operation has undefined behavior. See **value()** (p. 1895).

8.232.3.11 operator->() [1/2]

```
template<typename T >
const T *  rti::core::optional_value< T >::operator-> ( ) const  [inline]
```

Get the value.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value()

References **rti::core::optional_value< T >::value()**.

8.232.3.12 operator->() [2/2]

```
template<typename T >
T *  rti::core::optional_value< T >::operator-> ( )  [inline]
```

Get the value.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if !has_value()

References **rti::core::optional_value< T >::value()**.

8.232.4 Friends And Related Function Documentation

8.232.4.1 swap

```
template<typename T >
void swap (
              optional_value< T > & left,
              optional_value< T > & right )  [friend]
```

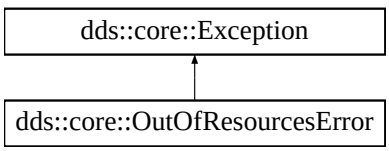
Swaps the underlying objects.

It uses `swap(*left, *right)` if that function is defined for type `T`; otherwise it uses `std::swap`.

8.233 OsapiFile Class Reference

`#include <utilities.hpp>`

8.233.1 Detailed Description



A class that wraps the RTIOsapiFile API to provide a C++-style file management. It automatically opens the file on construction, closes it on destruction, and removes the file when the object is destroyed.

8.234 dds::core::OutOfResourcesError Class Reference

Indicates that RTI Connext ran out of the resources needed to complete the operation.

`#include <Exception.hpp>`

Inheritance diagram for dds::core::OutOfResourcesError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **OutOfResourcesError** (p. 1898) exception.*

8.234.1 Detailed Description

Indicates that RTI Connext ran out of the resources needed to complete the operation.

Inherits also from `std::runtime_error`

8.234.2 Member Function Documentation

8.234.2.1 what()

```
virtual const char * dds::core::OutOfResourcesError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **OutOfResourcesError** (p. 1898) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.235 dds::core::policy::Ownership Class Reference

Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 1138)'s to write the same instance of the data and if so, how these modifications should be arbitrated.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Ownership** ()

  Creates an ownership policy set to shared.
- **Ownership** (**dds::core::policy::OwnershipKind** the_kind)

  Creates an instance with the specified ownership kind.
- **Ownership** & **kind** (**dds::core::policy::OwnershipKind** the_kind)

  Sets the ownership kind.
- **dds::core::policy::OwnershipKind kind** () const

  Getter (see setter with the same name)

Static Public Member Functions

- static **Ownership Exclusive** ()

  *Creates a **Ownership** (p. 1899) instance with exclusive kind.*
- static **Ownership Shared** ()

  *Creates a **Ownership** (p. 1899) instance with shared kind.*

8.235.1 Detailed Description

Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 1138)'s to write the same instance of the data and if so, how these modifications should be arbitrated.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::StatusMask↩ ::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

See also

OWNERSHIP_STRENGTH (p. 539)

8.235.2 Usage

Along with the **OWNERSHIP_STRENGTH** (p. 539), this QoS policy specifies if **dds::sub::DataReader** (p. 976) entities can receive updates to the same instance (identified by its key) from multiple **dds::pub::DataWriter** (p. 1138) entities at the same time.

There are two kinds of ownership, selected by the setting of the `kind:` SHARED and EXCLUSIVE.

8.235.2.1 SHARED ownership

dds::core::policy::OwnershipKind_def::SHARED (p. 1906) indicates that RTI Connext does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the **dds::topic::Topic** (p. 2474) will be able to access modifications from all **dds::pub::DataWriter** (p. 1138) objects, subject to the settings of other QoS that may filter particular samples (e.g. the **TIME_BASED_FILTER** (p. 547) or **HISTORY** (p. 533) policy). In any case, there is no "filtering" of modifications made based on the identity of the **dds::pub::Data↩ Writer** (p. 1138) that causes the modification.

8.235.2.2 EXCLUSIVE ownership

dds::core::policy::OwnershipKind_def::EXCLUSIVE (p. 1906) indicates that each instance of a data type can only be modified by one **dds::pub::DataWriter** (p. 1138). In other words, at any point in time, a single **dds::pub::DataWriter** (p. 1138) owns each instance and is the only one whose modifications will be visible to the **dds::sub::DataReader** (p. 976) objects. The owner is determined by selecting the **dds::pub::DataWriter** (p. 1138) with the highest value of the **dds::core::policy::OwnershipStrength::value** (p. 1908) that is currently alive, as defined by the **LIVELINESS** (p. 535) policy, and has not violated its **DEADLINE** (p. 523) contract with regards to the data instance.

Ownership (p. 1899) can therefore change as a result of:

- a **dds::pub::DataWriter** (p. 1138) in the system with a higher value of the strength that modifies the instance,
- a change in the strength value of the **dds::pub::DataWriter** (p. 1138) that owns the instance, and
- a change in the liveliness of the **dds::pub::DataWriter** (p. 1138) that owns the instance.
- a deadline with regards to the instance that is missed by the **dds::pub::DataWriter** (p. 1138) that owns the instance.

The behavior of the system is as if the determination was made independently by each **dds::sub::DataReader** (p. 976). Each **dds::sub::DataReader** (p. 976) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **dds::sub::DataReader** (p. 976) objects for that **dds::topic::Topic** (p. 2474) have a consistent picture of who owns each instance.

It is also not a requirement that the **dds::pub::DataWriter** (p. 1138) objects are aware of whether they own a particular instance. There is no error or notification given to a **dds::pub::DataWriter** (p. 1138) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple **dds::pub::DataWriter** (p. 1138) objects with the same strength modify the same instance. If this occurs RTI Connext will pick one of the **dds::pub::DataWriter** (p. 1138) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all **dds::sub::DataReader** (p. 976) objects will make the same choice of the particular **dds::pub::DataWriter** (p. 1138) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new **dds::pub::DataWriter** (p. 1138) with higher same strength, or a new **dds::pub::DataWriter** (p. 1138) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **dds::pub::DataWriter** (p. 1138) as long as they affect instances whose values have not been set by the higher-strength **dds::pub::DataWriter** (p. 1138).

8.235.3 Compatibility

The value of the **dds::core::policy::OwnershipKind_def** (p. 1905) offered must exactly match the one requested or else they are considered incompatible.

8.235.4 Relationship between registration, liveliness and ownership

The need for registering/unregistering instances stems from two use cases:

- **Ownership** (p. 1899) resolution on redundant systems
- Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the **dds::pub::DataWriter::unregister_instance** (p. 1160) and **dds::pub::DataWriter::dispose_instance()** (p. 1162).

8.235.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **dds::pub::DataWriter** (p. 1138) entities are "capable" of writing the same instance. In this situation, the **dds::pub::DataWriter** (p. 1138) entities are configured such that:

- Either both are writing the instance "constantly"
- Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1906) and arbitrate themselves by means of the **dds::core::policy::OwnershipStrength** (p. 1906). Regardless of the scheme, the desired behavior from the **dds::sub::DataReader** (p. 976) point of view is that **dds::sub::DataReader** (p. 976) normally receives data from the primary unless the "primary" writer stops writing, in which case the **dds::sub::DataReader** (p. 976) starts to receive data from the secondary **dds::pub::DataWriter** (p. 1138).

This approach requires some mechanism to detect that a **dds::pub::DataWriter** (p. 1138) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault The application logic that was writing the data is faulty and has stopped calling **dds::pub::DataWriter::write()** (p. 1148).

Arbitrating from a **dds::pub::DataWriter** (p. 1138) to one of a higher strength is simple and the decision can be taken autonomously by the **dds::sub::DataReader** (p. 976). Switching ownership from a higher strength **dds::pub::Data↩ Writer** (p. 1138) to one of a lower strength **dds::pub::DataWriter** (p. 1138) requires that the **dds::sub::DataReader** (p. 976) can make a determination that the stronger **dds::pub::DataWriter** (p. 1138) is "no longer writing the instance".

8.235.4.1.1 Case where the data is periodically updated This determination is reasonably simple when the data is being written periodically at some rate. The **dds::pub::DataWriter** (p. 1138) simply states its offered **dds::core::policy::Deadline** (p. 1255) (maximum interval between updates), and the **dds::sub::DataReader** (p. 976) automatically monitors that the **dds::pub::DataWriter** (p. 1138) indeed updates the instance at least once per **dds::core::policy::Deadline::period** (p. 1258) set by the **dds::sub::DataReader** (p. 976). If the deadline is missed, the **dds::sub::DataReader** (p. 976) considers the **dds::pub::DataWriter** (p. 1138) "not alive" and automatically gives ownership to the next highest-strength **dds::pub::DataWriter** (p. 1138) that *is* alive.

8.235.4.1.2 Case where data is not periodically updated The case where the **dds::pub::DataWriter** (p. 1138) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. **Ownership** (p. 1899) is maintained while the **dds::pub::DataWriter** (p. 1138) is "alive" and for the **dds::pub::DataWriter** (p. 1138) to be alive it must fulfill its **dds::core::policy::Liveliness** (p. 1645) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], LIVELINESS must be **dds::core::policy::LivelinessKind_def::MANUAL_BY_TOPIC** (p. 1655). The **dds::pub::DataWriter** (p. 1138) can retain ownership by periodically writing data or else calling assert_liveliness if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the **dds::pub::DataWriter** (p. 1138) process periodically writes data or calls **dds::domain::DomainParticipant::assert_liveliness** (p. 1338). However, this scenario requires that the **dds::sub::DataReader** (p. 976) knows what instances are being "written" by the **dds::pub::DataWriter** (p. 1138). That is the only way that the **dds::sub::DataReader** (p. 976) deduces the ownership of specific instances from the fact that the **dds::pub::DataWriter** (p. 1138) is still "alive". Hence the need for the **dds::pub::DataWriter** (p. 1138) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the **dds::pub::DataWriter** (p. 1138) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the **dds::sub::DataReader** (p. 976).

8.235.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it knows that some specific writers have the minimum configured readers (e.g the alarm monitor is up).

A *more* common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the **dds::core::policy::Deadline** (p. 1255) and the on_deadline_missed listener provides the notification. The case where data is not periodically updated requires the use of the **dds::core::policy::Liveliness** (p. 1645) in combination with register_instance/unregister_instance to detect whether the "connectivity" has been lost, and the notification is provided by means of **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

8.235.4.3 Semantic Difference between unregister_instance and dispose

dds::pub::DataWriter::dispose_instance() (p. 1162) is semantically different from **dds::pub::DataWriter↩ ::unregister_instance** (p. 1160). **dds::pub::DataWriter::dispose_instance()** (p. 1162) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas **dds::pub::DataWriter::unregister_instance** (p. 1160) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **dds::pub::DataWriter** (p. 1138) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **dds::topic::Topic** (p. 2474) with **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1906), if the current owner of an instance *disposes* it, the readers accessing the instance will see the instance_state as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **dds::pub::DataWriter** (p. 1138) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a **dds::topic::Topic** (p. 2474) with **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1906), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

8.235.5 Constructor & Destructor Documentation

8.235.5.1 Ownership() [1/2]

```
dds::core::policy::Ownership::Ownership ( )  [inline]
```

Creates an ownership policy set to shared.

8.235.5.2 Ownership() [2/2]

```
dds::core::policy::Ownership::Ownership (
            dds::core::policy::OwnershipKind the_kind )  [inline], [explicit]
```

Creates an instance with the specified ownership kind.

8.235.6 Member Function Documentation

8.235.6.1 kind() [1/2]

```
Ownership & dds::core::policy::Ownership::kind (
            dds::core::policy::OwnershipKind the_kind )  [inline]
```

Sets the ownership kind.

[default] dds::core::policy::OwnershipKind_def::SHARED (p. 1906)

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Applied Per-Instance** (p. 287), **Data Availability** (p. 167)

8.235.6.2 kind() [2/2]

```
dds::core::policy::OwnershipKind dds::core::policy::Ownership::kind ( ) const  [inline]
```

Getter (see setter with the same name)

8.235.6.3 Exclusive()

```
static  Ownership dds::core::policy::Ownership::Exclusive ( )  [inline], [static]
```

Creates a **Ownership** (p. 1899) instance with exclusive kind.

8.235.6.4 Shared()

```
static  Ownership dds::core::policy::Ownership::Shared ( )  [inline], [static]
```

Creates a **Ownership** (p. 1899) instance with shared kind.

8.236 dds::core::policy::OwnershipKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) OwnershipKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  SHARED ,
  EXCLUSIVE }

  The underlying `enum` *type.*

8.236.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) OwnershipKind.

8.236.2 Member Enumeration Documentation

8.236.2.1 type

`enum` **dds::core::policy::OwnershipKind_def::type**

The underlying `enum` type.

Enumerator

SHARED	**[default]** Indicates shared ownership for each instance. Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances. This is the **default** behavior if the **OWNERSHIP** (p. 538) policy is not specified or supported.
EXCLUSIVE	Indicates each instance can only be owned by one **dds::pub::DataWriter** (p. 1138), but the owner of an instance can change dynamically. The selection of the owner is controlled by the setting of the **OWNERSHIP_STRENGTH** (p. 539) policy. The owner is always set to be the highest-strength **dds::pub::DataWriter** (p. 1138) object among the ones currently active (as determined by the **LIVELINESS** (p. 535)).

8.237 dds::core::policy::OwnershipStrength Class Reference

Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by its **dds::topic::Topic** (p. 2474) and key).

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **OwnershipStrength** ()

  Creates an instance with the default strength (0)
- **OwnershipStrength** (int32_t strength)

  Creates an instance with the specified strength value.
- **OwnershipStrength** & **value** (int32_t strength)

  Sets the ownership strength to arbitrate among multiple writers.
- int32_t **value** () const

  Getter (see setter with the same name)

8.237.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by its **dds::topic::Topic** (p. 2474) and key).

This policy only applies if the **OWNERSHIP** (p. 538) policy is of kind **dds::core::policy::OwnershipKind_def::↩ EXCLUSIVE** (p. 1906).

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **YES** (p. 514)

The value of the **OWNERSHIP_STRENGTH** (p. 539) is used to determine the ownership of a data instance (identified by the key). The arbitration is performed by the **dds::sub::DataReader** (p. 976).

8.238.1 Detailed Description

Entry created when a **dds::domain::DomainParticipant** (p. 1326) is discovered.

8.238.2 Member Function Documentation

8.238.2.1 TParticipantBuiltinTopicData()

```
dds::topic::ParticipantBuiltinTopicData::TParticipantBuiltinTopicData ( )  [inline]
```

Create a default **ParticipantBuiltinTopicData** (p. 1908).

8.238.2.2 key()

```
const  dds::topic::BuiltinTopicKey & dds::topic::ParticipantBuiltinTopicData::key ( ) const  [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

8.238.2.3 user_data()

```
const  dds::core::policy::UserData & dds::topic::ParticipantBuiltinTopicData::user_data ( ) const
[inline]
```

Get the **dds::core::policy::UserData** (p. 2591) policy of the corresponding **dds::domain::DomainParticipant** (p. 1326).

Returns

The UserData policy

8.238.2.4 property()

```
const  rti::core::policy::Property & property ( ) const
```

<<***extension***>> *(p. 354)* Get the name-value pair properties to be stored with dds::domin::DomainParticipant

Returns

The name-value pair properties that were propagated from the corresponding **dds::domain::DomainParticipant** (p. 1326)

8.238.2.5 rtps_protocol_version()

```
const  rti::core::ProtocolVersion & rtps_protocol_version ( ) const
```

<<***extension***>> *(p. 354)* Get the version number of the RTPS wire protocol used.

Returns

The protocol version.

8.238.2.6 rtps_vendor_id()

```
const  rti::core::VendorId & rtps_vendor_id ( ) const
```

<<***extension***>> *(p. 354)* Get the ID of the vendor implementing the RTPS wire protocol.

Returns

The vendor id.

8.238.2.7 dds_builtin_endpoints()

```
uint32_t dds_builtin_endpoints ( ) const
```

<<***extension***>> *(p. 354)* Bitmap of builtin endpoints supported by the participant

Each bit indicates a builtin endpoint that may be available on the participant.

Bit	Endpoint
0	SPDPbuiltinParticipantWriter
1	SPDPbuiltinParticipantReader
2	SEDPbuiltinPublicationsWriter
3	SEDPbuiltinPublicationsReader
4	SEDPbuiltinSubscriptionsWriter
5	SEDPbuiltinSubscriptionsReader
10	BuiltinParticipantMessageWriter
11	BuiltinParticipantMessageReader
12	TypeLookupServiceRequestDataWriter
13	TypeLookupServiceRequestDataReader
14	TypeLookupServiceReplyDataWriter
15	TypeLookupServiceReplyDataReader
16	SEDPbuiltinPublicationsSecureWriter
17	SEDPbuiltinPublicationsSecureReader

Bit	Endpoint
18	SEDPbuiltinSubscriptionsSecureWriter
19	SEDPbuiltinSubscriptionsSecureReader
20	BuiltinParticipantMessageSecureWriter
21	BuiltinParticipantMessageSecureReader
22	BuiltinParticipantStatelessMessageWriter
23	BuiltinParticipantStatelessMessageReader
24	BuiltinParticipantVolatileMessageSecureWriter
25	BuiltinParticipantVolatileMessageSecureReader
26	SPDPbuiltinParticipantSecureWriter
27	SPDPbuiltinParticipantSecureReader

8.238.2.8 available_builtin_endpoints_ext()

```
uint32_t available_builtin_endpoints_ext ( ) const
```

<<***extension***>> *(p. 354)* Extended bitmap of builtin endpoints supported by the participant

This bitmap is an extension of the **dds::topic::ParticipantBuiltinTopicData::dds_builtin_endpoints** (p. 1911) field. It is used to indicate additional builtin endpoints that may be available on the participant.

Bit	Endpoint
0	TypeLookupServiceRequestSecureWriter
1	TypeLookupServiceRequestSecureReader
2	TypeLookupServiceReplySecureWriter
3	TypeLookupServiceReplySecureReader

8.238.2.9 default_unicast_locators()

```
const  dds::core::vector<  rti::core::Locator > & default_unicast_locators ( ) const
```

<<***extension***>> *(p. 354)* Get the unicast locators used when individual entities do not specify unicast locators.

Returns

A sequence of the default unicast locators used

8.238.2.10 partition()

```
const  dds::core::policy::Partition & partition ( ) const
```

<<***extension***>> *(*p. *354)* Get the Partition Qos Policy

Returns

The Partition QoS policy

8.238.2.11 trust_protection_info()

```
const  rti::topic::trust::ParticipantTrustProtectionInfo & trust_protection_info ( ) const
```

<<***extension***>> *(*p. *354)* Trust plugins information associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two DomainParticipants will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.238.2.12 trust_algorithm_info()

```
const  rti::topic::trust::ParticipantTrustAlgorithmInfo & trust_algorithm_info ( ) const
```

<<***extension***>> *(*p. *354)* Trust plugins algorithms associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata. trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two DomainParticipants will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.238.2.13 product_version()

```
const  rti::core::ProductVersion & product_version ( ) const
```

<<***extension***>> *(*p. *354)* Get the current version for RTI Connext.

Returns

The RTI Connext version being used

8.238.2.14 participant_name()

```
const  rti::core::policy::EntityName & participant_name ( ) const
```

<<***extension***>> *(*p. *354)* Get the participant name and role name.

Returns

The **rti::core::policy::EntityName** (p. 1530) QoS policy for the corresponding **dds::domain::DomainParticipant** (p. 1326).

8.238.2.15 domain_id()

```
int32_t domain_id ( ) const
```

<<***extension***>> *(*p. *354)* Get the domain ID associated with the discovered **dds::domain::DomainParticipant** (p. 1326).

Returns

The domain id

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.238.2.16 transport_info()

```
const  rti::core::TransportInfoSeq & transport_info ( ) const
```

<<***extension***>> *(p. 354)* Get the sequence of **rti::core::TransportInfo** (p. 2541) containing information about each of the installed transports of the discovered **dds::domain::DomainParticipant** (p. 1326).

This parameter contains a sequence of **rti::core::TransportInfo** (p. 2541) containing the class_id and message_↩ size_max for all installed transports of the discovered participant. The maximum number of **rti::core::TransportInfo** (p. 2541) that will be stored in this sequence is controlled by the DomainParticipant's resource limit **rti::core::policy::**↩ **DomainParticipantResourceLimits::transport_info_list_max_length** (p. 1428).

Returns

The sequence of transport infos

8.238.2.17 partial_configuration()

```
DDS_Boolean partial_configuration ( ) const
```

<<***extension***>> *(p. 354)* Get the value of partial_configuration in the **ParticipantBuiltinTopicData** (p. 1908). This will be TRUE if the **ParticipantBuiltinTopicData** (p. 1908) only contains bootstrapping information.

Returns

The value of partial_configuration

8.238.2.18 reachability_lease_duration()

```
const  dds::core::Duration & reachability_lease_duration ( ) const
```

<<***extension***>> *(p. 354)* Get the reachability lease duration.

8.238.2.19 vendor_builtin_endpoints()

```
uint32_t vendor_builtin_endpoints ( ) const
```

<<***extension***>> *(p. 354)* Bitmap of vendor-specific builtin endpoints supported by the participant

8.239 rti::test::ParticipantFactoryGuard Class Reference

RAII guard for managing the DomainParticipantFactory lifecycle.

`#include <utilities.hpp>`

8.239.1 Detailed Description

RAII guard for managing the DomainParticipantFactory lifecycle.

When an instance of this class goes out of scope, it automatically finalizes the participant factory, ensuring all DDS resources are properly released.

8.240 rti::topic::trust::ParticipantTrustAlgorithmInfo Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins algorithm information associated with the discovered DomainParticipant.

`#include <rti/topic/trust/ParticipantTrustAlgorithmInfo.hpp>`

Public Member Functions

- **ParticipantTrustAlgorithmInfo** ()=default

  Create an instance with the default Trust Algorithm Info associated with the discovered DomainParticipant.
- **ParticipantTrustSignatureAlgorithmInfo signature** () const

  Get the Trust Plugins algorithms for validation of data and metadata exchanged by the DomainParticipant.
- **ParticipantTrustKeyEstablishmentAlgorithmInfo key_establishment** () const

  Get the Trust Plugins algorithms for transformation of data and metadata exchanged by the DomainParticipant.
- **ParticipantTrustInterceptorAlgorithmInfo interceptor** () const

  Get the Trust Plugins algorithms for interception of data and metadata exchanged by the DomainParticipant.

8.240.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins algorithm information associated with the discovered DomainParticipant.

8.240.2 Constructor & Destructor Documentation

Get the Trust Plugins signature algorithm requirements of the DomainParticipant in the context of checking that messages are authentic.

8.245 dds::core::policy::Partition Class Reference

Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities.

#include <dds/core/policy/CorePolicy.hpp>

Public Member Functions

- **TPartition** ()
  Creates a policy with the default partition.
- **TPartition** (const std::string &partition)
  Creates a policy with a single partition with the specified name.
- **TPartition** (const **dds::core::StringSeq** &partitions)
  Creates a policy with the partitions specified in a vector.
- **TPartition** & **name** (const **dds::core::StringSeq** &partitions)
  Sets the partition names specified in a vector.
- const **dds::core::StringSeq** **name** () const
  Getter (see setter with the same name)

8.245.1 Detailed Description

Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities.

This QoS policy is used to set string identifiers that are used for partitioning entities that would otherwise be connected to and exchange data with each other:

- A **dds::pub::DataWriter** (p. 1138) within a **dds::pub::Publisher** (p. 1993) only communicates with a **dds::sub::DataReader** (p. 976) in a **dds::sub::Subscriber** (p. 2410) if (in addition to matching the **dds::topic::Topic** (p. 2474) and having compatible QoS) the **dds::pub::Publisher** (p. 1993) and **dds::sub::Subscriber** (p. 2410) have a common partition name string.
- **dds::domain::DomainParticipant** (p. 1326) entities (with the same domain ID and domain tag) are visible to each other only if they have at least one partition name string in common.

Entity:

dds::pub::Publisher (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::domain::DomainParticipant** (p. 1326)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **YES** (p. 514)

8.245.2 Usage

The **Partition** (p. 1923) QoS policy provides another way to control which entities will match-and thus communicate with-which other entities. It can be used to prevent entities that would have otherwise matched from talking to each other. Much in the same way that only applications within the same DDS domain will communicate with each other, only entities that belong to the same partition can talk to each other.

The **Partition** (p. 1923) QoS policy allows you to add one or more strings, "partitions", to an entity:

- A DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).
- DomainParticipants (with the same domain ID and domain tag) are visible to each other only if they have at least one partition in common.

Since the set of partitions for an entity can be dynamically changed, the **Partition** (p. 1923) QoS policy is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data with each other.

DomainParticipant partitions and Publisher/Subscriber partitions are independent of each other. You can use both features independently or in combination to provide the right level of isolation.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition (p. 1923) strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of an entity intersect with the partitions or wildcard patterns of otherwise matching entities, the entities match; otherwise they do not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.↩ 6). A **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entity may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used on the entities, RTI Connext will not try to match two regular expressions.

Each entity must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If an entity has not specified a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating **dds::core::Entity** (p. 1520) objects in different domains in several ways.

- First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Connext itself to see entities in a domain it does not belong to.
- Second, a **dds::core::Entity** (p. 1520) can only belong to one domain whereas a **dds::core::Entity** (p. 1520) can be in multiple partitions.
- Finally, as far as RTI Connext is concerned, each unique data instance is identified by the tuple **(DomainID, domain tag, dds::topic::Topic (**p. **2474), key)**. Therefore two **dds::core::Entity** (p. 1520) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

For more information, see the "PARTITION QosPolicy" section of the `Core Libraries User's Manual`.

8.245.3 Member Function Documentation

8.245.3.1 TPartition() [1/3]

```
dds::core::policy::Partition::TPartition ( )  [inline]
```

Creates a policy with the default partition.

8.245.3.2 TPartition() [2/3]

```
dds::core::policy::Partition::TPartition (
            const std::string & partition )  [inline], [explicit]
```

Creates a policy with a single partition with the specified name.

8.245.3.3 TPartition() [3/3]

```
dds::core::policy::Partition::TPartition (
            const  dds::core::StringSeq & partitions )  [inline], [explicit]
```

Creates a policy with the partitions specified in a vector.

8.245.3.4 name() [1/2]

```
TPartition & dds::core::policy::Partition::name (
            const  dds::core::StringSeq & partitions )  [inline]
```

Sets the partition names specified in a vector.

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a **dds::core::InconsistentPolicyError** (p. 1610) when setting a **dds::pub::Publisher** (p. 1993)'s or **dds::sub::Subscriber** (p. 2410)'s QoS.

- A partition name string cannot contain the reserved comma character (',').
- The maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1923) is specified on a domain basis in **rti::core::policy::DomainParticipantResourceLimits::max_partitions** (p. 1417). The length of this sequence may not be greater than that value.
- The maximum cumulative length of all partition name strings in a **dds::core::policy::Partition** (p. 1923) is specified on a domain basis in **rti::core::policy::DomainParticipantResourceLimits::max_partition_cumulative_characters** (p. 1417).

[default] Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Connext will assume the entity to be in default partition (empty string partition "").

[range] List of partition name with above restrictions

  Sets the file name where the durable writer history or durable reader state will be stored.
- **rti::core::optional_value**< std::string > **file_name** () const

  Getter (see setter with the same name).
- **PersistentStorageSettings** & **trace_file_name** (const **rti::core::optional_value**< std::string > &the_trace↩ _file_name)

  Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
- **PersistentStorageSettings** & **trace_file_name** (const char *the_trace_file_name)

  Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
- **rti::core::optional_value**< std::string > **trace_file_name** () const

  Getter (see setter with the same name).
- **PersistentStorageSettings** & **journal_kind** (**rti::core::policy::PersistentJournalKind** the_journal_kind)

  Sets the journal mode of the persistent storage.
- **rti::core::policy::PersistentJournalKind journal_kind** () const

  Getter (see setter with the same name).
- **PersistentStorageSettings** & **synchronization_kind** (**rti::core::policy::PersistentSynchronizationKind** the_synchronization_kind)

  Sets the level of synchronization with the physical disk.
- **rti::core::policy::PersistentSynchronizationKind synchronization_kind** () const

  Getter (see setter with the same name).
- **PersistentStorageSettings** & **vacuum** (bool the_vacuum)

<<***extension***>> *(p. 116) Sets the auto-vacuum status of the storage.*

- bool **vacuum** () const

  Getter (see setter with the same name).

- **PersistentStorageSettings** & **restore** (bool the_restore)

  <<***extension***>> *(p. 116) Indicates if the persisted writer history or reader state must be restored.*

- bool **restore** () const

  Getter (see setter with the same name).

- **PersistentStorageSettings** & **writer_instance_cache_allocation** (const **AllocationSettings** &the_writer_↩ instance_cache_allocation)

  <<***extension***>> *(p. 116) Configures the resource limits associated with the instance durable writer history cache.*

- **AllocationSettings** **writer_instance_cache_allocation** () const

  Gets the writer instance cache allocation (see setter)

- **PersistentStorageSettings** & **writer_sample_cache_allocation** (const **AllocationSettings** &the_writer_↩ sample_cache_allocation)

  <<***extension***>> *(p. 116) Configures the resource limits associated with the sample durable writer history cache.*

- **AllocationSettings** **writer_sample_cache_allocation** () const

  Gets the writer instance cache allocation (see setter)

- **PersistentStorageSettings** & **writer_memory_state** (bool the_writer_memory_state)

  <<***extension***>> *(p. 116) Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.*

- bool **writer_memory_state** () const

  Getter (see setter with the same name).

- **PersistentStorageSettings** & **reader_checkpoint_frequency** (uint32_t the_reader_checkpoint_frequency)

  <<***extension***>> *(p. 116) Controls how often the reader state is stored into the database.*

- uint32_t **reader_checkpoint_frequency** () const

  Getter (see setter with the same name).

8.246.1 Detailed Description

<<***extension***>> *(p. 354)* Configures the persistent storage settings for durable writer history and durable reader state.

In a **dds::pub::DataWriter** (p. 1138), this structure configures durable writer history. This feature allows a DataWriter to persist its historical cache, so that it can survive shutdowns, crashes, and restarts. When an application restarts, each DataWriter that has been configured to have durable writer history automatically loads all of the data in this cache from disk and can carry on sending data as if it had never stopped executing.

In a **dds::sub::DataReader** (p. 976), this structure configures durable reader state. This feature allows a DataReader to persist its state and remember which data it has already received. When an application restarts, each DataReader that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the DataReader before the restart will be suppressed so that it is not even sent over the network.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

QoS:

dds::core::policy::Durability (p. 1433)

8.246.2 Constructor & Destructor Documentation

8.246.2.1 PersistentStorageSettings()

```
rti::core::PersistentStorageSettings::PersistentStorageSettings ( )  [inline]
```

Creates an instance with the default settings.

8.246.3 Member Function Documentation

8.246.3.1 enable() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::enable (
            bool the_enable )
```

<<***extension***>> *(p. 116)* Enables durable writer history in a **dds::pub::DataWriter** (p. 1138) and durable reader state in a **dds::sub::DataReader** (p. 976).

When this field is set to true, the persistent storage configuration using this structure will take precedence over the configuration using the deprecated **dds.data_writer.history.odbc_plugin.builtin**.∗ and **dds.data_reader.state**.∗ properties.

[default] false

            const  rti::core::optional_value< std::string > & the_file_name )
```

Sets the file name where the durable writer history or durable reader state will be stored.

Parameters

the_file_name	An optional string. A value is required when enable is set to true.

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **rti::core::PersistentStorageSettings::restore** (p. 1934) is set to true, the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 1060) and **rti↩ ::core::policy::DataWriterProtocol::virtual_guid** (p. 1212) will be set by RTI Connext based on the file content. If you change these fields, the value will be ignored.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

[default] NULL

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.4 file_name() [2/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::file_name (
            const char * the_file_name )
```

Sets the file name where the durable writer history or durable reader state will be stored.

Parameters

the_file_name	The file name. A value different other than NULL is required when enable is set to true.

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **rti::core::PersistentStorageSettings::restore** (p. 1934) is set to true, the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 1060) and **rti↩ ::core::policy::DataWriterProtocol::virtual_guid** (p. 1212) will be set by RTI Connext based on the file content. If you change these fields, the value will be ignored.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

[default] NULL

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.5 file_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::PersistentStorageSettings::file_name ( )
const
```

Getter (see setter with the same name).

8.246.3.6 trace_file_name() [1/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::trace_file_name (
            const  rti::core::optional_value< std::string > & the_trace_file_name )
```

Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Parameters

the_trace_file_name	An optional string. When not set, no trace file will be generated.

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] NULL

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.7 trace_file_name() [2/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::trace_file_name (
            const char * the_trace_file_name )
```

Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Parameters

the_trace_file_name	The trace file name. When NULL, no trace file will be generated.

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] NULL

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.8 trace_file_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::PersistentStorageSettings::trace_file_name (
) const
```

Getter (see setter with the same name).

8.246.3.9 journal_kind() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::journal_kind (
            rti::core::policy::PersistentJournalKind the_journal_kind )
```

Sets the journal mode of the persistent storage.

Parameters

the_journal_kind	The journal kind.

[default] rti::core::policy::PersistentJournalKind::wal_journal (p. 530)

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.10 journal_kind() [2/2]

```
rti::core::policy::PersistentJournalKind rti::core::PersistentStorageSettings::journal_kind ( )
const
```

Getter (see setter with the same name).

8.246.3.11 synchronization_kind() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::synchronization_kind (
            rti::core::policy::PersistentSynchronizationKind the_synchronization_kind )
```

Sets the level of synchronization with the physical disk.

Parameters

the_synchronization_kind	The synchronization kind.

[default] rti::core::policy::PersistentSynchronizationKind::normal (p. 531)

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.12 synchronization_kind() [2/2]

```
rti::core::policy::PersistentSynchronizationKind rti::core::PersistentStorageSettings::synchronization↩
_kind ( ) const
```

Getter (see setter with the same name).

8.246.3.13 vacuum() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::vacuum (
            bool the_vacuum )
```

<<***extension***>> *(p. 116)* Sets the auto-vacuum status of the storage.

When auto-vacuum is true, the storage files will be compacted automatically with every transaction.

When auto-vacuum is false, after data is deleted from the storage files, the files remain the same size.

[default] true

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.14 vacuum() [2/2]

```
bool rti::core::PersistentStorageSettings::vacuum ( ) const
```

Getter (see setter with the same name).

8.246.3.15 restore() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::restore (
            bool the_restore )
```

<<***extension***>> *(*p. *116)* Indicates if the persisted writer history or reader state must be restored.

For a **dds::pub::DataWriter** (p. 1138), this field indicates whether or not the persisted writer history must be restored once the DataWriter is restarted.

For a **dds::sub::DataReader** (p. 976), this field indicates whether or not the persisted reader state must be restored once the DataReader is restarted.

[default] true

Categories

Immutable (p. 243), **Durability** (p. 184)

8.246.3.16 restore() [2/2]

```
bool rti::core::PersistentStorageSettings::restore ( ) const
```

Getter (see setter with the same name).

8.246.3.17 writer_instance_cache_allocation() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::writer_instance_cache_allocation
(
            const  AllocationSettings & the_writer_instance_cache_allocation )
```

<<***extension***>> *(p. 116)* Configures the resource limits associated with the instance durable writer history cache.

This field only applies to **dds::pub::DataWriter** (p. 1138) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses an instance cache.

Do not confuse this limit with the initial and maximum number of instances that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **dds::core::policy::ResourceLimits::max_instances** (p. 2206) and **dds::core::policy::ResourceLimits::initial_instances** (p. 2208).

If **rti::core::PersistentStorageSettings::writer_memory_state** (p. 1936) is set to true, then the value of **rti::core::AllocationSettings::max_count** (p. 804) is set to **dds::core::LENGTH_UNLIMITED** (p. 438), overwriting any value set by the user.

rti::core::AllocationSettings::incremental_count (p. 805) is ignored.

[range] rti::core::AllocationSettings::max_count (p. 804) in interval [1, INT_MAX], rti::core::LENGTH_AUTO, or **dds::core::LENGTH_UNLIMITED** (p. 438). **rti::core::AllocationSettings::initial_count** (p. 804) in interval [1, INT_MAX], or rti::core::LENGTH_AUTO.

rti::core::LENGTH_AUTO means that the value will be set to the equivalent value of **dds::core::policy::ResourceLimits** (p. 2203).

[default] rti::core::AllocationSettings::max_count (p. 804) = rti::core::LENGTH_AUTO (= **dds::core::policy::ResourceLimits::max_instances** (p. 2206)) and **rti::core::AllocationSettings::initial_count** (p. 804) = rti::core::LENGTH_AUTO (= **dds::core::policy::ResourceLimits::initial_instances** (p. 2208)).

Categories

Immutable (p. 243), **Durability** (p. 184), **Sample Memory Management** (p. 230)

8.246.3.18 writer_instance_cache_allocation() [2/2]

```
AllocationSettings rti::core::PersistentStorageSettings::writer_instance_cache_allocation ( )
const
```

Gets the writer instance cache allocation (see setter)

8.246.3.19 writer_sample_cache_allocation() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::writer_sample_cache_allocation
(
            const  AllocationSettings & the_writer_sample_cache_allocation )
```

<<***extension***>> *(p. 116)* Configures the resource limits associated with the sample durable writer history cache.

This field only applies to **dds::pub::DataWriter** (p. 1138) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses a sample cache.

Do not confuse this limit with the initial and maximum number of samples that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **dds::core::policy::ResourceLimits::max_samples** (p. 2205) and **dds::core::policy::ResourceLimits::initial_samples** (p. 2207).

rti::core::AllocationSettings::incremental_count (p. 805) is ignored.

[range] rti::core::AllocationSettings::max_count (p. 804) in interval [1, INT_MAX], rti::core::LENGTH_AUTO, or **dds::core::LENGTH_UNLIMITED** (p. 438). **rti::core::AllocationSettings::initial_count** (p. 804) in interval [1, INT_↩ MAX], or rti::core::LENGTH_AUTO.

rti::core::LENGTH_AUTO means that the value will be set to the equivalent value of **dds::core::policy::Resource↩ Limits** (p. 2203).

[default] rti::core::AllocationSettings::max_count (p. 804) = 32 and **rti::core::AllocationSettings::initial_count** (p. 804) = 32.

Categories

Immutable (p. 243), **Durability** (p. 184), **Sample Memory Management** (p. 230)

8.246.3.20 writer_sample_cache_allocation() [2/2]

```
AllocationSettings rti::core::PersistentStorageSettings::writer_sample_cache_allocation ( ) const
```

Gets the writer instance cache allocation (see setter)

8.246.3.21 writer_memory_state() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::writer_memory_state (
            bool the_writer_memory_state )
```

<<***extension***>> *(p. 116)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.

This field only applies to **dds::pub::DataWriter** (p. 1138) entities.

If this field is set to true, then **rti::core::AllocationSettings::max_count** (p. 804) in **rti::core::PersistentStorage↩ Settings::writer_instance_cache_allocation** (p. 1934) is set to **dds::core::LENGTH_UNLIMITED** (p. 438), overwriting any value set by the user.

In addition, the durable writer history will keep a fixed state overhead per sample in memory. This mode provides the best durable writer history performance. However, the restore operation will be slower, and the maximum number of samples that the durable writer history can manage is limited by the available physical memory.

If this field is set to false, all the state will be kept in the underlying database. In this mode, the maximum number of samples in the durable writer history is not limited by the physical memory available.

This field is always set to false when the DataWriter is configured with **dds::core::policy::Reliability↩ ::acknowledgment_kind** (p. 2154) set to **rti::core::policy::AcknowledgmentKind_def::APPLICATION_AUTO** (p. 798) or **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798), or **rti::core::policy::↩ Availability::enable_required_subscriptions** (p. 871) is set to true.

[default] true

Categories

Immutable (p. 243), **Durability** (p. 184), **Middleware Memory Management** (p. 204)

8.246.3.22 writer_memory_state() [2/2]

```
bool rti::core::PersistentStorageSettings::writer_memory_state ( ) const
```

Getter (see setter with the same name).

8.246.3.23 reader_checkpoint_frequency() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::reader_checkpoint_frequency (
            uint32_t the_reader_checkpoint_frequency )
```

<<***extension***>> *(p. 116)* Controls how often the reader state is stored into the database.

This field only applies to **dds::sub::DataReader** (p. 976) entities.

A value of N means store the state once every N received and processed samples.

The circumstances under which a data sample is considered "processed by the application" depends on the DataReader configuration.

For additional information on when a sample is considered "processed by the application" see `Durable Reader State`, in the Core Libraries User's Manual.

A high value will provide better performance. However, if the DataReader is restarted it may receive some duplicate samples.

[range] [1, 1000000] **[default]** 1

Categories

8.247.1 Detailed Description

template<typename T>
class rti::core::pointer< T >

Helper class for generated types that contain IDL pointers (an RTI extension)

It wraps a loaned pointer and provides overloads of certain operators to access the contents rather than the pointer. It never deep-copies or deletes the underlying pointer.

8.247.2 Constructor & Destructor Documentation

8.247.2.1 pointer() [1/2]

```
template<typename T >
rti::core::pointer< T >::pointer ( )  [inline]
```

Initialize to NULL

8.247.2.2 pointer() [2/2]

```
template<typename T >
rti::core::pointer< T >::pointer (
            T * ptr )  [inline]
```

Shallow-copy the pointer and allow automatic conversion from T *

8.247.3 Member Function Documentation

8.247.3.1 set()

```
template<typename T >
void  rti::core::pointer< T >::set (
            T * ptr )  [inline]
```

Set the underlying pointer. This function does not copy or delete, it just replaces this pointer.

8.247.3.2 get()

```
template<typename T >
T *  rti::core::pointer< T >::get ( ) const  [inline]
```

Returns the underlying pointer

Referenced by **rti::core::pointer< T >::operator==()**.

8.247.3.3 operator=()

```
template<typename T >
pointer< T > &  rti::core::pointer< T >::operator= (
            T * other )  [inline]
```

Assign another pointer replacing the current one

8.247.3.4 operator==()

```
template<typename T >
bool  rti::core::pointer< T >::operator== (
            const  pointer< T > & other ) const  [inline]
```

Deep equality comparison

References **rti::core::pointer< T >::get()**.

8.247.3.5 operator"!=()

```
template<typename T >
bool  rti::core::pointer< T >::operator!= (
            const  pointer< T > & other ) const  [inline]
```

Deep inequality comparison

8.248 dds::core::policy::policy_id< Policy > Class Template Reference

Obtains the QosPolicyId of a QoS Policy.

`#include <PolicyTraits.hpp>`

8.248.1 Detailed Description

template<typename Policy>
class dds::core::policy::policy_id< Policy >

Obtains the QosPolicyId of a QoS Policy.

Template Parameters

A	QoS policy from the namespaces **dds::core::policy** (p. 627) or rti::core::policy

Specializations for each QoS policy provide the following constant:

```
static const dds::core::policy::QosPolicyId value;
```

For example, the policy ID for the **dds::core::policy::Deadline** (p. 1255) policy is `dds::core::policy::policy_id<dds::core::policy::Deadline>::value`.

8.249 dds::core::policy::policy_name< Policy > Class Template Reference

Obtains the policy name.

```
#include <PolicyTraits.hpp>
```

8.249.1 Detailed Description

template<typename Policy>
class dds::core::policy::policy_name< Policy >

Obtains the policy name.

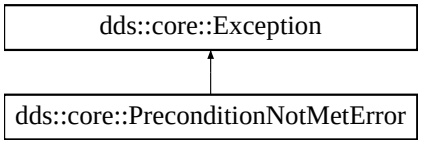
Template Parameters

A	QoS policy from the namespaces **dds::core::policy** (p. 627) or rti::core::policy

Specializations for each QoS policy provide the following method:

```
static const std::string& name();
```

For example:



```
using namespace dds::core::policy;
std::cout « policy_name<Reliability>::name() « std::endl; // Prints "Reliability"
```

8.250 dds::core::PreconditionNotMetError Class Reference

A **PreconditionNotMetError** (p. 1941) is thrown when a pre-condition for the operation was not met.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::PreconditionNotMetError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **PreconditionNotMetError** (p. 1941) exception.*

8.250.1 Detailed Description

A **PreconditionNotMetError** (p. 1941) is thrown when a pre-condition for the operation was not met.

Inherits also from `std::logic_error`

The system is not in the expected state when the function is called, or the parameter itself is not in the expected state when the function is called.

8.250.2 Member Function Documentation

8.250.2.1 what()

```
virtual const char * dds::core::PreconditionNotMetError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **PreconditionNotMetError** (p. 1941) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.251 dds::core::policy::Presentation Class Reference

Specifies how the samples representing changes to data instances are presented to a subscribing application.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Presentation** ()

  Create an instance with the default value.
- **Presentation** (**dds::core::policy::PresentationAccessScopeKind** the_access_scope, bool the_coherent_↩ access, bool the_ordered_access)

  Creates an instance with the specified access scope and coherent and ordered access.
- **Presentation** & **access_scope** (**dds::core::policy::PresentationAccessScopeKind** the_access_scope)

  Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
- **dds::core::policy::PresentationAccessScopeKind** **access_scope** () const

  Getter (see setter with the same name)
- **Presentation** & **coherent_access** (bool enable)

  Controls whether coherent access is supported within the access_scope.
- bool **coherent_access** () const

  Getter (see setter with the same name)
- **Presentation** & **ordered_access** (bool enable)

  Controls whether ordered access is supported within the access_scope.
- bool **ordered_access** () const

  Getter (see setter with the same name)
- **dds::core::policy::Presentation** & **drop_incomplete_coherent_set** (bool enable)

  <<***extension***>> (p. *116) Indicates whether or not a DataReader should drop samples from an incomplete coherent set for which not all the relevant samples where received.*
- bool **drop_incomplete_coherent_set** () const

  <<***extension***>> (p. *116) Getter (see setter with the same name)*

Static Public Member Functions

- static **Presentation** **GroupAccessScope** (bool coherent, bool ordered)

  Creates a ***Presentation*** (p. *1942) instnace with group access scope.*
- static **Presentation** **InstanceAccessScope** (bool coherent, bool ordered)

  Creates a ***Presentation*** (p. *1942) instance with instance access scope.*
- static **Presentation** **TopicAccessScope** (bool coherent, bool ordered)

  Creates a ***Presentation*** (p. *1942) instance with topic access scope.*

8.251.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Connext. Specifically, this policy affects the application's ability to:

- specify and receive coherent changes to instances
- specify the relative order in which changes are presented

Entity:

dds::pub::Publisher (p. 1993), **dds::sub::Subscriber** (p. 2410)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::StatusMask↩ ::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.251.2 Usage

A **dds::sub::DataReader** (p. 976) will usually receive data in the order that it was sent by a **dds::pub::DataWriter** (p. 1138), and the data is presented to the **dds::sub::DataReader** (p. 976) as soon as the application receives the next expected value. However, sometimes you may want a set of data for the same DataWriter or different DataWriters to be presented to the DataReader(s) only after *all* of the elements of the set have been received, but not before. Or you may want the data to be presented in a different order than that in which it was sent. Specifically for keyed data, you may want the middleware to present the data in keyed – or *instance* – order, such that samples pertaining to the same instance are presented together.

The **Presentation** (p. 1942) QoS policy is a request-offered QoS policy that allows you to specify different *scopes* of presentation. It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- `coherent_access` controls whether RTI Connext will preserve the groupings of changes made by a publishing application by means of the operations **dds::pub::CoherentSet::CoherentSet** (p. 932) and **dds::pub::↩ CoherentSet::end()** (p. 933).

- `ordered_access` controls whether RTI Connext will preserve the order of changes.

- `access_scope` controls the granularity of the other settings. See below:

If `coherent_access` is set, then the `access_scope` set on the **dds::sub::Subscriber** (p. 2410) controls the maximum extent of coherent changes. The behavior is as follows:

- If `access_scope` is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) (the default), the behavior is the same as **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951).

- If access_scope is set to **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951), then coherent changes (indicated by their enclosure within calls to **dds::pub::CoherentSet::CoherentSet** (p. 932) and **dds::pub::CoherentSet::end()** (p. 933)) will be made available as a unit to each remote **dds::sub::DataReader** (p. 976) independently. That is, changes made to instances within each individual **dds::pub::DataWriter** (p. 1138) will be presented as a unit. They will not be grouped with changes made to instances belonging to a different **dds::pub::DataWriter** (p. 1138).

- If access_scope is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951), then coherent changes made to instances through a set of **dds::pub::DataWriter** (p. 1138) entities attached to a common **dds::pub::Publisher** (p. 1993) will be made available as a unit to the **dds::sub::DataReader** (p. 976) entities within a **dds::sub::Subscriber** (p. 2410).

If ordered_access is set, then the access_scope set on the **dds::sub::Subscriber** (p. 2410) controls the maximum extent to which order will be preserved by RTI Connext.

- If access_scope is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) (the lowest level), then the relative order of DDS samples sent by a **dds::pub::DataWriter** (p. 1138) is only preserved on a per-instance basis. If two DDS samples refer to the same instance (identified by Topic and a particular value for the key), then the order in which they are stored in the **dds::sub::DataReader** (p. 976) queue is consistent with the order in which the changes occurred. However, if the two DDS samples belong to different instances, the order in which they are presented may or may not match the order in which the changes occurred. This is the case even if it is the same application thread making the changes using the same **dds::pub::DataWriter** (p. 1138).

- If access_scope is set to **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951), changes (creations, deletions, modifications) made by a single **dds::pub::DataWriter** (p. 1138) to one or more instances are presented to a **dds::sub::DataReader** (p. 976) in the same order in which they occur. Changes made to instances though different **dds::pub::DataWriter** (p. 1138) entities are not required to be presented in the order in which they occur. This is the case even if the changes are made by a single application thread using **dds::pub::DataWriter** (p. 1138) objects attached to the same **dds::pub::Publisher** (p. 1993).

- Finally, if access_scope is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951), changes made to instances via **dds::pub::DataWriter** (p. 1138) entities attached to the same **dds::pub::Publisher** (p. 1993) object are presented to the **dds::sub::DataReader** (p. 976) entities within a **dds::sub::Subscriber** (p. 2410) in the same order in which they occur. For this to happen, the application must take the samples using the Subscriber's **dds::sub::CoherentAccess::CoherentAccess()** (p. 930) and **dds::sub::CoherentAccess::end()** (p. 931) operations.

See the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the Core Libraries User's Manual for more information.

If access_scope is set to **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1951) on the **dds::sub::Subscriber** (p. 2410), then the **dds::sub::Subscriber** (p. 2410) will use the access_scope offered by the remote **dds::pub::Publisher** (p. 1993).

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily imply that the **dds::sub::Subscriber** (p. 2410) **will** indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the **dds::sub::DataReader** (p. 976) objects.

For **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951) the subscribing application must use the APIs **dds::sub::CoherentAccess::CoherentAccess()** (p. 930), **dds::sub::CoherentAccess::end()** (p. 931) and **dds::sub::find** (p. 672) to access the changes in the proper order. If you do not use these operations, the data may not be ordered across DataWriters that belong to the same **dds::pub::Publisher** (p. 1993).

The field **dds::sub::SampleInfo::coherent_set_info** (p. 2295) is set when a sample is part of a coherent set. This field provides information to identify the coherent set that a sample is part of. In addition, **rti::core::CoherentSetInfo::incomplete_coherent_set** (p. 938) indicates if a sample is part of an incomplete coherent set (one for which not all samples have been received). Coherent sets for which some of the samples are filtered out by content or time on the **dds::pub::DataWriter** (p. 1138) are considered incomplete.

By default, the samples that are received from an incomplete coherent set are dropped by the DataReader(s) and they are not provided to the application. Such samples are reported as lost in the SAMPLE_LOST Status. By setting **dds::core::policy::Presentation::drop_incomplete_coherent_set** (p. 1949) to false, you can change this behavior and, in this case, samples from incomplete coherent sets will be provided to the application. These samples have **rti::core::CoherentSetInfo::incomplete_coherent_set** (p. 938) set to true.

8.251.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered* `access_scope` >= *requested* `access_scope` evaluates to 'TRUE' or requested `access_scope` is **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1951). For the purposes of this inequality, the values of `access_scope` are considered ordered such that **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) < **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951) < **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951).

- requested `coherent_access` is false, or else both offered and requested `coherent_access` are true.

- requested `ordered_access` is false, or else both offered and requested `ordered_access` are true.

8.251.4 Constructor & Destructor Documentation

8.251.4.1 Presentation() [1/2]

```
dds::core::policy::Presentation::Presentation ( )  [inline]
```

Create an instance with the default value.

8.251.4.2 Presentation() [2/2]

```
dds::core::policy::Presentation::Presentation (
             dds::core::policy::PresentationAccessScopeKind the_access_scope,
            bool the_coherent_access,
            bool the_ordered_access )  [inline]
```

Creates an instance with the specified access scope and coherent and ordered access.

See the corresponding setters.

8.251.5 Member Function Documentation

8.251.5.1 access_scope() [1/2]

```
Presentation & dds::core::policy::Presentation::access_scope (
            dds::core::policy::PresentationAccessScopeKind the_access_scope )  [inline]
```

Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] dds::core::policy::PresentationAccessScopeKind_def::INSTANCE (p. 1951)

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Applied Per-Instance** (p. 287), **Sample Ordering** (p. 234), **Data Availability** (p. 167)

8.251.5.2 access_scope() [2/2]

```
dds::core::policy::PresentationAccessScopeKind dds::core::policy::Presentation::access_scope ( )
const  [inline]
```

Getter (see setter with the same name)

8.251.5.3 coherent_access() [1/2]

```
Presentation & dds::core::policy::Presentation::coherent_access (
            bool enable )  [inline]
```

Controls whether coherent access is supported within the access_scope.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

Note: To use this feature, the DataWriter must be configured for RELIABLE communication (see **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157)).

[default] false

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Sample Ordering** (p. 234), **Data Availability** (p. 167)

8.251.5.4 coherent_access() [2/2]

```
bool dds::core::policy::Presentation::coherent_access ( ) const  [inline]
```

Getter (see setter with the same name)

8.251.5.5 ordered_access() [1/2]

```
Presentation & dds::core::policy::Presentation::ordered_access (
            bool enable )  [inline]
```

Controls whether ordered access is supported within the access_scope.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

[default] false

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Applied Per-Instance** (p. 287), **Sample Ordering** (p. 234), **Data Availability** (p. 167)

8.251.5.6 ordered_access() [2/2]

```
bool dds::core::policy::Presentation::ordered_access ( ) const  [inline]
```

Getter (see setter with the same name)

8.251.5.7 GroupAccessScope()

```
static  Presentation dds::core::policy::Presentation::GroupAccessScope (
            bool coherent,
            bool ordered )  [inline], [static]
```

Creates a **Presentation** (p. 1942) instnace with group access scope.

8.251.5.8 InstanceAccessScope()

```
static  Presentation dds::core::policy::Presentation::InstanceAccessScope (
            bool coherent,
            bool ordered )  [inline], [static]
```

Creates a **Presentation** (p. 1942) instance with instance access scope.

8.251.5.9 TopicAccessScope()

```
static  Presentation dds::core::policy::Presentation::TopicAccessScope (
            bool coherent,
            bool ordered )  [inline], [static]
```

Creates a **Presentation** (p. 1942) instance with topic access scope.

8.251.5.10 drop_incomplete_coherent_set() [1/2]

```
dds::core::policy::Presentation & drop_incomplete_coherent_set (
            bool enable )
```

<<***extension***>> *(p. 116)* Indicates whether or not a DataReader should drop samples from an incomplete coherent set for which not all the relevant samples where received.

Note that a coherent set will be considered incomplete if some of its samples are filtered by content or time on the DataWriter side.

By default, the samples that are received from an incomplete coherent set are dropped (and reported as lost) by the DataReader(s) and they are not provided to the application. By setting this parameter to false, you can change this behavior.

Samples from an incomplete coherent set have **rti::core::CoherentSetInfo::incomplete_coherent_set** (p. 938) set to true in **dds::sub::SampleInfo::coherent_set_info** (p. 2295).

[default] true

Categories

Immutable (p. 243), **Sample Ordering** (p. 234), **Data Availability** (p. 167)

8.251.5.11 drop_incomplete_coherent_set() [2/2]

```
bool drop_incomplete_coherent_set ( ) const
```

<<***extension***>> *(p. 116)* Getter (see setter with the same name)

8.252 dds::core::policy::PresentationAccessScopeKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) PresentationAccessScopeKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  INSTANCE ,
  TOPIC ,
  GROUP ,
  HIGHEST_OFFERED }

  The underlying `enum` *type.*

8.252.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) PresentationAccessScopeKind.

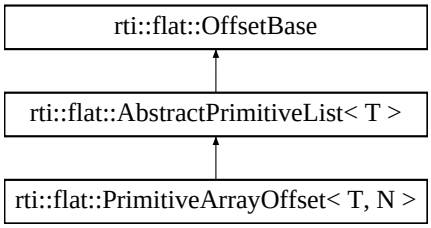
8.252.2 Member Enumeration Documentation

8.252.2.1 type

`enum` **dds::core::policy::PresentationAccessScopeKind_def::type**

The underlying `enum` type.

Enumerator



INSTANCE	**[default]** Scope spans only a single instance. Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.
TOPIC	Scope spans all instances within the same **dds::pub::DataWriter** (p. 1138), but not across instances in different **dds::pub::DataWriter** (p. 1138) entities.
GROUP	Scope spans all instances belonging to **dds::pub::DataWriter** (p. 1138) entities within the same **dds::pub::Publisher** (p. 1993).
HIGHEST_OFFERED	This value only applies to a **dds::sub::Subscriber** (p. 2410). The **dds::sub::Subscriber** (p. 2410) will use the access scope specified by each remote **dds::pub::Publisher** (p. 1993).

8.253 rti::flat::PrimitiveArrayOffset< T, N > Class Template Reference

Offset to an array of primitive elements.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::PrimitiveArrayOffset< T, N >:

Public Member Functions

- unsigned int **element_count** () const

  Returns the number of elements, N.

8.253.1 Detailed Description

template<typename T, unsigned int N>
class rti::flat::PrimitiveArrayOffset< T, N >

Offset to an array of primitive elements.

Template Parameters

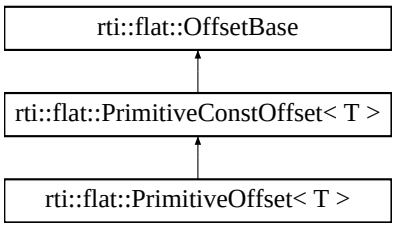
T	The primitive type
N	The array bound. For multidimensional arrays, N is the product of each dimension bound.

A **PrimitiveArrayOffset** (p. 1951) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 417)).

8.253.2 Member Function Documentation

8.253.2.1 element_count()

```
template<typename T , unsigned int N>
unsigned int  rti::flat::PrimitiveArrayOffset< T, N >::element_count ( ) const  [inline]
```



Returns the number of elements, N.

8.254 rti::flat::PrimitiveConstOffset< T > Struct Template Reference

A const Offset to an optional primitive member.

`#include <Offset.hpp>`

Inheritance diagram for rti::flat::PrimitiveConstOffset< T >:

Public Member Functions

- T **get** () const

  Gets the value of this primitive member.

8.254.1 Detailed Description

template<typename T>
struct rti::flat::PrimitiveConstOffset< T >

A const Offset to an optional primitive member.

Read-only version of **PrimitiveOffset** (p. 1953).

If !is_null(), the value can be retrieved with **get()** (p. 1953).

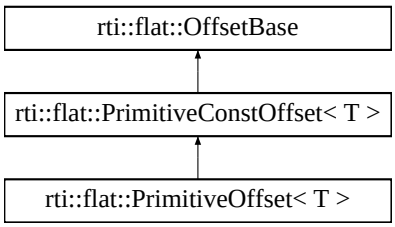
8.254.2 Member Function Documentation

8.254.2.1 get()

```
template<typename T >
T  rti::flat::PrimitiveConstOffset< T >::get ( ) const  [inline]
```

Gets the value of this primitive member.

Precondition



!is_null()

8.255 rti::flat::PrimitiveOffset< T > Struct Template Reference

An Offset to an optional primitive member.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::PrimitiveOffset< T >:

Public Member Functions

- bool **set** (T value)

  Sets a value for this primitive member.

8.255.1 Detailed Description

template<typename T>
struct rti::flat::PrimitiveOffset< T >

An Offset to an optional primitive member.

Template Parameters

T	The primitive type

Non-optional primitive members are accessed directly using its container type's methods; however, since an optional member may not exist, this Offset is returned instead. The only purpose of the type **PrimitiveOffset** (p. 1953) is to provide a way to check for the member's existence.

If !is_null(), the value can be retrieved with **get()** (p. 1953) or set with **set()** (p. 1954).

See also

MyFlatMutableOffset::my_optional_primitive (p. 1772) vs. **MyFlatMutableOffset::my_primitive** (p. 1772)

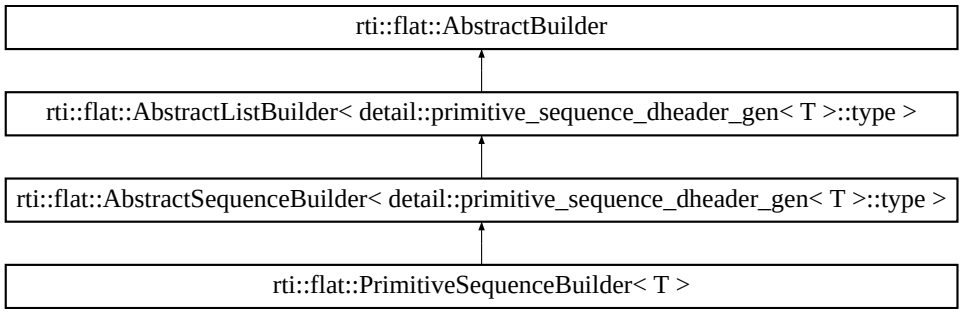
8.255.2 Member Function Documentation

8.255.2.1 set()

```
template<typename T >
bool  rti::flat::PrimitiveOffset< T >::set (
            T value )  [inline]
```

Sets a value for this primitive member.

Precondition



!is_null()

8.256 rti::flat::PrimitiveSequenceBuilder< T > Class Template Reference

Builds a sequence of primitive members.

`#include <SequenceBuilders.hpp>`

Inheritance diagram for rti::flat::PrimitiveSequenceBuilder< T >:

Public Member Functions

- **PrimitiveSequenceBuilder** & **add_next** (T value)

  Adds the next element.
- **PrimitiveSequenceBuilder** & **add_n** (const T *array, unsigned int count)

  Adds all the elements in an array.
- **PrimitiveSequenceBuilder** & **add_n** (unsigned int count, T value)

  Adds a number of elements with the same value.
- **PrimitiveSequenceBuilder** & **add_n** (unsigned int count)

  Adds a number of uninitialized elements.
- **Offset finish** ()

  Finishes building the sequence.

Additional Inherited Members

8.256.1 Detailed Description

template<typename T>
class rti::flat::PrimitiveSequenceBuilder< T >

Builds a sequence of primitive members.

The elements can be added one by one with add_next() or all at once with **add_n()** (p. 1956).

8.256.2 Member Function Documentation

8.256.2.1 add_next()

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_next (
            T value ) [inline]
```

Adds the next element.

Parameters

value	The primitive element to add

8.256.2.2 add_n() [1/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
            const T * array,
            unsigned int count ) [inline]
```

Adds all the elements in an array.

Parameters

array	The array containing the values to add
count	The size of the array

Precondition

array must not be NULL

8.256.2.3 add_n() [2/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
            unsigned int count,
            T value ) [inline]
```

Adds a number of elements with the same value.

This overload initializes all the elements to a value.

Note

This operation is O(`count`). The other overloads, **add_n(unsigned int)** (p. 1957) and **add_n(const T*, unsigned int)** (p. 1956), are more efficient

Parameters

count	The number of elements to add
value	The value to set for each element

8.256.2.4 add_n() [3/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
            unsigned int count ) [inline]
```

Adds a number of uninitialized elements.

This operation is O(1), since it leaves the elements uninitialized. They can be initialized using the Offset returned by **finish()** (p. 1957) and **rti::flat::plain_cast()** (p. 417). For example:

```
MyFlatMutableBuilder builder = ...;
auto seq_builder = builder.build_my_primitive_seq();
seq_builder.add_n(1000);
auto seq_offset = seq_builder.finish();
int32_t *elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 1000; i++) {
    elements[i] = ...;
}
```

Parameters

count	The number of elements to add

8.256.2.5 finish()

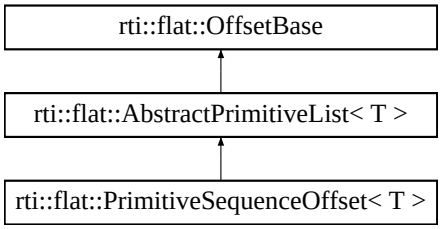
```
template<typename T >
Offset rti::flat::PrimitiveSequenceBuilder< T >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

See also



discard() (p. 784)

8.257 rti::flat::PrimitiveSequenceOffset< T > Class Template Reference

Offset to a sequence of primitive elements.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::PrimitiveSequenceOffset< T >:

Public Member Functions

- unsigned int **element_count** () const
  Returns the number of elements.

8.257.1 Detailed Description

template<typename T>
class rti::flat::PrimitiveSequenceOffset< T >

Offset to a sequence of primitive elements.

Template Parameters

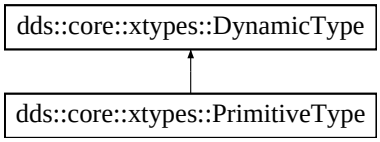
T	The primitive type

8.257.2 Member Function Documentation

8.257.2.1 element_count()

```
template<typename T >
unsigned int  rti::flat::PrimitiveSequenceOffset< T >::element_count ( ) const  [inline]
```

Returns the number of elements.



Referenced by **rti::flat::StringOffset::element_count()**.

8.258 dds::core::xtypes::PrimitiveType Class Reference

<<***value-type***>> *(p. 350)* Represents an IDL primitive type

`#include <dds/core/xtypes/PrimitiveTypes.hpp>`

Inheritance diagram for dds::core::xtypes::PrimitiveType:

Related Functions

(Note that these are not member functions.)

- template<typename T >
  const **PrimitiveType**< T > & **primitive_type** ()

  Obtains a singleton of PrimitiveType<T>

Additional Inherited Members

8.258.1 Detailed Description

<<***value-type***>> *(p. 350)* Represents an IDL primitive type

Template Parameters

T	The C++ primitive type for which to obtain a **DynamicType** (p. 1504). These are the possible types:

C++ type (T)	IDL type
char	char
bool	boolean
uint8_t	uint8
int8_t	int8
octet_tag_t	octet
(u)int16_t	(unsigned) short
(u)int32_t	(unsigned) long
(u)int64_t	(unsigned) long long
float	float
double	double
rti::core::LongDouble (p. 1696)	long double
wchar_t	wchar

Instead of instantiating this class it is recommended to obtain a singleton for each primitive type T using primitive_type.

Note: this class doesn't have any members other than those inherited from **DynamicType** (p. 1504).

See also

primitive_type() (p. 1960)

8.258.2 Friends And Related Function Documentation

8.258.2.1 primitive_type()

```
template<typename T >
const  PrimitiveType< T > & primitive_type ( )  [related]
```

Obtains a singleton of PrimitiveType<T>

8.259 rti::config::PrintFormat_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) PrintFormat.

```
#include <rti/config/Logger.hpp>
```

Public Types

- enum **type** { }
  The underlying `enum` *type.*

8.259.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) PrintFormat.

8.259.2 Member Enumeration Documentation

8.259.2.1 type

```
enum  rti::config::PrintFormat_def::type
```

The underlying `enum` type.

Enumerator

DEFAULT	(default) Print message, method name, log level, **Activity Context** (p. 449) (what was happening when the event occurred), and logging category.
TIMESTAMPED	Print message, method name, log level, **Activity Context** (p. 449), logging category, and timestamp.
VERBOSE	Print message with all available context information (includes thread identifier, message location).
VERBOSE_TIMESTAMPED	Print message with all available context information, and timestamp.
DEBUG	Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.
MINIMAL	Print only message number and message location.
MAXIMAL	Print all available fields.

8.260 rti::topic::PrintFormatKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) PrintFormatKind.

`#include <PrintFormat.hpp>`

Public Types

- enum **type** {
  DEFAULT = DDS_DEFAULT_PRINT_FORMAT ,
  XML = DDS_XML_PRINT_FORMAT ,
  JSON = DDS_JSON_PRINT_FORMAT }

  The underlying `enum` type.

8.260.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) PrintFormatKind.

8.260.2 Member Enumeration Documentation

8.260.2.1 type

`enum` **rti::topic::PrintFormatKind_def::type**

The underlying `enum` type.

Enumerator

DEFAULT	Use a default format specific to RTI Connext to represent the data when converting a data sample to a string.
XML	Use an XML format to represent the data when converting a data sample to a string.
JSON	Use an JSON format to represent the data when converting a data sample to a string.

8.261 rti::topic::PrintFormatProperty Class Reference

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* A collection of attributes used to configure how data samples will be formatted when converted to a string.

`#include <rti/topic/PrintFormat.hpp>`

Public Member Functions

- **PrintFormatProperty** (**PrintFormatKind** the_kind=PrintFormatKind::DEFAULT, bool is_pretty_print=true, bool is_enum_as_int=false, bool is_include_root_elements=true)

  Initializes the properties.
- **PrintFormatKind kind** () const

  Get the value of kind.
- **PrintFormatProperty** & **kind** (**PrintFormatKind** value)

  Set the value for kind, indicating the kind of format to be used when converting a data sample to a string.
- bool **pretty_print** () const

  Get the value of pretty_print.
- **PrintFormatProperty** & **pretty_print** (bool value)

  Set the value for pretty_print, indicating if the string representation of the data sample should be a more readable format or should be void of all white space.
- bool **enum_as_int** () const

  Get the value of enum_as_int.
- **PrintFormatProperty** & **enum_as_int** (bool value)

  Set the value for enum_as_int, indicating whether to format enum values as integers or as strings when converting data samples to strings.
- bool **include_root_elements** () const

  Get the value of include_root_elements.
- **PrintFormatProperty** & **include_root_elements** (bool value)

  Set the value for include_root_elements, indicating whether to include the root elements of the print format in the output string when converting data samples to strings.

Static Public Member Functions

- static **PrintFormatProperty Default** ()

  Creates a property with PrintFormatKind::DEFAULT.
- static **PrintFormatProperty Xml** ()

  Creates a property with PrintFormatKind::XML.
- static **PrintFormatProperty Json** ()

  Creates a property with PrintFormatKind::JSON.

8.261.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A collection of attributes used to configure how data samples will be formatted when converted to a string.

See also

rti::topic::to_string (p. 445)

8.261.2 Constructor & Destructor Documentation

8.261.2.1 PrintFormatProperty()

```
rti::topic::PrintFormatProperty::PrintFormatProperty (
              PrintFormatKind the_kind = PrintFormatKind::DEFAULT,
             bool is_pretty_print = true,
             bool is_enum_as_int = false,
             bool is_include_root_elements = true )  [inline]
```

Initializes the properties.

8.261.3 Member Function Documentation

8.261.3.1 kind() [1/2]

```
PrintFormatKind rti::topic::PrintFormatProperty::kind ( ) const  [inline]
```

Get the value of kind.

See also

kind(PrintFormatKind value) (p. 1963)

8.261.3.2 kind() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::kind (
             PrintFormatKind value )  [inline]
```

Set the value for kind, indicating the kind of format to be used when converting a data sample to a string.

Data samples can be represented in a default, XML, or JSON format.

See also

PrintFormatKind (p. 445)

[default] PrintFormatKind::DEFAULT_PRINT_FORMAT

Parameters

value	The value to set for kind

8.261.3.3 pretty_print() [1/2]

```
bool rti::topic::PrintFormatProperty::pretty_print ( ) const  [inline]
```

Get the value of pretty_print.

See also

pretty_print(bool value) (p. 1964)

8.261.3.4 pretty_print() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::pretty_print (
            bool value )  [inline]
```

Set the value for pretty_print, indicating if the string representation of the data sample should be a more readable format or should be void of all white space.

A value of true will add indentation and newlines to the string representation of the data sample making it more readable. For example:

```
<FooType>
   <myLong>5</myLong>
</FooType>
```

A value of false will cause all white space in the string representation of the data sample to be eliminated. For example:

```
<FooType><myLong>5</myLong></FooType>
```

[default] true

Parameters

value	The value to set for pretty_print

8.261.3.5 enum_as_int() [1/2]

```
bool rti::topic::PrintFormatProperty::enum_as_int ( ) const  [inline]
```

Get the value of enum_as_int.

See also

enum_as_int(bool value) (p. 1965)

8.261.3.6 enum_as_int() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::enum_as_int (
            bool value )  [inline]
```

Set the value for enum_as_int, indicating whether to format enum values as integers or as strings when converting data samples to strings.

A value of true will cause enumeration literals to be printed using their integer value. For example:

```
<FooType>
   <myEnum>5</myEnum>
</FooType>
```

A value of false will cause enumeration literals to be printed as strings using their member names. For example:

```
<FooType>
   <myEnum>RED</myEnum>
</FooType>
```

[default] false

Parameters

value	The value to set for enum_as_int

8.261.3.7 include_root_elements() [1/2]

```
bool rti::topic::PrintFormatProperty::include_root_elements ( ) const  [inline]
```

Get the value of include_root_elements.

See also

include_root_elements(bool value) (p. 1965)

8.261.3.8 include_root_elements() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::include_root_elements (
            bool value )  [inline]
```

Set the value for include_root_elements, indicating whether to include the root elements of the print format in the output string when converting data samples to strings.

This field only applies if the **PrintFormatProperty::kind** (p. 1963) is PrintFormatKind::XML_PRINT_FORMAT or PrintFormatKind::JSON_PRINT_FORMAT

If the value is true and the kind is PrintFormatKind::XML_PRINT_FORMAT then a top-level tag with the type's name in it will be included in the output. For example:

```
<FooType>
   <myLong>5</myLong>
</FooType>
```

If the value is true and the kind is PrintFormatKind::JSON_PRINT_FORMAT then top-level opening and closing braces will be included in the output. For example:

```
{
   "myLong":5
}
```

If the value is false the elements described above will not be included in the output. For example:

```
<myLong>5</myLong>
"myLong":5
```

[default] true

Parameters

value	The value to set for include_root_elements

8.261.3.9 Default()

```
static  PrintFormatProperty rti::topic::PrintFormatProperty::Default ( )  [inline], [static]
```

Creates a property with PrintFormatKind::DEFAULT.

8.261.3.10 Xml()

```
static  PrintFormatProperty rti::topic::PrintFormatProperty::Xml ( )  [inline], [static]
```

Creates a property with PrintFormatKind::XML.

8.261.3.11 Json()

```
static PrintFormatProperty rti::topic::PrintFormatProperty::Json ( ) [inline], [static]
```

Creates a property with PrintFormatKind::JSON.

8.262 rti::core::ProductVersion Class Reference

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Represents the current version of RTI Connext

```
#include <rti/core/ProductVersion.hpp>
```

Public Member Functions

- **ProductVersion** ()

  *Creates the **unknown()** (*p. *1969) product version.*
- std::string **to_string** () const

  Get the product version as a string.
- uint8_t **major_version** () const

  Get the major product version.
- uint8_t **minor_version** () const

  Get the minor product version.
- uint8_t **release_version** () const

  Get the release letter for product version.
- uint8_t **revision_version** () const

  Get the revision number of product.

Static Public Member Functions

- static **ProductVersion** **current** ()

  Returns the current version of RTI Connext.
- static **ProductVersion** **unknown** ()

  Returns the value to indicate that the version is unknown.

8.262.1 Detailed Description

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Represents the current version of RTI Connext

8.262.2 Constructor & Destructor Documentation

8.262.2.1 ProductVersion()

```
rti::core::ProductVersion::ProductVersion ( )  [inline]
```

Creates the **unknown()** (p. 1969) product version.

8.262.3 Member Function Documentation

8.262.3.1 to_string()

```
std::string rti::core::ProductVersion::to_string ( ) const  [inline]
```

Get the product version as a string.

8.262.3.2 major_version()

```
uint8_t rti::core::ProductVersion::major_version ( ) const  [inline]
```

Get the major product version.

8.262.3.3 minor_version()

```
uint8_t rti::core::ProductVersion::minor_version ( ) const  [inline]
```

Get the minor product version.

8.262.3.4 release_version()

```
uint8_t rti::core::ProductVersion::release_version ( ) const  [inline]
```

Get the release letter for product version.

8.262.3.5 revision_version()

```
uint8_t rti::core::ProductVersion::revision_version ( ) const  [inline]
```

Get the revision number of product.

8.262.3.6 current()

```
static  ProductVersion rti::core::ProductVersion::current ( )  [inline], [static]
```

Returns the current version of RTI Connext.

8.262.3.7 unknown()

```
static  ProductVersion rti::core::ProductVersion::unknown ( )  [inline], [static]
```

Returns the value to indicate that the version is unknown.

8.263 rti::core::policy::Property Class Reference

<<***extension***>> *(*p. *116)* Stores key/value string pairs that can configure certain parameters of RTI Connext not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a **dds::core::Entity** (p. 1520).

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Types

- typedef std::pair< std::string, std::string > **Entry**

  *The type of the elements that **Property** (*p. *1969) contains.*

Public Member Functions

- **Property** ()

  *Creates an empty **Property** (p. 1969) container.*
- template<typename EntryIter >
  Property (EntryIter begin, EntryIter end, bool is_propagate=false)

  *Creates a **Property** (p. 1969) container with the entries specified by an iterator range.*
- **Property** (std::initializer_list< **Entry** > entries)

  *<<**C++11**>> (p. 353) Creates a **Property** (p. 1969) container with entries from an initializer_list*
- bool **exists** (const std::string &key) const

  Returns true if a property exists.
- std::string **get** (const std::string &key) const

  Returns the value of a property identified by a key if it exists.
- **rti::core::optional_value**< std::string > **try_get** (const std::string &key) const

  *Returns the value of a property identified by a key or an empty **optional_value** (p. 1892) if it doesn't exist.*
- **Property** & **set** (const **Entry** &property, bool **propagate**=false)

  Adds or assigns a property from a pair of strings.
- template<typename EntryIter >
  Property & **set** (EntryIter begin, EntryIter end, bool is_propagate=false)

  Adds a range of properties.
- bool **remove** (const std::string &key)

  Removes the property identified by a key.
- size_t **size** () const

  Returns the number of properties.
- std::map< std::string, std::string > **get_all** () const

  Retrieves a copy of all the entries in a std::map.
- void **set** (std::initializer_list< **Entry** > entries, bool is_propagate=false)

  *<<**C++11**>> (p. 353) Adds properties from an initializer_list*
- bool **propagate** (const std::string &key) const

  Returns whether the 'propagate' attribute for a property is set or not.

8.263.1 Detailed Description

*<<**extension**>> (p. 116)* Stores key/value string pairs that can configure certain parameters of RTI Connext not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a **dds::core::Entity** (p. 1520).

Entity:

dds::domain::DomainParticipant (p. 1326) **dds::sub::DataReader** (p. 976) **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = N/A;
Changeable (p. 514) = **YES** (p. 514)

See also

dds::sub::builtin_subscriber (p. 671)

8.263.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138), or **dds::domain::DomainParticipant** (p. 1326). This is similar to the **dds::core::policy::UserData** (p. 2591), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the `Property Reference Guide`.

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 101)
- Durable Reader State, see **Configuring Durable Reader State** (p. 102)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 388), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 401), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 383)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 81)
- **Clock Selection** (p. 43)

In addition, you may add your own name/value pairs to the **Property** (p. 1969) QoS policy of an Entity. Via this QoS policy, you can direct RTI Connext to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **dds::core::policy::UserData** (p. 2591) or **dds::core::policy::GroupData** (p. 1591)).

8.263.2.1 Reasons for Using the PropertyQosPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connext capabilities configurable via the **Property** (p. 1969) QoS policy can also be configured in code via APIs. However, the **Property** (p. 1969) QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the **Property** (p. 1969) QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 541) page.

8.263.3 Member Typedef Documentation

8.263.3.1 Entry

```
typedef std::pair<std::string, std::string>  rti::core::policy::Property::Entry
```

The type of the elements that **Property** (p. 1969) contains.

Key/value string pairs.

8.263.4 Constructor & Destructor Documentation

8.263.4.1 Property() [1/3]

```
rti::core::policy::Property::Property ( )  [inline]
```

Creates an empty **Property** (p. 1969) container.

8.263.4.2 Property() [2/3]

```
template<typename EntryIter >
rti::core::policy::Property::Property (
            EntryIter begin,
            EntryIter end,
            bool is_propagate = false )  [inline]
```

Creates a **Property** (p. 1969) container with the entries specified by an iterator range.

See also

set(EntryIter, EntryIter, bool) (p. 1974)

8.263.4.3 Property() [3/3]

```
rti::core::policy::Property::Property (
            std::initializer_list<  Entry > entries )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a **Property** (p. 1969) container with entries from an initializer_list

For example:
```
Property my_properties {{"key 1", "value 1"}, {"key 2", "value 2"}};
```

If a key is duplicated, only one entry will be inserted, with the value that comes last.

8.263.5 Member Function Documentation

8.263.5.1 exists()

```
bool rti::core::policy::Property::exists (
            const std::string & key ) const  [inline]
```

Returns true if a property exists.

8.263.5.2 get()

```
std::string rti::core::policy::Property::get (
            const std::string & key ) const
```

Returns the value of a property identified by a key if it exists.

If the property doesn't exist it throws **dds::core::PreconditionNotMetError** (p. 1941).

8.263.5.3 try_get()

```
rti::core::optional_value< std::string > rti::core::policy::Property::try_get (
            const std::string & key ) const
```

Returns the value of a property identified by a key or an empty **optional_value** (p. 1892) if it doesn't exist.

8.263.5.4 set() [1/3]

```
Property & rti::core::policy::Property::set (
            const  Entry & property,
            bool propagate = false )
```

Adds or assigns a property from a pair of strings.

If the key doesn't exists it adds the new entry, otherwise it overrides its value with the new one.

Parameters

property	`property.first` is the key and `property.second` is the value
propagate	Indicates if the property must be propagated on discovery

8.263.5.5 set() [2/3]

```
template<typename EntryIter >
Property & rti::core::policy::Property::set (
            EntryIter begin,
            EntryIter end,
            bool is_propagate = false )  [inline]
```

Adds a range of properties.

If a key is duplicated, only one entry will remain, with the value that comes last.

Template Parameters

EntryIter	A forward iterator whose value type is **Property::Entry** (p. 1972), such as the iterators of a `std::map<std::string, std::string>`.

Parameters

begin	Beginning of a range of Entry
end	End of that range
is_propagate	Indicates if the property must be propagated on discovery

8.263.5.6 remove()

```
bool rti::core::policy::Property::remove (
            const std::string & key )
```

Removes the property identified by a key.

Returns

true if the property was removed or false if it didn't exist.

8.263.5.7 size()

```
size_t rti::core::policy::Property::size ( ) const
```

Returns the number of properties.

8.263.5.8 get_all()

```
std::map< std::string, std::string > rti::core::policy::Property::get_all ( ) const
```

Retrieves a copy of all the entries in a std::map.

8.263.5.9 set() [3/3]

```
void rti::core::policy::Property::set (
            std::initializer_list<  Entry > entries,
            bool is_propagate = false )  [inline]
```

<<***C++11***>> *(*p. *353)* Adds properties from an initializer_list

8.263.5.10 propagate()

```
bool rti::core::policy::Property::propagate (
            const std::string & key ) const
```

Returns whether the 'propagate' attribute for a property is set or not.

8.264 rti::core::ProtocolVersion Class Reference

<<***extension***>> *(*p. *354)* Represents the current version of RTI Connext

```
#include <rti/core/ProtocolVersion.hpp>
```

Public Member Functions

- **ProtocolVersion** ()

  Creates an invalid protocol version.
- **ProtocolVersion** (uint8_t major, uint8_t minor)

  Creates a version with the given major and minor values.
- uint8_t **major_version** () const

  The major version number.
- uint8_t **minor_version** () const

  The minor version number.

Static Public Member Functions

- static **ProtocolVersion current** ()

  The most recent protocol version. Currently 2.1.

8.264.1 Detailed Description

<<***extension***>> *(*p. *354)* Represents the current version of RTI Connext

8.264.2 Constructor & Destructor Documentation

8.264.2.1 ProtocolVersion() [1/2]

```
rti::core::ProtocolVersion::ProtocolVersion ( )  [inline]
```

Creates an invalid protocol version.

8.264.2.2 ProtocolVersion() [2/2]

```
rti::core::ProtocolVersion::ProtocolVersion (
            uint8_t major,
            uint8_t minor )  [inline]
```

Creates a version with the given major and minor values.

8.264.3 Member Function Documentation

8.264.3.1 major_version()

```
uint8_t rti::core::ProtocolVersion::major_version ( ) const  [inline]
```

The major version number.

8.264.3.2 minor_version()

```
uint8_t rti::core::ProtocolVersion::minor_version ( ) const  [inline]
```

The minor version number.

8.264.3.3 current()

```
static  ProtocolVersion rti::core::ProtocolVersion::current ( )  [inline], [static]
```

The most recent protocol version. Currently 2.1.

8.265 dds::topic::PublicationBuiltinTopicData Class Reference

Entry created when a **dds::pub::DataWriter** (p. 1138) is discovered in association with its **dds::pub::Publisher** (p. 1993).

```
#include <dds/topic/BuiltinTopic.hpp>
```

Public Member Functions

- **TPublicationBuiltinTopicData** ()

  *Create a default **PublicationBuiltinTopicData** (p. 1977).*
- const **dds::topic::BuiltinTopicKey** & **key** () const

  Get the DCPS key to distinguish entries.
- const **dds::topic::BuiltinTopicKey** & **participant_key** () const

  *Get the DCPS key of the **dds::domain::DomainParticipant** (p. 1326) to which the **dds::pub::DataWriter** (p. 1138) belongs.*

  *Get the **dds::topic::BuiltinTopicKey** (p. 905) of the related **dds::sub::DataReader** (p. 976) of this DataWriter.*
- const **rti::core::policy::Service** & **service** () const

  <<***extension***>> *(p. 354) Get the Service policy*

8.265.1 Detailed Description

Entry created when a **dds::pub::DataWriter** (p. 1138) is discovered in association with its **dds::pub::Publisher** (p. 1993).

Data associated with the built-in topic **dds::topic::publication_topic_name()** (p. 443). It contains QoS policies and additional information that apply to the remote **dds::pub::DataWriter** (p. 1138) the related **dds::pub::Publisher** (p. 1993).

8.265.2 Member Function Documentation

8.265.2.1 TPublicationBuiltinTopicData()

```
dds::topic::PublicationBuiltinTopicData::TPublicationBuiltinTopicData ( )  [inline]
```

Create a default **PublicationBuiltinTopicData** (p. 1977).

8.265.2.2 key()

```
const dds::topic::BuiltinTopicKey & dds::topic::PublicationBuiltinTopicData::key ( ) const [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

8.265.2.3 participant_key()

```
const dds::topic::BuiltinTopicKey & dds::topic::PublicationBuiltinTopicData::participant_key ( )
const [inline]
```

Get the DCPS key of the **dds::domain::DomainParticipant** (p. 1326) to which the **dds::pub::DataWriter** (p. 1138) belongs.

Returns

The DomainParticipant's key

8.265.2.4 topic_name()

```
const dds::core::string & dds::topic::PublicationBuiltinTopicData::topic_name ( ) const [inline]
```

Get the name of the related **dds::topic::Topic** (p. 2474).

Returns

The topic name

8.265.2.5 type_name()

```
const dds::core::string & dds::topic::PublicationBuiltinTopicData::type_name ( ) const [inline]
```

Get the name of the type attached to the **dds::topic::Topic** (p. 2474).

Returns

The type name

8.265.2.6 durability()

```
const dds::core::policy::Durability & dds::topic::PublicationBuiltinTopicData::durability ( )
const [inline]
```

Get the **dds::core::policy::Durability** (p. 1433) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Durability policy

8.265.2.7 durability_service()

```
const dds::core::policy::DurabilityService & dds::topic::PublicationBuiltinTopicData::durability↩
_service ( ) const [inline]
```

Get the **dds::core::policy::DurabilityService** (p. 1443) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The DurabilityService policy

8.265.2.8 deadline()

```
const dds::core::policy::Deadline & dds::topic::PublicationBuiltinTopicData::deadline ( ) const
[inline]
```

Get the **dds::core::policy::Deadline** (p. 1255) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Deadline policy

8.265.2.9 latency_budget()

```
const dds::core::policy::LatencyBudget & dds::topic::PublicationBuiltinTopicData::latency_budget
( ) const [inline]
```

Get the **dds::core::policy::LatencyBudget** (p. 1631) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The LatencyBudget policy

8.265.2.10 liveliness()

```
const dds::core::policy::Liveliness & dds::topic::PublicationBuiltinTopicData::liveliness ( )
const [inline]
```

Get the **dds::core::policy::Liveliness** (p. 1645) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Liveliness policy

8.265.2.11 reliability()

```
const dds::core::policy::Reliability & dds::topic::PublicationBuiltinTopicData::reliability ( )
const [inline]
```

Get the **dds::core::policy::Reliability** (p. 2149) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Reliability policy

8.265.2.12 lifespan()

```
const dds::core::policy::Lifespan & dds::topic::PublicationBuiltinTopicData::lifespan ( ) const
[inline]
```

Get the **dds::core::policy::Lifespan** (p. 1635) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Lifespan policy

8.265.2.13 user_data()

```
const dds::core::policy::UserData & dds::topic::PublicationBuiltinTopicData::user_data ( ) const
[inline]
```

Get the **dds::core::policy::UserData** (p. 2591) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The UserData policy

8.265.2.14 ownership()

```
const dds::core::policy::Ownership & dds::topic::PublicationBuiltinTopicData::ownership ( ) const
[inline]
```

Get the **dds::core::policy::Ownership** (p. 1899) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Ownership policy

8.265.2.15 ownership_strength()

```
const dds::core::policy::OwnershipStrength & dds::topic::PublicationBuiltinTopicData::ownership↩
_strength ( ) const [inline]
```

Get the **dds::core::policy::OwnershipStrength** (p. 1906) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The OwnershipStrength policy

8.265.2.16 destination_order()

```
const dds::core::policy::DestinationOrder & dds::topic::PublicationBuiltinTopicData::destination↩
_order ( ) const [inline]
```

Get the **dds::core::policy::DestinationOrder** (p. 1258) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The DestinationOrder policy

8.265.2.17 presentation()

```
const dds::core::policy::Presentation & dds::topic::PublicationBuiltinTopicData::presentation ( )
const [inline]
```

Get the **dds::core::policy::Presentation** (p. 1942) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Presentation policy

8.265.2.18 partition()

```
const dds::core::policy::Partition & dds::topic::PublicationBuiltinTopicData::partition ( ) const
[inline]
```

Get the **dds::core::policy::Partition** (p. 1923) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The Partition policy

References **dds::core::Value**< **D** >**::delegate()**.

8.265.2.19 topic_data()

```
const dds::core::policy::TopicData & dds::topic::PublicationBuiltinTopicData::topic_data ( )
const [inline]
```

Get the **dds::core::policy::TopicData** (p. 2500) policy of the related **dds::topic::Topic** (p. 2474).

Returns

The TopicData policy

References **dds::core::Value**< **D** >**::delegate()**.

8.265.2.20 group_data()

```
const dds::core::policy::GroupData & dds::topic::PublicationBuiltinTopicData::group_data ( )
const [inline]
```

Get the **dds::core::policy::GroupData** (p. 1591) policy of the **dds::pub::Publisher** (p. 1993) to which the **dds::pub**↩ **::DataWriter** (p. 1138) belongs.

Returns

The GroupData policy

References **dds::core::Value**< **D** >**::delegate()**.

8.265.2.21 representation() [1/2]

```
const dds::core::policy::DataRepresentation & dds::topic::PublicationBuiltinTopicData::representation
( ) const [inline]
```

Get the **dds::core::policy::DataRepresentation** (p. 1113) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The DataRepresentation policy

References **dds::core::Value**< **D** >**::delegate()**.

8.265.2.22 data_tag()

```
const dds::core::policy::DataTag & dds::topic::PublicationBuiltinTopicData::data_tag ( ) const
[inline]
```

Get the **dds::core::policy::DataTag** (p. 1132) policy of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The DataTag policy

References **dds::core::Value**< **D** >**::delegate()**.

8.265.2.23 representation() [2/2]

```
const dds::core::policy::DataRepresentation & representation ( ) const
```

Get the publication data representation.

Returns

The **dds::core::policy::DataRepresentation** (p. 1113) policy of the corresponding DataWriter

Examples

Foo.hpp.

8.265.2.24 type()

```
dds::core::optional< dds::core::xtypes::DynamicType > type ( ) const
```

<<***extension***>> *(p. 354)* Get the type

Note

This is not a lightweight getter–obtaining the type may require some processing so it is recommended that you keep the value if you need to use it multiple times rather than look it up every time. See also **get_type_no_copy()** (p. 1986).

Returns

The type or an unset optional value if the type is not available

Examples

Foo.hpp.

8.265.2.25 get_type_no_copy()

```
const dds::core::optional< dds::core::xtypes::DynamicType > & get_type_no_copy ( ) const
```

<<***extension***>> *(p. 354)* Get the type by reference if possible

Exceptions

dds::core::PreconditionNotMet	If the type is available but is not in a format that is directly accessible. In that case it needs some extra processing and has to be accessed using **type()** (p. 1985). You can also ensure that it is in the right format by setting **rti::core::policy::↩ DomainParticipantResourceLimits::type_code_max_serialized_length()** (p. 1418) to 0.

Returns

The type or an unset optional value if the type is not available

See also

type() (p. 1985)

8.265.2.26 publisher_key()

```
const dds::topic::BuiltinTopicKey & publisher_key ( ) const
```

<<***extension***>> *(p. 354)* Get the DCPS key of the **dds::pub::Publisher** (p. 1993) to which the **dds::pub::DataWriter** (p. 1138) belongs

Returns

The key

8.265.2.27 property()

```
const rti::core::policy::Property & property ( ) const
```

<<***extension***>> *(p. 354)* Get the propagated name-value properties of the corresponding **dds::pub::DataWriter** (p. 1138).

Returns

The properties

8.265.2.28 unicast_locators()

```
const dds::core::vector< rti::core::Locator > & unicast_locators ( ) const
```

<<***extension***>> *(p. 354)* Get the custom unicast locators that the endpoint can specify.

The default locators will be used if this is not specified.

Returns

The custom unicast locators specified by the corresponding DataWriter

8.265.2.29 virtual_guid()

```
const rti::core::Guid & virtual_guid ( ) const
```

<<***extension***>> *(p. 354)* Get the virtual **rti::core::Guid** (p. 1596) associated to the **dds::pub::DataWriter** (p. 1138).

Returns

The virtual guid

8.265.2.30 rtps_protocol_version()

```
const rti::core::ProtocolVersion & rtps_protocol_version ( ) const
```

<<***extension***>> *(p. 354)* Get the version number of the RTPS wire protocol used.

Returns

The RTPS wire protocol version

8.265.2.31 rtps_vendor_id()

```
const rti::core::VendorId & rtps_vendor_id ( ) const
```

<<***extension***>> *(p. 354)* Get the ID of the vendor implementing the RTPS wire protocol.

Returns

The vendor ID

8.265.2.32 product_version()

```
const rti::core::ProductVersion & product_version ( ) const
```

<<***extension***>> *(p. 354)* Get the current version for RTI Connext.

Returns

The

8.265.2.33 locator_filter()

```
const rti::core::policy::LocatorFilter & locator_filter ( ) const
```

<<***extension***>> *(p. 354)* Get the locator filters of the corresponding **dds::pub::DataWriter** (p. 1138)

Returns

The rti::core::LocatorFilterQosPolicy

See also

rti::core::policy::MultiChannel (p. 1749)

8.265.2.34 disable_positive_acks()

```
bool disable_positive_acks ( ) const
```

<<***extension***>> *(p. 354)* See whether or not a matching **dds::sub::DataReader** (p. 976) will send positive acknowledgments for reliability.

Returns

true if positive acks are disabled, false otherwise

8.265.2.35 publication_name()

```
const  rti::core::policy::EntityName & publication_name ( ) const
```

<<***extension***>> *(p. 354)* Get the publication name and role name.

Returns

The **rti::core::policy::EntityName** (p. 1530) policy of the corresponding DataWriter

8.265.2.36 trust_protection_info()

```
const  rti::topic::trust::EndpointTrustProtectionInfo & trust_protection_info ( ) const
```

<<***extension***>> *(p. 354)* Get the Trust Plugins information associated with the discovered DataWriter.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.265.2.37 trust_algorithm_info()

```
const rti::topic::trust::EndpointTrustAlgorithmInfo & trust_algorithm_info ( ) const
```

<<***extension***>> *(p. 354)* Get the Trust plugins algorithms associated with the discovered DataWriter.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.265.2.38 related_datareader_key()

```
const dds::topic::BuiltinTopicKey & related_datareader_key ( ) const
```

Get the **dds::topic::BuiltinTopicKey** (p. 905) of the related **dds::sub::DataReader** (p. 976) of this DataWriter.

This field will be set to something other than **dds::topic::BuiltinTopicKey::unknown()** (p. 906) only when the discovered DataWriter is a part of Remote Procedure Call (RPC) or Request-Reply endpoints.

8.265.2.39 service()

```
const rti::core::policy::Service & service ( ) const
```

<<***extension***>> *(p. 354)* Get the Service policy

8.266 dds::core::status::PublicationMatchedStatus Class Reference

Information about the status **dds::core::status::StatusMask::publication_matched()** (p. 2384)

`#include <TStatus.hpp>`

Public Member Functions

- int32_t **total_count** () const

  *The total cumulative number of times that this **dds::pub::DataWriter** (p. 1138) discovered a "match" with a **dds::sub::DataReader** (p. 976).*
- int32_t **total_count_change** () const

  The changes in total_count since the last time the listener was called or the status was read.
- int32_t **current_count** () const

  *The current number of DataReaders with which this **dds::pub::DataWriter** (p. 1138) is matched.*
- int32_t **current_count_change** () const

  The change in current_count since the last time the listener was called or the status was read.
- const **dds::core::InstanceHandle last_subscription_handle** () const

  *This **InstanceHandle** (p. 1612) can be used to look up which remote **dds::sub::DataReader** (p. 976) was the last to cause this DataWriter's status to change, using **dds::pub::matched_subscription_data()** (p. 650).*
- int32_t **current_count_peak** () const

  <<***extension***>> *(p. 354) Greatest number of DataReaders that matched this **dds::pub::DataWriter** (p. 1138) simultaneously.*

8.266.1 Detailed Description

Information about the status **dds::core::status::StatusMask::publication_matched()** (p. 2384)

A "match" happens when the **dds::pub::DataWriter** (p. 1138) finds a **dds::sub::DataReader** (p. 976) with the same **dds::topic::Topic** (p. 2474), same or compatible data type, and requested QoS that is compatible with that offered by the **dds::pub::DataWriter** (p. 1138). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **dds::pub::DataWriter** (p. 1138) will become "unmatched" from a remote **dds::sub::DataReader** (p. 976) when that **dds::sub::DataReader** (p. 976) goes away for any of the following reasons:

- The matched **dds::sub::DataReader** (p. 976)'s **dds::domain::DomainParticipant** (p. 1326) has lost liveliness.
- This DataWriter or the matched DataReader has changed QoS such that the entities are now incompatible.
- The matched DataReader has been deleted.

This status may reflect changes from multiple match or unmatch events, and the **dds::core::status::PublicationMatchedStatus::current_count_change** (p. 1992) can be used to determine the number of changes since the listener was called back or the status was checked.

8.266.2 Member Function Documentation

8.266.2.1 total_count()

```
int32_t dds::core::status::PublicationMatchedStatus::total_count ( ) const  [inline]
```

The total cumulative number of times that this **dds::pub::DataWriter** (p. 1138) discovered a "match" with a **dds::sub::DataReader** (p. 976).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **dds::core::status::PublicationMatchedStatus** (p. 1990).

8.266.2.2 total_count_change()

```
int32_t dds::core::status::PublicationMatchedStatus::total_count_change ( ) const  [inline]
```

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times this DataWriter ever matched with a DataReader).

8.266.2.3 current_count()

```
int32_t dds::core::status::PublicationMatchedStatus::current_count ( ) const  [inline]
```

The current number of DataReaders with which this **dds::pub::DataWriter** (p. 1138) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **dds::core::status::PublicationMatchedStatus** (p. 1990).

8.266.2.4 current_count_change()

```
int32_t dds::core::status::PublicationMatchedStatus::current_count_change ( ) const  [inline]
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataReaders have become unmatched for one or more of the reasons described in **dds::core::status::PublicationMatchedStatus** (p. 1990).

8.266.2.5 last_subscription_handle()

```
const  dds::core::InstanceHandle dds::core::status::PublicationMatchedStatus::last_subscription_↩
handle ( ) const  [inline]
```

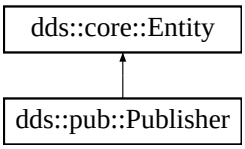
This **InstanceHandle** (p. 1612) can be used to look up which remote **dds::sub::DataReader** (p. 976) was the last to cause this DataWriter's status to change, using **dds::pub::matched_subscription_data()** (p. 650).

If the DataReader no longer matches this DataWriter due to any of the reasons in **dds::core::status::Publication↩ MatchedStatus** (p. 1990) except incompatible QoS, then the DataReader has been purged from this DataWriter's DomainParticipant discovery database. (See the "Discovery Overview" section of the User's Manual.) In that case, the **dds::pub::matched_subscription_data()** (p. 650) method will not be able to return information about the DataReader. The only way to get information about the lost DataReader is if you cached the information previously.

8.266.2.6 current_count_peak()

```
int32_t current_count_peak ( ) const
```

<<***extension***>> *(p. 354)* Greatest number of DataReaders that matched this **dds::pub::DataWriter** (p. 1138) simultaneously.



That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, total_count can be higher than current_count_peak.)

8.267 dds::pub::Publisher Class Reference

<<***reference-type***>> *(p. 351)* A publisher is the object responsible for the actual dissemination of publications.

`#include <dds/pub/Publisher.hpp>`

Inheritance diagram for dds::pub::Publisher:

Public Member Functions

- **Publisher** (const **dds::domain::DomainParticipant** &the_participant)

  *Create a **Publisher** (p. 1993).*
- **Publisher** (const **dds::domain::DomainParticipant** &the_participant, const **dds::pub::qos::PublisherQos** &the_qos, **dds::pub::PublisherListener** *the_listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())

8.267.1 Detailed Description

*<<**reference-type**>> (*p. *351)* A publisher is the object responsible for the actual dissemination of publications.

QoS:

dds::pub::qos::PublisherQos (p. 2007)

Listener:

PublisherListener (p. 2006)

A publisher acts on the behalf of one or several **dds::pub::DataWriter** (p. 1138) objects that belong to it. When it is informed of a change to the data associated with one of its **dds::pub::DataWriter** (p. 1138) objects, it decides when it is appropriate to actually send the data-update message. In making this decision, it considers any extra information that goes with the data (timestamp, writer, etc.) as well as the QoS of the **dds::pub::Publisher** (p. 1993) and the **dds::pub::DataWriter** (p. 1138).

The following operations may be called even if the **dds::pub::Publisher** (p. 1993) is not enabled. Other operations will fail with the value **dds::core::NotEnabledError** (p. 1869) if called on a disabled **dds::pub::Publisher** (p. 1993):

- **dds::core::Entity::enable** (p. 1524),
- **dds::pub::Publisher::qos(const dds::pub::qos::PublisherQos&)** (p. 1997), **dds::pub::Publisher::qos() const** (p. 1997)
- **dds::pub::Publisher::set_listener** (p. 1999), **dds::pub::Publisher::get_listener** (p. 2000),
- **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2373), **dds::core::Entity::status_changes()** (p. 1525)
- **dds::pub::DataWriter** (p. 1138) constructors, **dds::pub::DataWriter::close()** (p. 1525),
- **dds::pub::Publisher::default_datawriter_qos(const dds::pub::qos::DataWriterQos&)** (p. 1998), **dds::pub::Publisher::default_datawriter_qos()** (p. 1998), **dds::pub::Publisher::wait_for_acknowledgments** (p. 2001),

8.267.2 Constructor & Destructor Documentation

8.267.2.1 Publisher() [1/3]

```
dds::pub::Publisher::Publisher (
            const  dds::domain::DomainParticipant & the_participant )  [inline], [explicit]
```

Create a **Publisher** (p. 1993).

It uses default **qos::PublisherQos** (p. 2007) and no listener.

Parameters

the_participant	The DomainParticipant where this **Publisher** (p. 1993) will be created

8.267.2.2 Publisher() [2/3]

```
dds::pub::Publisher::Publisher (
            const  dds::domain::DomainParticipant & the_participant,
            const  dds::pub::qos::PublisherQos & the_qos,
             dds::pub::PublisherListener * the_listener = NULL,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **Publisher** (p. 1993) with the desired QoS policies and attaches to it the specified **PublisherListener** (p. 2006).

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

Precondition

The specified QoS policies must be consistent, or the operation will fail

Parameters

the_participant	The DomainParticipant where this **Publisher** (p. 1993) will be created
the_qos	The PublisherQos
the_listener	The **PublisherListener** (p. 2006)
mask	Indicates which status updates the listener will receive

Exceptions

dds::core::Error *(p. 1539)*	If there is any error creating the **Publisher** (p. 1993)

8.267.2.3 Publisher() [3/3]

```
dds::pub::Publisher::Publisher (
            const  ::dds::domain::DomainParticipant & the_participant,
            const  dds::pub::qos::PublisherQos & the_qos,
            std::shared_ptr<  Listener > the_listener,
```

```
            const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a **Publisher** (p. 1993) with the desired QoS policies and attaches to it the specified **PublisherListener** (p. 2006).

Precondition

The specified QoS policies must be consistent, or the operation will fail

Parameters

the_participant	The DomainParticipant where this **Publisher** (p. 1993) will be created
the_qos	The PublisherQos
the_listener	A shared_ptr to the listener. See **set_listener()** (p. 1999) for more information.
mask	Indicates which status updates the listener will receive

Exceptions

dds::core::Error *(p. 1539)*	If there is any error creating the **Publisher** (p. 1993)

8.267.3 Member Function Documentation

8.267.3.1 qos() [1/2]

```
const dds::pub::qos::PublisherQos dds::pub::Publisher::qos ( ) const [inline]
```

Gets the PublisherQos.

8.267.3.2 qos() [2/2]

```
void dds::pub::Publisher::qos (
            const dds::pub::qos::PublisherQos & the_qos ) [inline]
```

Set the PublisherQos.

This operation modifies the QoS of the **dds::pub::Publisher** (p. 1993).

The **dds::core::policy::GroupData** (p. 1591), **dds::core::policy::Partition** (p. 1923) and **dds::core::policy::Entity↩ Factory** (p. 1527) can be changed. The other policies are immutable.

Parameters

the_qos	<<***in***>> *(*p. *355)* **dds::pub::qos::PublisherQos** (p. 2007) to be set to. Policies must be consistent. Immutable policies cannot be changed after **dds::pub::Publisher** (p. 1993) is enabled. The special value PUBLISHER_QOS_DEFAULT can be used to indicate that the QoS of the **dds::pub::Publisher** (p. 1993) should be changed to match the current default **dds::pub::qos::PublisherQos** (p. 2007) set in the **dds::domain::DomainParticipant** (p. 1326).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::ImmutablePolicyError** (p. 1609), or **dds::core::InconsistentPolicyError** (p. 1610).

See also

dds::pub::qos::PublisherQos (p. 2007) for rules on consistency among QoS

set_qos (abstract) (p. 1522)

Operations Allowed in Listener Callbacks (p. 1639)

8.267.3.3 operator<<()

```
Publisher & dds::pub::Publisher::operator<< (
            const  dds::pub::qos::PublisherQos & the_qos )  [inline]
```

Sets the PublisherQos.

8.267.3.4 operator>>()

```
Publisher & dds::pub::Publisher::operator>> (
             dds::pub::qos::PublisherQos & the_qos )  [inline]
```

Gets the PublisherQos.

8.267.3.5 default_datawriter_qos() [1/2]

```
Publisher & dds::pub::Publisher::default_datawriter_qos (
            const  dds::pub::qos::DataWriterQos & dwqos )  [inline]
```

Sets the default DataWriterQos.

8.267.3.6 default_datawriter_qos() [2/2]

```
dds::pub::qos::DataWriterQos dds::pub::Publisher::default_datawriter_qos ( ) const  [inline]
```

Gets the default DataWriterQos.

The retrieved DataWriterQos will match the set of values specified on the last call to **default_datawriter_qos(const dds::pub::qos::DataWriterQos&)** (p. 1998). If the application never called that function, the default value comes from the **dds::domain::DomainParticipant** (p. 1326).

8.267.3.7 listener() [1/2]

```
void dds::pub::Publisher::listener (
             Listener * plistener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the **Publisher** (p. 1993) listener.

[DEPRECATED] The use of **set_listener()** (p. 1999) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

set_listener (abstract) (p. 1523)

Parameters

plistener	the topic listener
event_mask	Changes of communication status to be invoked on the listener

8.267.3.8 listener() [2/2]

```
Listener * dds::pub::Publisher::listener ( ) const  [inline]
```

Returns the listener currently associated with this **Publisher** (p. 1993).

[DEPRECATED] Use get_listener instead of this function.

If there's no listener it returns NULL.

8.267.3.9 set_listener() [1/2]

```
void dds::pub::Publisher::set_listener (
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener associated with this publisher.

The **Publisher** (p. 1993) will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this **Publisher** (p. 1993) is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the **Publisher** (p. 1993). If it does, the application needs to manually reset the listener or manually close this **Publisher** (p. 1993) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.
event_mask	A mask that indicates which status updates will be notified to the listener

8.267.3.10 set_listener() [2/2]

```
void dds::pub::Publisher::set_listener (
            std::shared_ptr<  Listener > the_listener )  [inline]
```

Sets the listener associated with this publisher.

If `the_listener` is not `nullptr`, this overload is equivalent to:

```
publisher.set_listener(the_listener,
dds::core::status::StatusMask::all());
```

If `the_listener` is `nullptr`, it is equivalent to:

```
publisher.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.

8.267.3.11 get_listener()

```
std::shared_ptr< Listener > dds::pub::Publisher::get_listener ( ) const [inline]
```

Returns the listener currently associated with this **Publisher** (p. 1993).

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.267.3.12 wait_for_acknowledgments()

```
void dds::pub::Publisher::wait_for_acknowledgments (
            const dds::core::Duration & max_wait ) [inline]
```

Blocks the calling thread until all data written by this **Publisher** (p. 1993)'s reliable DataWriters is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable DataWriters entities is acknowledged by (a) all reliable **dds::sub::DataReader** (p. 976) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged; a timeout indicates that max_wait elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to this operation on a **dds::pub::Publisher** (p. 1993) and a different thread writes new samples on any of the reliable DataWriters that belong to this **Publisher** (p. 1993), the new samples must be acknowledged before unblocking the thread that is waiting on this operation.

If none of the **dds::pub::DataWriter** (p. 1138) instances have **dds::core::policy::Reliability** (p. 2149) kind set to RELIABLE, the operation will complete successfully.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869), **dds::core::TimeoutError** (p. 2473)

8.267.3.13 participant()

```
const dds::domain::DomainParticipant & dds::pub::Publisher::participant ( ) const [inline]
```

Gets the DomainParticipant to which this **Publisher** (p. 1993) belongs.

8.267.3.14 wait_for_asynchronous_publishing()

```
void wait_for_asynchronous_publishing (
            const  dds::core::Duration & max_wait )
```

<<***extension***>> *(p. 354)* Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **dds::pub::DataWriter** (p. 1138) entities is sent and acknowledged (if reliable) by all matched **dds::sub::DataReader** (p. 976) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; if it times out, this indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **dds::sub::DataReader** (p. 976) is complete in addition to what **dds::pub::Publisher::wait_for_acknowledgments** (p. 2001) provides.

If none of the **dds::pub::DataWriter** (p. 1138) instances have **rti::core::policy::PublishMode::kind** (p. 2016) set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019), the operation will complete immediately .

Parameters

max_wait	<<***in***>> *(p. 355)* Specifies maximum time to wait for acknowledgements **dds::core::Duration** (p. 1448).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869), **dds::core::TimeoutError** (p. 2473)

8.267.3.15 close_contained_entities()

```
void close_contained_entities ( )
```

<<***extension***>> *(p. 354)* Closes all the entities created from this **Publisher** (p. 1993)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Calling this function explicitly is not necessary to close a **Publisher** (p. 1993).

Deletes all contained **dds::pub::DataWriter** (p. 1138) objects. Once **dds::pub::Publisher::close_contained_entities** (p. 2002) completes successfully, the application may delete the **dds::pub::Publisher** (p. 1993), knowing that it has no contained **dds::pub::DataWriter** (p. 1138) objects.

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1941) if any of the contained entities is in a state where it cannot be deleted.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::PreconditionNotMetError** (p. 1941).

8.267.4 Friends And Related Function Documentation

8.267.4.1 find_publishers() [1/2]

```
template<typename PublisherForwardIterator >
uint32_t find_publishers (
            const  dds::domain::DomainParticipant participant,
            PublisherForwardIterator begin,
            uint32_t max_size )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all of the **dds::pub::Publisher** (p. 1993) created from this **dds::domain::Domain↩ Participant** (p. 1326)

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

PublisherForwardIterator	A forward iterator whose value type is **dds::pub::Publisher** (p. 1993)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Publishers belong to
begin	A forward iterator to the position in the destination container to insert the found Publishers into
max_size	The maximum number of Publishers to add

Returns

The number of found Publishers

See also

Looking up DataWriters (p. 314)

8.267.4.2 find_publishers() [2/2]

```
template<typename PublisherBackInsertIterator >
uint32_t find_publishers (
             const  dds::domain::DomainParticipant participant,
             PublisherBackInsertIterator begin )  [related]
```

Retrieve all the **dds::pub::Publisher** (p. 1993) created from this **dds::domain::DomainParticipant** (p. 1326).

Template Parameters

PublisherBackInsertIterator	A back-inserting iterator whose value type is **dds::pub::Publisher** (p. 1993)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Publishers belong to
begin	A back-inserting iterator to the position in the destination container to insert the found Publishers in

Returns

The number of found Publishers

See also

Looking up DataWriters (p. 314)

8.267.4.3 find_publisher()

```
dds::pub::Publisher find_publisher (
             const  dds::domain::DomainParticipant participant,
             const std::string & publisher_name )  [related]
```

<<***extension***>> *(p. 354)* Looks up a **dds::pub::Publisher** (p. 1993) by its entity name within the **dds::domain::DomainParticipant** (p. 1326).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::Publisher** (p. 1993) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves a **dds::pub::Publisher** (p. 1993) within the **dds::domain::DomainParticipant** (p. 1326) given the entity's name. If there are several **dds::pub::Publisher** (p. 1993) with the same name within the **dds::domain::DomainParticipant** (p. 1326), this function returns the first matching occurrence.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) to look for the **dds::pub::Publisher** (p. 1993) in.
publisher_name	Entity name of the **Publisher** (p. 1993)

Returns

The first **Publisher** (p. 1993) found with the specified name or **dds::core::null** (p. 438) if it is not found.

See also

Looking up DataWriters (p. 314)

8.267.4.4 implicit_publisher()

```
dds::pub::Publisher implicit_publisher (
            const  dds::domain::DomainParticipant & dp )  [related]
```

<<***extension***>> *(p. 354)* Get the implicit **dds::pub::Publisher** (p. 1993) for a given **dds::domain::Domain↩ Participant** (p. 1326).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

If an implicit **Publisher** (p. 1993) does not already exist, this creates one.

The implicit **Publisher** (p. 1993) is created with default **dds::pub::qos::PublisherQos** (p. 2007) and no listener. When a DomainParticipant is deleted, if there are no attached **dds::pub::DataWriter** (p. 1138) that belong to the implicit **Publisher** (p. 1993), the implicit **Publisher** (p. 1993) will be implicitly deleted.

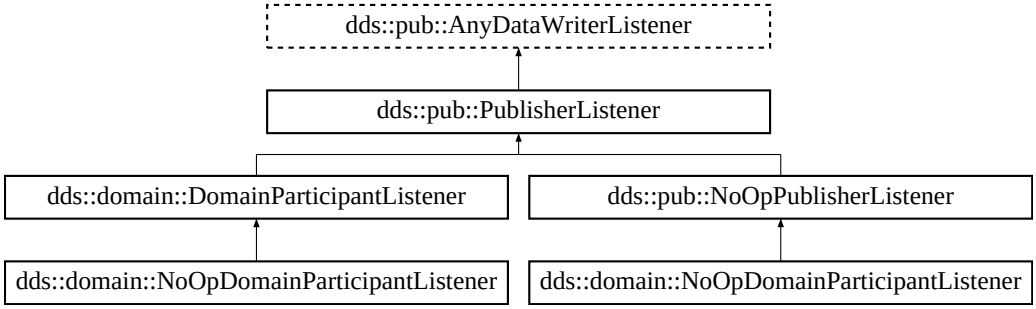
MT Safety:

UNSAFE. It is not safe to create an implicit **Publisher** (p. 1993) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_publisher_qos** (p. 1342).

Parameters

dp	The DomainParticipant that the implicit publisher belongs to

Returns



The implicit publisher

8.268 dds::pub::PublisherListener Class Reference

The listener to notify status changes for a **dds::pub::Publisher** (p. 1993).

`#include <dds/pub/PublisherListener.hpp>`

Inheritance diagram for dds::pub::PublisherListener:

Additional Inherited Members

8.268.1 Detailed Description

The listener to notify status changes for a **dds::pub::Publisher** (p. 1993).

A **PublisherListener** (p. 2006) contains exactly the same methods as a **AnyDataWriterListener** (p. 821), since it can receive status changes from any of its contained DataWriters.

Entity:

dds::pub::Publisher (p. 1993)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2383), **dds::core::status::LivelinessLostStatus** (p. 1655);
dds::core::status::StatusMask::offered_deadline_missed() (p. 2379), **dds::core::status::OfferedDeadlineMissedStatus** (p. 1871);
dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::OfferedIncompatibleQosStatus** (p. 1873);
dds::core::status::StatusMask::publication_matched() (p. 2384), **dds::core::status::PublicationMatchedStatus** (p. 1990);
dds::core::status::StatusMask::reliable_reader_activity_changed() (p. 2385), **rti::core::status::ReliableReaderActivityChangedStatus** (p. 2157);
dds::core::status::StatusMask::reliable_writer_cache_changed() (p. 2385), **rti::core::status::ReliableWriterCacheChangedStatus** (p. 2159)

8.269.1 Detailed Description

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::pub::Publisher** (p. 1993) supports

8.269.2 PublisherQos Policies

A **PublisherQos** (p. 2007) contains the following policies:

- **dds::core::policy::Presentation** (p. 1942),
- **dds::core::policy::Partition** (p. 1923),
- **dds::core::policy::GroupData** (p. 1591),
- **dds::core::policy::EntityFactory** (p. 1527),
- **rti::core::policy::AsynchronousPublisher** (p. 832),
- **rti::core::policy::EntityName** (p. 1530)

To get or set policies use the **policy()** (p. 2009) getters and setters or operator << (see **examples** (p. 603)).

You must set certain members in a consistent manner:

length of **dds::core::policy::GroupData::value** (p. 1593) <= **rti::core::policy::DomainParticipantResourceLimits**↩ **::publisher_group_data_max_length** (p. 1415)

length of **dds::core::policy::Partition::name** (p. 1926) <= **rti::core::policy::DomainParticipantResourceLimits**↩ **::max_partitions** (p. 1417)

combined number of characters (including terminating 0) in **dds::core::policy::Partition::name** (p. 1926) <= **rti**↩ **::core::policy::DomainParticipantResourceLimits::max_partition_cumulative_characters** (p. 1417)

If any of the above are not true, **dds::pub::Publisher::qos(const dds::pub::qos::PublisherQos&)** (p. 1997) and dds↩ ::pub::Publisher::set_qos_with_profile will fail with **dds::core::InconsistentPolicyError** (p. 1610) and the **dds::pub::**↩ **Publisher** (p. 1993) constructors will fail with **dds::core::Error** (p. 1539)

Qos Use Cases (p. 602)

8.269.3 Member Function Documentation

8.269.3.1 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::pub::qos::PublisherQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

Policy	One of the **PublisherQos Policies** (p. 2008)

See also

Setting Qos Values (p. 603)

8.269.3.2 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::pub::qos::PublisherQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

Policy	One of the **PublisherQos Policies** (p. 2008)

See also

Setting Qos Values (p. 603)

8.269.3.3 policy() [3/3]

```
template<typename Policy >
PublisherQos & dds::pub::qos::PublisherQos::policy (
            const Policy & p )  [inline]
```

Sets a policy.

See also

policy() (p. 2009)

Setting Qos Values (p. 603)

8.269.3.4 operator<<()

```
template<typename Policy >
PublisherQos & dds::pub::qos::PublisherQos::operator<< (
            const Policy & p )  [inline]
```

Sets a policy.

policy() (p. 2009)

Setting Qos Values (p. 603)

8.269.3.5 operator>>()

```
template<typename Policy >
const  PublisherQos & dds::pub::qos::PublisherQos::operator>> (
            Policy & p ) const  [inline]
```

Copies the values of a policy.

Parameters

p	The destination where to copy the current value of the Policy

See also

policy() (p. 2009)

Setting Qos Values (p. 603)

8.269.4 Friends And Related Function Documentation

8.269.4.1 swap()

```
void swap (
            PublisherQosImpl & left,
            PublisherQosImpl & right )  [related]
```

Swap the contents of two **PublisherQos** (p. 2007) objects.

Parameters

left	A **PublisherQos** (p. 2007)
right	The other **PublisherQos** (p. 2007)

8.269.4.2 to_string() [1/3]

```
std::string to_string (
            const  PublisherQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 2007)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
PublisherQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for PublisherQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
PublisherQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.269.4.3 to_string() [2/3]

```
std::string to_string (
            const  PublisherQos & qos,
            const  PublisherQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(*p. *354)* Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 2007)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.269.4.4 to_string() [3/3]

```
std::string to_string (
            const  PublisherQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(*p. *354)* Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 2007)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
`to_string(qos, rti::core::qos_print_all);`

Returns

The string representation of the qos

8.269.4.5 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::pub::qos::PublisherQos & qos )  [related]
```

<<***extension***>> *(*p. *354)* Prints a **dds::pub::qos::PublisherQos** (p. 2007) to an output stream.

8.270 rti::core::policy::PublishMode Class Reference

<<***extension***>> *(*p. *116)* Specifies whether a **dds::pub::DataWriter** (p. 1138) sends data synchronously or asynchronously.

`#include <rti/core/policy/CorePolicy.hpp>`

Public Member Functions

- **PublishMode** ()

  *Creates a **PublishMode** (*p. *2013) qos policy of synchronous kind.*
- **PublishMode** & **kind** (const **rti::core::policy::PublishModeKind** the_kind)

  Sets the publish mode (synchronous or asynchronous) for a DataWriter.
- **rti::core::policy::PublishModeKind kind** () const

  Gets the publish mode.
- std::string **flow_controller_name** () const

  Gets the flow controller name.
- **PublishMode** & **flow_controller_name** (const std::string &name)

  Sets the flow controller name associated with a DataWriter.
- int32_t **priority** () const

  Sets the priority of all samples written by a DataWriter.
- **PublishMode** & **priority** (int32_t value)

  Gets the priority.

Static Public Member Functions

- static **PublishMode Synchronous** ()

  *Creates a **PublishMode** (*p. *2013) qos policy of synchronous kind.*
- static **PublishMode Asynchronous** ()

  *Creates a **PublishMode** (*p. *2013) qos policy of asynchronous kind with default flow controller and undefined priority.*
- static **PublishMode Asynchronous** (const std::string & **flow_controller_name**)

  *Creates a **PublishMode** (*p. *2013) qos policy of asynchronous kind with a specific flow controller and undefined priority.*
- static **PublishMode Asynchronous** (const std::string & **flow_controller_name**, int32_t **priority**)

  *Creates a **PublishMode** (*p. *2013) qos policy of asynchronous kind with specific flow controller and priority.*

8.270.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies whether a **dds::pub::DataWriter** (p. 1138) sends data synchronously or asynchronously.

The publishing mode of a **dds::pub::DataWriter** (p. 1138) determines whether data is written synchronously in the context of the user thread when calling **dds::pub::DataWriter::write()** (p. 1148) or asynchronously in the context of a separate thread internal to the middleware.

Each **dds::pub::Publisher** (p. 1993) spawns a single asynchronous publishing thread (**rti::core::policy::AsynchronousPublisher::thread** (p. 835)) to serve all its asynchronous **dds::pub::DataWriter** (p. 1138) instances.

See also

rti::core::policy::AsynchronousPublisher (p. 832)

dds::core::policy::History (p. 1602)

rti::pub::FlowController (p. 1572)

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.270.2 Usage

The fastest way for RTI Connext to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead.

When data is written asynchronously, a **rti::pub::FlowController** (p. 1572), identified by `flow_controller_name`, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a **dds::pub::DataWriter** (p. 1138). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The **dds::pub::DataWriter::write()** (p. 1148) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.

- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.

- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding **rti::pub::FlowController** (p. 1572)). The number of samples that will be queued is determined by the **dds::core::policy::History** (p. 1602). When using **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607), only the most recent **dds::core::policy::History::depth** (p. 1605) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

8.270.3 Constructor & Destructor Documentation

8.270.3.1 PublishMode()

```
rti::core::policy::PublishMode::PublishMode ( )
```

Creates a **PublishMode** (p. 2013) qos policy of synchronous kind.

8.270.4 Member Function Documentation

8.270.4.1 Synchronous()

```
static PublishMode rti::core::policy::PublishMode::Synchronous ( ) [static]
```

Creates a **PublishMode** (p. 2013) qos policy of synchronous kind.

8.270.4.2 Asynchronous() [1/3]

```
static PublishMode rti::core::policy::PublishMode::Asynchronous ( ) [static]
```

Creates a **PublishMode** (p. 2013) qos policy of asynchronous kind with default flow controller and undefined priority.

8.270.4.3 Asynchronous() [2/3]

```
static PublishMode rti::core::policy::PublishMode::Asynchronous (
            const std::string & flow_controller_name ) [static]
```

Creates a **PublishMode** (p. 2013) qos policy of asynchronous kind with a specific flow controller and undefined priority.

8.270.4.4 Asynchronous() [3/3]

```
static PublishMode rti::core::policy::PublishMode::Asynchronous (
            const std::string & flow_controller_name,
            int32_t priority ) [static]
```

Creates a **PublishMode** (p. 2013) qos policy of asynchronous kind with specific flow controller and priority.

8.270.4.5 kind() [1/2]

```
PublishMode & rti::core::policy::PublishMode::kind (
            const rti::core::policy::PublishModeKind the_kind )
```

Sets the publish mode (synchronous or asynchronous) for a DataWriter.

[default] rti::core::policy::PublishModeKind_def::SYNCHRONOUS (p. 2019)

Categories

Immutable (p. 243), **Flow Control** (p. 188)

8.270.4.6 kind() [2/2]

```
rti::core::policy::PublishModeKind rti::core::policy::PublishMode::kind ( ) const
```

Gets the publish mode.

8.270.4.7 flow_controller_name() [1/2]

```
std::string rti::core::policy::PublishMode::flow_controller_name ( ) const
```

Gets the flow controller name.

8.270.4.8 flow_controller_name() [2/2]

```
PublishMode & rti::core::policy::PublishMode::flow_controller_name (
            const std::string & name )
```

Sets the flow controller name associated with a DataWriter.

The following builitin values are supported:

- **rti::pub::FlowController::DEFAULT_NAME** (p. 58)
- **rti::pub::FlowController::FIXED_RATE_NAME** (p. 59)
- **rti::pub::FlowController::ON_DEMAND_NAME** (p. 60)

See also

rti::pub::FlowController::FlowController(dds::domain::DomainParticipant,const std::string&,const FlowControllerProperty&) (p. 1573)

[default] rti::pub::FlowController::DEFAULT_NAME (p. 58)

Categories

Immutable (p. 243), **Flow Control** (p. 188)

8.270.4.9 priority() [1/2]

```
int32_t rti::core::policy::PublishMode::priority ( ) const
```

Sets the priority of all samples written by a DataWriter.

A positive integer value designating the relative priority of the **dds::pub::DataWriter** (p. 1138), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019)) with **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) set to FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST.

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than PUBLICATION_PRIORITY_UNDEFINED, then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is PUBLICATION_PRIORITY_UNDEFINED, then the channel will inherit the publication priority of the DataWriter.

If the publicaton priority of the DataWriter, and of any channel of a multi-channel DataWriter, are PUBLICATION_↩ PRIORITY_UNDEFINED, then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is PUBLICATION_PRIORITY_AUTOMATIC, then the DataWriter will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **rti::pub::WriteParams** (p. 2642) of the **dds::pub::Data↩ Writer::write(const T&,rti::pub::WriteParams&)** (p. 1179) function.

For dispose and unregister samples, use the **rti::pub::WriteParams** (p. 2642) of **dds::pub::DataWriter::dispose↩ _instance(rti::pub::WriteParams&)** (p. 1173) and **dds::pub::DataWriter::unregister_instance(rti::pub::Write↩ Params&)** (p. 1173).

[default] PUBLICATION_PRIORITY_UNDEFINED

[range] [-1, MAX_INT]

Categories

Immutable (p. 243), **Flow Control** (p. 188)

8.270.4.10 priority() [2/2]

```
PublishMode & rti::core::policy::PublishMode::priority (
            int32_t value )
```

Gets the priority.

8.271 rti::core::policy::PublishModeKind_def Struct Reference

<<***extension***>> *(p. 354)* The enumeration for **PublishMode** (p. 2013) kinds

`#include <PolicyKind.hpp>`

Public Types

- enum **type** {
  SYNCHRONOUS ,
  ASYNCHRONOUS }

  The underlying `enum` type.

8.271.1 Detailed Description

<<***extension***>> *(p. 354)* The enumeration for **PublishMode** (p. 2013) kinds

8.271.2 Member Enumeration Documentation

8.271.2.1 type

enum **rti::core::policy::PublishModeKind_def::type**

The underlying enum type.

Enumerator

SYNCHRONOUS	Indicates to send data synchronously. If **rti::core::policy::DataWriterProtocol::push_on_write** (p. 1213) is true, data is sent immediately in the context of **dds::pub::DataWriter::write()** (p. 1148). As data is sent immediately in the context of the user thread, no flow control is applied. **See also** **rti::core::policy::DataWriterProtocol::push_on_write** (p. 1213) **[default]** for **dds::pub::DataWriter** (p. 1138)
ASYNCHRONOUS	Indicates to send data asynchronously. Configures the **dds::pub::DataWriter** (p. 1138) to delegate the task of data transmission to a separate publishing thread. The **dds::pub::DataWriter::write()** (p. 1148) call does not send the data, but instead schedules the data to be sent later by its associated **dds::pub::Publisher** (p. 1993). Each **dds::pub::Publisher** (p. 1993) uses its dedicated publishing thread (**rti::core::policy::AsynchronousPublisher** (p. 832)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated **rti::pub::FlowController** (p. 1572) determines when the publishing thread is allowed to send the data. **dds::pub::DataWriter::wait_for_asynchronous_publishing** (p. 1174) and **dds::pub::Publisher::wait_for_asynchronous_publishing** (p. 2001) enable you to determine when the data has actually been sent. **See also** **rti::pub::FlowController** (p. 1572) **dds::core::policy::History** (p. 1602) **dds::pub::DataWriter::wait_for_asynchronous_publishing** (p. 1174) **dds::pub::Publisher::wait_for_asynchronous_publishing** (p. 2001) **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789)

8.272 rti::core::qos_print_all_t Struct Reference

A tag type that selects the to_string overload that prints all the values of a Qos object.

#include <types.hpp>

8.272.1 Detailed Description

A tag type that selects the to_string overload that prints all the values of a Qos object.

The only value of this type is **rti::core::qos_print_all** (p. 439), and is used only as a sentinel to select one of the to_string overloads.

For example:

auto s = to_string(my_reader_qos, ..., rti::core::qos_print_all);

See rti::sub::qos::to_string(...).

See also

rti::sub::qos::to_string

8.273 dds::core::policy::QosPolicyCount Class Reference

<<***value-type***>> *(*p. *350)* Holds a counter for a QosPolicyId

`#include <dds/core/policy/QosPolicyCount.hpp>`

Public Member Functions

- **QosPolicyCount** (**QosPolicyId** the_policy_id, int32_t the_count)
  Creates an instance with the policy ID and its counter.
- **QosPolicyId policy_id** () const
  Gets the policy ID.
- int32_t **count** () const
  Gets the counter.

8.273.1 Detailed Description

<<***value-type***>> *(*p. *350)* Holds a counter for a QosPolicyId

8.273.2 Constructor & Destructor Documentation

8.273.2.1 QosPolicyCount()

```
dds::core::policy::QosPolicyCount::QosPolicyCount (
              QosPolicyId the_policy_id,
             int32_t the_count )  [inline]
```

Creates an instance with the policy ID and its counter.

8.273.3 Member Function Documentation

8.273.3.1 policy_id()

```
QosPolicyId dds::core::policy::QosPolicyCount::policy_id ( ) const  [inline]
```

Gets the policy ID.

8.273.3.2 count()

```
int32_t dds::core::policy::QosPolicyCount::count ( ) const  [inline]
```

Gets the counter.

8.274 rti::core::QosPrintFormat Class Reference

<<***extension***>> (p. 354) <<***value-type***>> (p. 350) A collection of attributes used to configure how QoS will be formatted when converted to strings.

```
#include <rti/core/QosPrintFormat.hpp>
```

Public Member Functions

- **QosPrintFormat** ()
  Initializes the properties with the default values.
- **QosPrintFormat** (unsigned int indent_in, bool print_private_in, bool is_standalone_in)
  Initializes the properties.
- unsigned int **indent** () const
  Get the value of indent.
- **QosPrintFormat** & **indent** (unsigned int value)
  Set the amount of additional indent to be included when converting a QoS to a string.
- bool **print_private** () const
  Get the value of print_private.
- **QosPrintFormat** & **print_private** (bool value)
  Set whether or not to print private Qos fields.
- bool **is_standalone** () const
  Get the value of is_standalone.
- **QosPrintFormat** & **is_standalone** (bool value)
  Set whether or not to print the XML preamble.

8.274.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A collection of attributes used to configure how QoS will be formatted when converted to strings.

8.274.2 Constructor & Destructor Documentation

8.274.2.1 QosPrintFormat() [1/2]

```
rti::core::QosPrintFormat::QosPrintFormat ( )  [inline]
```

Initializes the properties with the default values.

8.274.2.2 QosPrintFormat() [2/2]

```
rti::core::QosPrintFormat::QosPrintFormat (
             unsigned int indent_in,
             bool print_private_in,
             bool is_standalone_in )  [inline]
```

Initializes the properties.

8.274.3 Member Function Documentation

8.274.3.1 indent() [1/2]

```
unsigned int rti::core::QosPrintFormat::indent ( ) const  [inline]
```

Get the value of indent.

See also

indent(unsigned int value) (p. 2022)

8.274.3.2 indent() [2/2]

```
QosPrintFormat & rti::core::QosPrintFormat::indent (
            unsigned int value )  [inline]
```

Set the amount of additional indent to be included when converting a QoS to a string.

Configures how much additional indent is applied when converting a QoS to a string. This value acts as a total offset on the string, increasing the indent which is applied to all elements by the same amount. With indent set to 0, a string representation of a QoS may appear as:

```
<datareader_qos>
    <durability>
        <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
    </durability>
</datareader_qos>
```

Setting the indent property to 1, the same QoS would be printed as:

```
    <datareader_qos>
        <durability>
            <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
        </durability>
    </datareader_qos>
```

I.e., the entire structure is indented.

[default] 0

Parameters

value	The value to set for indent

8.274.3.3 print_private() [1/2]

```
bool rti::core::QosPrintFormat::print_private ( ) const  [inline]
```

Get the value of print_private.

See also

print_private(bool value) (p. 2023)

8.274.3.4 print_private() [2/2]

```
QosPrintFormat & rti::core::QosPrintFormat::print_private (
            bool value )  [inline]
```

Set whether or not to print private Qos fields.

There are some QoS policies which are not intended for external use. By default, these QoS policies are only printed if they are different to the default value for that policy. When true, private policies are treated like any other policy, and printed if they are different to the supplied base QoS. These private policies cannot be parsed from XML, and are always printed as XML comments.

[default] false

Parameters

value	The value to set for print_private.

8.274.3.5 is_standalone() [1/2]

```
bool rti::core::QosPrintFormat::is_standalone ( ) const  [inline]
```

Get the value of is_standalone.

See also

print_private(bool value) (p. 2023)

8.274.3.6 is_standalone() [2/2]

```
QosPrintFormat & rti::core::QosPrintFormat::is_standalone (
            bool value )  [inline]
```

Set whether or not to print the XML preamble.

The default value for this property (false) results in QoS being printed starting from the <ENTITY_qos> tag (where the <ENTITY_qos> tag is, e.g., <domain_participant_qos>, or, <datareader_qos>. This result cannot be directly parsed as valid XML (as it lacks <dds>, <qos_library>, and <qos_profile> tags). If is_standalone is set to true, these additional tags are printed, resulting in valid, parseable XML.

For example, with is_standalone set to false, a Qos may appear as:

```
<datareader_qos>
    <durability>
        <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
    </durability>
</datareader_qos>
```

Setting is_standalone to true would result in the same Qos being printed as:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <qos_library name="QosLibrary">
        <qos_profile name="QosProfile">
            <datareader_qos>
                <durability>
                    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
                </durability>
            </datareader_qos>
        </qos_profile>
    </qos_library>
</dds>
```

[default] false

Parameters

value	The value to set for is_standalone.

8.275 dds::core::QosProvider Class Reference

*<<**reference-type**>> (p. 351)* The **QosProvider** (p. 2025) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connext

```
#include <dds/core/QosProvider.hpp>
```

Public Member Functions

- **QosProvider** (const std::string &uri, const std::string &profile)

  *Create a **QosProvider** (p. 2025) fetching QoS configuration from the specified URI.*

8.275.1 Detailed Description

<<***reference-type***>> *(p. 351)* The **QosProvider** (p. 2025) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connext

A **QosProvider** (p. 2025) is created with a URI that identifies a resource from where to load the definition of:

- QoS profiles
- Type definitions
- Full XML-defined DDS systems

The URI can be:

- An XML file
- A string representation of an XML document `str://"..."`
- A group of several files and strings (see `URL Groups` in the User's Manual)

The following example loads a file named "`MyProfiles.xml`" in the current directory. Then it retrieves the `DataReaderQos` from a `<qos_profile>` named "`MyProfile`" under a `<qos_library>` named "`My↩Library`" to create a `DataReader`:

```
dds::core::QosProvider my_qos_provider("MyProfiles.xml");
dds::sub::DataReader<Foo> my_reader(
        my_subscriber,
        my_topic,
        my_qos_provider.datareader_qos("MyLibrary::MyProfile"));
```

To load type definitions, see **QosProvider::type()** (p. 2044).

To create a `DomainParticipant` and its contained entities, see **QosProvider::create_participant_from_config()** (p. 2046).

8.275.2 Selecting a QoS profile

The profile name argument is optional:

```
auto reader_qos = my_qos_provider.datareader_qos();
```

When omitted, the **QosProvider** (p. 2025) looks for a profile as follows (in order of precedence):

- The profile set with **default_profile()** (p. 2041)
- The profile set in the constructor (an optional argument)
- The <qos_profile> identified as the default profile with the attribute is_default_qos=true
- If none of the above methods have been used, a QoS object with the documented default values is returned

A **QosProvider** (p. 2025) can be used in combination with functions such as **dds::pub::Publisher::default_datawriter_qos()** (p. 1998) or **dds::sub::Subscriber::default_datareader_qos()** (p. 2417) to set the profile that entities are created with by default:

```
subscriber.default_datareader_qos(
        my_qos_provider.datareader_qos("MyLibrary::MyProfile"));
// reader created with the QoS in the profile "MyLibrary::MyProfile"
dds::sub::DataReader<Foo> reader(subscriber, topic);
```

More information about QoS Profiles can be found in the QoS Profiles section, in the User's Manual.

8.275.3 The Default QosProvider

A special **QosProvider** (p. 2025), **QosProvider::Default()** (p. 2036) is always available to obtain the QoS profiles from the default locations, such as the file USER_QOS_PROFILES.xml in the current directory. For example, the following code obtains the default DataReaderQos:

```
dds::sub::qos::DataReaderQos default_reader_qos =
        dds::core::QosProvider::Default().datareader_qos();
```

This section in the User's Manual explains which profiles are automatically loaded by the default **QosProvider** (p. 2025).

The profiles that **QosProvider::Default()** (p. 2036) loads can be configured with **rti::core::default_qos_provider_params()** (p. 710).

QosProvider::Default() (p. 2036) also determines the default values for <participant_factory_qos>, which can be used to configure logging.

8.275.4 Built-in QoS Profiles

Any **QosProvider** (p. 2025), including the default **QosProvider** (p. 2025), has access to the **Builtin Qos Profiles** (p. 462) For example, to obtain the DataWriterQos from the "strict reliable" built-in profile:

```
auto strict_reliable_writer_qos =
    dds::core::QosProvider::Default().datawriter_qos(
        rti::core::builtin_profiles::qos_lib::generic_strict_reliable());
```

8.275.5 Specifying a Topic Filter

XML QoS definitions can specify a `topic_filter` attribute. Several functions (such as **datareader_qos_w_topic_name()** (p. 2039)) receive a `topic_name` argument. When these functions look for the QoS, they will try to match the `topic_name` against the `topic_filter`s, if they are used. See the `Topic Filters section` in the User's Manual.

See also

For more examples, see **Qos Provider Use Cases** (p. 604)

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.275.6 Constructor & Destructor Documentation

8.275.6.1 QosProvider() [1/2]

```
dds::core::QosProvider::QosProvider (
            const std::string & uri,
            const std::string & profile )  [inline]
```

Create a **QosProvider** (p. 2025) fetching QoS configuration from the specified URI.

For instance, the following code:

```
dds::core::QosProvider xml_file_provider(
    "file:///somewhere/on/disk/qos-config.xml", "MyLibrary::MyProfile");
```

will create a **QosProvider** (p. 2025) which loads all of the QoS profiles from qos-config.xml and uses "MyLibrary::MyProfile" as the default profile when the profile argument to the **QosProvider** (p. 2025) getters is omitted, as described in **Selecting a QoS profile** (p. 2029).

Parameters

uri	The URI describing the location of the QoS profiles to load.
profile	The QoS profile to set as the default, overriding any is_default_qos tag in the loaded XML file.

8.275.6.2 QosProvider() [2/2]

```
dds::core::QosProvider::QosProvider (
            const std::string & uri )  [inline], [explicit]
```

Create a **QosProvider** (p. 2025) fetching QoS configuration from the specified URI.

For instance, the following code:
```
QosProvider xml_file_provider("file:///somewhere/on/disk/qos-config.xml");
```

will create a **QosProvider** (p. 2025) which loads all of the QoS profiles from qos-config.xml. When the profile argument to the **QosProvider** (p. 2025) getters is omitted, the default profile is determined as described in **Selecting a QoS profile** (p. 2029).

Parameters

uri	The URI describing the location of the QoS profiles to load. If no is_default_qos tag is found in the QoS profiles, then no profile will be set as default. Instead, the **QosProvider** (p. 2025) will be associated with the DDS default QoS values until a default profile is set using the default_library and default_profile methods.

8.275.7 Member Function Documentation

8.275.7.1 participant_qos() [1/2]

```
const dds::domain::qos::DomainParticipantQos dds::core::QosProvider::participant_qos ( ) [inline]
```

Get the **dds::domain::qos::DomainParticipantQos** (p. 1384) in the default profile.

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Returns

The DomainParticipantQos

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.275.7.2 participant_qos() [2/2]

```
const dds::domain::qos::DomainParticipantQos dds::core::QosProvider::participant_qos (
        const std::string & profile ) [inline]
```

Get the DomainParticipantQos from a QoS profile.

Parameters

profile	The profile from which to get the DomainParticipantQos, for example "MyLibrary::MyProfile"

Returns

The DomainParticipantQos that is located in the specified profile

8.275.7.3 topic_qos() [1/2]

```
const dds::topic::qos::TopicQos dds::core::QosProvider::topic_qos ( ) [inline]
```

Get the **dds::topic::qos::TopicQos** (p. 2509) in the default profile.

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Returns

The TopicQos

8.275.7.4 topic_qos() [2/2]

```
const dds::topic::qos::TopicQos dds::core::QosProvider::topic_qos (
            const std::string & profile ) [inline]
```

Get the **dds::topic::qos::TopicQos** (p. 2509) from a QoS profile.

Parameters

profile	The profile from which to get the TopicQos, for example "MyLibrary::MyProfile"

Returns

The TopicQos that is located in the specified profile

8.275.7.5 subscriber_qos() [1/2]

```
const dds::sub::qos::SubscriberQos dds::core::QosProvider::subscriber_qos ( ) [inline]
```

Get the **dds::sub::qos::SubscriberQos** (p. 2423) in the default profile.

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Returns

The SubscriberQos

8.275.7.6 subscriber_qos() [2/2]

```
const dds::sub::qos::SubscriberQos dds::core::QosProvider::subscriber_qos (
            const std::string & profile ) [inline]
```

Get the **dds::sub::qos::SubscriberQos** (p. 2423) from a QoS profile.

Parameters

profile	The profile from which to get the SubscriberQos, for example "MyLibrary::MyProfile"

Returns

The SubscriberQos that is located in the specified profile

8.275.7.7 datareader_qos() [1/2]

```
const dds::sub::qos::DataReaderQos dds::core::QosProvider::datareader_qos ( ) [inline]
```

Get the **dds::sub::qos::DataReaderQos** (p. 1072) in the default profile.

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datareader_qos_↩w_topic_name()** (p. 2039).

Returns

The DataReaderQos

Examples

Foo_subscriber.cxx.

8.275.7.8 datareader_qos() [2/2]

```
const dds::sub::qos::DataReaderQos dds::core::QosProvider::datareader_qos (
        const std::string & profile ) [inline]
```

Get the **dds::sub::qos::DataReaderQos** (p. 1072) from a QoS profile.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datareader_qos_↩w_topic_name()** (p. 2039).

Parameters

profile	The profile from which to get the DataReaderQos, for example "`MyLibrary::MyProfile`"

Returns

The DataReaderQos that is located in the specified profile

8.275.7.9 publisher_qos() [1/2]

```
const dds::pub::qos::PublisherQos dds::core::QosProvider::publisher_qos ( ) [inline]
```

Get the **dds::pub::qos::PublisherQos** (p. 2007) in the default profile.

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Returns

The PublisherQos

8.275.7.10 publisher_qos() [2/2]

```
dds::pub::qos::PublisherQos dds::core::QosProvider::publisher_qos (
        const std::string & profile ) [inline]
```

Get the **dds::pub::qos::PublisherQos** (p. 2007) from a QoS profile.

Parameters

profile	The profile from which to get the PublisherQos, for example "`MyLibrary::MyProfile`"

Returns

The PublisherQos that is located in the specified profile

8.275.7.11 datawriter_qos() [1/2]

```
const dds::pub::qos::DataWriterQos dds::core::QosProvider::datawriter_qos ( ) [inline]
```

Get the **dds::pub::qos::DataWriterQos** (p. 1226) from the default profile.

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datawriter_qos_w↩ _topic_name()** (p. 2040).

Returns

The DataWriterQos

Examples

Foo_publisher.cxx.

8.275.7.12 datawriter_qos() [2/2]

```
const dds::pub::qos::DataWriterQos dds::core::QosProvider::datawriter_qos (
        const std::string & profile ) [inline]
```

Get the **dds::pub::qos::DataWriterQos** (p. 1226) from a QoS profile.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datawriter_qos_w↩ _topic_name()** (p. 2040).

Parameters

profile	The profile from which to get the DataWriterQos, for example "`MyLibrary::MyProfile`"

Returns

The DataWriterQos that is located in the specified profile

8.275.7.13 Default()

```
static QosProvider dds::core::QosProvider::Default ( ) [inline], [static]
```

Get the default **QosProvider** (p. 2025).

The default **QosProvider** (p. 2025) automatically loads XML QoS, types and application profiles from several predetermined locations, such as the file USER_QOS_PROFILES.xml in the current working directory.

Returns

The Default **QosProvider** (p. 2025)

MT Safety:

Unsafe. On VxWorks, none of the following is safe until the first **dds::domain::DomainParticipant** (p. 1326) has been created or **dds::core::QosProvider::Default()** (p. 2036) has been obtained for the first time:

- creating several **dds::domain::DomainParticipant** (p. 1326) in parallel;
- calling **dds::core::QosProvider::Default()** (p. 2036) from two or more threads in parallel;
- creating a **dds::domain::DomainParticipant** (p. 1326) and calling **dds::core::QosProvider::Default()** (p. 2036) in parallel.

See also

The Default QosProvider (p. 2029)

Default QoS (p. 1522)

Default QosProvider Use Cases (p. 605)

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.275.7.14 reset_default()

```
static void dds::core::QosProvider::reset_default ( ) [inline], [static]
```

Reset the default settings of the default **QosProvider** (p. 2025).

If you change the default library or profile associated with the default **QosProvider** (p. 2025), calling reset_default will set the library and profile back to the default values.

8.275.7.15 default_provider_params() [1/2]

```
static  rti::core::QosProviderParams default_provider_params ( )  [static]
```

<<***extension***>> *(p. 354)* (deprecated) Get the **rti::core::QosProviderParams** (p. 2049) for the default **QosProvider** (p. 2025)

[DEPRECATED] Use **rti::core::default_qos_provider_params()** (p. 710)

Returns

rti::core::QosProviderParams (p. 2049)

8.275.7.16 default_provider_params() [2/2]

```
static void default_provider_params (
            const  rti::core::QosProviderParams & params )  [static]
```

<<***extension***>> *(p. 354)* (deprecated) Set the **rti::core::QosProviderParams** (p. 2049) for the default **QosProvider** (p. 2025)

[DEPRECATED] Use **rti::core::default_qos_provider_params()** (p. 710)

Parameters

params	The QosProviderParams to set

8.275.7.17 participant_factory_qos() [1/2]

```
dds::domain::qos::DomainParticipantFactoryQos participant_factory_qos ( ) const
```

<<***extension***>> *(p. 354)* Get the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378) in the default profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

See **Selecting a QoS profile** (p. 2029) for information on how the default profile is chosen.

Returns

The DomainParticipantFactoryQos

8.275.7.18 participant_factory_qos() [2/2]

```
dds::domain::qos::DomainParticipantFactoryQos participant_factory_qos (
            const std::string & profile ) const
```

<<***extension***>> *(p. 354)* Get the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378) from a QoS profile

Parameters

profile	The profile from which to get the DomainParticipantFactoryQos, for example "`MyLibrary::MyProfile`"

Returns

The DomainParticipantFactoryQos that is located in the specified profile

8.275.7.19 topic_qos_w_topic_name() [1/2]

```
const  dds::topic::qos::TopicQos topic_qos_w_topic_name (
            const std::string & profile,
            const std::string & topic_name ) const
```

<<***extension***>> *(p. 354)* Get the **dds::topic::qos::TopicQos** (p. 2509) for a topic name in a given profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The TopicQos will be found based on the given profile name and topic name.

Parameters

profile	The profile where the **QosProvider** (p. 2025) should look for the TopicQos
topic_name	The topic name used to select a qos within the profile, if the `topic_filter` attribute is used

Returns

dds::topic::qos::TopicQos (p. 2509) The TopicQos that is located in the specified profile

8.275.7.20 topic_qos_w_topic_name() [2/2]

```
const  dds::topic::qos::TopicQos topic_qos_w_topic_name (
            const std::string & topic_name ) const
```

<<***extension***>> *(p. 354)* Get the **dds::topic::qos::TopicQos** (p. 2509) for a topic name in the default profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The TopicQos will be found based on the given topic name and must be located in the default profile (see **Selecting a QoS profile** (p. 2029) for information on how the default profile is determined).

Parameters

topic_name	The topic name used to select a qos within the profile, if the `topic_filter` attribute is used

Returns

dds::topic::qos::TopicQos (p. 2509) The TopicQos that is located in the specified profile

8.275.7.21 datareader_qos_w_topic_name() [1/2]

```
const dds::sub::qos::DataReaderQos datareader_qos_w_topic_name (
            const std::string & profile,
            const std::string & topic_name ) const
```

<<***extension***>> *(p. 354)* Get the **dds::sub::qos::DataReaderQos** (p. 1072) for a topic name in a given profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The DataReaderQos will be found based on the given profile name and topic name.

Parameters

profile	The profile where the **QosProvider** (p. 2025) should look for the DataReaderQos
topic_name	The topic name used to select a qos within the profile, if the `topic_filter` attribute is used

Returns

dds::sub::qos::DataReaderQos (p. 1072) The DataReaderQos that is located in the specified profile

8.275.7.22 datareader_qos_w_topic_name() [2/2]

```
const dds::sub::qos::DataReaderQos datareader_qos_w_topic_name (
            const std::string & topic_name ) const
```

<<***extension***>> *(p. 354)* Get the **dds::sub::qos::DataReaderQos** (p. 1072) for a topic name in the default profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The DataReaderQos will be found based on the given topic name and must be located in the default profile (see **Selecting a QoS profile** (p. 2029) for information on how the default profile can is determined).

Parameters

topic_name	The topic name used to select a qos within the profile, if the `topic_filter` attribute is used

Returns

dds::sub::qos::DataReaderQos (p. 1072) The DataReaderQos that is located in the specified profile

8.275.7.23 datawriter_qos_w_topic_name() [1/2]

```
const  dds::pub::qos::DataWriterQos datawriter_qos_w_topic_name (
             const std::string & profile,
             const std::string & topic_name ) const
```

<<***extension***>> *(p. 354)* Get the **dds::pub::qos::DataWriterQos** (p. 1226) for a topic name.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The DataWriterQos will be found based on the given profile name and topic name.

Parameters

profile	The profile where the **QosProvider** (p. 2025) should look for the DataWriterQos
topic_name	The topic name used to select a qos within the profile, if the `topic_filter` attribute is used

Returns
