dds::pub::qos::DataWriterQos (p. 1226) The DataWriterQos that is located in the specified profile

8.275.7.24 datawriter_qos_w_topic_name() [2/2]

```
const  dds::pub::qos::DataWriterQos datawriter_qos_w_topic_name (
             const std::string & topic_name ) const
```

<<***extension***>> *(p. 354)* Get the **dds::pub::qos::DataWriterQos** (p. 1226) for a topic name.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The DataWriterQos will be found based on the given topic name and must be located in the current default profile associated with the **QosProvider** (p. 2025).

Parameters

topic_name	The topic name used to select a qos within the profile, if the `topic_filter` attribute is used

Returns

dds::pub::qos::DataWriterQos (p. 1226) The DataWriterQos that is located in the specified profile

8.275.7.25 default_library() [1/2]

```
void default_library (
            const std::string & library_name )
```

<<***extension***>> *(p. 354)* Set the default library for this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

After a default library is set, the functions that expect a `profile` argument don't need the library name prefix. For example:

```
auto reader_qos = qos_provider.datareader_qos("MyLibrary::MyProfile");
// This has the same effect:
qos_provider.extensions().default_library("MyLibrary");
reader_qos = qos_provider.datareader_qos("MyProfile");
```

Parameters

library_name	The library to set as the default, or `rti::core::USE_DDS_DEFAULT_QOS_PROFILE` to unset the default library and use the system default.

8.275.7.26 default_profile() [1/2]

```
void default_profile (
            const std::string & profile_name )
```

<<***extension***>> *(p. 354)* Set the default profile for this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

When a default profile is set, the getters that don't receive a profile argument retrieve the QoS object from this profile (see **Selecting a QoS profile** (p. 2029)).

The profile must be located in the current default library unless the library is also specified in the name.

Parameters

profile_name	The profile to set as the default in the form `"MyLibrary::MyProfile"`, or if the **default_library()** (p. 2041) is also set, `"MyProfile"`. The special value `rti::core::USE_DDS_DEFAULT_QOS_PROFILE` unsets a previously set default profile.

8.275.7.27 default_library() [2/2]

```
rti::core::optional_value< std::string > default_library ( ) const
```

<<***extension***>> *(p. 354)* Get the default library associated with this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

There may not be a default library set. The default library is the library that is checked in when setting the default profile if no library name is explicitly given. The default library is configurable.

Returns

rti::core::optional_value<std::string> The default library.

8.275.7.28 default_profile() [2/2]

```
rti::core::optional_value< std::string > default_profile ( ) const
```

<<***extension***>> *(p. 354)* Get the default profile associated with this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

There may not be a default profile set.

Returns

rti::core::optional_value<std::string> The default profile.

8.275.7.29 default_profile_library()

```
rti::core::optional_value< std::string > default_profile_library ( ) const
```

<<***extension***>> *(*p. *354)* Get the default profile library associated with this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

There may not be a default profile library set. The default profile library is the library in which the default profile resides and is not necessarily the same library as the one returned from **default_library()** (p. 2041). The default profile library is not configurable.

Returns

rti::core::optional_value<std::string> The default profile library.

8.275.7.30 qos_profile_libraries()

```
dds::core::StringSeq qos_profile_libraries ( ) const
```

<<***extension***>> *(*p. *354)* Get a list of the QoS profile libraries loaded by this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Returns

dds::core::StringSeq (p. 436) A list of the currently loaded QoS profile libraries.

8.275.7.31 qos_profiles()

```
dds::core::StringSeq qos_profiles (
            const std::string & library_name ) const
```

<<***extension***>> *(*p. *354)* Get a list of the QoS profiles located in the default library of this **QosProvider** (p. 2025).

Returns

dds::core::StringSeq (p. 436) A list of profiles.

8.275.7.32 profiles_loaded()

```
bool profiles_loaded ( ) const
```

<<***extension***>> *(p. 354)* Check if the profiles are loaded by this **QosProvider** (p. 2025)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Returns

bool false if the profiles are not loaded, true otherwise.

8.275.7.33 type()

```
const  dds::core::xtypes::DynamicType & type (
             const std::string & type_name ) const
```

<<***extension***>> *(p. 354)* Load a type

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Parameters

type_name	The name of the type

This function loads a type from its XML definition under the tags <dds><types>.

See also

Example (p. 610).

8.275.7.34 provider_params() [1/2]

```
rti::core::QosProviderParams provider_params ( ) const
```

<<***extension***>> *(p. 354)* Get the **QosProvider** (p. 2025) params for this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Returns

rti::core::QosProviderParams (p. 2049) The QosProviderParams for this **QosProvider** (p. 2025).

8.275.7.35 provider_params() [2/2]

```
void provider_params (
            const  rti::core::QosProviderParams & provider_params )
```

<<***extension***>> *(p. 354)* Set the **rti::core::QosProviderParams** (p. 2049) for this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Parameters

provider_params	The QosProviderParams to set.

8.275.7.36 load_profiles()

```
void load_profiles ( )
```

<<***extension***>> *(p. 354)* Load the XML QoS profiles.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The XML QoS profiles are loaded implicitly after the first **dds::domain::DomainParticipant** (p. 1326) is created or explicitly, after a call to this function. This method has the same effect as **reload_profiles()** (p. 2045).

8.275.7.37 reload_profiles()

```
void reload_profiles ( )
```

<<***extension***>> *(p. 354)* Reload the XML QoS profiles.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The XML QoS profiles are loaded implicitly after the first DomainParticipant is created or explicitly, after a call to this function. This method has the same effect as **load_profiles()** (p. 2045).

8.275.7.38 unload_profiles()

```
void unload_profiles ( )
```

<<***extension***>> *(p. 354)* Unload the XML QoS profiles.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The resources associated with the XML QoS profiles are freed. Any reference to the profiles after calling this function will fail with an **Exception** (p. 1546).

8.275.7.39 create_participant_from_config()

```
dds::domain::DomainParticipant create_participant_from_config (
            const std::string & config_name,
            const  rti::domain::DomainParticipantConfigParams & params =  rti::domain::Domain↩
ParticipantConfigParams() )
```

<<***extension***>> *(p. 354)* Creates a **dds::domain::DomainParticipant** (p. 1326) given its configuration name from a description provided in an XML configuration file that has been loaded by this **QosProvider** (p. 2025).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This operation creates a **dds::domain::DomainParticipant** (p. 1326) registering all the necessary data types and creating all the contained entities (**dds::topic::Topic** (p. 2474), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::pub::DataWriter** (p. 1138), **dds::sub::DataReader** (p. 976)) from a description given in an XML configuration file.

The configuration name is the fully qualified name of the XML participant object, consisting of the name of the participant library plus the name of participant configuration.

For example the name "MyParticipantLibrary::PublicationParticipant" can be used to create the domain participant from the description in an XML file with contents shown in the snippet below:

```
<participant_library name="MyParticipantLibrary">

    <domain_participant name="PublicationParticipant" domain_ref="MyDomainLibrary::HelloWorldDomain">

        <publisher name="MyPublisher">

            <data_writer name="HelloWorldWriter" topic_ref="HelloWorldTopic"/>

        </publisher>

    </domain_participant>

</participant_library>
```

The entities belonging to the newly created **dds::domain::DomainParticipant** (p. 1326) can be retrieved with the help of lookup operations such as: **rti::sub::find_datareader_by_name** (p. 762).

MT Safety:

UNSAFE. On VxWorks, when enabling the RTI Security Plugins, it is not safe for multiple threads to attempt to create a **dds::domain::DomainParticipant** (p. 1326) when there are no other DomainParticipants in the Domain↩ ParticipantFactory.

See also

rti::domain::find_participant_by_name (p. 731)

dds::topic::find() (p. 694)

rti::pub::find_publisher (p. 744)

rti::sub::find_subscriber (p. 758)

rti::sub::find_datareader_by_name (p. 762)

rti::pub::find_datawriter_by_name (p. 748)

rti::pub::find_datawriter_by_name (p. 748)

rti::sub::find_datareader_by_name (p. 762)

Parameters

config_name	Name of the participant configuration in the XML file.
params	input parameters that allow changing some properties of the configuration referred to by `config_name`. Specifically, `params` allows overriding the domain ID, participant name, and entities QoS specified in the XML configuration.

XML Application Creation (p. 342)

8.275.8 Friends And Related Function Documentation

8.275.8.1 USE_DDS_DEFAULT_QOS_PROFILE

```
const char* USE_DDS_DEFAULT_QOS_PROFILE  [related]
```

Special value to select the default QoS profile.

8.275.8.2 create_qos_provider_ex()

```
dds::core::detail::QosProvider create_qos_provider_ex (
            const  rti::core::QosProviderParams & params )  [related]
```

<<***extension***>> *(p. 354)* Creates a **QosProvider** (p. 2025) with parameters

Note

This is a standalone function in the namespace **rti::core** (p. 701)

A **dds::core::QosProvider** (p. 2025) is usually created with one of its constructors, but this extension function allows configuring certain parameters. By default a **QosProvider** (p. 2025) loads the profiles from certain standard locations; this function allows, for example, disabling that behavior.

8.275.8.3 default_qos_provider_params() [1/2]

```
QosProviderParams default_qos_provider_params ( )  [related]
```

<<***extension***>> *(p. 354)* Get the **rti::core::QosProviderParams** (p. 2049) for the default **QosProvider** (p. 2025)

Note

This is a standalone function in the namespace **rti::core** (p. 701)

Returns

rti::core::QosProviderParams (p. 2049)

8.275.8.4 default_qos_provider_params() [2/2]

```
void default_qos_provider_params (
            const  rti::core::QosProviderParams & params )  [related]
```

<<***extension***>> *(p. 354)* Set the **rti::core::QosProviderParams** (p. 2049) for the default **QosProvider** (p. 2025)

Note

This is a standalone function in the namespace **rti::core** (p. 701)

Use this function to configure the profiles that **dds::core::QosProvider::Default()** (p. 2036) loads.

```
rti::core::QosProviderParams params;
params.url_profile({"my_profiles.xml"});
rti::core::default_qos_provider_params(params);
auto participant_qos =
    dds::core::QosProvider::Default().participant_qos("my_library::my_profile");
```

Parameters

params	The QosProviderParams to set

8.276 rti::core::QosProviderParams Class Reference

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 2025).

`#include <rti/core/QosProviderParams.hpp>`

Public Member Functions

- **QosProviderParams** & **ignore_environment_profile** (bool the_ignore_environment_profile)

  *Choose whether or not to ignore the **NDDS_QOS_PROFILES** (p. 304).*
- bool **ignore_resource_profile** () const

  Get the value that is currently set for ignore_resource_profile.
- **QosProviderParams** & **ignore_resource_profile** (bool the_ignore_resource_profile)

  Choose whether or not to ignore NDDS_QOS_PROFILES.xml.

8.276.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 2025).

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Connext in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Connext, and the locations specified by an environment variable.

You may disable any or all of these default locations using the Profile QoS policy.

Note: This class is equivalent to DDS_ProfileQosPolicy the other RTI Connext language APIs.

8.276.2 Constructor & Destructor Documentation

8.276.2.1 QosProviderParams()

```
rti::core::QosProviderParams::QosProviderParams ( )  [inline]
```

Create a **QosProviderParams** (p. 2049) with default settings.

8.276.3 Member Function Documentation

8.276.3.1 string_profile() [1/2]

```
const  dds::core::StringSeq rti::core::QosProviderParams::string_profile ( ) const
```

Get the current list of string profiles stored by this **QosProviderParams** (p. 2049).

Returns

dds::core::StringSeq (p. 436) The list of string profiles.

8.276.3.2 string_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::string_profile (
            const  dds::core::StringSeq & the_string_profile )
```

Set the current list of string profiles stored by this **QosProviderParams** (p. 2049).

Parameters

the_string_profile	A sequence of strings containing an XML document to load. The concatenation of the strings in this sequence must be a valid XML document according to the XML QoS profile schema.

[default] An empty list

8.276.3.3 url_profile() [1/2]

```
const  dds::core::StringSeq rti::core::QosProviderParams::url_profile ( ) const
```

Get the current list of **URL groups** (p. 304) stored by this **QosProviderParams** (p. 2049).

Returns

dds::core::StringSeq (p. 436) The list of string profiles.

8.276.3.4 url_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::url_profile (
            const  dds::core::StringSeq & the_url_profile )
```

Set the current list of **URL groups** (p. 304) stored by this **QosProviderParams** (p. 2049).

Parameters

the_url_profile	Sequence of **URL groups** (p. 304) containing a set of XML documents to load. Only one of the elements of each group will be loaded by RTI Connext, starting from the left.

[default] An empty list

8.276.3.5 ignore_user_profile() [1/2]

```
bool rti::core::QosProviderParams::ignore_user_profile ( ) const
```

Get the value that is currently set for ignore_user_profile.

Returns

bool Whether or not the **dds::core::QosProvider** (p. 2025) set with these **QosProviderParams** (p. 2049) will ignore the USER_QOS_PROFILES.xml.

8.276.3.6 ignore_user_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::ignore_user_profile (
            bool the_ignore_user_profile )
```

Choose whether or not to ignore USER_QOS_PROFILES.xml.

When this field is set to true, the QoS profiles contained in the file USER_QOS_PROFILES.xml in the current working directory will not be loaded.

Parameters

the_ignore_user_profile	Whether or not to ignore the USER_QOS_PROFILES.xml in the current working directory.

Returns

QosProviderParams (p. 2049)& This **QosProviderParams** (p. 2049)

[default] false

8.276.3.7 ignore_environment_profile() [1/2]

```
bool rti::core::QosProviderParams::ignore_environment_profile ( ) const
```

Get the value that is currently set for ignore_environment_profile.

Returns

bool Whether or not the **dds::core::QosProvider** (p. 2025) set with these **QosProviderParams** (p. 2049) will ignore the **NDDS_QOS_PROFILES** (p. 304).

8.276.3.8 ignore_environment_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::ignore_environment_profile (
            bool the_ignore_environment_profile )
```

Choose whether or not to ignore the **NDDS_QOS_PROFILES** (p. 304).

When this field is set to true, the QoS profiles pointed to by the **NDDS_QOS_PROFILES** (p. 304) will not be loaded.

Parameters

the_ignore_environment_profile	Whether or not to ignore **NDDS_QOS_PROFILES** (p. 304).

Returns

QosProviderParams (p. 2049)& This **QosProviderParams** (p. 2049)

[default] false

8.276.3.9 ignore_resource_profile() [1/2]

```
bool rti::core::QosProviderParams::ignore_resource_profile ( ) const
```

Get the value that is currently set for ignore_resource_profile.

Returns

bool Whether or not the **dds::core::QosProvider** (p. 2025) set with these **QosProviderParams** (p. 2049) will ignore NDDS_QOS_PROFILES.xml.

8.276.3.10 ignore_resource_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::ignore_resource_profile (
            bool the_ignore_resource_profile )
```

Choose whether or not to ignore NDDS_QOS_PROFILES.xml.

When this field is set to true, the QoS profiles contained in the file NDDS_QOS_PROFILES.xml in $↩ NDDSHOME/resource/qos_profiles_../xml will not be loaded.

Parameters

the_ignore_resource_profile	Whether or not to ignore the NDDS_QOS_PROFILES.xml.

Returns

QosProviderParams (p. 2049)& This **QosProviderParams** (p. 2049)

[default] false

8.277 dds::sub::Query Class Reference

<<***value-type***>> *(p. 350)* Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 2059).

```
#include <dds/sub/Query.hpp>
```

Public Member Functions

- template<typename T >
  Query (const **dds::sub::DataReader**< T > &reader, const std::string &query_expression)

  Creates a query.

- template<typename T , typename FWIterator >
  Query (const **dds::sub::DataReader**< T > &reader, const std::string &query_expression, const FWIterator &params_begin, const FWIterator &params_end)

  Creates a query with the expression parameters in an iterator range.
- template<typename T >
  Query (const **dds::sub::DataReader**< T > &reader, const std::string &query_expression, const std::vector< std::string > &params)

  Creates a query with the expression parameters in a vector.
- const std::string & **expression** () const

  Gets the expression.
- const_iterator **begin** () const

  Provides the begin iterator to the parameter list.
- const_iterator **end** () const

  Provides the end iterator to the parameter list.
- iterator **begin** ()

  Provides the begin iterator to the parameter list.
- iterator **end** ()

  Provides the end iterator to the parameter list.
- template<typename FWIterator >
  void **parameters** (const FWIterator &the_begin, const FWIterator the_end)

  Sets the parameters for the expression.
- void **add_parameter** (const std::string &param)

  Appends a parameter.
- size_t **parameters_length** () const

  Gets the number of parameters.
- const std::vector< std::string > & **parameters** () const

  <<***extension***>> *(*p. *354) Gets the parameters*
- std::string **name** () const

  <<***extension***>> *(*p. *354) Gets the filter name*
- **dds::sub::Query** & **name** (const std::string &the_name)

  <<***extension***>> *(*p. *354) Sets a filter name*
- const **AnyDataReader** & **data_reader** () const

  *Gets the related **DataReader** (*p. *976).*

8.277.1 Detailed Description

<<***value-type***>> *(*p. *350)* Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 2059).

A query contains the **DataReader** (p. 976) to query data from, an expression and optionally a list of parameters.

Queries and Filters Syntax (p. 84) defines the syntax of the expression and the parameters.

See also

Filtering with Query Conditions (p. 332)

8.277.2 Constructor & Destructor Documentation

8.277.2.1 Query() [1/3]

```
template<typename T >
dds::sub::Query::Query (
            const  dds::sub::DataReader< T > & reader,
            const std::string & query_expression )  [inline]
```

Creates a query.

Template Parameters

T	The topic-type of the **DataReader** (p. 976)

Parameters

reader	**DataReader** (p. 976) to query data from
query_expression	Expression describing the query

8.277.2.2 Query() [2/3]

```
template<typename T , typename FWIterator >
dds::sub::Query::Query (
            const  dds::sub::DataReader< T > & reader,
            const std::string & query_expression,
            const FWIterator & params_begin,
            const FWIterator & params_end )  [inline]
```

Creates a query with the expression parameters in an iterator range.

Template Parameters

T	The topic-type of the **DataReader** (p. 976)
FWIterator	A forward iterator whose value type is std::string (or convertible to std::string)

Parameters

reader	**DataReader** (p. 976) to query data from
query_expression	Expression describing the query
params_begin	The beginning of a range of parameters for the query expression

Parameters

params_end	The end of the range

8.277.2.3 Query() [3/3]

```
template<typename T >
dds::sub::Query::Query (
             const  dds::sub::DataReader< T > & reader,
             const std::string & query_expression,
             const std::vector< std::string > & params )  [inline]
```

Creates a query with the expression parameters in a vector.

Template Parameters

T	The topic-type of the **DataReader** (p. 976)

Parameters

reader	**DataReader** (p. 976) to query data from
query_expression	Expression describing the query
params	The parameters for the query expression

8.277.3 Member Function Documentation

8.277.3.1 expression()

```
const std::string & dds::sub::Query::expression ( ) const  [inline]
```

Gets the expression.

8.277.3.2 begin() [1/2]

```
const_iterator dds::sub::Query::begin ( ) const  [inline]
```

Provides the begin iterator to the parameter list.

Returns

A random-access iterator whose value type is std::string

8.277.3.3 end() [1/2]

```
const_iterator dds::sub::Query::end ( ) const  [inline]
```

Provides the end iterator to the parameter list.

Returns

A random-access iterator whose value type is std::string

8.277.3.4 begin() [2/2]

```
iterator dds::sub::Query::begin ( )  [inline]
```

Provides the begin iterator to the parameter list.

Returns

A random-access iterator whose value type is std::string

8.277.3.5 end() [2/2]

```
iterator dds::sub::Query::end ( )  [inline]
```

Provides the end iterator to the parameter list.

Returns

A random-access iterator whose value type is std::string

8.277.3.6 parameters() [1/2]

```
template<typename FWIterator >
void dds::sub::Query::parameters (
            const FWIterator & the_begin,
            const FWIterator the_end )  [inline]
```

Sets the parameters for the expression.

Template Parameters

FWIterator	A forward iterator whose value type is std::string (or convertible to std::string)

Parameters

the_begin	The beginning of a range of parameters for the query expression
the_end	The end of the range

8.277.3.7 add_parameter()

```
void dds::sub::Query::add_parameter (
            const std::string & param )  [inline]
```

Appends a parameter.

8.277.3.8 parameters_length()

```
size_t dds::sub::Query::parameters_length ( ) const  [inline]
```

Gets the number of parameters.

8.277.3.9 parameters() [2/2]

```
const std::vector< std::string > & dds::sub::Query::parameters ( ) const
```

<<***extension***>> *(*p. *354)* Gets the parameters

8.277.3.10 name() [1/2]

```
std::string dds::sub::Query::name ( ) const
```

<<***extension***>> *(*p. *354)* Gets the filter name

Returns

The name of the filter, or an empty string when using the default SQL filter.

8.277.3.11 name() [2/2]

```
dds::sub::Query & dds::sub::Query::name (
            const std::string & the_name )
```

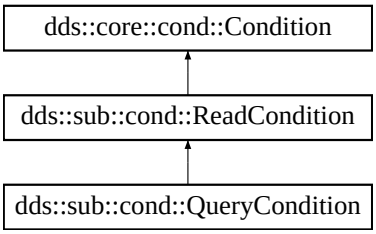
<<***extension***>> *(p. 354)* Sets a filter name

You can use one of the built-in filters (**rti::topic::sql_filter_name** (p. 49) and **rti::topic::stringmatch_filter_name** (p. 49)), or a custom filter, which you need to register using **dds::domain::DomainParticipant::register_contentfilter()** (p. 1349).

[default] Empty string (equivalent to **rti::topic::sql_filter_name** (p. 49))

8.277.3.12 data_reader()

```
const AnyDataReader & dds::sub::Query::data_reader ( ) const [inline]
```



Gets the related **DataReader** (p. 976).

8.278 dds::sub::cond::QueryCondition Class Reference

<<***reference-type***>> *(p. 351)* Specialized **ReadCondition** (p. 2133) that allows applications to also specify a filter on the data available in a **dds::sub::DataReader** (p. 976)

```
#include <dds/sub/cond/QueryCondition.hpp>
```

Inheritance diagram for dds::sub::cond::QueryCondition:

8.278.1 Detailed Description

<<***reference-type***>> *(p. 351)* Specialized **ReadCondition** (p. 2133) that allows applications to also specify a filter on the data available in a **dds::sub::DataReader** (p. 976)

Each query condition filter is composed of a **dds::sub::cond::ReadCondition** (p. 2133) state filter and a content filter expressed as a `query_expression` and `query_parameters`.

The query (`query_expression`) is similar to an SQL WHERE clause and can be parameterised by arguments that are dynamically changeable by the set_query_parameters() operation.

Two query conditions that have the same `query_expression` will require unique query condition content filters if their `query_paramters` differ. **Query** (p. 2053) conditions that differ only in their state masks will share the same query condition content filter.

Queries and Filters Syntax (p. 84) describes the syntax of `query_expression` and `query_parameters`.

8.279.1 Detailed Description

template<typename T>
class rti::queuing::QueueConsumer< T >

Allows you to receive samples from a SharedReaderQueue.

A **QueueConsumer** (p. 2063) is an entity that allows you to receive samples from a SharedReaderQueue hosted by Queuing Service. A **QueueConsumer** (p. 2063) has one underlying **dds::sub::DataReader** (p. 976) to communicate with a SharedReaderQueue.

Valid types for the topic of the DataReader (T) are those generated by rtiddsgen, the **DDS built-in types** (p. 50), and **dds::core::xtypes::DynamicData** (p. 1461).

To receive samples from a SharedReaderQueue, a **QueueConsumer** (p. 2063) must set its topic name (see Queue↩ ConsumerParams::queue_topic_name) equal to the SharedReaderQueue topic name (set with the XML tag <topic_↩ name> under <shared_reader_queue>).

In addition, the **QueueConsumer** (p. 2063) must set its SharedSubscriber name (QueueConsumerParams::shared_↩ subscriber_name) equal to the name of the SharedSubscriber hosting the SharedReaderQuueue.

The **QueueConsumer** (p. 2063) and the SharedReaderQueue must also be in the same DDS domain (that is, they must have the same domain ID).

A **QueueConsumer** (p. 2063) has an associated **dds::domain::DomainParticipant** (p. 1326), which can be shared with other QueueConsumers or RTI Connext routines. All the other DDS entities required for queuing interaction, including the **dds::sub::DataReader** (p. 976) to receive samples, are automatically created when the **QueueConsumer** (p. 2063) is constructed.

Quality of Service (QoS) for the underlying DataReader is configurable (see **QueueConsumerParams::qos_profile** (p. 2079) and QueueConsumerParams::datareader_qos).

If no QoS is specified in the **QueueConsumerParams** (p. 2077), the default DataReaderQos will be used.

A **QueueConsumer** (p. 2063) must always be reliable in order to match and communicate with the SharedReader↩ Queue. In addition, it shall use application acknowledgement to notify Queuing Service that a sample has been consumed successfully. Hence, whichever DataReaderQos is selected, the following QoS settings are always overriden:

- **dds::core::policy::Reliability::kind** (p. 2153) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
- **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) is set to **rti::core::policy::Acknowledgment↩ Kind_def::APPLICATION_EXPLICIT** (p. 798).
- **rti::core::policy::DataReaderResourceLimits::max_app_ack_response_length** (p. 1101) is set to 1.

The underlying DataReader is created with an internal **dds::sub::DataReaderListener** (p. 1055), which is required to provide the behavior of a **QueueConsumer** (p. 2063), including notification of events via **QueueConsumerListener** (p. 2075). For this reason, when accessing the underlying DataReader, the listener should not be set, removed or modified; otherwise the behavior of the **QueueConsumer** (p. 2063) will be incorrect and unpredictable.

Optionally, a **QueueConsumer** (p. 2063) can be configured to create an availability channel (QueueConsumerParams↩ ::enable_availability). This channel is used to report the **QueueConsumer** (p. 2063)'s availability to the SharedReader↩ Queue from which the **QueueConsumer** (p. 2063) receives samples. Queuing Service uses the reported availability to distribute samples to the **QueueConsumer** (p. 2063).

If the availability channel is enabled for the **QueueConsumer** (p. 2063), a **dds::pub::DataWriter** (p. 1138) is created to send availability samples to the SharedReaderQueue.

You can configure the DataWriterQos used by the availability DataWriter by using **QueueConsumerParams::qos_↩ profile** (p. 2079).

Whichever DataWriterQos is selected, the following QoS settings are always overriden:

- **dds::core::policy::Reliability::kind** (p. 2153) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
- **dds::core::policy::Durability::kind** (p. 1437) is set to **dds::core::policy::DurabilityKind_def::TRANSIENT_↩ LOCAL** (p. 1442).
- **dds::core::policy::History::kind** (p. 1604) is set to **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607).

Template Parameters

T	The data type for the SharedReaderQueue topic

See also

QueueConsumer (p. 2063)

QueueConsumerListener (p. 2075)

8.279.2 Constructor & Destructor Documentation

8.279.2.1 QueueConsumer() [1/2]

```
template<typename T >
rti::queuing::QueueConsumer< T >::QueueConsumer (
             const  QueueConsumerParams & params,
             bool is_enabled = true,
              Listener * consumer_listener = NULL,
```

```
            const  rti::core::Guid & consumer_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a queue consumer.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

8.279.2.2 QueueConsumer() [2/2]

```
template<typename T >
rti::queuing::QueueConsumer< T >::QueueConsumer (
            const  QueueConsumerParams & params,
            bool is_enabled,
            std::shared_ptr<  Listener > consumer_listener,
            const  rti::core::Guid & consumer_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a **QueueConsumer** (p. 2063) with parameters.

Parameters

params	All the parameters that configure this **QueueConsumer** (p. 2063)
is_enabled	Specifies if the **QueueConsumer** (p. 2063) is created ready to receive notifications in its listener and receive data. If you choose to bind the **QueueConsumer** (p. 2063) to a **QueueConsumerListener** (p. 2075) using an **rti::core::ListenerBinder** (p. 1641) you should create the **QueueConsumer** (p. 2063) disabled to avoid missing listener notifications. You can later enable the disabled **QueueConsumer** (p. 2063) using **QueueConsumer::enable** (p. 2069).
consumer_listener	A shared_ptr to a **QueueConsumerListener** (p. 2075) object to receive event notifications.
consumer_guid	A GUID identifier for the consumer. When consumer_guid is set to **rti::core::Guid::unknown()** (p. 1597) the Guid identifier is generated automatically. You can retrieve the generated **QueueConsumer** (p. 2063) Guid using the **QueueConsumer::guid** (p. 2070) method. To restart a **QueueConsumer** (p. 2063) just create a new one with its same GUID.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

QueueConsumerParams (p. 2077)

8.279.3 Member Function Documentation

8.279.3.1 listener() [1/2]

```
template<typename T >
void  rti::queuing::QueueConsumer< T >::listener (
              Listener * the_listener,
             const  dds::core::status::StatusMask & event_mask =  dds::core::status::StatusMask↩
::none() )  [inline]
```

Sets the listener associated with this consumer.

[DEPRECATED] The use of **set_listener()** (p. 2068) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Parameters

the_listener	The **QueueConsumerListener** (p. 2075) to set
event_mask	The **dds::core::status::StatusMask** (p. 2375) associated with the listener

8.279.3.2 listener() [2/2]

```
template<typename T >
Listener *  rti::queuing::QueueConsumer< T >::listener ( ) const  [inline]
```

Returns the listener currently associated with this Consumer.

[DEPRECATED] Prefer **get_listener()** (p. 2068) instead of this function.

If there is no listener it returns NULL.

8.279.3.3 get_listener()

```
template<typename T >
std::shared_ptr<  Listener >  rti::queuing::QueueConsumer< T >::get_listener ( ) const  [inline]
```

Gets the listener.

8.279.3.4 set_listener()

```
template<typename T >
void  rti::queuing::QueueConsumer< T >::set_listener (
             std::shared_ptr<  Listener > the_listener )  [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive updates or `nullptr` to reset the current listener and stop receiving updates.

8.279.3.5 enable()

```
template<typename T >
void  rti::queuing::QueueConsumer< T >::enable ( )  [inline]
```

Enables the **QueueConsumer** (p. 2063) to receive data and listener notifications.

If you create the **QueueConsumer** (p. 2063) disabled you can enable it using this mehtod. To avoid missing listener notifciation when you use an **rti::core::ListenerBinder** (p. 1641) to bind the **QueueConsumer** (p. 2063) to a **Queue↩ ConsumerListener** (p. 2075) use **QueueConsumer::enable** (p. 2069) to enable the **QueueConsumer** (p. 2063) after it is bound to the listener.

8.279.3.6 acknowledge_sample()

```
template<typename T >
void  rti::queuing::QueueConsumer< T >::acknowledge_sample (
            const  dds::sub::SampleInfo & sample_info,
            bool is_positive_acknowledgment = true )  [inline]
```

Explicitly acknowledges a single sample.

This operation calls **dds::sub::DataReader::acknowledge_sample** (p. 1015) on the underlying DataReader.

The parameter is_positive_acknowledgment indicates whether or not the acknowledged sample was successfully processed by the application. If the sample was not processed successfully, Queuing Service will try to redeliver it to a different **QueueConsumer** (p. 2063) according to the delivery policy of the SharedReaderQueue.

Parameters

sample_info	Identifies the sample being acknowledged. The sampleInfo can be extracted from Sample::info.
is_positive_acknowledgment	Indicates whether or not the sample was succesfully processed.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.279.3.7 acknowledge_all()

```
template<typename T >
void  rti::queuing::QueueConsumer< T >::acknowledge_all (
            bool is_positive_acknowledgment = true )  [inline]
```

Acknowledge all previously accessed samples.

This is equivalent to calling **QueueConsumer::acknowledge_sample(const dds::sub::SampleInfo&, bool)** (p. 2069) for every single previously accessed sample.

Parameters

is_positive_acknowledgment	Indicates whether or not the acknowledged samples were successfully processed by the application. If the samples were not processed successfully, Queuing Service will try to redeliver them to a different **QueueConsumer** (p. 2063) according to the delivery policy of the SharedReaderQueue.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

QueueConsumer::acknowledge_sample(const dds::sub::SampleInfo&, bool) (p. 2069)

8.279.3.8 reader()

```
template<typename T >
dds::sub::DataReader< T >  rti::queuing::QueueConsumer< T >::reader ( ) const  [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 976).

Accessing the DataReader may be useful for a number of advanced use cases, such as getting DataReader protocol or cache statuses.

MT Safety:

SAFE

See also

dds::sub::DataReader (p. 976)

dds::sub::DataReader (p. 976)

dds::sub::DataReader::datareader_protocol_status (p. 1013)

8.279.3.9 guid()

```
template<typename T >
rti::core::Guid  rti::queuing::QueueConsumer< T >::guid ( ) const  [inline]
```

Returns the GUID of this **QueueConsumer** (p. 2063).

The GUID of the **QueueConsumer** (p. 2063) is determined based on the value of QueueConsumerParams::entity_↩ name and QueueConsumerParams::queue_topic_name. Note that the **QueueConsumer** (p. 2063) GUID may be equal or different than the GUID of the underlying DataReader virtual GUID.

The GUID identifies a **QueueConsumer** (p. 2063) and the samples it consumes. The underlying DataReader's content filter on the related_reader_guid is set to the **QueueConsumer** (p. 2063)'s GUID.

See also

QueueConsumerParams::entity_name

QueueProducer::guid (p. 2089)

8.279.3.10 receive_samples() [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T >  rti::queuing::QueueConsumer< T >::receive_samples (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple samples and provides a loaned container to access them.

Equivalent to using **QueueConsumer::receive_samples(int, int, const dds::core::Duration&)** (p. 2071) with `min↩ _count=1` and `max_count=`**`dds::core::LENGTH_UNLIMITED`** (p. 438).

See also

dds::sub::LoanedSamples (p. 1663)

QueueConsumer::receive_samples(int, int, const dds::core::Duration&) (p. 2071)

8.279.3.11 receive_samples() [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T >  rti::queuing::QueueConsumer< T >::receive_samples (
            int min_count,
            int max_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple samples and provides a loaned container to access them.

Equivalent to using **QueueConsumer::wait_for_samples(int, const dds::core::Duration&)** (p. 2073) and **Queue↩ Consumer::take_samples(int)** (p. 2072).

See also

dds::sub::LoanedSamples (p. 1663)

```
template<typename T >
dds::sub::LoanedSamples< T >  rti::queuing::QueueConsumer< T >::take_samples (
            int max_count )  [inline]
```

Provides a loaned container to access the existing samples.

Takes all the existing samples up to `max_count` and provides a loaned container to access them.

This operation does not make a copy of the data.

The loan is returned with **dds::sub::LoanedSamples::return_loan** (p. 1667).

This operation may be used after a call to **QueueConsumer::wait_for_samples(int, const dds::core::Duration&)** (p. 2073).

Parameters

max_count	The maximum number of samples that are taken at a time. The special value **dds::core::LENGTH_UNLIMITED** (p. 438) may be used. This value will read up to the limit specified by **rti::core::policy::DataReaderResourceLimits::max_samples_per_read** (p. 1091).

Returns

A container with up to max_count elements. May be empty if there were no replies to get.

Exceptions

One	of the **Standard Exceptions** (p. 428)

MT Safety:

SAFE

dds::sub::DataReader::take (p. 997) (for a more detailed description on how QoS and other **parameters** (p. 2063) affect the underlying DataReader)

QueueConsumer::take_samples() (p. 2071)

8.279.3.14 read_samples() [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T >  rti::queuing::QueueConsumer< T >::read_samples ( )  [inline]
```

Provides a loaned container to access the existing samples.

This operation is equivalent to **QueueConsumer::take_samples()** (p. 2071), except the samples remain in the **QueueConsumer** (p. 2063) and can be read or taken again.

8.279.3.15 read_samples() [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T >  rti::queuing::QueueConsumer< T >::read_samples (
            int max_count )  [inline]
```

Provides a loaned container to access the existing samples.

This operation is equivalent to **QueueConsumer::take_samples(int)** (p. 2072), except the samples remain in the **QueueConsumer** (p. 2063) and can be read or taken again.

8.279.3.16 wait_for_samples() [1/2]

```
template<typename T >
bool  rti::queuing::QueueConsumer< T >::wait_for_samples (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for samples.

This operation is equivalent to **QueueConsumer::wait_for_samples(int, const dds::core::Duration&)** (p. 2073) with `min_count=1`.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 2073)

8.279.3.17 wait_for_samples() [2/2]

```
template<typename T >
bool  rti::queuing::QueueConsumer< T >::wait_for_samples (
            int min_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for samples.

This operation waits for min_count samples to be available. It will wait up to max_wait .

If this operation is called several times but the available samples are not taken (with **QueueConsumer::take_samples(int)** (p. 2072)), this operation may return immediately and will not wait for new samples. New samples may replace existing ones if they are not taken, depending on the **dds::core::policy::History** (p. 1602) used to configure this **QueueConsumer** (p. 2063).

Parameters

min_count	Minimum number of samples that need to be available for this operation to unblock.
max_wait	Maximum waiting time after which this operation unblocks regardless of how many samples are available.

Returns

true if at least min_count samples were available before max_wait elapsed, or false otherwise.

MT Safety:

Concurrent calls to this operation on the same object are not allowed.

8.279.3.18 send_availability()

```
template<typename T >
void  rti::queuing::QueueConsumer< T >::send_availability (
             ConsumerAvailabilityParams parameters )  [inline]
```

Sends the **QueueConsumer** (p. 2063) availability to Queuing Service.

This method will use the availability DataWriter to send a sample to Queue Service indicating the availability status of the **QueueConsumer** (p. 2063) application.

The method throws **dds::core::PreconditionNotMetError** (p. 1941) if availability is not enabled for this **QueueConsumer** (p. 2063) using QueueConsumerParams::enable_availability.

Exceptions

One	of the **Standard Exceptions** (p. 428) ;

Parameters

parameters	Availability status

8.280 rti::queuing::QueueConsumerListener< T > Class Template Reference

Called when certain events occur in a **QueueConsumer** (p. 2063).

```
#include <rti/queuing/QueueConsumerListener.hpp>
```

Inheritance diagram for rti::queuing::QueueConsumerListener< T >:

Public Member Functions

- virtual void **on_sample_available** (**QueueConsumer**< T > &consumer)=0

  User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueConsumer**< T > &consumer, const **dds::core::status::SubscriptionMatchedStatus** &status)=0

  User callback.

8.280.1 Detailed Description

template<**typename T**>
class rti::queuing::QueueConsumerListener< **T** >

Called when certain events occur in a **QueueConsumer** (p. 2063).

A **QueueConsumer** (p. 2063) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueConsumerParams** (p. 2077).

You can use this listener to receive notification when:

- Samples are available
- There are SharedReaderQueue matching events

QueueConsumer::QueueConsumer() (p. 2066)

8.280.2 Member Function Documentation

8.280.2.1 on_sample_available()

```
template<typename T >
virtual void  rti::queuing::QueueConsumerListener< T >::on_sample_available (
              QueueConsumer< T > & consumer )  [pure virtual]
```

User callback.

This callback is invoked whenever the **QueueConsumer** (p. 2063) has received at least one sample. Any operation to get samples i.e. QueueConsumer::take_sample) can be called within this context.

See also

dds::sub::DataReaderListener::on_data_available (p. 1058)

Implemented in **rti::queuing::NoOpQueueConsumerListener< T >** (p. 1857), **rti::queuing::NoOpQueue↩ ConsumerListener< TRep >** (p. 1857), and **rti::queuing::NoOpQueueConsumerListener< TReq >** (p. 1857).

8.280.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void  rti::queuing::QueueConsumerListener< T >::on_shared_reader_queue_matched (
              QueueConsumer< T > & consumer,
             const  dds::core::status::SubscriptionMatchedStatus & status )  [pure virtual]
```

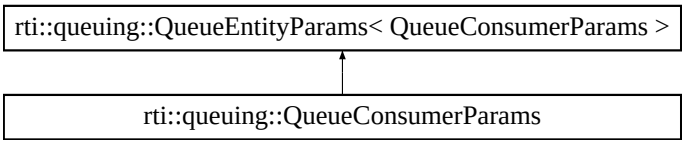
User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **Queue↩ Consumer** (p. 2063), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::SubscriptionMatchedStatus (p. 2439)

dds::sub::DataReaderListener::on_subscription_matched (p. 1058)



Implemented in **rti::queuing::NoOpQueueConsumerListener< T >** (p. 1857), **rti::queuing::NoOpQueue↩ ConsumerListener< TRep >** (p. 1857), and **rti::queuing::NoOpQueueConsumerListener< TReq >** (p. 1857).

8.281 rti::queuing::QueueConsumerParams Class Reference

Contains the parameters for creating a **QueueConsumer** (p. 2063).

`#include <rti/queuing/QueueParams.hpp>`

Inheritance diagram for rti::queuing::QueueConsumerParams:

Public Member Functions

- **QueueConsumerParams** (**dds::domain::DomainParticipant** participant)

  *Creates a **QueueConsumerParams** (p. 2077) object with the participant set.*
- **QueueConsumerParams** & **enable_availability** (bool enable)

  *Indicates whether the availability channel is enabled for a **QueueConsumer** (p. 2063).*

8.281.1 Detailed Description

Contains the parameters for creating a **QueueConsumer** (p. 2063).

8.281.2 Constructor & Destructor Documentation

8.281.2.1 QueueConsumerParams()

```
rti::queuing::QueueConsumerParams::QueueConsumerParams (
              dds::domain::DomainParticipant participant )  [inline], [explicit]
```

Creates a **QueueConsumerParams** (p. 2077) object with the participant set.

The rest of the parameters that can be set in a **QueueConsumerParams** (p. 2077) object are optional.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) a **QueueConsumer** (p. 2063) uses to join a domain.

8.281.3 Member Function Documentation

8.281.3.1 enable_availability()

```
QueueConsumerParams & rti::queuing::QueueConsumerParams::enable_availability (
            bool enable )  [inline]
```

Indicates whether the availability channel is enabled for a **QueueConsumer** (p. 2063).

When this parameter is set to true, the **QueueConsumer** (p. 2063) creates a DataWriter to report its availability to the SharedReaderQueue from which the **QueueConsumer** (p. 2063) receives samples.

The **QueueConsumer** (p. 2063) can send availability samples to the SharedReaderQueue using the method **Queue↩ Consumer::send_availability(ConsumerAvailabilityParams)** (p. 2074)

See also

QueueConsumer::send_availability(ConsumerAvailabilityParams) (p. 2074)

References **rti::util::network_capture::enable()**.

8.282 rti::queuing::QueueEntityParams< ActualEntity > Class Template Reference

A parent class for all queue parameter classes.

`#include <rti/queuing/QueueParams.hpp>`

Inherits rti::request::detail::EntityParamsWithSetters< ActualEntity >.

Public Member Functions

- ActualEntity & **qos_profile** (const std::string &qos_library_name, const std::string &qos_profile_name)

  Specifies an XML QoS profile that will be used to configure the quality of service of the DDS entities created. This includes the DataReader and DataWriter used to send and receive samples from a SharedReaderQueue. Alternatively, you can set the DataReader and DataWriter QoS using datareader_qos() and datawriter_qos() methods. If you set the DataReader QoS or the DataWriter QoS the provided values will be used instead of the QoS specified in the XML qos profile. .
- ActualEntity & **shared_subscriber_name** (const std::string &name)

  Sets the SharedSubscriber name associated with the SharedReaderQueues.
- ActualEntity & **entity_name** (const std::string &name)

  Sets the name of the QueueEntity.

8.282.1 Detailed Description

template<typename ActualEntity>
class rti::queuing::QueueEntityParams< ActualEntity >

A parent class for all queue parameter classes.

8.282.2 Member Function Documentation

8.282.2.1 qos_profile()

```
template<typename ActualEntity >
ActualEntity &  rti::queuing::QueueEntityParams< ActualEntity >::qos_profile (
            const std::string & qos_library_name,
            const std::string & qos_profile_name )  [inline]
```

Specifies an XML QoS profile that will be used to configure the quality of service of the DDS entities created. This includes the DataReader and DataWriter used to send and receive samples from a SharedReaderQueue. Alternatively, you can set the DataReader and DataWriter QoS using datareader_qos() and datawriter_qos() methods. If you set the DataReader QoS or the DataWriter QoS the provided values will be used instead of the QoS specified in the XML qos profile. .

Parameters

qos_library_name	The name of the QoS library
qos_profile_name	The name of the QoS profile inside the QoS library

8.282.2.2 shared_subscriber_name()

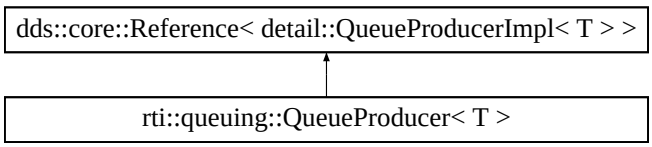
```
template<typename ActualEntity >
ActualEntity &  rti::queuing::QueueEntityParams< ActualEntity >::shared_subscriber_name (
             const std::string & name )  [inline]
```

Sets the SharedSubscriber name associated with the SharedReaderQueues.

8.282.2.3 entity_name()

```
template<typename ActualEntity >
ActualEntity &  rti::queuing::QueueEntityParams< ActualEntity >::entity_name (
             const std::string & name )  [inline]
```

Sets the name of the QueueEntity.



The name of the QueueEntity is used along with the topic name to generate the QueueEntity's GUID. The entity name is used along with the topic name to generate a Guid. By default, entity name is null which means that the entity Guid is randomly generated.

8.283 rti::queuing::QueueProducer< T > Class Template Reference

Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service.

```

  Sends a sample with the specified parameters and gets back metadata information related to the sample sent.
- bool **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)

  *Blocks the calling thread until all samples written by this **QueueProducer** (p. 2080) since the last call to this method are acknowledged by Queuing Service.*
- bool **wait_for_acknowledgments** (const **rti::core::SampleIdentity** &identity, const **dds::core::Duration** &max_wait)

  Blocks the calling thread until the sample identified by identity is acknowledged by Queuing Service.
- **dds::pub::DataWriter**< T > **writer** () const

  *Retrieves the underlying **dds::pub::DataWriter** (p. 1138).*
- **rti::core::Guid** **guid** () const

  *Returns the GUID of this **QueueProducer** (p. 2080).*
- bool **has_matching_reader_queue** ()

  *Checks whether this **QueueProducer** (p. 2080) has matched with at least one SharedReaderQueue.*

8.283.1 Detailed Description

template<typename T>
class rti::queuing::QueueProducer< T >

Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service.

A **QueueProducer** (p. 2080) is an entity that allows you to send samples to a SharedReaderQueue hosted by Queuing Service. A **QueueProducer** (p. 2080) has one underlying **dds::pub::DataWriter** (p. 1138) to communicate with a SharedReaderQueue.

Valid types for the topic of the DataWriter (T) are those generated by rtiddsgen, the **DDS built-in types** (p. 50), and **dds::core::xtypes::DynamicData** (p. 1461).

To send samples to a SharedReaderQueue, a **QueueProducer** (p. 2080) must set its topic name (see QueueProducer↩ Params::queue_topic_name) equal to the SharedReaderQueue topic name.

The **QueueProducer** (p. 2080) and the SharedReadeeQueue must also be in the same DDS domain (that is, they must have the same domain ID).

A **QueueProducer** (p. 2080) has an associated **dds::domain::DomainParticipant** (p. 1326), which can be shared with other QueueProducers or RTI Connext routines. All the other RTI Connext entities required for queuing interaction, including a **dds::pub::DataWriter** (p. 1138) for writing samples, are automatically created when the **QueueProducer** (p. 2080) is constructed.

Quality of Service (QoS) for the underlying DataWriter is configurable (see **QueueProducerParams::qos_profile** (p. 2079) and QueueProducerParams::datawriter_qos).

If no QoS is specified in the **QueueProducerParams** (p. 2092), the default DataWriterQos will be used.

A **QueueProducer** (p. 2080) must always be reliable in order to match and communicate with the SharedReaderQueue. Hence, whichever DataWriterQos is selected, the following QoS setting is always overriden:

- **dds::core::policy::Reliability::kind** (p. 2153) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).

The underlying DataWriter is created with an internal **dds::pub::DataWriterListener** (p. 1202), which is required to provide the behavior of a **QueueProducer** (p. 2080), including the notification of events via **QueueProducerListener** (p. 2090). For this reason, when accessing the underlying DataWriter, the listener should not be set, removed or modified; otherwise the behavior of the **QueueProducer** (p. 2080) will be incorrect and unpredictable.

Template Parameters

T	The data type for the SharedReaderQueue topic

See also

QueueProducer (p. 2080)

QueueProducerListener (p. 2090)

8.283.2 Constructor & Destructor Documentation

8.283.2.1 QueueProducer() [1/2]

```
template<typename T >
rti::queuing::QueueProducer< T >::QueueProducer (
```

```
            const  QueueProducerParams & params,
            bool is_enabled = true,
             Listener * producer_listener = NULL,
            const  rti::core::Guid & producer_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a queue producer.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

8.283.2.2 QueueProducer() [2/2]

```
template<typename T >
rti::queuing::QueueProducer< T >::QueueProducer (
            const  QueueProducerParams & params,
            bool is_enabled,
            std::shared_ptr<  Listener > producer_listener,
            const  rti::core::Guid & producer_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a **QueueProducer** (p. 2080) with parameters.

Parameters

params	All the parameters that configure this **QueueProducer** (p. 2080). See **QueueProducerParams** (p. 2092) for the list of required parameters.
is_enabled	Specifies if the **QueueProducer** (p. 2080) is created ready to receive notifications in its listener and send data. If you choose to bind the **QueueProducer** (p. 2080) to a **QueueProducerListener** (p. 2090) using an **rti::core::ListenerBinder** (p. 1641) you should create the **QueueProducer** (p. 2080) disabled to avoid missing listener notifications. You can later enable the disabled **QueueProducer** (p. 2080) using **QueueProducer::enable** (p. 2085).
producer_listener	A shared_ptr to a **QueueProducerListener** (p. 2090) object to receive event notifications.
producer_guid	A GUID identifier for the producer. When producer_guid is set to **rti::core::Guid::unknown()** (p. 1597) the Guid identifier is generated automatically. You can retrieve the generated **QueueProducer** (p. 2080) Guid using the **QueueProducer::guid** (p. 2089) method. To restart a **QueueProducer** (p. 2080) just create a new one with its same GUID.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

QueueProducerParams (p. 2092)

8.283.3 Member Function Documentation

8.283.3.1 listener() [1/2]

```
template<typename T >
void  rti::queuing::QueueProducer< T >::listener (
             Listener * the_listener,
            const  dds::core::status::StatusMask & event_mask =  dds::core::status::StatusMask↩
::none() )  [inline]
```

Sets the listener associated with this producer.

[DEPRECATED] The use of **set_listener()** (p. 2084) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Parameters

the_listener	The **QueueProducerListener** (p. 2090) to set
event_mask	The **dds::core::status::StatusMask** (p. 2375) associated with the listener

8.283.3.2 listener() [2/2]

```
template<typename T >
Listener *  rti::queuing::QueueProducer< T >::listener ( ) const  [inline]
```

Returns the listener currently associated with this Producer.

[DEPRECATED] Prefer **get_listener()** (p. 2084) instead of this function.

If there is no listener it returns NULL.

8.283.3.3 get_listener()

```
template<typename T >
std::shared_ptr<  Listener >  rti::queuing::QueueProducer< T >::get_listener ( ) const  [inline]
```

Gets the listener.

8.283.3.4 set_listener()

```
template<typename T >
void  rti::queuing::QueueProducer< T >::set_listener (
            std::shared_ptr<  Listener > the_listener )  [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive updates or `nullptr` to reset the current listener and stop receiving updates.

8.283.3.5 enable()

```
template<typename T >
void  rti::queuing::QueueProducer< T >::enable ( )  [inline]
```

Enables the **QueueProducer** (p. 2080) to send data and receive listener notifications.

If you create the **QueueProducer** (p. 2080) disabled you can enable it using this mehtod. To avoid missing listener notifciation when you use an **rti::core::ListenerBinder** (p. 1641) to bind the **QueueProducer** (p. 2080) to a **Queue↩ ProducerListener** (p. 2090) use **QueueProducer::enable** (p. 2085) to enable the **QueueProducer** (p. 2080) after it is bound to the listener.

8.283.3.6 send_sample() [1/2]

```
template<typename T >
void  rti::queuing::QueueProducer< T >::send_sample (
            const T & sample )  [inline]
```

Sends a sample.

This operation is equivalent to calling **QueueProducer::send_sample(const T&, rti::pub::WriteParams&)** (p. 2085) using a default **rti::pub::WriteParams** (p. 2642).

Parameters

sample	The sample to be sent

Exceptions

One	of the **Standard Exceptions** (p. 428) or **NoMatchingQueueException** (p. 1835)

MT Safety:

SAFE

See also

QueueProducer::send_sample(const T&, rti::pub::WriteParams&) (p. 2085)

8.283.3.7 send_sample() [2/2]

```
template<typename T >
void  rti::queuing::QueueProducer< T >::send_sample (
            const T & sample,
             rti::pub::WriteParams & write_params )  [inline]
```

Sends a sample with the specified parameters and gets back metadata information related to the sample sent.

After calling this operation, write_params contains valid metadata information associated with the sample sent.

The metadata field **rti::pub::WriteParams::source_guid** (p. 2650) of the write_params in the sample is always set to this **QueueProducer** (p. 2080)'s GUID.

Parameters

sample	<<***in***>> *(p. 355)* the sample to send.
write_params	<<***inout***>> *(p. 355)* Parameters to send the sample. When this call ends successfully, `write_params` contains valid metadata information associated with the sample sent.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **NoMatchingQueueException** (p. 1835) if by the time this operation is called there is not a single matching SharedReaderQueue.

MT Safety:

SAFE

See also

QueueProducer::send_sample(const T&) (p. 2085)

8.283.3.8 wait_for_acknowledgments() [1/2]

```
template<typename T >
bool  rti::queuing::QueueProducer< T >::wait_for_acknowledgments (
            const  dds::core::Duration & max_wait )  [inline]
```

Blocks the calling thread until all samples written by this **QueueProducer** (p. 2080) since the last call to this method are acknowledged by Queuing Service.

This operation will keep the calling thread blocked as long as there are samples pending on acknowledgement, unless a timeout occurs.

After unblocking, the return value is true if all samples have been acknowledged positively or false if at least one of them was acknowledged negatively.

If there is a timeout, this operation throws **dds::core::TimeoutError** (p. 2473).

This operation requires setting QueueProducerParams::enable_wait_for_ack to true. Otherwise, it will throw **dds::core::PreconditionNotMetError** (p. 1941).

When a SharedReaderQueue is not replicated, a sample is acknowledged positively once the running Queuing Service instance has enqueued the sample.

When a SharedReaderQueue is replicated, a sample is acknowledged positively once it has been enqueued by the Queuing Service instance acting as a master. This means that the sample has been received and enqueued by a configurable quorum of instances (using <replication_settings>/<queue_instances>).

This operation waits until all the previously written samples since the last call to this method are acknowledged. If you want to wait for a specific sample, use the method **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 2087).

This operation cannot be called by two threads concurrently. If this occurs, the second thread will throw **dds::core::PreconditionNotMetError** (p. 1941).

This operation cannot be called concurrently with **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 2087) either.

Parameters

max_wait	<<***in***>> *(p. 355)* Maximum waiting time.

Returns

true if all the samples are acknowledged positively or false if there was at least one sample acknowledged negatively.

Exceptions

One	of the **Standard Exceptions** (p. 428) ; **NoMatchingQueueException** (p. 1835) if during this call, the **QueueProducer** (p. 2080) lost the matching status with Queuing Service. **dds::core::TimeoutError** (p. 2473) if a timeout occurs before receiving all the acknowledgments.

8.283.3.9 wait_for_acknowledgments() [2/2]

```
template<typename T >
bool  rti::queuing::QueueProducer< T >::wait_for_acknowledgments (
            const  rti::core::SampleIdentity & identity,
            const  dds::core::Duration & max_wait )  [inline]
```

Blocks the calling thread until the sample identified by identity is acknowledged by Queuing Service.

This operation blocks the calling thread until the sample identified by identity is acknowledged by Queuing Service or there is a timeout.

After unblocking, the return value is true if the sample has been acknowledged positively or false if the sample has been acknowledged negatively.

If there is a timeout, this operation throws **dds::core::TimeoutError** (p. 2473).

This operation requires setting QueueProducerParams::enable_wait_for_ack to true. Otherwise, it will throw **dds::core::PreconditionNotMetError** (p. 1941).

When a SharedReaderQueue is not replicated, a sample is acknowledged positively once the running Queuing Service instance has enqueued the sample.

When a SharedReaderQueue is replicated, a sample is acknowledged positively once it has been enqueued by the Queuing Service instance acting as a master. This means that the sample has been received and enqueued by a configurable quorum of instances (using <replication_settings>/<queue_instances>).

This operation cannot be called by two threads concurrently on the same identity. If this occurs, the second thread will throw **dds::core::PreconditionNotMetError** (p. 1941).

This operation cannot be called concurrently with **QueueProducer::wait_for_acknowledgments(const dds::core::Duration&)** (p. 2086) either.

Parameters

max_wait	<<***in***>> *(p. 355)* Maximum waiting time.
identity	<<***in***>> *(p. 355)*. Sample identity.

Returns

true if the sample is acknowledged positively or false if the sample is acknowledged negatively.

Exceptions

One	of the **Standard Exceptions** (p. 428) ; **NoMatchingQueueException** (p. 1835) if during this call, the **QueueProducer** (p. 2080) lost the matching status with Queuing Service. **dds::core::TimeoutError** (p. 2473) if a timeout occurs before receiving all the acknowledgments.

8.283.3.10 writer()

```
template<typename T >
dds::pub::DataWriter< T >  rti::queuing::QueueProducer< T >::writer ( ) const  [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 1138).

Accessing the DataWriter may be useful for a number of advanced use cases, such as getting the DataWriter protocol or cache statuses.

MT Safety:

SAFE

See also

dds::pub::DataWriter (p. 1138)

dds::pub::DataWriter (p. 1138)

dds::pub::DataWriter::datawriter_protocol_status() (p. 1176)

8.283.3.11 guid()

```
template<typename T >
rti::core::Guid  rti::queuing::QueueProducer< T >::guid ( ) const  [inline]
```

Returns the GUID of this **QueueProducer** (p. 2080).

The GUID of the **QueueProducer** (p. 2080) is determined based on the value of QueueEntityParams::entity_name and QueueProducerParams::queue_topic_name. Note that the **QueueProducer** (p. 2080) GUID may be equal to or different than the GUID of the underlying DataWriter virtual GUID.

The GUID identifies a **QueueProducer** (p. 2080) and the samples it writes. This is the value set in the source GUID of the samples sent by the **QueueProducer** (p. 2080).

See also

QueueProducer::send_sample(const T&) (p. 2085)

QueueEntityParams::entity_name

8.283.3.12 has_matching_reader_queue()

```
template<typename T >
bool  rti::queuing::QueueProducer< T >::has_matching_reader_queue ( )  [inline]
```

Checks whether this **QueueProducer** (p. 2080) has matched with at least one SharedReaderQueue.

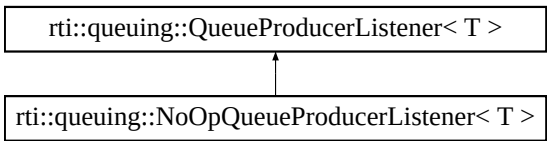
Exceptions

One	of the **Standard Exceptions** (p. 428) ;

Returns

True if this **QueueProducer** (p. 2080) matches with at least one SharedReaderQueue.

MT Safety:



SAFE

8.284 rti::queuing::QueueProducerListener< T > Class Template Reference

Called when certain events occur in a **QueueProducer** (p. 2080).

`#include <rti/queuing/QueueProducerListener.hpp>`

Inheritance diagram for rti::queuing::QueueProducerListener< T >:

Public Member Functions

- virtual void **on_sample_acknowledged** (**QueueProducer**< T > &producer, const **rti::pub::AcknowledgmentInfo** &info)=0

  User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueProducer**< T > &producer, const **dds::core::status::PublicationMatchedStatus** &status)=0

  User callback.

8.284.1 Detailed Description

template<typename T>
class rti::queuing::QueueProducerListener< T >

Called when certain events occur in a **QueueProducer** (p. 2080).

A **QueueProducer** (p. 2080) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueProducerParams** (p. 2092).

You can use this listener to receive notification when:

- A sample previously sent by a **QueueProducer** (p. 2080) has been acknowledged by Queuing Service.
- There are SharedReaderQueue matching events.

QueueProducer::QueueProducer() (p. 2082)

8.284.2 Member Function Documentation

8.284.2.1 on_sample_acknowledged()

```
template<typename T >
virtual void  rti::queuing::QueueProducerListener< T >::on_sample_acknowledged (
              QueueProducer< T > & producer,
             const  rti::pub::AcknowledgmentInfo & info )  [pure virtual]
```

User callback.

This callback is invoked whenever Queuing Service acknowledges a sample sent by the **QueueProducer** (p. 2080).

See also

AcknowledgmentInfo

Implemented in **rti::queuing::NoOpQueueProducerListener< T >** (p. 1858), **rti::queuing::NoOpQueue↩ ProducerListener< TRep >** (p. 1858), and **rti::queuing::NoOpQueueProducerListener< TReq >** (p. 1858).

8.284.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void  rti::queuing::QueueProducerListener< T >::on_shared_reader_queue_matched (
              QueueProducer< T > & producer,
             const  dds::core::status::PublicationMatchedStatus & status )  [pure virtual]
```

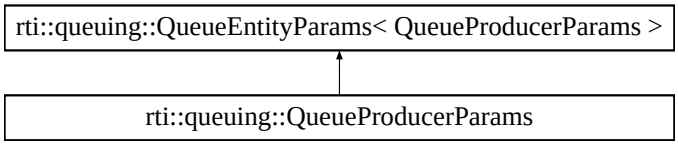
User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **QueueProducer** (p. 2080), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::PublicationMatchedStatus (p. 1990)

dds::pub::DataWriterListener::on_publication_matched (p. 1205)



Implemented in **rti::queuing::NoOpQueueProducerListener< T >** (p. 1858), **rti::queuing::NoOpQueueProducerListener< TRep >** (p. 1858), and **rti::queuing::NoOpQueueProducerListener< TReq >** (p. 1858).

8.285 rti::queuing::QueueProducerParams Class Reference

Contains the parameters for creating a **QueueProducer** (p. 2080).

`#include <rti/queuing/QueueParams.hpp>`

Inheritance diagram for rti::queuing::QueueProducerParams:

Public Member Functions

- **QueueProducerParams** (**dds::domain::DomainParticipant** participant)

  *Creates a **QueueProducerParams** (p. 2092) object with the participant set.*
- bool **enable_sample_replication** () const

  *Causes the **QueueProducer** (p. 2080) to write all the samples with the **dds::sub::SampleInfo::flag** (p. 2293) including the bit **rti::core::SampleFlag::replicate** (p. 2280).*
- **QueueProducerParams** & **enable_wait_for_ack** (bool enable)

  *Enables the Queuing Service's 'Acknowledgment Management' feature for the **QueueProducer** (p. 2080).*

8.285.1 Detailed Description

Contains the parameters for creating a **QueueProducer** (p. 2080).

8.285.2 Constructor & Destructor Documentation

8.285.2.1 QueueProducerParams()

```
rti::queuing::QueueProducerParams::QueueProducerParams (
            dds::domain::DomainParticipant participant )  [inline], [explicit]
```

Creates a **QueueProducerParams** (p. 2092) object with the participant set.

The rest of the parameters that can be set in a **QueueProducerParams** (p. 2092) object are optional.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) a **QueueProducer** (p. 2080) uses to join a domain.

8.285.3 Member Function Documentation

8.285.3.1 enable_sample_replication()

```
bool rti::queuing::QueueProducerParams::enable_sample_replication ( ) const  [inline]
```

Causes the **QueueProducer** (p. 2080) to write all the samples with the **dds::sub::SampleInfo::flag** (p. 2293) including the bit **rti::core::SampleFlag::replicate** (p. 2280).

When this value is set to true, all the samples are written with the associated metadata containing the bit **rti::core::SampleFlag::replicate** (p. 2280). This behavior cannot be changed once this option is enabled (no matter which operation is used to send samples).

8.285.3.2 enable_wait_for_ack()

```
QueueProducerParams & rti::queuing::QueueProducerParams::enable_wait_for_ack (
            bool enable )  [inline]
```

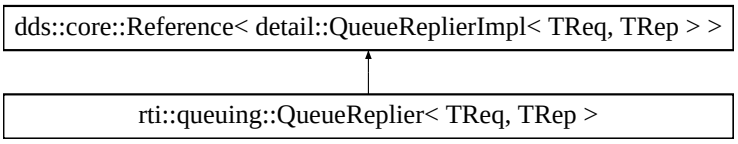
Enables the Queuing Service's 'Acknowledgment Management' feature for the **QueueProducer** (p. 2080).

When this value is set to true, you can call the APIs **QueueProducer::wait_for_acknowledgments(const dds::core::Duration&)** (p. 2086) and **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 2087) to wait for acknowledgments from Queuing Service. These acknowledgments indicate whether or not samples have been successfully enqueued.

Notice that if you enable this feature, at some point you must call **QueueProducer::wait_for_acknowledgments(const dds::core::Duration&)** (p. 2086) or **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 2087). Otherwise, the **QueueProducer** (p. 2080)'s memory will grow unbounded, since it will keep some state per sample.

You must also set the XML tag <app_ack_sample_to_producer> under <queue_qos>/<reliability> to true.

[default] true



References **rti::util::network_capture::enable()**.

8.286 rti::queuing::QueueReplier< TReq, TRep > Class Template Reference

Allows receiving requests and sending replies.

`#include <rti/queuing/QueueReplier.hpp>`

Inheritance diagram for rti::queuing::QueueReplier< TReq, TRep >:

Public Member Functions

- **QueueReplier** (const **QueueReplierParams** &params, bool is_enabled=true, **Listener** *replier_listener=NULL, const **rti::core::Guid** &replier_guid= **rti::core::Guid::unknown**())

  Creates a queue replier.
- **QueueReplier** (const **QueueReplierParams** &params, bool is_enabled, std::shared_ptr< **Listener** > replier_listener, const **rti::core::Guid** &replier_guid= **rti::core::Guid::unknown**())

  Creates a Replier with parameters.
- void **listener** (**Listener** *the_listener, const **dds::core::status::StatusMask** &event_mask= **dds::core::status::StatusMask::none**())

  Sets the listener associated with this queue requester.
- **Listener** * **listener** () const

  Returns the listener currently associated with this requester.
- std::shared_ptr< **Listener** > **get_listener** () const

  Gets the listener.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)

  Sets a listener to be notified of status updates.
- void **enable** ()

  *Enables the **QueueReplier** (p. 2094) to send data, receive data and receive listener notifications.*
- void **send_reply** (const TRep &reply, const **dds::sub::SampleInfo** &related_request_info)

  Sends a reply for a previous request.
- void **send_reply** (const TRep &reply, **rti::pub::WriteParams** &write_params)

  Sends a reply with the specified parameters and gets back metadata information related to the reply sent.
- void **acknowledge_request** (const **dds::sub::SampleInfo** &sample_info, bool is_positive_acknowledgment=true)

  Explicitly acknowledges a single request.
- void **acknowledge_all** (bool is_positive_acknowledgment=true)

  Acknowledges all previously accessed requests.
- bool **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)

  *Blocks the calling thread until all replies written by this **QueueReplier** (p. 2094) are acknowledged by Queuing Service, or until a timeout occurs.*
- bool **wait_for_acknowledgments** (const **rti::core::SampleIdentity** &identity, const **dds::core::Duration** &max_wait)

Blocks the calling thread until the reply identified by identity is acknowledged by Queuing Service, or until a timeout occurs.

- **rti::queuing::QueueConsumer**< TReq > **consumer** () const

  *Retrieves the underlying **dds::sub::DataReader** (p. 976).*
- **rti::queuing::QueueProducer**< TRep > **producer** () const

  *Retrieves the underlying **dds::pub::DataWriter** (p. 1138).*
- void **send_availability** (**ConsumerAvailabilityParams** parameters)

  Sends an availability sample with the specified parameters. The availability applies to the reply queue.
- bool **has_matching_request_reader_queue** ()

  *Checks whether or not this **QueueReplier** (p. 2094) has matched with at least one request SharedReaderQueue.*
- bool **has_matching_reply_reader_queue** ()

  *Checks whether or not this **QueueReplier** (p. 2094) has matched with at least one reply SharedReaderQueue.*
- bool **wait_for_requests** (const **dds::core::Duration** &max_wait)

  Waits for requests.
- bool **wait_for_requests** (int min_count, const **dds::core::Duration** &max_wait)

  Waits for requests.
- **dds::sub::LoanedSamples**< TReq > **receive_requests** (const **dds::core::Duration** &max_wait)

  Waits for multiple requests and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< TReq > **receive_requests** (int min_count, int max_count, const **dds::core::Duration** &max_wait)

  Waits for multiple requests and provides a loaned container to access them.
- **rti::pub::WriteParams get_write_params_for_related_request** (**rti::pub::WriteParams** &write_params, const **dds::sub::SampleInfo** &related_request_info)

  Gets the write parameters ready to send a reply for a given related request.
- **dds::sub::LoanedSamples**< TReq > **take_requests** ()

  Provides a loaned container to access the existing requests.
- **dds::sub::LoanedSamples**< TReq > **take_requests** (int max_count)

  Provides a loaned container to access the existing requests.
- **dds::sub::LoanedSamples**< TReq > **read_requests** ()

  Provides a loaned container from which you can access the existing requests.
- **dds::sub::LoanedSamples**< TReq > **read_requests** (int max_count)

  Provides a loaned container from which you can access the existing requests.
- **dds::pub::DataWriter**< TRep > **writer** () const

  *Retrieves the underlying **dds::pub::DataWriter** (p. 1138) used to send replies.*
- **dds::sub::DataReader**< TReq > **reader** () const

  *Retrieves the underlying **dds::sub::DataReader** (p. 976) used to receive requests.*
- **rti::core::Guid guid** ()

  *Returns the GUID of this **QueueReplier** (p. 2094).*

8.286.1 Detailed Description

template<typename TReq, typename TRep>
class rti::queuing::QueueReplier< TReq, TRep >

Allows receiving requests and sending replies.

A **QueueReplier** (p. 2094) is a component suited for the queuing request-reply use case. A **QueueReplier** (p. 2094) plays the role of a request **QueueConsumer** (p. 2063) and reply **QueueProducer** (p. 2080).

A **QueueReplier** (p. 2094) is an entity that allows you to receive requests from a request SharedReaderQueue and send replies to a reply SharedReaderQueue, which are hosted by Queuing Service.

To communicate with the SharedReaderQueues, the **QueueReplier** (p. 2094) creates two topics. The first topic corresponds to the request SharedReaderQueue topic and the second topic to the reply SharedReaderQueue topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by rtiddsgen, the **DDS built-in types** (p. 50), and **dds::core::xtypes::DynamicData** (p. 1461).

See also

QueueConsumer (p. 2063)

QueueProducer (p. 2080)

Template Parameters

TReq	The data type for the request SharedReaderQueue topic
TRep	The data type for the reply SharedReaderQueue topic

8.286.2 Constructor & Destructor Documentation

8.286.2.1 QueueReplier() [1/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueReplier< TReq, TRep >::QueueReplier (
            const  QueueReplierParams & params,
            bool is_enabled = true,
             Listener * replier_listener = NULL,
            const  rti::core::Guid & replier_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a queue replier.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<`**Listener** (p. 1637)`>` instead of a regular `Listener*` pointer.

8.286.2.2 QueueReplier() [2/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueReplier< TReq, TRep >::QueueReplier (
            const  QueueReplierParams & params,
            bool is_enabled,
            std::shared_ptr<  Listener > replier_listener,
            const  rti::core::Guid & replier_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a Replier with parameters.

Parameters

params	All the parameters that configure this **QueueReplier** (p. 2094) See **QueueReplierParams** (p. 2109) for the list of required parameters.
is_enabled	Specifies if the **QueueReplier** (p. 2094) is created ready to receive notifications in its listener and send or receive data. If you choose to bind the **QueueReplier** (p. 2094) to a **QueueReplierListener** (p. 2107) using an **rti::core::ListenerBinder** (p. 1641) you should create the **QueueReplier** (p. 2094) disabled to avoid missing listener notifications. You can later enable the disabled **QueueReplier** (p. 2094) using **QueueReplier::enable** (p. 2098).
replier_listener	A shared_ptr to a **QueueReplierListener** (p. 2107) object to receive event notifications.
replier_guid	A GUID identifier for the replier. When replier_guid is set to **rti::core::Guid::unknown()** (p. 1597) the Guid identifier is generated automatically. You can retrieve the generated **QueueReplier** (p. 2094) Guid using the **QueueReplier::guid()** (p. 2106) method. To restart a **QueueReplier** (p. 2094) just create a new one with its same GUID.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

QueueReplierParams (p. 2109)

8.286.3 Member Function Documentation

8.286.3.1 listener() [1/2]

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueReplier< TReq, TRep >::listener (
              Listener * the_listener,
             const  dds::core::status::StatusMask & event_mask =  dds::core::status::StatusMask↩
::none() )  [inline]
```

Sets the listener associated with this queue requester.

[DEPRECATED] The use of **`set_listener()`** (p. 2098) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

the_listener	The **QueueReplierListener** (p. 2107) to set
event_mask	The **dds::core::status::StatusMask** (p. 2375) associated with the listener

8.286.3.2 listener() [2/2]

```
template<typename TReq , typename TRep >
Listener * rti::queuing::QueueReplier< TReq, TRep >::listener ( ) const [inline]
```

Returns the listener currently associated with this requester.

[DEPRECATED] Prefer **get_listener()** (p. 2098) instead of this function.

If there is no listener it returns NULL.

8.286.3.3 get_listener()

```
template<typename TReq , typename TRep >
std::shared_ptr< Listener > rti::queuing::QueueReplier< TReq, TRep >::get_listener ( ) const
[inline]
```

Gets the listener.

8.286.3.4 set_listener()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::set_listener (
            std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive updates or `nullptr` to reset the current listener and stop receiving updates.

8.286.3.5 enable()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::enable ( ) [inline]
```

Enables the **QueueReplier** (p. 2094) to send data, receive data and receive listener notifications.

If you create the **QueueReplier** (p. 2094) disabled you can enable it using this mehtod. To avoid missing listener notifciation when you use an **rti::core::ListenerBinder** (p. 1641) to bind the **QueueReplier** (p. 2094) to a **QueueReplierListener** (p. 2107) use **QueueReplier::enable** (p. 2098) to enable the **QueueReplier** (p. 2094) after it is bound to the listener.

8.286.3.6 send_reply() [1/2]

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueReplier< TReq, TRep >::send_reply (
            const TRep & reply,
            const  dds::sub::SampleInfo & related_request_info )  [inline]
```

Sends a reply for a previous request.

The related request identity can be retrieved from an existing request sample (Sample).

Parameters

reply	The reply to be sent
related_request_info	The identity of a previously received request

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

QueueProducer::send_sample(const T&) (p. 2085)

8.286.3.7 send_reply() [2/2]

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueReplier< TReq, TRep >::send_reply (
            const TRep & reply,
             rti::pub::WriteParams & write_params )  [inline]
```

Sends a reply with the specified parameters and gets back metadata information related to the reply sent.

After calling this operation, write_params contains metadata information associated with the reply sent.

Contrary to the **QueueRequester** (p. 2111), where retrieving the sample identity for correlation is common, on the **QueueReplier** (p. 2094) side using a write_params is only necessary when the default write parameters need to be overridden, and **QueueReplier::send_reply(const TRep&, const dds::sub::SampleInfo&)** (p. 2099) may be used if that is not necessary.

Parameters

reply	<<***in***>> *(*p. *355)* the reply sample to send.
write_params	<<***inout***>> *(*p. *355)* Parameters used to send the reply. When this call ends successfully, `write_params` contains valid metadata information associated with the reply sent.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **NoMatchingQueueException** (p. 1835) if by the time this operation is called there is not a single matching SharedReaderQueue.

MT Safety:

SAFE

template<typename TReq , typename TRep >
bool  rti::queuing::QueueReplier< TReq, TRep >::wait_for_acknowledgments (
            const  rti::core::SampleIdentity & identity,
            const  dds::core::Duration & max_wait )  [inline]
```

Blocks the calling thread until the reply identified by identity is acknowledged by Queuing Service, or until a timeout occurs.

See also

QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::↩ Duration&) (p. 2087)

QueueReplier::send_reply(const TRep&, const dds::sub::SampleInfo&) (p. 2099)

QueueReplierListener::on_reply_acknowledged (p. 2108)

8.286.3.12 consumer()

```
template<typename TReq , typename TRep >
rti::queuing::QueueConsumer< TReq >  rti::queuing::QueueReplier< TReq, TRep >::consumer ( )
const  [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 976).

8.286.3.13 producer()

```
template<typename TReq , typename TRep >
rti::queuing::QueueProducer< TRep >  rti::queuing::QueueReplier< TReq, TRep >::producer ( )
const  [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 1138).

8.286.3.14 send_availability()

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueReplier< TReq, TRep >::send_availability (
              ConsumerAvailabilityParams parameters )  [inline]
```

Sends an availability sample with the specified parameters. The availability applies to the reply queue.

See also

QueueConsumer::send_availability(ConsumerAvailabilityParams) (p. 2074)

QueueReplierParams::enable_availability

8.286.3.15 has_matching_request_reader_queue()

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueReplier< TReq, TRep >::has_matching_request_reader_queue ( )  [inline]
```

Checks whether or not this **QueueReplier** (p. 2094) has matched with at least one request SharedReaderQueue.

See also

QueueProducer::has_matching_reader_queue() (p. 2089)

8.286.3.16 has_matching_reply_reader_queue()

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueReplier< TReq, TRep >::has_matching_reply_reader_queue ( )  [inline]
```

Checks whether or not this **QueueReplier** (p. 2094) has matched with at least one reply SharedReaderQueue.

See also

QueueConsumer::has_matching_reader_queue() (p. 2075)

8.286.3.17 wait_for_requests() [1/2]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueReplier< TReq, TRep >::wait_for_requests (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for requests.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 2073)

8.286.3.18 wait_for_requests() [2/2]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueReplier< TReq, TRep >::wait_for_requests (
            int min_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for requests.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 2073)

8.286.3.19 receive_requests() [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq >  rti::queuing::QueueReplier< TReq, TRep >::receive_requests (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple requests and provides a loaned container to access them.

See also

QueueConsumer::receive_samples(const dds::core::Duration&) (p. 2071)

QueueReplier::wait_for_requests(int, const dds::core::Duration&) (p. 2103)

QueueReplier::take_requests(int) (p. 2105)

8.286.3.20 receive_requests() [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq >  rti::queuing::QueueReplier< TReq, TRep >::receive_requests (
            int min_count,
            int max_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple requests and provides a loaned container to access them.

See also

QueueConsumer::receive_samples(int, int, const dds::core::Duration&) (p. 2071)

QueueReplier::wait_for_requests(int, const dds::core::Duration&) (p. 2103)

QueueReplier::take_requests(int) (p. 2105)

8.286.3.21 get_write_params_for_related_request()

```
template<typename TReq , typename TRep >
rti::pub::WriteParams  rti::queuing::QueueReplier< TReq, TRep >::get_write_params_for_related_↩
request (
             rti::pub::WriteParams & write_params,
            const  dds::sub::SampleInfo & related_request_info )  [inline]
```

Gets the write parameters ready to send a reply for a given related request.

You can use this method to modify the parameters before you send a reply using **QueueReplier::send_reply(const TRep&, rti::pub::WriteParams&)** (p. 2099).

Parameters

write_params	<<***out***>> *(*p. *355)* the write params to send the reply.
related_request_info	<<***in***>> *(*p. *355)* The sample info of the releated request.

MT Safety:

SAFE

QueueReplier::send_reply(const TRep&, rti::pub::WriteParams&) (p. 2099)

8.286.3.22 take_requests() [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq >  rti::queuing::QueueReplier< TReq, TRep >::take_requests ( )
[inline]
```

Provides a loaned container to access the existing requests.

See also

QueueConsumer::take_samples() (p. 2071)

8.286.3.23 take_requests() [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq >  rti::queuing::QueueReplier< TReq, TRep >::take_requests (
            int max_count )  [inline]
```

Provides a loaned container to access the existing requests.

See also

QueueConsumer::take_samples(int) (p. 2072)

8.286.3.24 read_requests() [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq >  rti::queuing::QueueReplier< TReq, TRep >::read_requests ( )
[inline]
```

Provides a loaned container from which you can access the existing requests.

This operation is equivalent to **QueueReplier::take_requests()** (p. 2105), except the sample remains in the **Queue↩ Replier** (p. 2094) and can be read or taken again.

8.286.3.25 read_requests() [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq >  rti::queuing::QueueReplier< TReq, TRep >::read_requests (
            int max_count )  [inline]
```

Provides a loaned container from which you can access the existing requests.

This operation is equivalent to **QueueReplier::take_requests(int)** (p. 2105), except the sample remains in the **Queue↩ Replier** (p. 2094) and can be read or taken again.

8.286.3.26 writer()

```
template<typename TReq , typename TRep >
dds::pub::DataWriter< TRep >  rti::queuing::QueueReplier< TReq, TRep >::writer ( ) const  [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 1138) used to send replies.

See also

QueueProducer::writer() (p. 2088)

8.286.3.27 reader()

```
template<typename TReq , typename TRep >
dds::sub::DataReader< TReq >  rti::queuing::QueueReplier< TReq, TRep >::reader ( ) const  [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 976) used to receive requests.

See also

QueueConsumer::reader (p. 2070)

8.286.3.28 guid()

```
template<typename TReq , typename TRep >
rti::core::Guid  rti::queuing::QueueReplier< TReq, TRep >::guid ( )  [inline]
```

Returns the GUID of this **QueueReplier** (p. 2094).

The **QueueReplier** (p. 2094)'s GUID is the same GUID of both underlying **QueueProducer** (p. 2080) and **Queue↩ Consumer** (p. 2063).

8.287.1 Detailed Description

template<typename TReq, typename TRep>
class rti::queuing::QueueReplierListener< TReq, TRep >

Called when certain events occur in a **QueueReplier** (p. 2094).

A **QueueReplier** (p. 2094) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueReplierParams** (p. 2109).

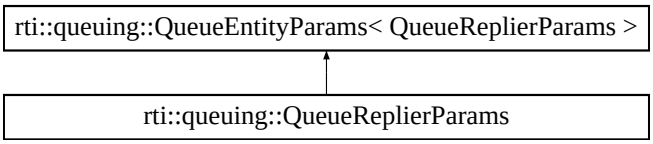
            const  dds::core::status::PublicationMatchedStatus & status )  [pure virtual]
```

User callback.

See also

QueueProducerListener::on_shared_reader_queue_matched (p. 2091)



Implemented in **rti::queuing::NoOpQueueReplierListener< TReq, TRep >** (p. 1861).

8.288 rti::queuing::QueueReplierParams Class Reference

Contains the parameters for creating a **QueueReplier** (p. 2094).

```
#include <rti/queuing/QueueParams.hpp>
```

Inheritance diagram for rti::queuing::QueueReplierParams:

Public Member Functions

- **QueueReplierParams** (**dds::domain::DomainParticipant** participant)

  *Creates a **QueueReplierParams** (p. 2109) object with the participant set.*
- **QueueReplierParams** & **enable_availability** (bool enable)

  Indicates whether the availability channel is enabled with the request SharedReaderQueue.
- **QueueReplierParams** & **enable_sample_replication** (bool enable)

  *Causes the **QueueReplier** (p. 2094) to write all the replies with the **dds::sub::SampleInfo::flag** (p. 2293) including the bit **rti::core::SampleFlag::replicate** (p. 2280).*
- **QueueReplierParams** & **enable_wait_for_ack** (bool enable)

  Enables Queuing Service's 'Acknowledgment Management' feature for replies.

8.288.1 Detailed Description

Contains the parameters for creating a **QueueReplier** (p. 2094).

8.288.2 Constructor & Destructor Documentation

8.288.2.1 QueueReplierParams()

```
rti::queuing::QueueReplierParams::QueueReplierParams (
              dds::domain::DomainParticipant participant )  [inline], [explicit]
```

Creates a **QueueReplierParams** (p. 2109) object with the participant set.

The rest of the parameters that can be set in a **QueueReplierParams** (p. 2109) object are optional.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) a **QueueReplier** (p. 2094) uses to join a domain.

8.288.3 Member Function Documentation

8.288.3.1 enable_availability()

```
QueueReplierParams & rti::queuing::QueueReplierParams::enable_availability (
            bool enable )  [inline]
```

Indicates whether the availability channel is enabled with the request SharedReaderQueue.

See also

QueueConsumerParams::enable_availability.

References **rti::util::network_capture::enable()**.

8.288.3.2 enable_sample_replication()

```
QueueReplierParams & rti::queuing::QueueReplierParams::enable_sample_replication (
            bool enable )  [inline]
```

Causes the **QueueReplier** (p. 2094) to write all the replies with the **dds::sub::SampleInfo::flag** (p. 2293) including the bit **rti::core::SampleFlag::replicate** (p. 2280).

See also

QueueProducerParams::enable_sample_replication (p. 2093)

References **rti::util::network_capture::enable()**.

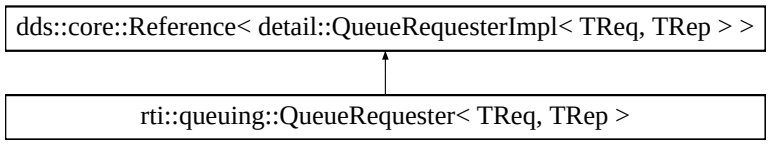
8.288.3.3 enable_wait_for_ack()

```
QueueReplierParams & rti::queuing::QueueReplierParams::enable_wait_for_ack (
            bool enable )  [inline]
```

Enables Queuing Service's 'Acknowledgment Management' feature for replies.

See also

QueueProducerParams::enable_wait_for_ack



References **rti::util::network_capture::enable()**.

8.289 rti::queuing::QueueRequester< TReq, TRep > Class Template Reference

Allows sending requests and receiving replies.

`#include <rti/queuing/QueueRequester.hpp>`

Inheritance diagram for rti::queuing::QueueRequester< TReq, TRep >:

Public Member Functions

- **QueueRequester** (const **QueueRequesterParams** &params, bool is_enabled=true, **Listener** *requester_listener=NULL, const **rti::core::Guid** &requester_guid= **rti::core::Guid::unknown**())

  Creates a queue requester.
- **QueueRequester** (const **QueueRequesterParams** &params, bool is_enabled, std::shared_ptr< **Listener** > requester_listener, const **rti::core::Guid** &requester_guid= **rti::core::Guid::unknown**())

  *Creates a **QueueRequester** (p. 2111) with parameters.*
- void **listener** (**Listener** *the_listener, const **dds::core::status::StatusMask** &event_mask= **dds::core::status::StatusMask::none**())

  Sets the listener associated with this queue requester.
- **Listener** * **listener** () const

  Returns the listener currently associated with this requester.
- std::shared_ptr< **Listener** > **get_listener** () const

  Gets the listener.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)

  Sets a listener to be notified of status updates.
- void **enable** ()

  *Enables the **QueueRequester** (p. 2111) to send data, receive data and receive listener notifications.*
- **dds::sub::LoanedSamples**< TRep > **receive_replies** (const **dds::core::Duration** &max_wait)

  Waits for multiple replies and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< TRep > **receive_replies** (int min_count, int max_count, const **dds::core::Duration** &max_wait)

  Waits for multiple replies and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< TRep > **take_replies** ()

  Provides a loaned container from which you can access the existing replies.
- **dds::sub::LoanedSamples**< TRep > **take_replies** (int max_count)

  Provides a loaned container from which you can access the existing replies.
- **dds::sub::LoanedSamples**< TRep > **read_replies** ()

  Provides a loaned container from which you can access the existing replies.
- **dds::sub::LoanedSamples**< TRep > **read_replies** (int max_count)

  Provides a loaned container from which you can access the existing replies for a specific request.
- **dds::sub::LoanedSamples**< TRep > **take_replies** (int max_count, const **rti::core::SampleIdentity** &related_request_id)

  Provides a loaned container to access the existing replies for a specific request.
- **dds::sub::LoanedSamples**< TRep > **take_replies** (const **rti::core::SampleIdentity** &related_request_id)

  Provides a loaned container from which you can access the existing replies for a specific request.
- **dds::sub::LoanedSamples**< TRep > **read_replies** (const **rti::core::SampleIdentity** &related_request_id)

  Provides a loaned container from which you can access the existing replies for a specific request.
- void **send_request** (const TReq &request)

  Sends a request.
- void **send_request** (const TReq &request, **rti::pub::WriteParams** &write_params)

  Sends a request with the specified parameters and gets back metadata information related to the request sent.
- void **acknowledge_reply** (const **dds::sub::SampleInfo** &sample_info, bool is_positive_acknowledgment=true)

  Explicitly acknowledges a single reply.
- void **acknowledge_all** (bool is_positive_acknowledgment=true)

  Acknowledges all previously accessed replies.
- bool **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)

*Blocks the calling thread until all requests written by this **QueueRequester** (p. 2111) are acknowledged Queuing Service, or until a timeout occurs.*

- bool **wait_for_acknowledgments** (const **rti::core::SampleIdentity** &identity, const **dds::core::Duration** &max_wait)

  Blocks the calling thread until the request identified by identity is acknowledged by Queuing Service, or until a timeout occurs.
- **rti::queuing::QueueConsumer**< TRep > **consumer** () const

  *Retrieves the underlying **QueueConsumer** (p. 2063).*
- **rti::queuing::QueueProducer**< TReq > **producer** () const

  *Retrieves the underlying **QueueProducer** (p. 2080).*
- bool **wait_for_replies** (const **dds::core::Duration** &max_wait)

  Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **dds::core::Duration** &max_wait)

  Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **dds::core::Duration** &max_wait, const **rti::core::SampleIdentity** &related_request_id)

  Waits for replies to a specific request.
- void **send_availability** (**ConsumerAvailabilityParams** parameters)

  *Sends the availability status of the **QueueConsumer** (p. 2063) receiving samples from the reply SharedReaderQueue to Queuing Service.*
- bool **has_matching_request_reader_queue** ()

  *Checks whether this **QueueRequester** (p. 2111) has matched with at least one request SharedReaderQueue.*
- bool **has_matching_reply_reader_queue** ()

  *Checks whether this **QueueRequester** (p. 2111) has matched with at least one reply SharedReaderQueue.*
- **dds::pub::DataWriter**< TReq > **writer** () const

  *Retrieves the underlying **dds::pub::DataWriter** (p. 1138) used to send requests.*
- **dds::sub::DataReader**< TRep > **reader** () const

  *Retrieves the underlying **dds::sub::DataReader** (p. 976) used to receive replies.*
- **rti::core::Guid guid** ()

  *Returns the GUID of this **QueueRequester** (p. 2111).*

8.289.1 Detailed Description

template<typename TReq, typename TRep>
class rti::queuing::QueueRequester< TReq, TRep >

Allows sending requests and receiving replies.

A **QueueRequester** (p. 2111) is a component suited for the queuing request-reply use case. A **QueueRequester** (p. 2111) plays the role of a request **QueueProducer** (p. 2080) and reply **QueueConsumer** (p. 2063).

A **QueueRequester** (p. 2111) is the entity that allows sending requests to a a request SharedReaderQueue and receiving replies from a reply SharedReaderQueue.

To communicate with the SharedReaderQueues the **QueueRequester** (p. 2111) creates two topics. The first topic corresponds to the request SharedReaderQueue topic and the second topic to the reply SharedReaderQueue topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by rtiddsgen, the **DDS built-in types** (p. 50), and **dds::core::xtypes::DynamicData** (p. 1461).

See also

QueueProducer (p. 2080)

QueueConsumer (p. 2063)

Template Parameters

TReq	The data type for the request SharedReaderQueue topic
TRep	The data type for the reply SharedReaderQueue topic

8.289.2 Constructor & Destructor Documentation

8.289.2.1 QueueRequester() [1/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueRequester< TReq, TRep >::QueueRequester (
            const  QueueRequesterParams & params,
            bool is_enabled = true,
             Listener * requester_listener = NULL,
            const  rti::core::Guid & requester_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a queue requester.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

8.289.2.2 QueueRequester() [2/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueRequester< TReq, TRep >::QueueRequester (
            const  QueueRequesterParams & params,
            bool is_enabled,
            std::shared_ptr<  Listener > requester_listener,
            const  rti::core::Guid & requester_guid =  rti::core::Guid::unknown() )  [inline],
[explicit]
```

Creates a **QueueRequester** (p. 2111) with parameters.

Parameters

params	All the parameters that configure this **QueueRequester** (p. 2111). See **QueueRequesterParams** (p. 2128) for the list of mandatory parameters.
is_enabled	Specifies if the **QueueRequester** (p. 2111) is created ready to receive notifications in its listener and send or receive data. If you choose to bind the **QueueRequester** (p. 2111) to a **QueueRequesterListener** (p. 2126) using an **rti::core::ListenerBinder** (p. 1641) you should create the **QueueRequester** (p. 2111) disabled to avoid missing listener notifications. You can later enable the disabled **QueueRequester** (p. 2111) using **QueueRequester::enable** (p. 2116).
requester_listener	A shared_ptr to a **QueueRequesterListener** (p. 2126) object to receive event notifications.
requester_guid	A GUID identifier for the requester. When requester_guid is set to **rti::core::Guid::unknown()** (p. 1597) the Guid identifier is generated automatically. You can retrieve the generated **QueueRequester** (p. 2111) Guid using the **QueueRequester::guid()** (p. 2125) method. To restart a **QueueRequester** (p. 2111) just create a new one with its same GUID.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

QueueRequesterParams (p. 2128)

8.289.3 Member Function Documentation

8.289.3.1 listener() [1/2]

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueRequester< TReq, TRep >::listener (
             Listener * the_listener,
            const  dds::core::status::StatusMask & event_mask =  dds::core::status::StatusMask↩
::none() )  [inline]
```

Sets the listener associated with this queue requester.

[DEPRECATED] The use of **set_listener()** (p. 2116) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Parameters

the_listener	The **QueueRequesterListener** (p. 2126) to set
event_mask	The **dds::core::status::StatusMask** (p. 2375) associated with the listener

8.289.3.2 listener() [2/2]

```
template<typename TReq , typename TRep >
Listener *  rti::queuing::QueueRequester< TReq, TRep >::listener ( ) const  [inline]
```

Returns the listener currently associated with this requester.

[DEPRECATED] Prefer **get_listener()** (p. 2115) instead of this function.

If there is no listener it returns NULL.

8.289.3.3 get_listener()

```
template<typename TReq , typename TRep >
std::shared_ptr< Listener > rti::queuing::QueueRequester< TReq, TRep >::get_listener ( ) const
[inline]
```

Gets the listener.

8.289.3.4 set_listener()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::set_listener (
            std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive updates or `nullptr` to reset the current listener and stop receiving updates.

8.289.3.5 enable()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::enable ( ) [inline]
```

Enables the **QueueRequester** (p. 2111) to send data, receive data and receive listener notifications.

If you create the **QueueRequester** (p. 2111) disabled you can enable it using this mehtod. To avoid missing listener notifciation when you use an **rti::core::ListenerBinder** (p. 1641) to bind the **QueueRequester** (p. 2111) to a **Queue↩ RequesterListener** (p. 2126) use **QueueRequester::enable** (p. 2116) to enable the **QueueRequester** (p. 2111) after it is bound to the listener.

8.289.3.6 receive_replies() [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::receive_replies (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple replies and provides a loaned container to access them.

See also

QueueConsumer::receive_samples(const dds::core::Duration&) (p. 2071)

QueueRequester::wait_for_replies(int, const dds::core::Duration&) (p. 2123)

QueueRequester::take_replies(int) (p. 2117)

8.289.3.7 receive_replies() [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::receive_replies (
            int min_count,
            int max_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple replies and provides a loaned container to access them.

See also

QueueConsumer::receive_samples(int, int, const dds::core::Duration&) (p. 2071)

QueueRequester::wait_for_replies(int, const dds::core::Duration&) (p. 2123)

QueueRequester::take_replies(int) (p. 2117)

8.289.3.8 take_replies() [1/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::take_replies ( )
[inline]
```

Provides a loaned container from which you can access the existing replies.

See also

QueueConsumer::take_samples() (p. 2071)

8.289.3.9 take_replies() [2/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::take_replies (
            int max_count )  [inline]
```

Provides a loaned container from which you can access the existing replies.

See also

QueueConsumer::take_samples(int) (p. 2072)

8.289.3.10 read_replies() [1/3]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::read_replies ( )
[inline]
```

Provides a loaned container from which you can access the existing replies.

This operation is equivalent to **QueueRequester::take_replies()** (p. 2117), except the sample remains in the **Queue↩ Requester** (p. 2111) and can be read or taken again.

8.289.3.11 read_replies() [2/3]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::read_replies (
            int max_count )  [inline]
```

Provides a loaned container from which you can access the existing replies for a specific request.

This operation is equivalent to **QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 2118), except the sample remains in the **QueueRequester** (p. 2111) and can be read or taken again.

8.289.3.12 take_replies() [3/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::take_replies (
            int max_count,
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Provides a loaned container to access the existing replies for a specific request.

This operation is analogous to **QueueRequester::take_replies(int)** (p. 2117), except the replies this operation provides correspond to a specific request.

Parameters

max_count	The maximum number of samples that are taken at a time. The special value **dds::core::LENGTH_UNLIMITED** (p. 438) may be used.
related_request_id	The identity of a request previously sent by this **QueueRequester** (p. 2111)

MT Safety:

SAFE

QueueRequester::take_replies(int) (p. 2117)

dds::sub::LoanedSamples (p. 1663)

8.289.3.13 take_replies() [4/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::take_replies (
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Provides a loaned container from which you can access the existing replies for a specific request.

This operation is equivalent to using **QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 2118) with max_count=**dds::core::LENGTH_UNLIMITED** (p. 438)

MT Safety:

SAFE

See also

dds::sub::LoanedSamples (p. 1663)

QueueRequester::take_replies(int, const rti::core::SampleIdentity&) (p. 2118)

8.289.3.14 read_replies() [3/3]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep >  rti::queuing::QueueRequester< TReq, TRep >::read_replies (
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Provides a loaned container from which you can access the existing replies for a specific request.

This operation is equivalent to **QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 2118), except the sample remains in the **QueueRequester** (p. 2111) and can be read or taken again.

8.289.3.15 send_request() [1/2]

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueRequester< TReq, TRep >::send_request (
             const TReq & request )  [inline]
```

Sends a request.

. If a future reply needs to be correlated to exactly this request, use QueueRequester::send_request_w_writesample.

Parameters

request	The request to be sent

Exceptions

One	of the **Standard Exceptions** (p. 428)

MT Safety:

SAFE

See also

QueueProducer::send_sample(const T&, rti::pub::WriteParams&) (p. 2085)

8.289.3.16 send_request() [2/2]

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueRequester< TReq, TRep >::send_request (
             const TReq & request,
              rti::pub::WriteParams & write_params )  [inline]
```

Sends a request with the specified parameters and gets back metadata information related to the request sent.

After calling this operation, write_params contains valid metadata information associated with the request sent.

The metadata field **rti::pub::WriteParams::source_guid** (p. 2650) of the write_params in the request is always set to this **QueueProducer** (p. 2080)'s GUID.

Parameters

request	<<***in***>> *(p. 355)* the request sample to send.
write_params	<<***inout***>> *(p. 355)* Parameters used to send the request. When this call ends successfully, `write_params` contains valid metadata information associated with the request sent.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **NoMatchingQueueException** (p. 1835) if by the time this operation is called there is not a single matching SharedReaderQueue.

MT Safety:

SAFE

8.289.3.17 acknowledge_reply()

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueRequester< TReq, TRep >::acknowledge_reply (
            const  dds::sub::SampleInfo & sample_info,
            bool is_positive_acknowledgment = true )  [inline]
```

Explicitly acknowledges a single reply.

See also

QueueConsumer::acknowledge_sample(const dds::sub::SampleInfo&, bool) (p. 2069)

QueueRequester::acknowledge_all(bool) (p. 2121)

8.289.3.18 acknowledge_all()

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueRequester< TReq, TRep >::acknowledge_all (
            bool is_positive_acknowledgment = true )  [inline]
```

Acknowledges all previously accessed replies.

See also

QueueConsumer::acknowledge_all(bool) (p. 2069)

QueueRequester::acknowledge_reply(const dds::sub::SampleInfo&, bool) (p. 2121)

8.289.3.19 wait_for_acknowledgments() [1/2]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::wait_for_acknowledgments (
            const  dds::core::Duration & max_wait )  [inline]
```

Blocks the calling thread until all requests written by this **QueueRequester** (p. 2111) are acknowledged Queuing Service, or until a timeout occurs.

See also

QueueProducer::wait_for_acknowledgments(const dds::core::Duration&) (p. 2086)

QueueRequester::send_request(const TReq&) (p. 2119)

QueueRequesterListener::on_request_acknowledged (p. 2127)

8.289.3.20 wait_for_acknowledgments() [2/2]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::wait_for_acknowledgments (
            const  rti::core::SampleIdentity & identity,
            const  dds::core::Duration & max_wait )  [inline]
```

Blocks the calling thread until the request identified by identity is acknowledged by Queuing Service, or until a timeout occurs.

See also

QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::↩ Duration&) (p. 2087)

8.289.3.21 consumer()

```
template<typename TReq , typename TRep >
rti::queuing::QueueConsumer< TRep >  rti::queuing::QueueRequester< TReq, TRep >::consumer ( )
const  [inline]
```

Retrieves the underlying **QueueConsumer** (p. 2063).

8.289.3.22 producer()

```
template<typename TReq , typename TRep >
rti::queuing::QueueProducer< TReq >  rti::queuing::QueueRequester< TReq, TRep >::producer ( )
const  [inline]
```

Retrieves the underlying **QueueProducer** (p. 2080).

8.289.3.23 wait_for_replies() [1/3]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::wait_for_replies (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for replies to any request.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 2073)

8.289.3.24 wait_for_replies() [2/3]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::wait_for_replies (
            int min_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for replies to any request.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 2073)

8.289.3.25 wait_for_replies() [3/3]

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::wait_for_replies (
            int min_count,
            const  dds::core::Duration & max_wait,
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Waits for replies to a specific request.

This operation is analogous to **QueueRequester::wait_for_replies(int, const dds::core::Duration&)** (p. 2123), except this operation waits for replies for a specific request.

Parameters

min_count	Minimum number of replies for the related request that need to be available for this operation to unblock.
max_wait	Maximum wait time after which this operation unblocks, regardless of how many replies are available.
related_request_id	The identity of a request previously sent by this **QueueRequester** (p. 2111)

Returns

true if at least min_count replies for the related request were available before max_wait elapsed, or false otherwise.

Exceptions

One	of the **Standard Exceptions** (p. 428)

MT Safety:

SAFE

See also

QueueRequester::wait_for_replies(int, const dds::core::Duration&) (p. 2123)

8.289.3.26 send_availability()

```
template<typename TReq , typename TRep >
void  rti::queuing::QueueRequester< TReq, TRep >::send_availability (
            ConsumerAvailabilityParams parameters )  [inline]
```

Sends the availability status of the **QueueConsumer** (p. 2063) receiving samples from the reply SharedReaderQueue to Queuing Service.

See also

QueueConsumer::send_availability(ConsumerAvailabilityParams) (p. 2074)

QueueRequesterParams::enable_availability

8.289.3.27 has_matching_request_reader_queue()

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::has_matching_request_reader_queue ( )  [inline]
```

Checks whether this **QueueRequester** (p. 2111) has matched with at least one request SharedReaderQueue.

See also

QueueProducer::has_matching_reader_queue() (p. 2089)

8.289.3.28 has_matching_reply_reader_queue()

```
template<typename TReq , typename TRep >
bool  rti::queuing::QueueRequester< TReq, TRep >::has_matching_reply_reader_queue ( )  [inline]
```

Checks whether this **QueueRequester** (p. 2111) has matched with at least one reply SharedReaderQueue.

See also

QueueConsumer::has_matching_reader_queue() (p. 2075)

8.289.3.29 writer()

```
template<typename TReq , typename TRep >
dds::pub::DataWriter< TReq >  rti::queuing::QueueRequester< TReq, TRep >::writer ( ) const  [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 1138) used to send requests.

See also

QueueProducer::writer() (p. 2088)

8.289.3.30 reader()

```
template<typename TReq , typename TRep >
dds::sub::DataReader< TRep >  rti::queuing::QueueRequester< TReq, TRep >::reader ( ) const  [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 976) used to receive replies.

See also

QueueConsumer::reader (p. 2070)

8.289.3.31 guid()

```
template<typename TReq , typename TRep >
rti::core::Guid rti::queuing::QueueRequester< TReq, TRep >::guid ( ) [inline]
```

Returns the GUID of this **QueueRequester** (p. 2111).

The **QueueRequester** (p. 2111)'s GUID is the same GUID of both the underlying **QueueProducer** (p. 2080) and **QueueConsumer** (p. 2063).

The GUID of the **QueueRequester** (p. 2111) is also used by Queuing Service to correlate the replies the **QueueRequester** (p. 2111) produces. Replies are only delivered to the **QueueRequester** (p. 2111) that generated the related request.

  User callback.

8.290.1 Detailed Description

template<typename TReq, typename TRep>
class rti::queuing::QueueRequesterListener< TReq, TRep >

Called when certain events occur in a **QueueRequester** (p. 2111).

A **QueueRequester** (p. 2111) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueRequesterParams** (p. 2128).

```
template<typename TReq , typename TRep >
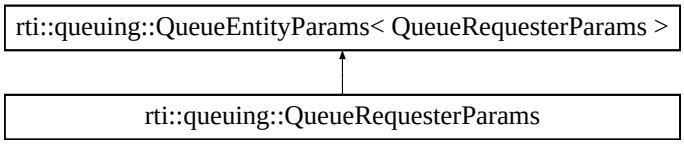
virtual void  rti::queuing::QueueRequesterListener< TReq, TRep >::on_reply_shared_reader_queue_↩
matched (
              QueueRequester< TReq, TRep > & requester,
             const  dds::core::status::SubscriptionMatchedStatus & status )  [pure virtual]
```

User callback.

See also

QueueConsumerListener::on_shared_reader_queue_matched (p. 2077)



Implemented in **rti::queuing::NoOpQueueRequesterListener< TReq, TRep >** (p. 1863).

8.291 rti::queuing::QueueRequesterParams Class Reference

Contains the parameters for creating a **QueueRequester** (p. 2111).

```
#include <rti/queuing/QueueParams.hpp>
```

Inheritance diagram for rti::queuing::QueueRequesterParams:

Public Member Functions

- **QueueRequesterParams** (**dds::domain::DomainParticipant** participant)

  *Creates a **QueueRequesterParams** (p. 2128) object with the participant set.*
- **QueueRequesterParams** & **enable_availability** (bool enable)

  Indicates whether the availability channel is enabled with the reply SharedReaderQueue.
- **QueueRequesterParams** & **enable_sample_replication** (bool enable)

  *Causes the **QueueRequester** (p. 2111) to write all the requests with the **dds::sub::SampleInfo::flag** (p. 2293) including the bit **rti::core::SampleFlag::replicate** (p. 2280).*
- **QueueRequesterParams** & **enable_wait_for_ack** (bool enable)

  Enables Queuing Service's 'Acknowledgment Management' feature for requests.

8.291.1 Detailed Description

Contains the parameters for creating a **QueueRequester** (p. 2111).

8.291.2 Constructor & Destructor Documentation

8.291.2.1 QueueRequesterParams()

```
rti::queuing::QueueRequesterParams::QueueRequesterParams (
              dds::domain::DomainParticipant participant )  [inline], [explicit]
```

Creates a **QueueRequesterParams** (p. 2128) object with the participant set.

The rest of the parameters that can be set in a **QueueRequesterParams** (p. 2128) object are optional.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) a **QueueRequester** (p. 2111) uses to join a domain.

8.291.3 Member Function Documentation

8.291.3.1 enable_availability()

```
QueueRequesterParams & rti::queuing::QueueRequesterParams::enable_availability (
            bool enable )  [inline]
```

Indicates whether the availability channel is enabled with the reply SharedReaderQueue.

See also

QueueConsumerParams::enable_availability.

References **rti::util::network_capture::enable()**.

8.291.3.2 enable_sample_replication()

```
QueueRequesterParams & rti::queuing::QueueRequesterParams::enable_sample_replication (
            bool enable )  [inline]
```

Causes the **QueueRequester** (p. 2111) to write all the requests with the **dds::sub::SampleInfo::flag** (p. 2293) including the bit **rti::core::SampleFlag::replicate** (p. 2280).

See also

QueueProducerParams::enable_sample_replication (p. 2093)

References **rti::util::network_capture::enable()**.

8.291.3.3 enable_wait_for_ack()

```
QueueRequesterParams & rti::queuing::QueueRequesterParams::enable_wait_for_ack (
            bool enable )  [inline]
```

Enables Queuing Service's 'Acknowledgment Management' feature for requests.

See also

QueueProducerParams::enable_wait_for_ack

References **rti::util::network_capture::enable()**.

8.292 dds::sub::Rank Class Reference

<<***value-type***>> *(p. 350)* Contains the sample and generation ranks of a data-sample

```
#include <TRank.hpp>
```

Public Member Functions

- **Rank** ()

  *Create a default **Rank** (p. 2130) object.*
- **Rank** (int32_t sample_rank, int32_t generation_rank, int32_t absolute_generation_rank)

  *Create a **Rank** (p. 2130) object with the provided sample_rank, generation_rank, and absolute_generation_rank.*
- int32_t **sample** () const

  Get the sample rank of the sample.
- int32_t **generation** () const

  Get the generation rank of the sample.
- int32_t **absolute_generation** () const

  Get the absolute generation rank of the sample.

8.292.1 Detailed Description

<<***value-type***>> *(p. 350)* Contains the sample and generation ranks of a data-sample

See also

dds::sub::SampleInfo::rank() (p. 2289)

8.292.2 Constructor & Destructor Documentation

8.292.2.1 Rank() [1/2]

```
dds::sub::Rank::Rank ( )  [inline]
```

Create a default **Rank** (p. 2130) object.

8.292.2.2 Rank() [2/2]

```
dds::sub::Rank::Rank (
            int32_t sample_rank,
            int32_t generation_rank,
            int32_t absolute_generation_rank )  [inline]
```

Create a **Rank** (p. 2130) object with the provided sample_rank, generation_rank, and absolute_generation_rank.

8.292.3 Member Function Documentation

8.292.3.1 sample()

```
int32_t dds::sub::Rank::sample ( ) const  [inline]
```

Get the sample rank of the sample.

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by `read` or `take`.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 2288)

8.292.3.2 generation()

```
int32_t dds::sub::Rank::generation ( ) const  [inline]
```

Get the generation rank of the sample.

The generation rank of the sample.

Indicates the generation difference (number of times the instance was NOT_ALIVE and become alive again) between the time the sample was received and the time the most recent sample in the collection related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 2288)

8.292.3.3 absolute_generation()

```
int32_t dds::sub::Rank::absolute_generation ( ) const  [inline]
```

Get the absolute generation rank of the sample.

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

8.293.1 Detailed Description

<<***reference-type***>> *(p. 351)* Condition specifically dedicated to read operations and attached to one **dds::sub::DataReader** (p. 976).

dds::sub::cond::ReadCondition (p. 2133) objects allow an application to specify the data samples it is interested in (by specifying the desired `sample_states`, `view_states` as well as `instance_states` in **dds::sub::DataReader::read** (p. 996) and **dds::sub::DataReader::take** (p. 997) variants.

This allows RTI Connext to enable the condition only when suitable information is available. They are to be used in conjunction with a WaitSet as normal conditions.

More than one **dds::sub::cond::ReadCondition** (p. 2133) may be attached to the same **dds::sub::DataReader** (p. 976).

Examples

Foo_subscriber.cxx.

8.293.2 Constructor & Destructor Documentation

8.293.2.1 ReadCondition() [1/2]

```
template<typename T >
dds::sub::cond::ReadCondition::ReadCondition (
            const  dds::sub::DataReader< T > & reader,
            const  dds::sub::status::DataState & status )  [inline]
```

Creates a **ReadCondition** (p. 2133).

Template Parameters

T	The topic-type of the **DataReader** (p. 976).

Parameters

reader	The reader associated to the condition. One reader can have multiple ReadConditions but one **ReadCondition** (p. 2133) belongs to exactly one **DataReader** (p. 976).
status	The sample, view and instance states of interest.

See also

rti::sub::cond::create_read_condition_ex

8.293.2.2 ReadCondition() [2/2]

```
template<typename T , typename Functor >
dds::sub::cond::ReadCondition::ReadCondition (
             const  dds::sub::DataReader< T > & reader,
             const  dds::sub::status::DataState & status,
             const Functor & handler )  [inline]
```

Creates a **ReadCondition** (p. 2133) with a handler.

Template Parameters

T	The topic-type of the **DataReader** (p. 976).
Functor	Any type whose instances can be called with a no-argument function call (i.e. `f()`, if `f` is an instance of `Functor`), or with a Condition argument (`f(condition)`) Examples are functions, types that override `operator()`, and lambdas.

Parameters

reader	The reader associated to the condition. One reader can have multiple ReadConditions but one **ReadCondition** (p. 2133) belongs to exactly one **DataReader** (p. 976).
status	The sample, view and instance states of interest.
handler	The handler that **dds::core::cond::WaitSet::dispatch()** (p. 2624) will call when the condition is triggered. This argument is copied.

The following examples creates two ReadConditions with handlers. The first one receives a lambda function with no arguments. The second one receives a function with the condition as an argument.

```
// Example 1: lambda function with no arguments
dds::sub::cond::ReadCondition my_read_condition(
       reader,
       dds::sub::status::DataState::any(),
       []()
       {
           std::cout « "condition has been triggered\n";
       }
);
// Example 2: function with a condition argument
void function_handler(dds::core::cond::Condition c)
{
    // function receiving the condition
    std::cout « "condition has been triggered\n";
}
dds::sub::cond::ReadCondition my_read_condition2(
       reader,
       dds::sub::status::DataState::any(),
       function_handler
);
```

dds::core::cond::WaitSet::dispatch() (p. 2624)

WaitSet wait and dispatch examples (p. 330)

8.293.3 Member Function Documentation

8.293.3.1 state_filter()

```
const dds::sub::status::DataState dds::sub::cond::ReadCondition::state_filter ( ) const [inline]
```

Returns the DataState of this condition.

8.293.3.2 data_reader()

```
const AnyDataReader & dds::sub::cond::ReadCondition::data_reader ( ) const [inline]
```

Returns the **DataReader** (p. 976) associated to this condition.

To obtain the actual typed **DataReader** (p. 976), see **AnyDataReader::get()** (p. 810)

8.293.3.3 close()

```
void dds::sub::cond::ReadCondition::close ( ) [inline]
```

Closes the **ReadCondition** (p. 2133).

This is a explicit deletion, which otherwise would occur when all references to this **ReadCondition** (p. 2133) go out of scope.

Precondition

The **ReadCondition** (p. 2133) must not be attached to any Waitsets.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	If the **ReadCondition** (p. 2133) is attached to a Waitset when it is closed.

8.293.3.4 closed()

```
bool dds::sub::cond::ReadCondition::closed ( ) const [inline]
```

Indicates whether this **ReadCondition** (p. 2133) has been closed with **close()** (p. 2136).

8.293.4 Friends And Related Function Documentation

8.293.4.1 create_read_condition_ex() [1/2]

```
dds::sub::cond::detail::ReadCondition create_read_condition_ex (
            const  dds::sub::AnyDataReader & reader,
            const  ::rti::sub::status::DataStateEx & status )  [related]
```

<<***extension***>> *(p. 354)* Creates a **ReadCondition** (p. 2133) with the extended DataStateEx.

Note

This is a standalone function in the namespace rti::sub::cond

The usual way to create a **dds::sub::cond::ReadCondition** (p. 2133) is the constructor that receives a **dds::sub↩ ::status::DataState** (p. 1118). This extension function allows using **rti::sub::status::DataStateEx** (p. 1126), which includes additional state masks.

References **dds::sub::condition()**.

8.293.4.2 create_read_condition_ex() [2/2]

```
template<typename Functor >
dds::sub::cond::detail::ReadCondition create_read_condition_ex (
            const  dds::sub::AnyDataReader & reader,
            const  ::rti::sub::status::DataStateEx & status,
            const Functor & handler )  [related]
```

<<***extension***>> *(p. 354)* Creates a **ReadCondition** (p. 2133) with the extended DataStateEx and a handler.

Note

This is a standalone function in the namespace rti::sub::cond

The usual way to create a **dds::sub::cond::ReadCondition** (p. 2133) is the constructor that receives a **dds::sub↩ ::status::DataState** (p. 1118). This extension function allows using **rti::sub::status::DataStateEx** (p. 1126), which includes additional state masks.

References **dds::sub::condition()**.

8.294 dds::core::policy::ReaderDataLifecycle Class Reference

Controls how a DataReader manages the lifecycle of the data that it has received.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **ReaderDataLifecycle** ()

  Creates the default policy.
- **ReaderDataLifecycle** (const **dds::core::Duration** &the_nowriter_delay, const **dds::core::Duration** &the_↩ disposed_samples_delay)

  Creates an instance with the specified nowriter and disposed-samples purge delays.
- **ReaderDataLifecycle** & **autopurge_nowriter_samples_delay** (const **dds::core::Duration** &duration)

  Minimum duration for which the DataReader will maintain samples for an instance once its `instance_state` becomes InstanceStateKind::NOT_ALIVE_NO_WRITERS.

  *<<**extension**>> (p. 116) Getter (see setter with the same name)*

Static Public Member Functions

- static **ReaderDataLifecycle NoAutoPurge** ()

  Returns a policy where all purge delays are disabled (the default)
- static **ReaderDataLifecycle AutoPurgeDisposedSamples** (const **dds::core::Duration** &duration)

  Returns a policy where only the disposed-samples purge delay is enabled with a specified duration.
- static **ReaderDataLifecycle AutoPurgeNoWriterSamples** (const **dds::core::Duration** &d)

  Returns a policy where only the no-writer purge delay is enabled with a specified duration.

8.294.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

When a DataReader receives data, it is stored in a receive queue for the DataReader. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Connext will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more DataWriters alive for that data. It specifies how long a **dds::sub::DataReader** (p. 976) must retain information regarding instances that have the instance_state **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The **dds::sub::DataReader** (p. 976) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203).

The **dds::sub::DataReader** (p. 976) also maintains information regarding the identity, `view_state` and `instance_state` of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the **dds::sub::DataReader** (p. 976) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the **dds::sub::DataReader** (p. 976) will have taken for that instance will have an `instance_state` of either **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) or **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of **READER_DATA_LIFECYCLE** (p. 543), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the **dds::sub::DataReader** (p. 976) from reclaiming the resources and they would remain in the **dds::sub::DataReader** (p. 976) indefinitely.

A DataReader can also reclaim all resources for instances that have an instance state of **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) and for which all DDS samples have been 'taken'. DataReaders will only reclaim resources in this situation when the autopurge_disposed_instances_delay has been set to zero.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Connext detects that there are no longer DataWriters alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

dds::sub::DataReader (p. 976)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **YES** (p. 514)

8.294.2 Constructor & Destructor Documentation

8.294.2.1 ReaderDataLifecycle() [1/2]

```
dds::core::policy::ReaderDataLifecycle::ReaderDataLifecycle ( )  [inline]
```

Creates the default policy.

8.294.2.2 ReaderDataLifecycle() [2/2]

```
dds::core::policy::ReaderDataLifecycle::ReaderDataLifecycle (
            const  dds::core::Duration & the_nowriter_delay,
            const  dds::core::Duration & the_disposed_samples_delay )  [inline]
```

Creates an instance with the specified nowriter and disposed-samples purge delays.

8.294.3 Member Function Documentation

8.294.3.1 autopurge_nowriter_samples_delay() [1/2]

```
ReaderDataLifecycle & dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay (
            const  dds::core::Duration & duration )  [inline]
```

Minimum duration for which the DataReader will maintain samples for an instance once its `instance_state` becomes InstanceStateKind::NOT_ALIVE_NO_WRITERS.

At some point after this time elapses, the **dds::sub::DataReader** (p. 976) will purge all samples for the instance; any "untaken" samples will also be dropped.

[default] dds::core::Duration::infinite() (p. 1451)

[range] [1 nanosec, 1 year] or **dds::core::Duration::infinite()** (p. 1451)

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193), **Sample Memory Management** (p. 230), **Data Availability** (p. 167)

8.294.3.2 autopurge_nowriter_samples_delay() [2/2]

```
dds::core::Duration dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay ( )
const  [inline]
```

Getter (see setter with the same name)

8.294.3.3 autopurge_disposed_samples_delay() [1/2]

```
ReaderDataLifecycle & dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay (
            const  dds::core::Duration & duration )  [inline]
```

Minimum duration for which the DataReader will maintain samples for an instance once its `instance_state` becomes InstanceStateKind::NOT_ALIVE_DISPOSED.

After this time elapses, the **dds::sub::DataReader** (p. 976) will purge all samples for the instance even if they have not been read by the application. This purge is done lazily when space is needed for other samples or instances.

[default] dds::core::Duration::infinite() (p. 1451)

[range] [1 nanosec, 1 year] or **dds::core::Duration::infinite()** (p. 1451)

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193), **Sample Memory Management** (p. 230), **Data Availability** (p. 167)

8.294.3.4 autopurge_disposed_samples_delay() [2/2]

```
dds::core::Duration dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay ( )
const  [inline]
```

Getter (see setter with the same name)

8.294.3.5 NoAutoPurge()

```
static  ReaderDataLifecycle dds::core::policy::ReaderDataLifecycle::NoAutoPurge ( )  [inline],
[static]
```

Returns a policy where all purge delays are disabled (the default)

[DEPRECATED] Use the default constructor instead

8.294.3.6 AutoPurgeDisposedSamples()

```
static ReaderDataLifecycle dds::core::policy::ReaderDataLifecycle::AutoPurgeDisposedSamples (
            const dds::core::Duration & duration ) [inline], [static]
```

Returns a policy where only the disposed-samples purge delay is enabled with a specified duration.

8.294.3.7 AutoPurgeNoWriterSamples()

```
static ReaderDataLifecycle dds::core::policy::ReaderDataLifecycle::AutoPurgeNoWriterSamples (
            const dds::core::Duration & d ) [inline], [static]
```

Returns a policy where only the no-writer purge delay is enabled with a specified duration.

8.294.3.8 autopurge_disposed_instances_delay() [1/2]

```
dds::core::policy::ReaderDataLifecycle & autopurge_disposed_instances_delay (
            const dds::core::Duration & duration )
```

<<***extension***>> *(p. 116)* Minimum duration for which the DataReader will maintain an instance once its `instance_state` becomes InstanceStateKind::NOT_ALIVE_DISPOSED.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

After this time elapses, when the last sample for the disposed instance is taken, the **dds::sub::DataReader** (p. 976) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set keep_minimum_state_for_instances to FALSE in **rti::core::policy::DataReaderResourceLimits** (p. 1081).

The only currently supported values are **dds::core::Duration::zero()** (p. 1450) and **dds::core::Duration::infinite()** (p. 1451). A value of **dds::core::Duration::zero()** (p. 1450) will purge an instance's state immediately after the instance state transitions to **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617), as long as all samples, including the dispose sample, associated with that instance have been 'taken'.

[default] dds::core::Duration::infinite() (p. 1451)

- int32_t **buffer_alignment** () const

  Getter (see setter with the same name)

8.296.1 Detailed Description

<<***extension***>> *(*p. *116)* Configures threads that RTI Connext uses to receive and process data from the transport modules (such as UDP)

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

See also

Controlling CPU Core Affinity for RTI Threads (p. 2453)

8.296.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports.

RTI uses a separate receive thread per port per transport plug-in. To force RTI Connext to use a separate thread to process the data for a **dds::sub::DataReader** (p. 976), set a unique port for the **rti::core::policy::TransportUnicast** (p. 2556) or **rti::core::policy::TransportMulticast** (p. 2543) for the **dds::sub::DataReader** (p. 976).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **dds::domain::DomainParticipant** (p. 1326) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

8.296.3 Constructor & Destructor Documentation

8.296.3.1 ReceiverPool() [1/2]

```
rti::core::policy::ReceiverPool::ReceiverPool ( )  [inline]
```

Creates the default policy.

8.296.3.2 ReceiverPool() [2/2]

```
rti::core::policy::ReceiverPool::ReceiverPool (
            const  rti::core::ThreadSettings & the_thread,
            int32_t the_buffer_size,
            int32_t the_buffer_alignment )
```

Creates an instance with the thread settings, buffer size and buffer alignment configuration.

See individual setters.

8.296.4 Member Function Documentation

8.296.4.1 thread() [1/3]

```
ReceiverPool & rti::core::policy::ReceiverPool::thread (
            const  rti::core::ThreadSettings & the_thread )
```

Configures the receiver pool thread(s)

There is at least one receive thread, possibly more.

[default] priority above normal.
The actual value depends on your architecture:

For Windows: 2
For Linux: OS default priority
For a complete list of platform specific values, please refer to `Platform Notes`.

[default] The actual value depends on your architecture:

For Windows: OS default stack size
For Linux: OS default stack size
For a complete list of platform specific values, please refer to `Platform Notes`.

8.296.4.2 thread() [2/3]

```
const  rti::core::ThreadSettings & rti::core::policy::ReceiverPool::thread ( ) const
```

Getter (see setter with the same name)

8.296.4.3 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::ReceiverPool::thread ( )
```

Getter (see setter with the same name)

8.296.4.4 buffer_size() [1/2]

```
ReceiverPool & rti::core::policy::ReceiverPool::buffer_size (
            int32_t the_buffer_size )
```

Sets the length of the buffer used to store the incoming raw data.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

buffer_size must always be at least as large as the maximum **NDDS_Transport_Property_t::message_size_max** (p. 1789) across *all* of the transports being used that are not doing zero-copy.

By default (rti::core::LENGTH_AUTO): the size is equal to the maximum **NDDS_Transport_Property_t::message_↩ size_max** (p. 1789) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set **NDDS_Transport_Property_t::message_size_max** (p. 1789) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the buffer_size should be equal to the original **NDDS_Transport_Property_t::message_size_max** (p. 1789).

[default] rti::core::LENGTH_AUTO

[range] [1, 1 GB] or rti::core::LENGTH_AUTO

8.298.1 Detailed Description

Indicates the level of reliability in sample delivered that a **dds::pub::DataWriter** (p. 1138) offers or a **dds::sub::Data↩ Reader** (p. 976) requests.

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2380), **dds::core::status::StatusMask↩ ::requested_incompatible_qos()** (p. 2381)

Properties:

RxO (p. 514) = YES
Changeable (p. 514) = **UNTIL ENABLE** (p. 514) (the instance_state_consistency_kind is **Changeable** (p. 514) = **NO** (p. 514))

8.298.2 Usage

This policy indicates the level of reliability requested by a **dds::sub::DataReader** (p. 976) or offered by a **dds::pub::DataWriter** (p. 1138).

The reliability of a connection between a DataWriter and DataReader is entirely user configurable. It can be done on a per DataWriter/DataReader connection. A connection may be configured to be "best effort" which means that RTI Connext will not use any resources to monitor or guarantee that the data sent by a DataWriter is received by a DataReader.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from DataWriters to DataReaders. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a DataWriter is received reliably by DataReaders. This means that RTI Connext must check whether or not data was received, and repair any data that was rejected by resending a copy of the data as many times as it takes for the DataReader to receive the data. RTI Connext uses a reliability protocol configured and tuned by these QoS policies: **dds::core::policy::History** (p. 1602), **rti::core::policy::DataWriterProtocol** (p. 1210), **rti::core::policy::DataReaderProtocol** (p. 1059), and **dds::core::policy::ResourceLimits** (p. 2203).

The **Reliability** (p. 2149) QoS policy is simply a switch to turn on the reliability protocol for a DataWriter/DataReader connection. The level of reliability provided by RTI Connext is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Connext to deliver *all* data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last *N* values are guaranteed to be delivered reliably to DataReaders (where *N* is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last *N* are received. Only the last *N* data packets are monitored and repaired if necessary.

These levels are ordered, **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157) $<$ **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157). A **dds::pub::DataWriter** (p. 1138) offering one level is implicitly offering all levels below.

The setting of this policy has a dependency on the setting of the **RESOURCE_LIMITS** (p. 546) policy. In case the reliability kind is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) the write operation on the **dds::pub::DataWriter** (p. 1138) may block if the modification would cause data to be lost or else cause one of the limits in specified in the **RESOURCE_LIMITS** (p. 546) to be exceeded. Under these circumstances, the **RELIABILITY** (p. 544) `max_blocking_time` configures the maximum duration the write operation may block.

If the **dds::core::policy::Reliability::kind** (p. 2153) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157), data samples originating from a single **dds::pub::DataWriter** (p. 1138) cannot be made available to the **dds::sub::DataReader** (p. 976) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Connext will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the **dds::pub::DataWriter** (p. 1138) history before it is accessible by the **dds::sub::DataReader** (p. 976).

If the **dds::core::policy::Reliability::kind** (p. 2153) is set to **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157), the service will not re-transmit missing data samples. However, for data samples originating from any one DataWriter the service will ensure they are stored in the **dds::sub::DataReader** (p. 976) history in the same order they originated in the **dds::pub::DataWriter** (p. 1138). In other words, the **dds::sub::DataReader** (p. 976) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

dds::core::policy::History (p. 1602)

dds::core::policy::ResourceLimits (p. 2203)

8.298.3 Compatibility

The value offered is considered compatible with the value requested if and only if:

- The inequality *offered* `kind` >= *requested* `kind` evaluates to 'TRUE'. For the purposes of this inequality, the values of **dds::core::policy::Reliability::kind** (p. 2153) are considered ordered such that **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157) < **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157). If **dds::core::policy::Reliability::exact_reliability_kind_match** (p. 2155) is set to true, then only exact kind matches, *offered* `kind` == *requested* `kind`, are considered compatible.

- The offered acknowledgment_kind = **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 797) and requested acknowledgment_kind = **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 797) OR offered acknowledgment_kind != **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 797).

- The inequality *offered* `instance_state_consistency_kind` >= *requested* `instance_state_consistency_kind` evaluates to 'TRUE'. For the purposes of this inequaility, the values of **dds::core::policy::Reliability::instance_state_consistency_kind** (p. 2155) are considered ordered such that **rti::core::policy::InstanceStateConsistencyKind::none** (p. 545) < **rti::core::policy::InstanceStateConsistencyKind::recover_state** (p. 545).

8.298.4 Constructor & Destructor Documentation

8.298.4.1 Reliability() [1/2]

```
dds::core::policy::Reliability::Reliability ( )  [inline]
```

Creates a best-effort policy.

8.298.4.2 Reliability() [2/2]

```
dds::core::policy::Reliability::Reliability (
             dds::core::policy::ReliabilityKind the_kind,
            const  dds::core::Duration & the_max_blocking_time =  dds::core::Duration::from_millisecs(100) )  [inline]
```

Creates an instance with the specified reliability kind an optionally a specific maximum blocking time.

The max blocking time only applies to reliable DataWriters.

8.298.5 Member Function Documentation

8.298.5.1 kind() [1/2]

```
Reliability & dds::core::policy::Reliability::kind (
            dds::core::policy::ReliabilityKind the_kind )  [inline]
```

Sets the reliability kind.

[default] **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157) for **dds::sub::DataReader** (p. 976) and **dds::topic::Topic** (p. 2474), **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) for **dds::pub::DataWriter** (p. 1138)

```
dds::core::policy::Reliability & instance_state_consistency_kind (
            rti::core::policy::InstanceStateConsistencyKind isr_kind )
```

<<***extension***>> *(*p. *116)* Whether instance state consistency is enabled

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

A DataReader that determines that the DataWriter is no longer alive will transition instances to NOT_ALIVE_NO_↩ WRITERS if there are no other DataWriters updating that instance. If the DataReader rediscovers the DataWriter, the DataReader does not automatically transition instances back to the state they were in prior to the disconnection until it gets updates (i.e., samples) for them.

If `InstanceStateConsistencyKind` is set to `RECOVER_INSTANCE_STATE_CONSISTENCY`, then when the DataReader rediscovers a DataWriter, the DataReader will query the DataWriter for the state of its instances, and restore the instances to their correct state.

[default] rti::core::policy::InstanceStateConsistencyKind::none (p. 545) for **dds::sub::DataReader** (p. 976), **rti↩ ::core::policy::InstanceStateConsistencyKind::recover_state** (p. 545) for **dds::pub::DataWriter** (p. 1138)

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Reliability** (p. 222), **Instance Lifecycle** (p. 193)

8.298.5.10 instance_state_consistency_kind() [2/2]

```
rti::core::policy::InstanceStateConsistencyKind instance_state_consistency_kind ( ) const
```

<<***extension***>> *(*p. *116)* Getter (see setter with the same name)

8.298.5.11 exact_reliability_kind_match() [1/2]

```
dds::core::policy::Reliability & exact_reliability_kind_match (
            bool exact_reliability_kind_match )
```

<<***extension***>> *(*p. *116)* Sets whether or not the reliability kind should match exactly when checking compatibility between DataReaders and DataWriters.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

If set to TRUE in the DataWriter, the offered and requested reliability kinds must be exactly the same to be considered compatible for endpoint matching. If set to FALSE in the DataWriter, the offered reliability kind must be greater than or equal to the requested reliability kind to be considered compatible for endpoint matching. Set it to TRUE in the DataWriter to save memory and CPU cycles if communication with **dds::core::policy::ReliabilityKind_def::BEST_↩ EFFORT** (p. 2157) DataReaders is not required.

This setting has no effect on DataReaders.

[default] FALSE

The definition of the **dds::core::safe_enum** (p. 2265) ReliabilityKind.

8.299.2 Member Enumeration Documentation

8.299.2.1 type

`enum` **dds::core::policy::ReliabilityKind_def::type**

The underlying `enum` type.

Enumerator

BEST_EFFORT	Indicates that it is acceptable to not retry propagation of any samples. Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples. **[default]** for **dds::sub::DataReader** (p. 976) and **dds::topic::Topic** (p. 2474)
RELIABLE	Specifies that RTI Connext will attempt to deliver all samples in its history. Missed samples may be retried. In steady-state (no modifications communicated via the **dds::pub::DataWriter** (p. 1138)), RTI Connext guarantees that all samples in the **dds::pub::DataWriter** (p. 1138) history will eventually be delivered to all the **dds::sub::DataReader** (p. 976) objects (subject to timeouts that indicate loss of communication with a particular **dds::sub::Subscriber** (p. 2410)). Outside steady state, the **HISTORY** (p. 533) and **RESOURCE_LIMITS** (p. 546) policies will determine how samples become part of the history and whether samples can be discarded from it. **[default]** for **dds::pub::DataWriter** (p. 1138)

- **dds::core::InstanceHandle last_instance_handle** () const

  The instance handle of the last reliable remote reader to be determined inactive.

8.300.1 Detailed Description

<<***extension***>> *(*p. *354)* Information about the status **dds::core::status::StatusMask::reliable_reader_activity_changed()** (p. 2385)

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

This status is the reciprocal status to the **dds::core::status::LivelinessChangedStatus** (p. 1652) on the reader. It is different than the **dds::core::status::LivelinessLostStatus** (p. 1655) on the writer in that the latter informs the writer about its own liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

8.300.2 Member Function Documentation

8.300.2.1 active_count()

```
EventCount32 rti::core::status::ReliableReaderActivityChangedStatus::active_count ( ) const  [inline]
```

The current number of reliable readers currently matched with this reliable writer.

8.300.2.2 inactive_count()

```
EventCount32 rti::core::status::ReliableReaderActivityChangedStatus::inactive_count ( ) const
[inline]
```

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats **rti::core::policy::RtpsReliableWriterProtocol↩ ::max_heartbeat_retries** (p. 2239) times, each heartbeat having been separated from the previous by the current heartbeat period.

8.300.2.3 last_instance_handle()

```
dds::core::InstanceHandle rti::core::status::ReliableReaderActivityChangedStatus::last_instance↩
_handle ( ) const  [inline]
```

The instance handle of the last reliable remote reader to be determined inactive.

Public Member Functions

- **EventCount32 empty_reliable_writer_cache** () const

  The number of times the reliable writer's cache of unacknowledged samples has become empty.
- **EventCount32 full_reliable_writer_cache** () const

  The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.
- **EventCount32 low_watermark_reliable_writer_cache** () const

  The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.
- **EventCount32 high_watermark_reliable_writer_cache** () const

  The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.
- int32_t **unacknowledged_sample_count** () const

  The current number of unacknowledged samples in the writer's cache.
- int32_t **unacknowledged_sample_count_peak** () const

  The highest value that unacknowledged_sample_count has reached until now.
- int64_t **replaced_unacknowledged_sample_count** () const

  The number of unacknowledged samples that have been replaced in the writer's cache.

8.301.1 Detailed Description

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385)

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

8.301.2 Member Function Documentation

8.301.2.1 empty_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::empty_reliable_writer_cache ( )
const  [inline]
```

The number of times the reliable writer's cache of unacknowledged samples has become empty.

8.301.2.2 full_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::full_reliable_writer_cache ( )
const  [inline]
```

The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.

Applies to writer's cache when the send window is enabled (when both **rti::core::policy::RtpsReliableWriterProtocol::min_send_window_size** (p. 2249) and **rti::core::policy::RtpsReliableWriterProtocol::max_send_window_size** (p. 2250) are not **dds::core::LENGTH_UNLIMITED** (p. 438)).

Otherwise, applies when the number of unacknowledged samples has reached the send window limit.

8.301.2.3 low_watermark_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::low_watermark_reliable_writer↩
_cache ( ) const  [inline]
```

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

When the writer's send window is enabled, the low watermark is scaled down, if necessary, to fit within the current send window.

Set the low watermark value using the **rti::core::policy::RtpsReliableWriterProtocol::low_watermark** (p. 2232) field of the **rti::core::policy::RtpsReliableWriterProtocol** (p. 2229) structure.

8.301.2.4 high_watermark_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::high_watermark_reliable_↩
writer_cache ( ) const  [inline]
```

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

When the writer's send window is enabled, the high watermark is scaled down, if necessary, to fit within the current send window.

Set the high watermark value using the **rti::core::policy::RtpsReliableWriterProtocol::high_watermark** (p. 2233) field of the **rti::core::policy::RtpsReliableWriterProtocol** (p. 2229) structure.

8.301.2.5 unacknowledged_sample_count()

```
int32_t rti::core::status::ReliableWriterCacheChangedStatus::unacknowledged_sample_count ( ) const
[inline]
```

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

8.301.2.6 unacknowledged_sample_count_peak()

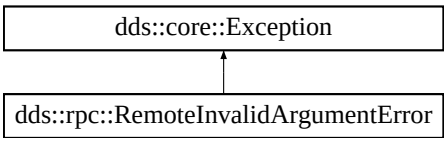
```
int32_t rti::core::status::ReliableWriterCacheChangedStatus::unacknowledged_sample_count_peak ( )
const  [inline]
```

The highest value that unacknowledged_sample_count has reached until now.

8.301.2.7 replaced_unacknowledged_sample_count()

```
int64_t rti::core::status::ReliableWriterCacheChangedStatus::replaced_unacknowledged_sample_count
( ) const  [inline]
```

The number of unacknowledged samples that have been replaced in the writer's cache.



Total number of unacknowledged samples that have been replaced by a DataWriter after applying **dds::core::policy↩ ::HistoryKind_def::KEEP_LAST** (p. 1607) policy.

8.302 dds::rpc::RemoteInvalidArgumentError Class Reference

Thrown when a Client provides an invalid argument to a Service operation.

Access the message contained in this **RemoteOutOfResourcesError** (p. 2163) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.304 rti::core::policy::RemoteParticipantPurgeKind_def Struct Reference

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) RemoteParticipantPurgeKind

`#include <PolicyKind.hpp>`

Public Types

- enum **type** {
  LIVELINESS_BASED ,
  NO_PURGE }
  The underlying `enum` *type.*

8.304.1 Detailed Description

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) RemoteParticipantPurgeKind

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also

rti::core::policy::DiscoveryConfig::remote_participant_purge_kind (p. 1281)

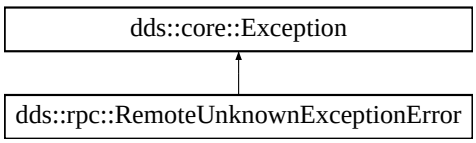
8.304.2 Member Enumeration Documentation

8.304.2.1 type

`enum` **rti::core::policy::RemoteParticipantPurgeKind_def::type**

The underlying `enum` type.

Enumerator



LIVELINESS_BASED	**[default]** Maintain knowledge of the remote participant for as long as it maintains its liveliness contract. A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered. The liveliness contract a participant promises to its peers – its "liveliness lease duration" – is specified in its **rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration** (p. 1279) QoS field. It maintains that contract by writing data to those other participants with a writer that has a **dds::core::policy::LivelinessKind_def** (p. 1654) of **dds::core::policy::LivelinessKind_def::AUTOMATIC** (p. 1655) or **dds::core::policy::LivelinessKind_def::MANUAL_BY_PARTICIPANT** (p. 1655) and by asserting itself (at the **rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period** (p. 1279)) over the Simple **Discovery** (p. 1265) Protocol.
NO_PURGE	Never "forget" a remote participant with which discovery communication has been lost. If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely. This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.

8.305 dds::rpc::RemoteUnknownExceptionError Class Reference

Thrown when an unknown exception occurs in the Service.

`#include <Exception.hpp>`

Inheritance diagram for dds::rpc::RemoteUnknownExceptionError:

Public Member Functions

- virtual const char * **what** () const noexcept

  *Access the message contained in this **RemoteUnknownExceptionError** (p. 2165) exception.*

  *Obtains the number of Requesters that match with a **Replier** (p. 2168).*

8.308.1 Detailed Description

template<typename RequestType, typename ReplyType>
class rti::request::Replier< RequestType, ReplyType >

*<<**reference-type**>>* *(p. 351)* Allows receiving requests and sending replies

Note

A **Replier** (p. 2168) provides all the functions of a *<<**reference-type**>>* *(p. 351)* except **close()** (p. 1024) and retain().

A **Replier** (p. 2168) is an entity with two associated **topics** (p. 47): a request topic and a reply topic. It can receive requests by subscribing to the request topic and can send replies to those requests by publishing the reply topic.

Valid types for these topics are: those generated by rtiddsgen, the **DDS built-in types** (p. 50), and **dds::core::xtypes::DynamicData** (p. 1461). See **Creating a Replier** (p. 347).

A **Replier** (p. 2168) has four main types of operations:

- Waiting for requests to be received from the middleware
- Getting those requests
- Receiving requests (a convenience operation that is a combination of waiting and getting in a single operation)
- Sending a reply for a previously received request (i.e., publishing a reply sample on the reply topic with special meta-data so that the orignal **Requester** (p. 2187) can identify it)

For multi-reply scenarios in which a **rti::request::Replier** (p. 2168) generates more than one reply for a request, the **rti::request::Replier** (p. 2168) should mark all the intermediate replies (all but the last) using the **rti::core::SampleFlag::intermediate_reply_sequence** (p. 2280) flag in **rti::pub::WriteParams::flag** (p. 2649).

Much like a **Requester** (p. 2187), a **Replier** (p. 2168) has an associated **dds::domain::DomainParticipant** (p. 1326), which can be shared with other Repliers or RTI Connext routines. All the other entities required for the request-reply interaction, including a **dds::pub::DataWriter** (p. 1138) for writing replies and a **dds::sub::DataReader** (p. 976) for reading requests, are automatically created when the **Replier** (p. 2168) is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see RequesterParams::qos_profile). By default, they are created with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 348)

There are several ways to use a **Replier** (p. 2168):

- A thread **receives** (p. 2175) requests and then dispatches them. If the computation of a reply is a simple operation, consider using a **SimpleReplier** (p. 2368) instead of a **Replier** (p. 2168).
- Polling without waiting, using **rti::request::Replier::take_requests** (p. 2176) directly.
- Using a **ReplierListener** (p. 2179) to get notified and **get** (p. 2176) the requests within the callback.

Template Parameters

RequestType	The data type for the request topic
ReplyType	The data type for the reply topic

See also

rti::request::Requester (p. 2187)

Request-Reply Examples (p. 344)

Basic Replier example (p. 348)

8.308.2 Constructor & Destructor Documentation

8.308.2.1 Replier() [1/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
              dds::domain::DomainParticipant participant,
             const std::string & service_name )  [inline]
```

Creates a **Replier** (p. 2168) with the minimum set of parameters.

Parameters

participant	The DomainParticipant that this **Replier** (p. 2168) uses to join a domain.
service_name	The service name. See **ReplierParams::service_name** (p. 2181)

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.308.2.2 Replier() [2/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
             const  ReplierParams & params )  [inline], [explicit]
```

Creates a **Replier** (p. 2168) with parameters.

Parameters

params	All the parameters that configure this **Replier** (p. 2168)

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

ReplierParams (p. 2180)

Creating a Replier (p. 347)

8.308.2.3 Replier() [3/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
            const  ReplierParams & params,
             Listener * the_listener )  [inline]
```

Creates a replier with additional parameters and a listener.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<`**Listener** (p. 1637)`>` instead of a regular `Listener*` pointer.

Parameters

params	All the parameters that configure this **Replier** (p. 2168)
the_listener	A **ReplierListener** (p. 2179) that notifies when new requests are available. Cannot be NULL.

Note

The listener must be reset with `this->listener(NULL)` before this object can be destroyed. Alternatively, create the **Replier** (p. 2168) and then use **rti::core::bind_listener()** (p. 708) to have it automatically reset.

8.308.2.4 Replier() [4/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
            const  ReplierParams & params,
            std::shared_ptr<  Listener > the_listener )  [inline]
```

Creates a replier with additional parameters and a listener.

Parameters

params	All the parameters that configure this **Replier** (p. 2168)
the_listener	A **ReplierListener** (p. 2179) that notifies when new requests are available. Cannot be nullptr, but the parameter can be omitted.

8.308.3 Member Function Documentation

8.308.3.1 send_reply() [1/3]

```
template<typename RequestType , typename ReplyType >
void  rti::request::Replier< RequestType, ReplyType >::send_reply (
            const ReplyType & reply,
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Sends a reply for a previous request.

The related request identity can be retrieved from an existing request sample (Sample).

Parameters

reply	The reply to be sent.
related_request_id	The identity of a previously received request

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

Sample::identity

rti::request::Replier::receive_requests (p. 2175)

rti::request::Replier::take_requests (p. 2176)

Basic Replier example (p. 348)

8.308.3.2 send_reply() [2/3]

```
template<typename RequestType , typename ReplyType >
void  rti::request::Replier< RequestType, ReplyType >::send_reply (
```

```
            const ReplyType & reply,
            const  dds::sub::SampleInfo & related_request_info )  [inline]
```

Sends a reply.

This operation obtains the related_request_id from a request SampleInfo, that is, it's equivalent to send_reply(reply, related_request_info->**original_publication_virtual_sample_identity()** (p. 2292))

References **dds::sub::SampleInfo::original_publication_virtual_sample_identity()**.

8.308.3.3 send_reply() [3/3]

```
template<typename RequestType , typename ReplyType >
void  rti::request::Replier< RequestType, ReplyType >::send_reply (
            const ReplyType & reply,
             rti::pub::WriteParams & params )  [inline]
```

Sends a reply with advanced parameters.

Parameters

reply	The reply to be sent
params	(in-out) The parameters to write the reply (see).

Precondition

params.related_sample_identity() must be set with the related request SampleIdentity.

Other parameters to customize are discussed in **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179). In particular, **rti::pub::WriteParams::flag** (p. 2649) can be set to **rti::core::SampleFlag::intermediate_reply_sequence** (p. 2280) to inform the **Requester** (p. 2187) application that this reply will be followed by additional replies to the same request. The **Requester** (p. 2187) can access the flag in **dds::sub::SampleInfo::flag()** (p. 2293) when it receives the reply.

8.308.3.4 wait_for_requests() [1/2]

```
template<typename RequestType , typename ReplyType >
bool  rti::request::Replier< RequestType, ReplyType >::wait_for_requests (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for requests.

Equivalent to **rti::request::Replier::wait_for_requests** (p. 2174) with `min_count=1`

See also

rti::request::Replier::wait_for_requests (p. 2174)

8.308.3.5 wait_for_requests() [2/2]

```
template<typename RequestType , typename ReplyType >
bool  rti::request::Replier< RequestType, ReplyType >::wait_for_requests (
            int min_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for requests.

This operation waits for min_count requests to be available. It will wait up to max_wait .

This operation is similar to **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195).

Parameters

min_count	Minimum number of requests that need to be available for this operation to unblock.
max_wait	Maximum waiting time after which this operation unblocks regardless of how many requests are available.

Returns

true if at least min_count requests were available before max_wait elapsed, or false otherwise.

See also

rti::request::Replier::take_requests (p. 2176)

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 2195)

8.308.3.6 receive_requests() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType >  rti::request::Replier< RequestType, ReplyType >::receive↩
_requests (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple requests and provides a loaned container to access them.

Equivalent to using **rti::request::Replier::receive_requests** (p. 2175) with `min_count=1` and `max_count=`**dds↩ ::core::LENGTH_UNLIMITED** (p. 438)

See also

dds::sub::LoanedSamples (p. 1663)

rti::request::Replier::receive_requests (p. 2175)

8.308.3.7 receive_requests() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType >  rti::request::Replier< RequestType, ReplyType >::receive_requests (
            int min_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple requests and provides a loaned container to access them.

Equivalent to using **rti::request::Replier::wait_for_requests** (p. 2174) and **rti::request::Replier::take_requests** (p. 2176)

See also

dds::sub::LoanedSamples (p. 1663)

rti::request::Replier::wait_for_requests (p. 2174)

rti::request::Replier::take_requests (p. 2176)

8.308.3.8 take_requests()

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType >  rti::request::Replier< RequestType, ReplyType >::take_requests ( )  [inline]
```

Takes all the requests.

See also

rti::request::Requester::take_replies (p. 2193)

8.308.3.9 read_requests()

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType >  rti::request::Replier< RequestType, ReplyType >::read_requests ( )  [inline]
```

Reads all the requests.

This operation is equivalent to **rti::request::Replier::take_requests** (p. 2176) except the requests remain in the **Replier** (p. 2168) and can be read or taken again.

8.308.3.10 listener() [1/2]

```
template<typename RequestType , typename ReplyType >
Listener * rti::request::Replier< RequestType, ReplyType >::listener ( ) const [inline]
```

Gets the replier listener.

[DEPRECATED] Prefer **get_listener()** (p. 2177) instead of this function.

8.308.3.11 listener() [2/2]

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::listener (
            Listener * the_listener,
            const dds::core::status::StatusMask & = dds::core::status::StatusMask::none() )
[inline]
```

Sets a listener to be notified when requests are available.

[DEPRECATED] The use of **set_listener()** (p. 2177) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

The listener will be called when new requests are available.

Note

rti::core::bind_listener() (p. 708) is recommended instead of this listener setter. **bind_listener()** (p. 1644) and **bind_and_manage_listener()** (p. 1644) automatically remove the listener, which allows the **Replier** (p. 2168) to be automatically destroyed.

(The second parameter is ignored)

8.308.3.12 get_listener()

```
template<typename RequestType , typename ReplyType >
std::shared_ptr< Listener > rti::request::Replier< RequestType, ReplyType >::get_listener ( )
const [inline]
```

Gets the replier listener.

The listener will be called when new requests are available

8.308.3.13 set_listener()

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::set_listener (
            std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified when requests are available.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the replier. If it does, the application needs to manually reset the listener (set_listener(nullptr)) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive updates or `nullptr` to reset the current listener and stop receiving updates.

8.308.3.14 request_datareader()

```
template<typename RequestType , typename ReplyType >
dds::sub::DataReader< RequestType > rti::request::Replier< RequestType, ReplyType >::request_↩
datareader ( ) const [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 976).

See also

rti::request::Requester::get_reply_datareader

Referenced by **rti::request::Replier< RequestType, ReplyType >::matched_requester_count()**.

8.308.3.15 reply_datawriter()

```
template<typename RequestType , typename ReplyType >
dds::pub::DataWriter< ReplyType > rti::request::Replier< RequestType, ReplyType >::reply_↩
datawriter ( ) const [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 1138).

See also

rti::request::Requester::get_request_datawriter

Referenced by **rti::request::Replier< RequestType, ReplyType >::matched_requester_count()**.

8.308.4 Friends And Related Function Documentation

8.308.4.1 matched_requester_count()

```
template<typename RequestType , typename ReplyType >
size_t matched_requester_count (
              Replier< RequestType, ReplyType > replier )  [related]
```

Obtains the number of Requesters that match with a **Replier** (p. 2168).

Note

This is a standalone function in the namespace rti::request

For a **Requester** (p. 2187) to be included in the total count, the **Requester** (p. 2187)'s DataReader or DataWriter role name (in **rti::core::policy::EntityName** (p. 1530)) must not have been modified.

References **rti::request::Replier< RequestType, ReplyType >::reply_datawriter()**, and **rti::request::Replier< RequestType, ReplyType >::request_datareader()**.

8.309 rti::request::ReplierListener< RequestType, ReplyType > Class Template Reference

Called when a **Replier** (p. 2168) has new available requests.

```
#include <rti/request/ReplierListener.hpp>
```

Public Member Functions

- virtual void **on_request_available** (**Replier**< RequestType, ReplyType > &replier)=0
  User callback.

8.309.1 Detailed Description

template<typename RequestType, typename ReplyType>
class rti::request::ReplierListener< RequestType, ReplyType >

Called when a **Replier** (p. 2168) has new available requests.

A replier listener is a way to implement a callback that will be invoked when requests are available.

This listener simply notifies when requests are available. The callback implementation can then use **rti::request::Replier::take_requests** (p. 2176) to retrieve them.

A simpler callback mechanism, where one request sample is a parameter and the reply is the callback return value, is implemented by the **SimpleReplier** (p. 2368).

See also

rti::request::Replier::Replier(const ReplierParams&) (p. 2171)

8.309.2 Member Function Documentation

8.309.2.1 on_request_available()

```
template<typename RequestType , typename ReplyType >
virtual void  rti::request::ReplierListener< RequestType, ReplyType >::on_request_available (
              Replier< RequestType, ReplyType > & replier )  [pure virtual]
```

User callback.

See also

dds::sub::DataReaderListener::on_data_available (p. 1058)

8.310 rti::request::ReplierParams Class Reference

Contains the parameters for creating a **rti::request::Replier** (p. 2168).

```
#include <ReplierParams.hpp>
```

Inherits rti::request::detail::EntityParamsWithSetters< ActualEntity >.

Public Member Functions

- **ReplierParams** (**dds::domain::DomainParticipant** participant)
  *Creates a **ReplierParams** (p. 2180) with the parameters that a **Replier** (p. 2168) always needs.*
- **ReplierParams** & **service_name** (const std::string &name)
  *The service name the **Replier** (p. 2168) offers and Requesters use to match.*
- **ReplierParams** & **request_topic_name** (const std::string &name)
  Sets a specific request topic name.
- **ReplierParams** & **reply_topic_name** (const std::string &name)
  Sets a specific reply topic name.
- **ReplierParams** & **datawriter_qos** (const **dds::core::optional**< **dds::pub::qos::DataWriterQos** > &qos)
  Sets the quality of service of the reply DataWriter.
- **ReplierParams** & **datareader_qos** (const **dds::core::optional**< **dds::sub::qos::DataReaderQos** > &qos)
  Sets the quality of service of the request DataReader.
- **ReplierParams** & **publisher** (**dds::pub::Publisher** publisher)
  Sets a specific Publisher.
- **ReplierParams** & **subscriber** (**dds::sub::Subscriber** subscriber)
  Sets a specific Subscriber.
- **ReplierParams** & **request_type** (const **dds::core::optional**< **dds::core::xtypes::DynamicType** > &type)
  The request type, when DynamicData is used.
- **ReplierParams** & **reply_type** (const **dds::core::optional**< **dds::core::xtypes::DynamicType** > &type)
  The reply type, when DynamicData is used.
- **ReplierParams** & **service_instance_name** (const **dds::core::optional**< std::string > &name)
  *The service instance name of the **Replier** (p. 2168) or the service instance the **Requester** (p. 2187) is bound to at creation.*

8.310.1 Detailed Description

Contains the parameters for creating a **rti::request::Replier** (p. 2168).

See also

RequesterParams (p. 2199)

8.310.2 Constructor & Destructor Documentation

8.310.2.1 ReplierParams()

```
rti::request::ReplierParams::ReplierParams (
            dds::domain::DomainParticipant participant )  [inline], [explicit]
```

Creates a **ReplierParams** (p. 2180) with the parameters that a **Replier** (p. 2168) always needs.

In addition to the participant , a **Replier** (p. 2168) needs either:

- A service name (**ReplierParams::service_name** (p. 2181)), or
- Custom topic names (**ReplierParams::reply_topic_name** (p. 2182) and **ReplierParams::request_topic_name** (p. 2182)).

When **dds::core::xtypes::DynamicData** (p. 1461) is used, **ReplierParams::request_type** (p. 2183) and/or **ReplierParams::reply_type** (p. 2183) are required as well.

The other parameters are optional.

Parameters

participant	The DomainParticipant that this replier uses to join a domain.

8.310.3 Member Function Documentation

8.310.3.1 service_name()

```
ReplierParams & rti::request::ReplierParams::service_name (
            const std::string & name )
```

The service name the **Replier** (p. 2168) offers and Requesters use to match.

See also

RequesterParams::service_name (p. 2200)

8.310.3.2 request_topic_name()

```
ReplierParams & rti::request::ReplierParams::request_topic_name (
            const std::string & name )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **ReplierParams::service_name** (p. 2181). If that topic already exists, it will be reused. This is useful to have the **Replier** (p. 2168) use a **dds::topic::ContentFilteredTopic** (p. 954) to receive only certain requests.

8.310.3.3 reply_topic_name()

```
ReplierParams & rti::request::ReplierParams::reply_topic_name (
            const std::string & name )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on c the **ReplierParams::service_name** (p. 2181). If that topic already exists, it will be reused.

8.310.3.4 datawriter_qos()

```
ReplierParams & rti::request::ReplierParams::datawriter_qos (
            const dds::core::optional< dds::pub::qos::DataWriterQos > & qos )
```

Sets the quality of service of the reply DataWriter.

See also

dds::core::QosProvider (p. 2025) to access Qos profiles.

8.310.3.5 datareader_qos()

```
ReplierParams & rti::request::ReplierParams::datareader_qos (
            const dds::core::optional< dds::sub::qos::DataReaderQos > & qos )
```

Sets the quality of service of the request DataReader.

See also

dds::core::QosProvider (p. 2025) to access Qos profiles.

8.310.3.6 publisher()

```
ReplierParams & rti::request::ReplierParams::publisher (
            dds::pub::Publisher publisher )
```

Sets a specific Publisher.

See also

RequesterParams::publisher (p. 2201)

8.310.3.7 subscriber()

```
ReplierParams & rti::request::ReplierParams::subscriber (
            dds::sub::Subscriber subscriber )
```

Sets a specific Subscriber.

See also

RequesterParams::subscriber (p. 2202)

8.310.3.8 request_type()

```
ReplierParams & rti::request::ReplierParams::request_type (
           const  dds::core::optional<  dds::core::xtypes::DynamicType > & type )
```

The request type, when DynamicData is used.

This is required when the **Replier** (p. 2168) RequestType is **dds::core::xtypes::DynamicData** (p. 1461). Otherwise this is ignored.

8.310.3.9 reply_type()

```
ReplierParams & rti::request::ReplierParams::reply_type (
           const  dds::core::optional<  dds::core::xtypes::DynamicType > & type )
```

The reply type, when DynamicData is used.

This is required when the **Replier** (p. 2168) ReplyType is **dds::core::xtypes::DynamicData** (p. 1461). Otherwise this is ignored.

8.310.3.10 service_instance_name()

```
ReplierParams & rti::request::ReplierParams::service_instance_name (
            const  dds::core::optional< std::string > & name )
```

The service instance name of the **Replier** (p. 2168) or the service instance the **Requester** (p. 2187) is bound to at creation.

8.311 dds::core::status::RequestedDeadlineMissedStatus Class Reference

Information about the status **dds::core::status::StatusMask::requested_deadline_missed()** (p. 2380)

```
#include <TStatus.hpp>
```

Public Member Functions

  *Total cumulative count of the missed deadlines detected for any instance read by the **dds::sub::DataReader** (p. 976).*
- int32_t **total_count_change** () const

  The incremental number of missed deadlines detected since the last time the listener was called or the status was read.
- const **dds::core::InstanceHandle last_instance_handle** () const

  *Handle to the last instance in the **dds::sub::DataReader** (p. 976) for which a requested deadline was missed.*

8.311.1 Detailed Description

Information about the status **dds::core::status::StatusMask::requested_deadline_missed()** (p. 2380)

8.311.2 Member Function Documentation

8.311.2.1 total_count()

```
int32_t dds::core::status::RequestedDeadlineMissedStatus::total_count ( ) const  [inline]
```

Total cumulative count of the missed deadlines detected for any instance read by the **dds::sub::DataReader** (p. 976).

8.311.2.2 total_count_change()

```
int32_t dds::core::status::RequestedDeadlineMissedStatus::total_count_change ( ) const  [inline]
```

The incremental number of missed deadlines detected since the last time the listener was called or the status was read.

8.311.2.3 last_instance_handle()

```
const  dds::core::InstanceHandle dds::core::status::RequestedDeadlineMissedStatus::last_instance↩
_handle ( ) const  [inline]
```

Handle to the last instance in the **dds::sub::DataReader** (p. 976) for which a requested deadline was missed.

8.312 dds::core::status::RequestedIncompatibleQosStatus Class Reference

Information about the status **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381)

```
#include <TStatus.hpp>
```

Public Member Functions

- int32_t **total_count** () const

  *Total cumulative count of how many times the concerned **dds::sub::DataReader** (p. 976) discovered a **dds::pub::Data↩ Writer** (p. 1138) for the same **dds::topic::Topic** (p. 2474) with an offered QoS that is incompatible with that requested by the **dds::sub::DataReader** (p. 976).*
- int32_t **total_count_change** () const

  The change in `total_count` since the last time the listener was called or the status was read.
- **dds::core::policy::QosPolicyId last_policy_id** () const

  *The **dds::core::policy::QosPolicyId** (p. 514) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- const **dds::core::policy::QosPolicyCountSeq policies** () const

  *A list containing, for each policy, the total number of times that the concerned **dds::sub::DataReader** (p. 976) discovered a **dds::pub::DataWriter** (p. 1138) for the same **dds::topic::Topic** (p. 2474) with an offered QoS that is incompatible with that requested by the **dds::sub::DataReader** (p. 976).*

  size_t **matched_replier_count** (**Requester**< RequestType, ReplyType > requester)

  *Obtains the number of Repliers that match with a **Requester** (p. 2187).*

8.313.1 Detailed Description

template<typename RequestType, typename ReplyType>
class rti::request::Requester< RequestType, ReplyType >

<<***reference-type***>> *(p. 351)* Allows sending requests and receiving replies

Note

A **Requester** (p. 2187) provides all the functions of a <<***reference-type***>> *(p. 351)* except **close()** (p. 1024) and retain().

A requester is an entity with two associated **topics** (p. 47): a request topic and a reply topic. It can send requests by publishing samples of the request topic and receive replies to those requests by subscribing to the reply topic.

Valid types for these topics are: those generated by rtiddsgen, the **DDS built-in types** (p. 50), and **dds::core::xtypes::DynamicData** (p. 1461).

A **Replier** (p. 2168) and a **Requester** (p. 2187) communicate when they use the same topics for requests and replies (see **RequesterParams::service_name** (p. 2200)) on the same domain ID.

A **Requester** (p. 2187) can send requests and receive one or multiple replies. It does that using the following operations:

- Sending requests (i.e. publishing request samples on the request topic)
- Waiting for replies to be received by the middleware (for any request or for a specific request)
- Getting those replies from the middleware. There are two ways to do this: take (the data samples are removed from the middleware), read (the data samples remain in the middleware and can be read or taken again).
- A convenience operation, receive (which is a combination of wait and take).

In all cases, the middleware guarantees that a requester only receives reply samples that are associated with those requests that it sends.

For multi-reply scenarios, in which a **Requester** (p. 2187) receives multiple replies from a **Replier** (p. 2168) for a given request, the **Requester** (p. 2187) can check if a reply is the last reply of a sequence of replies. To do so, see if the bit **rti::core::SampleFlag::intermediate_reply_sequence** (p. 2280) is set in **dds::sub::SampleInfo::flag** (p. 2293) after receiving each reply. This indicates it is NOT the last reply.

A requester has an associated **dds::domain::DomainParticipant** (p. 1326), which can be shared with other requesters or RTI Connext routines. All the other RTI Connext entities required for the request-reply interaction, including a **dds::pub::DataWriter** (p. 1138) for writing requests and a **dds::sub::DataReader** (p. 976) for reading replies, are automatically created when the requester is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see RequesterParams::qos_profile). By default, they are created with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 348)

Template Parameters

RequestType	The data type for the request topic
ReplyType	The data type for the reply topic

See also

rti::request::Replier (p. 2168)

Request-Reply Examples (p. 344)

Basic Requester example (p. 346)

8.313.2 Constructor & Destructor Documentation

8.313.2.1 Requester() [1/2]

```
template<typename RequestType , typename ReplyType >
rti::request::Requester< RequestType, ReplyType >::Requester (
            const  RequesterParams & params )  [inline], [explicit]
```

Creates a **Requester** (p. 2187) with parameters.

Parameters

params	All the parameters that configure this requester. See **RequesterParams** (p. 2199) for the list of mandatory parameters.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

RequesterParams (p. 2199)

Requester Creation (p. 345)

8.313.2.2 Requester() [2/2]

```
template<typename RequestType , typename ReplyType >
rti::request::Requester< RequestType, ReplyType >::Requester (
              dds::domain::DomainParticipant participant,
             const std::string & service_name )  [inline]
```

Creates a **Requester** (p. 2187) with the minimum set of parameters.

Parameters

participant	The DomainParticipant this requester uses to join a DDS domain
service_name	The service name. See **RequesterParams::service_name** (p. 2200)

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.313.3 Member Function Documentation

8.313.3.1 wait_for_service()

```
template<typename RequestType , typename ReplyType >
bool  rti::request::Requester< RequestType, ReplyType >::wait_for_service (
             const  dds::core::Duration & max_wait =  dds::core::Duration::infinite() )  [inline]
```

Waits for one or more repliers to be discovered. This function takes advantage of enhanced discovery, making sure both the **Requester** (p. 2187) and the **Replier** (p. 2168) discover each other.

Parameters

max_wait	The maximum time to wait. Default: **dds::core::Duration::infinite()** (p. 1451) (unlimited period to wait).

Returns

True if a **Replier** (p. 2168) is discovered. False if a timeout occurs.

Exceptions

dds::core::AlreadyClosedError *(p. 806)*	if the **Requester** (p. 2187) is closed while waiting.

8.313.3.2 send_request() [1/2]

```
template<typename RequestType , typename ReplyType >
rti::core::SampleIdentity  rti::request::Requester< RequestType, ReplyType >::send_request (
            const RequestType & request )  [inline]
```

Sends a request.

Parameters

request	The request to be sent

Returns

The identity of the request, which can be used to correlate it with a future reply (see **rti::request::Requester↩ ::wait_for_replies(int, const dds::core::Duration&, const rti::core::SampleIdentity&)** (p. 2196))

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if a **Replier** (p. 2168) hasn't been discovered. Make sure to call **wait_for_service()** (p. 2190) before sending a request. (This exception is not thrown if this **Requester** (p. 2187) was created with **RequesterParams::require_matching_service_on_↩ send_request** (p. 2202) set to false.)
standard-dds-exception	One of the standard DDS exceptions (**Exceptions** (p. 427)).

8.313.3.3 send_request() [2/2]

```
template<typename RequestType , typename ReplyType >
void  rti::request::Requester< RequestType, ReplyType >::send_request (
            const RequestType & request,
             rti::pub::WriteParams & params )  [inline]
```

Sends a request with advanced parameters.

Parameters

request	The request to be sent
params	(in-out) The parameters to write the request (see **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179))

This function allows setting the request identity in `params.identity()`, among other advanced parameters. If the identity is not set, RTI Connext automatically assigns it; for the automatic assignment to occur, `params.replace_automatic_values()` needs to be set to true. After this function ends, `params.identity()` will contain the request identity. If no additional parameters need to be set, use the simpler **send_request(const RequestType&)** (p. 2191), which directly returns the automatically assigned identity.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if a **Replier** (p. 2168) hasn't been discovered. Make sure to call **wait_for_service()** (p. 2190) before sending a request. (This exception is not thrown if this **Requester** (p. 2187) was created with **RequesterParams::require_matching_service_on_send_request** (p. 2202) set to false.)
standard-dds-exception	One of the standard DDS exceptions (**Exceptions** (p. 427)).

8.313.3.4 receive_replies() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType >  rti::request::Requester< RequestType, ReplyType >::receive_replies (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for multiple replies and provides a loaned container to access them.

This operation is equivalent to using **rti::request::Requester::receive_replies** (p. 2192) with `min_count=1` and `max_count=dds::core::LENGTH_UNLIMITED` (p. 438)

MT Safety:

See **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195)

See also

dds::sub::LoanedSamples (p. 1663)

rti::request::Requester::receive_replies (p. 2192)

8.313.3.5 receive_replies() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::receive_replies (
            int min_count,
            const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple replies and provides a loaned container to access them.

This operation is equivalent to using **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195) and **rti::request::Requester::take_replies** (p. 2193).

MT Safety:

See **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195)

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

dds::sub::LoanedSamples (p. 1663)

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 2195)

rti::request::Requester::take_replies (p. 2193)

8.313.3.6 take_replies() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::take_replies ( ) [inline]
```

Takes all the replies.

Takes all the existing replies up to `max_count` and provides a loaned container to access them.

This operation does not make a copy of the data. It is similar to **dds::sub::DataReader::take** (p. 997).

The loan is returned with **dds::sub::LoanedSamples::return_loan** (p. 1667) or in the destructor

This operation may be used after a call to **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195)

Returns

A container with up to max_count elements. May be empty if there were no replies to get.

Exceptions

One	of the **Standard Exceptions** (p. 428)

MT Safety:

SAFE

dds::sub::LoanedSamples::return_loan (p. 1667)

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 2195)

dds::sub::DataReader::take (p. 997) (for a more detailed description on how QoS and other **parameters** (p. 2063) affect the underlying DataReader)

8.313.3.7 take_replies() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType >  rti::request::Requester< RequestType, ReplyType >::take_↩
replies (
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Takes the replies for a specific requests.

This operation is operation is analogous to **take_replies()** (p. 2193) but it only returns those replies associated with a specific request.

Parameters

related_request↩ _id	Identifies a request previously sent by this **Requester** (p. 2187)'s **send_request()** (p. 2191).

8.313.3.8 read_replies() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType >  rti::request::Requester< RequestType, ReplyType >::read_↩
replies ( )  [inline]
```

Reads all the replies.

This operation is equivalent to **rti::request::Requester::take_replies** (p. 2193) except the replies remain in the **Requester** (p. 2187) and can be read or taken again.

8.313.3.9 read_replies() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType >  rti::request::Requester< RequestType, ReplyType >::read_↩
replies (
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Reads the replies for a specific request.

This operation is equivalent to **take_replies(const rti::core::SampleIdentity&)** (p. 2194), except the replies remain in the **Requester** (p. 2187) and can be read or taken again.

8.313.3.10 wait_for_replies() [1/3]

```
template<typename RequestType , typename ReplyType >
bool  rti::request::Requester< RequestType, ReplyType >::wait_for_replies (
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for replies to any request.

This operation is equivalent to using **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195) with `min_count=1`.

See also

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 2195)

8.313.3.11 wait_for_replies() [2/3]

```
template<typename RequestType , typename ReplyType >
bool  rti::request::Requester< RequestType, ReplyType >::wait_for_replies (
            int min_count,
            const  dds::core::Duration & max_wait )  [inline]
```

Waits for replies to any request.

This operation waits for min_count requests to be available for up to max_wait .

If this operation is called several times but the available replies are not taken (with **rti::request::Requester::take_↩ replies** (p. 2193)), this operation may return immediately and will not wait for new replies. New replies may replace existing ones if they are not taken, depending on the **dds::core::policy::History** (p. 1602) used to configure this **Requester** (p. 2187).

Parameters

min_count	Minimum number of replies that need to be available for this operation to unblock.
max_wait	Maximum waiting time after which this operation unblocks, regardless of how many replies are available.

Returns

true if at least minCount replies were available before maxWait elapsed, or false otherwise.

MT Safety:

Concurrent calls to this operation on the same object are not allowed. However, waiting for replies for specific requests in parallel is supported (see **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&, const rti::core::SampleIdentity&)** (p. 2196)).

See also

rti::request::Requester::take_replies (p. 2193)

8.313.3.12 wait_for_replies() [3/3]

```
template<typename RequestType , typename ReplyType >
bool  rti::request::Requester< RequestType, ReplyType >::wait_for_replies (
            int min_count,
            const  dds::core::Duration & max_wait,
            const  rti::core::SampleIdentity & related_request_id )  [inline]
```

Waits for replies to a specific request.

This operation is analogous to **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 2195) except this operation waits for replies for a specific request.

Parameters

min_count	Minimum number of replies for the related request that need to be available for this operation to unblock.
max_wait	Maximum wait time after which this operation unblocks, regardless of how many replies are available.
related_request_id	The identity of a request previously sent by this **Requester** (p. 2187)

Returns

true if at least min_count replies for the related request were available before max_wait elapsed, or false otherwise.

Exceptions

One	of the **Standard Exceptions** (p. 428)

MT Safety:

SAFE

8.313.4 Friends And Related Function Documentation

8.313.4.1 matched_replier_count()

```
template<typename RequestType , typename ReplyType >
size_t matched_replier_count (
              Requester< RequestType, ReplyType > requester )  [related]
```

Obtains the number of Repliers that match with a **Requester** (p. 2187).

Note

This is a standalone function in the namespace rti::request

For a **Replier** (p. 2168) to be included in the total count, the **Replier** (p. 2168)'s DataReader or DataWriter role name (in **rti::core::policy::EntityName** (p. 1530)) must not have been modified.

References **rti::request::Requester< RequestType, ReplyType >::reply_datareader()**, and **rti::request::Requester< RequestType, ReplyType >::request_datawriter()**.

8.314 rti::request::RequesterParams Class Reference

Contains the parameters for creating a **rti::request::Requester** (p. 2187).

`#include <RequesterParams.hpp>`

Inherits rti::request::detail::EntityParamsWithSetters< ActualEntity >.

Public Member Functions

- **RequesterParams** (**dds::domain::DomainParticipant** participant)

  The reply type, when DynamicData is used.
- **RequesterParams** & **require_matching_service_on_send_request** (bool value)
  *Sets whether send_request will fail if there is no matching **Replier** (p. 2168).*
- bool **require_matching_service_on_send_request** () const
  Getter (see setter with the same name)

8.314.1 Detailed Description

Contains the parameters for creating a **rti::request::Requester** (p. 2187).

See also

Creating a Requester with optional parameters (p. 345)

8.314.2 Constructor & Destructor Documentation

8.314.2.1 RequesterParams()

```
rti::request::RequesterParams::RequesterParams (
              dds::domain::DomainParticipant participant )  [inline], [explicit]
```

Creates a **RequesterParams** (p. 2199) with the parameters a **Requester** (p. 2187) always needs.

In addition to the participant , a **Requester** (p. 2187) needs either:

- A service name (**RequesterParams::service_name** (p. 2200)),
- Or custom topic names (**RequesterParams::request_topic_name** (p. 2200) and **RequesterParams::reply_↩ topic_name** (p. 2201))

When **dds::core::xtypes::DynamicData** (p. 1461) is used, **RequesterParams::request_type** (p. 2202) and/or **RequesterParams::reply_type** (p. 2202) are required as well.

The rest of the parameters that can be set in a **RequesterParams** (p. 2199) object are optional.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) this requester uses to join a domain.

See also

Creating a Requester with optional parameters (p. 345)

8.314.3 Member Function Documentation

8.314.3.1 service_name()

```
RequesterParams & rti::request::RequesterParams::service_name (
            const std::string & name )
```

The service name that Repliers and **Requester** (p. 2187) use to match and communicate.

A **Requester** (p. 2187) and a **Replier** (p. 2168) need to be configured with the same topic names in order to match.

The service name is used to generate a request topic and a reply topic that the **Requester** (p. 2187) and **Replier** (p. 2168) will use to communicate. For example, the service name "MyService" will be used to create topics named "MyServiceRequest" and "MyServiceReply".

In some cases, the name of these topics is known beforehand or needs to be customized for another reason. The service name can be overridden by setting specific request and reply topic names using **RequesterParams::request↩ _topic_name** (p. 2200) and **RequesterParams::reply_topic_name** (p. 2201).

8.314.3.2 request_topic_name()

```
RequesterParams & rti::request::RequesterParams::request_topic_name (
            const std::string & name )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RequesterParams::service_name** (p. 2200). If that topic already exists, it will be reused.

8.314.3.3 reply_topic_name()

```
RequesterParams & rti::request::RequesterParams::reply_topic_name (
            const std::string & name )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RequesterParams::service_name** (p. 2200). If that topic already exists, it will be reused.

8.314.3.4 datawriter_qos()

```
RequesterParams & rti::request::RequesterParams::datawriter_qos (
            const  dds::core::optional< dds::pub::qos::DataWriterQos > & qos )
```

Sets the quality of service of the request DataWriter.

See also

dds::core::QosProvider (p. 2025) to access Qos profiles.

8.314.3.5 datareader_qos()

```
RequesterParams & rti::request::RequesterParams::datareader_qos (
            const  dds::core::optional< dds::sub::qos::DataReaderQos > & qos )
```

Sets the quality of service of the request DataReader.

See also

dds::core::QosProvider (p. 2025) to access Qos profiles.

8.314.3.6 publisher()

```
RequesterParams & rti::request::RequesterParams::publisher (
            dds::pub::Publisher publisher )
```

Sets a specific Publisher.

By default, a **Requester** (p. 2187) uses the DomainParticipant's implicit Publisher. Sometimes a different Publisher may be needed, for example, to use non-default PublisherQos.

8.314.3.7 subscriber()

```
RequesterParams & rti::request::RequesterParams::subscriber (
            dds::sub::Subscriber subscriber )
```

Sets a specific Subscriber.

By default, a **Requester** (p. 2187) uses the DomainParticipant's implicit Subscriber. Sometimes a different Subscriber may be needed, for example, to use non-default SubscriberQos.

8.314.3.8 request_type()

```
RequesterParams & rti::request::RequesterParams::request_type (
            const  dds::core::optional< dds::core::xtypes::DynamicType > & type )
```

The request type, when DynamicData is used.

This is required when the **Requester** (p. 2187) RequestType is **dds::core::xtypes::DynamicData** (p. 1461). Otherwise this is ignored.

8.314.3.9 reply_type()

```
RequesterParams & rti::request::RequesterParams::reply_type (
            const  dds::core::optional< dds::core::xtypes::DynamicType > & type )
```

The reply type, when DynamicData is used.

This is required when the **Requester** (p. 2187) ReplyType is **dds::core::xtypes::DynamicData** (p. 1461). Otherwise this is ignored.

8.314.3.10 require_matching_service_on_send_request() [1/2]

```
RequesterParams & rti::request::RequesterParams::require_matching_service_on_send_request (
            bool value )  [inline]
```

Sets whether send_request will fail if there is no matching **Replier** (p. 2168).

When set to `true`, **Requester::send_request()** (p. 2191) will check if there is at least one matching **Replier** (p. 2168) and throw an exception if there isn't one. This prevents `send_request` to silently drop a request. When set to `false`, `send_request` will not perform this precondition check.

Note that you can use `wait_for_service()` regardless of this setting.

[default] true

8.314.3.11 require_matching_service_on_send_request() [2/2]

```
bool rti::request::RequesterParams::require_matching_service_on_send_request ( ) const  [inline]
```

Getter (see setter with the same name)

8.315 dds::core::policy::ResourceLimits Class Reference

Controls the memory usage of **dds::pub::DataWriter** (p. 1138) or a **dds::sub::DataReader** (p. 976).

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

  *<<**extension**>> (p. 116) Sets the number of instances that a DataReader or a DataWriter will preallocate.*
- int32_t **initial_instances** () const

  Getter (see setter with the same name)
- **dds::core::policy::ResourceLimits** & **instance_hash_buckets** (int32_t the_instance_hash_buckets)

  ***[DEPRECATED]** (p. **296**) <<**extension**>> (p. 116) Sets the number of hash buckets for looking up instances*
- int32_t **instance_hash_buckets** () const

  Getter (see setter with the same name)

8.315.1 Detailed Description

Controls the memory usage of **dds::pub::DataWriter** (p. 1138) or a **dds::sub::DataReader** (p. 976).

Entity:

dds::topic::Topic (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Status:

dds::core::status::StatusMask::sample_rejected() (p. 2382), **dds::core::status::SampleRejectedStatus** (p. 2315)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.315.2 Usage

This policy controls the resources that RTI Connext can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **dds::core::policy::Durability** (p. 1433)), this QoS policy determines the actual maximum queue size when the **dds::core::policy::History** (p. 1602) is set to **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607).

In general, this QoS policy is used to limit the amount of system memory that RTI Connext can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If **dds::pub::DataWriter** (p. 1138) objects are communicating samples faster than they are ultimately taken by the **dds::sub::DataReader** (p. 976) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single **dds::sub::DataReader** (p. 976) cannot keep up with its corresponding **dds::pub::DataWriter** (p. 1138). The behavior in this case depends on the setting for the **RELIABILITY** (p. 544). If reliability is **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157), then RTI Connext is allowed to drop samples. If the reliability is **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157), RTI Connext will block the **dds::pub::DataWriter** (p. 1138) or discard the sample at the **dds::sub::DataReader** (p. 976) in order not to lose existing samples.

The constant **dds::core::LENGTH_UNLIMITED** (p. 438) may be used to indicate the absence of a particular limit. For example setting **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) to **dds::core::LENGTH_UNLIMITED** (p. 438) will cause RTI Connext not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the **dds::pub::DataWriter** (p. 1138) may block on a **write()** (p. 1179) call even though the **dds::core::policy::History** (p. 1602) is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607). To guarantee the writer does not block for **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607), make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

dds::core::policy::Reliability (p. 2149)

dds::core::policy::History (p. 1602)

8.315.3 Consistency

The setting of **dds::core::policy::ResourceLimits::max_samples** (p. 2205) must be consistent with **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207). For these two values to be consistent, it must be true that **dds::core::policy::ResourceLimits::max_samples** (p. 2205) >= **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207). As described above, this limit will not be enforced if **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) is set to **dds::core::LENGTH_UNLIMITED** (p. 438).

The setting of **RESOURCE_LIMITS** (p. 546) `max_samples_per_instance` must be consistent with the **HISTORY** (p. 533) `depth`. For these two QoS to be consistent, it must be true that *depth* <= *max_samples_per_instance*.

dds::core::policy::History (p. 1602)

8.315.4 Constructor & Destructor Documentation

8.315.4.1 ResourceLimits() [1/2]

```
dds::core::policy::ResourceLimits::ResourceLimits ( )  [inline]
```

Creates the default policy.

8.315.4.2 ResourceLimits() [2/2]

```
dds::core::policy::ResourceLimits::ResourceLimits (
            int32_t the_max_samples,
            int32_t the_max_instances,
            int32_t the_max_samples_per_instance )  [inline]
```

Creates a **ResourceLimits** (p. 2203) object with the specified max_samples, max_instances, and max_samples_per instance and default values for the rest of the parameters.

8.315.5 Member Function Documentation

8.315.5.1 max_samples() [1/2]

```
ResourceLimits & dds::core::policy::ResourceLimits::max_samples (
            int32_t the_max_samples )  [inline]
```

Sets the maximum number of data samples that a DataWriter or a DataReader can manage across all instances.

Specifies the maximum number of data samples a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage across all the instances associated with it.

For unkeyed types, this value has to be equal to max_samples_per_instance if max_samples_per_instance is not equal to **dds::core::LENGTH_UNLIMITED** (p. 438).

When batching is enabled, the maximum number of data samples a **dds::pub::DataWriter** (p. 1138) can manage will also be limited by **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1240).

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_samples, >= max_samples_per_instance, >= **rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 1087) or >= **rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_samples** (p. 2240)

For **dds::pub::qos::DataWriterQos** (p. 1226) max_samples >= **rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_samples** (p. 2240) in **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217) if batching is disabled.

8.315.5.2 max_samples() [2/2]

```
int32_t dds::core::policy::ResourceLimits::max_samples ( ) const  [inline]
```

Getter (see setter with the same name)

8.315.5.3 max_instances() [1/2]

```
ResourceLimits & dds::core::policy::ResourceLimits::max_instances (
            int32_t the_max_instances )  [inline]
```

Sets the maximum number of instances that a DataWriter or a DataReader can manage.

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_instances

Categories

> **Immutable** (p. 243), **Durability** (p. 184), **Instance Lifecycle** (p. 193), **Sample Memory Management** (p. 230), **Middleware Memory Management** (p. 204), **Data Availability** (p. 167)

8.315.5.4 max_instances() [2/2]

```
int32_t dds::core::policy::ResourceLimits::max_instances ( ) const  [inline]
```

Getter (see setter with the same name)

8.315.5.5 max_samples_per_instance() [1/2]

```
ResourceLimits & dds::core::policy::ResourceLimits::max_samples_per_instance (
            int32_t the_max_samples_per_instance )  [inline]
```

Sets the maximum number of data samples per instance that a DataWriter or a DataReader can manage.

While an unkeyed type is logically considered as a single instance, for unkeyed types this value has to be equal to max_samples or **dds::core::LENGTH_UNLIMITED** (p. 438).

[default] dds::core::LENGTH_UNLIMITED (p. 438)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), <= max_samples or **dds::core::LENGTH_↩ UNLIMITED** (p. 438), >= **dds::core::policy::History::depth** (p. 1605)

Categories

int32_t initial_instances ( ) const
```

Getter (see setter with the same name)

8.315.5.11 instance_hash_buckets() [1/2]

```
dds::core::policy::ResourceLimits & instance_hash_buckets (
            int32_t the_instance_hash_buckets )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Sets the number of hash buckets for looking up instances

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The instance hash table facilitates instance lookup. A higher number of buckets decreases instance lookup time but increases the memory usage.

[default] 1 **[range]** [1,1 million]

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193)

8.315.5.12 instance_hash_buckets() [2/2]

```
int32_t instance_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.316 rti::core::Result< T > Class Template Reference

A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.

```
#include <Result.hpp>
```

Public Member Functions

- **Result** ()=default

  *Creates a **Result** (p. 2209) object with a return code of DDS_RETCODE_ERROR and no value.*
- **Result** (const T &value)

  *Creates a **Result** (p. 2209) object with a return code of DDS_RETCODE_OK and a value that is copied.*
- **Result** (T &&value)

  *Creates a **Result** (p. 2209) object with a return code of DDS_RETCODE_OK and a value that is moved.*
- **Result** (DDS_ReturnCode_t retcode)

  *Creates a **Result** (p. 2209) object with a return code and no value.*
- const T & **get** () const &noexcept

  Gets the value without checking if the operation was successful.
- T & **get** () &noexcept

  Gets the value without checking if the operation was successful.
- DDS_ReturnCode_t **get_return_code** () const noexcept

  Gets the return code.
- bool **is_ok** () const noexcept

  Returns true if the operation was successful.
- const T & **get_if_ok** () const &

  Gets the value if the operation was successful, otherwise throws an exception.
- T & **get_if_ok** () &

  Gets the value if the operation was successful, otherwise throws an exception.
- T && **get_if_ok** () &&

  Gets the value if the operation was successful, otherwise throws an exception.
- void **throw_if_error** () const

  Throws an exception if the operation was not successful.

8.316.1 Detailed Description

template<typename T>
class rti::core::Result< T >

A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.

For some critical operations in the API a exception-throwing and a noexcept version of the same function are provided. The noexcept versions return a Result<T> object to indicate if the operation was successful or not and, if it was, provide the return value of type T.

Note that **Result** (p. 2209)<void> is specialized to not provide a value, only a return code.

8.316.2 Constructor & Destructor Documentation

8.316.2.1 Result() [1/4]

```
template<typename T >
rti::core::Result< T >::Result ( )  [default]
```

Creates a **Result** (p. 2209) object with a return code of DDS_RETCODE_ERROR and no value.

8.316.2.2 Result() [2/4]

```
template<typename T >
rti::core::Result< T >::Result (
            const T & value )  [inline], [explicit]
```

Creates a **Result** (p. 2209) object with a return code of DDS_RETCODE_OK and a value that is copied.

8.316.2.3 Result() [3/4]

```
template<typename T >
rti::core::Result< T >::Result (
            T && value )  [inline], [explicit]
```

Creates a **Result** (p. 2209) object with a return code of DDS_RETCODE_OK and a value that is moved.

8.316.2.4 Result() [4/4]

```
template<typename T >
rti::core::Result< T >::Result (
            DDS_ReturnCode_t retcode )  [inline], [explicit]
```

Creates a **Result** (p. 2209) object with a return code and no value.

8.316.3 Member Function Documentation

8.316.3.1 get() [1/2]

```
template<typename T >
const T &  rti::core::Result< T >::get ( ) const &  [inline], [noexcept]
```

Gets the value without checking if the operation was successful.

If the operation was not successful, the behavior is undefined; use **is_ok()** (p. 2212) first or use **get_if_ok()** (p. 2212) instead.

8.316.3.2 get() [2/2]

```
template<typename T >
T &  rti::core::Result< T >::get ( ) &  [inline], [noexcept]
```

Gets the value without checking if the operation was successful.

If the operation was not successful, the behavior is undefined; use **is_ok()** (p. 2212) first or use **get_if_ok()** (p. 2212) instead.

8.316.3.3 get_return_code()

```
template<typename T >
DDS_ReturnCode_t  rti::core::Result< T >::get_return_code ( ) const  [inline], [noexcept]
```

Gets the return code.

8.316.3.4 is_ok()

```
template<typename T >
bool  rti::core::Result< T >::is_ok ( ) const  [inline], [noexcept]
```

Returns true if the operation was successful.

This is equivalent to **get_return_code()** (p. 2212) == DDS_RETCODE_OK

8.316.3.5 get_if_ok() [1/3]

```
template<typename T >
const T &  rti::core::Result< T >::get_if_ok ( ) const &  [inline]
```

Gets the value if the operation was successful, otherwise throws an exception.

References **rti::core::Result< T >::throw_if_error()**.

8.316.3.6 get_if_ok() [2/3]

```
template<typename T >
T &  rti::core::Result< T >::get_if_ok ( ) &  [inline]
```

Gets the value if the operation was successful, otherwise throws an exception.

References **rti::core::Result< T >::throw_if_error()**.

8.316.3.7 get_if_ok() [3/3]

```
template<typename T >
T &&  rti::core::Result< T >::get_if_ok ( ) &&  [inline]
```

Gets the value if the operation was successful, otherwise throws an exception.

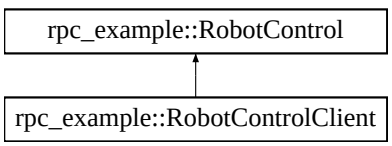
References **rti::core::Result< T >::throw_if_error()**.

8.316.3.8 throw_if_error()

```
template<typename T >
void  rti::core::Result< T >::throw_if_error ( ) const  [inline]
```

Throws an exception if the operation was not successful.

If the operation was successful, this function does nothing.



Referenced by **rti::core::Result< T >::get_if_ok()**.

8.317 rpc_example::RobotControl Class Reference

The synchronous interface generated from the **RobotControl** (p. 97) IDL service.

```
#include <ServiceEndpoint.hpp>
```

Inheritance diagram for rpc_example::RobotControl:

Public Member Functions

- virtual Coordinates **walk_to** (const Coordinates &destination, float speed)=0

  *An IDL interface method defined in **RobotControl** (p. 2213).*
- virtual float **get_speed** ()=0

  *An IDL interface method defined in **RobotControl** (p. 2213).*
- virtual ~**RobotControl** ()

  An empty virtual destructor.

8.317.1 Detailed Description

The synchronous interface generated from the **RobotControl** (p. 97) IDL service.

RobotControlClient (p. 2217) implements this interface to make synchronous remote function calls.

Server-side applications must implement this interface to handle remote calls. To execute an implementation of this interface, create a **RobotControlService** (p. 408).

8.317.2 Constructor & Destructor Documentation

8.317.2.1 ~RobotControl()

```
virtual rpc_example::RobotControl::~RobotControl ( )  [inline], [virtual]
```

An empty virtual destructor.

8.317.3 Member Function Documentation

8.317.3.1 walk_to()

```
virtual Coordinates rpc_example::RobotControl::walk_to (
            const Coordinates & destination,
            float speed )  [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 2213).

Parameters

destination	An input argument
speed	An input argument

Returns

A return value

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if a Service hasn't been discovered. Make sure to call **RobotControlClient::wait_for_service()** (p. 927) before sending a request.
dds::core::TimeoutError *(p. 2473)*	if a reply is not received after the timeout specified in the ClientParams.
dds::rpc::RemoteUnknownOperationError *(p. 2166)*	if the remote operation doesn't exist.
user-defined-exception	A user-defined exception (if any) when thrown on the server side.
standard-dds-exception	One of the standard DDS exceptions (**Exceptions** (p. 427)).

Note: the previous exceptions may be thrown on the client side.

8.317.3.2 get_speed()

```
virtual float rpc_example::RobotControl::get_speed ( )  [pure virtual]
```

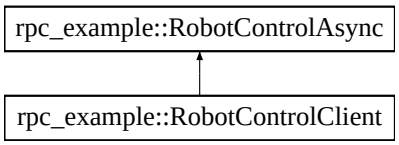
An IDL interface method defined in **RobotControl** (p. 2213).

Returns

The return value of this method

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	if a Service hasn't been discovered. Make sure to call **RobotControlClient::wait_for_service()** (p. 927) before sending a request.
dds::core::TimeoutError *(p. 2473)*	if a reply is not received after the timeout specified in the ClientParams.
dds::rpc::RemoteUnknownOperationError *(p. 2166)*	if the remote operation doesn't exist.
user-defined-exception	A user-defined exception (if any) when thrown on the server side.
standard-dds-exception	One of the standard DDS exceptions (**Exceptions** (p. 427)).



Note: the previous exceptions may be thrown on the client side.

8.318 rpc_example::RobotControlAsync Class Reference

The asynchronous interface derived from the **RobotControl** (p. 2213) service.

`#include <ServiceEndpoint.hpp>`

Inheritance diagram for rpc_example::RobotControlAsync:

Public Member Functions

- virtual std::future< Coordinates > **walk_to_async** (const Coordinates &destination, float speed)=0

  *An IDL interface method defined in **RobotControl** (p. 2213).*
- virtual std::future< float > **get_speed_async** ()=0

  *An IDL interface method defined in **RobotControl** (p. 2213).*
- virtual ~**RobotControlAsync** ()

  An empty virtual destructor.

8.318.1 Detailed Description

The asynchronous interface derived from the **RobotControl** (p. 2213) service.

RobotControlClient (p. 2217) implements this interface to make asynchronous remote function calls.

This interface is not implemented on the server side.

8.318.2 Constructor & Destructor Documentation

8.318.2.1 ~RobotControlAsync()

```
virtual rpc_example::RobotControlAsync::~RobotControlAsync ( )  [inline], [virtual]
```

An empty virtual destructor.

8.318.3 Member Function Documentation

8.318.3.1 walk_to_async()

```
virtual std::future< Coordinates > rpc_example::RobotControlAsync::walk_to_async (
            const Coordinates & destination,
            float speed )  [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 2213).

Parameters

destination	An input argument
speed	An input argument

Returns

The future return value

Exceptions

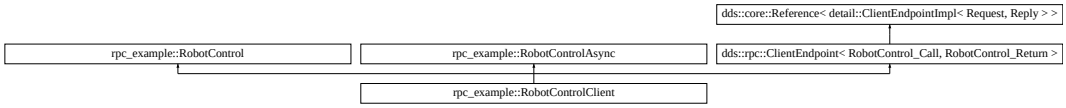
dds::core::PreconditionNotMetError *(p. 1941)*	if a Service hasn't been discovered. Make sure to call wait_for_service() before sending a request.

8.318.3.2 get_speed_async()

```
virtual std::future< float > rpc_example::RobotControlAsync::get_speed_async ( )  [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 2213).

Exceptions



dds::core::PreconditionNotMetError *(p. 1941)*	if a Service hasn't been discovered. Make sure to call wait_for_service() before sending a request.

8.319 rpc_example::RobotControlClient Class Reference

<<***reference-type***>> *(p. 351)* Allows client applications to make remote function calls

```
#include <ClientEndpoint.hpp>
```

Inheritance diagram for rpc_example::RobotControlClient:

Additional Inherited Members

8.319.1 Detailed Description

<<***reference-type***>> *(*p. *351)* Allows client applications to make remote function calls

This class implements the **RobotControl** (p. 2213) and **RobotControlAsync** (p. 2215) interfaces to make remote function calls. It also inherits from RobotControlClientEndpoint, which manages the DDS entities required to make those function calls.

8.320 rti::config::compliance::RpcMask Class Reference

XTypes compliance mask.

`#include <Compliance.hpp>`

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**
  A typedef of std::bitset<32> for convenience.

Public Member Functions

- **RpcMask** ()
  Default RPC compliance mask.
- **RpcMask** (uint64_t mask)
  *Construct a **RpcMask** (*p. *2218) from an integer.*
- **RpcMask** (const **MaskType** &mask)
  *Construct a **RpcMask** (*p. *2218) from a MaskType object.*

Static Public Member Functions

- static const **RpcMask use_standard_related_sample_pid** ()
  This bit configures a standard value for PID_RELATED_SAMPLE_IDENTITY.
- static const **RpcMask vendor** ()
  This mask configures compliance with the OMG DDS-RPC specification.
- static const **RpcMask default_mask** ()
  Default RPC compliance mask.

8.320.1 Detailed Description

XTypes compliance mask.

The **rti::config::compliance::XTypesMask** (p. 2666) configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Applications that don't use the exact same XTypes compliance mask may not be interoperable.

By default, data serialization is not fully compliant with Extended CDR encoding. While this doesn't affect correctness, it may prevent interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**
- Calling the function **rti::config::compliance::set_xtypes_mask()** (p. 452)

The environment variable will be automatically loaded when a DomainParticipantFactory is created. If you need to load it before that, use the function **rti::config::compliance::load_compliance_masks()** (p. 453).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is **rti::config::compliance::XTypesMask::default_mask()** (p. 2674).

To be fully compliant with the XTypes specification, set the mask to **rti::config::compliance::XTypesMask::vendor()** (p. 2674).

[default] rti::config::compliance::XTypesMask::default_mask() (p. 2674)

When changing the mask for an application is not desired, the property dds.xtypes.compliance_mask will change the mask at the DomainParticipant or DataWriter level. When set in the DomainParticipant, it configures the mask for all DataWriters in the participant. See `Extensible Types Compliance Mask` in the RTI Connext Core Libraries Extensible Types Guide.

8.320.2 Member Typedef Documentation

8.320.2.1 MaskType

`typedef std::bitset<32>` **`rti::config::compliance::RpcMask::MaskType`**

A typedef of std::bitset<32> for convenience.

8.320.3 Constructor & Destructor Documentation

8.320.3.1 RpcMask() [1/3]

```
rti::config::compliance::RpcMask::RpcMask ( )  [inline]
```

Default RPC compliance mask.

The mask does not sets any bits.

The HEX value for the mask is: 0x00000000.

8.320.3.2 RpcMask() [2/3]

```
rti::config::compliance::RpcMask::RpcMask (
            uint64_t mask )  [inline], [explicit]
```

Construct a **RpcMask** (p. 2218) from an integer.

Parameters

mask	Value whose bits are copied to the bitset positions

8.320.3.3 RpcMask() [3/3]

```
rti::config::compliance::RpcMask::RpcMask (
            const  MaskType & mask )  [inline]
```

Construct a **RpcMask** (p. 2218) from a MaskType object.

Parameters

mask	A std::bitset<32> to construct this **RpcMask** (p. 2218) from

8.320.4 Member Function Documentation

8.320.4.1 use_standard_related_sample_pid()

```
static const  RpcMask rti::config::compliance::RpcMask::use_standard_related_sample_pid ( )  [inline],
[static]
```

This bit configures a standard value for PID_RELATED_SAMPLE_IDENTITY.

Value: 0x00000001

Set this bit to be compliant with the OMG DDS-RPC specification. The PID_RELATED_SAMPLE_IDENTITY will be 0x0083 as is defined as is defined in the RPC over DDS OMG specification. See `https://www.omg.org/spec/DDS-RPC`

Using **rti::config::compliance::RpcMask::use_standard_related_sample_pid()** (p. 2220) will affect both RPC and Request-Reply communtications. The PID_RELATED_SAMPLE_IDENTITY is a parameter identifier (PID) used by the RTPS wire protocol and required for Request-Reply and RPC communications. By default, this PID takes a non-standard value that is compatible with previous versions of Connext.

This bit is unset by default. See **rti::config::compliance::RpcMask::default_mask()** (p. 2221)

8.320.4.2 vendor()

```
static const RpcMask rti::config::compliance::RpcMask::vendor ( ) [inline], [static]
```

This mask configures compliance with the OMG DDS-RPC specification.

The mask sets the following bits:

- **rti::config::compliance::RpcMask::use_standard_related_sample_pid()** (p. 2220)

The HEX value for the mask is: 0x00000001.

8.320.4.3 default_mask()

```
static const RpcMask rti::config::compliance::RpcMask::default_mask ( ) [inline], [static]
```

Default RPC compliance mask.

The mask does not sets any bits.

The HEX value for the mask is: 0x00000000.

8.321.1 Detailed Description

<<***extension***>> *(p. 354)* Configures aspects of the RTPS protocol related to a reliable DataReader

It is used to config reliable reader according to RTPS protocol.

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

QoS:

rti::core::policy::DataReaderProtocol (p. 1059) **rti::core::policy::DiscoveryConfig** (p. 1271)

8.321.2 Constructor & Destructor Documentation

8.321.2.1 RtpsReliableReaderProtocol()

```
rti::core::RtpsReliableReaderProtocol::RtpsReliableReaderProtocol ( )  [inline]
```

Creates an instance with the default settings.

8.321.3 Member Function Documentation

8.321.3.1 min_heartbeat_response_delay() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::min_heartbeat_response_delay
(
        const  dds::core::Duration & the_min_heartbeat_response_delay )
```

<<***extension***>> *(p. 116)* The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0, 1 year], <= max_heartbeat_response_delay

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.321.3.2 min_heartbeat_response_delay() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::min_heartbeat_response_delay ( ) const
```

Getter (see setter with the same name)

8.321.3.3 max_heartbeat_response_delay() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::max_heartbeat_response_delay
(
            const  dds::core::Duration & the_max_heartbeat_response_delay )
```

<<***extension***>> *(*p. *116)* The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

[default] The default value depends on the container policy:

- For **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064): 0.5 seconds
- For **rti::core::policy::DiscoveryConfig::publication_reader** (p. 1286): 0 seconds
- For **rti::core::policy::DiscoveryConfig::subscription_reader** (p. 1288): 0 seconds
- For **rti::core::policy::DiscoveryConfig::participant_message_reader** (p. 1295): 0 seconds

[range] [0, 1 year], >= min_heartbeat_response_delay

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.321.3.4 max_heartbeat_response_delay() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::max_heartbeat_response_delay ( ) const
```

Getter (see setter with the same name)

8.321.3.5 heartbeat_suppression_duration() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::heartbeat_suppression_↩
duration (
            const  dds::core::Duration & the_heartbeat_suppression_duration )
```

<<***extension***>> *(*p. *116)* The duration a reader ignores consecutively received heartbeats

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

[default] 0.0625 seconds

[range] [0, 1 year],

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.321.3.6 heartbeat_suppression_duration() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::heartbeat_suppression_duration ( )
const
```

Getter (see setter with the same name)

8.321.3.7 nack_period() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::nack_period (
            const  dds::core::Duration & the_nack_period )
```

<<***extension***>> *(*p. *116)* The period at which to send NACKs

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

[default] 5 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.321.3.8 nack_period() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::nack_period ( ) const
```

Getter (see setter with the same name)

8.321.3.9 receive_window_size() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::receive_window_size (
            int32_t the_receive_window_size )
```

<<***extension***>> *(p. 116)* The number of received out-of-order samples a reader can keep at a time

A reliable reader stores the out-of-order samples it receives until it can present them to the application in-order. The receive window is the maximum number of out-of-order samples that a reliable reader keeps at a given time. When the receive window is full, subsequently received out-of-order samples are dropped.

[default] 256

[range] [>= 1]

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.321.3.10 receive_window_size() [2/2]

```
int32_t rti::core::RtpsReliableReaderProtocol::receive_window_size ( ) const
```

Getter (see setter with the same name)

8.321.3.11 round_trip_time() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::round_trip_time (
            const  dds::core::Duration & the_round_trip_time )
```

<<***extension***>> *(p. 116)* The duration from sending a NACK to receiving a repair of a sample

This round-trip time is an estimate of the time starting from when the reader sends a NACK for a specific sample to when it receives that sample. For each sample, the reader will not send a subsequent NACK for it until the round-trip time has passed, thus preventing inefficient redundant requests.

[default] 0 seconds

[range] [0 nanosec, 1 year]

Categories

Immutable (p. 243), **Reliability** (p. 222)

8.321.3.12 round_trip_time() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::round_trip_time ( ) const
```

Getter (see setter with the same name)

8.321.3.13 app_ack_period() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::app_ack_period (
            const  dds::core::Duration & the_app_ack_period )
```

<<***extension***>> *(*p. *116)* The period at which application-level acknowledgment messages are sent

A **dds::sub::DataReader** (p. 976) sends application-level acknowledgment messages to a **dds::pub::DataWriter** (p. 1138) at this periodic rate, and will continue sending until it receives a message from the **dds::pub::DataWriter** (p. 1138) that it has received and processed the acknowledgment and an AppAckConfirmation has been received by the **dds::sub::DataReader** (p. 976). Note: application-level acknowledgment messages can also be sent non-periodically, as determined by **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 2228).

[default] 5 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 243), **Reliability** (p. 222), **Application Acknowledgement** (p. 158)

8.321.3.14 app_ack_period() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::app_ack_period ( ) const
```

Getter (see setter with the same name)

8.321.3.15 min_app_ack_response_keep_duration() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::min_app_ack_response_keep_↩
duration (
            const  dds::core::Duration & the_app_ack_period )
```

<<***extension***>> *(*p. *116)* Minimum duration for which application-level acknowledgment response data is kept

The user-specified response data of an explicit application-level acknowledgment (called by **dds::sub::DataReader↩ ::acknowledge_sample** (p. 1015) or **dds::sub::DataReader::acknowledge_all** (p. 1013)) is cached by the **dds::sub↩ ::DataReader** (p. 976) for the purpose of reliably resending the data with the acknowledgment message. After this duration has passed from the time of the first acknowledgment, the response data is dropped from the cache and will not be resent with future acknowledgments for the corresponding sample(s).

[default] 0 sec

[range] [0 sec, 1 year]

Categories

Immutable (p. 243), **Reliability** (p. 222), **Application Acknowledgement** (p. 158)

8.321.3.16 min_app_ack_response_keep_duration() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::min_app_ack_response_keep_duration ( )
const
```

Getter (see setter with the same name)

8.321.3.17 samples_per_app_ack() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::samples_per_app_ack (
            int32_t the_samples_per_app_ack )
```

<<***extension***>> *(*p. *116)* The minimum number of samples acknowledged by one application-level acknowledgment message

This setting applies only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 2154) = **rti::core::policy↩ ::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 798) or **rti::core::policy::AcknowledgmentKind_def↩ ::APPLICATION_AUTO** (p. 798)

A **dds::sub::DataReader** (p. 976) will immediately send an application-level acknowledgment message when it has at least this many samples that have been acknowledged. It will not send an acknowledgment message until it has at least this many samples pending acknowledgment.

For example, calling **dds::sub::DataReader::acknowledge_sample** (p. 1015) this many times consecutively will trigger the sending of an acknowledgment message. Calling **dds::sub::DataReader::acknowledge_all** (p. 1013) may trigger the sending of an acknowledgment message, if at least this many samples are being acknowledged at once.

This is independent of the **rti::core::RtpsReliableReaderProtocol::app_ack_period** (p. 2227), where a **dds::sub::↩ DataReader** (p. 976) will send acknowledgement messages at the periodic rate regardless.

When this is set to **dds::core::LENGTH_UNLIMITED** (p. 438), then acknowledgement messages are sent only periodically, at the rate set by **rti::core::RtpsReliableReaderProtocol::app_ack_period** (p. 2227).

[default] 1

[range] [1, 1000000], or **dds::core::LENGTH_UNLIMITED** (p. 438)

Categories

8.322.3.18 heartbeats_per_max_samples() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_↩
samples (
            int32_t the_heartbeats_per_max_samples )
```

<<***extension***>> *(*p. *116)* The number of piggyback heartbeats sent per max send window.

When a DataWriter is configured with a fixed send window size (**rti::core::policy::RtpsReliableWriterProtocol::min↩ _send_window_size** (p. 2249) is equal to effective max_send_window_size), a piggyback heartbeat is sent every [(effective max send window size/heartbeats_per_max_samples)] number of samples written.

Otherwise, the number of piggyback heartbeats sent is scaled according to the current size of the send window. For example, consider a **rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_samples** (p. 2240) of 50. If the current send window size is 100, a piggyback heartbeat will be sent every 2 samples. If the send window size grows to 150, a piggyback heartbeat will be sent every 3 samples, and so on. Additionally, when the send window size

grows, a piggyback heartbeat is sent with the next sample. (If it weren't, the sending of that heartbeat could be delayed, since the heartbeat rate scales with the increasing window size.)

The effective max send window is calculated as follows:

Without batching:

min (**dds::core::policy::ResourceLimits::max_samples** (p. 2205), **rti::core::policy::RtpsReliableWriterProtocol↩ ::max_send_window_size** (p. 2250))

With batching:

min (**rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1240), **rti::core::policy::RtpsReliableWriter↩ Protocol::max_send_window_size** (p. 2250))

If heartbeats_per_max_samples is set to zero, no piggyback heartbeats will be sent.

If current send window size is **dds::core::LENGTH_UNLIMITED** (p. 438), 100 million is assumed as the effective max send window.

[default] The default value depends on the container policy:

- For **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217): 8
- For **rti::core::policy::DiscoveryConfig::publication_writer** (p. 1289): 8
- For **rti::core::policy::DiscoveryConfig::subscription_writer** (p. 1291): 8
- For **rti::core::policy::DiscoveryConfig::participant_message_writer** (p. 1296): 1

[range] [0, 100 million]

- For **rti::core::policy::DiscoveryConfig::publication_writer** (p. 1289): heartbeats_per_max_samples<= **rti::core::AllocationSettings::max_count** (p. 804) in **rti::core::policy::↩ DomainParticipantResourceLimits::local_writer_allocation** (p. 1398)
- For **rti::core::policy::DiscoveryConfig::subscription_writer** (p. 1291): heartbeats_per_max_samples<= **rti::core::AllocationSettings::max_count** (p. 804) in **rti::core::policy::↩ DomainParticipantResourceLimits::local_reader_allocation** (p. 1398)
- For **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217):

heartbeats_per_max_samples<= **dds::core::policy::ResourceLimits::max_samples** (p. 2205) if batching is disabled. Otherwise:
heartbeats_per_max_samples<= **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1240)

heartbeats_per_max_samples<= **rti::core::policy::RtpsReliableWriterProtocol::max_send_window_size** (p. 2250)

Categories

RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::nack_suppression_↩
duration (
            const  dds::core::Duration & the_nack_suppression_duration )
```

<<***extension***>> *(p. 116)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs/NACK_FRAGs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs/NACK_FRAGs are ignored to prevent redundant repairs from being sent.

A redundant NACK is a NACK that requests the same or lower first sequence number (SN) than the last NACK from the same reader.

A redundant NACK_FRAG is a NACK_FRAG that requests the same first fragment number for a sample as the last NACK_FRAG from the same reader.

The suppression duration applies separately to NACKs and NACK_FRAGS. For example, replying to a NACK_FRAG message in between receiving two NACK messages will not cause the second NACK message to be suppressed if the two NACK messages are received more than the suppression duration apart.

[default] 0 seconds

[range] [0, 1 day]

Categories

Immutable (p. 243), **Reliability** (p. 222), **Fragmentation** (p. 191)

8.322.3.25 nack_suppression_duration() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::nack_suppression_duration ( )

8.322.3.26 max_bytes_per_nack_response() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::max_bytes_per_nack_↩
response (
            int32_t the_max_bytes_per_nack_response )
```

<<***extension***>> *(*p. *116)* The maximum total message size when resending rejected samples or data fragments.

As part of the reliable communication protocol, DataWriters send heartbeat (HB) messages to their DataReaders. Each HB message contains the sequence number of the most recent sample sent by the DataWriter.

In response, a DataReader may send a negative acknowledgement (NACK) message, indicating what sequence numbers it did not receive, if any. If the samples were fragmented, it can also send a NACK_FRAG requesting the fragments of a sample that did not arrive. If the DataReader is missing some samples or fragments, the DataWriter will send them again.

max_bytes_per_nack_response determines the maximum size of the message sent by the DataWriter in response to a NACK or NACK_FRAG. This message may contain multiple samples or fragments. The DataWriter will always send at least one message, even if the size of that message exceeds the max_bytes_per_nack_response value.

If the total size of all samples or fragments that needs to be resent is larger than max_bytes_per_nack_response, the remaining samples or fragments will be resent the next time a NACK or NACK_FRAG arrives.

Note: If **rti::core::policy::RtpsReliableWriterProtocol::min_nack_response_delay** (p. 2242) and **rti::core::policy↩ ::RtpsReliableWriterProtocol::max_nack_response_delay** (p. 2242) are both **dds::core::Duration::zero()** (p. 1450) (which means repairs are processed immediately), this limit applies separately to NACKs and NACK_FRAGs: repairing a NACK in this case does not affect the maximum size of a NACK_FRAG response and vice versa. Otherwise, the limit applies to the total size of the response, including received NACKs and NACK_FRAGs.

[default] The default value depends on the container policy:

- For **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217): 131072 bytes
- For **rti::core::policy::DiscoveryConfig::publication_writer** (p. 1289): 131072 bytes

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_positive_↩
acks_enable_adaptive_sample_keep_duration (
            bool disable )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting **rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_↩ keep_duration** (p. 2247) = true, enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by **rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_increase↩ _sample_keep_duration_factor** (p. 2248). Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by **rti::core::policy::RtpsReliable↩ WriterProtocol::disable_positive_acks_decrease_sample_keep_duration_factor** (p. 2248).

The lower and upper bounds of the dynamic sample keep duration are set by **rti::core::policy::RtpsReliableWriter↩ Protocol::disable_positive_acks_min_sample_keep_duration** (p. 2245) and **rti::core::policy::RtpsReliable↩ WriterProtocol::disable_positive_acks_max_sample_keep_duration** (p. 2246), respectively.

When **rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_keep↩ _duration** (p. 2247) = false, the sample keep duration is set to **rti::core::policy::RtpsReliableWriterProtocol↩ ::disable_positive_acks_min_sample_keep_duration** (p. 2245) .

[default] true

8.324.1 Detailed Description

<<***extension***>> *(p. 354)* Configures the mapping of the RTPS well-known ports

RTI Connext uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Connext. These parameters are exposed in **rti::core::RtpsWellKnownPorts** (p. 2258). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **rti::core::RtpsWellKnownPorts** (p. 2258), the port numbers depend on:

- `domain_id`, as specified in **dds::domain::DomainParticipant()** (p. 1326)
- `participant_id`, as specified using **rti::core::policy::WireProtocol::participant_id** (p. 2635)

The `domain_id` parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The `participant_id` parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The *metatraffic_unicast_port* is used to exchange discovery metatraffic using unicast.

```
metatraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + b
```

The *metatraffic_multicast_port* is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268) on a **dds::domain::DomainParticipant** (p. 1326) entity.

```
metatraffic_multicast_port = port_base + (domain_id_gain * domain_id) + builtin_multicast_port_offset
```

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **rti::core::policy::TransportMulticast** (p. 2543), **rti::core::policy::TransportUnicast** (p. 2556), or by the **rti::core::policy::TransportUnicast** (p. 2556) QoS policies.

The *usertraffic_unicast_port* is used to exchange user data using unicast.

```
usertraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + u
```

The *usertraffic_multicast_port* is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using **rti::core::policy::TransportMulticast** (p. 2543).

```
usertraffic_multicast_port = port_base + (domain_id_gain * domain_id) + user_multicast_port_offset
```

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also **rti::core::RtpsWellKnownPorts::Interoperable()** (p. 557)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Connext middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

Note: On Windows, you should avoid using ports 49152 through 65535 for inbound traffic. RTI Connext's ephemeral ports (see "Ports Used for Communication" in the `User's Manual`) may be within that range (see `https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550(v=vs.85).aspx`). With the default **RtpsWellKnownPorts** (p. 2258) settings, port 49152 corresponds to domain ID 167, so using domain IDs 168 through 232 on Windows introduces the risk of a port collision and failure to create the Domain Participant when using multicast discovery. You may see this error:

RTIOsapiSocket_bindWithIP:OS bind() failure, error 0X271D: An attempt was made to access a socket in a way forbidden by its access permissions.

QoS:

rti::core::policy::WireProtocol (p. 2630)

8.324.2 Constructor & Destructor Documentation

8.324.2.1 RtpsWellKnownPorts() [1/2]

```
rti::core::RtpsWellKnownPorts::RtpsWellKnownPorts ( )  [inline]
```

Creates an instance that contains the default RTPS well-known ports.

8.324.2.2 RtpsWellKnownPorts() [2/2]

```
rti::core::RtpsWellKnownPorts::RtpsWellKnownPorts (
            int32_t the_port_base,
            int32_t the_domain_id_gain,
            int32_t the_participant_id_gain,
            int32_t the_builtin_multicast_port_offset,
            int32_t the_builtin_unicast_port_offset,
            int32_t the_user_multicast_port_offset,
            int32_t the_user_unicast_port_offset )  [inline]
```

Creates an instance with the specified ports.

See individual setters.

8.324.3 Member Function Documentation

8.324.3.1 port_base() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::port_base ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.2 port_base() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::port_base (
            int32_t the_port_base )  [inline]
```

<<***extension***>> *(*p. *116)* The base port offset.

All mapped well-known ports are offset by this value.

[default] 7400

[range] [>= 1], but resulting ports must be within the range imposed by the underlying transport.

8.324.3.3 domain_id_gain() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::domain_id_gain ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.4 domain_id_gain() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::domain_id_gain (
            int32_t the_domain_id_gain )  [inline]
```

<<***extension***>> *(*p. *116)* Tunable domain gain parameter.

Multiplier of the `domain_id`. Together with `participant_id_gain`, it determines the highest `domain_id` and `participant_id` allowed on this network.

In general, there are two ways to setup `domain_id_gain` and `participant_id_gain` parameters.

If `domain_id_gain` > `participant_id_gain`, it results in a port mapping layout where all **dds::domain::DomainParticipant** (p. 1326) instances within a single domain occupy a consecutive range of `domain_id_gain` ports. Precisely, all ports occupied by the domain fall within:

```
(port_base + (domain_id_gain * domain_id))
```

and:

```
(port_base + (domain_id_gain * (domain_id + 1)) - 1)
```

Under such a case, the highest `domain_id` is limited only by the underlying transport's maximum port. The highest `participant_id`, however, must satisfy:

```
max_participant_id < (domain_id_gain / participant_id_gain)
```

On the contrary, if `domain_id_gain` <= `participant_id_gain`, it results in a port mapping layout where a given domain's **dds::domain::DomainParticipant** (p. 1326) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain Id = 1	Participant ID = 2
	Domain Id = 0	Participant ID = 2
	Domain Id = 1	Participant ID = 1
	Domain Id = 0	Participant ID = 1
	Domain Id = 1	Participant ID = 0
lower port number	Domain Id = 0	Participant ID = 0

Under this case, the highest `participant_id` is limited only by the underlying transport's maximum port. The highest `domain_id`, however, must satisfy:

```
max_domain_id < (participant_id_gain / domain_id_gain)
```

Additionally, `domain_id_gain` also determines the range of the port-specific offsets.

```
domain_id_gain > abs(builtin_multicast_port_offset - user_multicast_port_offset)
```

```
domain_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

Violating this may result in port aliasing and undefined discovery behavior.

[default] 250

[range] [$>$ 0], but resulting ports must be within the range imposed by the underlying transport.

8.324.3.5 participant_id_gain() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::participant_id_gain ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.6 participant_id_gain() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::participant_id_gain (
            int32_t the_participant_id_gain )  [inline]
```

<<***extension***>> *(p. 116)* Tunable participant gain parameter.

Multiplier of the `participant_id`. See **rti::core::RtpsWellKnownPorts::domain_id_gain** (p. 2262) for its implications on the highest `domain_id` and `participant_id` allowed on this network.

Additionally, `participant_id_gain` also determines the range of `builtin_unicast_port_offset` and `user_unicast_port_offset`.

```
participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

[default] 2

[range] [$>$ 0], but resulting ports must be within the range imposed by the underlying transport.

8.324.3.7 builtin_multicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::builtin_multicast_port_offset ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.8 builtin_multicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::builtin_multicast_port_offset (
            int32_t the_builtin_multicast_port_offset )  [inline]
```

<<***extension***>> *(*p. *116)* Additional offset for **metatraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 0

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.324.3.9 builtin_unicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::builtin_unicast_port_offset ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.10 builtin_unicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::builtin_unicast_port_offset (
            int32_t the_builtin_unicast_port_offset )  [inline]
```

<<***extension***>> *(*p. *116)* Additional offset for **metatraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 10

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.324.3.11 user_multicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::user_multicast_port_offset ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.12 user_multicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::user_multicast_port_offset (
            int32_t the_user_multicast_port_offset )  [inline]
```

<<***extension***>> *(*p. *116)* Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 1

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.324.3.13 user_unicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::user_unicast_port_offset ( ) const  [inline]
```

Getter (see setter with the same name)

8.324.3.14 user_unicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::user_unicast_port_offset (
            int32_t the_user_unicast_port_offset )  [inline]
```

<<***extension***>> *(*p. *116)* Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 11

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.325 dds::core::safe_enum< def, inner > Class Template Reference

<<***value-type***>> *(*p. *350)* Provides a safe, scoped enumeration based on def::type

```
#include <SafeEnumeration.hpp>
```

Inherits def.

Public Types

- typedef inner **inner_enum**

Public Member Functions

- **safe_enum** ()
  Initializes the enumeration to zero.
- **safe_enum** (**inner_enum** v)
  Copy constructor.
- **inner_enum underlying** () const
  Retrieves the actual `enum` *value.*
- bool **operator==** (const **safe_enum** &s) const
  Applies operator to underlying enumeration value.
- bool **operator!=** (const **safe_enum** &s) const
  Applies operator to underlying enumeration value.
- bool **operator**< (const **safe_enum** &s) const
  Applies operator to underlying enumeration value.
- bool **operator**<**=** (const **safe_enum** &s) const
  Applies operator to underlying enumeration value.
- bool **operator**> (const **safe_enum** &s) const
  Applies operator to underlying enumeration value.
- bool **operator**>**=** (const **safe_enum** &s) const
  Applies operator to underlying enumeration value.

Friends

- void **swap** (**safe_enum** &left, **safe_enum** &right) OMG_NOEXCEPT
  Swaps the enumeration values.

Related Functions

(Note that these are not member functions.)

- template<typename def , typename inner >
  std::ostream & **operator**<< (std::ostream &out, const **safe_enum**< def, inner > &the_enum)
  Applies `operator<<` *to the underlying enum.*

8.325.1 Detailed Description

template<typename def, typename inner = typename def::type>
class dds::core::safe_enum< def, inner >

<<***value-type***>> *(*p. *350)* Provides a safe, scoped enumeration based on def::type

The purpose of this class is to provide a C++11-style enum class, where the enumeration constants are scoped.

Template Parameters

def	A struct containing the actual enumeration, `def::type`

See for example **dds::core::policy::ReliabilityKind** (p. 545). The actual enumeration is in **dds::core::policy::ReliabilityKind_def** (p. 2156), but the application only needs to use the former:

```
using dds::core::policy::ReliabilityKind;
ReliabilityKind kind = ReliabilityKind::RELIABLE;
```

A **safe_enum** (p. 2265) can be converted to and from an integer.

To convert to an integer, use the member function **underlying()** (p. 2268):

```
ReliabilityKind reliability = ReliabilityKind::RELIABLE;
int reliability_as_int = reliability.underlying();
```

To convert from an integer, `static_cast` it to the member type `inner_enum`:

```
int reliability_as_int = 2;
ReliabilityKind reliability = static_cast<ReliabilityKind::inner_enum>(reliability_as_int);
```

8.325.2 Member Typedef Documentation

8.325.2.1 inner_enum

```
template<typename def , typename inner = typename def::type>
typedef inner  dds::core::safe_enum< def, inner >::inner_enum
```

The underlying `enum` type

To convert from an integer, `static_cast` it to the member type `inner_enum`:

```
int reliability_as_int = 2;
ReliabilityKind reliability = static_cast<ReliabilityKind::inner_enum>(reliability_as_int);
```

8.325.3 Constructor & Destructor Documentation

8.325.3.1 safe_enum() [1/2]

```
template<typename def , typename inner = typename def::type>
dds::core::safe_enum< def, inner >::safe_enum ( )  [inline]
```

Initializes the enumeration to zero.

Note

Zero may not be a valid enumerator. It's best to assign a valid enumerator whenever possible:

```
Reliability reliability = Reliability::RELIABLE;
```

8.325.3.2 safe_enum() [2/2]

```
template<typename def , typename inner = typename def::type>
dds::core::safe_enum< def, inner >::safe_enum (
              inner_enum v )  [inline]
```

Copy constructor.

8.325.4 Member Function Documentation

8.325.4.1 underlying()

```
template<typename def , typename inner = typename def::type>
inner_enum  dds::core::safe_enum< def, inner >::underlying ( ) const  [inline]
```

Retrieves the actual enum value.

Referenced by **dds::core::safe_enum< def, inner >::operator<<()**.

8.325.4.2 operator==()

```
template<typename def , typename inner = typename def::type>
bool  dds::core::safe_enum< def, inner >::operator== (
             const  safe_enum< def, inner > & s ) const  [inline]
```

Applies operator to underlying enumeration value.

8.325.4.3 operator"!=()

```
template<typename def , typename inner = typename def::type>
bool  dds::core::safe_enum< def, inner >::operator!= (
             const  safe_enum< def, inner > & s ) const  [inline]
```

Applies operator to underlying enumeration value.

8.325.4.4 operator<()

```
template<typename def , typename inner = typename def::type>
bool  dds::core::safe_enum< def, inner >::operator< (
            const  safe_enum< def, inner > & s ) const  [inline]
```

Applies operator to underlying enumeration value.

8.325.4.5 operator<=()

```
template<typename def , typename inner = typename def::type>
bool  dds::core::safe_enum< def, inner >::operator<= (
            const  safe_enum< def, inner > & s ) const  [inline]
```

Applies operator to underlying enumeration value.

8.325.4.6 operator>()

```
template<typename def , typename inner = typename def::type>
bool  dds::core::safe_enum< def, inner >::operator> (
            const  safe_enum< def, inner > & s ) const  [inline]
```

Applies operator to underlying enumeration value.

8.325.4.7 operator>=()

```
template<typename def , typename inner = typename def::type>
bool  dds::core::safe_enum< def, inner >::operator>= (
            const  safe_enum< def, inner > & s ) const  [inline]
```

Applies operator to underlying enumeration value.

8.325.5 Friends And Related Function Documentation

8.325.5.1 swap

```
template<typename def , typename inner = typename def::type>
void swap (
              safe_enum< def, inner > & left,
              safe_enum< def, inner > & right )  [friend]
```

Swaps the enumeration values.

8.325.5.2 operator<<()

```
template<typename def , typename inner >
std::ostream & operator<< (
             std::ostream & out,
             const  safe_enum< def, inner > & the_enum )  [related]
```

Applies operator<< to the underlying enum.

References **dds::core::safe_enum< def, inner >::underlying()**.

8.326 dds::sub::Sample< T > Class Template Reference

8.326.1 Detailed Description

template<typename T>
class dds::sub::Sample< T >

<<***value-type***>> *(p. 350)* This class encapsulate the data and meta-data associated with DDS samples.

Template Parameters

The	type of the data that **Sample** (p. 2270) represents

8.326.2 Constructor & Destructor Documentation

8.326.2.1 Sample() [1/4]

```
template<typename T >
dds::sub::Sample< T >::Sample ( )  [default]
```

Create a sample.

Postcondition

The value of **data()** (p. 2272) is default-constructed, and **info()** (p. 2273).valid() is false.

8.326.2.2 Sample() [2/4]

```
template<typename T >
dds::sub::Sample< T >::Sample (
            const T & the_data,
            const  SampleInfo & the_info )  [inline]
```

Create a **Sample** (p. 2270) with the provided data and **SampleInfo** (p. 2285).

Parameters

the_data	The data to create the **Sample** (p. 2270) with
the_info	The **SampleInfo** (p. 2285) to create the **Sample** (p. 2270) with

8.326.2.3 Sample() [3/4]

```
template<typename T >
dds::sub::Sample< T >::Sample (
            const  rti::sub::LoanedSample< T > & loaned_sample )  [inline], [explicit]
```

<<***extension***>> *(p. 354)* Construct a **Sample** (p. 2270) from a LoanedSample

If `loaned_sample.info()`.valid() is false, this sample's data value is default-constructed.

8.326.2.4 Sample() [4/4]

```
template<typename T >
dds::sub::Sample< T >::Sample (
            const  Sample< T > & other )  [default]
```

Copy constructor.

8.326.3 Member Function Documentation

8.326.3.1 operator=() [1/2]

```
template<typename T >
Sample &  dds::sub::Sample< T >::operator= (
            const  Sample< T > & other )  [default]
```

Copy assignment operator.

8.326.3.2 data() [1/2]

```
template<typename T >
const DataType &  dds::sub::Sample< T >::data ( ) const  [inline]
```

Get the data of type T associated with this **Sample** (p. 2270).

This function returns the current value of the data even if **info()** (p. 2273).valid() is false.

8.326.3.3 data() [2/2]

```
template<typename T >
void  dds::sub::Sample< T >::data (
            const DataType & the_data )  [inline]
```

Set the data of type T associated with this **Sample** (p. 2270).

8.326.3.4 info() [1/2]

```
template<typename T >
const  SampleInfo &  dds::sub::Sample< T >::info ( ) const  [inline]
```

Get the **SampleInfo** (p. 2285) associated with this **Sample** (p. 2270).

Referenced by **rti::request::IsReplyRelatedPredicate< T >::operator()()**.

8.326.3.5 info() [2/2]

```
template<typename T >
void  dds::sub::Sample< T >::info (
            const  SampleInfo & the_info )  [inline]
```

Set the **SampleInfo** (p. 2285) associated with this **Sample** (p. 2270).

8.326.3.6 operator=() [2/2]

```
template<typename T >
Sample &  dds::sub::Sample< T >::operator= (
            const  rti::sub::LoanedSample< T > & loaned_sample )  [inline]
```

<<***extension***>> *(p. 354)* Assignment operator from an **rti::sub::LoanedSample** (p. 1659)

This operator allows obtaining a copy of both the data and the info from a LoanedSample.

Postcondition

If `loaned_sample.info()`.valid() is false, this sample's **data()** (p. 2272) value is not modified, but **info()** (p. 2273).valid() is false.

8.327 rti::flat::Sample< OffsetType > Class Template Reference

The generic definition of FlatData topic-types.

`#include <FlatSample.hpp>`

Inherits rti::flat::SampleBase.

Public Types

- typedef OffsetType **Offset**
  The related Offset type.
- typedef OffsetType::ConstOffset **ConstOffset**
  The related read-only Offset type.

Public Member Functions

- **Offset root** ()
  Provides the Offset to the top-level type.
- **ConstOffset root** () const
  Provides the Offset to the top-level type.
- **Sample**< OffsetType > * **clone** () const
  *Clones a **Sample** (p. 2274), creating an unmanaged **Sample** (p. 2274).*

Static Public Member Functions

- static **Sample**< OffsetType > * **create_data** ()
  *Creates an unmanaged FlatData **Sample** (p. 2274).*
- static void **delete_data** (**rti::flat::Sample**< OffsetType > *sample)
  *Releases an unmanaged **Sample** (p. 2274).*

8.327.1 Detailed Description

template<typename OffsetType>
class rti::flat::Sample< OffsetType >

The generic definition of FlatData topic-types.

Template Parameters

OffsetType	The Offset to the beginning of the data **Sample** (p. 2274) (the root), for example **MyFlatFinalOffset** (p. 1759), or **MyFlatMutableOffset** (p. 1770).

For a FlatData IDL type, **rtiddsgen** generates an instantiation of this class, such as MyFlatFinal or MyFlatMutable. That's the **topic-type** used to declare a **dds::topic::Topic** (p. 2474) and write or read FlatData samples.

A FlatData **Sample** (p. 2274) owns an inline buffer that contains the serialized data. To access the **Sample** (p. 2274) data members we use **Offsets** (p. 414), iterators that point to the position of a member in the **Sample** (p. 2274) buffer. The **root()** (p. 2276) is the Offset to the top-level element (for example **MyFlatMutableOffset** (p. 1770)). From there **MyFlatMutableOffset** (p. 1770)'s member functions provide access to its members.

The method to create a **Sample** (p. 2274) varies depending on whether the type is final or mutable.

Samples of **final** FlatData types always have the same size, and can be obtained directly with **dds::pub::DataWriter::get_loan()** (p. 1183).

Samples of **mutable** FlatData types need to be "built" using the Builder returned by **rti::flat::build_data()** (p. 411) (**MyFlatMutableBuilder** (p. 1763) in this example). A Builder allows adding each member individually in any order, and sizing sequences as needed.

See **Publishing FlatData** (p. 420) for code snippets.

Samples created with **dds::pub::DataWriter::get_loan()** (p. 1183) or **rti::flat::build_data()** (p. 411) are DataWriter-managed and do not need to be explicitly deleted. See **dds::pub::DataWriter::get_loan()** (p. 1183) for an explanation of the lifecycle of DataWriter-managed samples.

Samples received with a **dds::sub::DataReader** (p. 976) can be examined by obtaining the **root()** (p. 2276), but cannot be modified. See **Subscribing to FlatData** (p. 421).

FlatData samples are not value types. They don't provide copy constructors or assignment operators, because of their definition as an inline buffer that contains the serialized **Sample** (p. 2274) at all times. A **Sample** (p. 2274) can be cloned with the static function **clone()** (p. 2277). A cloned **Sample** (p. 2274) is unmanaged and has to be deleted with the static function **delete_data()** (p. 2277).

8.327.2 Member Typedef Documentation

8.327.2.1 Offset

```
template<typename OffsetType >
typedef OffsetType  rti::flat::Sample< OffsetType >::Offset
```

The related Offset type.

This is the template parameter, OffsetType

8.327.2.2 ConstOffset

```
template<typename OffsetType >
typedef OffsetType::ConstOffset  rti::flat::Sample< OffsetType >::ConstOffset
```

The related read-only Offset type.

For example, **MyFlatMutableOffset::ConstOffset** (p. 1771).

8.327.3 Member Function Documentation

8.327.3.1 root() [1/2]

```
template<typename OffsetType >
Offset rti::flat::Sample< OffsetType >::root ( ) [inline]
```

Provides the Offset to the top-level type.

Returns

An Offset that allows reading and modifying the members of this **Sample** (p. 2274), for example **MyFlatFinalOffset** (p. 1759) or **MyFlatMutableOffset** (p. 1770).

This overload allows modifying the **Sample** (p. 2274).

Example:

```
MyFlatFinal *my_sample = ...; // for example, created with DataWriter::get_loan()
MyFlatFinalOffset my_sample_root = my_sample->root();
my_sample_root.my_primitive(33);
auto my_member_offset = my_sample_root.my_complex();
// ... modify my_member_offset
```

8.327.3.2 root() [2/2]

```
template<typename OffsetType >
ConstOffset rti::flat::Sample< OffsetType >::root ( ) const [inline]
```

Provides the Offset to the top-level type.

Returns

An Offset that allows reading the members of this **Sample** (p. 2274). For example, **MyFlatFinalOffset::ConstOffset** (p. 1760) or **MyFlatMutableOffset::ConstOffset** (p. 1771).

This overload doesn't allow modifying the **Sample** (p. 2274).

Example:

```
const MyFlatMutable *my_sample = ...; // for example, read from a DataReader
MyFlatMutableOffset::ConstOffset my_sample_root = my_sample->root();
std::cout « my_sample_root.my_primitive() « std::endl;
auto my_member_offset = my_sample_root.my_mutable_seq();
// ... read my_member_offset
```

8.327.3.3 create_data()

```
template<typename OffsetType >
Sample< OffsetType > * rti::flat::Sample< OffsetType >::create_data [static]
```

Creates an unmanaged FlatData **Sample** (p. 2274).

Note

In general on the publication side it is recommended to create DataWriter-managed samples using **dds::pub::DataWriter::get_loan** (p. 1183) (for final types) and **rti::flat::build_data()** (p. 411) (for mutable types).

If the topic-type is final, the returned **Sample** (p. 2274) can be initialized by obtaining the **root()** (p. 2276).

If the topic-type is mutable, the resulting **Sample** (p. 2274) has no members, and **root()** (p. 2276) returns a **null** (p. 1876) Offset. The result of **create_data()** (p. 2276) must be used to create a Builder. This is a rare use case, and **rti::flat::build_data()** (p. 411) should be used in most situations.

In all cases, the returned **Sample** (p. 2274) must be explicitly deleted with **delete_data()** (p. 2277).

8.327.3.4 clone()

```
template<typename OffsetType >
Sample< OffsetType > * rti::flat::Sample< OffsetType >::clone ( ) const [inline]
```

Clones a **Sample** (p. 2274), creating an unmanaged **Sample** (p. 2274).

Warning

When this **Sample** (p. 2274) has been created with **dds::pub::DataWriter::get_loan** (p. 1183) or **rti::flat::build_data()** (p. 411), the clone this function creates cannot be used in **dds::pub::DataWriter::write()** (p. 1148), because the DataWriter is managing the lifecycle of its samples.

Creates a new **Sample** (p. 2274) and copies the underlying serialized buffer.

delete_data() (p. 2277) must be called to release the **Sample** (p. 2274).

8.327.3.5 delete_data()

```
template<typename OffsetType >
static void rti::flat::Sample< OffsetType >::delete_data (
            rti::flat::Sample< OffsetType > * sample ) [inline], [static]
```

Releases an unmanaged **Sample** (p. 2274).

Unmanaged samples are those created with **create_data()** (p. 2276) or **clone()** (p. 2277).

Precondition

`sample` cannot have been created with **dds::pub::DataWriter::get_loan** (p. 1183) or **rti::flat::build_data()** (p. 411).

Postcondition

`sample` becomes invalid and shouldn't be used

8.328 rti::core::SampleFlag Class Reference

<<***extension***>> *(*p. *354)* A set of flags that can be associated with a sample.

```
#include "rti/core/SampleFlag.hpp"
```

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**

  A typedef of std::bitset<32> for convenience.

Public Member Functions

- **SampleFlag** ()

  Construct an empty ***SampleFlag*** *(*p. *2278) with no bits set.*
- **SampleFlag** (uint64_t mask)

  Construct a ***SampleFlag*** *(*p. *2278) from an integer.*
- **SampleFlag** (const **MaskType** &mask)

  Construct a ***SampleFlag*** *(*p. *2278) from a MaskType object.*

Static Public Member Functions

- static const **SampleFlag redelivered** ()

  Indicates that a sample has been redelivered by RTI Queuing Service.
- static const **SampleFlag intermediate_reply_sequence** ()

  Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connext Repliers sending multiple responses for a request.
- static const **SampleFlag replicate** ()

  Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.
- static const **SampleFlag last_shared_reader_queue** ()

  Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.
- static const **SampleFlag intermediate_topic_query_sample** ()

  Indicates that a sample for a TopicQuery will be followed by more samples.
- static const **SampleFlag incomplete_snapshot_topic_query** ()

  Indicates that some of the samples that were published as part of a snapshot TopicQuery were lost. This flag is set in the last sample of the snapshot.
- static const **SampleFlag writer_removed_batch_sample** ()

  This flag will be set if a sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed.
- static const **SampleFlag discovery_service_sample** ()

  This flag will be set if the sample was sent by Cloud Discovery Service.

8.328.1 Detailed Description

<<***extension***>> *(p. 354)* A set of flags that can be associated with a sample.

A set of flags that can be associated with a sample.

- Least-significant bits [0-7] are reserved by RTI
- Least-significant bits [8-15] are application specific
- Least-significant bits [16-31] are invalid and cannot be used

8.328.2 Member Typedef Documentation

8.328.2.1 MaskType

```
typedef std::bitset<32>  rti::core::SampleFlag::MaskType
```

A typedef of std::bitset<32> for convenience.

8.328.3 Constructor & Destructor Documentation

8.328.3.1 SampleFlag() [1/3]

```
rti::core::SampleFlag::SampleFlag ( )  [inline]
```

Construct an empty **SampleFlag** (p. 2278) with no bits set.

8.328.3.2 SampleFlag() [2/3]

```
rti::core::SampleFlag::SampleFlag (
            uint64_t mask )  [inline], [explicit]
```

Construct a **SampleFlag** (p. 2278) from an integer.

Parameters

mask	Value whose bits are copied to the bitset positions

8.328.3.3 SampleFlag() [3/3]

```
rti::core::SampleFlag::SampleFlag (
            const  MaskType & mask )  [inline]
```

Construct a **SampleFlag** (p. 2278) from a MaskType object.

Parameters

mask	A std::bitset<32> to construct this **SampleFlag** (p. 2278) from

8.328.4 Member Function Documentation

8.328.4.1 redelivered()

```
static const  SampleFlag rti::core::SampleFlag::redelivered ( )  [inline], [static]
```

Indicates that a sample has been redelivered by RTI Queuing Service.

8.328.4.2 intermediate_reply_sequence()

```
static const  SampleFlag rti::core::SampleFlag::intermediate_reply_sequence ( )  [inline], [static]
```

Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connext Repliers sending multiple responses for a request.

8.328.4.3 replicate()

```
static const  SampleFlag rti::core::SampleFlag::replicate ( )  [inline], [static]
```

Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.

8.328.4.4 last_shared_reader_queue()

```
static const SampleFlag rti::core::SampleFlag::last_shared_reader_queue ( ) [inline], [static]
```

Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.

8.328.4.5 intermediate_topic_query_sample()

```
static const SampleFlag rti::core::SampleFlag::intermediate_topic_query_sample ( ) [inline],
[static]
```

Indicates that a sample for a TopicQuery will be followed by more samples.

This flag only applies to samples that have been published as a response to a **rti::sub::TopicQuery** (p. 2516).

When this bit is not set and **dds::sub::SampleInfo::topic_query_guid** (p. 2294) is different from **rti::core::Guid↩ ::unknown()** (p. 1597), this sample is the last sample for that TopicQuery coming from the DataWriter identified by **dds::sub::SampleInfo::source_guid** (p. 2293).

8.328.4.6 incomplete_snapshot_topic_query()

```
static const SampleFlag rti::core::SampleFlag::incomplete_snapshot_topic_query ( ) [inline],
[static]
```

Indicates that some of the samples that were published as part of a snapshot TopicQuery were lost. This flag is set in the last sample of the snapshot.

This flag is set in the last sample of the snapshot.

8.328.4.7 writer_removed_batch_sample()

```
static const SampleFlag rti::core::SampleFlag::writer_removed_batch_sample ( ) [inline], [static]
```

This flag will be set if a sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed.

A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the KEEP_LAST_↩ HISTORY_QOS QoS or because the duration in LifespanQosPolicy was reached.

If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.

A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the **dds::core::policy::↩ HistoryKind_def::KEEP_LAST** (p. 1607) **dds::core::policy::History** (p. 1602) QoS or because the duration in **dds↩ ::core::policy::Lifespan** (p. 1635) was reached.

If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.

8.328.4.8 discovery_service_sample()

```
static const  SampleFlag rti::core::SampleFlag::discovery_service_sample ( )  [inline], [static]
```

This flag will be set if the sample was sent by Cloud Discovery Service.

The samples sent by Cloud Discovery Service are participant announcement samples on the ParticipantBuiltinTopic.

8.329 rti::core::SampleIdentity Class Reference

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* A **SampleIdentity** (p. 2282) defines a pair (Virtual Writer **Guid** (p. 1596), **SequenceNumber** (p. 2335)) that uniquely identifies a sample within a DDS domain and a Topic.

```
#include "rti/core/SampleIdentity.hpp"
```

Public Member Functions

- **SampleIdentity** ()
  *Create a default **SampleIdentity** (p. 2282) object.*
- **SampleIdentity** (const **Guid** &the_writer_guid, const **SequenceNumber** &the_sequence_number)
  *Create a **SampleIdentity** (p. 2282) with the provided **Guid** (p. 1596) and **SequenceNumber** (p. 2335).*
- const **Guid** & **writer_guid** () const
  *Get the 16-byte identifier identifying the virtual **Guid** (p. 1596).*
- **Guid** & **writer_guid** ()
  *Get the 16-byte identifier identifying the virtual **Guid** (p. 1596).*
- const **SequenceNumber** & **sequence_number** () const
  *Get the monotonically increasing 64-bit **SequenceNumber** (p. 2335) that identifies the sample in the data source.*
- **SequenceNumber** & **sequence_number** ()
  *Get the monotonically increasing 64-bit **SequenceNumber** (p. 2335) that identifies the sample in the data source.*

Static Public Member Functions

- static **SampleIdentity** **automatic** ()
  Special value to indicate that RTI Connext will automatically assign the identity of a sample.
- static **SampleIdentity** **unknown** ()
  An invalid or unknown sample identity.

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator**<< (std::ostream &out, const **SampleIdentity** &sid)
  *Prints a **SampleIdentity** (p. 2282) to an output stream.*

8.329.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A **SampleIdentity** (p. 2282) defines a pair (Virtual Writer **Guid** (p. 1596), **SequenceNumber** (p. 2335)) that uniquely identifies a sample within a DDS domain and a Topic.

8.329.2 Constructor & Destructor Documentation

8.329.2.1 SampleIdentity() [1/2]

```
rti::core::SampleIdentity::SampleIdentity ( )  [inline]
```

Create a default **SampleIdentity** (p. 2282) object.

8.329.2.2 SampleIdentity() [2/2]

```
rti::core::SampleIdentity::SampleIdentity (
            const  Guid & the_writer_guid,
            const  SequenceNumber & the_sequence_number )  [inline]
```

Create a **SampleIdentity** (p. 2282) with the provided **Guid** (p. 1596) and **SequenceNumber** (p. 2335).

Parameters

the_writer_guid	The **Guid** (p. 1596) to create the **SampleIdentity** (p. 2282) with
the_sequence_number	The **SequenceNumber** (p. 2335) to create the **SampleIdentity** (p. 2282) with

8.329.3 Member Function Documentation

8.329.3.1 writer_guid() [1/2]

```
const  Guid & rti::core::SampleIdentity::writer_guid ( ) const  [inline]
```

Get the 16-byte identifier identifying the virtual **Guid** (p. 1596).

8.329.3.2 writer_guid() [2/2]

```
Guid & rti::core::SampleIdentity::writer_guid ( )  [inline]
```

Get the 16-byte identifier identifying the virtual **Guid** (p. 1596).

8.329.3.3 sequence_number() [1/2]

```
const  SequenceNumber & rti::core::SampleIdentity::sequence_number ( ) const  [inline]
```

Get the monotonically increasing 64-bit **SequenceNumber** (p. 2335) that identifies the sample in the data source.

8.329.3.4 sequence_number() [2/2]

```
SequenceNumber & rti::core::SampleIdentity::sequence_number ( )  [inline]
```

Get the monotonically increasing 64-bit **SequenceNumber** (p. 2335) that identifies the sample in the data source.

8.329.3.5 automatic()

```
static  SampleIdentity rti::core::SampleIdentity::automatic ( )  [inline], [static]
```

Special value to indicate that RTI Connext will automatically assign the identity of a sample.

8.329.3.6 unknown()

```
static  SampleIdentity rti::core::SampleIdentity::unknown ( )  [inline], [static]
```

An invalid or unknown sample identity.

8.329.4 Friends And Related Function Documentation

8.329.4.1 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const  SampleIdentity & sid )  [related]
```

Prints a **SampleIdentity** (p. 2282) to an output stream.

8.330 dds::sub::SampleInfo Class Reference

<<***value-type***>> *(p. 350)* Information that accompanies each sample received by a **DataReader** (p. 976)

8.330.1 Detailed Description

<<***value-type***>> *(p. 350)* Information that accompanies each sample received by a **DataReader** (p. 976)

Information that accompanies each sample that is `read` or `taken`.

8.330.2 Interpretation of the SampleInfo

The **dds::sub::SampleInfo** (p. 2285) contains information pertaining to the associated `Data` instance sample including:

- the **dds::sub::status::DataState** (p. 1118) of the Data value. The DataState provides information about:
- the `sample_state` of the `Data` value (i.e., if it has already been read or not)
- the `view_state` of the related instance (i.e., if the instance is new or not)
- the `instance_state` of the related instance (i.e., if the instance is alive or not)
- **dds::sub::SampleInfo::valid** (p. 2289) flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the `instance_state` of the corresponding instance.

- the **dds::sub::GenerationCount** (p. 1589) of the Data value. The **GenerationCount** (p. 1589) provides information about:

- The values of `disposed_generation_count` and `no_writers_generation_count` for the related instance at the time the sample was received. These counters indicate the number of times the instance had become ALIVE (with `instance_state=` **dds::sub::status::InstanceState::alive()** (p. 1617)) at the time the sample was received.

- the **dds::sub::Rank** (p. 2130) of the Data value. The **Rank** (p. 2130) provides information about:

- The `sample_rank` and `generation_rank` of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the `read` or `take` operations.

- The `absolute_generation_rank` of the sample within the **dds::sub::DataReader** (p. 976). This rank provides a preview of what is available within the **dds::sub::DataReader** (p. 976).

- The `source_timestamp` of the sample. This is the timestamp provided by the **dds::pub::DataWriter** (p. 1138) at the time the sample was produced.

8.330.3 Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count

For each instance, RTI Connext internally maintains two counts, the **dds::sub::GenerationCount::disposed()** (p. 1590) and **dds::sub::GenerationCount::no_writers()** (p. 1590), relative to each **DataReader** (p. 976):

- The **dds::sub::GenerationCount::disposed()** (p. 1590) and **dds::sub::GenerationCount::no_writers()** (p. 1590) are initialized to zero when the **dds::sub::DataReader** (p. 976) first detects the presence of a never-seen-before instance.

- The **dds::sub::GenerationCount::disposed()** (p. 1590) is incremented each time the instance_state of the corresponding instance changes from **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) to **dds::sub::status::InstanceState::alive()** (p. 1617).

- The **dds::sub::GenerationCount::no_writers()** (p. 1590) is incremented each time the instance_state of the corresponding instance changes from **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) to **dds::sub::status::InstanceState::alive()** (p. 1617).

- These 'generation counts' are reset to zero when the instance resource is reclaimed.

The **dds::sub::GenerationCount::disposed()** (p. 1590) and **dds::sub::GenerationCount::no_writers()** (p. 1590) available in the **dds::sub::SampleInfo** (p. 2285) capture a snapshot of the corresponding counters at the time the sample was received.

8.330.4 Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank

The **dds::sub::Rank::sample()** (p. 2132) and **dds::sub::Rank::generation()** (p. 2132) available in the **dds::sub::SampleInfo** (p. 2285) are computed based solely on the actual samples in the ordered collection returned by read or take.

- The **dds::sub::Rank::sample()** (p. 2132) indicates the number of samples of the same instance that follow the current one in the collection.
- The **dds::sub::Rank::generation()** (p. 2132) available in the **dds::sub::SampleInfo** (p. 2285) indicates the difference in "generations" between the sample (S) and the Most Recent **Sample** (p. 2270) of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The **dds::sub::Rank::generation()** (p. 2132) is computed using the formula:

```
generation_rank = (MRSIC.disposed_generation_count
                       + MRSIC.no_writers_generation_count)
                  - (S.disposed_generation_count
                       + S.no_writers_generation_count)
```

The **dds::sub::Rank::absolute_generation()** (p. 2132) available in the **dds::sub::SampleInfo** (p. 2285) indicates the difference in "generations" between the sample (S) and the Most Recent **Sample** (p. 2270) of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

```
absolute_generation_rank = (MRS.disposed_generation_count
                                + MRS.no_writers_generation_count)
                           - (S.disposed_generation_count
                                + S.no_writers_generation_count)
```

8.330.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance re-appeared again). Using the information in the **dds::sub::SampleInfo** (p. 2285), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with sample_rank == 0. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with generation_rank == 0. An application desiring only samples pertaining to the latest generation available will ignore samples for which absolute_generation_rank != 0. Other application-defined criteria may also be used.

dds::sub::status::SampleState (p. 2316), **dds::sub::status::InstanceState** (p. 1615), **dds::sub::status::ViewState** (p. 2614), **dds::sub::SampleInfo::valid** (p. 2289)

"Statechart of the \p instance_state and \p view_state of a single instance"

8.330.6 Member Function Documentation

8.330.6.1 source_timestamp()

```
dds::core::Time dds::sub::SampleInfo::source_timestamp ( ) const  [inline]
```

Get the timestamp when the sample was written by a DataWriter.

8.330.6.2 state()

```
dds::sub::status::DataState dds::sub::SampleInfo::state ( ) const  [inline]
```

Get the **dds::sub::status::DataState** (p. 1118) of the sample.

The DataState encapsulates the sample's **dds::sub::status::InstanceState** (p. 1615), **dds::sub::status::ViewState** (p. 2614), and **dds::sub::status::SampleState** (p. 2316)

8.330.6.3 generation_count()

```
dds::sub::GenerationCount dds::sub::SampleInfo::generation_count ( ) const  [inline]
```

Get the **dds::sub::GenerationCount** (p. 1589) of the sample.

8.330.6.4 rank()

```
dds::sub::Rank dds::sub::SampleInfo::rank ( ) const  [inline]
```

Get the **dds::sub::Rank** (p. 2130) of the sample.

8.330.6.5 valid()

```
bool dds::sub::SampleInfo::valid ( ) const  [inline]
```

Indicates whether the DataSample contains data or else it is only used to communicate a change in the **dds::sub::status::InstanceState** (p. 1615) of the instance.

Normally each `DataSample` contains both a **dds::sub::SampleInfo** (p. 2285) and some Data. However there are situations where a `DataSample` contains only the **dds::sub::SampleInfo** (p. 2285) and does not have any associated data. This occurs when the RTI Connext notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Connext detects that an instance has no writers and changes the corresponding instance_state to **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617).

The application can distinguish whether a particular `DataSample` has data by examining the value of the **`dds::sub::SampleInfo::valid`** (p. 2289). If this flag is set to true, then the `DataSample` contains valid Data. If the flag is set to false, the `DataSample` contains no Data.

Applications should check the **valid()** (p. 2289) flag before accessing the data. An attempt to access **rti::sub::LoanedSample::data()** (p. 1661) or **dds::sub::Sample::data()** (p. 2272) when **valid()** (p. 2289) is false will throw **dds::core::PreconditionNotMetError** (p. 1941).

8.330.6.6 instance_handle()

```
dds::core::InstanceHandle dds::sub::SampleInfo::instance_handle ( ) const  [inline]
```

Identifies locally the corresponding instance.

The handle is equal to **dds::core::InstanceHandle::nil()** (p. 1614) for unkeyed topics.

8.330.6.7 publication_handle()

```
dds::core::InstanceHandle dds::sub::SampleInfo::publication_handle ( ) const  [inline]
```

Identifies locally the DataWriter that modified the instance.

The `publication_handle` is the same **dds::core::InstanceHandle** (p. 1612) that is returned by the operation **dds::sub::matched_publications** (p. 668) and can also be used as a parameter to the operation **dds::sub::DataReader::matched_publication_data** (p. 1033).

8.330.6.8 reception_timestamp()

```
dds::core::Time reception_timestamp ( ) const
```

<<***extension***>> *(p. 354)* The timestamp when the sample was committed by a **dds::sub::DataReader** (p. 976).

8.330.6.17 flag()

```
rti::core::SampleFlag flag ( ) const
```

<<***extension***>> *(p. 354)* Flags associated with the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The flags can be set by using the field **rti::pub::WriteParams::flag** (p. 2649) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

8.330.6.18 source_guid()

```
rti::core::Guid source_guid ( ) const
```

<<***extension***>> *(p. 354)* The application logical data source associated with the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The source_guid can be set by using the field **rti::pub::WriteParams::source_guid** (p. 2650) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

See also

rti::pub::WriteParams::source_guid (p. 2650) for additional information on **source_guid** (p. 2293) and when it is used.

8.330.6.19 related_source_guid()

```
rti::core::Guid related_source_guid ( ) const
```

<<***extension***>> *(p. 354)* The application logical data source that is related to the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The source_guid can be set by using the field **rti::pub::WriteParams::source_guid** (p. 2650) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

See also

rti::pub::WriteParams::source_guid (p. 2650) for additional information on **source_guid** (p. 2293) and when it is used.

8.330.6.20 related_subscription_guid()

```
rti::core::Guid related_subscription_guid ( ) const
```

<<***extension***>> *(p. 354)* The related_reader_guid associated with the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

The related_reader_guid can be set by using the field **rti::pub::WriteParams::related_reader_guid** (p. 2651) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

8.330.6.21 topic_query_guid()

```
rti::core::Guid topic_query_guid ( ) const
```

<<***extension***>> *(*p. *354)* The GUID of the **rti::sub::TopicQuery** (p. 2516) that is related to the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

This GUID indicates whether a sample is part of the response to a **rti::sub::TopicQuery** (p. 2516) or a regular ("live") sample:

- If the sample was written for the TopicQuery stream, this field contains the GUID of the target TopicQuery.
- If the sample was written for the live stream, this field will be set to **rti::core::Guid::unknown()** (p. 1597).

8.330.6.22 encapsulation_id()

```
rti::core::EncapsulationId encapsulation_id ( ) const
```

<<***extension***>> *(*p. *354)* The encapsulation kind.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.330.6.23 coherent_set_info()

```
rti::core::optional_value< rti::core::CoherentSetInfo > coherent_set_info ( ) const
```

<<***extension***>> *(*p. *354)* When set, this field provides the information about the coherent set associated with the sample.

This field is set for all samples that are part of a coherent set. Coherent sets are initiated using the operation **dds::pub::CoherentSet::CoherentSet** (p. 932) and finalized using the operation **dds::pub::CoherentSet::end()** (p. 933).

See also

dds::pub::CoherentSet::CoherentSet (p. 932) for additional information on coherent sets.

8.331 rti::sub::SampleIterator< T > Class Template Reference

A random-access iterator of **LoanedSample** (p. 1659).

`#include <SampleIterator.hpp>`

Public Member Functions

- **SampleIterator** & **operator++** ()

8.331.1 Detailed Description

template<typename T>
class rti::sub::SampleIterator< T >

A random-access iterator of **LoanedSample** (p. 1659).

See also

dds::sub::LoanedSamples (p. 1663)

8.331.2 Member Function Documentation

8.331.2.1 operator++()

```
template<typename T >
SampleIterator &  rti::sub::SampleIterator< T >::operator++ ( )  [inline]
```

Coverity complains about this increment because it may overflow. However the user is responsible for not incrementing the iterator beyond the end of the sequence when accessing the iterator. With the current implementation we are providing a big enough iterator to iterate over a full sequence without overflowing.

8.332 rti::core::status::SampleLostState Class Reference

<<***extension***>> *(*p. *354)* Reasons why a sample was lost

`#include <Status.hpp>`

Inherits std::bitset< OMG_DDS_STATE_BIT_COUNT >.

```

Create from a bitset.

8.332.3 Member Function Documentation

8.332.3.1 not_lost()

```
static const SampleLostState rti::core::status::SampleLostState::not_lost ( ) [inline], [static]
```

The sample was not lost.

8.332.3.2 lost_by_writer()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_writer ( ) [inline],
[static]
```

A **dds::pub::DataWriter** (p. 1138) removed the sample before being received by the **dds::sub::DataReader** (p. 976).

8.332.3.3 lost_by_instances_limit()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_instances_limit ( )
[inline], [static]
```

A resource limit on the number of instances (**dds::core::policy::ResourceLimits::max_instances** (p. 2206)) was reached.

See also

dds::core::policy::ResourceLimits (p. 2203)

8.332.3.4 lost_by_remote_writers_per_instance_limit()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_remote_writers_per_↩
instance_limit ( ) [inline], [static]
```

A resource limit on the number of remote writers for a single instance from which a **dds::sub::DataReader** (p. 976) may read (**rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance** (p. 1086)) was reached.

See also

rti::core::policy::DataReaderResourceLimits (p. 1081)

8.332.3.5 lost_by_incomplete_coherent_set()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_incomplete_coherent_set
( ) [inline], [static]
```

A sample is lost because it is part of an incomplete coherent set. An incomplete coherent set is a coherent set for which some of the samples are missing.

For example, consider a **dds::pub::DataWriter** (p. 1138) using **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607) with a depth of 1. The DataWriter publishes two samples of the same instance as part of a coherent set 'CS1'; the first sample of 'CS1' is replaced by a new sample before it can be successfully delivered to the **dds::sub::DataReader** (p. 976). In this case, the coherent set containing the two samples is considered incomplete. The new sample, by default, will not be provided to the application, and will be reported as LOST_BY_INCOMPLETE_COHERENT_SET. (You can change this default behavior by setting **dds::core::policy::Presentation::drop_incomplete_coherent_set** (p. 1949) to FALSE. If you do, the new sample will be provided to the application, but it will be marked as part of an incomplete coherent set in the **dds::sub::SampleInfo** (p. 2285) structure.)

8.332.3.6 lost_by_large_coherent_set()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_large_coherent_set ( )
[inline], [static]
```

A sample is lost because it is part of a large coherent set. A large coherent set is a coherent set that cannot fit all at once into the **dds::sub::DataReader** (p. 976) queue because resource limits are exceeded.

For example, if **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) on the DataReader is 10 and the coherent set has 15 samples for a given instance, the coherent set is a large coherent set that will be considered incomplete.

The resource limits that can lead to large coherent sets are: **dds::core::policy::ResourceLimits::max_samples** (p. 2205), **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207), **dds::core::policy::ResourceLimits::max_instances** (p. 2206), and **rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 1087).

8.332.3.7 lost_by_samples_per_remote_writer_limit()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_samples_per_remote_
writer_limit ( ) [inline], [static]
```

When using **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 2157): a resource limit on the number of samples from a given remote writer that a **dds::sub::DataReader** (p. 976) may store (**rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 1087)) was reached. When using **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157), reaching **rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 1087) will trigger a rejection, not a loss, with reason **dds::core::status::SampleRejectedState::rejected_by_samples_per_remote_writer_limit()** (p. 2313).

8.334.1 Detailed Description

*<<**extension**>> (p. 354) <<**reference-type**>> (p. 351)* Utility to read and process the data samples that one or more DataReaders receive using a sample handler.

The following example shows how to create a full application that subscribes to a topic and prints each sample it receives:

```
int subscriber_main(int domain_id, int sample_count)
{
     dds::domain::DomainParticipant participant(domain_id);
     dds::topic::Topic<Foo> topic(participant, "Example Foo");
     dds::sub::DataReader<Foo> reader(dds::sub::Subscriber(participant), topic);
     int count = 0;
     rti::sub::SampleProcessor sample_processor;
     sample_processor.attach_reader(reader, [](const rti::sub::LoanedSample<Foo>& sample) {
         if (sample.info().valid()) {
             std::cout « "Received " « sample.data() « std::endl;
```

```
        }
    });
    while(1) {
        // wait forever
    }
    return 1;
}
```

Note that the expected sample handler is a functor with signature std::function<void(const rti::sub::LoanedSample<T>&)>, where `T` is the type associated with the **dds::sub::DataReader** (p. 976).

A **rti::sub::SampleProcessor** (p. 2305) relies on an underlying **rti::core::cond::AsyncWaitSet** (p. 840) to read and dispatch the data from the DataReaders. It internally creates a **dds::sub::cond::ReadCondition** (p. 2133) for each attached DataReader, an associates a custom handler that contains state to read samples and notify the corresponding handler .

The **SampleProcessor** (p. 2305) uses this ReadCondition to wait for data and then calls **dds::sub::DataReader::select()** (p. 1003) to take all the available data.

Notifications to any handler may be concurrent if the thread pool size set in **rti::core::cond::AsyncWaitSetProperty::thread_pool_size** (p. 862) is greater than 1. The same or different handlers may be called in parallel. The **SampleProcessor** (p. 2305) cycles through all attached DataReaders dispatching a sample at a time with the next available thread. This mechanism guarantees concurrent dispatching of the samples accross all DataReaders.

The **rti::sub::SampleProcessor** (p. 2305) internally creates and uses a **dds::sub::cond::ReadCondition** (p. 2133) for each attached **dds::sub::DataReader** (p. 976) to read the data. It's recommended to perform all the reading of the **dds::sub::DataReader** (p. 976)'s samples through the **rti::sub::SampleProcessor** (p. 2305) and avoid reading through other mechanisms in different parts of your applications. Similarly, your application must be careful to not modify the **dds::sub::cond::ReadCondition** (p. 2133) associated with an attached **dds::sub::DataReader** (p. 976).

In general, avoid or beware of using the following operations in combination with a **rti::sub::SampleProcessor** (p. 2305):

- read or take operation (and any of its overloads) of a **dds::sub::DataReader** (p. 976) from any part of your application, including a **dds::sub::DataReaderListener** (p. 1055) or a handler .
- Perform actions based on the **dds::core::cond::StatusCondition** (p. 2372) with the **dds::core::status::StatusMask::data_available()** (p. 2383) enabled (for example through a **rti::core::cond::AsyncWaitSet** (p. 840)).

On the other hand, you can externally provide the underlying **rti::sub::SampleProcessor** (p. 2305)'s **rti::core::cond::AsyncWaitSet** (p. 840) if you want to access additional capabilities of the **rti::core::cond::AsyncWaitSet** (p. 840) and use it to attach other **dds::core::cond::Condition** (p. 948) to handle other aspects of your application.

8.334.2 SampleProcessor Thread Safety

Similar to the **rti::core::cond::AsyncWaitSet** (p. 840), the **rti::sub::SampleProcessor** (p. 2305) provides a thread-safe interface. All the operations of this class can be called concurrently from multiple threads.

Because the **rti::sub::SampleProcessor** (p. 2305) relies on an **rti::core::cond::AsyncWaitSet** (p. 840) to dispatch the samples the same threading concepts apply. This means that operations on a **rti::sub::SampleProcessor** (p. 2305) may require synchronizing with the thread pool for safety. **rti::sub::SampleProcessor** (p. 2305) also relies on the asynchrnous completion pattern to effectively interact with the underlying thread pool.

For instance to detach a **dds::sub::DataReader** (p. 976), the **rti::sub::SampleProcessor** (p. 2305) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token on which the **rti::sub::SampleProcessor** (p. 2305) waits and blocks until it completes.

Due to the concurrent processing nature of operations on a **rti::sub::SampleProcessor** (p. 2305) as well as the sample handling, it's important to keep in mind the following aspects:

- The handler operation can be called concurrently for each sample. Therefore, handler implementations may need to apply thread synchronization strategies to protect shared resources.
- Calling a **rti::sub::SampleProcessor** (p. 2305) operation that requires internal synchronization (e.g., **rti::sub↩ ::SampleProcessor::attach_reader** (p. 2309)) from a handler notification will result in a error.

Note that the interface of the **rti::sub::SampleProcessor** (p. 2305) is similar to that of the **rti::core::cond::Async↩ WaitSet** (p. 840) but reduced and simplified. As noted above, if more advanced use and control of the thread pool is required, you can always create the **rti::core::cond::AsyncWaitSet** (p. 840) externally when calling dds::sub::Sample↩ Processor::SampleProcessor(rti::core::cond::AsyncWaitSet).

MT Safety:

Safe.

8.334.3 Constructor & Destructor Documentation

8.334.3.1 SampleProcessor() [1/3]

```
rti::sub::SampleProcessor::SampleProcessor (
            const  rti::core::cond::AsyncWaitSetProperty & aws_property )  [inline]
```

Single-argument constructor that allows creating a a **rti::sub::SampleProcessor** (p. 2305) with the configuration of the underlying **rti::core::cond::AsyncWaitSet** (p. 840).

You can provide **rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty()** (p. 859) as `property` to create the underlying **rti::core::cond::AsyncWaitSet** (p. 840) with default behavior.

This constructor creates **rti::core::cond::AsyncWaitSet** (p. 840) with no listener installed and will call **rti::core::cond↩ ::AsyncWaitSet::start** (p. 845) rigt after its creation.

Parameters

aws_property	<<***in***>> *(*p. *355)* configuration of the underlying **rti::core::cond::AsyncWaitSet** (p. 840).

See also

dds::sub::SampleProcessor::SampleProcessor(rti::core::cond::AsyncWaitSet)

8.334.3.2 SampleProcessor() [2/3]

```
rti::sub::SampleProcessor::SampleProcessor ( )  [inline]
```

Creates a **rti::sub::SampleProcessor** (p. 2305) with the default **rti::core::cond::AsyncWaitSetProperty** (p. 858).

See also

rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty() (p. 859)

8.334.3.3 SampleProcessor() [3/3]

```
rti::sub::SampleProcessor::SampleProcessor (
              rti::core::cond::AsyncWaitSet aws )  [inline]
```

Constructor that allows specifying an externally created **rti::core::cond::AsyncWaitSet** (p. 840).

Creates a new **rti::sub::SampleProcessor** (p. 2305) with the specified **rti::core::cond::AsyncWaitSet** (p. 840).

Tnis constructor flavor decouples the lifecycle of the **rti::sub::SampleProcessor** (p. 2305) from the **rti::core::cond::↩ AsyncWaitSet** (p. 840). It allows the application to have more control on the **rti::core::cond::AsyncWaitSet** (p. 840), such as to install an **rti::core::cond::AsyncWaitSetListener** (p. 856), a custom ThreadFactory, and controlling when it starts or stops.

Note that this constructor will not call **rti::core::cond::AsyncWaitSet::start** (p. 845), so it's the caller responsiblity to start and stop it. You can provide the external **rti::core::cond::AsyncWaitSet::start** (p. 845) in either started or stopped state.

Parameters

aws	<<***in***>> *(*p. *355)* the externally created **rti::core::cond::AsyncWaitSet** (p. 840).

See also

dds::sub::SampleProcessor::SampleProcessor(const rti::core::cond::AsyncWaitSetProperty&)

8.334.4 Member Function Documentation

8.334.4.1 attach_reader()

```
template<typename T , typename FUNCTOR >
SampleProcessor & rti::sub::SampleProcessor::attach_reader (
             dds::sub::DataReader< T > reader,
            const FUNCTOR & handler )  [inline]
```

Attaches the specified **dds::sub::DataReader** (p. 976) with an associated sample handler to this **rti::sub::SampleProcessor** (p. 2305).

Note that the expected sample handler is a functor with signature std::function<void(const rti::sub::LoanedSample<T>&)>, where `T` is the type associated with the **dds::sub::DataReader** (p. 976).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **dds::sub::DataReader** (p. 976) is attached and notifications to the handler may occur.

If this operation is called multiple times for an already attached **dds::sub::DataReader** (p. 976), it will result in no-op and return sucessfully, ignoring the specified handler. So if the handler is different, it will not be updated.

Parameters

reader	<<***in***>> *(p. 355)* **dds::sub::DataReader** (p. 976) to be attached.
handler	<<***in***>> *(p. 355)* handler to be notified on dispatching of the `reader` samples.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::sub::SampleProcessor::detach_reader (p. 2309)

References **attach_reader()**.

Referenced by **attach_reader()**.

8.334.4.2 detach_reader()

```
template<typename T >
SampleProcessor & rti::sub::SampleProcessor::detach_reader (
            dds::sub::DataReader< T > reader ) [inline]
```

Detaches the specified **dds::sub::DataReader** (p. 976) from this **rti::sub::SampleProcessor** (p. 2305).

Once the **dds::sub::DataReader** (p. 976) is detached, it is guaranteed that the **rti::sub::SampleProcessor** (p. 2305) will no longer process it so it is safe for your application to release any resources associated with the detached **dds::sub::DataReader** (p. 976).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **dds::sub::DataReader** (p. 976) is detached.

dds::sub::DataReader (p. 976) may be detached at any time independently of the state of the **rti::sub::SampleProcessor** (p. 2305).

Parameters

reader	<<***in***>> *(p. 355)* **dds::sub::DataReader** (p. 976) to be detached.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::sub::SampleProcessor::attach_reader (p. 2309)

  uint32_t **take** (SamplesBIIterator sbit)

  Take samples, inserting them into a provided container.

8.339.1 Detailed Description

template<typename T>
class dds::sub::DataReader< T >::Selector

The **Selector** (p. 2320) class is used by the **DataReader** (p. 976) to compose read and take operations.

A **Selector** (p. 2320) has an associated **DataReader** (p. 976) and configures the behavior of the read or take operation performed by that **DataReader** (p. 976).

A **Selector** (p. 2320) call is typically composed of the following steps:

1. Start with a call to `reader.select()` to return a **Selector** (p. 2320);
2. Follow with one or more **Selector** (p. 2320) setters configure what data to read;
3. Finally call **`read()`** (p. 2325) or **`take()`** (p. 2326) to perform the operation.

The following example reads a maximum of 5 previously unread samples:

```
LoanedSamples<Foo> samples = reader.select()
      .max_samples(5)
      .state(dds::sub::status::DataState::new_data());
      .read()
```

The selector also allows iterating over the samples one instance at a time, using the **next_instance()** (p. 2322) setter.

8.339.2.1 Selector()

```
template<typename T >
dds::sub::DataReader< T >::Selector::Selector (
              DataReader & dr )  [inline]
```

Create a **Selector** (p. 2320) for this **DataReader** (p. 976).

Selectors are created with the default filter state of the **DataReader** (p. 976)

Parameters

dr	The **DataReader** (p. 976) that this **Selector** (p. 2320) is attached to

See also

dds::sub::DataReader::default_filter_state() (p. 991)

8.339.3 Member Function Documentation

8.339.3.1 instance()

```
template<typename T >
Selector &  dds::sub::DataReader< T >::Selector::instance (
             const  dds::core::InstanceHandle & h )  [inline]
```

Select a specific instance to read/take.

This operation causes the subsequent read or take operation to access only samples belonging the single specified instance whose handle is h.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **SampleInfo** (p. 2285) verifies **SampleInfo.instance_handle()** (p. 2290) == h.

The subsequent read/take operation will be semantically equivalent to a read or take without specifying the instance, except in building the collection, the **DataReader** (p. 976) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The subsequent read/take may operation may fail with **dds::core::InvalidArgumentError** (p. 1619) if the Instance↩ Handle does not correspond to an existing data-object known to the **DataReader** (p. 976).

Parameters

h	The handle of the instance to select

8.339.3.2 next_instance()

```
template<typename T >
Selector &  dds::sub::DataReader< T >::Selector::next_instance (
             const  dds::core::InstanceHandle & previous_handle )  [inline]
```

Select the instance after a specific instance.

This operation causes the subsequent read or take operation to access only samples belonging a single instance whose handle is considered 'next' after the provided InstanceHandle h.

The accessed samples will all belong to the 'next' instance with InstanceHandle 'greater' than the specified previous handle that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the **dds::sub::DataReader** (p. 976). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of **dds::sub::DataReader::Selector::next_instance** (p. 2322) is 'as if' the **dds::sub::DataReader** (p. 976) invoked **dds::sub::instance(const dds::core::InstanceHandle& h)** (p. 665), passing the smallest instance_handle among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **dds::core::InstanceHandle::nil()** (p. 1614) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle` == **dds::core::InstanceHandle::nil()** (p. 1614) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation **dds::sub::DataReader::Selector::next_instance** (p. 2322) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle` == **dds::core::InstanceHandle::nil()** (p. 1614), examines the samples returned, and then uses the `instance_handle` returned in the **dds::sub::SampleInfo** (p. 2285) as the value of the `previous_handle` argument to the next call to **dds::sub::DataReader::Selector::next_instance** (p. 2322). The iteration continues until the read/take operation doesn't return any more samples. This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the **dds::sub::DataReader::Selector::next_instance** (p. 2322) operation with a `previous_handle` that does not correspond to an instance currently managed by the **dds::sub::DataReader** (p. 976). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the **dds::sub::DataReader** (p. 976). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

Parameters

previous_handle	The 'next smallest' instance with a value greater than this value that has available samples will be returned.

See also

Selecting what samples to read (p. 319) for an example

8.339.3.3 state()

```
template<typename T >
Selector &  dds::sub::DataReader< T >::Selector::state (
              const  dds::sub::status::DataState & s )  [inline]
```

Select a specific DataState.

By setting the DataState, you can specify the state of the samples that should be read or taken. The DataState of a sample encapsulates the SampleState, ViewState, and InstanceState of a sample. For example:

```
using namespace dds::sub::status;
LoanedSamples<Foo> samples = reader.select()
      .state(DataState(SampleState::not_read(), ViewState::new_view(), InstanceState::alive())
      .read();
```

If you're only interested in the SampleState, the ViewState, or the InstanceState, you can pass it directly. For example, to read alive instances with any SampleState or ViewState:

```
LoanedSamples<Foo> samples = reader.select()
      .state(InstanceState::alive())
      .read();
```

If this method comes before a call to **condition()** (p. 2324), then it will be overridden and will not have any effect on the read or take operation.

Parameters

s	The selected DataState

8.339.3.4 content()

```
template<typename T >
Selector &  dds::sub::DataReader< T >::Selector::content (
             const  dds::sub::Query & query )  [inline]
```

Select samples based on a **Query** (p. 2053).

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the **Query** (p. 2053)'s expression. If the **DataReader** (p. 976) has no samples that meet the constraints, the read/take will not return any data.

If this method is called before a call to condition then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **condition()** (p. 2324), then the previously set ReadCondition will be cleared.

Parameters

query	The **Query** (p. 2053) to read/take with

8.339.3.5 condition()

```
template<typename T >
Selector &  dds::sub::DataReader< T >::Selector::condition (
             const  dds::sub::cond::ReadCondition & the_condition )  [inline]
```

Select samples based on a ReadCondition.

When passing a QueryCondition, the effect of calling this method is that the subsequent read/take will filter the samples based on the QueryConditions's expression and state. If the **DataReader** (p. 976) has no samples that meet the constraints, the read/take will not return any data.

Passing an actual ReadCondition will only filter based on the state.

If this method is called before a call to content then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **content()** (p. 2324) and/or state, then the previously set **Query** (p. 2053) and DataState will be cleared.

This method is effectively a combination of calling content and state, but a QueryCondition is more efficient when reading with the same query multiple times.

For example:
```
samples = reader.select()
                .read()
                .content(dds::sub::Query(system.reader, "foo = 7"))
                .state(dds::sub::status::DataState::new_data())
```

is equivalent to:
```
samples = reader.select()
                .read()
                .condition(QueryCondition(Query(system.reader, "foo = 7"), DataState::new_data()))
```

Parameters

the_condition	The ReadCondition (or QueryCondition) to read/take with

8.339.3.6 max_samples()

```
template<typename T >
Selector &  dds::sub::DataReader< T >::Selector::max_samples (
              int32_t n )  [inline]
```

Choose to only read/take up to a maximum number of samples.

Parameters

n	The maximum number of samples to read/take

8.339.3.7 read() [1/3]

```
template<typename T >
dds::sub::LoanedSamples< T >  dds::sub::DataReader< T >::Selector::read ( )  [inline]
```

Read samples based on the state associated with this **Selector** (p. 2320).

Returns

dds::sub::LoanedSamples<T>

8.339.3.8 take() [1/3]

```
template<typename T >
dds::sub::LoanedSamples< T >  dds::sub::DataReader< T >::Selector::take ( )  [inline]
```

Take samples based on the state associated with this **Selector** (p. 2320).

Returns

dds::sub::LoanedSamples<T>

8.339.3.9 reader()

```
template<typename T >
DataReader  dds::sub::DataReader< T >::Selector::reader ( ) const  [inline]
```

Returns the **DataReader** (p. 976) associated with the **Selector** (p. 2320).

Returns

dds::sub::DataReader (p. 976)

8.339.3.10 read() [2/3]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t  dds::sub::DataReader< T >::Selector::read (
             SamplesFWIterator sfit,
             int32_t the_max_samples )  [inline]
```

Read up to max_samples samples, inserting the samples into a provided container.

Template Parameters

SamplesFWIterator	A forward iterator whose value type is dds::sub::Sample<T>

Parameters

sfit	A forward iterator pointing to the position in a container in which to put the read samples
the_max_samples	The maximum number of samples to read

Returns

uint32_t The number of read samples

8.339.3.11 take() [2/3]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t  dds::sub::DataReader< T >::Selector::take (
             SamplesFWIterator sfit,
             int32_t the_max_samples )  [inline]
```

Take up to max_samples samples, inserting the samples into a provided container.

Template Parameters

SamplesFWIterator	A forward iterator whose value type is dds::sub::Sample<T>

Parameters

sfit	A forward iterator pointing to the position in a container in which to put the taken samples
the_max_samples	The maximum number of samples to take

Returns

uint32_t The number of taken samples

8.339.3.12 read() [3/3]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t  dds::sub::DataReader< T >::Selector::read (
             SamplesBIIterator sbit )  [inline]
```

Read samples, inserting them into a provided container.

Template Parameters

SamplesBIIterator	A back-inserting iterator whose value type is dds::sub::Sample<T>

Parameters

sbit	A back-inserting iterator placed at the position in the destination container where the read samples should be placed

Returns

uint32_t The number of samples that were read

8.339.3.13 take() [3/3]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t  dds::sub::DataReader< T >::Selector::take (
             SamplesBIIterator sbit )  [inline]
```

Take samples, inserting them into a provided container.

Template Parameters

SamplesBIIterator	A back-inserting iterator whose value type is dds::sub::Sample<T>

Parameters

sbit	A back-inserting iterator placed at the position in the destination container where the taken samples should be placed

Returns

uint32_t The number of samples that were taken

8.340 rti::flat::SequenceIterator< E, OffsetKind > Class Template Reference

Iterator for collections of Offsets.

```
#include <SequenceIterator.hpp>
```

  The element type.
- typedef **value_type** **reference**

  The reference type is the same as the value type, an Offset.
- typedef **value_type** **pointer**

  The pointer type is the same as the value type, an Offset.
- typedef std::ptrdiff_t **difference_type**

  The difference type.

Public Member Functions

- **SequenceIterator** ()

  Constructs an invalid iterator.
- bool **is_null** () const

  Returns whether the iterator is invalid.
- **value_type** **operator*** () const

  Returns the Offset of the current element.
- **value_type** **operator->** () const

  Returns the Offset of the current element.
- bool **advance** ()

  Advances to the next element, reporting any errors by returning false.
- **SequenceIterator** & **operator++** ()

  Advances to the next element.
- **SequenceIterator** **operator++** (int)

  Advances to the next element.

Friends

- bool **operator<** (const **SequenceIterator** &s1, const **SequenceIterator** &s2)

  Compares two iterators.
- bool **operator>** (const **SequenceIterator** &s1, const **SequenceIterator** &s2)

  Compares two iterators.
- bool **operator<=** (const **SequenceIterator** &s1, const **SequenceIterator** &s2)

  Compares two iterators.
- bool **operator>=** (const **SequenceIterator** &s1, const **SequenceIterator** &s2)

  Compares two iterators.
- bool **operator==** (const **SequenceIterator** &s1, const **SequenceIterator** &s2)

  Compares two iterators.
- bool **operator!=** (const **SequenceIterator** &s1, const **SequenceIterator** &s2)

  Compares two iterators.

8.340.1 Detailed Description

template<typename E, typename OffsetKind>
class rti::flat::SequenceIterator< E, OffsetKind >

Iterator for collections of Offsets.

Template Parameters

E	The Offset type of the elements
OffsetKind	(implementation detail)

Note

This type should not be declared directly. For example, for a **SequenceOffset** (p. 2343), use **SequenceOffset::iterator** (p. 782) (or simply `auto`).

A **SequenceIterator** (p. 2328) moves through the Offset to elements of a sequence or array **Offset** (p. 414), and provides the functionality of a standard `forward_iterator`.

Note that a dereferenced **SequenceIterator** (p. 2328) returns **by value** the Offset to the current element; it doesn't return it by reference.

8.340.2 Member Typedef Documentation

8.340.2.1 iterator_category

```
template<typename E , typename OffsetKind >
typedef std::forward_iterator_tag  rti::flat::SequenceIterator< E, OffsetKind >::iterator_category
```

The iterator category.

8.340.2.2 value_type

```
template<typename E , typename OffsetKind >
typedef E  rti::flat::SequenceIterator< E, OffsetKind >::value_type
```

The element type.

8.340.2.3 reference

```
template<typename E , typename OffsetKind >
typedef  value_type  rti::flat::SequenceIterator< E, OffsetKind >::reference
```

The reference type is the same as the value type, an Offset.

8.340.2.4 pointer

```
template<typename E , typename OffsetKind >
typedef  value_type  rti::flat::SequenceIterator< E, OffsetKind >::pointer
```

The pointer type is the same as the value type, an Offset.

8.340.2.5 difference_type

```
template<typename E , typename OffsetKind >
typedef std::ptrdiff_t  rti::flat::SequenceIterator< E, OffsetKind >::difference_type
```

The difference type.

8.340.3 Constructor & Destructor Documentation

8.340.3.1 SequenceIterator()

```
template<typename E , typename OffsetKind >
rti::flat::SequenceIterator< E, OffsetKind >::SequenceIterator ( )  [inline]
```

Constructs an invalid iterator.

8.340.4 Member Function Documentation

8.340.4.1 is_null()

```
template<typename E , typename OffsetKind >
bool  rti::flat::SequenceIterator< E, OffsetKind >::is_null ( ) const  [inline]
```

Returns whether the iterator is invalid.

8.340.4.2 operator*()

```
template<typename E , typename OffsetKind >
value_type  rti::flat::SequenceIterator< E, OffsetKind >::operator* ( ) const  [inline]
```

Returns the Offset of the current element.

Returns

The Offset to the current element. Note that this function returns by value, not by reference. This Offset may be **null** (p. 1876) if the iterator has surpassed the length of the collection. See **Offset Error Management** (p. 416).

8.340.4.3 operator->()

```
template<typename E , typename OffsetKind >
value_type  rti::flat::SequenceIterator< E, OffsetKind >::operator-> ( ) const  [inline]
```

Returns the Offset of the current element.

8.340.4.4 advance()

```
template<typename E , typename OffsetKind >
bool  rti::flat::SequenceIterator< E, OffsetKind >::advance ( )  [inline]
```

Advances to the next element, reporting any errors by returning false.

Unlike operator++, which throws an exception in case of error, **advance()** (p. 2333) returns false

Returns

True if the function succeeds, or false if there was an error

8.340.4.5 operator++() [1/2]

```
template<typename E , typename OffsetKind >
SequenceIterator &  rti::flat::SequenceIterator< E, OffsetKind >::operator++ ( )  [inline]
```

Advances to the next element.

8.340.4.6 operator++() [2/2]

```
template<typename E , typename OffsetKind >
SequenceIterator  rti::flat::SequenceIterator< E, OffsetKind >::operator++ (
            int  )  [inline]
```

Advances to the next element.

8.340.5 Friends And Related Function Documentation

8.340.5.1 operator<

```
template<typename E , typename OffsetKind >
bool operator< (
            const  SequenceIterator< E, OffsetKind > & s1,
            const  SequenceIterator< E, OffsetKind > & s2 )  [friend]
```

Compares two iterators.

8.340.5.2 operator>

```
template<typename E , typename OffsetKind >
bool operator> (
            const  SequenceIterator< E, OffsetKind > & s1,
            const  SequenceIterator< E, OffsetKind > & s2 )  [friend]
```

Compares two iterators.

8.340.5.3 operator<=

```
template<typename E , typename OffsetKind >
bool operator<= (
            const  SequenceIterator< E, OffsetKind > & s1,
            const  SequenceIterator< E, OffsetKind > & s2 )  [friend]
```

Compares two iterators.

8.340.5.4 operator>=

```
template<typename E , typename OffsetKind >
bool operator>= (
            const  SequenceIterator< E, OffsetKind > & s1,
            const  SequenceIterator< E, OffsetKind > & s2 )  [friend]
```

Compares two iterators.

8.340.5.5 operator==

```
template<typename E , typename OffsetKind >
bool operator== (
            const  SequenceIterator< E, OffsetKind > & s1,
            const  SequenceIterator< E, OffsetKind > & s2 )  [friend]
```

Compares two iterators.

8.340.5.6 operator"!=

```
template<typename E , typename OffsetKind >
bool operator!= (
            const  SequenceIterator< E, OffsetKind > & s1,
            const  SequenceIterator< E, OffsetKind > & s2 )  [friend]
```

Compares two iterators.

8.341 rti::core::SequenceNumber Class Reference

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* A class representing the DDS 64-bit Sequence Number

```
#include <rti/core/SequenceNumber.hpp>
```

Public Member Functions

- **SequenceNumber** ()

  *Create a default **SequenceNumber** (p. 2335), equal to **unknown()** (p. 2338)*
- **SequenceNumber** (int32_t high_value, uint32_t low_value)

  *Create a **SequenceNumber** (p. 2335) with the provided high and low values.*
- **SequenceNumber** (int64_t the_value)

  *Creates a **SequenceNumber** (p. 2335) from an int64_t.*
- int32_t **high** () const

  Get the value of the most significant part of the sequence number.
- **SequenceNumber** & **high** (int32_t the_value)

  Set the value of the most significant part of the sequence number.
- uint32_t **low** () const

  Get the value of the most significant part of the sequence number.
- **SequenceNumber** & **low** (uint32_t the_value)

  Set the value of the least significant part of the sequence number.
- long long **value** () const

  Get the value of the sequence number.
- void **value** (long long value)

  Set the value of the sequence number.
- **SequenceNumber** **operator+** (const **SequenceNumber** &other) const

  Add two SequenceNumbers.
- **SequenceNumber** **operator-** (const **SequenceNumber** &other) const

  *Subtract one **SequenceNumber** (p. 2335) from another.*
- **SequenceNumber** & **operator+=** (const **SequenceNumber** &other)

  *Compound assignment operator, assigning the result of the addition to the current **SequenceNumber** (p. 2335) object.*
- **SequenceNumber** & **operator-=** (const **SequenceNumber** &other)

  *Compound assignment operator, assigning the result of the subtraction to the current **SequenceNumber** (p. 2335) object.*
- **SequenceNumber** **operator++** ()

  *Pre-increment the value of the **SequenceNumber** (p. 2335) by 1.*
- **SequenceNumber** **operator++** (int)

  *Post-increment the value of the **SequenceNumber** (p. 2335) by 1.*
- **SequenceNumber** **operator--** ()

  *Pre-decrement the value of the **SequenceNumber** (p. 2335) by 1.*
- **SequenceNumber** **operator--** (int)

  *Post-decrement the value of the **SequenceNumber** (p. 2335) by 1.*
- bool **operator<** (const **SequenceNumber** &other) const

  Compare two SequenceNumbers for a less-than relationship.
- bool **operator<=** (const **SequenceNumber** &other) const

  Compare two SequenceNumbers for a less-than-or-equal relationship.
- bool **operator>** (const **SequenceNumber** &other) const

  Compare two SequenceNumbers for a greater-than relationship.
- bool **operator>=** (const **SequenceNumber** &other) const

  Compare two SequenceNumbers for a greater-than-or-equal relationship.

Static Public Member Functions

- static **SequenceNumber zero** ()

  *Create a **SequenceNumber** (p. 2335) representing 0.*
- static **SequenceNumber unknown** ()

  *Create a **SequenceNumber** (p. 2335) representing the unknown **SequenceNumber** (p. 2335) value.*
- static **SequenceNumber maximum** ()

  *Create a **SequenceNumber** (p. 2335) representing the highest, most positive value for the sequence number.*

8.341.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A class representing the DDS 64-bit Sequence Number

8.341.2 Constructor & Destructor Documentation

8.341.2.1 SequenceNumber() [1/3]

```
rti::core::SequenceNumber::SequenceNumber ( )  [inline]
```

Create a default **SequenceNumber** (p. 2335), equal to **unknown()** (p. 2338)

8.341.2.2 SequenceNumber() [2/3]

```
rti::core::SequenceNumber::SequenceNumber (
            int32_t high_value,
            uint32_t low_value )  [inline]
```

Create a **SequenceNumber** (p. 2335) with the provided high and low values.

Parameters

high_value	The value for the most significant part of the sequence number.
low_value	The value for the least significant part of the sequence number.

8.341.2.3 SequenceNumber() [3/3]

```
rti::core::SequenceNumber::SequenceNumber (
            int64_t the_value )  [inline]
```

Creates a **SequenceNumber** (p. 2335) from an int64_t.

8.341.3 Member Function Documentation

8.341.3.1 zero()

```
static  SequenceNumber rti::core::SequenceNumber::zero ( )  [inline], [static]
```

Create a **SequenceNumber** (p. 2335) representing 0.

8.341.3.2 unknown()

```
static  SequenceNumber rti::core::SequenceNumber::unknown ( )  [inline], [static]
```

Create a **SequenceNumber** (p. 2335) representing the unknown **SequenceNumber** (p. 2335) value.

8.341.3.3 maximum()

```
static  SequenceNumber rti::core::SequenceNumber::maximum ( )  [inline], [static]
```

Create a **SequenceNumber** (p. 2335) representing the highest, most positive value for the sequence number.

8.341.3.4 automatic()

```
static  SequenceNumber rti::core::SequenceNumber::automatic ( )  [inline], [static]
```

Create a **SequenceNumber** (p. 2335) that will cause the value to be internally determined by RTI Connext.

See also

rti::core::WriteParams::replace_automatic_values()

8.341.3.5 high() [1/2]

```
int32_t rti::core::SequenceNumber::high ( ) const  [inline]
```

Get the value of the most significant part of the sequence number.

8.341.3.6 high() [2/2]

```
SequenceNumber & rti::core::SequenceNumber::high (
            int32_t the_value )  [inline]
```

Set the value of the most significant part of the sequence number.

8.341.3.7 low() [1/2]

```
uint32_t rti::core::SequenceNumber::low ( ) const  [inline]
```

Get the value of the most significant part of the sequence number.

8.341.3.8 low() [2/2]

```
SequenceNumber & rti::core::SequenceNumber::low (
            uint32_t the_value )  [inline]
```

Set the value of the least significant part of the sequence number.

8.341.3.9 value() [1/2]

```
long long rti::core::SequenceNumber::value ( ) const
```

Get the value of the sequence number.

8.341.3.10 value() [2/2]

```
void rti::core::SequenceNumber::value (
            long long value )
```

Set the value of the sequence number.

8.341.3.11 operator+()

```
SequenceNumber rti::core::SequenceNumber::operator+ (
            const  SequenceNumber & other ) const
```

Add two SequenceNumbers.

8.341.3.12 operator-()

```
SequenceNumber rti::core::SequenceNumber::operator- (
            const  SequenceNumber & other ) const
```

Subtract one **SequenceNumber** (p. 2335) from another.

8.341.3.13 operator+=()

```
SequenceNumber & rti::core::SequenceNumber::operator+= (
            const  SequenceNumber & other )
```

Compound assignment operator, assigning the result of the addition to the current **SequenceNumber** (p. 2335) object.

8.341.3.14 operator-=()

```
SequenceNumber & rti::core::SequenceNumber::operator-= (
            const  SequenceNumber & other )
```

Compound assignment operator, assigning the result of the subtraction to the current **SequenceNumber** (p. 2335) object.

8.341.3.15 operator++() [1/2]

```
SequenceNumber rti::core::SequenceNumber::operator++ ( )
```

Pre-increment the value of the **SequenceNumber** (p. 2335) by 1.

8.341.3.16 operator++() [2/2]

```
SequenceNumber rti::core::SequenceNumber::operator++ (
            int  )
```

Post-increment the value of the **SequenceNumber** (p. 2335) by 1.

8.341.3.17 operator--() [1/2]

```
SequenceNumber rti::core::SequenceNumber::operator-- ( )
```

Pre-decrement the value of the **SequenceNumber** (p. 2335) by 1.

8.341.3.18 operator--() [2/2]

```
SequenceNumber rti::core::SequenceNumber::operator-- (
            int  )
```

Post-decrement the value of the **SequenceNumber** (p. 2335) by 1.

8.341.3.19 operator<()

```
bool rti::core::SequenceNumber::operator< (
            const  SequenceNumber & other ) const
```

Compare two SequenceNumbers for a less-than relationship.

8.341.3.20 operator<=()

```
bool rti::core::SequenceNumber::operator<= (
            const  SequenceNumber & other ) const
```

Compare two SequenceNumbers for a less-than-or-equal relationship.

8.341.3.21 operator>()

```
bool rti::core::SequenceNumber::operator> (
            const  SequenceNumber & other ) const
```

Compare two SequenceNumbers for a greater-than relationship.

8.341.3.22 operator>=()

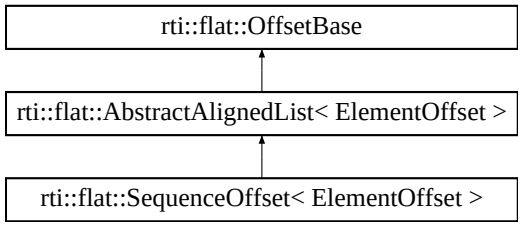
```
bool rti::core::SequenceNumber::operator>= (
            const  SequenceNumber & other ) const
```

Compare two SequenceNumbers for a greater-than-or-equal relationship.

8.341.4 Friends And Related Function Documentation

8.341.4.1 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const  SequenceNumber & sn )  [related]
```



Prints a **SequenceNumber** (p. 2335) to an output stream.

8.342 rti::flat::SequenceOffset< ElementOffset > Class Template Reference

Offset to a sequence of non-primitive elements.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::SequenceOffset< ElementOffset >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)

  Gets the Offset to an element.
- unsigned int **element_count** () const

  The number of elements.

Additional Inherited Members

8.342.1 Detailed Description

template<typename ElementOffset>
class rti::flat::SequenceOffset< ElementOffset >

Offset to a sequence of non-primitive elements.

Template Parameters

ElementOffset	The Offset type, for example **MyFlatMutableOffset** (p. 1770), **MyFlatFinalOffset** (p. 1759), or **StringOffset** (p. 2394).

Represents an Offset to a sequence member and allows getting an Offset to each of its elements.

A **SequenceOffset** (p. 2343) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast** (p. 417)), if the `ElementOffset` is a final type.

8.342.2 Member Function Documentation

8.342.2.1 get_element()

```
template<typename ElementOffset >
ElementOffset  rti::flat::SequenceOffset< ElementOffset >::get_element (
            unsigned int i )  [inline]
```

Gets the Offset to an element.

Parameters

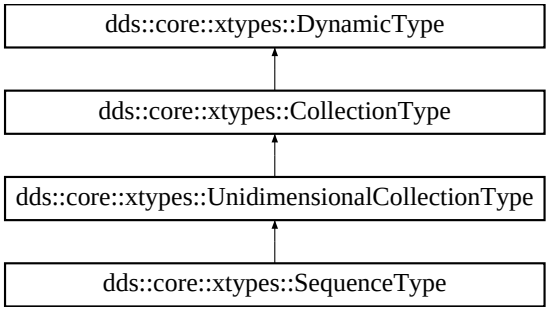
i	The zero-based index to the element

Returns

The Offset to the element in the i-th position

8.342.2.2 element_count()

```
template<typename ElementOffset >
unsigned int  rti::flat::SequenceOffset< ElementOffset >::element_count ( ) const  [inline]
```



The number of elements.

8.343 dds::core::xtypes::SequenceType Class Reference

<<***value-type***>> *(p. 350)* Represents an IDL `sequence` type.

`#include <dds/core/xtypes/CollectionTypes.hpp>`

Inheritance diagram for dds::core::xtypes::SequenceType:

Public Member Functions

- **SequenceType** (const **dds::core::xtypes::DynamicType** &type)

  Creates an unbounded collection with an element type.
- **SequenceType** (const **dds::core::xtypes::DynamicType** &type, uint32_t **bounds**)

  Creates a bounded collection with an element type.
- **SequenceType** (**dds::core::xtypes::DynamicType** &&type)

  <<***C++11***>> *(*p. *353) Creates an unbounded collection with an element type*
- **SequenceType** (**dds::core::xtypes::DynamicType** &&type, uint32_t the_bounds)

  <<***C++11***>> *(*p. *353) Creates a bounded collection with an element type*

Additional Inherited Members

8.343.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents an IDL `sequence` type.

8.343.2 Constructor & Destructor Documentation

8.343.2.1 SequenceType() [1/4]

```
dds::core::xtypes::SequenceType::SequenceType (
            const  dds::core::xtypes::DynamicType & type )  [explicit]
```

Creates an unbounded collection with an element type.

Parameters

type	The element type

8.343.2.2 SequenceType() [2/4]

```
dds::core::xtypes::SequenceType::SequenceType (
            const  dds::core::xtypes::DynamicType & type,
            uint32_t bounds )
```

Creates a bounded collection with an element type.

Parameters

type	The element type
bounds	The maximum length

8.343.2.3 SequenceType() [3/4]

```
dds::core::xtypes::SequenceType::SequenceType (
            dds::core::xtypes::DynamicType && type )  [inline], [explicit]
```

<<***C++11***>> *(p. 353)* Creates an unbounded collection with an element type

Parameters

type	The element type

8.343.2.4 SequenceType() [4/4]

```
dds::core::xtypes::SequenceType::SequenceType (
            dds::core::xtypes::DynamicType && type,
           uint32_t the_bounds )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a bounded collection with an element type

Parameters

type	The element type
the_bounds	The maximum length

8.344 dds::rpc::Server Class Reference

<<***reference-type***>> *(p. 351)* Provides the execution environment for one or more **ServiceEndpoint** (p. 2354).

`#include <dds/rpc/Server.hpp>`

Public Member Functions

- **Server** ()

*Creates a new server with default **ServerParams** (p. 2348).*

- **Server** (const **ServerParams** &params)

  *Creates a new server with the specified **ServerParams** (p. 2348).*
- void **run** ()

  Holds the execution of the current thread.
- void **run** (const **dds::core::Duration** &max_wait)

  Holds the execution of the current thread for the specified amount of time.
- void **close** ()

  Forces the destruction of this entity.

8.344.1 Detailed Description

<<***reference-type***>> *(p. 351)* Provides the execution environment for one or more **ServiceEndpoint** (p. 2354).

8.344.2 Constructor & Destructor Documentation

8.344.2.1 Server() [1/2]

```
dds::rpc::Server::Server ( )  [inline]
```

Creates a new server with default **ServerParams** (p. 2348).

8.344.2.2 Server() [2/2]

```
dds::rpc::Server::Server (
            const  ServerParams & params )  [inline], [explicit]
```

Creates a new server with the specified **ServerParams** (p. 2348).

8.344.3 Member Function Documentation

8.344.3.1 run() [1/2]

```
void dds::rpc::Server::run ( )  [inline]
```

Holds the execution of the current thread.

Calling this function is optional. A **Server** (p. 2346) manages a thread pool that runs as soon as a **ServiceEndpoint** (p. 2354) is attached.

8.344.3.2 run() [2/2]

```
void dds::rpc::Server::run (
            const  dds::core::Duration & max_wait )  [inline]
```

Holds the execution of the current thread for the specified amount of time.

Calling this function is optional. A **Server** (p. 2346) manages a thread pool that runs as soon as a **ServiceEndpoint** (p. 2354) is attached.

Parameters

max_wait	The time to sleep

8.344.3.3 close()

```
void dds::rpc::Server::close ( )  [inline]
```

Forces the destruction of this entity.

If **run()** (p. 2347) is currently blocked on another thread, **close()** (p. 2348) unblocks it.

Any operation after **close()** (p. 2348) throws **dds::core::AlreadyClosedError** (p. 806)

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

See also

Reference types (p. 351)

8.345 dds::rpc::ServerParams Class Reference

<<***value-type***>> *(p. 350)* The parameters used to configure a **Server** (p. 2346)

```
#include <dds/rpc/ServerParams.hpp>
```

Public Member Functions

- void **thread_pool_size** (int32_t size)

  *Configures the number of threads of a **Server** (p. 2346) thread pool.*
- int32_t **thread_pool_size** () const

  Returns the thread pool size.
- **rti::core::cond::AsyncWaitSetProperty** & **async_waitset_property** ()

  Allows fine-tuning the internal AsyncWaitSet used to process function calls.
- const **rti::core::cond::AsyncWaitSetProperty** & **async_waitset_property** () const

  Returns the AsyncWaitSetProperty by const reference.

8.345.1 Detailed Description

<<***value-type***>> *(p. 350)* The parameters used to configure a **Server** (p. 2346)

8.345.2 Member Function Documentation

8.345.2.1 thread_pool_size() [1/2]

```
void thread_pool_size (
            int32_t size )
```

Configures the number of threads of a **Server** (p. 2346) thread pool.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

By default a server uses only one thread, processing all function calls sequentially. Incresing the pool size provides more parallelism.

8.345.2.2 thread_pool_size() [2/2]

```
int32_t thread_pool_size ( ) const
```

Returns the thread pool size.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.345.2.3 async_waitset_property() [1/2]

```
rti::core::cond::AsyncWaitSetProperty & async_waitset_property ( )
```

Allows fine-tuning the internal AsyncWaitSet used to process function calls.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.345.2.4 async_waitset_property() [2/2]

```
const rti::core::cond::AsyncWaitSetProperty & async_waitset_property ( ) const
```

Returns the AsyncWaitSetProperty by const reference.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.346 rti::core::policy::Service Class Reference

<<***extension***>> *(p. 116)* Indicates if an Entity is associated with a service or tool and if so, which one.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Service** ()
  Creates the default policy (no service)
- **Service** (**rti::core::policy::ServiceKind** the_kind)
  Creates an instance with the specified service kind.
- **Service** & **kind** (const **rti::core::policy::ServiceKind** the_kind)
  Sets the service kind.
- **rti::core::policy::ServiceKind kind** () const
  Gets the service kind.

Static Public Member Functions

- static **Service NoService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::NO_SERVICE** (p. 2358).*
- static **Service PersistenceService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::PERSISTENCE** (p. 2358).*
- static **Service QueuingService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::QUEUING** (p. 2358).*
- static **Service RoutingService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::ROUTING** (p. 2358).*
- static **Service RecordingService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::RECORDING** (p. 2358).*
- static **Service ReplayService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::REPLAY** (p. 2358).*
- static **Service DatabaseIntegrationService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::DATABASE_INTEGRATION** (p. 2358).*
- static **Service WebIntegrationService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::WEB_INTEGRATION** (p. 2358).*
- static **Service ObservabilityCollectorService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::OBSERVABILITY_COLLECTOR** (p. 2358).*
- static **Service AdminConsoleService** ()

  *Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::ADMIN_CONSOLE** (p. 2358).*

8.346.1 Detailed Description

<<***extension***>> *(p. 116)* Indicates if an Entity is associated with a service or tool and if so, which one.

This QoS policy is intended to be used by RTI infrastructure services and RTI tools.

User applications should not modify its value.

Entity:

dds::domain::DomainParticipant (p. 1326), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.346.2 Constructor & Destructor Documentation

8.346.2.1 Service() [1/2]

```
rti::core::policy::Service::Service ( )  [inline]
```

Creates the default policy (no service)

8.346.2.2 Service() [2/2]

```
rti::core::policy::Service::Service (
            rti::core::policy::ServiceKind the_kind )  [inline]
```

Creates an instance with the specified service kind.

8.346.3 Member Function Documentation

8.346.3.1 NoService()

```
static  Service rti::core::policy::Service::NoService ( )  [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::NO_SERVICE** (p. 2358).

8.346.3.2 PersistenceService()

```
static  Service rti::core::policy::Service::PersistenceService ( )  [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::PERSISTENCE** (p. 2358).

8.346.3.3 QueuingService()

```
static  Service rti::core::policy::Service::QueuingService ( )  [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::QUEUING** (p. 2358).

8.346.3.4 RoutingService()

```
static Service rti::core::policy::Service::RoutingService ( ) [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::ROUTING** (p. 2358).

8.346.3.5 RecordingService()

```
static Service rti::core::policy::Service::RecordingService ( ) [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::RECORDING** (p. 2358).

8.346.3.6 ReplayService()

```
static Service rti::core::policy::Service::ReplayService ( ) [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::REPLAY** (p. 2358).

8.346.3.7 DatabaseIntegrationService()

```
static Service rti::core::policy::Service::DatabaseIntegrationService ( ) [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::DATABASE_INTEGRATION** (p. 2358).

8.346.3.8 WebIntegrationService()

```
static Service rti::core::policy::Service::WebIntegrationService ( ) [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::WEB_INTEGRATION** (p. 2358).

8.346.3.9 ObservabilityCollectorService()

```
static Service rti::core::policy::Service::ObservabilityCollectorService ( ) [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::OBSERVABILITY_COLLECTOR** (p. 2358).

8.346.3.10 AdminConsoleService()

```
static  Service rti::core::policy::Service::AdminConsoleService ( )  [inline], [static]
```

Returns a **Service** (p. 2350) with **rti::core::policy::ServiceKind_def::ADMIN_CONSOLE** (p. 2358).

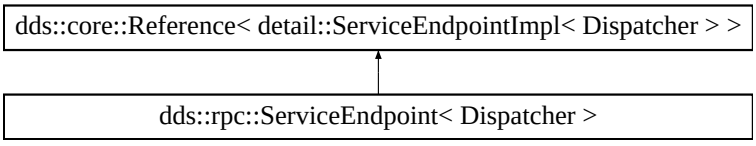
8.346.3.11 kind() [1/2]

```
Service & rti::core::policy::Service::kind (
            const  rti::core::policy::ServiceKind the_kind )
```

Sets the service kind.

8.346.3.12 kind() [2/2]

```
rti::core::policy::ServiceKind rti::core::policy::Service::kind ( ) const
```



Gets the service kind.

8.347 dds::rpc::ServiceEndpoint< Dispatcher > Class Template Reference

Manages the DDS entities required to receive function calls and send the return values.

```
#include <ServiceEndpoint.hpp>
```

Inheritance diagram for dds::rpc::ServiceEndpoint< Dispatcher >:

Public Types

- using **InterfaceType** = typename Dispatcher::InterfaceType
  *The interface type, such as **rpc_example::RobotControl** (p. 2213).*
- using **RequestType** = typename Dispatcher::RequestType
  The internal type used to receive requests (function calls)
- using **ReplyType** = typename Dispatcher::ReplyType
  The internal type used to send replies (the return values of the function calls)

Public Member Functions

- **ServiceEndpoint** (std::shared_ptr< **InterfaceType** > service_impl, **dds::rpc::Server** server, const **ServiceParams** &params)

  Construct a new Service Endpoint object.
- void **close** ()

  Destroys the underlying resources.
- **dds::sub::DataReader**< **RequestType** > **request_datareader** ()

  Accesses the underlying DataReader that receives the requests (function calls)
- **dds::pub::DataWriter**< **ReplyType** > **reply_datawriter** ()

  Accesses the underlying DataWriter that sends the replies (return values from the function calls)

8.347.1 Detailed Description

template<typename Dispatcher>
class dds::rpc::ServiceEndpoint< Dispatcher >

Manages the DDS entities required to receive function calls and send the return values.

Template Parameters

Dispatcher	Internal type generated by `rtiddsgen`

Applications shouldn't use this class directly. `rtiddsgen` will generate the proper instantiation of this class, such as rpc_example::RobotControlService

A **ServiceEndpoint** (p. 2354) requires a an implementation of an IDL service interface, such as **rpc_example::RobotControl** (p. 2213).

A **ServiceEndpoint** (p. 2354) is attached to a **Server** (p. 2346) in order to start receiving and processing remote function calls.

8.347.2 Member Typedef Documentation

8.347.2.1 InterfaceType

```
template<typename Dispatcher >
using dds::rpc::ServiceEndpoint< Dispatcher >::InterfaceType = typename Dispatcher::Interface↩
Type
```

The interface type, such as **rpc_example::RobotControl** (p. 2213).

8.347.2.2 RequestType

```
template<typename Dispatcher >
using  dds::rpc::ServiceEndpoint< Dispatcher >::RequestType = typename Dispatcher::RequestType
```

The internal type used to receive requests (function calls)

8.347.2.3 ReplyType

```
template<typename Dispatcher >
using  dds::rpc::ServiceEndpoint< Dispatcher >::ReplyType = typename Dispatcher::ReplyType
```

The internal type used to send replies (the return values of the function calls)

8.347.3 Constructor & Destructor Documentation

8.347.3.1 ServiceEndpoint()

```
template<typename Dispatcher >
dds::rpc::ServiceEndpoint< Dispatcher >::ServiceEndpoint (
            std::shared_ptr<  InterfaceType > service_impl,
             dds::rpc::Server server,
            const  ServiceParams & params )  [inline]
```

Construct a new Service Endpoint object.

Parameters

service_impl	The implementation of the DDS service, such as **rpc_example::RobotControl** (p. 2213).
server	The server where to run this service endpoint.
params	The parameters used to configure this service endpoint

8.347.4 Member Function Documentation

8.347.4.1 close()

```
template<typename Dispatcher >
void  dds::rpc::ServiceEndpoint< Dispatcher >::close ( )  [inline]
```

Destroys the underlying resources.

Any operation after **close()** (p. 2356) throws **dds::core::AlreadyClosedError** (p. 806)

8.347.4.2 request_datareader()

```
template<typename Dispatcher >
dds::sub::DataReader< RequestType > dds::rpc::ServiceEndpoint< Dispatcher >::request_datareader
( ) [inline]
```

Accesses the underlying DataReader that receives the requests (function calls)

Returns

The DataReader

8.347.4.3 reply_datawriter()

```
template<typename Dispatcher >
dds::pub::DataWriter< ReplyType > dds::rpc::ServiceEndpoint< Dispatcher >::reply_datawriter (
) [inline]
```

Accesses the underlying DataWriter that sends the replies (return values from the function calls)

Returns

The DataWriter

8.348 rti::core::policy::ServiceKind_def Struct Reference

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) ServiceKind

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
  NO_SERVICE ,
  PERSISTENCE ,
  QUEUING ,
  ROUTING ,
  RECORDING ,
  REPLAY ,
  DATABASE_INTEGRATION ,
  WEB_INTEGRATION ,
  OBSERVABILITY_COLLECTOR ,
  ADMIN_CONSOLE }

  The underlying `enum` *type.*

8.348.1 Detailed Description

<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) ServiceKind

8.348.2 Member Enumeration Documentation

8.348.2.1 type

`enum` **`rti::core::policy::ServiceKind_def::type`**

The underlying `enum` type.

Enumerator

NO_SERVICE	There is no service associated to the Entity.
PERSISTENCE	The Entity is associated to RTI Persistence **Service** (p. 2350).
QUEUING	The Entity is associated to RTI Queuing **Service** (p. 2350).
ROUTING	The Entity is associated to RTI Routing **Service** (p. 2350).
RECORDING	The Entity is associated to RTI Recording **Service** (p. 2350).
REPLAY	The Entity is associated to RTI Replay **Service** (p. 2350).
DATABASE_INTEGRATION	The Entity is associated to RTI **Database** (p. 969) Integration **Service** (p. 2350).
WEB_INTEGRATION	The Entity is associated to RTI Web Integration **Service** (p. 2350).
OBSERVABILITY_COLLECTOR	The Entity is associated to RTI Observability Collector **Service** (p. 2350).
ADMIN_CONSOLE	The Entity is associated to RTI Admin Console.

8.349 rti::topic::ServiceRequest Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A request coming from one of the built-in services

`#include <dds/topic/BuiltinTopic.hpp>`

Public Member Functions

- **rti::core::ServiceRequestId service_id** () const

  Get the service id of the request.
- const **rti::core::Guid** & **instance_id** () const

  Get the instance id of the request.
- const **dds::core::vector**< uint8_t > & **request_body** () const

  Get the request body of the request.

8.349.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A request coming from one of the built-in services

Data associated with the built-in topic **rti::topic::service_request_topic_name()** (p. 568). It contains service-specific information.

See also

rti::topic::service_request_topic_name() (p. 568)

8.349.2 Member Function Documentation

8.349.2.1 service_id()

```
rti::core::ServiceRequestId rti::topic::ServiceRequest::service_id ( ) const  [inline]
```

Get the service id of the request.

Returns

The service id of the request

8.349.2.2 instance_id()

```
const  rti::core::Guid & rti::topic::ServiceRequest::instance_id ( ) const  [inline]
```

Get the instance id of the request.

Returns

The instance id of the request

8.349.2.3 request_body()

```
const  dds::core::vector< uint8_t > & rti::topic::ServiceRequest::request_body ( ) const  [inline]
```

Get the request body of the request.

Returns

The request body of the request

8.350 rti::core::status::ServiceRequestAcceptedStatus Class Reference

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::service_request_accepted()** (p. 2388)

`#include <Status.hpp>`

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **EventCount32 total_count** () const

  *The total cumulative number of ServiceRequests that have been accepted by a **dds::pub::DataWriter** (p. 1138).*
- **EventCount32 current_count** () const

  *The current number of ServiceRequests that have been accepted by this **dds::pub::DataWriter** (p. 1138).*
- **dds::core::InstanceHandle last_request_handle** () const

  *A handle to the last **rti::topic::ServiceRequest** (p. 2358) that caused the **dds::pub::DataWriter** (p. 1138)'s status to change.*
- **rti::core::ServiceRequestId service_id** () const

  ID of the service to which the accepted Request belongs.

8.350.1 Detailed Description

<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::service_request_accepted()** (p. 2388)

Currently, the only service that causes the **ServiceRequestAcceptedStatus** (p. 2360) to be triggered is the **rti::sub::TopicQuery** (p. 2516) service. A **rti::topic::ServiceRequest** (p. 2358) is accepted when a **dds::pub::DataWriter** (p. 1138) matches with a **dds::sub::DataReader** (p. 976) that has created a **rti::sub::TopicQuery** (p. 2516).

This status is also changed (and the listener, if any, called) when a ServiceRequest has been cancelled, or deleted. This will happen when a **dds::sub::DataReader** (p. 976) deletes a TopicQuery using **rti::sub::TopicQuery::close()** (p. 2518).

8.350.2 Member Function Documentation

8.350.2.1 total_count()

```
EventCount32 rti::core::status::ServiceRequestAcceptedStatus::total_count ( ) const  [inline]
```

The total cumulative number of ServiceRequests that have been accepted by a **dds::pub::DataWriter** (p. 1138).

This number increases whenever a new request is accepted. It does not change when a request is cancelled.

8.350.2.2 current_count()

```
EventCount32 rti::core::status::ServiceRequestAcceptedStatus::current_count ( ) const  [inline]
```

The current number of ServiceRequests that have been accepted by this **dds::pub::DataWriter** (p. 1138).

This number increases when a new request is accepted and decreases when an existing request is cancelled.

8.350.2.3 last_request_handle()

```
dds::core::InstanceHandle rti::core::status::ServiceRequestAcceptedStatus::last_request_handle (
) const  [inline]
```

A handle to the last **rti::topic::ServiceRequest** (p. 2358) that caused the **dds::pub::DataWriter** (p. 1138)'s status to change.

8.350.2.4 service_id()

```
rti::core::ServiceRequestId rti::core::status::ServiceRequestAcceptedStatus::service_id ( ) const
[inline]
```

ID of the service to which the accepted Request belongs.

See also

rti::core::ServiceRequestId_def::TOPIC_QUERY (p. 2362)

8.351 rti::core::ServiceRequestId_def Struct Reference

The definition of the rti::core::safe_enum ServiceRequestId.

```
#include <rti/core/ServiceRequestId.hpp>
```

Public Types

- enum **type** {
  UNKNOWN = PRES_SERVICE_REQUEST_ID_UNKNOWN ,
  TOPIC_QUERY = PRES_SERVICE_REQUEST_ID_TOPIC_QUERY ,
  LOCATOR_REACHABILITY = PRES_SERVICE_REQUEST_ID_LOCATOR_REACHABILITY ,
  INSTANCE_STATE = PRES_SERVICE_REQUEST_ID_INSTANCE_STATE ,
  MONITORING_LIBRARY_COMMAND ,
  MONITORING_LIBRARY_REPLY }

  The underlying `enum` *type.*

8.351.1 Detailed Description

The definition of the rti::core::safe_enum ServiceRequestId.

Use ServiceRequestId.

8.351.2 Member Enumeration Documentation

8.351.2.1 type

`enum` **rti::core::ServiceRequestId_def::type**

The underlying `enum` type.

Enumerator

UNKNOWN	An unknown service.
TOPIC_QUERY	The topic query service.
LOCATOR_REACHABILITY	The locator reachability service.
INSTANCE_STATE	The instance state service.
MONITORING_LIBRARY_COMMAND	The Monitoring Library 2.0 command service.
MONITORING_LIBRARY_REPLY	The Monitoring Library 2.0 reply service.

8.352 dds::sub::SharedSamples< T, DELEGATE > Class Template Reference

8.352.1 Detailed Description

template<typename T, template< typename Q > class DELEGATE = detail::SharedSamples>
class dds::sub::SharedSamples< T, DELEGATE >

<<***reference-type***>> *(p. 351)* A sharable and container-safe version of **LoanedSamples** (p. 1663).

A **SharedSamples** (p. 2362) instance is constructed from a **LoanedSamples** (p. 1663) instance, removing the ownership of the loan from the **LoanedSamples** (p. 1663).

The destruction of the **LoanedSamples** (p. 1663) object or the explicit invocation of its method return_loan will have no effect on loaned data.

Constructing a **SharedSamples** (p. 2362) from another **SharedSamples** (p. 2362), creates a new reference to the same loan. Loaned data will be returned automatically to the **DataReader** (p. 976) once the reference count reaches zero.

See also

LoanedSamples (p. 1663)

8.352.2 Constructor & Destructor Documentation

8.352.2.1 SharedSamples()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
dds::sub::SharedSamples< T, DELEGATE >::SharedSamples (
              dds::sub::LoanedSamples< T > & ls )  [inline]
```

Constructs and instance of **SharedSamples** (p. 2362) removing the ownership of the loan from the **LoanedSamples** (p. 1663).

The constructor is implicit to simplify statements like the following:

```
SharedSamples<Foo> samples = reader.take(); // reader.take() returns LoanedSamples
```

Parameters

ls	the loaned samples.

8.352.3 Member Function Documentation

8.352.3.1 begin()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
const_iterator  dds::sub::SharedSamples< T, DELEGATE >::begin ( ) const  [inline]
```

Same as **LoanedSamples::begin()** (p. 1667)

See also

LoanedSamples::begin() (p. 1667)

8.352.3.2 end()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
const_iterator  dds::sub::SharedSamples< T, DELEGATE >::end ( ) const  [inline]
```

Same as **LoanedSamples::end()** (p. 1668)

See also

LoanedSamples::end() (p. 1668)

8.352.3.3 operator[]()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
DELEGATE< T >::value_type  dds::sub::SharedSamples< T, DELEGATE >::operator[] (
            size_t index ) const  [inline]
```

Same as **LoanedSamples::operator[ ](size_t)** (p. 1666)

See also

LoanedSamples::operator[ ](size_t) (p. 1666)

8.352.3.4 length()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
uint32_t  dds::sub::SharedSamples< T, DELEGATE >::length ( ) const  [inline]
```

Returns the number of samples.

See also

LoanedSamples::length() (p. 1667)

Referenced by **dds::sub::SharedSamples< T, DELEGATE >::unpack()**.

8.352.4 Friends And Related Function Documentation

8.352.4.1 unpack() [1/3]

```
template<typename T >
void unpack (
            const  dds::sub::SharedSamples< T > & samples,
            std::vector< std::shared_ptr< const T > > & sample_vector )  [related]
```

<<***extension***>> *(p. 354)* <<***C++11***>> *(p. 353)* Unpacks a **SharedSamples** (p. 2362) collection into individual shared_ptr's in a vector

Note

`#include <rti/sub/unpack.hpp>`

This is a standalone function in the namespace **rti::sub** (p. 751)

This function creates a reference (not a copy) to each sample with valid data in a **SharedSamples** (p. 2362) container and pushes it back into a vector.

Each individual sample in the vector retains a reference to the original **SharedSamples** (p. 2362) that controls when the loan is returned. These references can be further shared. When all the references go out of scope, the loan is returned.

This can be also useful to insert samples from different calls to **read()** (p. 661)/take() into the same vector. It is however recommended to not hold these samples indefinitely, since they use internal resources.

Example:

```
dds::sub::SharedSamples<Foo> shared_samples = reader.take();
std::vector<std::shared_ptr<const Foo» sample_vector;
rti::sub::unpack(shared_samples, sample_vector);
std::cout « *sample_vector[0] « std::endl;
// ...
// Read more samples, unpack them at the end of the same vector
shared_samples = reader.take();
rti::sub::unpack(shared_samples, sample_vector);
// References to the samples can be shared freely
std::shared_ptr<const Foo> sample = sample_vector[3];
// ...
// The loans will be returned automatically
```

Note

To finalize a **DataReader** (p. 976), all the shared_ptr obtained via **unpack()** (p. 2365) need to have been released. Otherwise **DataReader::close()** (p. 1024) will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Template Parameters

T	The topic-type

Parameters

samples	The collection of samples obtained from the **DataReader** (p. 976)
sample_vector	The destination where the samples are pushed back.

8.352.4.2 unpack() [2/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > unpack (
            const  dds::sub::SharedSamples< T > & samples )  [related]
```

<<***extension***>> *(p. 354)* <<***C++11***>> *(p. 353)* Unpacks a **SharedSamples** (p. 2362) collection into individual shared_ptr's in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

This overload returns a new vector instead of adding into an existing one.

See also

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 2365)

References **dds::sub::SharedSamples< T, DELEGATE >::length()**, and **rti::sub::unpack()**.

8.352.4.3 unpack() [3/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > unpack (
             dds::sub::LoanedSamples< T > && samples )  [related]
```

<<***extension***>> *(p. 354)* <<***C++11***>> *(p. 353)* Unpacks a **LoanedSamples** (p. 1663) collection into individual shared_ptr's in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

This overload is a shortcut for `unpack(SharedSamples<T>(loaned_samples))` to simplify code like the following:

```
auto sample_vector = unpack(reader.take());
```

See also

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 2365)

References **rti::sub::unpack()**.

8.353 rti::sub::SharedSamples< T > Class Template Reference

Provides access to a collection of middleware-loaned samples.

`#include <SharedSamplesImpl.hpp>`

Public Types

- typedef **SampleIterator**< T > **iterator**

  The iterator type.

8.353.1 Detailed Description

template<**typename T**>
class rti::sub::SharedSamples< **T** >

Provides access to a collection of middleware-loaned samples.

The samples in this container are loaned from the middleware and must be returned at some point.

To return the loan, use **dds::sub::LoanedSamples::return_loan** (p. 1667)

The contents of this container should not be modified and references to the samples it contains are only valid before the loan is returned.

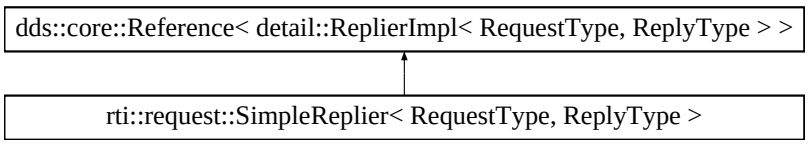
Template Parameters

T	The data type of the contained Samples

8.353.2 Member Typedef Documentation

8.353.2.1 iterator

```
template<typename T >
typedef  SampleIterator<T>  rti::sub::SharedSamples< T >::iterator
```



The iterator type.

8.354 rti::request::SimpleReplier< RequestType, ReplyType > Class Template Reference

<<***reference-type***>> *(p. 351)* A callback-based replier

`#include <rti/request/SimpleReplier.hpp>`

Inheritance diagram for rti::request::SimpleReplier< RequestType, ReplyType >:

Public Member Functions

- template<typename Functor >
  SimpleReplier (**dds::domain::DomainParticipant** participant, const std::string &service_name, Functor request_handler)

  *Creates a **SimpleReplier** (p. 2368).*
- template<typename Functor >
  SimpleReplier (const **ReplierParams** &params, Functor request_handler)

  *Creates a **SimpleReplier** (p. 2368) with additional parameters.*

8.354.1 Detailed Description

template<typename RequestType, typename ReplyType>
class rti::request::SimpleReplier< RequestType, ReplyType >

<<***reference-type***>> *(p. 351)* A callback-based replier

Note

A **SimpleReplier** (p. 2368) provides all the functions of a <<***reference-type***>> *(p. 351)* except **close()** (p. 1024) and retain().

A **SimpleReplier** (p. 2368) is based on a callback functor . Requests are passed to the callback, which returns a reply. The reply is directed only to the **Requester** (p. 2187) that sent the request.

SimpleRepliers are useful for simple use cases where a single reply for a request can be generated quickly, for example, looking up a table.

When more than one reply for a request can be generated or the processing is complex or needs to happen asynchronously, use a **rti::request::Replier** (p. 2168) instead.

See also

rti::request::Replier (p. 2168)

SimpleReplier example (p. 348)

In the following example, the **SimpleReplier** (p. 2368) responds to requests consisting of the built-in type **dds::core::StringTopicType** (p. 2395) with another string that prepends "Hello" to the request.

```
SimpleReplier<StringTopicType, StringTopicType> simple_replier(
    participant,
    "Test",
    [](const StringTopicType& request) {
        // If a Requester sends "World", this SimpleReplier will
        // reply with "Hello World"
        return StringTopicType("Hello " + request.data());
    }
);
```

8.354.2 Constructor & Destructor Documentation

8.354.2.1 SimpleReplier() [1/2]

```
template<typename RequestType , typename ReplyType >
template<typename Functor >
rti::request::SimpleReplier< RequestType, ReplyType >::SimpleReplier (
              dds::domain::DomainParticipant participant,
             const std::string & service_name,
             Functor request_handler )  [inline]
```

Creates a **SimpleReplier** (p. 2368).

Template Parameters

Functor	A function or function object that can receive a single parameter const RequestType& and returns a ReplyType instance by value.

Parameters

participant	The DomainParticipant that the **Replier** (p. 2168) uses to join a domain.
service_name	The service name. See **ReplierParams::service_name** (p. 2181)
request_handler	A functor that receives a request and returns a reply

8.354.2.2 SimpleReplier() [2/2]

```
template<typename RequestType , typename ReplyType >
template<typename Functor >
```

```
rti::request::SimpleReplier< RequestType, ReplyType >::SimpleReplier (
            const  ReplierParams & params,
            Functor request_handler )  [inline]
```

Creates a **SimpleReplier** (p. 2368) with additional parameters.

Template Parameters

Functor	A function or function object that can receive a single parameter const RequestType& and returns a ReplyType instance by value.

Parameters

params	The parameters used to configure the replier
request_handler	A functor that receives a request and returns a reply

8.355 rti::util::heap_monitoring::SnapshotContentFormat_def Struct Reference

Bitmap used to decide which information of the snapshot will be displayed.

`#include <rti/util/util.hpp>`

Public Types

- enum **type** {
  TOPIC ,
  FUNCTION ,
  ACTIVITY ,
  DEFAULT ,
  MINIMAL }
  The underlying `enum` type.

8.355.1 Detailed Description

Bitmap used to decide which information of the snapshot will be displayed.

The definition of the **rti::util::heap_monitoring** (p. 779) SnapshotContentFormat;

8.355.2 Member Enumeration Documentation

8.355.2.1 type

`enum` **rti::util::heap_monitoring::SnapshotContentFormat_def::type**

The underlying `enum` type.

Enumerator

TOPIC	Add the topic to the snapshot of heap monitoring.
FUNCTION	Add the function name to the snapshot of heap monitoring.
ACTIVITY	Add the activity context to the snapshot of heap monitoring. The user can select the information that will be part of the activity context by using the API **rti::config::activity_context::set_attribute_mask()** (p. 450)
DEFAULT	Add all the optional attributes to the snapshot of heap monitoring.
MINIMAL	Not add any optional attribute to the snapshot of heap monitoring.

8.356 rti::util::heap_monitoring::SnapshotOutputFormat_def Struct Reference

Specify the format of the output of the snapshot. RTI Connext.

```
#include <rti/util/util.hpp>
```

Public Types

- enum **type** {
  STANDARD ,
  COMPRESSED }

  The underlying `enum` *type.*

8.356.1 Detailed Description

Specify the format of the output of the snapshot. RTI Connext.

The definition of the **rti::util::heap_monitoring** (p. 779) SnapshotOutputFormat;

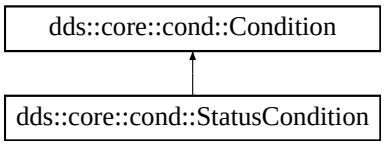
8.356.2 Member Enumeration Documentation

8.356.2.1 type

`enum` **rti::util::heap_monitoring::SnapshotOutputFormat_def::type**

The underlying `enum` type.

Enumerator



STANDARD	The output of the snapshot will be in plain text.
COMPRESSED	The output of the snapshot will be compressed using Zlib techonology. The file can be uncompressed using zlib-flate.

8.357 dds::core::cond::StatusCondition Class Reference

<<***reference-type***>> *(*p. *351)* A condition associated with each **dds::core::Entity** (p. 1520)

`#include <dds/core/cond/StatusCondition.hpp>`

Inheritance diagram for dds::core::cond::StatusCondition:

Public Member Functions

- **StatusCondition** (const **dds::core::Entity** &the_entity)

  Obtains a reference to the ***StatusCondition*** *(*p. *2372) in an entity.*
- void **enabled_statuses** (const **dds::core::status::StatusMask** &status)

  Defines the list of communication statuses that determine the trigger value.
- const **dds::core::status::StatusMask enabled_statuses** () const

  Gets the list of enabled statuses.
- **dds::core::Entity entity** () const

  Get the ***dds::core::Entity*** *(*p. *1520) associated with this* ***StatusCondition*** *(*p. *2372).*
- template<typename Functor >
  void **handler** (const Functor &func)

  <<***extension***>> *(*p. *354) Registers a custom handler with this condition.*
- void **reset_handler** ()

  <<***extension***>> *(*p. *354) Resets the handler for this condition.*

8.357.1 Detailed Description

<<***reference-type***>> *(*p. *351)* A condition associated with each **dds::core::Entity** (p. 1520)

The `trigger_value` of the **dds::core::cond::StatusCondition** (p. 2372) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of `enabled_statuses` on the **dds**↩**::core::cond::StatusCondition** (p. 2372).

See also

Status Kinds (p. 429)

dds::core::cond::WaitSet (p. 2617), **dds::core::cond::Condition** (p. 948)

Listener (p. 1637)

Note

There is exactly one **StatusCondition** (p. 2372) per **Entity** (p. 1520) and one **Entity** (p. 1520) per **StatusCondition** (p. 2372).

Warning

Destroying an **Entity** (p. 1520) invalidates all references to its **StatusCondition** (p. 2372). To avoid that, always keep a reference to the **Entity** (p. 1520) while you also have one to its **StatusCondition** (p. 2372) or **retain** (p. 1526) the **Entity** (p. 1520).

8.357.2 Constructor & Destructor Documentation

8.357.2.1 StatusCondition()

```
dds::core::cond::StatusCondition::StatusCondition (
            const  dds::core::Entity & the_entity )  [inline]
```

Obtains a reference to the **StatusCondition** (p. 2372) in an entity.

Parameters

the_entity	The **Entity** (p. 1520) whose status condition we're getting a reference to. There is exactly one **StatusCondition** (p. 2372) per **Entity** (p. 1520) and one **Entity** (p. 1520) per **StatusCondition** (p. 2372).

Note

This constructor doesn't create a new **Condition** (p. 948). It obtains a reference to the **StatusCondition** (p. 2372) that each **Entity** (p. 1520) owns. You can use this constructor as many times as needed to obtain a reference to the same **StatusCondition** (p. 2372).

8.357.3 Member Function Documentation

8.357.3.1 enabled_statuses() [1/2]

```
void dds::core::cond::StatusCondition::enabled_statuses (
            const  dds::core::status::StatusMask & status )  [inline]
```

Defines the list of communication statuses that determine the trigger value.

This operation may change the `trigger_value` of the **dds::core::cond::StatusCondition** (p. 2372).

dds::core::cond::WaitSet (p. 2617) objects' behavior depends on the changes of the `trigger_value` of their attached conditions. Therefore, any **dds::core::cond::WaitSet** (p. 2617) to which the **dds::core::cond::Status↩ Condition** (p. 2372) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.357.3.2 enabled_statuses() [2/2]

```
const  dds::core::status::StatusMask dds::core::cond::StatusCondition::enabled_statuses ( ) const
[inline]
```

Gets the list of enabled statuses.

See also

enabled_statuses(const dds::core::status::StatusMask&) (p. 2373)

8.357.3.3 entity()

```
 dds::core::Entity dds::core::cond::StatusCondition::entity ( ) const  [inline]
```

Get the **dds::core::Entity** (p. 1520) associated with this **StatusCondition** (p. 2372).

There is exactly one **Entity** (p. 1520) associated with each **StatusCondition** (p. 2372).

8.357.3.4 handler()

```
template<typename Functor >
void handler (
             const Functor & func )
```

<<***extension***>> *(p. 354)* Registers a custom handler with this condition.

For information about condition handlers, see **this ReadCondition constructor** (p. 2134)

Note

Changing this handler will affect any other references to this **Entity** (p. 1520)'s **StatusCondition** (p. 2372).

MT Safety:

It is not safe to call **handler()** (p. 2374) or **reset_handler()** (p. 2375) concurrently or while this condition is attached to a waitset being dispatched.

8.357.3.5 reset_handler()

```
void reset_handler ( )
```

<<***extension***>> *(p. 354)* Resets the handler for this condition.

After the invocation of this method no handler will be registered with this condition.

Note

Changing this handler will affect any other references to this **Entity** (p. 1520)'s **StatusCondition** (p. 2372).

MT Safety:

It is not safe to call **handler()** (p. 2374) or **reset_handler()** (p. 2375) while this condition is attached to a waitset being dispatched.

8.358 dds::core::status::StatusMask Class Reference

A std::bitset (list) of statuses.

```
#include <State.hpp>
```

Inherits std::bitset< OMG_DDS_STATUS_COUNT >.

Public Types

- typedef std::bitset< OMG_DDS_STATUS_COUNT > **MaskType**

  The base class, a std::bitset.

Public Member Functions

- **StatusMask** ()

  *Creates **StatusMask::none()** (p. 2379)*
- **StatusMask** (uint64_t mask)

  *Creates a **StatusMask** (p. 2375) from the bits in a uint64_t value.*
- **StatusMask** (const **MaskType** &mask)

  *Creates a **StatusMask** (p. 2375) from a bitset.*

Static Public Member Functions

- static const **StatusMask** **all** ()

  All the bits are set.
- static const **StatusMask** **none** ()

  No bits are set.
- static const **StatusMask** **inconsistent_topic** ()

  Another topic exists with the same name but different characteristics.
- static const **StatusMask** **offered_deadline_missed** ()

  *The deadline that the **dds::pub::DataWriter** (p. 1138) has committed through its **dds::core::policy::Deadline** (p. 1255) was not respected for a specific instance.*
- static const **StatusMask** **requested_deadline_missed** ()

  *The deadline that the **dds::sub::DataReader** (p. 976) was expecting through its **dds::core::policy::Deadline** (p. 1255) was not respected for a specific instance.*
- static const **StatusMask** **offered_incompatible_qos** ()

  A QosPolicy value was incompatible with what was requested.
- static const **StatusMask** **requested_incompatible_qos** ()

  A QosPolicy value was incompatible with what is offered.
- static const **StatusMask** **sample_lost** ()

  A sample has been lost (i.e. was never received).
- static const **StatusMask** **sample_rejected** ()

  A (received) sample has been rejected.
- static const **StatusMask** **data_on_readers** ()

  New data is available.
- static const **StatusMask** **data_available** ()

  One or more new data samples have been received.
- static const **StatusMask** **liveliness_lost** ()

  *The liveliness that the **dds::pub::DataWriter** (p. 1138) has committed to through its **dds::core::policy::Liveliness** (p. 1645) policy was not respected, thus **dds::sub::DataReader** (p. 976) entities will consider the writer as no longer alive.*
- static const **StatusMask** **liveliness_changed** ()

  *The liveliness of one or more **dds::pub::DataWriter** (p. 1138) that were writing instances read through the **dds::sub::DataReader** (p. 976) has changed. Some **dds::pub::DataWriter** (p. 1138) have become alive or not_alive.*

- static const **StatusMask publication_matched** ()

  *The **dds::pub::DataWriter*** (p. *1138*) *has found **dds::sub::DataReader*** (p. *976*) *that matches the **dds::topic::Topic*** (p. *2474*) *and has compatible QoS.*

Related Functions

(Note that these are not member functions.)

- template<typename STATUS >
  StatusMask get_status ()

  *Obtains the **StatusMask*** (p. *2375*) *mask associated to a status class.*

8.358.1 Detailed Description

A std::bitset (list) of statuses.

The bit-mask is an efficient and compact representation of a fixed-length list of **dds::core::status::StatusMask** (p. 2375) values.

Bits in the mask correspond to different statuses. You can choose which changes in status will trigger a callback by setting the corresponding status bits in this bit-mask and installing callbacks for each of those statuses.

The bits that are true indicate that the listener will be called back for changes in the corresponding status.

See also

Changing the listener and enabling/disabling statuses associated with it (p. 325)

8.358.2 Member Typedef Documentation

8.358.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATUS_COUNT >  dds::core::status::StatusMask::MaskType
```

The base class, a std::bitset.

8.358.3 Constructor & Destructor Documentation

8.358.3.1 StatusMask() [1/3]

```
dds::core::status::StatusMask::StatusMask ( )  [inline]
```

Creates **StatusMask::none()** (p. 2379)

8.358.4.11 data_available()

```
static const StatusMask dds::core::status::StatusMask::data_available ( ) [inline], [static]
```

One or more new data samples have been received.

Entity:

dds::sub::DataReader (p. 976)

Listener:

dds::sub::DataReaderListener (p. 1055)

References **StatusMask()**.

8.358.4.12 liveliness_lost()

```
static const StatusMask dds::core::status::StatusMask::liveliness_lost ( ) [inline], [static]
```

The liveliness that the **dds::pub::DataWriter** (p. 1138) has committed to through its **dds::core::policy::Liveliness** (p. 1645) policy was not respected, thus **dds::sub::DataReader** (p. 976) entities will consider the writer as no longer alive.

Entity:

dds::pub::DataWriter (p. 1138)

QoS:

LIVELINESS (p. 535)

Status:

dds::core::status::LivelinessLostStatus (p. 1655)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.4.13 liveliness_changed()

```
static const StatusMask dds::core::status::StatusMask::liveliness_changed ( ) [inline], [static]
```

The liveliness of one or more **dds::pub::DataWriter** (p. 1138) that were writing instances read through the **dds::sub::DataReader** (p. 976) has changed. Some **dds::pub::DataWriter** (p. 1138) have become alive or not_alive.

Entity:

dds::sub::DataReader (p. 976)

QoS:

LIVELINESS (p. 535)

Status:

dds::core::status::LivelinessChangedStatus (p. 1652)

Listener:

dds::sub::DataReaderListener (p. 1055)

References **StatusMask()**.

8.358.4.14 publication_matched()

```
static const StatusMask dds::core::status::StatusMask::publication_matched ( ) [inline], [static]
```

The **dds::pub::DataWriter** (p. 1138) has found **dds::sub::DataReader** (p. 976) that matches the **dds::topic::Topic** (p. 2474) and has compatible QoS.

Entity:

dds::pub::DataWriter (p. 1138)

Status:

dds::core::status::PublicationMatchedStatus (p. 1990)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.4.15 subscription_matched()

```
static const StatusMask dds::core::status::StatusMask::subscription_matched ( ) [inline], [static]
```

The **dds::sub::DataReader** (p. 976) has found **dds::pub::DataWriter** (p. 1138) that matches the **dds::topic::Topic** (p. 2474) and has compatible QoS.

Entity:

dds::sub::DataReader (p. 976)

Status:

dds::core::status::SubscriptionMatchedStatus (p. 2439)

Listener:

dds::sub::DataReaderListener (p. 1055)

References **StatusMask()**.

8.358.4.16 reliable_writer_cache_changed()

```
static const StatusMask dds::core::status::StatusMask::reliable_writer_cache_changed ( ) [inline],
[static]
```

<<***extension***>> *(p. 354)* The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point.

This status is considered changed at the following times: the cache is empty (i.e., contains no unacknowledged samples), the cache is full (i.e., the sample count has reached the value specified in **dds::core::policy::ResourceLimits↩ ::max_samples** (p. 2205)), or the number of samples has reached a high (see **rti::core::policy::RtpsReliableWriter↩ Protocol::high_watermark** (p. 2233)) or low (see **rti::core::policy::RtpsReliableWriterProtocol::low_watermark** (p. 2232)) watermark.

Entity:

dds::pub::DataWriter (p. 1138)

Status:

rti::core::status::ReliableWriterCacheChangedStatus (p. 2159)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.4.17 reliable_reader_activity_changed()

```
static const StatusMask dds::core::status::StatusMask::reliable_reader_activity_changed ( ) [inline],
[static]
```

<<***extension***>> *(p. 354)* One or more reliable readers has become active or inactive.

A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see **rti::core::policy::Rtps↩ ReliableWriterProtocol** (p. 2229) and **rti::core::status::ReliableReaderActivityChangedStatus** (p. 2157).

8.358.4.18 datawriter_cache()

```
static const StatusMask dds::core::status::StatusMask::datawriter_cache ( ) [inline], [static]
```

<<***extension***>> *(p. 354)* The status of the writer's cache.

Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2372).

References **StatusMask()**.

8.358.4.19 datawriter_protocol()

```
static const StatusMask dds::core::status::StatusMask::datawriter_protocol ( ) [inline], [static]
```

<<***extension***>> *(p. 354)* The status of a writer's internal protocol related metrics

The status of a writer's internal protocol-related metrics, such as the number of samples pushed, pulled, and filtered and the status of wire protocol traffic. Changes to this status information do not trigger a **dds::core::cond::StatusCondition** (p. 2372).

References **StatusMask()**.

8.358.4.20 datareader_cache()

```
static const  StatusMask dds::core::status::StatusMask::datareader_cache ( )  [inline], [static]
```

<<***extension***>> *(p. 354)* The status of the reader's cache.

Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2372).

References **StatusMask()**.

8.358.4.21 datareader_protocol()

```
static const  StatusMask dds::core::status::StatusMask::datareader_protocol ( )  [inline], [static]
```

<<***extension***>> *(p. 354)* The status of a reader's internal protocol related metrics

The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic. Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2372).

References **StatusMask()**.

8.358.4.22 datawriter_application_acknowledgment()

```
static const  StatusMask dds::core::status::StatusMask::datawriter_application_acknowledgment ( )
[inline], [static]
```

<<***extension***>> *(p. 354)* A **dds::pub::DataWriter** (p. 1138) has received an application-level acknowledgment for a sample

Enables a **dds::pub::DataWriter** (p. 1138) callback that is called when an application-level acknowledgment from a **dds::sub::DataReader** (p. 976) is received. The callback is called for each sample that is application-level acknowledged. Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2372).

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.4.23 datawriter_instance_replaced()

```
static const StatusMask dds::core::status::StatusMask::datawriter_instance_replaced ( ) [inline],
[static]
```

<<***extension***>> *(*p. *354)* A **dds::pub::DataWriter** (p. 1138) instance has been replaced

<<***extension***>> *(*p. *354)* A **dds::pub::DataWriter** (p. 1138) instance has been replaced

Enables a **dds::pub::DataWriter** (p. 1138) callback that is called when an instance in the writer queue is replaced.

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.4.24 service_request_accepted()

```
static const StatusMask dds::core::status::StatusMask::service_request_accepted ( ) [inline],
[static]
```

<<***extension***>> *(*p. *354)* A service request has been received for a **dds::pub::DataWriter** (p. 1138)

Enables a **dds::pub::DataWriter** (p. 1138) callback that is called when a **rti::topic::ServiceRequest** (p. 2358) has been accepted and dispatched to the DataWriter.

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.4.25 invalid_local_advance_notice()

```
static const StatusMask dds::core::status::StatusMask::invalid_local_advance_notice ( ) [inline],
[static]
```

<<***extension***>> *(p. 354)* The local **dds::domain::DomainParticipant** (p. 1326) credential will be invalid soon.

Enables a **dds::domain::DomainParticipant** (p. 1326) callback that is called when the local **dds::domain::Domain↩ Participant** (p. 1326) has or is about to have an invalid identity or permissions credential. Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

Entity:

dds::domain::DomainParticipant (p. 1326)

Listener:

DomainParticipantListener

References **StatusMask()**.

8.358.4.26 sample_removed()

```
static const StatusMask dds::core::status::StatusMask::sample_removed ( ) [inline], [static]
```

<<***extension***>> *(p. 354)* A sample has been removed from a **dds::pub::DataWriter** (p. 1138)

Enables a **dds::pub::DataWriter** (p. 1138) callback that is called when a sample is removed from its queue.

Entity:

dds::pub::DataWriter (p. 1138)

Listener:

dds::pub::DataWriterListener (p. 1202)

References **StatusMask()**.

8.358.5 Friends And Related Function Documentation

8.358.5.1 get_status()

```
template<typename STATUS >
StatusMask get_status ( )  [related]
```

Obtains the **StatusMask** (p. 2375) mask associated to a status class.

For example:
```
using namespace dds::core::status;
StatusMask mask = get_status<PublicationMatchedStatus>();
assert(mask == StatusMask::publication_matched());
```

8.359 rti::util::StreamFlagSaver Class Reference

`#include <StreamFlagSaver.hpp>`

8.359.1 Detailed Description

RAII utility to save and restore the flags of a std::ostream

Use: void example(std::ostream& out) { **rti::util::StreamFlagSaver** (p. 2390) flag_saver (out); out << std::hex << 33; // ... } // out flags restored

8.360 rti::sub::status::StreamKind Class Reference

<<***extension***>> *(p. 354)* Indicates which stream to read from: live stream, topic-query stream or both

`#include <rti/sub/status/DataStateEx.hpp>`

Inherits std::bitset< OMG_DDS_STATE_BIT_COUNT >.

Public Types

- typedef std::bitset< OMG_DDS_STATE_BIT_COUNT > **MaskType**

  An std::bitset of StreamKinds.

Public Member Functions

- **StreamKind** (const **MaskType** &other)

  *Create an **StreamKind** (p. 2390) from MaskType.*

Static Public Member Functions

- static **StreamKind live** ()

  *Returns the **StreamKind** (p. 2390) that selects the live stream.*
- static **StreamKind topic_query** ()

  *Returns the **StreamKind** (p. 2390) that selects the topic-query stream.*
- static **StreamKind any** ()

  *Returns the **StreamKind** (p. 2390) that selects either stream.*

8.360.1 Detailed Description

<<***extension***>> *(p. 354)* Indicates which stream to read from: live stream, topic-query stream or both

See also

Topic Queries (p. 67)

8.360.2 Member Typedef Documentation

8.360.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT >  rti::sub::status::StreamKind::MaskType
```

An std::bitset of StreamKinds.

8.360.3 Constructor & Destructor Documentation

8.360.3.1 StreamKind()

```
rti::sub::status::StreamKind::StreamKind (
            const  MaskType & other )  [inline]
```

Create an **StreamKind** (p. 2390) from MaskType.

Parameters

other	The MaskType to create the **StreamKind** (p. 2390) with

8.360.4 Member Function Documentation

8.360.4.1 live()

```
static StreamKind rti::sub::status::StreamKind::live ( ) [inline], [static]
```

Returns the **StreamKind** (p. 2390) that selects the live stream.

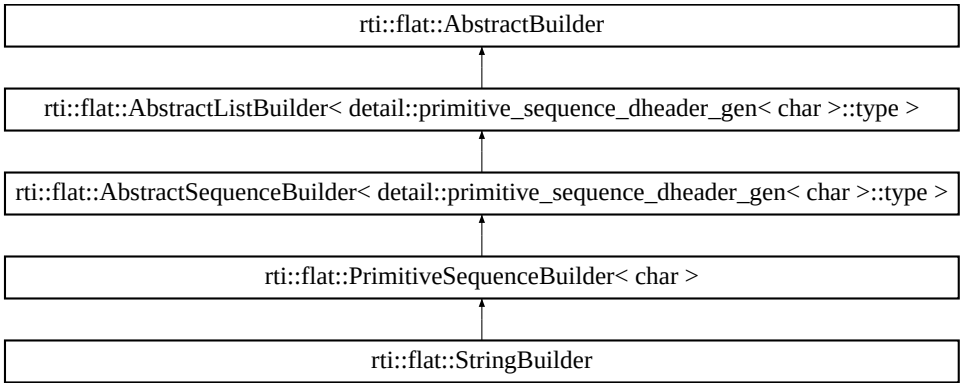
8.360.4.2 topic_query()

```
static StreamKind rti::sub::status::StreamKind::topic_query ( ) [inline], [static]
```

Returns the **StreamKind** (p. 2390) that selects the topic-query stream.

8.360.4.3 any()

```
static StreamKind rti::sub::status::StreamKind::any ( ) [inline], [static]
```



Returns the **StreamKind** (p. 2390) that selects either stream.

8.361 rti::flat::StringBuilder Class Reference

Builds a string.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::StringBuilder:

Public Member Functions

- **StringBuilder** & **set_string** (const char ∗value)

  Sets the string value.
- **Offset finish** ()

  Finishes building the string.

Additional Inherited Members

8.361.1 Detailed Description

Builds a string.

A **StringBuilder** (p. 2392) only provides one method, **set_string()** (p. 2393), so it can be typically used as follows:

```
MyFlatMutableBuilder my_builder = ...;
my_builder.build_my_string().set_string("Hello!");
```

Note that by relying on the builder destructor, there is no need to call **finish()** (p. 2393) on the object returned by build↩ _my_string().

8.361.2 Member Function Documentation

8.361.2.1 set_string()

```
StringBuilder & rti::flat::StringBuilder::set_string (
            const char * value )  [inline]
```

Sets the string value.

Parameters

value	The string value to set.

Precondition

value must not be NULL.

References **rti::flat::PrimitiveSequenceBuilder< char >::add_n()**.

8.361.2.2 finish()

```
Offset rti::flat::StringBuilder::finish ( )  [inline]
```

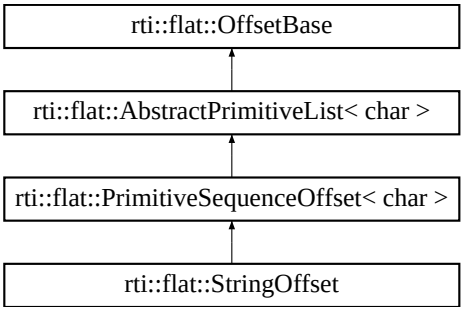
Finishes building the string.

Returns

An Offset to the member that has been built.

See also

discard() (p. 784)



References **rti::flat::PrimitiveSequenceBuilder< char >::add_next()**.

8.362 rti::flat::StringOffset Class Reference

Offset to a string.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::StringOffset:

Public Member Functions

- char * **get_string** ()
  Gets the string.
- const char * **get_string** () const
  Gets the string (const)
- unsigned int **element_count** () const
  Returns the number of characters.

8.362.1 Detailed Description

Offset to a string.

8.362.2 Member Function Documentation

8.362.2.1 get_string() [1/2]

```
char * rti::flat::StringOffset::get_string ( )  [inline]
```

Gets the string.

The string returned can be modified as long as its size doesn't change.

References **rti::flat::OffsetBase::get_buffer()**.

8.362.2.2 get_string() [2/2]

```
const char * rti::flat::StringOffset::get_string ( ) const  [inline]
```

Gets the string (const)

References **rti::flat::OffsetBase::get_buffer()**.

8.362.2.3 element_count()

```
unsigned int rti::flat::StringOffset::element_count ( ) const  [inline]
```

Returns the number of characters.

This number doesn't include the null terminating character.

References **rti::flat::PrimitiveSequenceOffset< T >::element_count()**.

8.363 dds::core::StringTopicType Class Reference

Built-in type consisting of a single character string.

```
#include <dds/core/BuiltinTopicTypes.hpp>
```

Public Member Functions

- **StringTopicType** ()

  Creates a sample containing an empty string.
- **StringTopicType** (const **dds::core::string** &the_data)

  *Creates a sample from a **dds::core::string*** (p. *435*).
- **StringTopicType** (const std::string &the_data)

  Creates a sample from a std::string.
- **StringTopicType** (const char ∗the_data)

  Creates an instance from a char∗.
- **operator std::string** () const

  Automatic conversion to std::string.
- **operator dds::core::string &** ()

  *Automatic conversion to **dds::core::string*** (p. *435*).
- **operator const dds::core::string &** () const

  *Automatic conversion to **dds::core::string*** (p. *435*).
- const **dds::core::string** & **data** () const

  Gets the string.
- **dds::core::string** & **data** ()

  Gets the string.
- void **data** (const **dds::core::string** &value)

  Sets the string.

8.363.1 Detailed Description

Built-in type consisting of a single character string.

See also

Built-in Types (p. 50)

8.363.2 Constructor & Destructor Documentation

8.363.2.1 StringTopicType() [1/4]

```
dds::core::StringTopicType::StringTopicType ( )  [inline]
```

Creates a sample containing an empty string.

8.363.2.2 StringTopicType() [2/4]

```
dds::core::StringTopicType::StringTopicType (
            const  dds::core::string & the_data )  [inline]
```

Creates a sample from a **dds::core::string** (p. 435).

Note that this constructor is implicit so you can use a **dds::core::string** (p. 435) wherever a **StringTopicType** (p. 2395) instance is expected

8.363.2.3 StringTopicType() [3/4]

```
dds::core::StringTopicType::StringTopicType (
            const std::string & the_data )  [inline]
```

Creates a sample from a std::string.

Note that this constructor is implicit so you can use an std::string wherever a **StringTopicType** (p. 2395) instance is expected, for example:

```
dds::pub::DataWriter<StringTopicType> writer(...);
std::string str = "Hello World!";
writer.write(str);
```

Parameters

the_data	The string to be copied to create this instance

8.363.2.4 StringTopicType() [4/4]

```
dds::core::StringTopicType::StringTopicType (
            const char * the_data )  [inline]
```

Creates an instance from a char∗.

Note that this constructor is implicit so you can use an char∗ wherever a **StringTopicType** (p. 2395) instance is expected, for example:

```
dds::pub::DataWriter<StringTopicType> writer(...);
writer.write("Hello, World!");
```

Parameters

the_data	The string to be copied to create this instance

8.363.3 Member Function Documentation

8.363.3.1 operator std::string()

```
dds::core::StringTopicType::operator std::string ( ) const  [inline]
```

Automatic conversion to std::string.

Returns

A copy of the string

8.363.3.2 operator dds::core::string &()

```
dds::core::StringTopicType::operator  dds::core::string & ( )  [inline]
```

Automatic conversion to **dds::core::string** (p. 435).

Returns

A reference to the string

8.363.3.3 operator const dds::core::string &()

```
dds::core::StringTopicType::operator const  dds::core::string & ( ) const  [inline]
```

Automatic conversion to **dds::core::string** (p. 435).

Returns

A const-reference to the string

8.363.3.4 data() [1/3]

```
const  dds::core::string & dds::core::StringTopicType::data ( ) const  [inline]
```

Gets the string.

Returns

A const-reference to the string

8.363.3.5 data() [2/3]

```
dds::core::string & dds::core::StringTopicType::data ( )  [inline]
```

Gets the string.

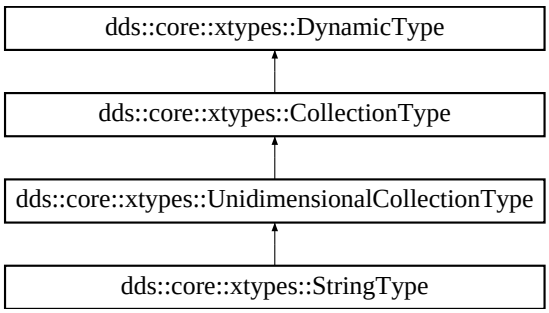
Returns

A reference to the string

8.363.3.6 data() [3/3]

```
void dds::core::StringTopicType::data (
            const  dds::core::string & value )  [inline]
```

Sets the string.



References **dds::core::Value< D >::delegate()**.

8.364 dds::core::xtypes::StringType Class Reference

<<***value-type***>> *(*p. *350)* Represents an IDL `string` type.

`#include <dds/core/xtypes/CollectionTypes.hpp>`

Inheritance diagram for dds::core::xtypes::StringType:

Public Member Functions

- **StringType** (uint32_t **bounds**)

  Creates a bounded string.

Additional Inherited Members

8.364.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents an IDL `string` type.

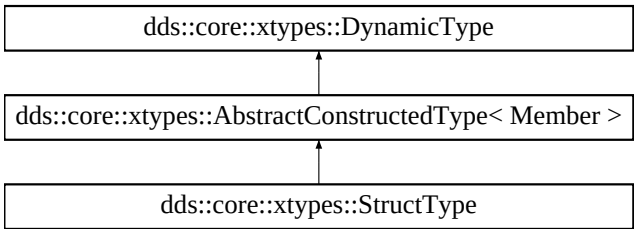
8.364.2 Constructor & Destructor Documentation

8.364.2.1 StringType()

```
dds::core::xtypes::StringType::StringType (
            uint32_t bounds )  [explicit]
```

Creates a bounded string.

Parameters



bounds	The maximum length

8.365 dds::core::xtypes::StructType Class Reference

<<***value-type***>> *(*p. *350)* Represents an IDL `struct` type

`#include <dds/core/xtypes/StructType.hpp>`

Inheritance diagram for dds::core::xtypes::StructType:

Public Member Functions

- **StructType** (const std::string & **name**)

  Creates an empty struct type.
- **StructType** (const std::string & **name**, const **StructType** & **parent**)

Creates an empty struct type with a base type.

- template<typename Container >
  StructType (const std::string &the_name, const Container &the_members)

  Creates a struct with the members in a container.
- template<typename Container >
  StructType (const std::string &the_name, const **StructType** &the_parent, const Container &the_members)

  Creates a struct with a base type and the members in a container.
- template<typename MemberIter >
  StructType (const std::string &the_name, MemberIter begin, MemberIter end)

  Creates a struct with the members in an iterator range.
- template<typename MemberIter >
  StructType (const std::string &the_name, const **StructType** &the_parent, MemberIter begin, MemberIter end)

  Creates a struct with a base type and the members in an iterator range.
- **StructType** (const std::string &the_name, **StructType** &&the_parent)

  <<***C++11***>> (p. *353) Creates an empty struct type with a base type.*
- template<typename MemberIter >
  StructType (const std::string &the_name, **StructType** &&the_parent, MemberIter begin, MemberIter end)

  <<***C++11***>> (p. *353) Creates an empty struct type with a base type and the members in an iterator range.*
- template<typename Container >
  StructType (const std::string &the_name, **StructType** &&the_parent, const Container &the_members)

  <<***C++11***>> (p. *353) Creates an empty struct type with a base type and the members in a container.*
- **StructType** (const std::string &the_name, std::initializer_list< MemberImpl > the_members)

  <<***C++11***>> (p. *353) Creates a struct with the members in an initializer_list*
- **StructType** (const std::string &the_name, const **StructType** &the_parent, std::initializer_list< MemberImpl > the_members)

  <<***C++11***>> (p. *353) Creates a struct with the members in an initializer_list and a base type*
- **StructType** & **extensibility_kind** (**dds::core::xtypes::ExtensibilityKind kind**)

  Sets the type extensibility kind.
- bool **has_parent** () const

  Indicates if this type has a base type.
- const **StructType** & **parent** () const

  Retrieves the base type.
- **MemberIndex find_member_by_id** (uint32_t id) const

  Gets the index of the member with a specific member ID.
- **StructType** & **add_member** (const MemberImpl & **member**)

  Adds a member at the end.
- template<typename Container >
  StructType & **add_members** (const Container &the_members)

  Adds all the members of a container at the end.
- **StructType** & **add_members** (std::initializer_list< MemberImpl > the_members)

  <<***C++11***>> (p. *353) Adds all the members of an initializer_list at the end*
- template<typename MemberIter >
  StructType & **add_members** (MemberIter begin, MemberIter end)

  Adds all the members in an iterator range at the end.
- **StructType** & **add_member** (MemberImpl &&the_member)

  <<***C++11***>> (p. *353) Adds a member, moving it, at the end*

Additional Inherited Members

8.365.1 Detailed Description

<<***value-type***>> *(p. 350)* Represents an IDL `struct` type

Examples

Foo.hpp.

8.365.2 Constructor & Destructor Documentation

8.365.2.1 StructType() [1/12]

```
dds::core::xtypes::StructType::StructType (
            const std::string & name )
```

Creates an empty struct type.

The struct doesn't have a base type. Members can be added after creation.

Parameters

name	The name of the type

8.365.2.2 StructType() [2/12]

```
dds::core::xtypes::StructType::StructType (
            const std::string & name,
            const  StructType & parent )
```

Creates an empty struct type with a base type.

Members can be added after creation.

Parameters

name	The name of the type
parent	The base type

8.365.2.3 StructType() [3/12]

```
template<typename Container >
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
            const Container & the_members )  [inline]
```

Creates a struct with the members in a container.

The struct doesn't have a base type.

Template Parameters

Container	A container that provides the member functions **begin()** (p. 1669) and **end()** (p. 1670) to iterate over **Member** (p. 1700) elements.

Parameters

the_name	The name of the type
the_members	A container with the members for this struct type

8.365.2.4 StructType() [4/12]

```
template<typename Container >
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
            const  StructType & the_parent,
            const Container & the_members )  [inline]
```

Creates a struct with a base type and the members in a container.

Template Parameters

Container	A container that provides the member functions **begin()** (p. 1669) and **end()** (p. 1670) to iterate over **Member** (p. 1700) elements.

Parameters

the_name	The name of the type
the_parent	The base type
the_members	A container with the members for this struct type

8.365.2.5 StructType() [5/12]

```
template<typename MemberIter >
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
            MemberIter begin,
            MemberIter end )  [inline]
```

Creates a struct with the members in an iterator range.

The struct doesn't have a base type.

Template Parameters

MemberIter	A forward iterator of **Member** (p. 1700) elements

Parameters

the_name	The name of the type
begin	The beginning of the range of Members
end	The end of the range of Members

8.365.2.6 StructType() [6/12]

```
template<typename MemberIter >
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
            const  StructType & the_parent,
```

```
        MemberIter begin,
        MemberIter end )  [inline]
```

Creates a struct with a base type and the members in an iterator range.

Template Parameters

MemberIter	A forward iterator of **Member** (p. 1700) elements

Parameters

the_parent	The base type
the_name	The name of the type
begin	The beginning of the range of Members
end	The end of the range of Members

8.365.2.7 StructType() [7/12]

```
dds::core::xtypes::StructType::StructType (
             const std::string & the_name,
              StructType && the_parent )  [inline]
```

<<***C++11***>> *(p. 353)* Creates an empty struct type with a base type.

The base type is moved. This is useful to save a copy in situations like the following example:
`StructType my_type("my_type", StructType("parent_type", parent_members));`

8.365.2.8 StructType() [8/12]

```
template<typename MemberIter >
dds::core::xtypes::StructType::StructType (
             const std::string & the_name,
              StructType && the_parent,
             MemberIter begin,
             MemberIter end )  [inline]
```

<<***C++11***>> *(p. 353)* Creates an empty struct type with a base type and the members in an iterator range.

The base type is moved.

8.365.2.9 StructType() [9/12]

```
template<typename Container >
dds::core::xtypes::StructType::StructType (
             const std::string & the_name,
              StructType && the_parent,
             const Container & the_members )  [inline]
```

<<***C++11***>> *(p. 353)* Creates an empty struct type with a base type and the members in a container.

The base type is moved.

8.365.2.10 StructType() [10/12]

```
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
            std::initializer_list< MemberImpl > the_members )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a struct with the members in an initializer_list

Parameters

the_name	The name of the type
the_members	An ininitalizer_list of Members

8.365.2.11 StructType() [11/12]

```
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
            const  StructType & the_parent,
            std::initializer_list< MemberImpl > the_members )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a struct with the members in an initializer_list and a base type

Parameters

the_name	The name of the type
the_parent	The base type
the_members	An ininitalizer_list of Members

8.365.2.12 StructType() [12/12]

```
dds::core::xtypes::StructType::StructType (
            const std::string & the_name,
             StructType && the_parent,
            std::initializer_list< MemberImpl > the_members )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a struct with the members in an initializer_list and a base type

Parameters

the_name	The name of the type
the_parent	The base type (moved)
the_members	An ininitalizer_list of Members

8.365.3 Member Function Documentation

8.365.3.1 extensibility_kind()

```
StructType & dds::core::xtypes::StructType::extensibility_kind (
            dds::core::xtypes::ExtensibilityKind kind )
```

Sets the type extensibility kind.

8.365.3.2 has_parent()

```
bool dds::core::xtypes::StructType::has_parent ( ) const
```

Indicates if this type has a base type.

8.365.3.3 parent()

```
const  StructType & dds::core::xtypes::StructType::parent ( ) const
```

Retrieves the base type.

If this type doesn't have a base type it throws **PreconditionNotMetError** (p. 1941).

See also

has_parent() (p. 2408)

8.365.3.4 find_member_by_id()

```
MemberIndex dds::core::xtypes::StructType::find_member_by_id (
            uint32_t id ) const
```

Gets the index of the member with a specific member ID.

Returns

The index (which can be passed to member(uint32_t) of the member selected by label or INVALID_INDEX if the ID doesn't exist in this type

8.365.3.5 add_member() [1/2]

```
StructType & dds::core::xtypes::StructType::add_member (
            const MemberImpl & member )
```

Adds a member at the end.

8.365.3.6 add_members() [1/3]

```
template<typename Container >
StructType & dds::core::xtypes::StructType::add_members (
            const Container & the_members )  [inline]
```

Adds all the members of a container at the end.

8.365.3.7 add_members() [2/3]

```
StructType & dds::core::xtypes::StructType::add_members (
            std::initializer_list< MemberImpl > the_members )  [inline]
```

<<***C++11***>> *(p. 353)* Adds all the members of an initializer_list at the end

8.365.3.8 add_members() [3/3]

```
template<typename MemberIter >
StructType & dds::core::xtypes::StructType::add_members (
            MemberIter begin,
            MemberIter end )  [inline]
```

Adds all the members in an iterator range at the end.

8.365.3.9 add_member() [2/2]

```
StructType & dds::core::xtypes::StructType::add_member (
            MemberImpl && the_member )  [inline]
```

<<***C++11***>> *(p. 353)* Adds a member, moving it, at the end

8.365.4 Friends And Related Function Documentation

8.365.4.1 create_type_from_tuple()

```
template<typename... Types>
dds::core::xtypes::StructType create_type_from_tuple (
            const std::string & name ) [related]
```

<<***C++11***>> *(*p. *353)* <<***experimental***>> (p. *355)* <<***extension***>> *(*p. *354)* Creates a **StructType** (p. 2400) from a list of types or a std::tuple

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

Types	A list of types or a std::tuple. The types must be primitive (see **dds::core::xtypes::PrimitiveType** (p. 1959)) or `std::string`.

The **StructType** (p. 2400) members are all default-created (i.e. non-key, non-optional, with default IDs...) and their names are m0, m1, m2, etc.

8.366.1 Detailed Description

<<***reference-type***>> (p. *351)* A subscriber is the object responsible for actually receiving data from a subscription.

QoS:

dds::sub::qos::SubscriberQos (p. 2423)

Status:

dds::core::status::StatusMask::data_on_readers() (p. 2382)

Listener:

dds::sub::SubscriberListener (p. 2422)

A subscriber acts on the behalf of one or several **dds::sub::DataReader** (p. 976) objects that are related to it. When it receives data (from the other parts of the system), it builds the list of concerned **dds::sub::DataReader** (p. 976) objects and then indicates to the application that data is available through its listener or by enabling related conditions.

The application can access the list of concerned **dds::sub::DataReader** (p. 976) objects through the operation **dds↩ ::sub::find** (p. 672) and then access the data available through operations on the **dds::sub::DataReader** (p. 976).

The following operations may be called even if the **dds::sub::Subscriber** (p. 2410) is not enabled. Other operations will the value **dds::core::NotEnabledError** (p. 1869) if called on a disabled **dds::sub::Subscriber** (p. 2410):

- **dds::core::Entity::enable** (p. 1524),
- **dds::sub::Subscriber::qos(const dds::sub::qos::SubscriberQos&)** (p. 2417), **dds::sub::Subscriber::qos() const** (p. 2417)
- **dds::sub::Subscriber::set_listener** (p. 2415), **dds::sub::Subscriber::get_listener** (p. 2416),

- **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2373), **dds::core::Entity::status_changes()** (p. 1525)
- dds::sub::DataReader::DataReader(), **dds::sub::DataReader::close()** (p. 1024),
- **dds::sub::Subscriber::default_datareader_qos(const dds::sub::qos::DataReaderQos&)** (p. 2417), **dds::sub::Subscriber::default_datareader_qos** (p. 2417),

All operations except for **dds::sub::Subscriber::qos(const dds::sub::qos::SubscriberQos&)** (p. 2417), **dds::sub::Subscriber::qos() const** (p. 2417), **dds::sub::Subscriber::set_listener** (p. 2415), **dds::sub::Subscriber::get_listener** (p. 2416), **dds::core::Entity::enable** (p. 1524) and dds::sub::DataReader::DataReader() may fail with **dds::core::NotEnabledError** (p. 1869).

Entity Use Cases (p. 325)

Examples

Foo_subscriber.cxx.

8.366.2 Constructor & Destructor Documentation

8.366.2.1 Subscriber() [1/3]

```
dds::sub::Subscriber::Subscriber (
            const  ::dds::domain::DomainParticipant & the_participant )  [inline], [explicit]
```

Create a **Subscriber** (p. 2410) attached to the given DomainParticipant.

The subscriber QoS will be set to participant.default_subscriber_qos()

Parameters

the_participant	the DomainParticipant that will own this subscriber.

8.366.2.2 Subscriber() [2/3]

```
dds::sub::Subscriber::Subscriber (
            const  ::dds::domain::DomainParticipant & dp,
```

```
            const  dds::sub::qos::SubscriberQos & the_qos,
             dds::sub::SubscriberListener * the_listener = NULL,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **Subscriber** (p. 2410) attached to the given DomainParticipant.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

Parameters

dp	The DomainParticipant that will own this subscriber.
the_qos	The **qos::SubscriberQos** (p. 2423)
the_listener	The subscriber listener.
mask	Indicates which status updates the listener will receive

8.366.2.3 Subscriber() [3/3]

```
dds::sub::Subscriber::Subscriber (
            const  ::dds::domain::DomainParticipant & dp,
            const  dds::sub::qos::SubscriberQos & the_qos,
            std::shared_ptr<  Listener > the_listener,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a **Subscriber** (p. 2410) attached to the given DomainParticipant.

Parameters

dp	The DomainParticipant that will own this subscriber.
the_qos	The **qos::SubscriberQos** (p. 2423)
the_listener	A shared_ptr to the listener. See **set_listener()** (p. 2415) for more information.
mask	Indicates which status updates the listener will receive

8.366.3 Member Function Documentation

8.366.3.1 notify_datareaders()

```
void dds::sub::Subscriber::notify_datareaders ( )  [inline]
```

This operation invokes the operation on_data_available on the **DataReaderListener** (p. 1055) objects attached to contained **DataReader** (p. 976) entities with a DATA_AVAILABLE status that is considered changed as described in **Changes in read communication status** (p. 432).

This operation is typically invoked from the dds::sub::SubscriberListener::on_data_on_readers operation in the **dds::sub::SubscriberListener** (p. 2422). That way the **dds::sub::SubscriberListener** (p. 2422) can delegate to the **dds::sub::DataReaderListener** (p. 1055) objects the handling of the data.

The operation will notify the data readers that have a `sample_state` of **dds::sub::status::SampleState::not_read()** (p. 2318), `view_state` of any() and `instance_state` of any().

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::NotEnabledError** (p. 1869).

8.366.3.2 listener() [1/2]

```
void dds::sub::Subscriber::listener (
              Listener * the_listener,
             const  dds::core::status::StatusMask & event_mask )  [inline]
```

Attach a listener to this **Subscriber** (p. 2410).

[DEPRECATED] The use of **`set_listener()`** (p. 2415) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

the_listener	The listener
event_mask	The event mask for the listener.

8.366.3.3 listener() [2/2]

```
Listener * dds::sub::Subscriber::listener ( ) const  [inline]
```

Get the **Subscriber** (p. 2410) listener.

[DEPRECATED] Use `get_listener` instead of this function.

8.366.3.4 set_listener() [1/2]

```
void dds::sub::Subscriber::set_listener (
            std::shared_ptr< Listener > the_listener,
            const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this subscriber.

The **Subscriber** (p. 2410) will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this **Subscriber** (p. 2410) is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the **Subscriber** (p. 2410). If it does, the application needs to manually reset the listener or manually close this **Subscriber** (p. 2410) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.
event_mask	A mask that indicates which status updates will be notified to the listener

8.366.3.5 set_listener() [2/2]

```
void dds::sub::Subscriber::set_listener (
            std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this subscriber.

If `the_listener` is not `nullptr`, this overload is equivalent to:
```
subscriber.set_listener(the_listener, dds::core::status::StatusMask::all());
```

If `the_listener` is `nullptr`, it is equivalent to:
```
subscriber.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

the_listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.

8.366.3.6 get_listener()

```
std::shared_ptr< Listener > dds::sub::Subscriber::get_listener ( ) const [inline]
```

Returns the listener currently associated with this **Subscriber** (p. 2410).

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.366.3.7 qos() [1/2]

```
const  dds::sub::qos::SubscriberQos dds::sub::Subscriber::qos ( ) const  [inline]
```

Get the **Subscriber** (p. 2410) QoS.

8.366.3.8 qos() [2/2]

```
void dds::sub::Subscriber::qos (
            const  dds::sub::qos::SubscriberQos & the_qos )  [inline]
```

Set the **Subscriber** (p. 2410) QoS.

Parameters

the_qos	the new QoS.

8.366.3.9 default_datareader_qos() [1/2]

```
dds::sub::qos::DataReaderQos dds::sub::Subscriber::default_datareader_qos ( ) const  [inline]
```

Get the default **DataReader** (p. 976) QoS.

Returns

dds::sub::qos::DataReaderQos (p. 1072)

8.366.3.10 default_datareader_qos() [2/2]

```
Subscriber & dds::sub::Subscriber::default_datareader_qos (
            const  dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Set the default DataReaderQoS.

Parameters

the_qos	The default DataReaderQoS.

8.366.3.11 participant()

```
const dds::domain::DomainParticipant & dds::sub::Subscriber::participant ( ) const [inline]
```

Return the DomainParticipant that owns this **Subscriber** (p. 2410).

Returns

const **dds::domain::DomainParticipant** (p. 1326)& The DomainParticipant that owns this subscriber

8.366.3.12 close_contained_entities()

```
void close_contained_entities ( )
```

<<***extension***>> *(p. 354)* Closes all the entities created from this **Subscriber** (p. 2410)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Calling this function explicitly is not necessary to close a **Subscriber** (p. 2410).

Deletes all contained **dds::sub::DataReader** (p. 976) objects. This pattern is applied recursively. In this manner, the operation **dds::sub::Subscriber::close_contained_entities** (p. 2418) on the **dds::sub::Subscriber** (p. 2410) will end up deleting all the entities recursively contained in the **dds::sub::Subscriber** (p. 2410), including the **dds::sub::cond↩ ::QueryCondition** (p. 2059), **dds::sub::cond::ReadCondition** (p. 2133), and **rti::sub::TopicQuery** (p. 2516) objects belonging to the contained **dds::sub::DataReader** (p. 976).

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1941) if any of the contained entities is in a state where it cannot be deleted. This will occur, for example, if a contained **dds::sub::DataReader** (p. 976) cannot be deleted because the application has called a **dds::sub::DataReader::read** (p. 996) or **dds::sub::DataReader::take** (p. 997) operation and the loan has not been returned.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::PreconditionNotMetError** (p. 1941)

8.366.4 Friends And Related Function Documentation

8.366.4.1 builtin_subscriber()

```
dds::sub::Subscriber builtin_subscriber (
            const  dds::domain::DomainParticipant & dp )  [related]
```

Access the built-in **Subscriber** (p. 2410).

Each **dds::domain::DomainParticipant** (p. 1326) contains several built-in **dds::topic::Topic** (p. 2474) objects as well as corresponding **dds::sub::DataReader** (p. 976) objects to access them. All of these **dds::sub::DataReader** (p. 976) objects belong to a single built-in **dds::sub::Subscriber** (p. 2410).

The built-in Topics are used to communicate information about other **dds::domain::DomainParticipant** (p. 1326), **dds::topic::Topic** (p. 2474), **dds::sub::DataReader** (p. 976), and **dds::pub::DataWriter** (p. 1138) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

Returns

The built-in **dds::sub::Subscriber** (p. 2410) singleton.

dds::topic::SubscriptionBuiltinTopicData (p. 2428)

dds::topic::PublicationBuiltinTopicData (p. 1977)

dds::topic::ParticipantBuiltinTopicData (p. 1908)

dds::topic::TopicBuiltinTopicData (p. 2493)

Parameters

dp	The DomainParticipant that the built-in subscriber belongs to.

8.366.4.2 find_subscribers() [1/2]

```
template<typename SubscriberForwardIterator >
uint32_t find_subscribers (
            const  dds::domain::DomainParticipant participant,
            SubscriberForwardIterator begin,
            uint32_t max_size )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all of the **dds::sub::Subscriber** (p. 2410) created from this **dds::domain::DomainParticipant** (p. 1326)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

SubscriberForwardIterator	Type of the forward iterator passed into this function, whose value_type must be **dds::sub::Subscriber** (p. 2410).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Publishers belong to
begin	A forward iterator to the position in the destination container where to begin copying the found Subscribers into
max_size	The maximum size of Subscribers to add

Returns

The number of found Subscribers

References **rti::sub::begin()**.

8.366.4.3 find_subscribers() [2/2]

```
template<typename SubscriberBackInsertIterator >
uint32_t find_subscribers (
            const  dds::domain::DomainParticipant participant,
            SubscriberBackInsertIterator begin )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all of the **dds::sub::Subscriber** (p. 2410) created from this **dds::domain::DomainParticipant** (p. 1326)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderBackInsertIterator	Type of the back-inserting iterator passed into this function, whose value_type must be **dds::sub::Subscriber** (p. 2410).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Subscribers belong to
begin	A back-inserting iterator to the position in the destination container to insert the found Subscribers into

Returns

The number of found Subscribers

References **rti::sub::begin()**.

8.366.4.4 find_subscriber()

```
dds::sub::Subscriber find_subscriber (
            const  dds::domain::DomainParticipant participant,
            const std::string & subscriber_name )  [related]
```

<<***extension***>> *(p. 354)* Finds a **Subscriber** (p. 2410) by name

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderBackInsertIterator	Type of the back-inserting iterator passed into this function, whose value_type must be **dds::sub::AnyDataReader** (p. 807).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Subscribers belong to
subscriber_name	The name of the **Subscriber** (p. 2410)

Returns

A valid reference if the a subscriber with that name exists or a reference equals to **dds::core::null** (p. 438) otherwise.

8.366.4.5 implicit_subscriber()

```
dds::sub::Subscriber implicit_subscriber (
            const  dds::domain::DomainParticipant & dp )  [related]
```

<<***extension***>> *(p. 354)* Retrieves the implicit **dds::sub::Subscriber** (p. 2410) for the given **dds::domain::DomainParticipant** (p. 1326).

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

If an implicit **Subscriber** (p. 2410) does not already exist, this creates one.

The implicit **Subscriber** (p. 2410) is created with default **dds::sub::qos::SubscriberQos** (p. 2423) and no listener. When a DomainParticipant is deleted, if there are no attached **dds::sub::DataReader** (p. 976) that belong to the implicit **Subscriber** (p. 2410), the implicit **Subscriber** (p. 2410) will be implicitly deleted.

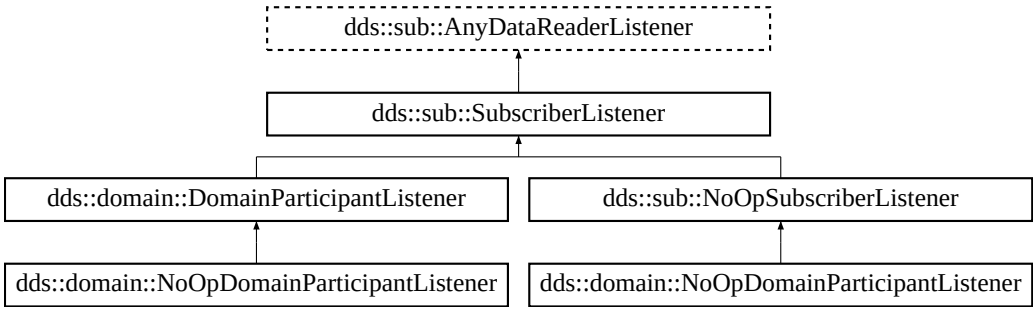
MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1343).

Parameters

dp	The DomainParticipant that the implicit subscriber belongs to.

Returns



The implicit **Subscriber** (p. 2410)

8.367 dds::sub::SubscriberListener Class Reference

The listener to notify status changes for a **dds::sub::Subscriber** (p. 2410).

`#include <dds/sub/SubscriberListener.hpp>`

Inheritance diagram for dds::sub::SubscriberListener:

Additional Inherited Members

8.367.1 Detailed Description

The listener to notify status changes for a **dds::sub::Subscriber** (p. 2410).

A **SubscriberListener** (p. 2422) contains exactly the same methods as a **AnyDataReaderListener** (p. 812), since it can receive status changes from any of its contained DataReaders.

Entity:

dds::sub::Subscriber (p. 2410)

Status:

dds::core::status::StatusMask::data_available() (p. 2383);
dds::core::status::StatusMask::data_on_readers() (p. 2382);
dds::core::status::StatusMask::liveliness_changed() (p. 2383), **dds::core::status::LivelinessChanged↩ Status** (p. 1652);
dds::core::status::StatusMask::requested_deadline_missed() (p. 2380), **dds::core::status::Requested↩ DeadlineMissedStatus** (p. 2184);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2381), **dds::core::status::Requested↩ IncompatibleQosStatus** (p. 2185);
dds::core::status::StatusMask::sample_lost() (p. 2381), **dds::core::status::SampleLostStatus** (p. 2303);
dds::core::status::StatusMask::sample_rejected() (p. 2382), **dds::core::status::SampleRejectedStatus** (p. 2315);
dds::core::status::StatusMask::subscription_matched() (p. 2384), **dds::core::status::Subscription↩ MatchedStatus** (p. 2439);

8.368.1 Detailed Description

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::sub::Subscriber** (p. 2410) supports

You must set certain members in a consistent manner:

length of **dds::core::policy::GroupData::value** (p. 1593) <= **rti::core::policy::DomainParticipantResourceLimits::subscriber_group_data_max_length** (p. 1415)

length of **dds::core::policy::Partition::name** (p. 1926) <= **rti::core::policy::DomainParticipantResourceLimits::max_partitions** (p. 1417)

combined number of characters (including terminating 0) in **dds::core::policy::Partition::name** (p. 1926) <= **rti::core::policy::DomainParticipantResourceLimits::max_partition_cumulative_characters** (p. 1417)

If any of the above are not true, **dds::sub::Subscriber::qos(const dds::sub::qos::SubscriberQos&)** (p. 2417) will fail with **dds::core::InconsistentPolicyError** (p. 1610)

DDSQosModule_set_qos

8.368.3 Friends And Related Function Documentation

8.368.3.1 to_string() [1/3]

```
std::string to_string (
             const  SubscriberQos & qos,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2423)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
SubscriberQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for SubscriberQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
SubscriberQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.368.3.2 to_string() [2/3]

```
std::string to_string (
             const  SubscriberQos & qos,
             const  SubscriberQos & base,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2423)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to
	print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019)
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.368.3.3 to_string() [3/3]

```
std::string to_string (
            const  SubscriberQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(*p. *354**)* Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2423)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.368.3.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::sub::qos::SubscriberQos & qos )  [related]
```

<<***extension***>> *(*p. *354**)* Prints a **dds::sub::qos::SubscriberQos** (p. 2423) to an output stream.

8.369 dds::topic::SubscriptionBuiltinTopicData Class Reference

Entry created when a **dds::sub::DataReader** (p. 976) is discovered in association with its **dds::sub::Subscriber** (p. 2410).

```
#include <dds/topic/BuiltinTopic.hpp>
```

8.369.1 Detailed Description

Entry created when a **dds::sub::DataReader** (p. 976) is discovered in association with its **dds::sub::Subscriber** (p. 2410).

Data associated with the built-in topic **dds::topic::subscription_topic_name()** (p. 444). It contains QoS policies and additional information that apply to the remote **dds::sub::DataReader** (p. 976) the related **dds::sub::Subscriber** (p. 2410).

8.369.2 Member Function Documentation

8.369.2.1 TSubscriptionBuiltinTopicData()

```
dds::topic::SubscriptionBuiltinTopicData::TSubscriptionBuiltinTopicData ( )  [inline]
```

Create a default **SubscriptionBuiltinTopicData** (p. 2428).

8.369.2.2 key()

```
const  dds::topic::BuiltinTopicKey & dds::topic::SubscriptionBuiltinTopicData::key ( ) const  [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

8.369.2.3 participant_key()

```
const  dds::topic::BuiltinTopicKey & dds::topic::SubscriptionBuiltinTopicData::participant_key ( )
const  [inline]
```

Get the DCPS key of the **dds::domain::DomainParticipant** (p. 1326) to which the **dds::sub::DataReader** (p. 976) belongs.

Returns

The DomainParticipant's key

8.369.2.4 topic_name()

```
const  dds::core::string & dds::topic::SubscriptionBuiltinTopicData::topic_name ( ) const  [inline]
```

Get the name of the related **dds::topic::Topic** (p. 2474).

Returns

The topic name

8.369.2.5 type_name()

```
const dds::core::string & dds::topic::SubscriptionBuiltinTopicData::type_name ( ) const [inline]
```

Get the name of the type attached to the **dds::topic::Topic** (p. 2474).

Returns

The type name

8.369.2.6 durability()

```
const dds::core::policy::Durability & dds::topic::SubscriptionBuiltinTopicData::durability ( )
const [inline]
```

Get the **dds::core::policy::Durability** (p. 1433) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Durability policy

8.369.2.7 deadline()

```
const dds::core::policy::Deadline & dds::topic::SubscriptionBuiltinTopicData::deadline ( ) const
[inline]
```

Get the **dds::core::policy::Deadline** (p. 1255) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Deadline policy

8.369.2.8 latency_budget()

```
const dds::core::policy::LatencyBudget & dds::topic::SubscriptionBuiltinTopicData::latency_budget
( ) const [inline]
```

Get the **dds::core::policy::LatencyBudget** (p. 1631) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The LatencyBudget policy

8.369.2.9 liveliness()

```
const dds::core::policy::Liveliness & dds::topic::SubscriptionBuiltinTopicData::liveliness ( )
const [inline]
```

Get the **dds::core::policy::Liveliness** (p. 1645) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Liveliness policy

8.369.2.10 reliability()

```
const dds::core::policy::Reliability & dds::topic::SubscriptionBuiltinTopicData::reliability ( )
const [inline]
```

Get the **dds::core::policy::Reliability** (p. 2149) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Reliability policy

8.369.2.11 ownership()

```
const dds::core::policy::Ownership & dds::topic::SubscriptionBuiltinTopicData::ownership ( )
const [inline]
```

Get the **dds::core::policy::Ownership** (p. 1899) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Ownership policy

8.369.2.12 destination_order()

```
const dds::core::policy::DestinationOrder & dds::topic::SubscriptionBuiltinTopicData::destination↩
_order ( ) const [inline]
```

Get the **dds::core::policy::DestinationOrder** (p. 1258) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The DestinationOrder policy

8.369.2.13 user_data()

```
const dds::core::policy::UserData & dds::topic::SubscriptionBuiltinTopicData::user_data ( ) const
[inline]
```

Get the **dds::core::policy::UserData** (p. 2591) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The UserData policy

8.369.2.14 time_based_filter()

```
const dds::core::policy::TimeBasedFilter & dds::topic::SubscriptionBuiltinTopicData::time_based↩
_filter ( ) const [inline]
```

Get the **dds::core::policy::TimeBasedFilter** (p. 2469) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The TimeBasedFilter policy

8.369.2.15 presentation()

```
const dds::core::policy::Presentation & dds::topic::SubscriptionBuiltinTopicData::presentation (
) const [inline]
```

Get the **dds::core::policy::Presentation** (p. 1942) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Presentation policy

8.369.2.16 partition()

```
const dds::core::policy::Partition & dds::topic::SubscriptionBuiltinTopicData::partition ( )
const [inline]
```

Get the **dds::core::policy::Partition** (p. 1923) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The Partition policy

8.369.2.17 topic_data()

```
const dds::core::policy::TopicData & dds::topic::SubscriptionBuiltinTopicData::topic_data ( )
const [inline]
```

Get the **dds::core::policy::TopicData** (p. 2500) policy of the related **dds::topic::Topic** (p. 2474).

Returns

The TopicData policy

8.369.2.18 group_data()

```
const dds::core::policy::GroupData & dds::topic::SubscriptionBuiltinTopicData::group_data ( )
const [inline]
```

Get the **dds::core::policy::GroupData** (p. 1591) policy of the **dds::sub::Subscriber** (p. 2410) to which the **dds::sub::DataReader** (p. 976) belongs.

Returns

The GroupData policy

8.369.2.19 representation()

```
const dds::core::policy::DataRepresentation & dds::topic::SubscriptionBuiltinTopicData::representation
( ) const [inline]
```

Get the **dds::core::policy::DataRepresentation** (p. 1113) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The DataRepresentation policy

8.369.2.20 data_tag()

```
const dds::core::policy::DataTag & dds::topic::SubscriptionBuiltinTopicData::data_tag ( ) const
[inline]
```

Get the **dds::core::policy::DataTag** (p. 1132) policy of the corresponding **dds::sub::DataReader** (p. 976).

Returns

The DataTag policy

8.369.2.21 type()

```
dds::core::optional< dds::core::xtypes::DynamicType > type ( ) const
```

<<***extension***>> *(p. 354)* Get the type

Note

This is not a lightweight getter–obtaining the type may require some processing so it is recommended that you keep the value if you need to use it multiple times rather than look it up every time. See also **get_type_no_copy()** (p. 2435).

Returns

The type or an unset optional value if the type is not available

8.369.2.22 get_type_no_copy()

```
const dds::core::optional< dds::core::xtypes::DynamicType > & get_type_no_copy ( ) const
```

<<***extension***>> *(p. 354)* Get the type by reference if possible

Exceptions

dds::core::PreconditionNotMet	If the type is available but is not in a format that is directly accessible. In that case it needs some extra processing and has to be accessed using **type()** (p. 2434). You can also ensure that it is in the right format by setting **rti::core::policy::↩ DomainParticipantResourceLimits::type_code_max_serialized_length()** (p. 1418) to 0.

Returns

The type or an unset optional value if the type is not available

See also

type() (p. 2434)

8.369.2.23 subscriber_key()

```
const dds::topic::BuiltinTopicKey & subscriber_key ( ) const
```

<<***extension***>> *(p. 354)* Get the DCPS key of the subscriber to which the DataReader belongs.

8.369.2.24 property()

```
const rti::core::policy::Property & property ( ) const
```

<<***extension***>> *(p. 354)* Get the Property policy of the corresponding DataReader

Returns

8.369.2.25 unicast_locators()

```
const dds::core::vector< rti::core::Locator > & unicast_locators ( ) const
```

<<***extension***>> *(p. 354)* Get the custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.369.2.26 multicast_locators()

```
const dds::core::vector< rti::core::Locator > & multicast_locators ( ) const
```

<<***extension***>> *(p. 354)* Get the custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.369.2.27 content_filter_property()

```
const rti::core::ContentFilterProperty & content_filter_property ( ) const
```

<<***extension***>> *(p. 354)* This provides all the required information to enable content filtering on the Writer side.

8.369.2.28 virtual_guid()

```
const rti::core::Guid & virtual_guid ( ) const
```

<<***extension***>> *(p. 354)* Gets the virtual GUID associated to the DataReader.

8.369.2.29 rtps_protocol_version()

```
const rti::core::ProtocolVersion & rtps_protocol_version ( ) const
```

<<***extension***>> *(p. 354)* Get the version of the RTPS wire protocol used.

8.369.2.30 rtps_vendor_id()

```
const rti::core::VendorId & rtps_vendor_id ( ) const
```

<<***extension***>> *(p. 354)* Get the ID of vendor implementing the RTPS wire protocol

8.369.2.31 product_version()

```
const rti::core::ProductVersion & product_version ( ) const
```

<<***extension***>> *(p. 354)* Gets the version of RTI Connext

Returns

8.369.2.32 disable_positive_acks()

```
bool disable_positive_acks ( ) const
```

<<***extension***>> *(p. 354)* Get whether or not the corresponding **dds::sub::DataReader** (p. 976) sends positive acknowledgments for reliability.

Returns

false if positive acknowledgments are disabled, true otherwise

8.369.2.33 subscription_name()

```
const rti::core::policy::EntityName & subscription_name ( ) const
```

<<***extension***>> *(p. 354)* Get the subscription name and role name.

8.369.2.34 trust_protection_info()

```
const  rti::topic::trust::EndpointTrustProtectionInfo & trust_protection_info ( ) const
```

<<***extension***>> *(p. 354)* Get the Trust Plugins information associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.369.2.35 trust_algorithm_info()

```
const  rti::topic::trust::EndpointTrustAlgorithmInfo & trust_algorithm_info ( ) const
```

<<***extension***>> *(p. 354)* Get the Trust plugins algorithms associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.369.2.36 related_datawriter_key()

```
const  dds::topic::BuiltinTopicKey & related_datawriter_key ( ) const
```

Get the **dds::topic::BuiltinTopicKey** (p. 905) of the related **dds::pub::DataWriter** (p. 1138) of this DataReader.

This field will be set to something other than **dds::topic::BuiltinTopicKey::unknown()** (p. 906) only when the discovered DataReader is a part of Remote Procedure Call (RPC) or Request-Reply endpoints.

8.369.2.37 service()

```
const  rti::core::policy::Service & service ( ) const
```

<<***extension***>> *(p. 354)* Get the Service policy of the corresponding DataReader.

8.370 dds::core::status::SubscriptionMatchedStatus Class Reference

  The change in current_count since the last time the listener was called or the status was read.
- const **dds::core::InstanceHandle last_publication_handle** () const

  *This **InstanceHandle** (p. 1612) can be used to look up which remote **dds::pub::DataWriter** (p. 1138) was the last to cause this DataReader's status to change, using **dds::sub::DataReader::matched_publication_data** (p. 1033).*
- int32_t **current_count_peak** () const

  *<<**extension**>> (p. 354) Greatest number of DataReaders that matched this **dds::pub::DataWriter** (p. 1138) simultaneously.*

8.370.1 Detailed Description

Information about the status **dds::core::status::StatusMask::subscription_matched()** (p. 2384)

A "match" happens when the **dds::sub::DataReader** (p. 976) finds a **dds::pub::DataWriter** (p. 1138) with the same **dds::topic::Topic** (p. 2474), same or compatible data type, and an offered QoS that is compatible with that requested by the **dds::sub::DataReader** (p. 976). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **dds::sub::DataReader** (p. 976) will become "unmatched" from a remote **dds::pub::DataWriter** (p. 1138) when that **dds::pub::DataWriter** (p. 1138) goes away for any of the following reasons:

- The **dds::domain::DomainParticipant** (p. 1326) containing the matched **dds::pub::DataWriter** (p. 1138) has lost liveliness.
- This DataReader or the matched DataWriter has changed QoS such that the entities are now incompatible.
- The matched DataWriter has been deleted.

This status may reflect changes from multiple match or unmatch events, and the **dds::core::status::SubscriptionMatchedStatus::current_count_change** (p. 2440) can be used to determine the number of changes since the listener was called back or the status was checked.

Note: A DataWriter's loss of liveliness (which is determined by **dds::core::policy::LivelinessKind_def** (p. 1654)) does not trigger an unmatch event. So a DataWriter may still match even though its liveliness is lost.

8.370.2 Member Function Documentation

8.370.2.1 total_count()

```
int32_t dds::core::status::SubscriptionMatchedStatus::total_count ( ) const  [inline]
```

The total cumulative number of times that this **dds::sub::DataReader** (p. 976) discovered a "match" with a **dds::pub↩ ::DataWriter** (p. 1138).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **dds::core::status::SubscriptionMatchedStatus** (p. 2439).

8.370.2.2 total_count_change()

```
int32_t dds::core::status::SubscriptionMatchedStatus::total_count_change ( ) const  [inline]
```

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times the DataReader ever matched with a DataWriter).

8.370.2.3 current_count()

```
int32_t dds::core::status::SubscriptionMatchedStatus::current_count ( ) const  [inline]
```

The current number of DataWriters with which the **dds::sub::DataReader** (p. 976) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **dds::core::status::SubscriptionMatchedStatus** (p. 2439).

8.370.2.4 current_count_change()

```
int32_t dds::core::status::SubscriptionMatchedStatus::current_count_change ( ) const  [inline]
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataWriters have become unmatched for one or more of the reasons described in **dds::core::status::SubscriptionMatchedStatus** (p. 2439).

8.370.2.5 last_publication_handle()

```
const dds::core::InstanceHandle dds::core::status::SubscriptionMatchedStatus::last_publication_↩
handle ( ) const [inline]
```

This **InstanceHandle** (p. 1612) can be used to look up which remote **dds::pub::DataWriter** (p. 1138) was the last to cause this DataReader's status to change, using **dds::sub::DataReader::matched_publication_data** (p. 1033).

If the DataWriter no longer matches this DataReader due to any of the reasons in **dds::core::status::Subscription↩ MatchedStatus** (p. 2439) except incompatible QoS, then the DataWriter has been purged from this DataReader's DomainParticipant discovery database. (See the "Discovery Overview" section of the User's Manual.) In that case, the **dds::sub::DataReader::matched_publication_data** (p. 1033) method will not be able to return information about the DataWriter. The only way to get information about the lost DataWriter is if you cached the information previously.

8.370.2.6 current_count_peak()

```
int32_t current_count_peak ( ) const
```

<<***extension***>> *(p. 354)* Greatest number of DataReaders that matched this **dds::pub::DataWriter** (p. 1138) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, total_count can be higher than current_count_peak.)

8.371 dds::pub::SuspendedPublication Class Reference

<<***value-type***>> *(p. 350)* Indicates that the application is about to make multiple modifications using several **dds↩ ::pub::DataWriter** (p. 1138)'s belonging to the same **dds::pub::Publisher** (p. 1993)

```
#include <dds/pub/SuspendedPublication.hpp>
```

Public Member Functions

- **SuspendedPublication** (const **dds::pub::Publisher** &pub)

  Suspends the publications of the publisher.
- void **resume** ()

  Indicates that the application has completed these changes.
- ~**SuspendedPublication** ()

  *Calls **resume()** (p. 2443)*

8.371.1 Detailed Description

<<***value-type***>> *(p. 350)* Indicates that the application is about to make multiple modifications using several **dds::pub::DataWriter** (p. 1138)'s belonging to the same **dds::pub::Publisher** (p. 1993)

It is a **hint** to RTI Connext so it can optimize its performance by e.g., holding the dissemination of the modifications and then batching them.

The use of this operation must be matched by a corresponding call to **dds::pub::SuspendedPublication::resume()** (p. 2443) indicating that the set of modifications has completed.

If the **dds::pub::Publisher** (p. 1993) is deleted before **dds::pub::SuspendedPublication::resume()** (p. 2443) is called, any suspended updates yet to be published will be discarded.

RTI Connext is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using *asynchronous publishing*. Combined with **rti::pub::FlowController** (p. 1572), **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019) **dds::pub::DataWriter** (p. 1138) instances allow the user even finer control of traffic shaping and sample coalescing.

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869).

8.372.1 Detailed Description

<<***extension***>> *(p. 116)* Configures resources that RTI Connext uses

Entity:

DomainParticipantFactory

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.372.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple **dds::domain::DomainParticipant** (p. 1326) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of **dds::domain::DomainParticipant** (p. 1326) entities that can be created in a single process/address space. These values cannot be changed after a DomainParticipant has been created and they cannot be set in a QoS XML file.

8.372.3 Constructor & Destructor Documentation

8.372.3.1 SystemResourceLimits() [1/3]

```
rti::core::policy::SystemResourceLimits::SystemResourceLimits ( )  [inline]
```

Creates a **SystemResourceLimits** (p. 2443) qos policy with default values.

8.372.3.2 SystemResourceLimits() [2/3]

```
rti::core::policy::SystemResourceLimits::SystemResourceLimits (
            int32_t the_max_objects_per_thread )  [inline], [explicit]
```

Creates a **SystemResourceLimits** (p. 2443) qos policy with the provided max_objects_per_thread and set initial_↩ objects_per_thread accordingly.

8.372.3.3 SystemResourceLimits() [3/3]

```
rti::core::policy::SystemResourceLimits::SystemResourceLimits (
            int32_t the_max_objects_per_thread,
            int32_t the_initial_objects_per_thread )  [inline]
```

Creates a **SystemResourceLimits** (p. 2443) qos policy with the provided max_objects_per_thread and initial_objects↩ _per_thread.

8.372.4 Member Function Documentation

8.372.4.1 max_objects_per_thread() [1/2]

```
SystemResourceLimits & rti::core::policy::SystemResourceLimits::max_objects_per_thread (
            int32_t the_max_objects_per_thread )
```

[DEPRECATED] (p. **296)** Sets the maximum number of objects that can be stored per thread

This value is the upper bound on the number of objects that can be stored per thread. When a DomainParticipantFactory is created, infrastructure will be created to manage the number of objects specified by initial_objects_per_thread. As more objects are required by the application, the infrastructure will be automatically grown to accommodate up to max↩ _objects_per_thread objects. Leave this property set to the default value to allow the infrastructure to grow as needed. If you wish to strictly control memory allocation, set max_objects_per_thread to a smaller value, but note that this runs the risk of a runtime error and reduced application functionality if your limit is reached.

[default] 261120

[range] [1, 261120]

Categories

Immutable (p. 243), **Middleware Memory Management** (p. 204)

8.372.4.2 initial_objects_per_thread() [1/2]

```
SystemResourceLimits & rti::core::policy::SystemResourceLimits::initial_objects_per_thread (
            int32_t the_initial_objects_per_thread )
```

Sets the initial number of objects that can be stored per thread.

The infrastructure for managing thread-specific objects will initially be sized according to this value. The infrastructure will grow automatically, up to a maximum of max_objects_per_thread, as required by the application at runtime. If you are certain that more than the default value of initial_objects_per_thread will be required for your application and you wish to reduce the number of memory allocations performed while your application reaches steady state, you may set this value to a larger number. To improve the efficiency of memory allocation, RTI Connext may initially size the infrastructure to a larger value than the value of initial_objects_per_thread. The infrastructure will never be sized less than initial_objects_per_thread or greater than max_objects_per_thread. When the infrastructure for managing thread-specific objects is created or increased, a log message stating "Allowed number of thread specific objects is now " will be produced at the local log level.

[default] 1024

[range] [1, 261120]; must be less than or equal to max_objects_per_thread

8.374 rti::core::ThreadSettings Class Reference

<<***extension***>> *(p. 354)* The properties of a thread of execution.

`#include <rti/core/ThreadSettings.hpp>`

Public Member Functions

- **ThreadSettings** ()

  Creates the default thread settings.
- **ThreadSettings** (**ThreadSettingsKindMask** the_mask, int32_t the_priority, int32_t the_stack_size, **dds::core::vector**< int32_t > the_cpu_list, ThreadSettingsCpuRotationKind::type the_cpu_rotation)

  Creates an instance with all the specified parameters.
- **ThreadSettingsKindMask mask** () const

  Getter (see setter with the same name)
- **ThreadSettings** & **mask** (**ThreadSettingsKindMask** the_mask)

  Describes the type of thread.
- int32_t **priority** () const

  Getter (see setter with the same name)
- **ThreadSettings** & **priority** (int32_t the_priority)

  Thread priority.
- int32_t **stack_size** () const

  Getter (see setter with the same name)
- **ThreadSettings** & **stack_size** (int32_t the_stack_size)

  The thread stack-size.
- **dds::core::vector**< int32_t > **cpu_list** () const

  Getter (see setter with the same name)
- **ThreadSettings** & **cpu_list** (const **dds::core::vector**< int32_t > &the_cpu_list)

  The list of processors on which the thread(s) may run.
- **ThreadSettingsCpuRotationKind cpu_rotation** () const

  Getter (see setter with the same name)
- **ThreadSettings** & **cpu_rotation** (**ThreadSettingsCpuRotationKind** the_cpu_rotation)

  Determines how processor affinity is applied to multiple threads.

8.374.1 Detailed Description

<<***extension***>> *(p. 354)* The properties of a thread of execution.

Consult `Platform Notes` for additional platform specific details.

QoS:

rti::core::policy::Event (p. 1541) **rti::core::policy::Database** (p. 969) **rti::core::policy::ReceiverPool** (p. 2144) **rti::core::policy::AsynchronousPublisher** (p. 832)

8.374.2 Constructor & Destructor Documentation

8.374.2.1 ThreadSettings() [1/2]

```
rti::core::ThreadSettings::ThreadSettings ( )  [inline]
```

Creates the default thread settings.

8.374.2.2 ThreadSettings() [2/2]

```
rti::core::ThreadSettings::ThreadSettings (
             ThreadSettingsKindMask the_mask,
            int32_t the_priority,
            int32_t the_stack_size,
             dds::core::vector< int32_t > the_cpu_list,
            ThreadSettingsCpuRotationKind::type the_cpu_rotation )
```

Creates an instance with all the specified parameters.

8.374.3 Member Function Documentation

8.374.3.1 mask() [1/2]

```
ThreadSettingsKindMask rti::core::ThreadSettings::mask ( ) const
```

Getter (see setter with the same name)

8.374.3.2 mask() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::mask (
             ThreadSettingsKindMask the_mask )
```

Describes the type of thread.

The meaning of each bit of the mask are defined by **rti::core::ThreadSettingsKindMask** (p. 2454).

[default] 0, use default options of the OS

8.374.3.3 priority() [1/2]

```
int32_t rti::core::ThreadSettings::priority ( ) const
```

Getter (see setter with the same name)

8.374.3.4 priority() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::priority (
            int32_t the_priority )
```

Thread priority.

[range] Platform-dependent - Consult `Platform Notes` for additional details.

8.374.3.5 stack_size() [1/2]

```
int32_t rti::core::ThreadSettings::stack_size ( ) const
```

Getter (see setter with the same name)

8.374.3.6 stack_size() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::stack_size (
            int32_t the_stack_size )
```

The thread stack-size.

[range] Platform-dependent. Consult `Platform Notes` for additional details.

Categories

Middleware Memory Management (p. 204)

8.374.3.7 cpu_list() [1/2]

```
dds::core::vector< int32_t > rti::core::ThreadSettings::cpu_list ( ) const
```

Getter (see setter with the same name)

8.374.3.8 cpu_list() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::cpu_list (
            const  dds::core::vector< int32_t > & the_cpu_list )
```

The list of processors on which the thread(s) may run.

A sequence of integers that represent the set of processors on which the thread(s) controlled by this QoS may run. An empty sequence (the default) means the middleware wlll make no CPU affinity adjustments.

Note: This feature is currently only supported on a subset of architectures (see the Platform Notes). The API may change as more architectures are added in future releases.

This value is only relevant to the **rti::core::policy::ReceiverPool** (p. 2144). It is ignored within other QoS policies that include **rti::core::ThreadSettings** (p. 2449).

See also

Controlling CPU Core Affinity for RTI Threads (p. 2453)

[default] Empty sequence

8.374.3.9 cpu_rotation() [1/2]

```
ThreadSettingsCpuRotationKind rti::core::ThreadSettings::cpu_rotation ( ) const
```

Getter (see setter with the same name)

8.374.3.10 cpu_rotation() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::cpu_rotation (
             ThreadSettingsCpuRotationKind the_cpu_rotation )
```

Determines how processor affinity is applied to multiple threads.

This value is only relevant to the **rti::core::policy::ReceiverPool** (p. 2144). It is ignored within other QoS policies that include **rti::core::ThreadSettings** (p. 2449).

See also

Controlling CPU Core Affinity for RTI Threads (p. 2453)

Note: This feature is currently only supported on a subset of architectures (see the Platform Notes). The API may change as more architectures are added in future releases.

8.375 rti::core::ThreadSettingsCpuRotationKind_def Struct Reference

Determines how **rti::core::ThreadSettings::cpu_list** (p. 2451) affects processor affinity for thread-related QoS policies that apply to multiple threads.

`#include <ThreadSettings.hpp>`

Public Types

- enum **type** {
  NO_ROTATION ,
  ROUND_ROBIN }

  The underlying `enum` type.

8.375.1 Detailed Description

Determines how **rti::core::ThreadSettings::cpu_list** (p. 2451) affects processor affinity for thread-related QoS policies that apply to multiple threads.

8.375.2 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the **rti::core::policy::Event** (p. 1541), **rti::core::policy::Database** (p. 969), and **rti::core::policy::AsynchronousPublisher** (p. 832)). However, the thread settings in the **rti::core::policy::ReceiverPool** (p. 2144) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

Controlling CPU Core Affinity is only relevant to the **rti::core::policy::ReceiverPool** (p. 2144). It is ignored within other QoS policies that include **rti::core::ThreadSettings** (p. 2449).

If **rti::core::ThreadSettings::cpu_list** (p. 2451) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that **rti::core::ThreadSettings::cpu_list** (p. 2451) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If **rti::core::ThreadSettings::cpu_rotation** (p. 2452) is **rti::core::ThreadSettingsCpuRotationKind_def::NO_ROTATION** (p. 2454), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If **rti::core::ThreadSettings::cpu_rotation** (p. 2452) is **rti::core::ThreadSettingsCpuRotationKind_def::ROUND_ROBIN** (p. 2454), each thread will be assigned in round-robin fashion to one of the processors in **rti::core::ThreadSettings::cpu_list** (p. 2451); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems. Refer to the Platform Notes for further information.

8.375.3 Member Enumeration Documentation

8.375.3.1 type

`enum` **rti::core::ThreadSettingsCpuRotationKind_def::type**

The underlying `enum` type.

Enumerator

NO_ROTATION	Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
ROUND_ROBIN	Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

8.376 rti::core::ThreadSettingsKindMask Class Reference

<<***extension***>> *(*p. *354)* A collection of flags used to configure threads of execution

`#include <rti/core/ThreadSettings.hpp>`

Inherits std::bitset< 4 >.

Public Types

- typedef std::bitset< 4 > **MaskType**

  The base type, a std::bitset.

Public Member Functions

- **ThreadSettingsKindMask** ()

  The dfault thread settings mask.
- **ThreadSettingsKindMask** (uint64_t mask)

  Create from the bits in an integer.
- **ThreadSettingsKindMask** (const **MaskType** &mask)

  Create from a std::bitset.

Static Public Member Functions

- static const **ThreadSettingsKindMask** **floating_point** ()

  Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.
- static const **ThreadSettingsKindMask** **stdio** ()

  Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.
- static const **ThreadSettingsKindMask** **realtime_priority** ()

  The thread will be scheduled on a FIFO basis.
- static const **ThreadSettingsKindMask** **priority_enforce** ()

  Strictly enforce this thread's priority.
- static const **ThreadSettingsKindMask** **cancel_asynchronous** ()

  Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

8.376.1 Detailed Description

<<***extension***>> *(p. 354)* A collection of flags used to configure threads of execution

Not all of these options may be relevant for all operating systems. Consult `Platform Notes` for additional details.

8.376.2 Member Typedef Documentation

8.376.2.1 MaskType

```
typedef std::bitset<4>  rti::core::ThreadSettingsKindMask::MaskType
```

The base type, a std::bitset.

8.376.3 Constructor & Destructor Documentation

8.376.3.1 ThreadSettingsKindMask() [1/3]

```
rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask ( )  [inline]
```

The dfault thread settings mask.

8.376.3.2 ThreadSettingsKindMask() [2/3]

```
rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask (
            uint64_t mask )  [inline], [explicit]
```

Create from the bits in an integer.

8.376.3.3 ThreadSettingsKindMask() [3/3]

```
rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask (
            const  MaskType & mask )  [inline]
```

Create from a std::bitset.

8.376.4 Member Function Documentation

8.376.4.1 floating_point()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::floating_point ( ) [inline], [static]
```

Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.

8.376.4.2 stdio()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::stdio ( ) [inline], [static]
```

Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.

8.376.4.3 realtime_priority()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::realtime_priority ( ) [inline], [static]
```

The thread will be scheduled on a FIFO basis.

8.376.4.4 priority_enforce()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::priority_enforce ( ) [inline], [static]
```

Strictly enforce this thread's priority.

8.376.4.5 cancel_asynchronous()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::cancel_asynchronous ( ) [inline], [static]
```

Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

8.377 dds::core::Time Class Reference

<<***extension***>> *(*p. *354)* Represents a point in time

`#include <Time.hpp>`

Public Member Functions

- **Time** ()

  *Create a default **Time** (*p. *2457) object. The constructed **Time** (*p. *2457) object will represent 0 seconds and 0 nanoseconds.*
- **Time** (int64_t **sec**, uint32_t **nanosec**=0)

  *Create a **Time** (*p. *2457) object. The constructed **Time** (*p. *2457) object will represent the given amount of time.*
- int64_t **sec** () const

  *Get the number of seconds that are represented by this **Time** (*p. *2457) object.*
- void **sec** (int64_t s)

  *Set the number of seconds that are represented by this **Time** (*p. *2457) object.*
- uint32_t **nanosec** () const

  *Get the number of nanoseconds that are represented by this **Time** (*p. *2457) object.*
- void **nanosec** (uint32_t ns)

  *Set the number of nanoseconds that are represented by this **Time** (*p. *2457) object.*
- int **compare** (const **Time** &other) const

  *Compare two **Time** (*p. *2457) objects.*
- bool **operator>** (const **Time** &other) const

  *Check if this **Time** (*p. *2457) is greater than another.*
- bool **operator>=** (const **Time** &other) const

  *Check if this **Time** (*p. *2457) is greater than or equal another.*
- bool **operator==** (const **Time** &other) const

  *Check if this **Time** (*p. *2457) of **Time** (*p. *2457) is equal to another.*
- bool **operator!=** (const **Time** &other) const

  *Check if this **Time** (*p. *2457) is not equal to another.*
- bool **operator<=** (const **Time** &other) const

  *Check if this **Time** (*p. *2457) is less than or equal another.*
- bool **operator<** (const **Time** &other) const

  *Check if this **Time** (*p. *2457) is less than another.*
- **Time** & **operator+=** (const **Duration** &duration)

  *Add a **Duration** (*p. *1448) to this **Time** (*p. *2457) object.*
- **Time** & **operator-=** (const **Duration** &duration)

  *Subtract a **Duration** (*p. *1448) from this **Time** (*p. *2457) object.*
- uint64_t **to_millisecs** () const

  *Convert this **Time** (*p. *2457) to milliseconds.*
- uint64_t **to_microsecs** () const

  *Convert this **Time** (*p. *2457) to microseconds.*
- uint64_t **to_nanosecs** () const

  *Convert this **Time** (*p. *2457) to nanoseconds.*
- double **to_secs** () const

  *Convert this **Time** (*p. *2457) to seconds.*

Static Public Member Functions

- static **Time** **invalid** ()

  *Get a **Time** (p. 2457) object representing an invalid amount of time.*
- static **Time** **zero** ()

  *Get a **Time** (p. 2457) object representing zero time.*
- static **Time** **maximum** ()

  *Get a **Time** (p. 2457) object representing the maximum amount of time.*
- static **Time** **from_microsecs** (uint64_t microseconds)

  *Create a **Time** (p. 2457) object from microseconds.*
- static **Time** **from_millisecs** (uint64_t milliseconds)

  *Create a **Time** (p. 2457) object from milliseconds.*
- static **Time** **from_secs** (double seconds)

  *Create a **Time** (p. 2457) object from seconds.*

Related Functions

(Note that these are not member functions.)

- **Time** **operator+** (const **Time** &time, const **Duration** &duration)

  *Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.*
- **Time** **operator+** (const **Duration** &duration, const **Time** &time)

  *Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.*
- **Time** **operator-** (const **Time** &time, const **Duration** &duration)

  *Subtract a **Duration** (p. 1448) from a **Time** (p. 2457).*
- **Duration** **operator-** (const **Time** &time1, const **Time** &time2)

  Calculate the duration between two times.

8.377.1 Detailed Description

<<***extension***>> *(p. 354)* Represents a point in time

8.377.2 Constructor & Destructor Documentation

8.377.2.1 Time() [1/2]

```
dds::core::Time::Time ( )
```

Create a default **Time** (p. 2457) object. The constructed **Time** (p. 2457) object will represent 0 seconds and 0 nanoseconds.

8.377.2.2 Time() [2/2]

```
dds::core::Time::Time (
            int64_t sec,
            uint32_t nanosec = 0 )  [explicit]
```

Create a **Time** (p. 2457) object. The constructed **Time** (p. 2457) object will represent the given amount of time.

8.377.3 Member Function Documentation

8.377.3.1 invalid()

```
static  Time dds::core::Time::invalid ( )  [static]
```

Get a **Time** (p. 2457) object representing an invalid amount of time.

Returns

const **Time** (p. 2457) A **Time** (p. 2457) object representing an invalid amount of time.

8.377.3.2 zero()

```
static  Time dds::core::Time::zero ( )  [static]
```

Get a **Time** (p. 2457) object representing zero time.

Returns

const **Time** (p. 2457) A **Time** (p. 2457) object representing zero time.

8.377.3.3 maximum()

```
static  Time dds::core::Time::maximum ( )  [static]
```

Get a **Time** (p. 2457) object representing the maximum amount of time.

Returns

const **Time** (p. 2457) A **Time** (p. 2457) object representing the maximum amount of time.

8.377.3.4 from_microsecs()

```
static  Time dds::core::Time::from_microsecs (
            uint64_t microseconds )  [static]
```

Create a **Time** (p. 2457) object from microseconds.

Parameters

microseconds	How many microseconds this **Time** (p. 2457) represent

Returns

Time (p. 2457) A new instance of **Time** (p. 2457) representing the given microseconds

8.377.3.5 from_millisecs()

```
static  Time dds::core::Time::from_millisecs (
             uint64_t milliseconds )  [static]
```

Create a **Time** (p. 2457) object from milliseconds.

Parameters

milliseconds	How many milliseconds this **Time** (p. 2457) should represent

Returns

Time (p. 2457) A new instance of **Time** (p. 2457) representing the given milliseconds

8.377.3.6 from_secs()

```
static  Time dds::core::Time::from_secs (
             double seconds )  [static]
```

Create a **Time** (p. 2457) object from seconds.

Parameters

seconds	How many seconds this **Time** (p. 2457) should represent

Returns

Time (p. 2457) A new instance of **Time** (p. 2457) representing the given seconds

8.377.3.7 sec() [1/2]

```
int64_t dds::core::Time::sec ( ) const
```

Get the number of seconds that are represented by this **Time** (p. 2457) object.

Returns

int64_t The number of seconds

8.377.3.8 sec() [2/2]

```
void dds::core::Time::sec (
            int64_t s )
```

Set the number of seconds that are represented by this **Time** (p. 2457) object.

Parameters

s	The number of seconds to set.

8.377.3.9 nanosec() [1/2]

```
uint32_t dds::core::Time::nanosec ( ) const
```

Get the number of nanoseconds that are represented by this **Time** (p. 2457) object.

Returns

uint32_t The number of nanoseconds

8.377.3.10 nanosec() [2/2]

```
void dds::core::Time::nanosec (
            uint32_t ns )
```

Set the number of nanoseconds that are represented by this **Time** (p. 2457) object.

Parameters

ns	The number of nanoseconds to set.

8.377.3.11 compare()

```
int dds::core::Time::compare (
            const  Time & other ) const
```

Compare two **Time** (p. 2457) objects.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

int The result of the comparison can be: -1 if this **Time** (p. 2457) is less than other; 0 if they are equal; 1 if this **Time** (p. 2457) is greater than other

8.377.3.12 operator>()

```
bool dds::core::Time::operator> (
            const  Time & other ) const
```

Check if this **Time** (p. 2457) is greater than another.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

bool false if this **Time** (p. 2457) is less than or equal to the other object, true otherwise.

8.377.3.13 operator>=()

```
bool dds::core::Time::operator>= (
            const  Time & other ) const
```

Check if this **Time** (p. 2457) is greater than or equal another.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

bool false if this **Time** (p. 2457) is less than to the other object, true otherwise.

8.377.3.14 operator==()

```
bool dds::core::Time::operator== (
             const  Time & other ) const
```

Check if this **Time** (p. 2457) of **Time** (p. 2457) is equal to another.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

bool false if this **Time** (p. 2457) is not equal to the other object, true otherwise.

8.377.3.15 operator"!=()

```
bool dds::core::Time::operator!= (
             const  Time & other ) const
```

Check if this **Time** (p. 2457) is not equal to another.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

bool false if this **Time** (p. 2457) is equal to the other object, true otherwise.

8.377.3.16 operator<=()

```
bool dds::core::Time::operator<= (
            const  Time & other ) const
```

Check if this **Time** (p. 2457) is less than or equal another.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

bool false if this **Time** (p. 2457) is greater than to the other object, true otherwise.

8.377.3.17 operator<()

```
bool dds::core::Time::operator< (
            const  Time & other ) const
```

Check if this **Time** (p. 2457) is less than another.

Parameters

other	The **Time** (p. 2457) object to compare with this **Time** (p. 2457).

Returns

bool false if this **Time** (p. 2457) is greater than or equal to the other object, true otherwise.

8.377.3.18 operator+=()

```
Time & dds::core::Time::operator+= (
            const  Duration & duration )
```

Add a **Duration** (p. 1448) to this **Time** (p. 2457) object.

Parameters

duration	The **Duration** (p. 1448) to add

Returns

Time (p. 2457)& This **Time** (p. 2457), with the added **Duration** (p. 1448)

8.377.3.19 operator-=()

```
Time & dds::core::Time::operator-= (
            const  Duration & duration )
```

Subtract a **Duration** (p. 1448) from this **Time** (p. 2457) object.

Parameters

duration	The **Duration** (p. 1448) to subtract

Returns

Time (p. 2457)& This **Time** (p. 2457), with the subtracted **Duration** (p. 1448)

8.377.3.20 to_millisecs()

```
uint64_t dds::core::Time::to_millisecs ( ) const
```

Convert this **Time** (p. 2457) to milliseconds.

Returns

uint64_t The number of milliseconds represented by this **Time** (p. 2457) object.

Exceptions

std::overflow_error	if the time in milliseconds exceeds the value that can be stored in an uint64_t

8.377.3.21 to_microsecs()

```
uint64_t dds::core::Time::to_microsecs ( ) const
```

Convert this **Time** (p. 2457) to microseconds.

Returns

uint64_t The number of microseconds represented by this **Time** (p. 2457) object.

Exceptions

std::overflow_error	if the time in microseconds exceeds the value that can be stored in an uint64_t

8.377.3.22 to_nanosecs()

```
uint64_t dds::core::Time::to_nanosecs ( ) const
```

Convert this **Time** (p. 2457) to nanoseconds.

Returns

uint64_t The number of nanoseconds represented by this **Time** (p. 2457) object.

Exceptions

std::overflow_error	if the time in nanoseconds exceeds the value that can be stored in an uint64_t

8.377.3.23 to_secs()

```
double dds::core::Time::to_secs ( ) const
```

Convert this **Time** (p. 2457) to seconds.

Returns

double The number of seconds represented by this **Time** (p. 2457) object.

8.377.4 Friends And Related Function Documentation

8.377.4.1 operator+() [1/2]

```
Time operator+ (
            const  Time & time,
            const  Duration & duration )  [related]
```

Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.

Parameters

time	The **Time** (p. 2457) object to add
duration	The **Duration** (p. 1448) object to add

Returns

Time (p. 2457) The result of the addition represented as a **Time** (p. 2457) object

8.377.4.2 operator+() [2/2]

```
Time operator+ (
            const  Duration & duration,
            const  Time & time )  [related]
```

Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.

Parameters

duration	The **Duration** (p. 1448) object to add
time	The **Time** (p. 2457) object to add

Returns

Time (p. 2457) The result of the addition represented as a **Time** (p. 2457) object

8.377.4.3 operator-() [1/2]

```
Time operator- (
            const  Time & time,
            const  Duration & duration )  [related]
```

Subtract a **Duration** (p. 1448) from a **Time** (p. 2457).

Parameters

time	The **Time** (p. 2457) object to subtract from
duration	The **Duration** (p. 1448) object to subtract

Returns

Time (p. 2457) The result of the subtraction represented as a **Time** (p. 2457) object

8.377.4.4 operator-() [2/2]

```
Duration operator- (
            const  Time & time1,
            const  Time & time2 )  [related]
```

Calculate the duration between two times.

Parameters

time1	The first ("before") time
time2	The second ("after") time

Exceptions

std::overflow_error	if duration exceeds the infinite limit

Returns

The duration elapsed between time1 and time2. If time1 $>$ time2 the duration is zero. If time1 is **Time::maximum()** (p. 2459), the duration is **Duration::infinite()** (p. 1451);

8.378 dds::core::policy::TimeBasedFilter Class Reference

Allows a **dds::sub::DataReader** (p. 976) to indicate that it is not interested in all the sample updates that occur within a time period.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TimeBasedFilter** ()

  Creates the default time-based filter.
- **TimeBasedFilter** (const **dds::core::Duration** &the_min_separation)

  Creates a policy with the specified minimum separation.
- **TimeBasedFilter** & **minimum_separation** (const **dds::core::Duration** &min_separation)

  Sets the minimum separation between subsequent samples.
- const **dds::core::Duration minimum_separation** () const

  Getter (see setter with the same name)

8.378.1 Detailed Description

Allows a **dds::sub::DataReader** (p. 976) to indicate that it is not interested in all the sample updates that occur within a time period.

The filter states that the **dds::sub::DataReader** (p. 976) does not want to receive more than one value each `minimum_separation`, regardless of how fast the changes occur.

Entity:

dds::sub::DataReader (p. 976)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **YES** (p. 514)

8.378.2 Usage

You can use this QoS policy to reduce the amount of data received by a **dds::sub::DataReader** (p. 976). **dds::pub::DataWriter** (p. 1138) entities may send data faster than needed by a **dds::sub::DataReader** (p. 976). For example, a **dds::sub::DataReader** (p. 976) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measured in tenths (0.1) of a second up to several seconds. However, a **dds::pub::DataWriter** (p. 1138) of sensor information may have other **dds::sub::DataReader** (p. 976) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **dds::sub::DataReader** (p. 976) entities can set their own time-based filters, so that data published faster than the period set by a each **dds::sub::DataReader** (p. 976) will not be delivered to that **dds::sub::DataReader** (p. 976).

The **TIME_BASED_FILTER** (p. 547) also applies to each instance separately; that is, the constraint is that the **dds::sub::DataReader** (p. 976) does not want to see more than one sample of each instance per `minimum_separation` period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **dds::sub::DataReader** (p. 976), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort data delivery, if the data type is unkeyed and the **dds::pub::DataWriter** (p. 1138) has an infinite **dds::core::policy::Liveliness::lease_duration** (p. 1649), RTI Connext will only send as many packets to a **dds::sub::DataReader** (p. 976) as required by the TIME_BASED_FILTER, no matter how fast **dds::pub::DataWriter::write()** (p. 1148) is called.

For multicast data delivery to multiple DataReaders, the one with the lowest `minimum_separation` determines the DataWriter's send rate. For example, if a **dds::pub::DataWriter** (p. 1138) sends over multicast to two DataReaders, one with `minimum_separation` of 2 seconds and one with `minimum_separation` of 1 second, the DataWriter will send every 1 second.

In configurations where RTI Connext must send all the data published by the **dds::pub::DataWriter** (p. 1138) (for example, when the **dds::pub::DataWriter** (p. 1138) is reliable, when the data type is keyed, or when the **dds::pub::DataWriter** (p. 1138) has a finite **dds::core::policy::Liveliness::lease_duration** (p. 1649)), only the data that passes the TIME_BASED_FILTER will be stored in the receive queue of the **dds::sub::DataReader** (p. 976). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

8.378.3 Consistency

It is inconsistent for a **dds::sub::DataReader** (p. 976) to have a `minimum_separation` longer than its **DEADLINE** (p. 523) `period`.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time t=0 seconds. You then publish your next sample at t=1 seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at t=2 seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your `minimum_separation` to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your `minimum_separation` to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See **dds::core::policy::Deadline** (p. 1255) for more information about the interactions between deadlines and time-based filters.

The setting of a **TIME_BASED_FILTER** (p. 547) – that is, the selection of a `minimum_separation` with a value greater than zero – is consistent with all settings of the **HISTORY** (p. 533) and **RELIABILITY** (p. 544) QoS. The **TIME_↩ BASED_FILTER** (p. 547) specifies the samples that are of interest to the **dds::sub::DataReader** (p. 976). The **HISTORY** (p. 533) and **RELIABILITY** (p. 544) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the **dds::sub::DataReader** (p. 976); that is, they apply *after* the **TIME_BASED_FILTER** (p. 547) has been applied.

In the case where the reliability QoS kind is **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157), in steady-state – defined as the situation where the **dds::pub::DataWriter** (p. 1138) does not write new samples for a period "long" compared to the `minimum_separation` – the system should guarantee delivery of the last sample to the **dds::sub::DataReader** (p. 976).

8.380.1 Detailed Description

template<typename T>
class dds::topic::Topic< T >

<<***reference-type***>> *(p. 351)* **Topic** (p. 2474) is the most basic description of the data to be published and subscribed.

Template Parameters

T	The type associated to this topic. It must be a type such that `dds::topic::is_topic_type<T>::value` is true (see **dds::topic::is_topic_type** (p. 1622)). Valid types are **IDL-generated types** (p. 606), the **built-in types** (p. 50) and **dds::core::xtypes::DynamicData** (p. 1461).

QoS:

dds::topic::qos::TopicQos (p. 2509)

Status:

dds::core::status::StatusMask::inconsistent_topic() (p. 2379), **dds::core::status::InconsistentTopicStatus** (p. 1611)

Listener:

TopicListener (p. 2508)

A **dds::topic::Topic** (p. 2474) is identified by its name, which must be unique in the whole domain. In addition (by virtue of extending **TopicDescription** (p. 2503)) it fully specifies the type of the data that can be communicated when publishing or subscribing to the **dds::topic::Topic** (p. 2474).

dds::topic::Topic (p. 2474) is the only **TopicDescription** (p. 2503) that can be used for publications and therefore associated with a **dds::pub::DataWriter** (p. 1138).

The following operations may be called even if the **dds::topic::Topic** (p. 2474) is not enabled. Other operations will fail with the value **dds::core::NotEnabledError** (p. 1869) if called on a disabled **dds::topic::Topic** (p. 2474):

- **dds::core::Entity::enable** (p. 1524)
- **dds::topic::Topic::qos(const dds::topic::qos::TopicQos&)** (p. 2484), **dds::topic::Topic::qos() const** (p. 2483)
- **dds::topic::Topic::set_listener** (p. 2482), **dds::topic::Topic::get_listener** (p. 2483)
- **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2373), **dds::core::Entity::status_changes()** (p. 1525)
- **dds::topic::Topic::inconsistent_topic_status** (p. 2484)

See also

Operations Allowed in Listener Callbacks (p. 1639)

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.380.2 Constructor & Destructor Documentation

8.380.2.1 Topic() [1/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
            const  dds::domain::DomainParticipant & participant,
            RTI_STRING_IN topic_name )  [inline]
```

Creates a new topic.

This constructor automatically deduces the type name, uses **the default TopicQos** (p. 1522) and doesn't set a listener.

Parameters

participant	The domain participant on which the topic will be defined.
topic_name	The topic name.

8.380.2.2 Topic() [2/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
            const  dds::domain::DomainParticipant & dp,
```

```
            RTI_STRING_IN topic_name,
            RTI_STRING_IN type_name )  [inline]
```

Creates a new topic.

This constructor uses **the default TopicQos** (p. 1522) and doesn't set a listener.

Parameters

dp	The domain participant on which the topic will be defined.
topic_name	The topic name.
type_name	The name to register the type with

8.380.2.3 Topic() [3/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
            const  dds::domain::DomainParticipant & dp,
            RTI_STRING_IN topic_name,
            const  dds::topic::qos::TopicQos & qos,
             dds::topic::TopicListener< T > * listener = NULL,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Creates a new **Topic** (p. 2474).

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

This constructor deduces the type name automatically

8.380.2.4 Topic() [4/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
            const  dds::domain::DomainParticipant & participant,
            RTI_STRING_IN topic_name,
            RTI_STRING_IN type_name,
            const  dds::topic::qos::TopicQos & qos,
             dds::topic::TopicListener< T > * listener = NULL,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1637)> instead of a regular Listener* pointer.

Parameters

participant	The domain participant on which the topic will be defined.
topic_name	The **Topic** (p. 2474) name. Must not exceed 255 characters.
type_name	The name given to the type `T`
qos	The Qos settings for this **Topic** (p. 2474)
listener	the topic listener (default: NULL)
mask	the event mask associated to the DataReader listener.

See also

Specifying QoS on entities (p. 513) for information on setting QoS before entity creation

dds::topic::qos::TopicQos (p. 2509) for rules on consistency among QoS

dds::core::QosProvider (p. 2025)

dds::domain::DomainParticipant::default_topic_qos() (p. 1344)

listener() (p. 2482)

8.380.2.5 Topic() [5/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
             const  dds::domain::DomainParticipant & participant,
             RTI_STRING_IN topic_name,
             const  dds::core::xtypes::DynamicType & type )  [inline]
```

Create a new topic with a dynamic type description.

This constructor uses a dynamic type description, **the default TopicQos** (p. 1522) and doesn't set a listener.

8.380.2.6 Topic() [6/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
             const  dds::domain::DomainParticipant & participant,
             RTI_STRING_IN topic_name,
             const  dds::core::xtypes::DynamicType & type,
             const  dds::topic::qos::TopicQos & qos,
              dds::topic::TopicListener< T > * listener = NULL,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic with a dynamic type description.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<`**Listener** (p. 1637)`>` instead of a regular `Listener*` pointer.

Notice that in this case the data type `T` has to be DynamicData. Thus the **Topic** (p. 2474) type will be `Topic<`↩ `DynamicData>`.

Parameters

participant	the domain participant on which the topic will be defined.
topic_name	the topic's name.
type	The DynamicType that describes the type for the DynamicData samples of this topic.
qos	The Qos settings for this **Topic** (p. 2474)
listener	the topic listener (default: NULL)
mask	the event mask associated to the DataReader listener.

See also

dds::core::xtypes::DynamicData (p. 1461)

rti::domain::register_type() (p. 733)

8.380.2.7 Topic() [7/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
             const  dds::domain::DomainParticipant & dp,
             RTI_STRING_IN topic_name,
             const  dds::topic::qos::TopicQos & qos,
             std::shared_ptr<  Listener > listener,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Creates a new **Topic** (p. 2474).

This constructor deduces the type name automatically.

8.380.2.8 Topic() [8/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
             const  dds::domain::DomainParticipant & participant,
             RTI_STRING_IN topic_name,
             RTI_STRING_IN type_name,
             const  dds::topic::qos::TopicQos & qos,
             std::shared_ptr<  Listener > listener,
             const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic.

Parameters

participant	The domain participant on which the topic will be defined.
topic_name	The **Topic** (p. 2474) name. Must not exceed 255 characters.
type_name	The name given to the type `T`
qos	The Qos settings for this **Topic** (p. 2474)
listener	A shared_ptr to the listener. See **set_listener()** (p. 2482) for more information.
mask	Indicates which status updates the listener will receive

dds::core::QosProvider (p. 2025)

dds::domain::DomainParticipant::default_topic_qos() (p. 1344)

listener() (p. 2482)

8.380.2.9 Topic() [9/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
            const  dds::domain::DomainParticipant & participant,
            RTI_STRING_IN topic_name,
            const  dds::core::xtypes::DynamicType & type,
            const  dds::topic::qos::TopicQos & qos,
            std::shared_ptr<  Listener > listener,
            const  dds::core::status::StatusMask & mask =  dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic with a dynamic type description.

Notice that in this case the data type `T` has to be DynamicData. Thus the **Topic** (p. 2474) type will be `Topic<DynamicData>`.

Parameters

participant	the domain participant on which the topic will be defined.
topic_name	the topic's name.
type	The DynamicType that describes the type for the DynamicData samples of this topic.
qos	The Qos settings for this **Topic** (p. 2474)
listener	A shared_ptr to the listener. See **set_listener()** (p. 2482) for more information.
mask	Indicates which status updates the listener will receive

rti::domain::register_type() (p. 733)

8.380.3 Member Function Documentation

8.380.3.1 listener() [1/2]

```
template<typename T >
void  dds::topic::Topic< T >::listener (
             Listener * listener,
            const  ::dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener.

[DEPRECATED] The use of **set_listener()** (p. 2482) is recommended. Unlike this function, set_listener receives a shared_ptr which simplifies the management of listener's lifecycle.

Parameters

listener	the topic listener
event_mask	Changes of communication status to be invoked on the listener

8.380.3.2 listener() [2/2]

```
template<typename T >
Listener *  dds::topic::Topic< T >::listener ( ) const  [inline]
```

Gets the listener.

[DEPRECATED] Prefer **get_listener()** (p. 2483) instead of this function.

Returns the listener or NULL if there's no listener attached.

8.380.3.3 set_listener() [1/2]

```
template<typename T >
void  dds::topic::Topic< T >::set_listener (
            std::shared_ptr<  Listener > listener,
            const  dds::core::status::StatusMask & event_mask )  [inline]
```

Sets the listener associated with this topic.

The topic will hold a shared_ptr to the listener argument, ensuring that it is not deleted at least until this topic is deleted or the listener is reset with set_listener(nullptr).

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the topic. If it does, the application needs to manually reset the listener or manually close this topic to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.
event_mask	A mask that indicates which status updates will be notified to the listener

8.380.3.4 set_listener() [2/2]

```
template<typename T >
void  dds::topic::Topic< T >::set_listener (
            std::shared_ptr<  Listener > listener )  [inline]
```

Sets the listener associated with this topic.

If `listener` is not `nullptr`, this overload is equivalent to:
```
topic.set_listener(listener, dds::core::status::StatusMask::all());
```

If `listener` is `nullptr`, it is equivalent to:
```
topic.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

listener	A shared pointer to the listener to receive status updates or `nullptr` to reset the current listener and stop receiving status updates.

8.380.3.5 get_listener()

```
template<typename T >
std::shared_ptr<  Listener >  dds::topic::Topic< T >::get_listener ( ) const  [inline]
```

Returns the listener currently associated with this topic.

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.380.3.6 qos() [1/2]

```
template<typename T >
const  dds::topic::qos::TopicQos  dds::topic::Topic< T >::qos ( ) const  [inline]
```

Gets the current TopicQos for this **Topic** (p. 2474).

8.380.3.7 qos() [2/2]

```
template<typename T >
void  dds::topic::Topic< T >::qos (
            const  dds::topic::qos::TopicQos & qos )  [inline]
```

Sets the TopicQos setting for this **Topic** (p. 2474).

Parameters

qos	Set of policies to be applied to the **Topic** (p. 2474). Immutable policies cannot be changed after this entity has been enabled.

Exceptions

dds::core::ImmutablePolicyError *(p. 1609)*	if `qos` contains a different value for an immutable policy.
dds::core::InconsistentPolicyError *(p. 1610)*	if some policies are inconsistent.

See also

dds::topic::qos::TopicQos (p. 2509) for rules on consistency among QoS policies

set_qos (abstract) (p. 1522)

dds::domain::DomainParticipant::default_topic_qos() (p. 1344)

dds::core::QosProvider::topic_qos() (p. 2032)

8.380.3.8 inconsistent_topic_status()

```
template<typename T >
dds::core::status::InconsistentTopicStatus  dds::topic::Topic< T >::inconsistent_topic_status ( )
const  [inline]
```

Retrieve the current InconsistentTopicStatus of this **Topic** (p. 2474).

8.380.4 Friends And Related Function Documentation

8.380.4.1 discover_any_topic() [1/2]

```
template<typename FwdIterator >
int32_t discover_any_topic (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            int32_t max_size )  [related]
```

Retrieves the topics discovered in a DomainParticipant.

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

Parameters

participant	The DomainParticipant where to look up the discovered topics
begin	The beginning of the range where to insert the InstanceHandles that correspond to the discovered topics
max_size	The maximum number of topics to insert or **dds::core::LENGTH_UNLIMITED** (p. 438)

8.380.4.2 discover_any_topic() [2/2]

```
template<typename BinIterator >
int32_t discover_any_topic (
            const  dds::domain::DomainParticipant & participant,
            BinIterator begin )  [related]
```

Retrieves the topics discovered in a DomainParticipant.

This is equivalent to discover_any_topic(participant, begin, dds::core::LENGTH_UNLIMITED)

References **dds::topic::discover_any_topic()**, and **dds::core::LENGTH_UNLIMITED**.

8.380.4.3 discover_topic_data() [1/4]

```
template<typename T >
dds::topic::TopicBuiltinTopicData discover_topic_data (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & topic_handle )  [related]
```

Gets the information about a discovered topic.

Returns **dds::topic::TopicBuiltinTopicData** (p. 2493) for the specified **dds::topic::Topic** (p. 2474).

This operation retrieves information on a **dds::topic::Topic** (p. 2474) that has been discovered by the local Participant and must not have been "ignored" by means of the **dds::topic::ignore()** (p. 693) operation.

The `topic_handle` must correspond to such a topic. Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

This call is not supported for remote topics. If a remote `topic_handle` is used, the operation will fail with **dds::core::UnsupportedError** (p. 2590).

Use the operation **dds::topic::discover_any_topic()** (p. 690) to find the topics that are currently discovered.

Parameters

participant	The DomainParticipant where to look up the topic information
topic_handle	<<***in***>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of **dds::topic::Topic** (p. 2474).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::TopicBuiltinTopicData (p. 2493)

dds::topic::discover_any_topic() (p. 690)

8.380.4.4 discover_topic_data() [2/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            const  dds::core::InstanceHandleSeq & handles )  [related]
```

Gets the information about several topics.

8.380.4.5 discover_topic_data() [3/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            int32_t max_size )  [related]
```

Gets the information about all topics.

Template Parameters

A	forward iterator whose value type is **dds::topic::TopicBuiltinTopicData** (p. 2493)

Parameters

participant	The DomainParticipant where to look up all the topics
begin	The beginning of a range where to copy the topic data
max_size	The maximum number of items to copy or **dds::core::LENGTH_UNLIMITED** (p. 438)

8.380.4.6 discover_topic_data() [4/4]

```
template<typename BinIterator >
int32_t discover_topic_data (
            const  dds::domain::DomainParticipant & participant,
            BinIterator begin )  [related]
```

Gets the information about all topics.

References **dds::topic::discover_topic_data()**, and **dds::core::LENGTH_UNLIMITED**.

8.380.4.7 ignore() [1/2]

```
template<typename T >
void ignore (
             dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & handle )  [related]
```

Instructs a DomainParticipant to ignore a topic.

Instructs RTI Connext to locally ignore a **dds::topic::Topic** (p. 2474).

This means it will locally ignore any publication, or subscription to the **dds::topic::Topic** (p. 2474).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The **dds::topic::Topic** (p. 2474) to ignore is identified by the `handle` argument. This is the handle of a **dds::topic::Topic** (p. 2474) that appears in the **dds::sub::SampleInfo** (p. 2285) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 976) for the **dds::topic::Topic** (p. 2474).

Parameters

participant	The DomainParticipant where to ignore the topic
handle	<<***in***>> *(p. 355)* Handle of the **dds::topic::Topic** (p. 2474) to be ignored.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::TopicBuiltinTopicData (p. 2493)

dds::topic::topic_topic_name() (p. 442)

dds::sub::builtin_subscriber (p. 671)

8.380.4.8 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
              dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             FwdIterator end )  [related]
```

Ignores a range of topics.

See also

ignore(dds::domain::DomainParticipant&,const dds::core::InstanceHandle&) (p. 2487)

References **dds::topic::ignore()**.

8.380.4.9 find()

```
template<typename TOPIC >
TOPIC find (
             const  dds::domain::DomainParticipant & participant,
             const std::string & topic_name )  [related]
```

Looks up a **Topic** (p. 2474) from a DomainParticipant.

Template Parameters

TOPIC	The topic to find; it can be one of the following: • A typed **TopicDescription** (p. 2503), such as `dds::topic::TopicDescription<Foo>`, • A typed **Topic** (p. 2474), such as `dds::topic::Topic<Foo>` • A typed **ContentFilteredTopic** (p. 954), such as `dds::topic::ContentFilteredTopic<Foo>` • **`dds::topic::AnyTopic`** (p. 825)

Parameters

participant	The DomainParticipant that contains the **Topic** (p. 2474)
topic_name	The topic name

Returns

A reference to an existing **Topic** (p. 2474) in this participant or an empty reference (i.e. equals to **dds::core::null** (p. 438)) if it doesn't exist.

Exceptions

dds::core::InvalidDowncastError *(p. 1620)*	If the concrete type of the topic description identified by `topic_name` is not `TOPIC`. For example, if the topic_name identifies a topic of type `Bar`, but the template parameter was dds::topic::Topic<Foo>.

The participant doesn't need to be enabled. The returned topic may be enabled or disabled.

8.380.4.10 find_topics() [1/2]

```
template<typename AnyTopicBackInsertIterator >
uint32_t find_topics (
             dds::domain::DomainParticipant participant,
            AnyTopicBackInsertIterator begin )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all the **dds::topic::Topic** (p. 2474) created from this **dds::domain::Domain↩ Participant** (p. 1326)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

Template Parameters

AnyTopicBackInsertIterator	Type of the back-inserting iterator, whose value_type is **dds::topic::AnyTopic** (p. 825).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Topics belong to
begin	A back-inserting iterator to the position in the destination container to insert the found Topics into

Returns

The number of found Topics

8.380.4.11 find_topics() [2/2]

```
template<typename AnyTopicForwardIterator >
uint32_t find_topics (
              dds::domain::DomainParticipant participant,
             AnyTopicForwardIterator begin,
             uint32_t max_size )  [related]
```

<<***extension***>> *(p. 354)* Retrieve all the **dds::topic::Topic** (p. 2474) created from this **dds::domain::Domain↩ Participant** (p. 1326)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

Template Parameters

AnyTopicBackInsertIterator	Type of the back-inserting iterator, whose value_type is **dds::topic::AnyTopic** (p. 825).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Topics belong to
begin	A forward iterator to the position in the destination container to insert the found Topics in
max_size	The maximum number of Topics to return

Returns

The number of found Topics

8.381 rti::topic::topic_type_disabled_copy< TopicType > Struct Template Reference

<<***extension***>> *(p. 354)* Indicates whether a TopicType is uncopyable

`#include <rti/topic/TopicTraits.hpp>`

Inherits dds::core::false_type.

8.381.1 Detailed Description

template<typename TopicType>
struct rti::topic::topic_type_disabled_copy< TopicType >

<<***extension***>> *(p. 354)* Indicates whether a TopicType is uncopyable

In general this is false_type (TopicType is a value types and therefore copyable), There is one situation when this is true_type:

- IDL types annotated with @language_binding(FLAT_DATA)

This trait enables (when it's `false_type`) or disables (when it's `true_type`) the DataReader read/take operations that copy instead of loaning the data (for example, **dds::sub::DataReader::take(SamplesFWIterator, int32_t)** (p. 1001))

8.382 rti::topic::topic_type_has_external_members< TopicType > Struct Template Reference

<<***extension***>> *(p. 354)* Indicates if a topic type contains directly or indirectly IDL external members.

`#include <rti/topic/TopicTraits.hpp>`

Inherits dds::core::false_type.

8.382.1 Detailed Description

template<typename TopicType>
struct rti::topic::topic_type_has_external_members< TopicType >

<<***extension***>> *(p. 354)* Indicates if a topic type contains directly or indirectly IDL external members.

This template is specialized in the generated code for topic types that do contain `&external` members.

8.383 dds::topic::topic_type_name< T > Struct Template Reference

Provides the name of a topic-type.

`#include <TopicTraits.hpp>`

8.383.1 Detailed Description

template<typename T>
struct dds::topic::topic_type_name< T >

Provides the name of a topic-type.

For example:

```
std::cout « dds::topic::topic_type_name<Foo>::value() « std::endl;
std::cout « dds::topic::topic_type_name<dds::core::StringTopicType>::value() « std::endl;
// output:
// Foo
// DDS::String
```

Note that `topic_type_name<dds::core::xtypes::DynamicData>::value()` is undefined, because DynamicData is used to dynamically represent any type so its actual topic-type is unknown at compilation time.

8.384 dds::topic::topic_type_support< T > Struct Template Reference

Provides convenience operations for a topic-type.

`#include <TopicTraits.hpp>`

8.384.1 Detailed Description

template<typename T>
struct dds::topic::topic_type_support< T >

Provides convenience operations for a topic-type.

8.385 dds::topic::TopicBuiltinTopicData Class Reference

Entry created when a **dds::topic::Topic** (p. 2474) object is discovered.

`#include <dds/topic/BuiltinTopic.hpp>`

Public Member Functions

- const **dds::core::policy::DataRepresentation** & **representation** () const

  *Get the **dds::core::policy::DataRepresentation** (p. 1113) policy of the corresponding **dds::topic::Topic** (p. 2474).*

8.385.1 Detailed Description

Entry created when a **dds::topic::Topic** (p. 2474) object is discovered.

Data associated with the built-in topic **dds::topic::topic_topic_name()** (p. 442). It contains QoS policies and additional information that apply to the remote **dds::topic::Topic** (p. 2474).

Note: The **dds::topic::TopicBuiltinTopicData** (p. 2493) built-in topic is meant to convey information about discovered Topics. This **Topic** (p. 2474)'s samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**dds::topic::PublicationBuiltinTopicData** (p. 1977) and **dds↩ ::topic::SubscriptionBuiltinTopicData** (p. 2428)). Therefore **TopicBuiltinTopicData** (p. 2493) DataReaders will not receive any data.

8.385.2 Member Function Documentation

8.385.2.1 key()

```
const dds::topic::BuiltinTopicKey & dds::topic::TopicBuiltinTopicData::key ( ) const [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

References **dds::core::Value< D >::delegate()**.

8.385.2.2 name()

```
const dds::core::string & dds::topic::TopicBuiltinTopicData::name ( ) const [inline]
```

Get the name of the **dds::topic::Topic** (p. 2474).

Returns

The topic's name

References **dds::core::Value< D >::delegate()**.

8.385.2.3 type_name()

```
const dds::core::string & dds::topic::TopicBuiltinTopicData::type_name ( ) const [inline]
```

Get the name of the type attached to the **dds::topic::Topic** (p. 2474).

Returns

The type's name

References **dds::core::Value< D >::delegate()**.

8.385.2.4 durability()

```
const dds::core::policy::Durability & dds::topic::TopicBuiltinTopicData::durability ( ) const
[inline]
```

Get the **dds::core::policy::Durability** (p. 1433) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The Durability policy

8.385.2.5 durability_service()

```
const dds::core::policy::DurabilityService & dds::topic::TopicBuiltinTopicData::durability_↩
service ( ) const [inline]
```

Get the **dds::core::policy::DurabilityService** (p. 1443) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The DurabilityService policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.6 deadline()

```
const dds::core::policy::Deadline & dds::topic::TopicBuiltinTopicData::deadline ( ) const [inline]
```

Get the **dds::core::policy::Deadline** (p. 1255) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The Deadline policy

8.385.2.7 latency_budget()

```
const dds::core::policy::LatencyBudget & dds::topic::TopicBuiltinTopicData::latency_budget ( )
const [inline]
```

Get the **dds::core::policy::LatencyBudget** (p. 1631) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The LatencyBudget policy

References **dds::core::Value< D >::delegate()**.

8.385.2.8 liveliness()

```
const dds::core::policy::Liveliness & dds::topic::TopicBuiltinTopicData::liveliness ( ) const
[inline]
```

Get the **dds::core::policy::Liveliness** (p. 1645) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The Liveliness policy

References **dds::core::Value< D >::delegate()**.

8.385.2.9 reliability()

```
const dds::core::policy::Reliability & dds::topic::TopicBuiltinTopicData::reliability ( ) const
[inline]
```

Get the **dds::core::policy::Reliability** (p. 2149) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The Reliability policy

References **dds::core::Value< D >::delegate()**.

8.385.2.10 transport_priority()

```
const dds::core::policy::TransportPriority & dds::topic::TopicBuiltinTopicData::transport_↩
priority ( ) const [inline]
```

Get the **dds::core::policy::TransportPriority** (p. 2552) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The TransportPriority policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.11 lifespan()

```
const dds::core::policy::Lifespan & dds::topic::TopicBuiltinTopicData::lifespan ( ) const [inline]
```

Get the **dds::core::policy::Lifespan** (p. 1635) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The Lifespan policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.12 destination_order()

```
const dds::core::policy::DestinationOrder & dds::topic::TopicBuiltinTopicData::destination_order
( ) const [inline]
```

Get the **dds::core::policy::DestinationOrder** (p. 1258) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The DestinationOrder policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.13 history()

```
const dds::core::policy::History & dds::topic::TopicBuiltinTopicData::history ( ) const [inline]
```

Get the **dds::core::policy::History** (p. 1602) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The History policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.14 resource_limits()

```
const dds::core::policy::ResourceLimits & dds::topic::TopicBuiltinTopicData::resource_limits ( )
const [inline]
```

Get the **dds::core::policy::ResourceLimits** (p. 2203) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The ResourceLimits policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.15 ownership()

```
const dds::core::policy::Ownership & dds::topic::TopicBuiltinTopicData::ownership ( ) const [inline]
```

Get the **dds::core::policy::Ownership** (p. 1899) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The Ownership policy

References **dds::core::Value**< **D** >**::delegate()**.

8.385.2.16 topic_data()

```
const dds::core::policy::TopicData & dds::topic::TopicBuiltinTopicData::topic_data ( ) const
[inline]
```

Get the **dds::core::policy::TopicData** (p. 2500) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The TopicData policy

References **dds::core::Value< D >::delegate()**.

8.385.2.17 representation()

```
const dds::core::policy::DataRepresentation & dds::topic::TopicBuiltinTopicData::representation (
) const [inline]
```

Get the **dds::core::policy::DataRepresentation** (p. 1113) policy of the corresponding **dds::topic::Topic** (p. 2474).

Returns

The DataRepresentation policy

References **dds::core::Value< D >::delegate()**.

8.386 dds::core::policy::TopicData Class Reference

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TopicData** ()
  Creates an empty sequence of bytes.
- **TopicData** (const **dds::core::ByteSeq** &seq)
  Creates an instance from a vector of bytes.
- **TopicData** (const uint8_t *value_begin, const uint8_t *value_end)
  Creates an instance from a range of bytes.
- template<typename OCTET_ITER >
  TopicData & **value** (OCTET_ITER the_begin, OCTET_ITER the_end)
  Set the value for the topic data.
- const **dds::core::ByteSeq** **value** () const
  Get the topic data.
- **dds::core::ByteSeq** & **value** (**dds::core::ByteSeq** &dst) const
  Get the topic data.
- const uint8_t * **begin** () const
  Beginning of the range of bytes.
- const uint8_t * **end** () const
  End of the range of bytes.

8.386.1 Detailed Description

Entity:

dds::topic::Topic (p. 2474)

Properties:

RxO (p. 514) = NO
Changeable (p. 514) = **YES** (p. 514)

See also

dds::sub::builtin_subscriber (p. 671)

8.386.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **dds::topic::Topic** (p. 2474) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Connext.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with **dds::sub::DataReaderListener** (p. 1055), **dds::pub::DataWriterListener** (p. 1202), or operations such as **dds::topic::ignore()** (p. 693), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **rti::core::policy::DomainParticipantResourceLimits::topic_data_max_length** (p. 1414).

8.386.3 Constructor & Destructor Documentation

8.386.3.1 TopicData() [1/3]

```
dds::core::policy::TopicData::TopicData ( )  [inline]
```

Creates an empty sequence of bytes.

8.386.3.2 TopicData() [2/3]

```
dds::core::policy::TopicData::TopicData (
            const  dds::core::ByteSeq & seq )  [inline], [explicit]
```

Creates an instance from a vector of bytes.

8.386.3.3 TopicData() [3/3]

```
dds::core::policy::TopicData::TopicData (
            const uint8_t * value_begin,
            const uint8_t * value_end )  [inline]
```

Creates an instance from a range of bytes.

8.386.4 Member Function Documentation

8.386.4.1 value() [1/3]

```
template<typename OCTET_ITER >
TopicData & dds::core::policy::TopicData::value (
            OCTET_ITER the_begin,
            OCTET_ITER the_end )  [inline]
```

Set the value for the topic data.

8.386.4.2 value() [2/3]

```
const  dds::core::ByteSeq dds::core::policy::TopicData::value ( ) const  [inline]
```

Get the topic data.

8.386.4.3 value() [3/3]

```
 dds::core::ByteSeq & dds::core::policy::TopicData::value (
             dds::core::ByteSeq & dst ) const  [inline]
```

Get the topic data.

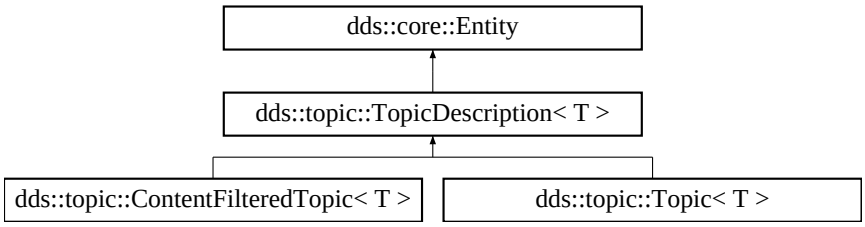
8.386.4.4 begin()

```
const uint8_t * dds::core::policy::TopicData::begin ( ) const  [inline]
```

Beginning of the range of bytes.

8.386.4.5 end()

```
const uint8_t * dds::core::policy::TopicData::end ( ) const  [inline]
```



End of the range of bytes.

8.387 dds::topic::TopicDescription< T > Class Template Reference

Abstract base class of **Topic** (p. 2474) and **ContentFilteredTopic** (p. 954).

```
#include <dds/topic/TopicDescription.hpp>
```

Inheritance diagram for dds::topic::TopicDescription< T >:

Public Member Functions

- const std::string & **name** () const

  Gets the topic name.
- const std::string & **type_name** () const

  Gets the type name.
- const **dds::domain::DomainParticipant** & **participant** () const

  *Gets the related **dds::domain::DomainParticipant** (p. 1326).*

Additional Inherited Members

8.387.1 Detailed Description

template<typename T>
class dds::topic::TopicDescription< T >

Abstract base class of **Topic** (p. 2474) and **ContentFilteredTopic** (p. 954).

TopicDescription (p. 2503) represents the fact that both publications and subscriptions are tied to a single data-type. Its attribute `type_name` defines a unique resulting type for the publication or the subscription and therefore creates an implicit association with a TypeSupport.

TopicDescription (p. 2503) has also a `name` that allows it to be retrieved locally.

See also

TypeSupport, FooTypeSupport

Template Parameters

T	The topic-type

8.387.2 Member Function Documentation

8.387.2.1 name()

```
template<typename T >
const std::string &  dds::topic::TopicDescription< T >::name ( ) const  [inline]
```

Gets the topic name.

8.387.2.2 type_name()

```
template<typename T >
const std::string &  dds::topic::TopicDescription< T >::type_name ( ) const  [inline]
```

Gets the type name.

The type name defines a locally unique type for the publication or the subscription.

The association between the topic and the type name is automatic through the template parameter `T`, via the trait dds::topic::topic_type_name<T>::name(), that is given

When `T` is rti::core::xtypes::DynamicData, the type name is obtained by default from the rti::core::xtypes::DynamicType.

8.387.2.3 participant()

```
template<typename T >
const dds::domain::DomainParticipant & dds::topic::TopicDescription< T >::participant ( ) const
[inline]
```

Gets the related **dds::domain::DomainParticipant** (p. 1326).

8.388 dds::topic::TopicInstance< T > Class Template Reference

Encapsulates a sample and its associated instance handle.

```
#include <TopicInstance.hpp>
```

Public Member Functions

- **TopicInstance** ()
  *Create a null **TopicInstance** (p. 2505).*
- **TopicInstance** (const **::dds::core::InstanceHandle** &the_handle)
  *Create a **TopicInstance** (p. 2505) with an InstanceHandle.*
- **TopicInstance** (const **::dds::core::InstanceHandle** &the_handle, const T &the_sample)
  *Create a **TopicInstance** (p. 2505) with a data sample and an InstanceHandle.*
- **operator dds::core::InstanceHandle** () const
  Obtains the InstanceHandle.
- **dds::core::InstanceHandle handle** () const
  Obtains the InstahnceHandle.
- void **handle** (const **::dds::core::InstanceHandle** &the_handle)
  Sets the InstanceHandle.
- const T & **sample** () const
  Gets the sample by const reference.
- T & **sample** ()
  Gets the sample by reference.
- void **sample** (const T &the_sample)
  Assigns the data sample.

8.388.1 Detailed Description

template<typename T>
class dds::topic::TopicInstance< T >

Encapsulates a sample and its associated instance handle.

Template Parameters

The	type of the sample that the **TopicInstance** (p. 2505) is encapsulating.

See also

dds::pub::DataWriter::write(const dds::topic::TopicInstance<T>&) (p. 1154)

8.388.2 Constructor & Destructor Documentation

8.388.2.1 TopicInstance() [1/3]

```
template<typename T >
dds::topic::TopicInstance< T >::TopicInstance ( )  [inline]
```

Create a null **TopicInstance** (p. 2505).

The sample is default constructed and the instance handle is equal to **dds::core::null** (p. 438).

8.388.2.2 TopicInstance() [2/3]

```
template<typename T >
dds::topic::TopicInstance< T >::TopicInstance (
            const  ::dds::core::InstanceHandle & the_handle )  [inline]
```

Create a **TopicInstance** (p. 2505) with an InstanceHandle.

The sample is default constructed and the instance handle is copied from `handle`.

8.388.2.3 TopicInstance() [3/3]

```
template<typename T >
dds::topic::TopicInstance< T >::TopicInstance (
            const  ::dds::core::InstanceHandle & the_handle,
            const T & the_sample )  [inline]
```

Create a **TopicInstance** (p. 2505) with a data sample and an InstanceHandle.

8.388.3 Member Function Documentation

8.388.3.1 operator dds::core::InstanceHandle()

```
template<typename T >
dds::topic::TopicInstance< T >::operator  dds::core::InstanceHandle ( ) const  [inline]
```

Obtains the InstanceHandle.

References **dds::topic::TopicInstance< T >::handle()**.

8.388.3.2 handle() [1/2]

```
template<typename T >
dds::core::InstanceHandle  dds::topic::TopicInstance< T >::handle ( ) const  [inline]
```

Obtains the InstahnceHandle.

Referenced by **dds::topic::TopicInstance< T >::operator dds::core::InstanceHandle()**.

8.388.3.3 handle() [2/2]

```
template<typename T >
void  dds::topic::TopicInstance< T >::handle (
            const  ::dds::core::InstanceHandle & the_handle )  [inline]
```

Sets the InstanceHandle.

8.388.3.4 sample() [1/3]

```
template<typename T >
const T &  dds::topic::TopicInstance< T >::sample ( ) const  [inline]
```

Gets the sample by const reference.

8.388.3.5 sample() [2/3]

```
template<typename T >
T &  dds::topic::TopicInstance< T >::sample ( )  [inline]
```

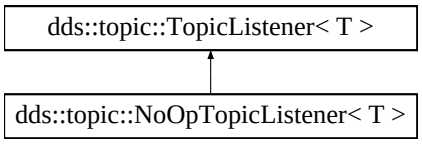
Gets the sample by reference.

8.388.3.6 sample() [3/3]

```
template<typename T >
void  dds::topic::TopicInstance< T >::sample (
            const T & the_sample )  [inline]
```

Assigns the data sample.

Parameters



the_sample	The data sample to copy into this **TopicInstance** (p. 2505)

8.389 dds::topic::TopicListener< T > Class Template Reference

The listener to notify status changes for a **dds::topic::Topic** (p. 2474).

`#include <dds/topic/TopicListener.hpp>`

Inheritance diagram for dds::topic::TopicListener< T >:

Public Member Functions

- virtual void **on_inconsistent_topic** (**Topic**< T > &topic, const **dds::core::status::InconsistentTopicStatus** &status)=0

  *Handles the **dds::core::status::InconsistentTopicStatus** (p. 1611) status.*

8.389.1 Detailed Description

template<typename T>
class dds::topic::TopicListener< T >

The listener to notify status changes for a **dds::topic::Topic** (p. 2474).

Entity:

dds::topic::Topic (p. 2474)

Status:

dds::core::status::StatusMask::inconsistent_topic() (p. 2379), **dds::core::status::InconsistentTopicStatus** (p. 1611)

This is the interface that can be implemented by an application-provided class and then registered with the **dds::topic::Topic** (p. 2474) such that the application can be notified by RTI Connext of relevant status changes.

See also

Status Kinds (p. 429)

Listener (p. 1637)

dds::topic::Topic::set_listener (p. 2482)

Operations Allowed in Listener Callbacks (p. 1639)

NoOpTopicListener (p. 1867)

8.389.2 Member Function Documentation

8.389.2.1 on_inconsistent_topic()

```
template<typename T >
virtual void  dds::topic::TopicListener< T >::on_inconsistent_topic (
              Topic< T > & topic,
             const  dds::core::status::InconsistentTopicStatus & status )  [pure virtual]
```

Handles the **dds::core::status::InconsistentTopicStatus** (p. 1611) status.

This callback is called when a remote **dds::topic::Topic** (p. 2474) is discovered but is inconsistent with the locally created **dds::topic::Topic** (p. 2474) of the same topic name.

Parameters

topic	<<***out***>> *(p. 355)* Locally created **dds::topic::Topic** (p. 2474) that triggers the listener callback
status	<<***out***>> *(p. 355)* Current inconsistent status of locally created **dds::topic::Topic** (p. 2474)

Implemented in **dds::topic::NoOpTopicListener**< **T** > (p. 1867).

8.390 dds::topic::qos::TopicQos Class Reference

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::topic::Topic** (p. 2474) supports

`#include <dds/topic/qos/TopicQos.hpp>`

Public Member Functions

- **TopicQos** ()
  *Creates a **TopicQos** (p. 2509) with the default value for each policy.*
- template<typename POLICY >
  const POLICY & **policy** () const
  Gets a QoS policy by const reference.
- template<typename POLICY >
  POLICY & **policy** ()
  Gets a QoS policy by reference.
- template<typename Policy >
  TopicQos & **policy** (const Policy &p)
  Sets a policy.
- template<typename Policy >
  TopicQos & **operator**<< (const Policy &p)
  Sets a policy.
- template<typename Policy >
  const **TopicQos** & **operator**>> (Policy &p) const
  Copies the values of a policy.

8.390.1 Detailed Description

<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::topic::Topic** (p. 2474) supports

8.390.2 TopicQos Policies

A **TopicQos** (p. 2509) contains the following policies:

- **dds::core::policy::TopicData** (p. 2500),
- **dds::core::policy::Durability** (p. 1433),
- **dds::core::policy::DurabilityService** (p. 1443),
- **dds::core::policy::Deadline** (p. 1255),
- **dds::core::policy::LatencyBudget** (p. 1631),
- **dds::core::policy::Liveliness** (p. 1645),
- **dds::core::policy::Reliability** (p. 2149),
- **dds::core::policy::DestinationOrder** (p. 1258),
- **dds::core::policy::History** (p. 1602),
- **dds::core::policy::ResourceLimits** (p. 2203),
- **dds::core::policy::TransportPriority** (p. 2552),
- **dds::core::policy::Lifespan** (p. 1635),
- **dds::core::policy::Ownership** (p. 1899),
- **dds::core::policy::DataRepresentation** (p. 1113)

To get or set policies use the **policy()** (p. 2512) getters and setters or operator << (see **examples** (p. 603)).

You must set certain members in a consistent manner:

length of dds::topic::qos::TopicQos::topic_data .value <= dds::domain::qos::DomainParticipantQos::resource_limits .topic_data_max_length

If any of the above are not true, **dds::topic::Topic::qos(const dds::topic::qos::TopicQos&)** (p. 2484), **dds::topic::Topic::qos()** (p. 2483) and **dds::domain::DomainParticipant::default_topic_qos** (p. 1344) will fail with **dds::core::InconsistentPolicyError** (p. 1610) and the **dds::topic::Topic** (p. 2474) constructors will fail with **dds::core::Error** (p. 1539)

Entity:

dds::topic::Topic (p. 2474)

Qos Use Cases (p. 602)

8.390.3 Constructor & Destructor Documentation

8.390.3.1 TopicQos()

```
dds::topic::qos::TopicQos::TopicQos ( )  [inline]
```

Creates a **TopicQos** (p. 2509) with the default value for each policy.

8.390.4 Member Function Documentation

8.390.4.1 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::topic::qos::TopicQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

Policy	One of the **TopicQos Policies** (p. 2510)

See also

Setting Qos Values (p. 603)

8.390.4.2 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::topic::qos::TopicQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

Policy	One of the **TopicQos Policies** (p. 2510)

See also

Setting Qos Values (p. 603)

8.390.4.3 policy() [3/3]

```
template<typename Policy >
TopicQos & dds::topic::qos::TopicQos::policy (
            const Policy & p )  [inline]
```

Sets a policy.

policy() (p. 2512)

Setting Qos Values (p. 603)

8.390.4.5 operator>>()

```
template<typename Policy >
const  TopicQos & dds::topic::qos::TopicQos::operator>> (
            Policy & p ) const  [inline]
```

Copies the values of a policy.

Parameters

p	The destination where to copy the current value of the Policy

See also

policy() (p. 2512)

Setting Qos Values (p. 603)

References **rti::topic::to_string()**.

8.390.5 Friends And Related Function Documentation

8.390.5.1 to_string() [1/3]

```
std::string to_string (
            const  TopicQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2509)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
TopicQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for TopicQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
TopicQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.390.5.2 to_string() [2/3]

```
std::string to_string (
            const  TopicQos & qos,
            const  TopicQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2509)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.390.5.3 to_string() [3/3]

```
std::string to_string (
            const  TopicQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )  [related]
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2509)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

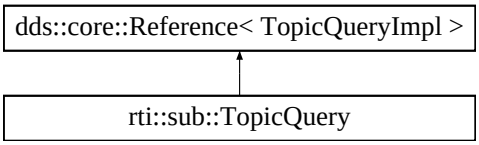
For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.390.5.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::topic::qos::TopicQos & qos )  [related]
```



<<***extension***>> *(p. 354)* Prints a **dds::topic::qos::TopicQos** (p. 2509) to an output stream.

8.391 rti::sub::TopicQuery Class Reference

*<<**extension**>> (p. 354) <<**reference-type**>> (p. 351)* Allows a **dds::sub::DataReader** (p. 976) to query the sample cache of its matching dds::pub::DataWriters.

`#include <rti/sub/TopicQuery.hpp>`

Inheritance diagram for rti::sub::TopicQuery:

Public Member Functions

- **TopicQuery** (**dds::sub::AnyDataReader** reader, const **TopicQuerySelection** &selection)

  *Creates a **TopicQuery** (p. 2516) for a given DataReader.*
- void **close** ()

  *Deletes and cancels this **TopicQuery** (p. 2516).*
- const **rti::core::Guid guid** () const

  *Gets the **TopicQuery** (p. 2516) GUID.*
- bool **closed** () const

  *Indicates whether this **TopicQuery** (p. 2516) has been closed with **close()** (p. 2518).*
- **dds::sub::AnyDataReader datareader** () const

  *Gets the DataReader associated to this **TopicQuery** (p. 2516).*

Static Public Member Functions

- static **TopicQuery UseReaderContentFilter** (**dds::sub::AnyDataReader** reader)

  *Creates a **TopicQuery** (p. 2516) with the same filter as this reader's ContentFilteredTopic.*
- static **TopicQuery SelectAll** (**dds::sub::AnyDataReader** reader)

  *Creates a **TopicQuery** (p. 2516) that requests all the samples in the DataWriters' cache.*

Related Functions

(Note that these are not member functions.)

- **TopicQuery find_topic_query** (**dds::sub::AnyDataReader datareader**, const **rti::core::Guid** & **guid**)

  *Looks up a **TopicQuery** (p. 2516) by its GUID.*

8.391.1 Detailed Description

<<***extension***>> *(p. 354)* <<***reference-type***>> *(p. 351)* Allows a **dds::sub::DataReader** (p. 976) to query the sample cache of its matching dds::pub::DataWriters.

Note

A **TopicQuery** (p. 2516) provides all the functions of a <<***reference-type***>> *(p. 351)*, including **close()** (p. 2518) and retain().

You can create a **TopicQuery** (p. 2516) for a DataReader with the constructor that receives a **TopicQuerySelection** (p. 2526) or with the following static member functions:

- **TopicQuery::UseReaderContentFilter** (p. 2518)
- **TopicQuery::SelectAll** (p. 2519)

As a <<***reference-type***>> *(p. 351)*, a **TopicQuery** (p. 2516) will be deleted when all references to it go out of scope or after calling **close()** (p. 2518). The middleware will notify the deletion of a **TopicQuery** (p. 2516) to the DataWriters. See **close()** (p. 2518) for more details.

8.391.2 Constructor & Destructor Documentation

8.391.2.1 TopicQuery()

```
rti::sub::TopicQuery::TopicQuery (
              dds::sub::AnyDataReader reader,
             const  TopicQuerySelection & selection )  [inline]
```

Creates a **TopicQuery** (p. 2516) for a given DataReader.

The resulting **TopicQuery** (p. 2516) will propagate to the matching DataWriters right after creating if the reader is enabled. Otherwise it will propagate after enabling the reader.

Any late-joining DataWriter matching with the DataReader will also receive the query.

Parameters

reader	The DataReader that will query and receive the requested samples
selection	Selects which samples the matching DataWriters will provide.

There are two special kinds of TopicQueries, created with the static member functions **UseReaderContentFilter()** (p. 2518) and **SelectAll()** (p. 2519).

8.391.3 Member Function Documentation

8.391.3.1 close()

```
void rti::sub::TopicQuery::close ( )  [inline]
```

Deletes and cancels this **TopicQuery** (p. 2516).

This is a explicit deletion, which otherwise would occur when all references to this **TopicQuery** (p. 2516) go out of scope.

After deleting a **TopicQuery** (p. 2516) new DataWriters won't discover it and existing DataWriters currently publishing cached samples may stop before delivering all of them.

8.391.3.2 guid()

```
const  rti::core::Guid rti::sub::TopicQuery::guid ( ) const  [inline]
```

Gets the **TopicQuery** (p. 2516) GUID.

See also

rti::sub::find_topic_query() (p. 769)

8.391.3.3 closed()

```
bool rti::sub::TopicQuery::closed ( ) const  [inline]
```

Indicates whether this **TopicQuery** (p. 2516) has been closed with **close()** (p. 2518).

8.391.3.4 datareader()

```
dds::sub::AnyDataReader rti::sub::TopicQuery::datareader ( ) const  [inline]
```

Gets the DataReader associated to this **TopicQuery** (p. 2516).

8.391.3.5 UseReaderContentFilter()

```
static  TopicQuery rti::sub::TopicQuery::UseReaderContentFilter (
              dds::sub::AnyDataReader reader )  [static]
```

Creates a **TopicQuery** (p. 2516) with the same filter as this reader's ContentFilteredTopic.

If the reader doesn't use a **dds::topic::ContentFilteredTopic** (p. 954), this **TopicQuery** (p. 2516) behaves as **TopicQuery::SelectAll()** (p. 2519).

8.391.3.6 SelectAll()

```
static  TopicQuery rti::sub::TopicQuery::SelectAll (
              dds::sub::AnyDataReader reader )  [static]
```

Creates a **TopicQuery** (p. 2516) that requests all the samples in the DataWriters' cache.

8.391.4 Friends And Related Function Documentation

8.391.4.1 find_topic_query()

```
TopicQuery find_topic_query (
              dds::sub::AnyDataReader datareader,
             const  rti::core::Guid & guid )  [related]
```

Looks up a **TopicQuery** (p. 2516) by its GUID.

Parameters

datareader	The DataReader used to create the **TopicQuery** (p. 2516)
guid	The **TopicQuery** (p. 2516)'s GUID

Returns

The **TopicQuery** (p. 2516) if it exists or a **dds::core::null** (p. 438) reference otherwise.

See also

rti::sub::TopicQuery::guid() (p. 2518)

8.392 rti::sub::TopicQueryData Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Provides information about a **TopicQuery** (p. 2516)

`#include <rti/sub/TopicQuery.hpp>`

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **TopicQuerySelection selection** () const
  The data selection.
- const **dds::core::string** & **topic_name** () const
  *The topic name of the **dds::sub::DataReader** (p. 976).*
- const **rti::core::Guid** & **original_related_reader_guid** () const
  *Identifies the **dds::sub::DataReader** (p. 976) that created the **rti::sub::TopicQuery** (p. 2516).*

Related Functions

(Note that these are not member functions.)

- **TopicQueryData create_topic_query_data_from_service_request** (const **rti::topic::ServiceRequest** &service_request)
  *Creates a **TopicQueryData** (p. 2520) from a ServiceRequest.*

8.392.1 Detailed Description

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Provides information about a **TopicQuery** (p. 2516)

Contains the information about a **TopicQuery** (p. 2516) that can be retrieved using **rti::sub::create_topic_query_↩ data_from_service_request()** (p. 768).

See also

rti::sub::create_topic_query_data_from_service_request() (p. 768)

8.392.2 Member Function Documentation

8.392.2.1 selection()

```
TopicQuerySelection rti::sub::TopicQueryData::selection ( ) const
```

The data selection.

8.392.2.2 topic_name()

```
const  dds::core::string & rti::sub::TopicQueryData::topic_name ( ) const
```

The topic name of the **dds::sub::DataReader** (p. 976).

8.392.2.3 original_related_reader_guid()

```
const  rti::core::Guid & rti::sub::TopicQueryData::original_related_reader_guid ( ) const
```

Identifies the **dds::sub::DataReader** (p. 976) that created the **rti::sub::TopicQuery** (p. 2516).

8.392.3 Friends And Related Function Documentation

8.392.3.1 create_topic_query_data_from_service_request()

```
TopicQueryData create_topic_query_data_from_service_request (
            const  rti::topic::ServiceRequest & service_request )  [related]
```

Creates a **TopicQueryData** (p. 2520) from a ServiceRequest.

This operation will extract the content from the request body of the **rti::topic::ServiceRequest** (p. 2358) to create a **rti::sub::TopicQueryData** (p. 2520) object.

The specified **rti::topic::ServiceRequest** (p. 2358) must be a valid sample associated with the service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2362). Otherwise this operation will return false.

This operation can be called within the context of a **dds::pub::DataWriterListener::on_service_request_accepted** (p. 1209) to retrieve the **rti::sub::TopicQueryData** (p. 2520) of a **rti::topic::ServiceRequest** (p. 2358) that has been received with service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2362)

Parameters

service_request	The **rti::topic::ServiceRequest** (p. 2358) that contains the **rti::sub::TopicQueryData** (p. 2520) as part of its request body.

Returns

A **rti::sub::TopicQueryData** (p. 2520) object where the content from the service request is extracted.

8.393 rti::core::policy::TopicQueryDispatch Class Reference

<<***extension***>> *(p. 116)* Configures the ability of a **dds::pub::DataWriter** (p. 1138) to publish samples in response to a **rti::sub::TopicQuery** (p. 2516)

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TopicQueryDispatch** ()

  Creates the default policy.
- **TopicQueryDispatch** (bool the_enable, const **dds::core::Duration** &the_publication_period, int32_t the_↩ samples_per_period)

  Creates a policy with the provided values for enable, publication_period and samples_per_period.
- **TopicQueryDispatch** & **enable** (bool the_enable)

  <<***extension***>> *(p. 116) Allows this writer to dispatch TopicQueries*
- bool **enable** () const

  Getter (see setter with the same name)
- **TopicQueryDispatch** & **publication_period** (const **dds::core::Duration** &the_publication_period)

  <<***basic***>> *(p. 104)* <<***extension***>> *(p. 116) Sets the periodic interval at which samples are published.*
- **dds::core::Duration** **publication_period** () const

  Getter (see setter with the same name)
- **TopicQueryDispatch** & **samples_per_period** (int32_t the_samples_per_period)

  <<***extension***>> *(p. 116) Sets the maximum number of samples to publish in each publication_period.*
- int32_t **samples_per_period** () const

  Getter (see setter with the same name)

8.393.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the ability of a **dds::pub::DataWriter** (p. 1138) to publish samples in response to a **rti::sub::TopicQuery** (p. 2516)

Enables the ability of a **dds::pub::DataWriter** (p. 1138) to publish historical samples upon reception of a **rti::sub::TopicQuery** (p. 2516) and how often they are published.

Since a TopicQuery selects previously written samples, the DataWriter must have a **dds::core::policy::Durability::kind** (p. 1437) different from **dds::core::policy::DurabilityKind_def::VOLATILE** (p. 1442). Also, **dds::core::policy::Reliability::kind** (p. 2153) must be set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).

Only samples that fall within the **dds::core::policy::Durability::writer_depth** (p. 1439) for an instance are evaluated against the TopicQuery filter. While the DataWriter is waiting for acknowledgements from one or more DataReaders, there may temporarily be more than **dds::core::policy::Durability::writer_depth** (p. 1439) samples per instance in the DataWriter's queue if the **dds::core::policy::History::depth** (p. 1605) is set to a higher value than **dds::core::policy::Durability::writer_depth** (p. 1439). Those additional samples past **dds::core::policy::Durability::writer_depth** (p. 1439) are not eligible to be sent in response to the TopicQuery.

A TopicQuery may select multiple samples at once. The writer will publish them periodically, independently from newly written samples. **rti::core::policy::TopicQueryDispatch::publication_period** (p. 2525) configures the frequency of that period and **rti::core::policy::TopicQueryDispatch::samples_per_period** (p. 2525) configures the maximum number of samples to publish each period.

If the DataWriter blocks during the publication of one of these samples, it will stop and try again the next period. (See **dds::pub::DataWriter::write()** (p. 1148) for the conditions that may cause the write operation to block.)

All the DataWriters that belong to a single **dds::pub::Publisher** (p. 1993) and enable TopicQueries share the same event thread, but each DataWriter schedules separate events. To configure that thread, see **rti::core::policy::AsynchronousPublisher::topic_query_publication_thread** (p. 838).

If the DataWriter is dispatching more than one TopicQuery at the same time, the configuration of this periodic event applies to all of them. For example, if a DataWriter receives two TopicQueries around the same time, the period is 1 second, the number of samples per period is 10, the first TopicQuery selects 5 samples, and the second one selects 8, the DataWriter will immediately attempt to publish all 5 for the first TopicQuery and 5 for the second one. After one second, it will publish the remaining 3 samples.

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

  Indicates whether the sample selection is limited to cached samples or not.

8.394.1 Detailed Description

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Specifies the data query that defines a **TopicQuery** (p. 2516).

A **TopicQuerySelection** (p. 2526) is defined by a **dds::topic::Filter** (p. 1558) that selects a subset of samples in the dds::pub::DataWriters

8.394.2 Member Typedef Documentation

8.394.2.1 Kind

```
typedef  TopicQuerySelectionKind  rti::sub::TopicQuerySelection::Kind
```

Alias for TopicQuerySelectionKind.

8.394.3 Constructor & Destructor Documentation

8.394.3.1 TopicQuerySelection() [1/2]

```
rti::sub::TopicQuerySelection::TopicQuerySelection (
            const  dds::topic::Filter & the_filter )  [inline], [explicit]
```

Creates a **TopicQuerySelection** (p. 2526).

Parameters

the_filter	Defines the data query

Note

The filter expression can start with the special condition "@instance_state = ALIVE AND" followed by the rest of the expression. This restricts the selection to samples of alive instances.

See also

TopicQuery::SelectAll() (p. 2519)

TopicQuery::UseReaderContentFilter() (p. 2518)

8.394.3.2 TopicQuerySelection() [2/2]

```
rti::sub::TopicQuerySelection::TopicQuerySelection (
            const  dds::topic::Filter & the_filter,
             Kind the_kind )  [inline]
```

Creates a **TopicQuerySelection** (p. 2526) with a selection kind.

Parameters

the_filter	Defines the data query
the_kind	Indicates the kind of selection

8.394.4 Member Function Documentation

8.394.4.1 filter() [1/2]

```
dds::topic::Filter & rti::sub::TopicQuerySelection::filter ( )  [inline]
```

Gets the filter.

8.394.4.2 filter() [2/2]

```
const  dds::topic::Filter & rti::sub::TopicQuerySelection::filter ( ) const  [inline]
```

Gets the filter.

8.394.4.3 kind() [1/2]

```
Kind rti::sub::TopicQuerySelection::kind ( ) const  [inline]
```

Gets the selection kind.

8.394.4.4 kind() [2/2]

```
TopicQuerySelection & rti::sub::TopicQuerySelection::kind (
            Kind the_kind )  [inline]
```

Indicates whether the sample selection is limited to cached samples or not.

[default] rti::sub::TopicQuerySelectionKind::HISTORY_SNAPSHOT

8.395 rti::sub::TopicQuerySelectionKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) **rti::sub::TopicQuerySelectionKind** (p. 71).

```
#include <TopicQuery.hpp>
```

Public Types

- enum **type** {
  HISTORY_SNAPSHOT ,
  CONTINUOUS }
  The underlying `enum` *type.*

8.395.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) **rti::sub::TopicQuerySelectionKind** (p. 71).

8.395.2 Member Enumeration Documentation

8.395.2.1 type

`enum` **rti::sub::TopicQuerySelectionKind_def::type**

The underlying `enum` type.

Enumerator

HISTORY_SNAPSHOT	Indicates that the **rti::sub::TopicQuery** (p. 2516) may only select samples that were in the DataWriter cache upon reception. **[default]**
CONTINUOUS	Indicates that the **rti::sub::TopicQuery** (p. 2516) may continue selecting samples published after its reception. The subscribing application must explicitly delete the **TopicQuery** (p. 2516) (see **rti::sub::TopicQuery::close()** (p. 2518)) to signal the DataWriters to stop publishing samples for it.

8.396 rti::util::network_capture::TrafficKindMask Class Reference

<<***extension***>> *(*p. *354)* Mask indicating the traffic direction to capture.

`#include <network_capture.hpp>`

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**
  A typedef of std::bitset<32> for convenience.

Public Member Functions

- **TrafficKindMask** ()

  *Default constructor for **TrafficKindMask*** (p. *2529*).
- **TrafficKindMask** (uint64_t mask)

  *Construct a **TrafficKindMask*** (p. *2529*) *from an integer.*
- **TrafficKindMask** (const **MaskType** &mask)

  *Construct a **TrafficKindMask*** (p. *2529*) *from a MaskType object.*

Static Public Member Functions

- static const **TrafficKindMask** **out** ()

  Do not capture outbound traffic.
- static const **TrafficKindMask** **in** ()

  Do not capture inbound traffic.
- static const **TrafficKindMask** **default_mask** ()

  *Default mask for **network_capture::TrafficKindMask*** (p. *2529*).
- static const **TrafficKindMask** **none** ()

  Do not capture any traffic.
- static const **TrafficKindMask** **all** ()

  Capture all traffic (both inbound and outbound).

8.396.1 Detailed Description

<<***extension***>> *(p. 354)* Mask indicating the traffic direction to capture.

The masks are based on a combination (or only one) of the **network_capture::TrafficKindMask** (p. 2529) bitmaps.

network_capture::TrafficKindMask (p. 2529)

8.396.2 Member Typedef Documentation

8.396.2.1 MaskType

`typedef std::bitset<32>` **`rti::util::network_capture::TrafficKindMask::MaskType`**

A typedef of std::bitset<32> for convenience.

8.396.3 Constructor & Destructor Documentation

8.396.3.1 TrafficKindMask() [1/3]

```
rti::util::network_capture::TrafficKindMask::TrafficKindMask ( )  [inline]
```

Default constructor for **TrafficKindMask** (p. 2529).

8.396.3.2 TrafficKindMask() [2/3]

```
rti::util::network_capture::TrafficKindMask::TrafficKindMask (
            uint64_t mask )  [inline], [explicit]
```

Construct a **TrafficKindMask** (p. 2529) from an integer.

Parameters

mask	Value whose bits are copied to the bitset positions

8.396.3.3 TrafficKindMask() [3/3]

```
rti::util::network_capture::TrafficKindMask::TrafficKindMask (
            const  MaskType & mask )  [inline]
```

Construct a **TrafficKindMask** (p. 2529) from a MaskType object.

Parameters

mask	A std::bitset<32> to construct this **TrafficKindMask** (p. 2529) from.

8.396.4 Member Function Documentation

8.396.4.1 out()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::out ( ) [inline],
[static]
```

Do not capture outbound traffic.

8.396.4.2 in()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::in ( ) [inline], [static]
```

Do not capture inbound traffic.

8.396.4.3 default_mask()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::default_mask ( ) [inline],
[static]
```

Default mask for **network_capture::TrafficKindMask** (p. 2529).

It is equivalent to **network_capture::TrafficKindMask::all()** (p. 2532).

[default] Capture all traffic: inbound and outbound.

8.396.4.4 none()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::none ( ) [inline],
[static]
```

Do not capture any traffic.

8.396.4.5 all()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::all ( ) [inline],
[static]
```

Capture all traffic (both inbound and outbound).

The value is equal to setting both the input and output bits of the mask: (**network_capture::TrafficKindMask::out()** (p. 2531) | **network_capture::TrafficKindMask::in()** (p. 2532)).

8.397 TransportAllocationSettings_t Struct Reference

Allocation settings used by various internal buffers.

`#include <transport_common_user.h>`

8.397.1 Detailed Description

Allocation settings used by various internal buffers.

An allocation setting structure defines the rules of memory management used by internal buffers.

An internal buffer can provide blocks of memory of fixed size. They are used in several places of any transport, and this structure defines its starting size, limits, and how to increase its capacity.

It contains three values:

- initial_count: the number of individual elements that are allocated when the buffer is created.
- max_count: the maximum number of elements the buffer can hold. The buffer will grow up to this amount. After this limit is reached, new allocation requests will fail. For unlimited size, use the value NDDS_TRANSPORT_↩ ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED
- incremental_count: The amount of elements that are allocated at every increment. You can use the value↩ : NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC to have the buffer double its size at every reallocation request.

8.398 rti::core::policy::TransportBuiltin Class Reference

<<***extension***>> *(*p. *116)* Specifies which built-in transports to use

`#include <rti/core/policy/CorePolicy.hpp>`

Public Member Functions

- **TransportBuiltin** ()

  Creates the default policy.
- **TransportBuiltin** (const **rti::core::policy::TransportBuiltinMask** &the_mask)

  Creates an instnace with the transport selection that the mask specifies.
- **TransportBuiltin** & **mask** (**rti::core::policy::TransportBuiltinMask** the_mask)

  Set the selected transports through a mask.
- **rti::core::policy::TransportBuiltinMask mask** () const

  Get the mask that indicates which transports are selected.

Static Public Member Functions

- static **TransportBuiltin All** ()

  *Creates a policy that selects **TransportBuiltinMask::all()** (p. 2539)*
- static **TransportBuiltin None** ()

  *Creates a policy that selects **TransportBuiltinMask::none()** (p. 2539)*
- static **TransportBuiltin Shmem** ()

  *Creates a policy that selects **TransportBuiltinMask::shmem()** (p. 2539)*
- static **TransportBuiltin UDPv4** ()

  *Creates a policy that selects **TransportBuiltinMask::udpv4()** (p. 2539)*
- static **TransportBuiltin UDPv6** ()

  *Creates a policy that selects **TransportBuiltinMask::udpv6()** (p. 2540)*
- static **TransportBuiltin UDPv4_WAN** ()

  *Creates a policy that selects **TransportBuiltinMask::udpv4_wan()** (p. 2540)*

Static Public Attributes

- static const std::string **SHMEM_ALIAS**

  Alias name for the shared-memory built-in transport: "builtin.shmem".
- static const std::string **UDPv4_ALIAS**

  Alias name for the UDPv4 built-in transport: "builtin.udpv4".
- static const std::string **UDPv4_WAN_ALIAS**

  Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".
- static const std::string **UDPv6_ALIAS**

  Alias name for the UDPv6 built-in transport: "builtin.udpv6".

8.398.1 Detailed Description

<<***extension***>> *(p. 116)* Specifies which built-in transports to use

Three different transport plug-ins are built into the core RTI Connext libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plug-ins are used by a **dds::domain::DomainParticipant** (p. 1326). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.398.2 Constructor & Destructor Documentation

8.398.2.1 TransportBuiltin() [1/2]

```
rti::core::policy::TransportBuiltin::TransportBuiltin ( )  [inline]
```

Creates the default policy.

8.398.2.2 TransportBuiltin() [2/2]

```
rti::core::policy::TransportBuiltin::TransportBuiltin (
            const  rti::core::policy::TransportBuiltinMask & the_mask )  [inline]
```

Creates an instnace with the transport selection that the mask specifies.

8.398.3 Member Function Documentation

8.398.3.1 All()

```
static  TransportBuiltin rti::core::policy::TransportBuiltin::All ( )  [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::all()** (p. 2539)

8.398.3.2 None()

```
static  TransportBuiltin rti::core::policy::TransportBuiltin::None ( )  [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::none()** (p. 2539)

8.398.3.3 Shmem()

```
static  TransportBuiltin rti::core::policy::TransportBuiltin::Shmem ( )  [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::shmem()** (p. 2539)

8.398.3.4 UDPv4()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::UDPv4 ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::udpv4()** (p. 2539)

8.398.3.5 UDPv6()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::UDPv6 ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::udpv6()** (p. 2540)

8.398.3.6 UDPv4_WAN()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::UDPv4_WAN ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::udpv4_wan()** (p. 2540)

8.398.3.7 mask() [1/2]

```
TransportBuiltin & rti::core::policy::TransportBuiltin::mask (
            rti::core::policy::TransportBuiltinMask the_mask )
```

Set the selected transports through a mask.

8.398.3.8 mask() [2/2]

```
rti::core::policy::TransportBuiltinMask rti::core::policy::TransportBuiltin::mask ( ) const
```

Get the mask that indicates which transports are selected.

References **rti::core::policy::TransportBuiltinMask::shmem()**.

8.398.4 Member Data Documentation

8.398.4.1 SHMEM_ALIAS

```
const std::string rti::core::policy::TransportBuiltin::SHMEM_ALIAS  [static]
```

Alias name for the shared-memory built-in transport: "builtin.shmem".

8.398.4.2 UDPv4_ALIAS

```
const std::string rti::core::policy::TransportBuiltin::UDPv4_ALIAS  [static]
```

Alias name for the UDPv4 built-in transport: "builtin.udpv4".

8.398.4.3 UDPv4_WAN_ALIAS

```
const std::string rti::core::policy::TransportBuiltin::UDPv4_WAN_ALIAS  [static]
```

Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".

8.398.4.4 UDPv6_ALIAS

```
const std::string rti::core::policy::TransportBuiltin::UDPv6_ALIAS  [static]
```

Alias name for the UDPv6 built-in transport: "builtin.udpv6".

8.399 rti::core::policy::TransportBuiltinMask Class Reference

<<***extension***>> *(*p. *354)* Mask that specifies which built-in transports are used

```
#include <PolicyKind.hpp>
```

Inherits std::bitset< 8 >.

Public Types

- typedef std::bitset< 8 > **MaskType**

  The base type, std::bitset.

Public Member Functions

- **TransportBuiltinMask** (uint64_t mask)

  Creates a mask from the bits in an integer.
- **TransportBuiltinMask** (const **MaskType** &mask)

  Creates a mask from a std::bitset.

Static Public Member Functions

- static const **TransportBuiltinMask** **all** ()

  All bits are set.
- static const **TransportBuiltinMask** **none** ()

  No bits are set.
- static const **TransportBuiltinMask** **shmem** ()

  Selects the built-in shared-memory transport.
- static const **TransportBuiltinMask** **udpv4** ()

  Selects the built-in UDPv4 transport.
- static const **TransportBuiltinMask** **udpv4_wan** ()

  Selects the built-in UDPv4 asymmetric transport.
- static const **TransportBuiltinMask** **udpv6** ()

  Selects the built-in UDPv6 transport.

8.399.1 Detailed Description

<<***extension***>> *(*p. *354)* Mask that specifies which built-in transports are used

8.399.2 Member Typedef Documentation

8.399.2.1 MaskType

`typedef std::bitset<8>` **`rti::core::policy::TransportBuiltinMask::MaskType`**

The base type, std::bitset.

8.399.3 Constructor & Destructor Documentation

8.399.3.1 TransportBuiltinMask() [1/2]

```
rti::core::policy::TransportBuiltinMask::TransportBuiltinMask (
            uint64_t mask )  [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.399.3.2 TransportBuiltinMask() [2/2]

```
rti::core::policy::TransportBuiltinMask::TransportBuiltinMask (
            const  MaskType & mask )  [inline]
```

Creates a mask from a std::bitset.

8.399.4 Member Function Documentation

8.399.4.1 all()

```
static const  TransportBuiltinMask rti::core::policy::TransportBuiltinMask::all ( )  [inline],
[static]
```

All bits are set.

8.399.4.2 none()

```
static const  TransportBuiltinMask rti::core::policy::TransportBuiltinMask::none ( )  [inline],
[static]
```

No bits are set.

8.399.4.3 shmem()

```
static const  TransportBuiltinMask rti::core::policy::TransportBuiltinMask::shmem ( )  [inline],

  Creates the default policy.
- **TransportMulticast** (const **TransportMulticastSettingsSeq** &the_value, **TransportMulticastKind** the_kind)

  Creates an instance with the speicfied multicast settings.
- **TransportMulticast** & **settings** (const **TransportMulticastSettingsSeq** &the_settings)

  *<<**basic**>> (p. 104) <<**extension**>> (p. 116) A sequence of multicast communications settings.*
- **TransportMulticastSettingsSeq settings** () const

  Getter (see setter with the same name)
- **TransportMulticast** & **kind** (**TransportMulticastKind** the_kind)

  *<<**extension**>> (p. 116) A value that specifies a way to determine how to obtain the multicast address.*
- **TransportMulticastKind kind** () const

  Getter (see setter with the same name)

8.402.1 Detailed Description

*<<**extension**>> (p. 116)* Specifies the multicast address on which a **dds::sub::DataReader** (p. 976) wants to receive its data and other settings.

By default, a **dds::pub::DataWriter** (p. 1138) will send individually addressed packets for each **dds::sub::DataReader** (p. 976) that subscribes to the topic of the DataWriter – this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **dds::pub::DataWriter** (p. 1138) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **dds::topic::Topic** (p. 2474).

Entity:

dds::sub::DataReader (p. 976)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.402.2 Constructor & Destructor Documentation

8.402.2.1 TransportMulticast() [1/2]

```
rti::core::policy::TransportMulticast::TransportMulticast ( )  [inline]
```

Creates the default policy.

8.402.2.2 TransportMulticast() [2/2]

```
rti::core::policy::TransportMulticast::TransportMulticast (
             const  TransportMulticastSettingsSeq & the_value,
              TransportMulticastKind the_kind )
```

Creates an instance with the speicfied multicast settings.

See individual setters.

8.402.3 Member Function Documentation

8.402.3.1 settings() [1/2]

```
 TransportMulticast & rti::core::policy::TransportMulticast::settings (
             const  TransportMulticastSettingsSeq & the_settings )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1384).

[default] Empty sequence.

Categories

Immutable (p. 243), **Transports** (p. 237), **Discovery Metadata** (p. 288)

8.402.3.2 settings() [2/2]

```
TransportMulticastSettingsSeq rti::core::policy::TransportMulticast::settings ( ) const
```

Getter (see setter with the same name)

8.402.3.3 kind() [1/2]

```
TransportMulticast & rti::core::policy::TransportMulticast::kind (
            TransportMulticastKind the_kind )
```

<<***extension***>> *(*p. *116)* A value that specifies a way to determine how to obtain the multicast address.

This field can be set to one of the following two values: **rti::core::policy::TransportMulticastKind_def::AUTOMATIC** (p. 2547) or **rti::core::policy::TransportMulticastKind_def::UNICAST** (p. 2547).

- If it is set to **rti::core::policy::TransportMulticastKind_def::AUTOMATIC** (p. 2547), the behavior will depend on the **rti::core::policy::TransportMulticast::settings** (p. 2545):
  - If **rti::core::policy::TransportMulticast::settings** (p. 2545) does not have any elements, then multicast will not be used.
  - If **rti::core::policy::TransportMulticast::settings** (p. 2545) first element has an empty address, then the address will be obtained from **rti::core::policy::TransportMulticastMapping** (p. 2547).
  - If none of the elements in **rti::core::policy::TransportMulticast::settings** (p. 2545) is empty, and at least one element has a valid address, then that address will be used.
- If it is set to **rti::core::policy::TransportMulticastKind_def::UNICAST** (p. 2547), then multicast will not be used.

[default] rti::core::policy::TransportMulticastKind_def::AUTOMATIC (p. 2547)

Categories

Immutable (p. 243), **Transports** (p. 237), **Data Availability** (p. 167)

  *<<**extension**>> (p. 116) A sequence of multicast communication mappings.*
- MulticastMappingSeq **mappings** () const

  Getter (see setter with the same name)

8.404.1 Detailed Description

*<<**extension**>> (p. 116)* Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

This QoS policy provides an alternate way to assign multicast receive addresses to DataReaders. It allows you to perform multicast configuration at the **dds::domain::DomainParticipant** (p. 1326) level.

To use multicast communication *without* this QoS policy, you must explicitly assign a multicast receive address on each **dds::sub::DataReader** (p. 976). This can quickly become difficult to configure as more DataReaders of different topics and multicast addresses are added.

With this QoS policy, you can configure a set of multicast addresses on the **dds::domain::DomainParticipant** (p. 1326); those addresses will then be automatically assigned to the DomainParticipant's DataReaders. A single configuration on the **dds::domain::DomainParticipant** (p. 1326) can thus replace per-DataReader configuration.

On the DomainParticipant, the set of assignable addresses can be configured for specific topics. Addresses are configured on topics because efficient usage of multicast will have all DataWriters and DataReaders of a single topic using the same multicast address.

You can specify a mapping between a topic's name and a multicast address. For example, topic 'A' can be assigned to address 239.255.1.1 and topic 'B' can be assigned to address 239.255.1.2.

You can use filter expressions to configure a subset of topics to use a specific list of addresses. For example, suppose topics "X", "Y" and "Z" need to be sent to any address within the range [239.255.1.1, 239.255.1.255]. You can specify an expression on the topic name (e.g. "[X-Z]") corresponding to that range of addresses. Then the DomainParticipant will select an address for a topic whose name matches the expression.

The middleware will use a hash function to perform the mapping from topic to address. Alternatively, you can specify a pluggable mapping function.

IMPORTANT: All the strings defined in each element of the sequence must be assigned using RTI_String_dup("foo");. For example:

mcastMappingElement->addresses = DDS_String_dup("[239.255.1.1,239.255.1.255]");

NOTE: To use this QoS policy, you must:

- Set **rti::core::policy::TransportMulticast::kind** (p. 2546) to **rti::core::policy::TransportMulticastKind_def↩ ::AUTOMATIC** (p. 2547).
- Set the first element in **dds::sub::DataReader** (p. 976)'s **rti::core::policy::TransportMulticast::settings** (p. 2545) with an empty address.

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.405.1 Detailed Description

<<***extension***>> *(*p. *354)* Represents a list of multicast locators

A multicast locator specifies a transport class, a multicast address, and a multicast port number on which messages can be received by an entity.

QoS:

rti::core::policy::TransportMulticast (p. 2543)

8.405.2 Constructor & Destructor Documentation

8.405.2.1 TransportMulticastSettings()

```
rti::core::TransportMulticastSettings::TransportMulticastSettings (
            const  dds::core::StringSeq & the_transports,
            const std::string & the_receive_address,
            int32_t the_receive_port )  [inline]
```

Creates an instance with the specified transport aliases, receive address and receive port.

See individual setters.

8.405.3 Member Function Documentation

8.405.3.1 transports() [1/2]

```
TransportMulticastSettings & rti::core::TransportMulticastSettings::transports (
            const  dds::core::StringSeq & the_transports )  [inline]
```

<<***extension***>> *(*p. *116)* A sequence of transport aliases that specifies the transports on which to receive *multicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias in this sequence are used to subscribe to the multicast group addresses. Thus, this list of aliases sub-selects from the transport s available to the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 548).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

8.405.3.2 transports() [2/2]

```
dds::core::StringSeq rti::core::TransportMulticastSettings::transports ( ) const  [inline]
```

Getter (see the setter with the same name)

8.405.3.3 receive_address() [1/2]

```
TransportMulticastSettings & rti::core::TransportMulticastSettings::receive_address (
            const std::string & the_receive_address )
```

<<***extension***>> *(*p. *116)* The multicast group address on which the entity can receive data.

Must must be an address in the proper format (see **Address Format** (p. 561)).

[default] NONE/INVALID. Required to specify a multicast group address to join.

[range] A valid IPv4 or IPv6 multicast address.

See also

Address Format (p. 561)

8.405.3.4 receive_address() [2/2]

```
std::string rti::core::TransportMulticastSettings::receive_address ( ) const  [inline]

```

Getter (see the setter with the same name)

8.406 dds::core::policy::TransportPriority Class Reference

Allows applications to take advantage of transports capable of sending messages with different priorities.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TransportPriority** ()
  Creates a policy with priority 0.
- **TransportPriority** (int32_t priority)
  Creates a policy with the specified priority.
- **TransportPriority** & **value** (int32_t priority)
  Sets the priority.
- int32_t **value** () const
  Getter (see setter with the same name)

8.406.1 Detailed Description

Allows applications to take advantage of transports capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DataWriter or DataReader basis that the data sent by that endpoint is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **dds::pub::Data↩ Writer::write()** (p. 1148). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

dds::pub::DataWriter (p. 1138), **dds::sub::DataReader** (p. 976), **dds::topic::Topic** (p. 2474)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.406.2 Usage

In RTI Connext, for the IP-based transports (UDPv4, UDPv6, Real-Time WAN, and TCP), the value set in the Transport Priority QoS policy can be used to set the differentiated services field (DS field) bits of the IPv4 and IPv6 headers for datagrams sent by a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976). It is platform-dependent on how and whether setting the DS field has an effect. Some platforms may require external permissions in order to set the DS field.

The transport priority value is not provided as is to the transports, but transformed according to the following fields: transport_priority_mask (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 1804)), transport_priority_mapping_low (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 1805)), and transport_priority_mapping_high (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 1805)). If you want the priority value to be exactly equal to the DS value, then the only change you need to make is to set transport_priority_mask to `0xff` (and keep the transport_priority_mapping_low and transport_priority_mapping_high defaults).

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976). All network elements, including switches and routers, must have the capability and be enabled to actually use the DS field to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a *system* level; just turning it on in an application may have no effect at all at a transport level.

For additional details on how to set the DS field in IP-based transports, see the "TRANSPORT_PRIORITY QosPolicy" section of the `User's Manual`.

8.406.3 Constructor & Destructor Documentation

8.406.3.1 TransportPriority() [1/2]

```
dds::core::policy::TransportPriority::TransportPriority ( )  [inline]
```

Creates a policy with priority 0.

8.406.3.2 TransportPriority() [2/2]

```
dds::core::policy::TransportPriority::TransportPriority (
            int32_t priority )  [inline], [explicit]
```

Creates a policy with the specified priority.

8.406.4 Member Function Documentation

8.406.4.1 value() [1/2]

```
TransportPriority & dds::core::policy::TransportPriority::value (
            int32_t priority )  [inline]
```

Sets the priority.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

Categories

Immutable (p. 243), **Transports** (p. 237), **Concurrency** (p. 164)

8.406.4.2 value() [2/2]

```
int32_t dds::core::policy::TransportPriority::value ( ) const  [inline]
```

Getter (see setter with the same name)

8.407 rti::core::policy::TransportSelection Class Reference

<<***extension***>> *(p. 116)* Specifies the transports that a **dds::pub::DataWriter** (p. 1138) or a **dds::sub::DataReader** (p. 976) may use to send or receive data

  Sets the unicast settings.
- **rti::core::TransportUnicastSettingsSeq settings** () const
  Gets the unicast settings.

8.408.1 Detailed Description

<<***extension***>> *(p. 116)* Specifies a subset of transports and a port number that can be used by a **dds::core::Entity** (p. 1520) to receive data.

Entity:

dds::domain::DomainParticipant (p. 1326), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.408.2 Usage

RTI Connext may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **dds::core::Entity** (p. 1520) announces to remote applications a list of (up to 16) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/NACKs and heartbeats). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1384).

Note: RTI Connext internally uses several dynamic locator lists to keep track of configured unicast locators. The initial size of these lists can be configured with the **dds::domain::DomainParticipant** (p. 1326) property 'dds.domain_participant.initial_locator_list_size'. By default, the initial size is derived from local information, such as the number of local locators. To prevent dynamic resizing at runtime, set the property's value to the maximum number of locators that a single participant or endpoint may advertise at any given time in your system.

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the Entity (see **rti::core::policy::TransportBuiltin** (p. 2533) and **rti::core::policy::TransportSelection** (p. 2554)). Also, the associated ports are automatically determined (see **rti::core::RtpsWellKnownPorts** (p. 2258)).

Use this QoS policy to manually set the receive address list for an Entity. You may optionally set a port to use a non-default receive port as well. Only the first 16 addresses will be used.

RTI Connext will create a receive thread for every unique port number that it encounters (on a per transport basis).

- For a **dds::domain::DomainParticipant** (p. 1326), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.

- For a **dds::sub::DataReader** (p. 976), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **dds::domain::DomainParticipant** (p. 1326).

- For a reliable **dds::pub::DataWriter** (p. 1138), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **dds::domain::DomainParticipant** (p. 1326).

8.408.3 Constructor & Destructor Documentation

8.408.3.1 TransportUnicast() [1/2]

```
rti::core::policy::TransportUnicast::TransportUnicast ( )  [inline]
```

Creates the default policy.

References **rti::core::policy::TransportBuiltinMask::udpv6()**.

8.408.3.2 TransportUnicast() [2/2]

```
rti::core::policy::TransportUnicast::TransportUnicast (
            const  rti::core::TransportUnicastSettingsSeq & settings )  [explicit]
```

Creates an instance with the specified settings.

8.408.4 Member Function Documentation

8.408.4.1 settings() [1/2]

```
TransportUnicast & rti::core::policy::TransportUnicast::settings (
            const  rti::core::TransportUnicastSettingsSeq & value )
```

Sets the unicast settings.

An empty sequence means that applicable defaults specified by elsewhere (e.g. dds::domain::qos::DomainParticipant↩ Qos::default_unicast) should be used.

The RTPS wire protocol currently limits the maximum number of unicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1384).

[default] Empty sequence.

8.409.1 Detailed Description

<<***extension***>> *(*p. *354)* Represents a list of unicast locators

A unicast locator specifies a transport class, a unicast address, and a unicast port number on which messages can be received by an entity.

QoS:

rti::core::policy::TransportUnicast (p. 2556)

8.409.2 Constructor & Destructor Documentation

8.409.2.1 TransportUnicastSettings() [1/2]

```
rti::core::TransportUnicastSettings::TransportUnicastSettings ( )  [inline]
```

Creates the default policy.

8.409.2.2 TransportUnicastSettings() [2/2]

```
rti::core::TransportUnicastSettings::TransportUnicastSettings (
            const  dds::core::StringSeq & transports,
            int32_t receive_port = 0 )  [explicit]
```

Creates an instance with the specified transports and receive_port.

8.409.3 Member Function Documentation

8.409.3.1 transports() [1/2]

```
TransportUnicastSettings & rti::core::TransportUnicastSettings::transports (
            const  dds::core::StringSeq & value )
```

Sets a sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias on this sequence are used to determine the unicast interfaces used by the entity.

Thus, this list of aliases sub-selects from the transports available to the entity.

Each unicast interface on a transport results in a unicast locator for the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 548).

[default] Empty sequence; i.e. all the transports available to the entity.
[range] Any sequence of non-null, non-empty strings.

8.409.3.2 transports() [2/2]

```
dds::core::StringSeq rti::core::TransportUnicastSettings::transports ( ) const
```

Getter (see setter with the same name)

8.409.3.3 receive_port() [1/2]

```
TransportUnicastSettings & rti::core::TransportUnicastSettings::receive_port (
            int32_t value )
```

The unicast port on which the entity can receive data.

Must be an *unused* unicast port on the system.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id`, and the **rti::core::policy::WireProtocol::participant_id** (p. 2635).

[range] [0,0xffffffff]

See also

rti::core::policy::WireProtocol::participant_id (p. 2635).

- static **TypeConsistencyEnforcement** **AutoTypeCoercion** ()

  Creates an instance with TypeConsistencyEnforcementKind::AUTO_TYPE_COERCION.

8.411.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

This policy defines a type consistency kind, which allows applications to select from among a set of predetermined behaviors. The following consistency kinds are specified: TypeConsistencyKind::DISALLOW_TYPE_COERCION, TypeConsistencyKind::ALLOW_TYPE_COERCION and TypeConsistencyKind::AUTO_TYPE_COERCION.

The type-consistency-enforcement rules consist of two steps:

Step 1. If both the DataWriter and DataReader specify a TypeObject, it is considered first. If the DataReader allows type coercion, then its type must be assignable from the DataWriter's type, taking into account the values of prevent_type_widening, ignore_sequence_bounds, ignore_string_bounds, ignore_member_names, and ignore_enum_literal_names. If the DataReader does not allow type coercion, then its type must be equivalent to the type of the DataWriter.

Step 2. If either the DataWriter or the DataReader does not provide a TypeObject definition, then the registered type names are examined. The DataReader's and DataWriter's registered type names must match exactly, as was true in RTI Connext releases prior to 5.0.0.

If either Step 1 or Step 2 fails, the Topics associated with the DataReader and DataWriter are considered to be inconsistent and the **dds::core::status::InconsistentTopicStatus** (p. 1611) is updated.

The default enforcement kind is TypeConsistencyKind::AUTO_TYPE_COERCION. This default kind translates to TypeConsistencyKind::ALLOW_TYPE_COERCION except in the following cases:

- When a **Zero Copy** (p. 50) DataReader is used, the kind is translated to TypeConsistencyKind::DISALLOW_TYPE_COERCION.

- When the middleware is introspecting the built-in topic data declaration of a remote DataReader in order to determine whether it can match with a local DataWriter, if it observes that no TypeConsistencyEnforcement↩ QosPolicy value is provided (as would be the case when communicating with a Service implementation not in conformance with this specification), it assumes a kind of TypeConsistencyKind::DISALLOW_TYPE_COERCION.

For additional information on type consistency enforcement refer to the `Extensible Types Guide` and the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

Entity:

dds::sub::DataReader (p. 976)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.411.2 Constructor & Destructor Documentation

8.411.2.1 TypeConsistencyEnforcement() [1/2]

```
dds::core::policy::TypeConsistencyEnforcement::TypeConsistencyEnforcement ( )  [inline]
```

Creates the default policy.

8.411.2.2 TypeConsistencyEnforcement() [2/2]

```
dds::core::policy::TypeConsistencyEnforcement::TypeConsistencyEnforcement (
            dds::core::policy::TypeConsistencyEnforcementKind the_kind )  [inline], [explicit]
```

Creates an instance with a specific enforcement kind.

8.411.3 Member Function Documentation

8.411.3.1 kind() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::kind (
            dds::core::policy::TypeConsistencyEnforcementKind value ) [inline]
```

Sets the enforcement kind.

[default] TypeConsistencyKind::AUTO_TYPE_COERCION

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.2 kind() [2/2]

```
dds::core::policy::TypeConsistencyEnforcementKind dds::core::policy::TypeConsistencyEnforcement↩
::kind ( ) const [inline]
```

Gets the enforcement kind.

8.411.3.3 ignore_sequence_bounds() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_sequence_↩
bounds (
            bool ignore ) [inline]
```

Controls whether sequence bounds are ignored.

If the option is set to true, then sequence bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 sequence type with maximum length L2 would be assignable to a T1 sequence type with maximum length L1, even if L2 is greater than L1. If the option is set to false, then sequence bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that L1 >= L2.

[default] true

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.4 ignore_sequence_bounds() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_sequence_bounds ( ) const  [inline]
```

Getter (see setter with the same name)

8.411.3.5 ignore_string_bounds() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_string_bounds
(
            bool ignore )  [inline]
```

Controls whether string bounds are ignored.

If the option is set to true, then string bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 string type with maximum length L2 would be assignable to a T1 string type with maximum length L1, even if L2 is greater than L1. If the option is set to false, then string bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that L1 $>=$ L2.

[default] true

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.6 ignore_string_bounds() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_string_bounds ( ) const  [inline]
```

Getter (see setter with the same name)

8.411.3.7 ignore_member_names() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_member_names (
            bool ignore )  [inline]
```

Controls whether member names are ignored.

If the option is set to true, then member names are not considered as part of the type assignability. If the option is set to false, then member names are taken into consideration for type assignability, and in order for members with the same ID to be assignable, the members must also have the same name.

[default] false

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.8 ignore_member_names() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_member_names ( ) const  [inline]
```

Getter (see setter with the same name)

8.411.3.9 prevent_type_widening() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::prevent_type_widening
(
            bool prevent )  [inline]
```

Controls whether type widening is prevented.

If the option is set to false, then type widening is permitted. If the option is set to true, then a wider type may not be assignable from a narrower type.

[default] false

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.10 prevent_type_widening() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::prevent_type_widening ( ) const  [inline]
```

Getter (see setter with the same name)

8.411.3.11 force_type_validation() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::force_type_validation
(
            bool force )  [inline]
```

Controls whether type validation is forced.

If the option is set to true, then type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976). If the option is set to false, then matching can occur without complete type information as long as the type names match exactly. Note that if the types have the same name but are not assignable, DataReaders may fail to deserialize incoming data samples.

[default] false

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.12 force_type_validation() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::force_type_validation ( ) const  [inline]
```

Getter (see setter with the same name)

8.411.3.13 ignore_enum_literal_names() [1/2]

```
 TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_enum_literal↩
_names (
             bool ignore )  [inline]
```

Controls whether enumeration literal names are ignored.

If the option is set to true, then enumeration constants may change their names, but not their values, and still maintain assignability. If the option is set to false, then in order for enumerations to be assignable, any constant that has the same value in both enumerations must also have the same name.

[default] false

Categories

Immutable (p. 243), **Matching** (p. 293), **Discovery Metadata** (p. 288), **Type System** (p. 240)

8.411.3.14 ignore_enum_literal_names() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_enum_literal_names ( ) const  [inline]
```

Getter (see setter with the same name)

8.411.3.15 AllowTypeCoercion()

```
static  TypeConsistencyEnforcement dds::core::policy::TypeConsistencyEnforcement::AllowType↩
Coercion ( )  [inline], [static]
```

Creates an instance with TypeConsistencyEnforcementKind::ALLOW_TYPE_COERCION.

8.411.3.16 DisallowTypeCoercion()

```
static TypeConsistencyEnforcement dds::core::policy::TypeConsistencyEnforcement::DisallowType↩
Coercion ( ) [inline], [static]
```

Creates an instance with TypeConsistencyEnforcementKind::DISALLOW_TYPE_COERCION.

8.411.3.17 AutoTypeCoercion()

```
static TypeConsistencyEnforcement dds::core::policy::TypeConsistencyEnforcement::AutoTypeCoercion
( ) [inline], [static]
```

Creates an instance with TypeConsistencyEnforcementKind::AUTO_TYPE_COERCION.

```

The underlying `enum` type.

Enumerator

DISALLOW_TYPE_COERCION	The DataWriter and the DataReader must support the same data type in order for them to communicate. This is the degree of type consistency enforcement required by the `OMG DDS Specification` prior to the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

ALLOW_TYPE_COERCION	The DataWriter and the DataReader need not support the same data type in order for them to communicate as long as the DataReader's type is assignable from the DataWriter's type. For example, the following two extensible types will be assignable to each other since MyDerivedType contains all the members of MyBaseType (member_1) plus some additional elements (member_2).
	`struct MyBaseType { long member_1; };`
	`struct MyDerivedType: MyBaseType { long member_2; };`
	Even if MyDerivedType was not explicitly inheriting from MyBaseType the types would still be assignable. For example:
	`struct MyBaseType { long member_1; };`
	`struct MyDerivedType { long member_1; long member_2; };`
	For additional information on type assignability refer to the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

AUTO_TYPE_COERCION	This AUTO value will be applied as TypeConsistencyKind::DISALLOW_TYPE_COERCION when the data type is annotated with @transfer_mode(SHMEM_REF) and the @language_binding is PLAIN (default) while using C, Traditional C++, or Modern C++ APIs. In all other cases, this AUTO value will be applied as TypeConsistencyKind::ALLOW_TYPE_COERCION. **[default]**

  Getter (see setter with the same name)

8.414.1 Detailed Description

<<***extension***>> *(p. 116)* Allows attaching application-specific information to a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976) that is passed to the serilization and deserialization routines.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions and choose whether or not to set the padding bytes to zero when serializing a sample using CDR encapsulation.

Entity:

dds::domain::DomainParticipant (p. 1326), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO

Changeable (p. 514) = **UNTIL ENABLE** (p. 514)

8.414.2 Usage

The **rti::core::policy::TypeSupport::plugin_data** (p. 2575) allows you to associate a pointer to an object with a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976). This object pointer is passed to the serialization routine of the data type associated with the **dds::pub::DataWriter** (p. 1138) or the deserialization routine of the data type associated with the **dds::sub::DataReader** (p. 976).

You can modify the rtiddsgen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a **dds::pub::DataWriter** (p. 1138) or received by a **dds::sub::DataReader** (p. 976) is serialized or deserialized on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the **TypeSupport** (p. 2574) QoS policy could be used to signal the serialization routine to send the row/column names the first time a **dds::pub::DataWriter** (p. 1138) calls **dds::pub::DataWriter::write()** (p. 1148), and then never again.

The **rti::core::policy::TypeSupport::cdr_padding_kind** (p. 2576) allows you to choose whether or not the padding bytes are set to zero during CDR serialization.

8.414.3 Constructor & Destructor Documentation

8.414.3.1 TypeSupport()

```
rti::core::policy::TypeSupport::TypeSupport ( )  [inline]
```

Creates the default policy.

8.414.4 Member Function Documentation

8.414.4.1 plugin_data() [1/2]

```
TypeSupport & rti::core::policy::TypeSupport::plugin_data (
            void * the_plugin_data )
```

[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Value to pass into the type plugin's de-/serialization function

[default] NULL

Categories

Immutable (p. 243), **Application-Defined Metadata** (p. 159)

  <<***C++11***>> *(p. 353) Creates a union member with a name, type and selected by a single label.*
- const **dds::core::string** & **name** () const
  Gets the member name.
- **dds::core::string** & **name** ()
  Gets the member name.
- const **DynamicType** & **type** ()
  Gets the member type.
- bool **has_id** () const
  Indicates it the member has an ID annotation.

- int32_t **get_id** () const

  Returns the ID annotation of this member.
- bool **is_pointer** () const

  *<<**extension**>> (p. 354) Indicates if this member is a pointer*
- uint32_t **label_count** () const

  Gets the number of labels that select this member.
- **LabelSeq** **labels** () const

  Gets a copy of all the labels that select this member.
- **UnionMember** & **labels** (const **LabelSeq** &values)

  Sets the labels that select this member.
- **UnionMember** & **label** (**DiscriminatorType** value)

  Sets a single label that selects this member.
- **UnionMember** & **name** (const **dds::core::string** &value)

  Sets the name.
- **UnionMember** & **id** (int32_t value)

  Sets the ID annotation of a member.
- **UnionMember** & **pointer** (bool value)

  *<<**extension**>> (p. 354) Makes a member a pointer*

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE **DiscriminatorType** **DEFAULT_LABEL**

  Special value for the `default:` union label.
- static const int32_t **INVALID_ID**

  The special ID of a member without the ID annotation.

8.417.1 Detailed Description

*<<**value-type**>> (p. 350)* Represents a **UnionType** (p. 2584) member

Encapsulates the name, type and labels of a **UnionType** (p. 2584) member along with several IDL annotations such as id.

8.417.2 Member Typedef Documentation

8.417.2.1 DiscriminatorType

```
typedef DDS_Long dds::core::xtypes::UnionMember::DiscriminatorType
```

The type to represent a union discriminator.

8.417.2.2 LabelSeq

```
typedef std::vector< DiscriminatorType> dds::core::xtypes::UnionMember::LabelSeq
```

A sequence of values for the discriminator that select a member.

8.417.3 Constructor & Destructor Documentation

8.417.3.1 UnionMember() [1/4]

```
dds::core::xtypes::UnionMember::UnionMember (
            const std::string & name,
            const DynamicTypeImpl & type,
            const  LabelSeq & labels )
```

Creates a union member with a name, type and selected by one or more labels.

8.417.3.2 UnionMember() [2/4]

```
dds::core::xtypes::UnionMember::UnionMember (
            const std::string & name,
            const DynamicTypeImpl & type,
             DiscriminatorType label )
```

Creates a union member with a name, type and selected by a single label.

8.417.3.3 UnionMember() [3/4]

```
dds::core::xtypes::UnionMember::UnionMember (
            const std::string & the_name,
            DynamicTypeImpl && the_type,
            const  LabelSeq & the_labels )  [inline]
```

<<***C++11***>> *(*p. *353)* Creates a union member with a name, type and selected by one or more labels.

It moves the type.

8.417.3.4 UnionMember() [4/4]

```
dds::core::xtypes::UnionMember::UnionMember (
            const std::string & the_name,
            DynamicTypeImpl && the_type,
             DiscriminatorType the_label )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a union member with a name, type and selected by a single label.

It moves the type.

8.417.4 Member Function Documentation

8.417.4.1 name() [1/3]

```
const  dds::core::string & dds::core::xtypes::UnionMember::name ( ) const
```

Gets the member name.

8.417.4.2 name() [2/3]

```
 dds::core::string & dds::core::xtypes::UnionMember::name ( )
```

Gets the member name.

8.417.4.3 type()

```
const  DynamicType & dds::core::xtypes::UnionMember::type ( )
```

Gets the member type.

8.417.4.4 has_id()

```
bool dds::core::xtypes::UnionMember::has_id ( ) const
```

Indicates it the member has an ID annotation.

Returns

True if this member has been annotated explicitly with an ID; false if the has a default-assigned ID.

8.417.4.5 get_id()

```
int32_t dds::core::xtypes::UnionMember::get_id ( ) const
```

Returns the ID annotation of this member.

Returns

If **has_id()** (p. 2581) is true, this returns the value of the ID annotation. Otherwise it returns INVALID_ID.

8.417.4.6 is_pointer()

```
bool dds::core::xtypes::UnionMember::is_pointer ( ) const
```

<<***extension***>> *(p. 354)* Indicates if this member is a pointer

8.417.4.7 label_count()

```
uint32_t dds::core::xtypes::UnionMember::label_count ( ) const
```

Gets the number of labels that select this member.

8.417.4.8 labels() [1/2]

```
LabelSeq dds::core::xtypes::UnionMember::labels ( ) const
```

Gets a copy of all the labels that select this member.

8.417.4.9 labels() [2/2]

```
UnionMember & dds::core::xtypes::UnionMember::labels (
            const  LabelSeq & values )
```

Sets the labels that select this member.

8.417.4.10 label()

```
UnionMember & dds::core::xtypes::UnionMember::label (
             DiscriminatorType value )
```

Sets a single label that selects this member.

If more than one label selects this case, use **labels(const LabelSeq&)** (p. 2582)

8.417.4.11 name() [3/3]

```
UnionMember & dds::core::xtypes::UnionMember::name (
            const  dds::core::string & value )
```

Sets the name.

8.417.4.12 id()

```
UnionMember & dds::core::xtypes::UnionMember::id (
            int32_t value )
```

Sets the ID annotation of a member.

[default] Automatically assigned as the ID of the previous member plus one previous member

8.417.4.13 pointer()

```
UnionMember & dds::core::xtypes::UnionMember::pointer (
            bool value )
```

<<***extension***>> *(p. 354)* Makes a member a pointer

[default] false

8.417.5 Member Data Documentation

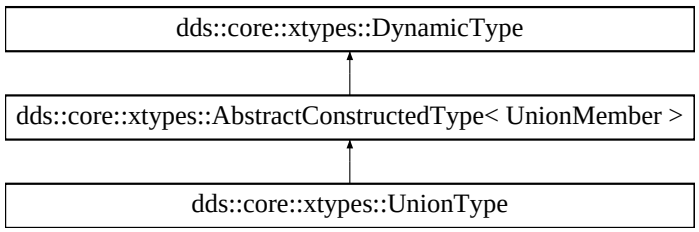
8.417.5.1 DEFAULT_LABEL

```
OMG_DDS_API_CLASS_VARIABLE  DiscriminatorType dds::core::xtypes::UnionMember::DEFAULT_LABEL  [static]
```

Special value for the `default:` union label.

8.417.5.2 INVALID_ID

```
const int32_t dds::core::xtypes::UnionMember::INVALID_ID  [static]
```



The special ID of a member without the ID annotation.

8.418 dds::core::xtypes::UnionType Class Reference

<<***value-type***>> *(*p. *350)* Represents an IDL `union` type

```
#include <dds/core/xtypes/UnionType.hpp>
```

Inheritance diagram for dds::core::xtypes::UnionType:

Public Types

- typedef UnionMember::DiscriminatorType **DiscriminatorType**

  The type used to set and get discriminator (label) values.

Public Member Functions

- **UnionType** (const std::string &the_name, const DynamicTypeImpl &discriminator_type)

  Creates an empty union.
- template<typename Container >
  UnionType (const std::string &the_name, const DynamicTypeImpl &discriminator_type, const Container &the_↩ members)

  Creates a union with the members in a container.
- template<typename MemberIter >
  UnionType (const std::string &the_name, const DynamicTypeImpl &discriminator_type, MemberIter begin, MemberIter end)

  Creates a union with the members in an iterator range.
- **UnionType** (const std::string &the_name, const DynamicTypeImpl &discriminator_type, std::initializer_list< **UnionMember** > the_members)

  Creates a union with the members in an initializer_list.
- const DynamicTypeImpl & **discriminator** () const

  Gets the type of the discriminator.
- **MemberIndex find_member_by_label** (**DiscriminatorType** label) const

Gets the index of the member selected by a label.

- **MemberIndex find_member_by_id** (uint32_t id) const

  Gets the index of the member with a specific member ID.

- **UnionType** & **add_member** (const **UnionMember** & **member**)

  Add a member to the end of this union.

- template<typename Container >
  UnionType & **add_members** (const Container &the_members)

  Adds all the members of a container at the end.

- **UnionType** & **add_members** (std::initializer_list< **UnionMember** > the_members)

  Adds all the members of an initializer_list at the end.

- template<typename MemberIter >
  UnionType & **add_members** (MemberIter begin, MemberIter end)

  Adds all the members in an iterator range at the end.

- **UnionType** & **add_member** (**UnionMember** &&the_member)

  Adds a member, moving it, at the end.

Additional Inherited Members

8.418.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents an IDL `union` type

Examples

Foo.hpp.

8.418.2 Member Typedef Documentation

8.418.2.1 DiscriminatorType

```
typedef UnionMember::DiscriminatorType dds::core::xtypes::UnionType::DiscriminatorType
```

The type used to set and get discriminator (label) values.

Note that this is different from **discriminator()** (p. 2587), which represents the discriminator type as defined in IDL.

8.418.3 Constructor & Destructor Documentation

8.418.3.1 UnionType() [1/4]

```
dds::core::xtypes::UnionType::UnionType (
            const std::string & the_name,
            const DynamicTypeImpl & discriminator_type )  [inline]
```

Creates an empty union.

Members can be added after creation.

Parameters

the_name	The name of the type
discriminator_type	The type of the discriminator

8.418.3.2 UnionType() [2/4]

```
template<typename Container >
dds::core::xtypes::UnionType::UnionType (
            const std::string & the_name,
            const DynamicTypeImpl & discriminator_type,
            const Container & the_members )  [inline]
```

Creates a union with the members in a container.

Template Parameters

Container	A container that provides the member functions **begin()** (p. 1669) and **end()** (p. 1670) to iterate over **UnionMember** (p. 2578) elements.

Parameters

the_name	The name of the type
discriminator_type	The type of the discriminator, which can be a primitive type, an **EnumType** (p. 1535) or an **AliasType** (p. 801) to any of these.
the_members	A container with the members for this union type

8.418.3.3 UnionType() [3/4]

```
template<typename MemberIter >
dds::core::xtypes::UnionType::UnionType (
            const std::string & the_name,
            const DynamicTypeImpl & discriminator_type,
            MemberIter begin,
            MemberIter end )  [inline]
```

Creates a union with the members in an iterator range.

Template Parameters

MemberIter	A forward iterator of **UnionMember** (p. 2578) elements

Parameters

the_name	The name of the type
discriminator_type	The type of the discriminator
begin	The beginning of the range of UnionMembers
end	The end of the range of UnionMembers

8.418.3.4 UnionType() [4/4]

```
dds::core::xtypes::UnionType::UnionType (
            const std::string & the_name,
            const DynamicTypeImpl & discriminator_type,
            std::initializer_list< UnionMember > the_members )  [inline]
```

Creates a union with the members in an initializer_list.

Parameters

the_name	The name of the type
discriminator_type	The type of the discriminator
the_members	An ininitalizer_list of UnionMembers

8.418.4 Member Function Documentation

8.418.4.1 discriminator()

```
const DynamicTypeImpl & dds::core::xtypes::UnionType::discriminator ( ) const
```

Gets the type of the discriminator.

8.418.4.2 find_member_by_label()

```
MemberIndex dds::core::xtypes::UnionType::find_member_by_label (
            DiscriminatorType label ) const
```

Gets the index of the member selected by a label.

The result of this function can be passed to member(uint32_t).

Returns

The index of the member selected by label or INVALID_INDEX if that label doesn't select any member

8.418.4.3 find_member_by_id()

```
MemberIndex dds::core::xtypes::UnionType::find_member_by_id (
            uint32_t id ) const
```

Gets the index of the member with a specific member ID.

The result of this function can be passed to member(uint32_t).

Returns

The index of the member that has this id or INVALID_INDEX if no member uses that id.

8.418.4.4 add_member() [1/2]

```
UnionType & dds::core::xtypes::UnionType::add_member (
            const  UnionMember & member )
```

Add a member to the end of this union.

8.418.4.5 add_members() [1/3]

```
template<typename Container >
UnionType & dds::core::xtypes::UnionType::add_members (
            const Container & the_members )  [inline]
```

Adds all the members of a container at the end.

8.418.4.6 add_members() [2/3]

```
UnionType & dds::core::xtypes::UnionType::add_members (
            std::initializer_list<  UnionMember > the_members )  [inline]
```

Adds all the members of an initializer_list at the end.

8.418.4.7 add_members() [3/3]

```
template<typename MemberIter >
UnionType & dds::core::xtypes::UnionType::add_members (
            MemberIter begin,
            MemberIter end )  [inline]
```

Adds all the members in an iterator range at the end.

8.418.4.8 add_member() [2/2]

```
 UnionType & dds::core::xtypes::UnionType::add_member (
             UnionMember && the_member )  [inline]
```

Adds a member, moving it, at the end.

8.419 rti::core::UnregisterThreadOnExit Class Reference

<<***extension***>> *(*p. *354)* Utility that calls **rti::core::unregister_thread** (p. 437) when leaving scope

```
#include <rti/core/thread.hpp>
```

Public Member Functions

- ~**UnregisterThreadOnExit** ()

  *Calls **rti::core::unregister_thread** (*p. *437).*

8.419.1 Detailed Description

<<***extension***>> *(*p. *354)* Utility that calls **rti::core::unregister_thread** (p. 437) when leaving scope

Declare an instance of this type in a thread function before any DDS API is called. After the function exits, this variable will be destroyed and the thread unregistered after everything else. This is only required on platforms that do not support automatic thread-specific storage (TSS) cleanup. Refer to the `Platform Notes` to see if your platform supports automatic TSS cleanup. It will be mentioned in the 'Thread Configuration' sub-section of the platform you are using.

See `Unregistering Threads`, in the Core Libraries User's Manual, for the equivalent API call in each of the supported language bindings.

For example:

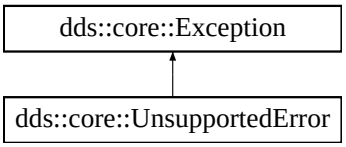
```
void my_thread()
{
    // Whenever my_thread leaves, rti::core::unregister_thread will be
called. UnregisterThreadOnExit unregister_thread_on_exit;
    // Use DDS API
}
```

8.419.2 Constructor & Destructor Documentation

8.419.2.1 ~UnregisterThreadOnExit()

```
rti::core::UnregisterThreadOnExit::~UnregisterThreadOnExit ( )  [inline]
```

Calls **rti::core::unregister_thread** (p. 437).



References **rti::core::unregister_thread()**.

8.420 dds::core::UnsupportedError Class Reference

Indicates that the application used an unsupported operation.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::UnsupportedError:

Public Member Functions

- virtual const char * **what** () const throw ()
  *Access the message contained in this **UnsupportedError** (p. 2590) exception.*

8.420.1 Detailed Description

Indicates that the application used an unsupported operation.

Inherits also from `std::logic_error`

Only unsupported operations can throw this exception.

8.420.2 Member Function Documentation

8.420.2.1 what()

```
virtual const char * dds::core::UnsupportedError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **UnsupportedError** (p. 2590) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.421 dds::core::policy::UserData Class Reference

Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 46) during discovery.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **UserData** ()
  Creates an instance with an empty sequence of bytes.
- **UserData** (const **dds::core::ByteSeq** &seq)
  Creates an instance with a sequence of bytes.
- **UserData** (const uint8_t *value_begin, const uint8_t *value_end)
  Creates an instance with a sequence of bytes.
- template<typename OctetIter >
  UserData & **value** (OctetIter the_begin, OctetIter the_end)
  Sets the byte sequence.
- const **dds::core::ByteSeq** **value** () const
  Gets the user data.
- **dds::core::ByteSeq** & **value** (**dds::core::ByteSeq** &dest) const
  Gets the user data.
- const uint8_t * **begin** () const
  *Gets the beginning of the range of bytes in this **UserData** (p. 2591).*
- const uint8_t * **end** () const
  *Gets the end of the range of bytes in this **UserData** (p. 2591).*

8.421.1 Detailed Description

Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 46) during discovery.

Entity:

dds::domain::DomainParticipant (p. 1326), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)

Properties:

RxO (p. 514) = NO;
Changeable (p. 514) = **YES** (p. 514)

See also

dds::sub::builtin_subscriber (p. 671)

8.421.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **dds::core::Entity** (p. 1520) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Connext.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as **dds::domain::ignore** (p. 635), **dds::pub::ignore** (p. 647), **dds::sub::ignore** (p. 667), and **dds::topic::ignore()** (p. 693), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **rti::core::policy::DomainParticipantResourceLimits::participant_user_data_max_length** (p. 1414), **rti::core::policy::DomainParticipantResourceLimits::writer_user_data_max_length** (p. 1416), and **rti↩ ::core::policy::DomainParticipantResourceLimits::reader_user_data_max_length** (p. 1416).

8.421.3 Constructor & Destructor Documentation

8.421.3.1 UserData() [1/3]

```
dds::core::policy::UserData::UserData ( )  [inline]
```

Creates an instance with an empty sequence of bytes.

8.421.3.2 UserData() [2/3]

```
dds::core::policy::UserData::UserData (
            const  dds::core::ByteSeq & seq )  [inline], [explicit]
```

Creates an instance with a sequence of bytes.

Parameters

seq	A vector containing the bytes to create this **UserData** (p. 2591)

8.421.3.3 UserData() [3/3]

```
dds::core::policy::UserData::UserData (
            const uint8_t * value_begin,
            const uint8_t * value_end )  [inline]
```

Creates an instance with a sequence of bytes.

Parameters

value_begin	Beginning of a range of bytes
value_end	End of the reange

8.421.4 Member Function Documentation

8.421.4.1 value() [1/3]

```
template<typename OctetIter >
UserData & dds::core::policy::UserData::value (
            OctetIter the_begin,
            OctetIter the_end )  [inline]
```

Sets the byte sequence.

Template Parameters

OctetIter	An input iterator of bytes (convertible to uint8_t).

Parameters

the_begin	Beginning of the range
the_end	End of the range

8.421.4.2 value() [2/3]

```
const  dds::core::ByteSeq dds::core::policy::UserData::value ( ) const  [inline]
```

Gets the user data.

Returns

the sequence of bytes representing the user data

8.421.4.3 value() [3/3]

```
dds::core::ByteSeq & dds::core::policy::UserData::value (
            dds::core::ByteSeq & dest ) const  [inline]
```

Gets the user data.

Parameters

dest	The vector where the bytes will be copied

Returns

A reference to `dest`

8.421.4.4 begin()

```
const uint8_t * dds::core::policy::UserData::begin ( ) const  [inline]
```

Gets the beginning of the range of bytes in this **UserData** (p. 2591).

8.421.4.5 end()

```
const uint8_t * dds::core::policy::UserData::end ( ) const  [inline]
```

Gets the end of the range of bytes in this **UserData** (p. 2591).

8.422 rti::sub::ValidLoanedSamples< T > Class Template Reference

<<***extension***>> *(p. 354)* <<***C++11***>> *(p. 353)* <<***move-only-type***>> *(p. 353)* Provides access to only those samples that contain valid data

`#include <LoanedSamplesImpl.hpp>`

Public Types

- typedef **ValidSampleIterator**< T > **iterator**
  *The iterator type that **ValidLoanedSamples** (p. 2595) provides.*
- typedef **ValidSampleIterator**< T > **const_iterator**
  *The const-iterator type that **ValidLoanedSamples** (p. 2595) provides.*
- typedef **ValidSampleIterator**< T >::value_type **value_type**
  This collection's value type, LoanedSample<T>

Public Member Functions

- **ValidLoanedSamples** (LoanedSamples< T > &&loaned_samples)
  Constructor from an rvalue LoanedSamples.
- **ValidLoanedSamples** (**ValidLoanedSamples**< T > &&other)
  Move constructor.
- **iterator begin** ()
  Returns a forward iterator to the first valid-data sample.
- **const_iterator begin** () const
  Returns a forward const iterator to the first valid-data sample.
- **iterator end** ()
  Returns a forward iterator that indicates the end of the collection.
- **const_iterator end** () const
  Returns a forward const iterator that indicates the end of the collection.

Related Functions

(Note that these are not member functions.)

- template<typename T >
  ValidLoanedSamples< T > **::iterator begin** (**ValidLoanedSamples**< T > &ls)
- template<typename T >
  ValidLoanedSamples< T > **::const_iterator begin** (const **ValidLoanedSamples**< T > &ls)
- template<typename T >
  ValidLoanedSamples< T > **::iterator end** (**ValidLoanedSamples**< T > &ls)
- template<typename T >
  ValidLoanedSamples< T > **::const_iterator end** (const **ValidLoanedSamples**< T > &ls)
- template<typename T >
  void **swap** (**ValidLoanedSamples**< T > &ls1, **ValidLoanedSamples**< T > &ls2) throw()

8.422.1 Detailed Description

template<typename T>
class rti::sub::ValidLoanedSamples< T >

*<<**extension**>> (p. 354) <<**C++11**>> (p. 353) <<**move-only-type**>> (p. 353)* Provides access to only those samples that contain valid data

Template Parameters

T	The topic-type. It has to match the type of the DataReader.

An instance of **ValidLoanedSamples** (p. 2595) is a wrapper that takes an existing LoanedSamples and provides forward iterators that only access samples with valid data.

The typical way to use this collection is through the function **rti::sub::valid_data** (p. 766), which transforms a **dds::sub::LoanedSamples** (p. 1663) into a **ValidLoanedSamples** (p. 2595).

For more information and a code example, see **rti::sub::valid_data(LoanedSamples<T>&&)** (p. 766)

See also

Reading data samples (p. 318)

8.422.2 Member Typedef Documentation

8.422.2.1 iterator

```
template<typename T >
typedef  ValidSampleIterator<T>  rti::sub::ValidLoanedSamples< T >::iterator
```

The iterator type that **ValidLoanedSamples** (p. 2595) provides.

8.422.2.2 const_iterator

```
template<typename T >
typedef  ValidSampleIterator<T>  rti::sub::ValidLoanedSamples< T >::const_iterator
```

The const-iterator type that **ValidLoanedSamples** (p. 2595) provides.

8.422.2.3 value_type

```
template<typename T >
typedef  ValidSampleIterator<T>::value_type  rti::sub::ValidLoanedSamples< T >::value_type
```

This collection's value type, LoanedSample<T>

8.422.3 Constructor & Destructor Documentation

8.422.3.1 ValidLoanedSamples() [1/2]

```
template<typename T >
rti::sub::ValidLoanedSamples< T >::ValidLoanedSamples (
            LoanedSamples< T > && loaned_samples )  [inline]
```

Constructor from an rvalue LoanedSamples.

The only way to create a **ValidLoanedSamples** (p. 2595) is through moving an existing LoanedSamples.

Postcondition

loaned_samples is invalid should not be used; this **ValidLoanedSamples** (p. 2595) now owns it.

Note

This constructor should not be used directly, the function **rti::sub::valid_data(LoanedSamples<T>&&)** (p. 766) is more convenient since it can deduce the template type.

8.422.3.2 ValidLoanedSamples() [2/2]

```
template<typename T >
rti::sub::ValidLoanedSamples< T >::ValidLoanedSamples (
             ValidLoanedSamples< T > && other )  [inline]
```

Move constructor.

A **ValidLoanedSamples** (p. 2595), just like LoanedSamples can be moved but not copied.

8.422.4 Member Function Documentation

8.422.4.1 begin() [1/2]

```
template<typename T >
iterator rti::sub::ValidLoanedSamples< T >::begin ( ) [inline]
```

Returns a forward iterator to the first valid-data sample.

Referenced by **rti::sub::ValidLoanedSamples< T >::begin()**.

8.422.4.2 begin() [2/2]

```
template<typename T >
const_iterator rti::sub::ValidLoanedSamples< T >::begin ( ) const [inline]
```

Returns a forward const iterator to the first valid-data sample.

8.422.4.3 end() [1/2]

```
template<typename T >
iterator rti::sub::ValidLoanedSamples< T >::end ( ) [inline]
```

Returns a forward iterator that indicates the end of the collection.

Referenced by **rti::sub::ValidLoanedSamples< T >::end()**.

8.422.4.4 end() [2/2]

```
template<typename T >
const_iterator rti::sub::ValidLoanedSamples< T >::end ( ) const [inline]
```

Returns a forward const iterator that indicates the end of the collection.

8.422.5 Friends And Related Function Documentation

8.422.5.1 begin() [1/2]

```
template<typename T >
ValidLoanedSamples< T > ::iterator begin (
            ValidLoanedSamples< T > & ls )  [related]
```

See also

ValidLoanedSamples::begin() (p. 2597)

References **rti::sub::ValidLoanedSamples< T >::begin()**.

8.422.5.2 begin() [2/2]

```
template<typename T >
ValidLoanedSamples< T > ::const_iterator begin (
          const  ValidLoanedSamples< T > & ls )  [related]
```

See also

ValidLoanedSamples::begin() (p. 2597)

References **rti::sub::ValidLoanedSamples< T >::begin()**.

8.422.5.3 end() [1/2]

```
template<typename T >
ValidLoanedSamples< T > ::iterator end (
            ValidLoanedSamples< T > & ls )  [related]
```

See also

ValidLoanedSamples::end() (p. 2598)

References **rti::sub::ValidLoanedSamples< T >::end()**.

8.422.5.4 end() [2/2]

```
template<typename T >
ValidLoanedSamples< T > ::const_iterator end (
            const  ValidLoanedSamples< T > & ls )  [related]
```

See also

ValidLoanedSamples::end() (p. 2598)

References **rti::sub::ValidLoanedSamples< T >::end()**.

8.422.5.5 swap()

```
template<typename T >
void swap (
             ValidLoanedSamples< T > & ls1,
             ValidLoanedSamples< T > & ls2 ) throw( )   [related]
```

8.423 rti::sub::ValidSampleIterator< T > Class Template Reference

A forward iterator adapter that skips invalid samples.

`#include <SampleIterator.hpp>`

8.423.1 Detailed Description

template<typename T>
class rti::sub::ValidSampleIterator< T >

A forward iterator adapter that skips invalid samples.

Instead of instantiating this class directly, use **valid_data()** (p. 766).

See also

rti::sub::valid_data(const SampleIterator<T> &) (p. 767)

rti::sub::valid_data(LoanedSamples<T>&&) (p. 766)

8.424 dds::core::Value< D > Class Template Reference

`#include <Value.hpp>`

Public Member Functions

- const D * **operator->** () const OMG_NOEXCEPT
- D * **operator->** () OMG_NOEXCEPT
- const D & **delegate** () const OMG_NOEXCEPT
- D & **delegate** () OMG_NOEXCEPT
- const D & **extensions** () const OMG_NOEXCEPT
- D & **extensions** () OMG_NOEXCEPT
- **operator D&** () OMG_NOEXCEPT
- **operator const D &** () const OMG_NOEXCEPT

8.424.1 Detailed Description

template<typename D>
class dds::core::Value< D >

This class provides the basic behavior for **Value** (p. 2601) types.

8.424.2 Member Function Documentation

8.424.2.1 operator->() [1/2]

```
template<typename D >
const D *  dds::core::Value< D >::operator-> ( ) const  [inline]
```

Return the delegate.

8.424.2.2 operator->() [2/2]

```
template<typename D >
D *  dds::core::Value< D >::operator-> ( )  [inline]
```

Return the delegate.

8.424.2.3 delegate() [1/2]

```
template<typename D >
const D &  dds::core::Value< D >::delegate ( ) const  [inline]
```

Return the delegate.

Referenced by **dds::core::StringTopicType::data()**, **dds::topic::PublicationBuiltinTopicData::data_tag()**, **dds::topic::TopicBuiltinTopicData::destination_order()**, **dds::topic::TopicBuiltinTopicData::durability_service()**, **dds::topic::PublicationBuiltinTopicData::group_data()**, **dds::topic::TopicBuiltinTopicData::history()**, **dds::core::KeyedStringTopicType::key()**, **dds::topic::TopicBuiltinTopicData::key()**, **dds::core::KeyedBytesTopicType::key()**, **dds::topic::TopicBuiltinTopicData::latency_budget()**, **dds::core::BytesTopicType::length()**, **dds::core::KeyedBytesTopicType::length()**, **dds::topic::TopicBuiltinTopicData::lifespan()**, **dds::topic::TopicBuiltinTopicData::liveliness()**, **dds::topic::TopicBuiltinTopicData::name()**, **dds::core::KeyedBytesTopicType::operator std::vector< uint8_t >()**, **dds::core::BytesTopicType::operator[]()**, **dds::core::KeyedBytesTopicType::operator[]()**, **dds::topic::TopicBuiltinTopicData::ownership()**, **dds::topic::PublicationBuiltinTopicData::partition()**, **dds::topic::TopicBuiltinTopicData::reliability()**, **dds::topic::TopicBuiltinTopicData::representation()**, **dds::topic::PublicationBuiltinTopicData::representation()**, **dds::topic::TopicBuiltinTopicData::resource_limits()**, **dds::pub::SuspendedPublication::resume()**, **dds::topic::TopicBuiltinTopicData::topic_data()**, **dds::topic::PublicationBuiltinTopicData::topic_data()**, **dds::topic::TopicBuiltinTopicData::transport_priority()**, **dds::topic::TopicBuiltinTopicData::type_name()**, **dds::core::KeyedStringTopicType::value()**, and **dds::core::KeyedBytesTopicType::value()**.

8.424.2.4 delegate() [2/2]

```
template<typename D >
D &  dds::core::Value< D >::delegate ( )  [inline]
```

Return the delegate.

8.424.2.5 extensions() [1/2]

```
template<typename D >
const D &  dds::core::Value< D >::extensions ( ) const  [inline]
```

Provides access to the extensions (just like **delegate()** (p. 2602))

8.424.2.6 extensions() [2/2]

```
template<typename D >
D &  dds::core::Value< D >::extensions ( )  [inline]
```

Provides access to the extensions (just like delegate)

8.424.2.7 operator D&()

```
template<typename D >
dds::core::Value< D >::operator D& ( )  [inline]
```

Return the delegate.

8.424.2.8 operator const D &()

```
template<typename D >
dds::core::Value< D >::operator const D & ( ) const  [inline]
```

Return the delegate.

8.425 dds::core::vector< T > Class Template Reference

<<***value-type***>> *(*p. *350)* A vector convertible to std::vector and with similar functionality

```
#include <dds/core/vector.hpp>
```

Public Member Functions

- **vector** ()
  Creates an empty vector.
- **vector** (size_type initial_size)
  Creates a vector with a number of default-constructed elements.
- **vector** (size_type initial_size, const T &value)
  Creates a vector with a number of copies of a value.
- **vector** (const **vector** &other)
  Creates a copy.
- **vector** (const std::vector< T > &other)
  Implicit construction from std::vector.
- **vector** (**vector** &&other) OMG_NOEXCEPT
  Creates a vector by moving an existing one.
- **operator std::vector**< **T** > () const
  Provides a conversion to std::vector.
- size_type **size** () const
  Get the current size.
- size_type **capacity** () const
  Get the current capacity.
- void **resize** (size_type new_size)
  Set the size to new_size.
- void **resize** (size_type new_size, const T &value)
  Set the size to new_size, copying value if new elements are added.
- void **clear** ()

Resize to zero.

- void **reserve** (size_type new_capacity)

  Reserve a new capacity without creating any elements or changing the size.
- reference **at** (size_type i)

  Get an element by reference and check bounds.
- const_reference **at** (size_type i) const

  Get an element by const-reference and check bounds.
- reference **operator[ ]** (size_type i)

  Get an element by reference.
- const_reference **operator[ ]** (size_type i) const

  Get an element by const-reference.
- **vector** & **operator=** (const **vector** &other)

  Assign another vector to this one.
- **vector** & **operator=** (**vector** &&other) OMG_NOEXCEPT

  Move-assign another vector to this one.
- bool **operator==** (const **vector** &other) const

  Returns if the elements of two vectors are equal.
- bool **operator!=** (const **vector** &other) const

  Returns if two vectors are different.
- iterator **begin** ()

  Iterator to the first element.
- const_iterator **begin** () const

  Const iterator to first element.
- iterator **end** ()

  Iterator to last element plus one.
- const_iterator **end** () const

  Const iterator to last element plus one.

Friends

- void **swap** (**vector** &left, **vector** &right) OMG_NOEXCEPT

  Efficiently swaps the contents of two vectors.

Related Functions

(Note that these are not member functions.)

- template<typename T , size_t N>
  std::ostream & **operator**<< (std::ostream &out, const bounded_sequence< T, N > &v)

  Print a vector applying << to all of its elements.
- template<typename T >
  std::ostream & **operator**<< (std::ostream &out, const **vector**< T > &v)

  Print a vector applying << to all of its elements.

8.425.1 Detailed Description

template<typename T>
class dds::core::vector< T >

<<***value-type***>> *(p. 350)* A vector convertible to std::vector and with similar functionality

In many cases, for performance reasons and other implementation requirements, the RTI Connext API uses **dds::core::vector** (p. 2603) instead of std::vector. The most significant case is the C++ types that rtiddsgen generates from **IDL** (p. 606).

A **dds::core::vector** (p. 2603) provides a subset of the functionality of a `std::vector`, including iterators, resizing and indexed access. It also provides automatic conversion to and from std::vector, making code like the following possible:

```
// IDL-generated type
class Foo {
public:
    // ...
    const dds::core::vector<int32_t>& my_ints() const;
};
// Application
Foo sample = ...;
dds::vector<int32_t> my_std_vector = sample.my_ints(); // conversion to std::vector
// ...
sample.my_ints() = my_std_vector; // conversion from std::vector
```

8.425.2 Constructor & Destructor Documentation

8.425.2.1 vector() [1/6]

```
template<typename T >
dds::core::vector< T >::vector ( )  [inline]
```

Creates an empty vector.

8.425.2.2 vector() [2/6]

```
template<typename T >
dds::core::vector< T >::vector (
            size_type initial_size )  [inline], [explicit]
```

Creates a vector with a number of default-constructed elements.

8.425.2.3 vector() [3/6]

```
template<typename T >
dds::core::vector< T >::vector (
            size_type initial_size,
            const T & value )  [inline]
```

Creates a vector with a number of copies of a value.

8.425.2.4 vector() [4/6]

```
template<typename T >
dds::core::vector< T >::vector (
            const  vector< T > & other )  [inline]
```

Creates a copy.

8.425.2.5 vector() [5/6]

```
template<typename T >
dds::core::vector< T >::vector (
            const std::vector< T > & other )  [inline]
```

Implicit construction from std::vector.

Note: this operation makes a copy of all the elements in `other`

8.425.2.6 vector() [6/6]

```
template<typename T >
dds::core::vector< T >::vector (
             vector< T > && other )  [inline]
```

Creates a vector by moving an existing one.

8.425.3 Member Function Documentation

8.425.3.1 operator std::vector< T >()

```
template<typename T >
dds::core::vector< T >::operator std::vector< T > ( ) const  [inline]
```

Provides a conversion to std::vector.

Note: this operation makes a copy of all the elements in this vector

8.425.3.2 size()

```
template<typename T >
size_type  dds::core::vector< T >::size ( ) const  [inline]
```

Get the current size.

8.425.3.3 capacity()

```
template<typename T >
size_type  dds::core::vector< T >::capacity ( ) const  [inline]
```

Get the current capacity.

8.425.3.4 resize() [1/2]

```
template<typename T >
void  dds::core::vector< T >::resize (
            size_type new_size )  [inline]
```

Set the size to new_size.

8.425.3.5 resize() [2/2]

```
template<typename T >
void  dds::core::vector< T >::resize (
            size_type new_size,
            const T & value )  [inline]
```

Set the size to new_size, copying value if new elements are added.

8.425.3.6 clear()

```
template<typename T >
void  dds::core::vector< T >::clear ( )  [inline]
```

Resize to zero.

8.425.3.7 reserve()

```
template<typename T >
void  dds::core::vector< T >::reserve (
            size_type new_capacity )  [inline]
```

Reserve a new capacity without creating any elements or changing the size.

8.425.3.8 at() [1/2]

```
template<typename T >
reference  dds::core::vector< T >::at (
            size_type i )  [inline]
```

Get an element by reference and check bounds.

Exceptions

std::out_of_range	if `i` is out of bounds

8.425.3.9 at() [2/2]

```
template<typename T >
const_reference  dds::core::vector< T >::at (
            size_type i ) const  [inline]
```

Get an element by const-reference and check bounds.

Exceptions

std::out_of_range	if `i` is out of bounds

8.425.3.10 operator[]() [1/2]

```
template<typename T >
reference  dds::core::vector< T >::operator[] (
             size_type i )  [inline]
```

Get an element by reference.

8.425.3.11 operator[]() [2/2]

```
template<typename T >
const_reference  dds::core::vector< T >::operator[] (
             size_type i ) const  [inline]
```

Get an element by const-reference.

8.425.3.12 operator=() [1/2]

```
template<typename T >
vector &  dds::core::vector< T >::operator= (
             const  vector< T > & other )  [inline]
```

Assign another vector to this one.

8.425.3.13 operator=() [2/2]

```
template<typename T >
vector &  dds::core::vector< T >::operator= (
              vector< T > && other )  [inline]
```

Move-assign another vector to this one.

8.425.3.14 operator==()

```
template<typename T >
bool  dds::core::vector< T >::operator== (
            const  vector< T > & other ) const  [inline]
```

Returns if the elements of two vectors are equal.

8.425.3.15 operator"!=()

```
template<typename T >
bool  dds::core::vector< T >::operator!= (
            const  vector< T > & other ) const  [inline]
```

Returns if two vectors are different.

8.425.3.16 begin() [1/2]

```
template<typename T >
iterator  dds::core::vector< T >::begin ( )  [inline]
```

Iterator to the first element.

8.425.3.17 begin() [2/2]

```
template<typename T >
const_iterator  dds::core::vector< T >::begin ( ) const  [inline]
```

Const iterator to first element.

8.425.3.18 end() [1/2]

```
template<typename T >
iterator  dds::core::vector< T >::end ( )  [inline]
```

Iterator to last element plus one.

8.425.3.19 end() [2/2]

```
template<typename T >
const_iterator  dds::core::vector< T >::end ( ) const  [inline]
```

Const iterator to last element plus one.

8.425.4 Friends And Related Function Documentation

8.425.4.1 swap

```
template<typename T >
void swap (
              vector< T > & left,
              vector< T > & right )  [friend]
```

Efficiently swaps the contents of two vectors.

8.425.4.2 operator<<() [1/2]

```
template<typename T , size_t N>
std::ostream & operator<< (
             std::ostream & out,
             const bounded_sequence< T, N > & v )  [related]
```

Print a vector applying << to all of its elements.

8.425.4.3 operator<<() [2/2]

```
template<typename T >
std::ostream & operator<< (
             std::ostream & out,
             const  vector< T > & v )  [related]
```

Print a vector applying << to all of its elements.

8.426 rti::core::VendorId Class Reference

<<***extension***>> *(*p. *354)* Represents the vendor of the service implementing the RTPS protocol.

`#include <rti/core/VendorId.hpp>`

Public Member Functions

- **VendorId** ()

  *Creates the **unknown()** (*p. *2612) vendor id.*
- std::vector< uint8_t > **value** () const

  Provides access to the bytes that represent the vendor id.

Static Public Member Functions

- static **VendorId unknown** ()

  The ID that indicates that the vendor is unknown.

8.426.1 Detailed Description

<<***extension***>> *(*p. *354)* Represents the vendor of the service implementing the RTPS protocol.

8.426.2 Constructor & Destructor Documentation

8.426.2.1 VendorId()

`rti::core::VendorId::VendorId ( )  [inline]`

Creates the **unknown()** (p. 2612) vendor id.

8.426.3 Member Function Documentation

8.426.3.1 value()

`std::vector< uint8_t > rti::core::VendorId::value ( ) const  [inline]`

Provides access to the bytes that represent the vendor id.

8.426.3.2 unknown()

```
static VendorId rti::core::VendorId::unknown ( ) [inline], [static]
```

The ID that indicates that the vendor is unknown.

8.427 rti::config::Verbosity_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 2265) Verbosity.

```
#include <rti/config/Logger.hpp>
```

Public Types

- enum **type** {
  silent ,
  exception ,
  warning ,
  status_local ,
  status_remote ,
  status_all ,
  SILENT = silent ,
  EXCEPTION = exception ,
  WARNING = warning ,
  STATUS_LOCAL = status_local ,
  STATUS_REMOTE = status_remote ,
  STATUS_ALL = status_all ,
  ERRORY = EXCEPTION }

  The underlying `enum` type.

8.427.1 Detailed Description

The definition of the **dds::core::safe_enum** (p. 2265) Verbosity.

8.427.2 Member Enumeration Documentation

8.427.2.1 type

```
enum rti::config::Verbosity_def::type
```

The underlying `enum` type.

Enumerator

silent	No further output will be logged.
exception	Only error and fatal error messages will be logged. An error indicates something wrong in the functioning of RTI Connext. The most common cause of errors is incorrect configuration.
warning	Both error and warning messages will be logged. A warning indicates that RTI Connext is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
status_local	Errors, warnings, and verbose information about the lifecycles of local RTI Connext objects will be logged.
status_remote	Errors, warnings, and verbose information about the lifecycles of remote RTI Connext objects will be logged.
status_all	Errors, warnings, verbose information about the lifecycles of local and remote RTI Connext objects, and periodic information about RTI Connext threads will be logged.

8.428 dds::sub::status::ViewState Class Reference

Indicates whether or not an instance is new.

`#include <dds/sub/status/DataState.hpp>`

Inherits std::bitset< OMG_DDS_STATE_BIT_COUNT >.

Public Types

- typedef std::bitset< OMG_DDS_STATE_BIT_COUNT > **MaskType**

  An std::bitset of ViewStates.

Public Member Functions

- **ViewState** (const **MaskType** &other)

  *Create an **ViewState** (p. 2614) from MaskType.*

Static Public Member Functions

- static const **ViewState** **new_view** ()

  *Creates a new_view **ViewState** (p. 2614) object.*
- static const **ViewState** **not_new_view** ()

  *Creates a not_new_view **ViewState** (p. 2614) object.*
- static const **ViewState** **any** ()

  *Creates a **ViewState** (p. 2614) object representing any view state.*

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator**<< (std::ostream &os, const **ViewState** &s)
  Prints a view state as a readable string.

8.428.1 Detailed Description

Indicates whether or not an instance is new.

For each instance (identified by the key), the middleware internally maintains a view state relative to each **dds::sub::DataReader** (p. 976). The view state can be either:

- **dds::sub::status::ViewState::new_view()** (p. 2616) indicates that either this is the first time that the **dds::sub::DataReader** (p. 976) has ever accessed samples of that instance, or else that the **dds::sub::DataReader** (p. 976) has accessed previous samples of the instance, but the instance has since been reborn (i.e. become not-alive and then alive again). These two cases are distinguished by examining the **dds::sub::GenerationCount::disposed()** (p. 1590) and the **dds::sub::GenerationCount::no_writers()** (p. 1590).

- **dds::sub::status::ViewState::not_new_view()** (p. 2616) indicates that the **dds::sub::DataReader** (p. 976) has already accessed samples of the same instance and that the instance has not been reborn since.

The view_state available in the **dds::sub::SampleInfo** (p. 2285) is a snapshot of the view state of the instance relative to the **dds::sub::DataReader** (p. 976) used to access the samples at the time the collection was obtained (i.e. at the time read or take was called). The view_state is therefore the same for all samples in the returned collection that refer to the same instance.

Once an instance has been detected as not having any "live" writers and all the samples associated with the instance are "taken" from the **dds::sub::DataReader** (p. 976), the middleware can reclaim all local resources regarding the instance. Future samples will be treated as "never seen."

8.428.2 Member Typedef Documentation

8.428.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT >  dds::sub::status::ViewState::MaskType
```

An std::bitset of ViewStates.

8.428.3 Constructor & Destructor Documentation

8.428.3.1 ViewState()

```
dds::sub::status::ViewState::ViewState (
            const  MaskType & other )  [inline]
```

Create an **ViewState** (p. 2614) from MaskType.

Parameters

other	The MaskType to create the **ViewState** (p. 2614) with

8.428.4 Member Function Documentation

8.428.4.1 new_view()

```
static const  ViewState dds::sub::status::ViewState::new_view ( )  [inline], [static]
```

Creates a new_view **ViewState** (p. 2614) object.

A new_view **ViewState** (p. 2614) indicates that the latest generation of the instance has not previously been accessed.

Referenced by **dds::sub::status::DataState::new_instance()**.

8.428.4.2 not_new_view()

```
static const  ViewState dds::sub::status::ViewState::not_new_view ( )  [inline], [static]
```

Creates a not_new_view **ViewState** (p. 2614) object.

Indicates that the latest generation of an instance has previously been accessed.

8.428.4.3 any()

```
static const  ViewState dds::sub::status::ViewState::any ( )  [inline], [static]
```

Creates a **ViewState** (p. 2614) object representing any view state.

This is equivalent to **new_view()** (p. 2616) | **not_new_view()** (p. 2616)

Referenced by **dds::sub::status::DataState::any()**, **dds::sub::status::DataState::any_data()**, and **dds::sub↩ ::status::DataState::new_data()**.

8.428.5 Friends And Related Function Documentation

8.428.5.1 operator<<()

```
std::ostream & operator<< (
            std::ostream & os,
            const  ViewState & s )  [related]
```

Prints a view state as a readable string.

8.429 dds::core::cond::WaitSet Class Reference

<<*reference-type*>> *(*p. *351)* Allows an application to wait until one or more of the attached **Condition** (p. 948) objects have a trigger_value of true or else until the timeout expires.

```
#include <dds/core/cond/WaitSet.hpp>
```

Public Types

- typedef std::vector< **dds::core::cond::Condition** > **ConditionSeq**

  A vector of Conditions.

Public Member Functions

- **WaitSet** ()

  *Creates a **WaitSet** (*p. *2617) with no conditions attached.*
- **WaitSetImpl** (const **rti::core::cond::WaitSetProperty** & **property**)

  <<***extension***>> *(*p. *354) Creates a **WaitSet** (*p. *2617) with a WaitSetProperty*
- const **ConditionSeq** **wait** (const **dds::core::Duration** &timeout)

  Allows an application thread to wait for the occurrence of certain conditions.
- const **ConditionSeq** **wait** ()

  Allows an application thread to wait for the occurrence of certain conditions.
- **ConditionSeq** & **wait** (**ConditionSeq** &triggered, const **dds::core::Duration** &timeout)

  Allows an application thread to wait for the occurrence of certain conditions.
- **ConditionSeq** & **wait** (**ConditionSeq** &triggered)

  Allows an application thread to wait for the occurrence of certain conditions.
- void **dispatch** (const **dds::core::Duration** &timeout)

  Waits for at least one of the attached conditions to trigger and then dispatches the events.
- void **dispatch** ()

  Waits for at least one of the attached conditions to trigger and then dispatches the events.
- **WaitSet** & **operator+=** (**dds::core::cond::Condition** cond)

  *Same as **attach_condition()** (*p. *2624)*
- **WaitSet** & **operator-=** (**dds::core::cond::Condition** cond)

  *Same as **detach_condition()** (*p. *2625).*
- **WaitSet** & **attach_condition** (**dds::core::cond::Condition** cond)

  *Attaches a **Condition** (*p. *948) to the **WaitSet** (*p. *2617).*
- bool **detach_condition** (**dds::core::cond::Condition** cond)

*Detaches a **Condition** (p. 948) from the **WaitSet** (p. 2617).*

- **ConditionSeq conditions** () const

  Retrieves the list of attached conditions.

- **ConditionSeq** & **conditions** (**ConditionSeq** &conds) const

  Retrieves the list of attached conditions.

- bool **wait_one** (const **dds::core::Duration** &timeout)

  *<<**extension**>> (p. 354) Simpler **wait()** (p. 2622) when only one condition is attached*

  *<<**extension**>> (p. 354) Sets the property to configure the **WaitSet** (p. 2617) to return after one or more trigger events have occurred.*

8.429.1 Detailed Description

*<<**reference-type**>> (p. 351)* Allows an application to wait until one or more of the attached **Condition** (p. 948) objects have a trigger_value of true or else until the timeout expires.

Note

A **WaitSet** (p. 2617) provides all the functions of a *<<**reference-type**>> (p. 351)* except **close()** (p. 1024) and retain().

8.429.2 Usage

dds::core::cond::Condition (p. 948) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

This mechanism is wait-based. Its general use pattern is as follows:

- The application indicates which relevant information it wants to get by creating **dds::core::cond::Condition** (p. 948) objects (**dds::core::cond::StatusCondition** (p. 2372), **dds::sub::cond::ReadCondition** (p. 2133) or **dds::sub::cond::QueryCondition** (p. 2059)) and attaching them to a **dds::core::cond::WaitSet** (p. 2617).

- It then waits on that **dds::core::cond::WaitSet** (p. 2617) until the `trigger_value` of one or several **dds::core::cond::Condition** (p. 948) objects become true.

- It then uses the result of the wait (i.e., active_conditions, the list of **dds::core::cond::Condition** (p. 948) objects with `trigger_value` == true) to actually get the information:

  – by calling **dds::core::Entity::status_changes()** (p. 1525) and then `get_<communication_status>()` on the relevant **dds::core::Entity** (p. 1520), if the condition is a **dds::core::cond::StatusCondition** (p. 2372) and the status changes, refer to plain communication status;

- by calling **dds::core::Entity::status_changes()** (p. 1525) and then **dds::sub::find** (p. 672) on the relevant **dds::sub::Subscriber** (p. 2410) (and then **dds::sub::DataReader::read()** (p. 996) or **dds::sub::Data↩ Reader::take** (p. 997) on the returned **dds::sub::DataReader** (p. 976) objects), if the condition is a **dds↩ ::core::cond::StatusCondition** (p. 2372) and the status changes refers to **dds::core::status::Status↩ Mask::data_on_readers()** (p. 2382);
- by calling **dds::core::Entity::status_changes()** (p. 1525) and then **dds::sub::DataReader::read()** (p. 996) or **dds::sub::DataReader::take** (p. 997) on the relevant **dds::sub::DataReader** (p. 976), if the condition is a **dds::core::cond::StatusCondition** (p. 2372) and the status changes refers to **dds::core::status::↩ StatusMask::data_available()** (p. 2383);
- by calling directly dds::sub::DataReader::read_w_condition or dds::sub::DataReader::take_w_condition on a **dds::sub::DataReader** (p. 976) with the **dds::core::cond::Condition** (p. 948) as a parameter if it is a **dds::sub::cond::ReadCondition** (p. 2133) or a **dds::sub::cond::QueryCondition** (p. 2059).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **dds::core::cond::Condition** (p. 948) objects), **dds::core::cond::Condition** (p. 948) objects are meant to embed all that is needed to react properly when enabled. In particular, **dds::core::Entity** (p. 1520)-related conditions are related to exactly one **dds::core::Entity** (p. 1520) and cannot be shared.

The blocking behavior of the **dds::core::cond::WaitSet** (p. 2617) is illustrated below.

The result of a **dds::core::cond::WaitSet::wait** (p. 2621) operation depends on the state of the **dds::core::cond::↩ WaitSet** (p. 2617), which in turn depends on whether at least one attached **dds::core::cond::Condition** (p. 948) has a `trigger_value` of true. If the wait operation is called on **dds::core::cond::WaitSet** (p. 2617) with state BLOCKED, it will block the calling thread. If wait is called on a **dds::core::cond::WaitSet** (p. 2617) with state UNBLOCKED, it will return immediately. In addition, when the **dds::core::cond::WaitSet** (p. 2617) transitions from BLOCKED to UNBLOCKED it wakes up any threads that had called wait on it.

A key aspect of the **Condition** (p. 948) and **WaitSet** (p. 2617) mechanism is the setting of the `trigger_value` of each **dds::core::cond::Condition** (p. 948).

The **dds::core::cond::WaitSet** (p. 2617) cannot be used after calling DomainParticipantFactory::finalize_instance.

8.429.3 Trigger State of a dds::core::cond::StatusCondition

The `trigger_value` of a **dds::core::cond::StatusCondition** (p. 2372) is the boolean OR of the ChangedStatus↩ Flag of all the communication statuses (see **Status Kinds** (p. 429)) to which it is sensitive. That is, `trigger_value` == false only if all the values of the ChangedStatusFlags are false.

The sensitivity of the **dds::core::cond::StatusCondition** (p. 2372) to a particular communication status is controlled by the list of `enabled_statuses` set on the condition by means of the **dds::core::cond::StatusCondition::enabled↩ _statuses(const dds::core::status::StatusMask&)** (p. 2373) operation.

Once the `trigger_value` of a **StatusCondition** (p. 2372) becomes true, it remains true until the status that changed is reset. To reset a status, call the related get_*_status() operation. Or, in the case of the data available status, call **read()** (p. 1024), **take()** (p. 1024), or one of their variants. Therefore, if you are using a **dds::core::cond::Status↩ Condition** (p. 2372) on a **dds::core::cond::WaitSet** (p. 2617) to be notified of events, your thread will wake up when one of the statuses associated with the **StatusCondition** (p. 2372) becomes true. If you do not reset the status, the **StatusCondition** (p. 2372) `trigger_value` remains true and your **WaitSet** (p. 2617) will not block again; it will immediately wake up when you call **dds::core::cond::WaitSet::wait** (p. 2621).

8.429.4 Trigger State of a dds::sub::cond::ReadCondition

Similar to the **dds::core::cond::StatusCondition** (p. 2372), a **dds::sub::cond::ReadCondition** (p. 2133) also has a `trigger_value` that determines whether the attached **dds::core::cond::WaitSet** (p. 2617) is BLOCKED or UNBLOCKED. However, unlike the **dds::core::cond::StatusCondition** (p. 2372), the `trigger_value` of the **dds::sub::cond::ReadCondition** (p. 2133) is tied to the presence of *at least a sample* managed by RTI Connext with **dds::sub::status::SampleState** (p. 2316) and **dds::sub::status::ViewState** (p. 2614) matching those of the **dds::sub::cond::ReadCondition** (p. 2133). Furthermore, for the **dds::sub::cond::QueryCondition** (p. 2059) to have a `trigger_value` == true, the data associated with the sample must be such that the `query_expression` evaluates to true.

The fact that the trigger_value of a **dds::sub::cond::ReadCondition** (p. 2133) depends on the presence of samples on the associated **dds::sub::DataReader** (p. 976) implies that a single take operation can potentially change the `trigger_value` of several **dds::sub::cond::ReadCondition** (p. 2133) or **dds::sub::cond::QueryCondition** (p. 2059) conditions. For example, if all samples are taken, any **dds::sub::cond::ReadCondition** (p. 2133) and **dds::sub::cond::QueryCondition** (p. 2059) conditions associated with the **dds::sub::DataReader** (p. 976) that had their `trigger_value==TRUE` before will see the `trigger_value` change to FALSE. Note that this does not guarantee that **dds::core::cond::WaitSet** (p. 2617) objects that were separately attached to those conditions will not be woken up. Once we have `trigger_value==TRUE` on a condition, it may wake up the attached **dds::core::cond::WaitSet** (p. 2617), the condition transitioning to `trigger_value==FALSE` does not necessarily 'unwakeup' the **WaitSet** (p. 2617) as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a **dds::core::cond::WaitSet** (p. 2617) may return from the wait with a list of conditions, some of which are not no longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate **dds::core::cond::WaitSet** (p. 2617) objects and taking data associated with the same **dds::sub::DataReader** (p. 976) entity.

To elaborate further, consider the following example: A **dds::sub::cond::ReadCondition** (p. 2133) that has a `sample_state_mask` = {**dds::sub::status::SampleState::not_read()** (p. 2318)} will have `trigger_value` of true whenever a new sample arrives and will transition to false as soon as all the newly-arrived samples are either read (so their sample state changes to READ) or taken (so they are no longer managed by RTI Connext). However if the same **dds::sub::cond::ReadCondition** (p. 2133) had a `sample_state_mask` = { **dds::sub::status::SampleState::read()** (p. 2318), **dds::sub::status::SampleState::not_read()** (p. 2318) }, then the `trigger_value` would only become false once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to READ), which overlaps the mask on the **dds::sub::cond::ReadCondition** (p. 2133).

8.429.5 Trigger State of a dds::core::cond::GuardCondition

The `trigger_value` of a **dds::core::cond::GuardCondition** (p. 1594) is completely controlled by the application via the operation **dds::core::cond::GuardCondition::trigger_value()** (p. 1595).

8.429.6.1 ConditionSeq

```
typedef std::vector< dds::core::cond::Condition> dds::core::cond::WaitSet::ConditionSeq
```

A vector of Conditions.

8.429.7 Constructor & Destructor Documentation

8.429.7.1 WaitSet()

```
dds::core::cond::WaitSet::WaitSet ( )  [inline]
```

Creates a **WaitSet** (p. 2617) with no conditions attached.

8.429.8 Member Function Documentation

8.429.8.1 WaitSetImpl()

```
dds::core::cond::WaitSet::WaitSetImpl (
            const  rti::core::cond::WaitSetProperty & property )
```

<<***extension***>> *(p. 354)* Creates a **WaitSet** (p. 2617) with a WaitSetProperty

8.429.8.2 wait() [1/4]

```
const  ConditionSeq dds::core::cond::WaitSet::wait (
            const  dds::core::Duration & timeout )  [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **dds::core::cond::WaitSet** (p. 2617) have a trigger_value of true, the wait operation will block, suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a trigger_value of true (i.e., the conditions that unblocked the wait).

The wait operation takes a timeout argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached **dds::core::cond::Condition** (p. 948) objects are true, wait will return an empty condition sequence.

Note: The resolution of the timeout period is constrained by the resolution of the system clock.

It is not allowable for more than one application thread to be waiting on the same **WaitSet** (p. 2617). If the wait operation is invoked on a **WaitSet** (p. 2617) that already has a thread blocking on it, the operation will return immediately with the value **dds::core::PreconditionNotMetError** (p. 1941).

Parameters

timeout	The maximum time to wait

Returns

A vector containing the active conditions or an empty vector if the operation times out.

Exceptions

dds::core::PreconditionNotMetError *(p. 1941)*	or one of the other **Standard Exceptions** (p. 428). Note however that this operation *does not* throw **dds::core::TimeoutError** (p. 2473).

8.429.8.3 wait() [2/4]

```
const  ConditionSeq dds::core::cond::WaitSet::wait ( )  [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

This function is equivalent to `wait(dds::core::Duration::infinite())`.

See also

wait(const dds::core::Duration&) (p. 2621)

8.429.8.4 wait() [3/4]

```
ConditionSeq & dds::core::cond::WaitSet::wait (
            ConditionSeq & triggered,
          const  dds::core::Duration & timeout )  [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

This function is equivalent to **`wait(const dds::core::Duration&)`** (p. 2621) but reuses an existing vector instead of returning a new one.

Parameters

triggered	A vector where the active conditions will be added. Any element already present in the vector will be removed. If the operation times out, this vector will be empty.
timeout	The wait timeout

Returns

A reference to `triggered` for convenience.

See also

wait(const dds::core::Duration&) (p. 2621)

8.429.8.5 wait() [4/4]

```
ConditionSeq & dds::core::cond::WaitSet::wait (
            ConditionSeq & triggered )  [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

This application is equivalent to wait(triggered, dds::core::Duration::infinite());

See also

wait(ConditionSeq&, const dds::core::Duration&) (p. 2622)

8.429.8.6 dispatch() [1/2]

```
void dds::core::cond::WaitSet::dispatch (
            const  dds::core::Duration & timeout )  [inline]
```

Waits for at least one of the attached conditions to trigger and then dispatches the events.

This is an alternative, simpler pattern to the use of **wait()** (p. 2622). Instead of receiving the list of active conditions, the application associates a handler (functor) to each conditions before attaching it to the **WaitSet** (p. 2617). Whenever this function wakes up it will call–in the current thread context–the handler of each triggered condition before returning.

Note that each condition can only have one handler, so if you want to attach it to multiple WaitSets you may need to use **wait()** (p. 2622) instead of **dispatch()** (p. 2624).

Parameters

timeout	The maximum time to wait. If that time elapses **dispatch()** (p. 2624) will return without having called any of the condition handlers.

MT Safety:

It is not thread-safe to reset or replace a condition's handler while **dispatch()** (p. 2624) is running. It should be detached first. Detaching a condition from a **WaitSet** (p. 2617) while **dispatch()** (p. 2624) is running is safe even if the condition is active, but whether the condition handler will be executed or not is undefined.

See also

WaitSet wait and dispatch examples (p. 330)

Examples

Foo_subscriber.cxx.

8.429.8.7 dispatch() [2/2]

```
void dds::core::cond::WaitSet::dispatch ( )  [inline]
```

Waits for at least one of the attached conditions to trigger and then dispatches the events.

This function is equivalent to dispatch(dds::core::Duration::infinite());

See also

dispatch(const dds::core::Duration&) (p. 2623)

8.429.8.8 operator+=()

```
WaitSet & dds::core::cond::WaitSet::operator+= (
            dds::core::cond::Condition cond )  [inline]
```

Same as **attach_condition()** (p. 2624)

8.429.8.9 operator-=()

```
WaitSet & dds::core::cond::WaitSet::operator-= (
            dds::core::cond::Condition cond )  [inline]
```

Same as **detach_condition()** (p. 2625).

8.429.8.10 attach_condition()

```
WaitSet & dds::core::cond::WaitSet::attach_condition (
            dds::core::cond::Condition cond )  [inline]
```

Attaches a **Condition** (p. 948) to the **WaitSet** (p. 2617).

It is possible to attach a **dds::core::cond::Condition** (p. 948) on a **dds::core::cond::WaitSet** (p. 2617) that is currently being waited upon (via the wait operation). In this case, if the **dds::core::cond::Condition** (p. 948) has a `trigger_value` of true, then attaching the condition will unblock the **dds::core::cond::WaitSet** (p. 2617).

If the same **dds::core::cond::Condition** (p. 948) is attached multiple times, only the first attachment has any effect. Subsequent attempts to attach the same **dds::core::cond::Condition** (p. 948) are silently ignored. As a result, the **dds::core::cond::Condition** (p. 948) is only considered attached once and must only be detached once.

Parameters

cond	<<***in***>> *(p. 355)* **Condition** (p. 948) to be attached.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::OutOfResourcesError** (p. 1898).

8.429.8.11 detach_condition()

```
bool dds::core::cond::WaitSet::detach_condition (
            dds::core::cond::Condition cond )  [inline]
```

Detaches a **Condition** (p. 948) from the **WaitSet** (p. 2617).

It is possible to detach a **dds::core::cond::Condition** (p. 948) on a **dds::core::cond::WaitSet** (p. 2617) that is currently being waited upon (via the wait operation). If the **dds::core::cond::Condition** (p. 948) was not attached to the **dds::core::cond::WaitSet** (p. 2617), the operation will return **dds::core::InvalidArgumentError** (p. 1619).

If the same **dds::core::cond::Condition** (p. 948) had been previously attached multiple times, only a single detach is required; the **dds::core::cond::Condition** (p. 948) is considered attached only once.

Parameters

cond	<<***in***>> *(p. 355)* **Condition** (p. 948) to be detached.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::PreconditionNotMetError** (p. 1941).

8.429.8.12 conditions() [1/2]

```
ConditionSeq dds::core::cond::WaitSet::conditions ( ) const  [inline]
```

Retrieves the list of attached conditions.

Returns

the list of attached conditions.

8.429.8.13 conditions() [2/2]

```
ConditionSeq & dds::core::cond::WaitSet::conditions (
            ConditionSeq & conds ) const  [inline]
```

Retrieves the list of attached conditions.

Parameters

conds	A vector where the conditions will be aded

Returns

A reference to `conds`.

8.429.8.14 wait_one()

```
bool wait_one (
            const  dds::core::Duration & timeout )
```

<<***extension***>> *(*p. *354)* Simpler **wait()** (p. 2622) when only one condition is attached

Unlike the rest of **`wait()`** (p. 2622) methods, **`wait_one()`** (p. 2626) doesn't return the active conditions. It only returns whether any condition was triggered (`true`) or whether the wait timed out (`false`).

8.429.8.15 detach_all()

```
void detach_all ( )
```

<<***extension***>> *(*p. *354)* Detaches all the conditions.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.429.8.16 property() [1/2]

```
rti::core::cond::WaitSetProperty property ( ) const
```

<<***extension***>> *(*p. *354)* Gets the WaitSetProperty

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.429.8.17 property() [2/2]

```
void property (
            const  rti::core::cond::WaitSetProperty & property )
```

<<***extension***>> *(*p. *354)* Sets the property to configure the **WaitSet** (p. 2617) to return after one or more trigger events have occurred.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

8.430 rti::core::cond::WaitSetProperty Class Reference

<<***extension***>> *(*p. *354)* <<***value-type***>> *(*p. *350)* Specifies the **dds::core::cond::WaitSet** (p. 2617) behavior for multiple trigger events

  Gets the max_event_count.
- **WaitSetProperty** & **max_event_count** (int32_t value)

  Sets the maximum number of trigger events to cause a WaitSet to wake up.
- **dds::core::Duration max_event_delay** () const

  Gets the max_event_delay.
- **WaitSetProperty** & **max_event_delay** (const **dds::core::Duration** &value)

  Sets the maximum delay from occurrence of first trigger event to cause a WaitSet to wake up.

8.430.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Specifies the **dds::core::cond::WaitSet** (p. 2617) behavior for multiple trigger events

In simple use, a **dds::core::cond::WaitSet** (p. 2617) returns when a single trigger event occurs on one of its attached **dds::core::cond::Condition** (p. 948) (s), or when the `timeout` maximum wait duration specified in the **dds::core::cond::WaitSet::wait** (p. 2621) call expires.

The **rti::core::cond::WaitSetProperty** (p. 2627) allows configuration of the waiting behavior of a **dds::core::cond::WaitSet** (p. 2617). If no conditions are true at the time of the call to wait, then the `max_event_count` parameter may be used to configure the WaitSet to wait for `max_event_count` trigger events to occur before returning, or to wait for up to `max_event_delay` time from the occurrence of the first trigger event before returning.

The `timeout` maximum wait duration specified in the **dds::core::cond::WaitSet::wait** (p. 2621) call continues to apply.

Entity:

dds::core::cond::WaitSet (p. 2617)

Properties:

RxO (p. 514) = N/A

Changeable (p. 514) = **YES** (p. 514)

8.430.2 Constructor & Destructor Documentation

8.430.2.1 WaitSetProperty() [1/2]

```
rti::core::cond::WaitSetProperty::WaitSetProperty ( )
```

Creates the default **WaitSetProperty** (p. 2627).

8.430.2.2 WaitSetProperty() [2/2]

```
rti::core::cond::WaitSetProperty::WaitSetProperty (
            int32_t the_max_event_count,
            const  dds::core::Duration & the_max_event_delay )
```

Creates a **WaitSetProperty** (p. 2627) with the given parameters.

8.430.3 Member Function Documentation

8.430.3.1 max_event_count() [1/2]

```
int32_t rti::core::cond::WaitSetProperty::max_event_count ( ) const
```

Gets the max_event_count.

See also

max_event_count(int32_t) (p. 2629)

8.430.3.2 max_event_count() [2/2]

```
WaitSetProperty & rti::core::cond::WaitSetProperty::max_event_count (
            int32_t value )
```

Sets the maximum number of trigger events to cause a WaitSet to wake up.

The **dds::core::cond::WaitSet** (p. 2617) will wait until up to `max_event_count` trigger events have occurred before returning. The **dds::core::cond::WaitSet** (p. 2617) may return earlier if either the `timeout` duration has expired, or `max_event_delay` has elapsed since the occurrence of the first trigger event. `max_event_count` may be used to "collect" multiple trigger events for processing at the same time.

[default] 1

[range] >= 1

8.430.3.3 max_event_delay() [1/2]

```
dds::core::Duration rti::core::cond::WaitSetProperty::max_event_delay ( ) const
```

Gets the max_event_delay.

See also

max_event_delay(const dds::core::Duration&) (p. 2630)

8.430.3.4 max_event_delay() [2/2]

```
WaitSetProperty & rti::core::cond::WaitSetProperty::max_event_delay (
            const  dds::core::Duration & value )
```

Sets the maximum delay from occurrence of first trigger event to cause a WaitSet to wake up.

The **dds::core::cond::WaitSet** (p. 2617) will return no later than `max_event_delay` after the first trigger event. `max_event_delay` may be used to establish a maximum latency for events reported by the **dds::core::cond::WaitSet** (p. 2617).

Note that **dds::core::TimeoutError** (p. 2473) is *not* returned if `max_event_delay` is exceeded. **dds::core::TimeoutError** (p. 2473) is returned only if the `timeout` duration expires before any trigger events occur.

[default] dds::core::Duration::infinite() (p. 1451)

8.431 dds::core::WeakReference< T > Class Template Reference

```
#include <WeakReference.hpp>
```

8.431.1 Detailed Description

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE const uint32_t **RTPS_AUTO_ID**

  Indicates that RTI Connext should choose an appropriate host, app, instance or object ID automatically.

8.432.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the write protocol of a **dds::domain::DomainParticipant** (p. 1326)

Entity:

dds::domain::DomainParticipant (p. 1326)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **NO** (p. 514)

8.432.2 Usage

This QoS policy configures some participant-wide properties of the DDS Real-Time Publish Subscribe (RTPS) on-the-wire protocol. (**rti::core::policy::DataWriterProtocol** (p. 1210) and **rti::core::policy::DataReaderProtocol** (p. 1059) configure RTPS and reliability properties on a per **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976) basis.)

NOTE: The default QoS policies returned by RTI Connext contain the correctly initialized wire protocol attributes. The defaults are not normally expected to be modified, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **dds::domain::DomainParticipant** (p. 1326) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **dds::domain::DomainParticipant** (p. 1326) must have a unique value for this prefix relative to all other participants in its domain.

If an application dies unexpectedly and is restarted, the IDs used by the new instance of DomainParticipants should be different than the ones used by the previous instances. A change in these values allows other DomainParticipants to know that they are communicating with a new instance of an application, and not the previous instance.

For legacy reasons, RTI Connext divides the 96-bit prefix into three integers:

- The first integer is called host ID. The original purpose of this integer was to contain the identity of the machine on which the DomainParticipant is executing.
- The second integer is called an application ID. The original purpose of this integer was to contain a value that identifies the process or task in which the DomainParticipant is contained.
- The third integer is called instance ID. The original purpose was to contain a value that uniquely identifies a DomainParticipant within a task or process.

The **rti::core::policy::WireProtocol::rtps_auto_id_kind** (p. 2639) field can be used to configure the algorithm that RTI Connext uses to populate the 96-bit prefix. Then you can optionally overwrite specific parts of the 96-bit prefix by explicitly configuring the **rti::core::policy::WireProtocol::rtps_host_id** (p. 2636) (first integer), **rti::core::policy↩ ::WireProtocol::rtps_app_id** (p. 2636) (second integer), and **rti::core::policy::WireProtocol::rtps_instance_id** (p. 2637) (third integer).

The **rti::core::policy::WireProtocol::rtps_auto_id_kind** (p. 2639) field supports three different prefix generation algorithms:

1. In the default and most common scenario, **rti::core::policy::WireProtocol::rtps_auto_id_kind** (p. 2639) is set to **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_UUID** (p. 2642). As the name suggests, this mechanism uses a unique, randomly generated UUID to fill the **rtps_host_id**, **rtps_app_id**, or **rtps_instance_id** fields. The first two bytes of the **rtps_host_id** are replaced with the RTI vendor ID (0x0101).

2. (Legacy) When rtps_auto_id_kind is set to **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_↩ FROM_IP** (p. 2642), the 96-bit prefix is generated as follows:

   - **rtps_host_id:** The 32-bit value of the IPv4 of the first up and running interface of the host machine is assigned. If the host does not have an IPv4 address, the host-id will be automatically set to 0x7F000001.
   - **rtps_app_id:** The process (or task) ID is assigned.
   - **rtps_instance_id:** A counter is assigned that is incremented per new participant within a process.

   DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

3. (Legacy) When rtps_auto_id_kind is set to **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_↩ FROM_MAC** (p. 2642), the 96-bit prefix is generated as follows:

   - **rtps_host_id:** The first 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
   - **rtps_app_id:** The last 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
   - **rtps_instance_id:** This field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant.

   DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

Some examples are provided to clarify the behavior of this QoSPolicy in case you want to change the default behavior with **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC** (p. 2642).

First, get the participant QoS from the DomainParticipantFactory:

Second, change the **rti::core::policy::WireProtocol** (p. 2630) using one of the options shown below.

Third, create the **dds::domain::DomainParticipant** (p. 1326) as usual, using the modified QoS structure instead of the default one.

Option 1: Use **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC** (p. 2642) to explicitly set just the application/task identifier portion of the **rtps_instance_id** field.

```
using namespace rti::core::policy;
```

```
participant_qos « WireProtocol()

    .rtps_auto_id_kind(WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC)

    .rtps_instance_id(

        /* App ID */ (12 « 8) | /* Instance ID */ WireProtocol::RTPS_AUTO_ID);
```

Option 2: Handle only the per participant counter and let RTI Connext handle the application/task identifier:

```
using namespace rti::core::policy;

participant_qos « WireProtocol()

    .rtps_auto_id_kind(WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC)

    .rtps_instance_id(

        /* App ID */ WireProtocol::RTPS_AUTO_ID | /* Instance ID */ 12);
```

Option 3: Handle the entire **rtps_instance_id** field yourself:

```
using namespace rti::core::policy;

participant_qos « WireProtocol()

    .rtps_auto_id_kind(WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC)

    .rtps_instance_id(

        /* App ID */ (12 « 8) | /* Instance ID */ 9);
```

NOTE: If you are using **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC** (p. 2642) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Connext handle the entire **rtps_instance_id** field:

```
using namespace rti::core::policy;

participant_qos « WireProtocol().rtps_auto_id_kind(

    WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC);
```

NOTE: If you are using **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC** (p. 2642) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

8.432.3 Constructor & Destructor Documentation

8.432.3.1 WireProtocol()

```
rti::core::policy::WireProtocol::WireProtocol ( )  [inline]
```

Creates the default policy.

8.432.4 Member Function Documentation

8.432.4.1 participant_id() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::participant_id (
            int32_t the_participant_id )
```

<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* A value used to distinguish among different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **rti::core::policy::TransportUnicast** (p. 2556) or **rti::core::policy::TransportUnicast** (p. 2556)).

For more information on port mapping, please refer to **rti::core::RtpsWellKnownPorts** (p. 2258).

Each **dds::domain::DomainParticipant** (p. 1326) in the same domain and running on the same host, must have a unique `participant_id`. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Connext will *automatically* resolve the participant ID as follows.

- RTI Connext will pick the *smallest* participant ID based on the unicast ports available on the transports enabled for discovery.
- RTI Connext will attempt to resolve an automatic port index either when a DomainPartcipant is enabled, or when a DataReader or DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainPartcipant is enabled.

[default] -1 [automatic], i.e. RTI Connext will automatically pick the `participant_id`, as described above.

[range] [>= 0], or -1, and does not violate guidelines stated in **rti::core::RtpsWellKnownPorts** (p. 2258).

`enum` **rti::core::policy::WireProtocolAutoKind_def::type**

The underlying `enum` type.

Enumerator

RTPS_AUTO_ID_FROM_IP	Builds the GUID prefix using the IPv4 address and process ID. Uses the IPv4 address of the first up-and-running interface of the host machine and the process ID to build the GUID prefix.
RTPS_AUTO_ID_FROM_MAC	Builds the GUID prefix using the MAC address and process ID. Uses the first 32 bits of the MAC address assigned to the first up-and-running interface and the process ID to build the GUID prefix. Note to Android Users: DDS_RTPS_AUTO_ID_FROM_MAC is not supported in recent versions of Android (6.0 and later).
RTPS_AUTO_ID_FROM_UUID	Builds the GUID prefix by selecting the UUID-based algorithm (default). This method of generating the GUID prefix does not require having a network interface and is friendly to IP mobility scenarios in which an RTI Connext application may start in a node that does not have a physical network interface enabled.

8.434 rti::pub::WriteParams Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Advanced parameters for writing with a DataWriter

`#include "rti/pub/WriteParams.hpp"`

Public Member Functions

- **WriteParams** ()

  *Creates a **WriteParams** (p. 2642) object with default values.*
- void **reset** ()

  Resets all the fields to their default values.
- bool **replace_automatic_values** () const

Indicates if the replacement of automatic values has been activated or not.

- **WriteParams** & **replace_automatic_values** (bool value)

  Allows retrieving the actual value of those fields that were automatic.
- **rti::core::SampleIdentity identity** () const

  Gets the sample identity.
- **WriteParams** & **identity** (const **rti::core::SampleIdentity** &value)

  Sets a explicit sample identity for writing.
- **rti::core::SampleIdentity related_sample_identity** () const

  Gets the related sample identity.
- **WriteParams** & **related_sample_identity** (const **rti::core::SampleIdentity** &value)

  Sets a related sample identity for a sample.
- **dds::core::Time source_timestamp** () const

  Gets the timestamp.
- **WriteParams** & **source_timestamp** (const **dds::core::Time** &value)

  Sets the source timestamp for writing.
- **rti::core::Cookie cookie** () const

  Gets the cookie.
- **WriteParams** & **cookie** (const **rti::core::Cookie** &value)

  Sets a cookie for writing.
- **dds::core::InstanceHandle handle** () const

  Gets the instance handle.
- **WriteParams** & **handle** (const **dds::core::InstanceHandle** &value)

  Sets the instance handle for writing.
- int32_t **priority** () const

  Gets the priority.
- **WriteParams** & **priority** (int32_t value)

  Sets the priority for writing.
- **rti::core::SampleFlag flag** () const

  Gets the sample flag.
- **WriteParams** & **flag** (const **rti::core::SampleFlag** &value)

  Sets the sample flags for writing.
- **rti::core::Guid source_guid** () const

  Gets the source GUID.
- **WriteParams** & **source_guid** (const **rti::core::Guid** &value)

  Sets the source GUID for writing.
- **rti::core::Guid related_source_guid** () const

  Gets the related source guid.
- **WriteParams** & **related_source_guid** (const **rti::core::Guid** &value)

  Sets the related source guid for writing.
- **rti::core::Guid related_reader_guid** () const

  Gets the related reader GUID.
- **WriteParams** & **related_reader_guid** (const **rti::core::Guid** &value)

  Sets the related reader guid for writing.

8.434.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Advanced parameters for writing with a DataWriter

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 1179)

8.434.2 Constructor & Destructor Documentation

8.434.2.1 WriteParams()

```
rti::pub::WriteParams::WriteParams ( )  [inline]
```

Creates a **WriteParams** (p. 2642) object with default values.

The default instance is such that it makes **dds::pub::DataWriter(const T&, WriteParams&)** (p. 1138) behave identically to **dds::pub::DataWriter(const T&)** (p. 1138).

8.434.3 Member Function Documentation

8.434.3.1 reset()

```
void rti::pub::WriteParams::reset ( )
```

Resets all the fields to their default values.

See also

replace_automatic_values() (p. 2644)

8.434.3.2 replace_automatic_values() [1/2]

```
bool rti::pub::WriteParams::replace_automatic_values ( ) const
```

Indicates if the replacement of automatic values has been activated or not.

8.434.3.3 replace_automatic_values() [2/2]

```
WriteParams & rti::pub::WriteParams::replace_automatic_values (
            bool value )
```

Allows retrieving the actual value of those fields that were automatic.

When this field is set, the fields that were configured with an automatic value (for example, **rti::core::SampleIdentity::automatic()** (p. 2284)) receive their actual value after **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179) is called.

To reset those fields to their automatic value after calling **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179), use **rti::pub::WriteParams::reset** (p. 2644)

Parameters

value	Whether to replace automatic values or not

[default] false

8.434.3.4 identity() [1/2]

```
rti::core::SampleIdentity rti::pub::WriteParams::identity ( ) const
```

Gets the sample identity.

8.434.3.5 identity() [2/2]

```
WriteParams & rti::pub::WriteParams::identity (
            const  rti::core::SampleIdentity & value )
```

Sets a explicit sample identity for writing.

Identifies the sample being written. The identity consists of a pair (Virtual Writer GUID, Virtual Sequence Number).

Use the default value to let RTI Connext determine the sample identity as follows:

- The Virtual Writer GUID is the virtual GUID associated with the writer writing the sample. This virtual GUID is configured using **rti::core::policy::DataWriterProtocol::virtual_guid** (p. 1212).
- The sequence number is increased by one with respect to the previous value.

The virtual sequence numbers for a virtual writer must be strictly monotonically increasing. If the user tries to write a sample with a sequence number smaller or equal to the last sequence number, the write operation will fail.

A DataReader can access the identity of a received sample by using the fields **dds::sub::SampleInfo::original_publication_virtual_guid** (p. 2291) and **dds::sub::SampleInfo::original_publication_virtual_sequence_number** (p. 2291) in the **dds::sub::SampleInfo** (p. 2285).

[default] rti::core::SampleIdentity::automatic() (p. 2284).

8.434.3.6 related_sample_identity() [1/2]

```
rti::core::SampleIdentity rti::pub::WriteParams::related_sample_identity ( ) const
```

Gets the related sample identity.

8.434.3.7 related_sample_identity() [2/2]

```
WriteParams & rti::pub::WriteParams::related_sample_identity (
            const  rti::core::SampleIdentity & value )
```

Sets a related sample identity for a sample.

Identifies another sample that is logically related to the one that is written.

When this field is set, the related sample identity is propagated and subscribing applications can retrieve it from the **dds::sub::SampleInfo** (p. 2285) (see **dds::sub::SampleInfo::related_original_publication_virtual_sample_identity** (p. 2293)).

The default value is **rti::core::SampleIdentity::unknown()** (p. 2284), and is not propagated.

A DataReader can access the related identity of a received sample by using the fields **dds::sub::SampleInfo::related_original_publication_virtual_guid** (p. 2292) and **dds::sub::SampleInfo::related_original_publication_virtual_sequence_number** (p. 2292) in the **dds::sub::SampleInfo** (p. 2285).

[default] rti::core::SampleIdentity::unknown() (p. 2284)

8.434.3.8 source_timestamp() [1/2]

```
dds::core::Time rti::pub::WriteParams::source_timestamp ( ) const
```

Gets the timestamp.

8.434.3.9 source_timestamp() [2/2]

```
WriteParams & rti::pub::WriteParams::source_timestamp (
            const  dds::core::Time & value )
```

Sets the source timestamp for writing.

Specifies the source timestamp that will be available to the **dds::sub::DataReader** (p. 976) objects by means of the `source_timestamp` attribute within the **dds::sub::SampleInfo** (p. 2285).

[default] dds::core::Time::invalid() (p. 2459).

8.434.3.10 cookie() [1/2]

```
rti::core::Cookie rti::pub::WriteParams::cookie ( ) const
```

Gets the cookie.

8.434.3.11 cookie() [2/2]

```
WriteParams & rti::pub::WriteParams::cookie (
            const  rti::core::Cookie & value )
```

Sets a cookie for writing.

Used in the callback **dds::pub::DataWriterListener::on_sample_removed** (p. 1209) to associate a removed sample with a written sample.

[default] Empty sequence (zero-length).

8.434.3.12 handle() [1/2]

```
dds::core::InstanceHandle rti::pub::WriteParams::handle ( ) const
```

Gets the instance handle.

Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p. 1158), or else the special value **dds::core::InstanceHandle::nil()** (p. 1614).

[default] dds::core::InstanceHandle::nil() (p. 1614)

8.434.3.13 handle() [2/2]

```
WriteParams & rti::pub::WriteParams::handle (
            const  dds::core::InstanceHandle & value )
```

Sets the instance handle for writing.

ă Instance handle

Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p. 1158), or else the special value **dds::core::InstanceHandle::nil()** (p. 1614).

[default] dds::core::InstanceHandle::nil() (p. 1614)

8.434.3.14 priority() [1/2]

```
int32_t rti::pub::WriteParams::priority ( ) const
```

Gets the priority.

8.434.3.15 priority() [2/2]

```
WriteParams & rti::pub::WriteParams::priority (
            int32_t value )
```

Sets the priority for writing.

A positive integer value designating the relative priority of the sample, used to determine the transmission order of pending writes.

Use of publication priorities requires an asynchronous publisher (**rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019)) with **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) set to **rti::core::policy::FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST** (p. 1583).

Larger numbers have higher priority.

For multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

If the publication priority of the parent DataWriter, or for multi-channel DataWriters, if the publication priority of the parent channel, is set to PUBLICATION_PRIORITY_AUTOMATIC, then the DataWriter or channel will be assigned the priority of the largest publication priority of all samples in the DataWriter or channel.

If the publication priority of the parent DataWriter, and for multi-channel DataWriters, if the publication priority of the parent channel, are set to PUBLICATION_PRIORITY_UNDEFINED, then the DataWriter or channel will be assigned the lowest priority, regardless of the value of the publication priorities of samples written to the DataWriter or channel.

The publication priority of each sample can be set in the **rti::pub::WriteParams** (p. 2642) of **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179).

For dispose and unregister samples, use the **rti::pub::WriteParams** (p. 2642) of **dds::pub::DataWriter::dispose_instance(rti::pub::WriteParams&)** (p. 1173) and **dds::pub::DataWriter::unregister_instance(rti::pub::WriteParams&)** (p. 1173).

[default] 0 (lowest priority)

See also

rti::core::ChannelSettings::priority (p. 924)

8.434.3.16 flag() [1/2]

```
rti::core::SampleFlag rti::pub::WriteParams::flag ( ) const
```

Gets the sample flag.

8.434.3.17 flag() [2/2]

```
WriteParams & rti::pub::WriteParams::flag (
            const  rti::core::SampleFlag & value )
```

Sets the sample flags for writing.

The flags are represented as a 32-bit integer, of which only the 16 least-significant bits are used.

RTI reserves least-significant bits [0-7] for middleware-specific usage.

The application can use least-significant bits [8-15].

The first bit (**rti::core::SampleFlag::redelivered** (p. 2280)) is reserved for marking samples as redelivered when using RTI Queuing Service.

The second bit (**rti::core::SampleFlag::intermediate_reply_sequence** (p. 2280)) is used to indicate that a response sample is not the last response sample for a given request. This bit is usually set by a Replier sending multiple responses for a request.

An application can inspect the flags associated with a received sample by checking the field **dds::sub::SampleInfo↩ ::flag** (p. 2293).

[default] 0 (no flags are set)

8.434.3.18 source_guid() [1/2]

```
rti::core::Guid rti::pub::WriteParams::source_guid ( ) const
```

Gets the source GUID.

8.434.3.19 source_guid() [2/2]

```
WriteParams & rti::pub::WriteParams::source_guid (
            const  rti::core::Guid & value )
```

Sets the source GUID for writing.

When this field is set, the source_guid is propagated and subscribing applications can retrieve it from the **dds::sub::↩ SampleInfo** (p. 2285) (see **dds::sub::SampleInfo::source_guid** (p. 2293)).

The default value is **rti::core::Guid::automatic()** (p. 1597), and is not propagated.

This field is used by RTI Connext in the following cases:

- In RTI Queuing Service, this field and **rti::pub::WriteParams::related_source_guid** (p. 2651) play a crucial role in ensuring that replies are correctly routed back to the requester in request/reply scenarios.
- In RTI Routing Service, this field is used by the TopicQuery proxy feature to identify the original writer(s) that published the response samples for the TopicQuery. When dealing with snapshot TopicQueries, there will be one final sample (sample without the flag **rti::core::SampleFlag::intermediate_topic_query_sample** (p. 2281)) per original writer that published one or more response samples.

You can use this field for your own purposes unless you are using Queuing Service or Routing Service as described above.

[default] rti::core::Guid::automatic() (p. 1597) (the source_guid is automatically set to the **dds::pub::DataWriter** (p. 1138) virtual GUID).

See also

rti::pub::WriteParams::related_source_guid (p. 2651)

8.434.3.20 related_source_guid() [1/2]

```
rti::core::Guid rti::pub::WriteParams::related_source_guid ( ) const
```

Gets the related source guid.

8.434.3.21 related_source_guid() [2/2]

```
WriteParams & rti::pub::WriteParams::related_source_guid (
            const  rti::core::Guid & value )
```

Sets the related source guid for writing.

When this field is set, the related_source_guid is propagated and subscribing applications can retrieve it from the **dds::sub::SampleInfo** (p. 2285) (see **dds::sub::SampleInfo::related_source_guid** (p. 2294)).

This field and **rti::pub::WriteParams::source_guid** (p. 2650) are used by RTI Queuing Service, to ensure that replies are correctly routed back to the requester in request/reply scenarios.

The default value is **rti::core::Guid::unknown()** (p. 1597), and is not propagated.

[default] rti::core::Guid::unknown() (p. 1597)

See also

rti::pub::WriteParams::source_guid (p. 2650)

8.434.3.22 related_reader_guid() [1/2]

```
rti::core::Guid rti::pub::WriteParams::related_reader_guid ( ) const
```

Gets the related reader GUID.

8.434.3.23 related_reader_guid() [2/2]

```
WriteParams & rti::pub::WriteParams::related_reader_guid (
            const  rti::core::Guid & value )
```

Sets the related reader guid for writing.

When this field is set, the related_reader_guid is propagated and subscribing applications can retrieve it from the **dds::sub::SampleInfo** (p. 2285) (see **dds::sub::SampleInfo::related_subscription_guid** (p. 2294)).

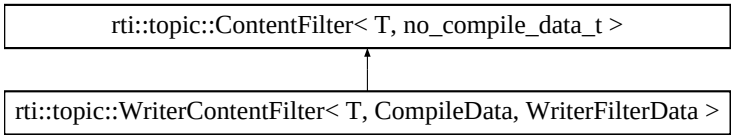
The default value is **rti::core::Guid::unknown()** (p. 1597), and is not propagated.

The main use case for this field is point-to-point sample distribution using CFT. DataReaders install a CFT on the related_reader_guid using a unique GUID. For example, the filter for DataReader 'n' can be:

```
@related_reader_guid.value = &hex(00000000000000000000000000000001)
```

Then, a DataWriter that wants to send the sample to DataReader 'n' will use the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 1179) method and set related_reader_guid to the value used by DataReader 'n' in its filter expression.

This field is currently used by RTI Queuing Service to distribute a sample to only one of the Consumer's DataReaders attached to a SharedReaderQueue.



[default] rti::core::Guid::unknown() (p. 1597)

8.435 rti::topic::WriterContentFilter< T, CompileData, WriterFilterData > Class Template Reference

<<***extension***>> *(p. 354)* A class to inherit from when implementing a writer-side custom content filter

```
#include <rti/topic/ContentFilter.hpp>
```

- virtual void **writer_return_loan** (WriterFilterData &writer_filter_data, rti::core::CookieSeq &cookies)=0

  A writer-side filtering API to return the loan on the list of DataReaders returned by writer_evaluate.

Additional Inherited Members

8.435.1 Detailed Description

template<typename T, typename CompileData = no_compile_data_t, typename WriterFilterData = no_compile_data_t>
class rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >

<<***extension***>> *(*p. *354)* A class to inherit from when implementing a writer-side custom content filter

This interface can be implemented by an application-provided class and then registered with the DomainParticipant such that samples can be filtered for **dds::topic::ContentFilteredTopic** (p. 954) with the filter name that the filter is registered with. This class inherits from **rti::topic::ContentFilter** (p. 950), therefore you must implement the compile, evaluate, and finalize funtions from that class in addition to the functions in this class.

Note: the API for using a custom content filter is subject to change in a future release.

For an example of how to create a custom content filter see **Creating Custom Content Filters** (p. 333)

Template Parameters

T	The type of the samples that this **ContentFilter** (p. 950) will filter
CompileData	the type of the data that the compile function will return. If your compile function will not return data, you can leave this template parameter to the default **no_compile_data_t** (p. 1835) type and return rti::topic::no_compile_data in your compile function
WriterFilterData	the type of the data that the writer_attach function will return. If your writer_attach function will not return data, you can leave this template parameter to the default **no_compile_data_t** (p. 1835) type and return rti::topic::no_compile_data in your compile function

dds::domain::DomainParticipant::register_contentfilter() (p. 1349)

8.435.2 Member Function Documentation

8.435.2.1 writer_compile()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual void  rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_compile
(
            WriterFilterData & writer_filter_data,
             ExpressionProperty & prop,
            const std::string & expression,
            const  dds::core::StringSeq & parameters,
            const  dds::core::optional<  dds::core::xtypes::DynamicType > & type_code,
            const std::string & type_class_name,
            const  rti::core::Cookie & cookie )  [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 976).

This method is called when the **dds::pub::DataWriter** (p. 1138) discovers a **dds::sub::DataReader** (p. 976) with a **dds::topic::ContentFilteredTopic** (p. 954) or when a **dds::pub::DataWriter** (p. 1138) is notified of a change in a DataReader's filter parameter for the locally registered content filter instance.

It is possible for multiple threads to be calling into this function at the same time.

Parameters

writer_filter_data	The state created using writer_attach
prop	An **ExpressionProperty** (p. 1547) that allows you to indicate to RTI Connext if a filter expression can be optimized.
expression	An std::string with the filter expression. If you want to manipulate this string, you **must** first make a copy of it.
parameters	A string sequence with the expression parameters the ContentFilteredTopic was created with. The string sequence is **equal** (but **not** identical) to the string sequence passed to **dds::topic::ContentFilteredTopic()** (p. 954). Note that the sequence passed to the compile function is **owned** by RTI Connext and **must not** be referenced outside the compile function.
type_code	The DynamicType for the related Topic of the ContentFilteredTopic. A type code is a description of a type in terms of which **types** it contains (int32, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
type_class_name	Fully qualified class name of the related Topic.
cookie	**rti::core::Cookie** (p. 965) to uniquely identify the DataReader for which writer_compile was called

8.435.2.2 writer_evaluate()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual rti::core::CookieSeq &  rti::topic::WriterContentFilter< T, CompileData, WriterFilterData
>::writer_evaluate (
            WriterFilterData & writer_filter_data,
            const T & sample,
            const  FilterSampleInfo & meta_data )  [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 976).

This method is called every time a **dds::pub::DataWriter** (p. 1138) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **dds::pub::DataWriter** (p. 1138) is performing writer-side filtering and return the list of **rti::core::Cookie** (p. 965) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

Parameters

writer_filter_data	The state created using the writer_compile method
sample	A deserialized sample to be filtered.
meta_data	Meta data associated with the sample.

Returns

A rti::core::CookieSeq which identifies the set of DataReaders whose filters pass the sample.

8.435.2.3 writer_finalize()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual void  rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_↩
finalize (
            WriterFilterData & writer_filter_data,
            const  rti::core::Cookie & cookie )  [pure virtual]
```

A writer-side filtering API to clean up a previously compiled instance of the content filter.

This method is called to notify the filter implementation that the **dds::pub::DataWriter** (p. 1138) is no longer matching with a **dds::sub::DataReader** (p. 976) for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the **dds::sub::DataReader** (p. 976).

It is possible for multiple threads to be calling into this function at the same time.

Parameters

writer_filter_data	The state created using writer_attach
cookie	**rti::core::Cookie** (p. 965) to uniquely identify the DataReader for which this method was invoked

8.435.2.4 writer_attach()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual WriterFilterData &  rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >↩
::writer_attach ( )  [pure virtual]
```

A writer-side filtering API to create some state that can facilitate filtering on the writer side.

This method is called to create some state required to perform filtering on the writer side using writer-side filtering APIs. This method will be called for every **dds::pub::DataWriter** (p. 1138); it will be called only the first time the **dds::pub::↩ DataWriter** (p. 1138) matches a **dds::sub::DataReader** (p. 976) using the specified filter. This function will not be called for any subsequent DataReaders that match the DataWriter and are using the same filter.

Returns

An object of user-specified type to some state created on the DataWriter that will help perform writer-side filtering efficiently. Can be no_compile_data

8.435.2.5 writer_detach()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual void  rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_detach
(
            WriterFilterData & writer_filter_data )  [pure virtual]
```

A writer-side filtering API to clean up a previously created state using writer_attach.

This method is called to delete any state created using the **WriterContentFilter::writer_attach** (p. 2656) function. This method will be called when the **dds::pub::DataWriter** (p. 1138) is deleted.

Parameters

writer_filter_data	The state created using writer_attach

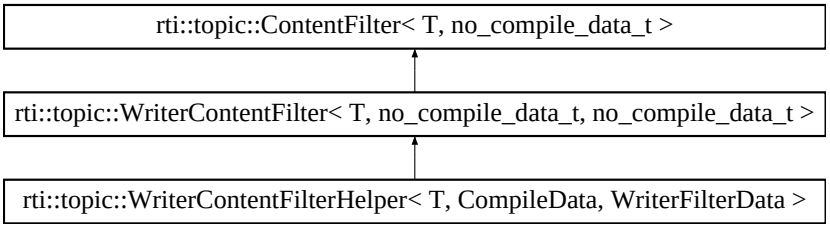
8.435.2.6 writer_return_loan()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual void  rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_↩
return_loan (
            WriterFilterData & writer_filter_data,
            rti::core::CookieSeq & cookies )  [pure virtual]
```

A writer-side filtering API to return the loan on the list of DataReaders returned by writer_evaluate.

This method is called to return the loan on CookieSeq returned by **WriterContentFilter::writer_return_loan** (p. 2656). It is possible for multiple threads to be calling into this function at the same time.

Parameters



writer_filter_data	The state created using writer_attach
cookies	rti::core::CookieSeq for which writer_return_loan was invoked

8.436 rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData > Class Template Reference

<<***extension***>> *(p. 354)* A class to inherit from when implementing a writer-side custom content filter.

```
#include <rti/topic/ContentFilter.hpp>
```

Inheritance diagram for rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >:

Public Member Functions

- virtual void **writer_evaluate_helper** (WriterFilterData &writer_filter_data, const T &sample, const **Filter↩ SampleInfo** &meta_data)=0

  *A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 976).*

Protected Member Functions

- void **add_cookie** (**rti::core::Cookie** &cookie)

  *A helper function which will add a **rti::core::Cookie** (p. 965) to the CookieSeq that is then returned by the writer_evaluate function.*

Additional Inherited Members

8.436.1 Detailed Description

template<typename T, typename CompileData = no_compile_data_t, typename WriterFilterData = no_compile_data_t>
class rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >

<<***extension***>> *(p. 354)* A class to inherit from when implementing a writer-side custom content filter.

This class manages for you the rti::core::CookieSeq which maintains a list of Cookies associated with the DataReaders whose filters pass the sample.

This class has a private CookieSeq member that you can add cookies too using the helper method, **add_cookie()** (p. 2659), and the sequence is automatically cleared for you in the return_loan method, meaning that you do not need to implement that method yourself.

For an example of how to create a custom content filter see **Creating Custom Content Filters** (p. 333)

Template Parameters

T	The type of the samples that this **ContentFilter** (p. 950) will filter
CompileData	the type of the data that the compile function will return. If your compile function will not return data, you can leave this template parameter to the default **no_compile_data_t** (p. 1835) type and return rti::topic::no_compile_data in your compile function
WriterFilterData	the type of the data that the writer_attach function will return. If your writer_attach function will not return data, you can leave this template parameter to the default **no_compile_data_t** (p. 1835) type and return rti::topic::no_compile_data in your compile function

dds::domain::DomainParticipant::register_contentfilter() (p. 1349)

8.436.2 Member Function Documentation

8.436.2.1 writer_evaluate_helper()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
virtual void  rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >::writer↩
_evaluate_helper (
            WriterFilterData & writer_filter_data,
            const T & sample,
            const  FilterSampleInfo & meta_data )  [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 976).

This method is called every time a **dds::pub::DataWriter** (p. 1138) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **dds::pub::DataWriter** (p. 1138) is performing writer-side filtering and return the list of **rti::core::Cookie** (p. 965) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

When using the **WriterContentFilterHelper** (p. 2657) helper class, you implement this method instead of writer_↩ evaluate. The writer_evaluate function calls this method and then returns the CookieSeq for you.

Parameters

writer_filter_data	The state created using the writer_compile method
sample	A deserialized sample to be filtered.
meta_data	Meta data associated with the sample.

8.436.2.2 add_cookie()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↩
compile_data_t>
void  rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >::add_cookie (
            rti::core::Cookie & cookie )  [inline], [protected]
```

A helper function which will add a **rti::core::Cookie** (p. 965) to the CookieSeq that is then returned by the writer_↩ evaluate function.

Call this method from writer_evaluate_helper whenever you need to add a Cookie for a DataReader whose filter has passed a particular sample.

Parameters

cookie	The cookie to add to the CookieSeq

8.437 dds::core::policy::WriterDataLifecycle Class Reference

Controls how a **dds::pub::DataWriter** (p. 1138) handles the lifecycle of the instances (keys) that it writes.

`#include <dds/core/policy/CorePolicy.hpp>`

Public Member Functions

- **WriterDataLifecycle** ()

  Creates the default policy.
- **WriterDataLifecycle** (bool autodispose)

  Creates an instance with a value for auto-dispose unregistered instances and default values for the rest of parameters.
- **WriterDataLifecycle** & **autodispose_unregistered_instances** (bool b)

  Indicates whether the DataWriter should automatically dispose an instance when it unregisters it.
- bool **autodispose_unregistered_instances** () const

  Getter (see setter with the same name)
- **dds::core::policy::WriterDataLifecycle** & **autopurge_unregistered_instances_delay** (const **dds::core::Duration** &duration)

  *<<**extension**>> (p. 116) Maximum duration for which the DataWriter will maintain information regarding an instance once it has unregistered the instance.*
- **dds::core::Duration autopurge_unregistered_instances_delay** () const

  *<<**extension**>> (p. 116) Getter (see setter with the same name)*
- **dds::core::policy::WriterDataLifecycle** & **autopurge_disposed_instances_delay** (const **dds::core::Duration** &duration)

  *<<**extension**>> (p. 116) Maximum duration for which the DataWriter will maintain information regarding an instance once it has disposed the instance.*
- **dds::core::Duration autopurge_disposed_instances_delay** () const

  *<<**extension**>> (p. 116) Getter (see setter with the same name)*

Static Public Member Functions

- static **WriterDataLifecycle AutoDisposeUnregisteredInstances** ()

  Creates `WriterDataLifecycle(true)`
- static **WriterDataLifecycle ManuallyDisposeUnregisteredInstances** ()

  Creates `WriterDataLifecycle(false)`

8.437.1 Detailed Description

Controls how a **dds::pub::DataWriter** (p. 1138) handles the lifecycle of the instances (keys) that it writes.

Entity:

dds::pub::DataWriter (p. 1138)

Properties:

RxO (p. 514) = N/A
Changeable (p. 514) = **YES** (p. 514)

8.437.2 Usage

This policy determines how the **dds::pub::DataWriter** (p. 1138) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the **dds::pub::DataWriter** (p. 1138) or implicitly registered by directly writing the data).

You may use **dds::pub::DataWriter::unregister_instance** (p. 1160) to indicate that the **dds::pub::DataWriter** (p. 1138) no longer wants to send data for a **dds::topic::Topic** (p. 2474).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a **dds↩ ::pub::DataWriter** (p. 1138) unregisters an instance, RTI Connext can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see **dds::core::policy::Ownership** (p. 1899)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other DataWriters to send updates for the value of that instance regardless of **Ownership** (p. 1899) Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

8.437.3 Constructor & Destructor Documentation

8.437.3.1 WriterDataLifecycle() [1/2]

```
dds::core::policy::WriterDataLifecycle::WriterDataLifecycle ( )  [inline]
```

Creates the default policy.

8.437.3.2 WriterDataLifecycle() [2/2]

```
dds::core::policy::WriterDataLifecycle::WriterDataLifecycle (
            bool autodispose )  [inline], [explicit]
```

Creates an instance with a value for auto-dispose unregistered instances and default values for the rest of parameters.

8.437.4 Member Function Documentation

8.437.4.1 autodispose_unregistered_instances() [1/2]

```
WriterDataLifecycle & dds::core::policy::WriterDataLifecycle::autodispose_unregistered_instances
(
            bool b )  [inline]
```

Indicates whether the DataWriter should automatically dispose an instance when it unregisters it.

- true
  The **dds::pub::DataWriter** (p. 1138) will dispose of the instance each time it is unregistered. The behavior is identical to explicitly calling one of the `dispose` operations on the instance prior to calling the `unregister` operation.
- false (default)
  The **dds::pub::DataWriter** (p. 1138) will not dispose of the instance. The application can still call one of the dispose operations prior to unregistering the instance and dispose of the instance that way.

[default] false

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193), **Sample Memory Management** (p. 230)

8.437.4.2 autodispose_unregistered_instances() [2/2]

```
bool dds::core::policy::WriterDataLifecycle::autodispose_unregistered_instances ( ) const  [inline]
```

Getter (see setter with the same name)

8.437.4.3 AutoDisposeUnregisteredInstances()

```
static  WriterDataLifecycle dds::core::policy::WriterDataLifecycle::AutoDisposeUnregistered↩
Instances ( )  [inline], [static]
```

Creates `WriterDataLifecycle(true)`

8.437.4.4 ManuallyDisposeUnregisteredInstances()

```
static  WriterDataLifecycle dds::core::policy::WriterDataLifecycle::ManuallyDisposeUnregistered↩
Instances ( )  [inline], [static]
```

Creates `WriterDataLifecycle(false)`

8.437.4.5 autopurge_unregistered_instances_delay() [1/2]

```
dds::core::policy::WriterDataLifecycle & autopurge_unregistered_instances_delay (
            const  dds::core::Duration & duration )
```

<<***extension***>> *(*p. *116)* Maximum duration for which the DataWriter will maintain information regarding an instance once it has unregistered the instance.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Determines how long the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance that has been unregistered. By default, the **dds::pub::DataWriter** (p. 1138) resources associated with an instance (e.g., the space needed to remember the Instance Key or KeyHash) are released lazily. This means the resources are only reclaimed when the space is needed for another instance because **dds::core::policy::ResourceLimits::max_instances** (p. 2206) is exceeded. This behavior can be changed by setting autopurge_unregistered_instances_delay to a value other than **dds::core::Duration::infinite()** (p. 1451).

After this time elapses, the **dds::pub::DataWriter** (p. 1138) will purge all internal information regarding the instance, including historical samples, even if **dds::core::policy::ResourceLimits::max_instances** (p. 2206) has not been reached.

The purging of unregistered instances can be done based on the source timestamp of the unregister sample or the time where the unregister sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

For durable writer history, autopurge_unregistered_instances_delay supports only the **dds::core::Duration::infinite()** (p. 1451) value.

With **dds::core::policy::DurabilityKind_def::VOLATILE** (p. 1442) durability, unregistered instances are removed as soon as all samples for the instance are fully acknowledged, regardless of how this field is set.

[default] dds::core::Duration::infinite() (p. 1451) (disabled) for all **dds::pub::DataWriter** (p. 1138) except for the built-in discovery DataWriters
dds::core::Duration::zero() (p. 1450) for built-in discovery DataWriters (see **rti::core::policy::DiscoveryConfig**↩ **::publication_writer_data_lifecycle** (p. 1291), **rti::core::policy::DiscoveryConfig::subscription_writer_data**↩ **_lifecycle** (p. 1293) and **rti::core::policy::DiscoveryConfig::participant_configuration_writer_data_lifecycle** (p. 1316)).

[range] [0, 1 year] or **dds::core::Duration::infinite()** (p. 1451)

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193), **Sample Memory Management** (p. 230)

8.437.4.6 autopurge_unregistered_instances_delay() [2/2]

```
dds::core::Duration autopurge_unregistered_instances_delay ( ) const
```

<<***extension***>> *(p. 116)* Getter (see setter with the same name)

8.437.4.7 autopurge_disposed_instances_delay() [1/2]

```
dds::core::policy::WriterDataLifecycle & autopurge_disposed_instances_delay (
            const  dds::core::Duration & duration )
```

<<***extension***>> *(p. 116)* Maximum duration for which the DataWriter will maintain information regarding an instance once it has disposed the instance.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 354)

Determines how long the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance that has been disposed of. By default, disposing of an instance does not make it eligible to be purged. By setting autopurge_↩ disposed_instances_delay to a value other than **dds::core::Duration::infinite()** (p. 1451), the DataWriter will delete the resources associated with an instance (including historical samples) once the time has elapsed and all matching DataReaders have acknowledged all the samples for this instance including the dispose sample.

The purging of disposed instances can be done based on the source timestamp of the dispose sample or the time when the dispose sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

This QoS value is supported with durable DataWriter queues only for **dds::core::Duration::zero()** (p. 1450) and **dds**↩ **::core::Duration::infinite()** (p. 1451) values (finite values are not supported).

[default] dds::core::Duration::infinite() (p. 1451) (disabled)

[range] [0, 1 year] or **dds::core::Duration::infinite()** (p. 1451)

Categories

Immutable (p. 243), **Instance Lifecycle** (p. 193), **Sample Memory Management** (p. 230)

8.437.4.8 autopurge_disposed_instances_delay() [2/2]

  Creates a bounded wide string.

Additional Inherited Members

8.438.1 Detailed Description

<<***value-type***>> *(p. 350)* Represents an IDL `wstring` type.

8.438.2 Constructor & Destructor Documentation

8.438.2.1 WStringType()

```
dds::core::xtypes::WStringType::WStringType (
            uint32_t bounds ) [explicit]
```

Creates a bounded wide string.

Parameters

bounds	The maximum length

8.439 rti::config::compliance::XTypesMask Class Reference

This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

`#include <rti/config/Compliance.hpp>`

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**

  A typedef of std::bitset<32> for convenience.

Public Member Functions

- **XTypesMask** ()

  Default XTypes compliance mask.
- **XTypesMask** (uint64_t mask)

  *Construct a **XTypesMask** (p. 2666) from an integer.*
- **XTypesMask** (const **MaskType** &mask)

  *Construct a **XTypesMask** (p. 2666) from a MaskType object.*

Static Public Member Functions

- static const **XTypesMask dheader_in_non_primitive_collections** ()

  When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER.
- static const **XTypesMask enum_as_primitive_in_collections** ()

  When this bit is set, enums are considered primitive types in collection types.
- static const **XTypesMask parameter_length_with_padding** ()

  When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary.
- static const **XTypesMask encapsulation_options_with_padding** ()

  When this bit is set, RTI Connext will set the padding bits in the options field of the encapsulation header of a serialized payload.
- static const **XTypesMask accept_unknown_enum_value** ()

  When this bit is set, samples containing an unknown enumerator can be successfully deserialized to the default enumeration value.
- static const **XTypesMask accept_unknown_discriminator** ()

  When this bit is set, samples containing an unknown discriminator can be successfully deserialized, and the sample won't be dropped.
- static const **XTypesMask select_default_discriminator** ()

  When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value; if the bit is not set, the sample will preserve the discriminator value.
- static const **XTypesMask sentinel_in_empty_union** ()

  When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value.

- static const **XTypesMask initialize_discriminator_to_default** ()

  When this bit is set, the union discriminator will be initialized to the default value of its type.
- static const **XTypesMask java_keyhash_750** ()

  When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions.
- static const **XTypesMask python_int8_730** ()

  Set this bit to interoperate with Connext 7.3.0 Python applications that published or subscribed to types with int8 members.
- static const **XTypesMask must_understand_in_key_and_discriminator** ()

  When this bit is set, the parameter ID for members that are part of the key, or for the discriminator of a union, will have the parameter ID's FLAG_MUST_UNDERSTAND bit set when serialized using XCDR2.
- static const **XTypesMask vendor** ()

  XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.
- static const **XTypesMask default_mask** ()

  Default XTypes compliance mask.

8.439.1 Detailed Description

This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

XTypes compliance mask.

The **rti::config::compliance::XTypesMask** (p. 2666) configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Applications that don't use the exact same XTypes compliance mask may not be interoperable.

By default, data serialization is not fully compliant with Extended CDR encoding. While this doesn't affect correctness, it may prevent interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**
- Calling the function **rti::config::compliance::set_xtypes_mask()** (p. 452)

The environment variable will be automatically loaded when a DomainParticipantFactory is created. If you need to load it before that, use the function **rti::config::compliance::load_compliance_masks()** (p. 453).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is **rti::config::compliance::XTypesMask::default_mask()** (p. 2674).

To be fully compliant with the XTypes specification, set the mask to **rti::config::compliance::XTypesMask::vendor()** (p. 2674).

[default] rti::config::compliance::XTypesMask::default_mask() (p. 2674)

When changing the mask for an application is not desired, the property dds.xtypes.compliance_mask will change the mask at the DomainParticipant or DataWriter level. When set in the DomainParticipant, it configures the mask for all DataWriters in the participant. See `Extensible Types Compliance Mask` in the RTI Connext Core Libraries Extensible Types Guide.

8.439.2 Member Typedef Documentation

8.439.2.1 MaskType

```
typedef std::bitset<32>  rti::config::compliance::XTypesMask::MaskType
```

A typedef of std::bitset<32> for convenience.

8.439.3 Constructor & Destructor Documentation

8.439.3.1 XTypesMask() [1/3]

```
rti::config::compliance::XTypesMask::XTypesMask ( )  [inline]
```

Default XTypes compliance mask.

The mask sets the following bits:

- **rti::config::compliance::XTypesMask::parameter_length_with_padding()** (p. 2669)
- **rti::config::compliance::XTypesMask::encapsulation_options_with_padding()** (p. 2670)
- **rti::config::compliance::XTypesMask::sentinel_in_empty_union()** (p. 2671)
- **rti::config::compliance::XTypesMask::initialize_discriminator_to_default()** (p. 2672)

The HEX value for the mask is: 0x0000018C.

8.439.3.2 XTypesMask() [2/3]

```
rti::config::compliance::XTypesMask::XTypesMask (
            uint64_t mask )  [inline], [explicit]
```

Construct a **XTypesMask** (p. 2666) from an integer.

Parameters

mask	Value whose bits are copied to the bitset positions

8.439.3.3 XTypesMask() [3/3]

```
rti::config::compliance::XTypesMask::XTypesMask (
            const  MaskType & mask )  [inline]
```

Construct a **XTypesMask** (p. 2666) from a MaskType object.

Parameters

mask	A std::bitset<32> to construct this **XTypesMask** (p. 2666) from

8.439.4 Member Function Documentation

8.439.4.1 dheader_in_non_primitive_collections()

```
static const  XTypesMask rti::config::compliance::XTypesMask::dheader_in_non_primitive_collections
( )  [inline], [static]
```

When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER.

Value: 0x00000001

To be compatible with the XTypes specification, this bit must be set.

This bit only applies to XCDR2 encoding.

Limitation: For FlatData, the compliant encoding is applied to arrays and sequences of mutable types, but not final types . The serialization of final types containing arrays of non-primitive types in the FlatData language binding is not compliant with Extended CDR encoding version 2 in any case.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.2 enum_as_primitive_in_collections()

```
static const  XTypesMask rti::config::compliance::XTypesMask::enum_as_primitive_in_collections ( )
[inline], [static]
```

When this bit is set, enums are considered primitive types in collection types.

Value: 0x00000002

A DHEADER will not be added to collections of enums if **rti::config::compliance::XTypesMask::dheader_in_non_↩ primitive_collections()** (p. 2669) is set.

To be compatible with the XTypes specification, this bit must be unset.

This bit only applies to XCDR2 encoding.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.3 parameter_length_with_padding()

```
static const XTypesMask rti::config::compliance::XTypesMask::parameter_length_with_padding ( )
[inline], [static]
```

When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary.

Value: 0x00000004

To be compatible with the XTypes specification, this bit must be unset.

This bit only applies to XCDR encoding.

This bit is set by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.4 encapsulation_options_with_padding()

```
static const XTypesMask rti::config::compliance::XTypesMask::encapsulation_options_with_padding (
) [inline], [static]
```

When this bit is set, RTI Connext will set the padding bits in the options field of the encapsulation header of a serialized payload.

Value: 0x00000008

When this bit is set RTI Connext will set the least significant two bits in the second byte of the options field to a value that encodes the number of padding bytes needed after the end of the serialized payload in order to reach the next 4-byte aligned offset. Specifically, the least significant two bits shall be set to binary 00 if no padding bits would be needed and binary 01, 10, or 11 if, respectively, there would be one, two, or three bytes of padding needed. These bits in the options field will be interpreted by a DataReader to determine where the serialized data exactly ended.

To be compatible with the XTypes specification, this bit must be set.

To be compatible with the following Micro versions this bit must be unset because those versions of Micro did not support padding bits and will discard any data with encapsulations options not set to 0.

- RTI Connext Micro 3.x.y.z
- RTI Connext Micro 2.4.15.1
- RTI Connext Micro 2.4.14.0 and 2.4.14.1
- RTI Connext Micro 2.4.13.1 through 2.4.13.5
- RTI Connext Micro 2.4.12.z

This bit applies to both, XCDR and XCDR2 encodings.

This bit is set by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.5 accept_unknown_enum_value()

```
static const XTypesMask rti::config::compliance::XTypesMask::accept_unknown_enum_value ( ) [inline],
[static]
```

When this bit is set, samples containing an unknown enumerator can be successfully deserialized to the default enumeration value.

Value: 0x00000010

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.6 accept_unknown_discriminator()

```
static const XTypesMask rti::config::compliance::XTypesMask::accept_unknown_discriminator ( )
[inline], [static]
```

When this bit is set, samples containing an unknown discriminator can be successfully deserialized, and the sample won't be dropped.

Value: 0x00000020

When this bit is set, samples containing an unknown discriminator won't be dropped, and the discriminator value assigned to the sample will depend on whether or not the bit **rti::config::compliance::XTypesMask::select_default_discriminator()** (p. 2671) is set.

To be compatible with the XTypes specification, this bit must be set.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.7 select_default_discriminator()

```
static const XTypesMask rti::config::compliance::XTypesMask::select_default_discriminator ( )
[inline], [static]
```

When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value; if the bit is not set, the sample will preserve the discriminator value.

Value: 0x00000040

When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value. If the default value selects a valid union member, that member will be initialized to the default value of its type. If the bit is not set, the sample will preserve the discriminator value. The bit **rti::config::compliance::XTypesMask::initialize_discriminator_to_default()** (p. 2672) determines what the default discriminator value is.

This bit is only relevant when the bit **rti::config::compliance::XTypesMask::accept_unknown_discriminator()** (p. 2671) is set, and it is used to determine the value of the discriminator when the sample contains an unknown discriminator.

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.8 sentinel_in_empty_union()

```
static const XTypesMask rti::config::compliance::XTypesMask::sentinel_in_empty_union ( ) [inline],
[static]
```

When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value.

Value: 0x00000080

When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value: 0x027f0000. This is the same sentinel value as the one used for samples of a mutable union that contain a known discriminator.

This bit only applies to XCDR encoding, Dynamic Data, and language APIs other than Java. When using Java and not using Dynamic Data, the sentinel is always added.

To be compatible with the XTypes specification and with Connext version 5.3.x, this bit must be set.

This bit is set by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.9 initialize_discriminator_to_default()

```
static const XTypesMask rti::config::compliance::XTypesMask::initialize_discriminator_to_default
( ) [inline], [static]
```

When this bit is set, the union discriminator will be initialized to the default value of its type.

Value: 0x00000100

When this bit is set, the union discriminator will be initialized to the default value of its type. This means 0 for numeric discriminators, false for boolean discriminators, and the first literal of the enumeration for enumerated discriminators. As a result, a union may be initialized with a discriminator value that does not correspond to any of its members.

The default value of the type can be modified by creating an alias type and using the **[default]** annotation to specify the desired default value. You can then use that alias type as the discriminator type, and the default discriminator value will be the one specified in the alias type.

When this bit is unset, the discriminator will be set to select to a value that selects the default union member, if one is defined, or otherwise to the lowest value associated with any member.

If you generated code (using Code Generator) with this bit configured one way using the -xTypesComplianceMask flag (for example, -xTypesComplianceMask 0x00000100) and then configure it the opposite way in the API (for example, unset at 0x00000000), you must regenerate code using Code Generator's -xTypesComplianceMask flag configured the same way as it is in the API (for example, -xTypesComplianceMask 0x00000000). Note that this bit is the only bit that Code Generator uses; therefore, you have to set it the same both in the API and in Code Generator. See information about Code Generator's -xTypesComplianceMask command-line option in `Command-Line Arguments for rtiddsgen`, in the RTI Code Generator User's Manual.

This bit affects **rti::config::compliance::XTypesMask::select_default_discriminator()** (p. 2671). (See that bit's description above.)

To be compatible with the XTypes specification, this bit must be set.

This bit is set by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.10 java_keyhash_750()

```
static const XTypesMask rti::config::compliance::XTypesMask::java_keyhash_750 ( ) [inline],
[static]
```

When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions.

Value: 0x00000200

When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions.

This affects KeyHash calculation only when using XCDR encoding and the Java language API for mutable types and either of the following conditions is met:

- The key is not a primitive type, and the maximum serialized size of a sample for the type exceeds 65KB.
- At least one key member has a member ID greater than 16128.

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.11 python_int8_730()

```
static const XTypesMask rti::config::compliance::XTypesMask::python_int8_730 ( ) [inline], [static]
```

Set this bit to interoperate with Connext 7.3.0 Python applications that published or subscribed to types with int8 members.

Value: 0x00000400

When this bit is set, the TypeCode generation for a Python type that contains an int8 member will match the one produced by the Python API in Connext 7.3.0. However, this behavior is not compliant with the XTypes specification, and Python types with int8 members won't interoperate with other APIs.

When this bit is unset, the TypeCode generation for a Python type that contains an int8 member will be done according to the XTypes specification, allowing interoperability with all the APIs except Python in Connext 7.3.0.

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.12 must_understand_in_key_and_discriminator()

```
static const XTypesMask rti::config::compliance::XTypesMask::must_understand_in_key_and_discriminator
( ) [inline], [static]
```

When this bit is set, the parameter ID for members that are part of the key, or for the discriminator of a union, will have the parameter ID's FLAG_MUST_UNDERSTAND bit set when serialized using XCDR2.

Value: 0x00000800

To be compatible with the XTypes specification, this bit must be set.

This bit only applies when you are using XCDR2. (For XCDR, the parameter ID's FLAG_MUST_UNDERSTAND bit will never be set for key members and union discriminators, because doing so would change the key hash computation and disrupt communication with older versions of RTI Connext.)

This bit is unset by default. See **rti::config::compliance::XTypesMask::default_mask()** (p. 2674)

8.439.4.13 vendor()

```
static const XTypesMask rti::config::compliance::XTypesMask::vendor ( ) [inline], [static]
```

XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.

The mask sets the following bits:

- **rti::config::compliance::XTypesMask::dheader_in_non_primitive_collections()** (p. 2669)
- **rti::config::compliance::XTypesMask::encapsulation_options_with_padding()** (p. 2670)
- **rti::config::compliance::XTypesMask::accept_unknown_discriminator()** (p. 2671)
- **rti::config::compliance::XTypesMask::sentinel_in_empty_union()** (p. 2671)
- **rti::config::compliance::XTypesMask::initialize_discriminator_to_default()** (p. 2672)

The HEX value for the mask is: 0x000001a9.

Warning

> This mask will always include all known fixes to ensure full alignment with the XTypes specification. As a result, its contents may change between releases or patches. If you want to ensure that your application's behavior remains unaffected by future changes, you should specify the exact bits you are interested in.

8.439.4.14 default_mask()

```
static const XTypesMask rti::config::compliance::XTypesMask::default_mask ( ) [inline], [static]
```

Default XTypes compliance mask.

The mask sets the following bits:

- **rti::config::compliance::XTypesMask::parameter_length_with_padding()** (p. 2669)
- **rti::config::compliance::XTypesMask::encapsulation_options_with_padding()** (p. 2670)
- **rti::config::compliance::XTypesMask::sentinel_in_empty_union()** (p. 2671)
- **rti::config::compliance::XTypesMask::initialize_discriminator_to_default()** (p. 2672)

The HEX value for the mask is: 0x0000018C.

Chapter 9

Example Documentation

9.1 Foo.idl

The definition of the type in IDL that rtiddsgen uses to generate Foo_publisher.cxx, Foo_subscriber.cxx and the type-support code. There is also the definition of MyType and MyOtherType, used in some **Programming How-To's** (p. 362).

See also

Working with IDL types (p. 606)

```
struct Foo {
    long x; //@key
    long y;
};
struct MyType {
    long my_long;
    string<512> my_string;
    Foo my_foo;
    sequence<long, 10> my_sequence;
    Foo my_array[5];
    Foo my_optional; //@Optional
};
enum Color {
    RED,
    GREEN,
    BLUE
};
enum MyUnionDiscriminator {
    USE_LONG,
    USE_STRING,
    USE_FOO
};
union MyUnion switch (MyUnionDiscriminator) {
case USE_LONG:
    long my_long;
case USE_STRING:
    string my_string;
case USE_FOO:
    Foo my_foo;
};
struct MyOtherType {
    long m1;
    double m2;
    string m3;
};
```

9.2 Foo.hpp

The definition of the C++ types create from Foo.idl
