RTI Connext Modern C++ API

Version 7.7.0

1 RTI Connext **1**

1.1 Getting Started . . . 1

1.2 Available Documentation. . . . 2

1.2.1 The documents for the Core Libraries and Utilities are: . . . 2

1.2.2 The API Reference HTML documentation contains: . . . 2

1.3 Feedback and Support for this Release. . . . 2

2 Module Index **3**

2.1 Modules . . . 3

3 Namespace Index **9**

3.1 Namespace List . . . 9

4 Hierarchical Index **11**

4.1 Class Hierarchy . . . 11

5 Class Index **23**

5.1 Class List . . . 23

6 Module Documentation **43**

6.1 Clock Selection . . . 43

6.1.1 Available Clocks . . . 43

6.1.2 Clock Selection Strategy . . . 44

6.1.3 Configuring Clock Selection . . . 44

6.2 Domain Module . . . 44

6.2.1 Detailed Description . . . 45

6.3 DomainParticipants . . . 45

6.3.1 Detailed Description . . . 45

6.4 Built-in Topics . . . 46

6.4.1 Detailed Description . . . 46

6.5 Topic Module . . . 47

6.5.1 Detailed Description . . . 48

6.6 Topics . . . 48

6.6.1 Detailed Description . . . 49

6.6.2 Function Documentation . . . 49

6.6.2.1 sql_filter_name() . . . 49

6.6.2.2 stringmatch_filter_name() . . . 50

6.7 Zero Copy Transfer Over Shared Memory . . . 50

6.8 Built-in Types . . . 50

6.8.1 Detailed Description . . . 51

6.8.2 Managing Memory for Builtin Types . . . 51

6.8.3 Typecodes for Builtin Types . . . 52
6.9 Built-in Topic's Trust Types . . . 54
6.9.1 Detailed Description . . . 54
6.10 Publication Module . . . 55
6.10.1 Detailed Description . . . 55
6.11 Publishers . . . 55
6.11.1 Detailed Description . . . 56
6.12 Data Writers . . . 56
6.12.1 Detailed Description . . . 57
6.13 Flow Controllers . . . 57
6.13.1 Detailed Description . . . 58
6.13.2 Typedef Documentation . . . 58
6.13.2.1 FlowControllerSchedulingPolicy . . . 58
6.13.3 Variable Documentation . . . 58
6.13.3.1 DEFAULT_NAME . . . 58
6.13.3.2 FIXED_RATE_NAME . . . 59
6.13.3.3 ON_DEMAND_NAME . . . 60
6.14 Subscription Module . . . 61
6.14.1 Detailed Description . . . 62
6.14.2 Access to data samples . . . 62
6.14.2.1 Data access patterns . . . 62
6.15 Subscribers . . . 63
6.15.1 Detailed Description . . . 63
6.16 DataReaders . . . 63
6.16.1 Detailed Description . . . 64
6.17 Read Conditions . . . 65
6.17.1 Detailed Description . . . 65
6.18 Query Conditions . . . 65
6.18.1 Detailed Description . . . 65
6.18.2 Function Documentation . . . 66
6.18.2.1 create_query_condition_ex() [1/2] . . . 66
6.18.2.2 create_query_condition_ex() [2/2] . . . 66
6.19 Data Samples . . . 66
6.19.1 Detailed Description . . . 67
6.20 Topic Queries . . . 67
6.20.1 Detailed Description . . . 68
6.20.2 Snapshot TopicQueries . . . 69
6.20.3 Reading TopicQuery Samples . . . 69
6.20.4 Debugging Topic Queries . . . 70

6.20.4.1 The Built-in ServiceRequest DataReader . . . 70
6.20.4.2 The on_service_request_accepted DataWriter Listener Callback . . . 71
6.20.5 Typedef Documentation . . . 71
6.20.5.1 TopicQuerySelectionKind . . . 71
6.21 Sample Information . . . 71
6.21.1 Detailed Description . . . 71
6.22 Data State . . . 71
6.22.1 Detailed Description . . . 72
6.23 Infrastructure Module . . . 72
6.23.1 Detailed Description . . . 73
6.24 Multi-channel DataWriters . . . 73
6.24.1 What is a Multi-channel DataWriter? . . . 73
6.24.2 Configuration on the Writer Side . . . 74
6.24.3 Configuration on the Reader Side . . . 74
6.24.4 Reliability with Multi-Channel DataWriters . . . 74
6.24.4.1 Reliable Delivery . . . 74
6.24.4.2 Reliable Protocol Considerations . . . 74
6.25 Transports . . . 75
6.25.1 Detailed Description . . . 75
6.25.2 Overview . . . 75
6.25.3 Transport Aliases . . . 76
6.25.4 Transport Lifecycle . . . 76
6.25.5 Transport Class Attributes . . . 77
6.25.6 Transport Instance Attributes . . . 78
6.25.7 Transport Network Address . . . 79
6.25.8 Transport Send Route . . . 79
6.25.9 Transport Receive Route . . . 79
6.26 Installing Transport Plugins . . . 80
6.26.1 Loading Transport Plugins through Property QoS Policy of Domain Participant . . . 81
6.27 Built-in Transport Plugins . . . 83
6.27.1 Detailed Description . . . 83
6.28 Creating New Transport Plugins . . . 84
6.29 Queries and Filters Syntax . . . 84
6.29.1 Syntax for DDS Queries and Filters . . . 84
6.29.2 SQL grammar in BNF . . . 85
6.29.3 Token expression . . . 85
6.29.4 String Parameters . . . 87
6.29.5 Type compatability in Predicate . . . 87
6.29.6 SQL Extension: Regular Expression Matching . . . 88

6.29.7 Character Encoding . . . 89
6.29.8 Unicode Normalization . . . 89
6.29.9 Examples . . . 90
6.30 Logging and Version . . . 90
6.30.1 Detailed Description . . . 90
6.31 General Utilities and Compliance Configuration . . . 90
6.31.1 Detailed Description . . . 91
6.32 Observability Framework . . . 91
6.32.1 Detailed Description . . . 91
6.33 Request-Reply Pattern . . . 91
6.33.1 Detailed Description . . . 92
6.34 Requester . . . 92
6.34.1 Detailed Description . . . 92
6.35 Replier . . . 93
6.35.1 Detailed Description . . . 93
6.36 Queuing Pattern . . . 93
6.36.1 Detailed Description . . . 94
6.37 QueueProducer . . . 95
6.37.1 Detailed Description . . . 95
6.38 QueueConsumer . . . 95
6.38.1 Detailed Description . . . 96
6.39 QueueRequester . . . 96
6.39.1 Detailed Description . . . 96
6.40 QueueReplier . . . 96
6.40.1 Detailed Description . . . 97
6.41 Remote Procedure Call . . . 97
6.41.1 Detailed Description . . . 98
6.42 Utilities . . . 98
6.43 Durability and Persistence . . . 99
6.43.1 Durable Writer History . . . 99
6.43.2 Durable Reader State . . . 99
6.43.3 Data Durability . . . 100
6.43.4 Durability and Persistence Based on Virtual GUID . . . 100
6.43.5 Configuring Durable Writer History . . . 101
6.43.6 Configuring Durable Reader State . . . 102
6.43.7 Configuring Data Durability . . . 103
6.44 Basic QoS . . . 104
6.45 DDS Specification QoS . . . 112
6.46 DDS Extension QoS . . . 116

6.47 Functional Categories . . . 156
6.47.1 Detailed Description . . . 158
6.48 Application Acknowledgement . . . 158
6.49 Application-Defined Metadata . . . 159
6.50 Application Startup . . . 161
6.51 Batching . . . 161
6.52 Concurrency . . . 164
6.53 Content Filtering . . . 165
6.54 Data Availability . . . 167
6.55 Debuggability . . . 172
6.56 Discovery . . . 177
6.57 Discovery Isolation . . . 183
6.58 Durability . . . 184
6.59 Flow Control . . . 188
6.60 Fragmentation . . . 191
6.61 Instance Lifecycle . . . 193
6.62 Sending Large Data . . . 197
6.63 Liveliness . . . 199
6.64 Logging . . . 201
6.65 Middleware Memory Management . . . 204
6.66 QoS Profile Management . . . 220
6.67 Reliability QoS . . . 222
6.68 Sample Memory Management QoS . . . 230
6.69 Sample Ordering . . . 234
6.70 Security . . . 235
6.71 Throughput . . . 236
6.72 Transports . . . 237
6.73 Topic Queries . . . 239
6.74 Type System . . . 240
6.75 QoS Mutability . . . 242
6.75.1 Detailed Description . . . 242
6.76 Immutable QoS . . . 243
6.77 Mutable QoS . . . 280
6.78 Other QoS Attributes . . . 286
6.78.1 Detailed Description . . . 287
6.79 Applied Per-Instance . . . 287
6.80 Discovery Metadata . . . 288
6.81 Matching . . . 293
6.82 Deprecated QoS . . . 296

6.83 System Properties . . . 301
6.83.1 System Properties List . . . 301
6.83.2 System Resource Consideration . . . 302
6.84 Configuring QoS Profiles with XML . . . 302
6.84.1 Detailed Description . . . 302
6.84.2 Loading QoS Profiles from XML Resources . . . 302
6.84.3 URL . . . 304
6.84.3.1 URL groups . . . 304
6.84.3.2 NDDS_QOS_PROFILES environment variable . . . 304
6.84.3.3 Built-In QoS Profiles . . . 304
6.85 Publication Example . . . 304
6.85.1 A typical publication example . . . 305
6.86 Subscription Example . . . 305
6.86.1 A typical subscription example . . . 306
6.87 Participant Use Cases . . . 306
6.87.1 Turning off auto-enable of newly created participant(s) . . . 306
6.87.2 Setting up a DomainParticipant . . . 307
6.87.3 Looking up DomainParticipants . . . 307
6.87.4 Tearing down a Participant . . . 308
6.87.5 Finalizing the factory . . . 308
6.88 Topic Use Cases . . . 308
6.88.1 Registering a user data type . . . 308
6.88.2 Setting up a Topic . . . 308
6.88.3 Discovering Topics . . . 309
6.88.4 Tearing down a topic . . . 310
6.89 Publisher Use Cases . . . 310
6.89.1 Setting up a publisher . . . 310
6.89.2 Looking up Publishers . . . 310
6.89.3 Tearing down a publisher . . . 311
6.90 DataWriter Use Cases . . . 311
6.90.1 Setting up a DataWriter . . . 311
6.90.2 Managing instances . . . 312
6.90.3 Sending data . . . 312
6.90.4 DataWriter Listeners . . . 313
6.90.5 Looking up DataWriters . . . 314
6.90.6 Getting Matched Subscriptions . . . 315
6.90.7 Tearing down a DataWriter . . . 315
6.91 Subscriber Use Cases . . . 315
6.91.1 Setting up a subscriber . . . 315

6.91.2 Looking up Subscribers . . . 316
6.91.3 Tearing down a subscriber . . . 316
6.92 DataReader Use Cases . . . 316
6.92.1 Setting up a DataReader . . . 316
6.92.2 Managing instances . . . 317
6.92.3 Set up a DataReader to access received data . . . 317
6.92.4 Accessing Received Data . . . 318
6.92.4.1 Reading data samples . . . 318
6.92.4.2 Selecting what samples to read . . . 319
6.92.4.3 Reading samples using coherent access . . . 320
6.92.5 DataReader Listeners . . . 320
6.92.6 Looking up DataReaders . . . 322
6.92.7 Getting Matched Publications . . . 323
6.92.8 Accessing the Built-in Subscriber and DataReaders . . . 323
6.92.9 Using untyped DataReaders . . . 324
6.92.10 Tearing down a DataReader . . . 324
6.93 Entity Use Cases . . . 325
6.93.1 Changing the QoS for an entity . . . 325
6.93.2 Changing the listener and enabling/disabling statuses associated with it . . . 325
6.93.3 Enabling/Disabling statuses associated with a status condition . . . 327
6.93.4 Ignoring Entities . . . 328
6.93.5 Tearing Down An Entity . . . 328
6.94 Waitset Use Cases . . . 330
6.94.1 Setting up a WaitSet . . . 330
6.94.2 Waiting for Condition(s) to trigger . . . 330
6.95 Filter Use Cases . . . 331
6.95.1 Introduction . . . 331
6.95.2 Code Examples . . . 332
6.95.3 Filtering with ContentFilteredTopic . . . 332
6.95.4 Filtering with Query Conditions . . . 332
6.95.5 Filtering Performance . . . 333
6.96 Creating Custom Content Filters . . . 333
6.96.1 Introduction
 . . . 333
6.96.2 The Custom Content Filter API . . . 334
6.96.2.1 The compile function . . . 334
6.96.2.2 The evaluate function . . . 335
6.96.2.3 The finalize function . . . 335
6.96.2.4 The writer_attach function . . . 335
6.96.2.5 The writer_compile function . . . 335

6.96.2.6 The writer_evaluate function . . . 335
6.96.2.7 The writer_detach function . . . 335
6.96.2.8 The writer_return_loan function . . . 335
6.96.2.9 The writer_finalize function . . . 336
6.96.3 Example Custom Writer Content Filter . . . 336
6.96.3.1 Writing the Compile Function . . . 337
6.96.3.2 Writing the Evaluate Function . . . 337
6.96.3.3 Writing the Finalize Function . . . 338
6.96.3.4 Writing the Writer Attach Function . . . 338
6.96.3.5 Writing the Writer Compile Function . . . 338
6.96.3.6 Writing the Writer Evaluate Function . . . 339
6.96.3.7 Writing the Writer Detach Function . . . 339
6.96.3.8 Writing the Writer Return Loan Function . . . 339
6.96.3.9 Writing the Writer Finalize Function . . . 339
6.96.3.10 Creating a CustomFilter . . . 340
6.96.3.11 Registering the Filter . . . 340
6.96.3.12 Unregistering the Filter . . . 340
6.96.3.13 Using a CustomFilter . . . 340
6.96.3.14 Looking up the Filter . . . 341
6.97 XML Application Creation . . . 342
6.97.1 Introduction
 . . . 342
6.97.2 Setting up this Example . . . 343
6.97.2.1 Using XML Application Creation . . . 343
6.98 Request-Reply Examples . . . 344
6.98.1 Request-Reply Examples . . . 344
6.98.2 Requester Creation . . . 345
6.98.3 Creating a Requester with optional parameters . . . 345
6.98.4 Basic Requester example . . . 346
6.98.5 Correlating requests and replies . . . 346
6.98.6 Creating a Replier . . . 347
6.98.7 Basic Replier example . . . 348
6.98.8 SimpleReplier example . . . 348
6.98.9 Configuring Request-Reply QoS profiles . . . 348
6.99 Documentation Roadmap . . . 349
6.100 Conventions . . . 350
6.100.1 Type system . . . 350
6.100.1.1 Value types . . . 350
6.100.1.2 Reference types . . . 351
6.100.1.3 Move-only types . . . 353

6.100.2 C++11 Support . . . 353
6.100.3 Exceptions in the API . . . 353
6.100.4 Extensions to the standard API . . . 354
6.100.5 Experimental . . . 355
6.100.6 Method Parameters . . . 355
6.101 Namespaces and headers . . . 355
6.101.1 Header Files . . . 355
6.101.2 Namespaces . . . 356
6.102 RTI Connext DDS API Reference . . . 357
6.102.1 Detailed Description . . . 358
6.102.2 Overview . . . 359
6.102.3 Conceptual Model . . . 359
6.102.4 Modules . . . 361
6.103 Additional RTI Connext Communication Patterns . . . 361
6.103.1 Detailed Description . . . 362
6.104 Programming How-To's . . . 362
6.104.1 Detailed Description . . . 363
6.105 Interface . . . 363
6.105.1 Detailed Description . . . 363
6.105.2 Enumeration Type Documentation . . . 364
6.105.2.1 NDDS_Transport_Interface_Status_t . . . 364
6.106 Transport Plugins Configuration . . . 365
6.106.1 Detailed Description . . . 366
6.106.2 Macro Definition Documentation . . . 367
6.106.2.1 NDDS_TRANSPORT_PORT_INVALID . . . 367
6.106.2.2 NDDS_TRANSPORT_UUID_SIZE . . . 367
6.106.2.3 NDDS_TRANSPORT_LENGTH_UNLIMITED . . . 367
6.106.2.4 NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN . . . 367
6.106.2.5 NDDS_TRANSPORT_UUID_UNKNOWN . . . 367
6.106.2.6 NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED . . . 368
6.106.2.7 NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC 368
6.106.2.8 NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT . . . 368
6.106.2.9 NDDS_TRANSPORT_CLASSID_INVALID . . . 368
6.106.2.10 NDDS_TRANSPORT_CLASSID_UDPv4 . . . 369
6.106.2.11 NDDS_TRANSPORT_CLASSID_SHMEM . . . 369
6.106.2.12 NDDS_TRANSPORT_CLASSID_SHMEM_510 . . . 369
6.106.2.13 NDDS_TRANSPORT_CLASSID_UDPv6 . . . 369
6.106.2.14 NDDS_TRANSPORT_CLASSID_UDPv6_510 . . . 369
6.106.2.15 NDDS_TRANSPORT_CLASSID_TCPV4_LAN . . . 369

6.106.2.16 NDDS_TRANSPORT_CLASSID_TCPV4_WAN . . . 370
6.106.2.17 NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN . . . 370
6.106.2.18 NDDS_TRANSPORT_CLASSID_TLSV4_LAN . . . 370
6.106.2.19 NDDS_TRANSPORT_CLASSID_TLSV4_WAN . . . 370
6.106.2.20 NDDS_TRANSPORT_CLASSID_UDPv4_WAN . . . 370
6.106.2.21 NDDS_TRANSPORT_CLASSID_RESERVED_RANGE . . . 370
6.106.2.22 NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED . . . 371
6.106.2.23 NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN . . . 371
6.106.3 Typedef Documentation . . . 371
6.106.3.1 NDDS_Transport_Port_t . . . 371
6.106.3.2 NDDS_Transport_ClassId_t . . . 372
6.107 Transport Address . . . 372
6.107.1 Detailed Description . . . 373
6.107.2 Macro Definition Documentation . . . 373
6.107.2.1 NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER . . . 374
6.107.2.2 NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE . . . 374
6.107.3 Function Documentation . . . 374
6.107.3.1 NDDS_Transport_Address_to_string() . . . 374
6.107.3.2 NDDS_Transport_Address_to_string_with_protocol_family_format() . . . 375
6.107.3.3 NDDS_Transport_Address_from_string() . . . 376
6.107.3.4 NDDS_Transport_Address_print() . . . 376
6.107.3.5 NDDS_Transport_Address_is_ipv4() . . . 376
6.107.3.6 NDDS_Transport_Address_is_multicast() . . . 377
6.107.4 Variable Documentation . . . 377
6.107.4.1 NDDS_TRANSPORT_ADDRESS_INVALID . . . 377
6.108 UDP Transport Plugin definitions . . . 378
6.108.1 Detailed Description . . . 378
6.108.2 Macro Definition Documentation . . . 378
6.108.2.1 NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT . . . 379
6.108.2.2 NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT . . . 379
6.108.2.3 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX . . . 379
6.108.2.4 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT . . . 379
6.108.2.5 NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT . . . 380
6.108.2.6 NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT . . . 380
6.108.2.7 NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT . . . 380
6.108.3 Typedef Documentation . . . 380
6.108.3.1 NDDS_Transport_UDP_Port . . . 380
6.109 Shared Memory Transport . . . 380
6.109.1 Detailed Description . . . 381

6.109.2 Compatibility of Sender and Receiver Transports . . . 381
6.109.3 Crashing and Restarting Programs . . . 382
6.109.4 Shared Resource Keys . . . 382
6.109.5 Creating and Registering Shared Memory Transport Plugin . . . 382
6.109.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant . . . 383
6.109.7 Macro Definition Documentation . . . 384
6.109.7.1 NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT . . . 384
6.109.7.2 NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT . . . 384
6.109.7.3 NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT 384
6.109.7.4 NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT . . . 384
6.109.7.5 NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT . . 385
6.109.7.6 NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT . . . 385
6.109.7.7 NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX . . . 385

Chapter 1

RTI Connext

Core Libraries and Utilities

Real-Time Innovations, Inc.

RTI Connext is network middleware for real-time distributed applications. It provides the communications services that programmers need to distribute time-critical data between embedded and/or enterprise devices or nodes. RTI Connext uses the publish-subscribe communications model to make data distribution efficient and robust.

The RTI Connext Application Programming Interface (API) is based on the OMG's Data Distribution Service (DDS) specification, version 1.4. The most recent publication of this specification can be found in the Catalog of OMG Specifications under "Platform Categories".

This documentation is for the **RTI Connext Modern C++ API**, based on the ISO/IEC C++ 2003 Language DDS PSM (DDS-PSM-Cxx) specification, version 1.0. The RTI Connext Traditional C++ API is also available.

1.1 Getting Started

- Learn about the **conventions** (p. 350) used in the API (such as type semantics, C++11 support, use of standard and extension APIs...) and the **headers and namespaces** (p. 355)
- Look at the **programming tutorials** (p. 362). These are a good starting point: **Publication Example** (p. 304) and **Subscription Example** (p. 305).
- Browse the API reference: **RTI Connext DDS API Reference** (p. 357) and **Additional RTI Connext Communication Patterns** (p. 361).
- Browse, download, and build these RTI Community code examples.

1.2 Available Documentation.

The documentation for this release is provided in two forms: the API Reference HTML documentation and PDF documents. If you are new to RTI Connext, the **Documentation Roadmap** (p. 349) will provide direction on how to learn about this product.

1.2.1 The documents for the Core Libraries and Utilities are:

- **What's New.** An overview of the new features in this release.
- **Release Notes.** System requirements, compatibility, what's fixed in this release, and known issues.
- **Platform Notes.** Specific details, such as compilation setting and libraries, related to building and using RTI Connext on the various supported platforms.
- **Getting Started Guide.** Core value and concepts behind the product, taking you step-by-step through the creation of a simple example application. Developers should read this document first.
- **Code Generator User's Manual.** Information about using rtiddsgen to generate code from data types.
- **User's Manual.** Introduction to RTI Connext, product tour and conceptual presentation of the functionality of RTI Connext.
- **QoS Reference Guide.** A compact summary of supported Quality of Service (QoS) policies.
- **XML-Based Application Creation Getting Started Guide.** Details on how to use XML-Based Application Creation.
- **Extensible Types Guide.** Additional information about extensible types.
- See more `documentation` on RTI Community.

1.2.2 The API Reference HTML documentation contains:

- **RTI Connext DDS API Reference** (p. 357) - The RTI Connext API reference.
- **Additional RTI Connext Communication Patterns** (p. 361) - RTI Connext APIs for additional communication patterns
- **Programming How-To's** (p. 362) - Describes and shows the common tasks done using the API.

The API Reference HTML documentation can be accessed through the tree view in the left frame of the web browser window. The bulk of the documentation is found under the entry labeled "Modules".

1.3 Feedback and Support for this Release.

We welcome any input on how to improve RTI Connext to suit your needs. If you have questions or comments about this release, please visit the RTI Customer Portal at `https://support.rti.com`.

The Customer Portal provides access to RTI software, documentation, and support. It also allows you to log support cases. Furthermore, the portal provides detailed solutions and a free public knowledge base. To access the software, documentation or log support cases, the RTI Customer Portal requires a username and password. You will receive this in the email confirming your purchase. If you do not have this email, please contact `license@rti.com`. Resetting your login password can be done directly at the RTI Customer Portal.

Chapter 3

Namespace Index

3.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

dds
The dds namespace. The dds namespace includes all of the standard types, classes, and functions 615
dds::all
<<***extension***>> *(p. 354)* A single namespace where all standard symbols are included 615
dds::core
The core namespace contains infrastructure types and functions 616
dds::core::cond
Contains the **Condition** (p. 948) classes 627
dds::core::policy
Contains the standard Qos policy classes 627
dds::core::status
Contains the Status and State classes 630
dds::core::xtypes
Contains the types and functions to support Extensible Types 631
dds::domain
The domain namespace contains types, classes, and functions related to DomainParticipants 634
dds::domain::qos
Contains **DomainParticipantQos** (p. 1384) 640
dds::pub
Contains the type and functions to support publishing topics 645
dds::pub::qos
Contains **PublisherQos** (p. 2007) and **DataWriterQos** (p. 1226) 653
dds::sub
Contains the types and functions to support subscribing to topics 658
dds::sub::cond
Contains Conditions specific to DataReaders 680
dds::sub::qos
Contains **DataReaderQos** (p. 1072) and **SubscriberQos** (p. 2423) 681
dds::sub::status
Contains **DataState** (p. 1118) 686

dds::topic
Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types . . . 688
dds::topic::qos
Contains **TopicQos** (p. 2509) . . . 695
rti
<<***extension***>> *(p. 354)* The namespace that contains the extension types and functions to the DDS standard . . . 698
rti::all
<<***extension***>> *(p. 354)* A single namespace where all symbols are included . . . 699
rti::config
<<***extension***>> *(p. 354)* Logging configuration and version information . . . 699
rti::core
<<***extension***>> *(p. 354)* Extensions to **dds::core** (p. 616) . . . 701
rti::core::builtin_profiles
<<***extension***>> *(p. 354)* Contains the names of the built-in profiles . . . 711
rti::core::builtin_profiles::qos_lib
<<***extension***>> *(p. 354)* Contains the names of the built-in profiles in the regular (non-experimental) qos library . . . 712
rti::core::builtin_profiles::qos_lib_exp
<<***extension***>> *(p. 354)* <<***experimental***>> *(p. 355)* Contains the names of the built-in profiles in the experimental qos library . . . 714
rti::core::builtin_profiles::qos_snippet_lib
<<***extension***>> *(p. 354)* Contains the names of the built-in QoS Snippets . . . 716
rti::core::xtypes
<<***extension***>> *(p. 354)* Extensions to **dds::core::xtypes** (p. 631) . . . 718
rti::domain
<<***extension***>> *(p. 354)* Extensions to **dds::domain** (p. 634) . . . 727
rti::flat
<<***extension***>> *(p. 354)* Support for **FlatData Topic-Types** (p. 419) . . . 735
rti::pub
<<***extension***>> *(p. 354)* Extensions to **dds::pub** (p. 645) . . . 736
rti::sub
<<***extension***>> *(p. 354)* Extensions to **dds::sub** (p. 658) . . . 751
rti::topic
<<***extension***>> *(p. 354)* Extensions to **dds::topic** (p. 688) . . . 771
rti::util
<<***extension***>> *(p. 354)* Contains general-purpose utilities . . . 777
rti::util::activation
<<***extension***>> *(p. 354)* Contains the necessary functions related to Activation . . . 778
rti::util::discovery
<<***extension***>> *(p. 354)* Contains the functions to take discovery snapshot for DomainParticipant, DataWriter and DataReader entities . . . 778
rti::util::function_history
<<***extension***>> *(p. 354)* Contains the functions to enable Function History feature . . . 778
rti::util::heap_monitoring
<<***extension***>> *(p. 354)* Contains the functions to enable and use the heap-monitoring utility . . . 779
rti::util::network_capture
<<***extension***>> *(p. 354)* Contains the functions to enable and use the Network Capture utility . . . 780

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

rti::flat::AbstractBuilder . . . 783
rti::flat::AbstractListBuilder< detail::DHeaderGenerator > . . . 791
rti::flat::AbstractSequenceBuilder< detail::DHeaderGenerator > . . . 794
rti::flat::FinalSequenceBuilder< ElementOffset > . . . 1569
rti::flat::MutableSequenceBuilder< ElementBuilder > . . . 1757
rti::flat::MutableArrayBuilder< ElementBuilder, N > . . . 1753
rti::flat::AbstractListBuilder< detail::primitive_sequence_dheader_gen< T >::type > . . . 791
rti::flat::AbstractSequenceBuilder< detail::primitive_sequence_dheader_gen< T >::type > . . . 794
rti::flat::PrimitiveSequenceBuilder< T > . . . 1955
rti::flat::AbstractListBuilder< detail::primitive_sequence_dheader_gen< char >::type > . . . 791
rti::flat::AbstractSequenceBuilder< detail::primitive_sequence_dheader_gen< char >::type > . . . 794
rti::flat::PrimitiveSequenceBuilder< char > . . . 1955
rti::flat::StringBuilder . . . 2392
rti::flat::AbstractListBuilder< DHeaderGen > . . . 791
rti::flat::AbstractSequenceBuilder< DHeaderGen > . . . 794
rti::flat::AggregationBuilder . . . 800
rti::flat::UnionBuilder< int32_t > . . . 2577
MyFlatUnionBuilder . . . 1777
MyFlatMutableBuilder . . . 1763
rti::flat::UnionBuilder< Discriminator > . . . 2577
rti::pub::AcknowledgmentInfo . . . 795
rti::core::policy::AcknowledgmentKind_def . . . 797
rti::sub::AckResponseData . . . 798
rti::core::AllocationSettings . . . 803
dds::sub::AnyDataReader . . . 807
dds::sub::AnyDataReaderListener . . . 812
dds::sub::SubscriberListener . . . 2422

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

rti::flat::AbstractAlignedList< ElementOffset >
Base class of Offsets to sequences and arrays of non-primitive members . . . 781
rti::flat::AbstractBuilder
Base class of all **Builders** (p. 409) . . . 783
dds::core::xtypes::AbstractConstructedType< MemberType >
The base class of types that have members and an extensibility kind . . . 785
rti::flat::AbstractListBuilder< DHeaderGen >
Base class of all array and sequence builders . . . 791
rti::flat::AbstractPrimitiveList< T >
Base class for Offsets to sequences and arrays of primitive types . . . 792
rti::flat::AbstractSequenceBuilder< DHeaderGen >
Base class of Builders for sequence members . . . 794
rti::pub::AcknowledgmentInfo
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Information about an application-acknowledged sample . . . 795
rti::core::policy::AcknowledgmentKind_def
<<***extension***>> *(p. 354)* The enumeration for Reliability acknowledgment kinds . . . 797
rti::sub::AckResponseData
<<***extension***>> *(p. 354)* Data payload associated to an application-level acknowledgment . . . 798
rti::flat::AggregationBuilder
Base class of struct and union builders . . . 800
dds::core::xtypes::AliasType
<<***value-type***>> *(p. 350)* Represents an IDL `typedef` . . . 801
rti::core::AllocationSettings
<<***extension***>> *(p. 354)* Resource allocation settings . . . 803
dds::core::AlreadyClosedError
Indicates that an object has been closed . . . 806
dds::sub::AnyDataReader
<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **DataReader** (p. 976) of any type . . . 807
dds::sub::AnyDataReaderListener
The listener to notify status changes for a **dds::sub::DataReader** (p. 976) of a generic type . . . 812

dds::pub::AnyDataWriter
<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **DataWriter** (p. 1138) of any type . . . 815
dds::pub::AnyDataWriterListener
The listener to notify status changes for a **dds::pub::DataWriter** (p. 1138) of a generic type . . . 821
dds::topic::AnyTopic
<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **Topic** (p. 2474) of any type . . . 825
dds::core::xtypes::ArrayType
<<***value-type***>> *(p. 350)* Represents an IDL array type . . . 828
rti::core::policy::AsynchronousPublisher
<<***extension***>> *(p. 116)* Configures the mechanism to publish data using a separate thread . . . 832
rti::core::cond::AsyncWaitSet
<<***extension***>> *(p. 354)* Dispatches **dds::core::cond::Condition** (p. 948) objects using separate threads of execution. Unlike a normal **dds::core::cond::WaitSet** (p. 2617), which operates on the current thread, an **AsyncWaitSet** (p. 840) uses a thread pool . . . 840
rti::core::cond::AsyncWaitSetCompletionToken
Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **AsyncWaitSet** (p. 840) behavior . . . 853
rti::core::cond::AsyncWaitSetListener
Listener (p. 1637) for receiving event notifications related to the thread pool of the **AsyncWaitSet** (p. 840) . . . 856
rti::core::cond::AsyncWaitSetProperty
Specifies the **rti::core::cond::AsyncWaitSet** (p. 840) behavior . . . 858
rti::util::atomic_shared_ptr< T >
Utility class to provide atomic operations on std::shared_ptr . . . 862
rti::config::activity_context::AttributeKindMask
The attributes used in the string representation of the Activity Context can be configured through this mask . . . 863
rti::core::policy::Availability
<<***extension***>> *(p. 116)* Configures data availability in the context of Collaborative DataWriters and Required Subscriptions . . . 868
dds::core::basic_string< CharType, Allocator >
<<***value-type***>> *(p. 350)* A string convertible to std::string and with similar functionality . . . 875
rti::core::policy::Batch
<<***extension***>> *(p. 116)* Allows a **dds::pub::DataWriter** (p. 1138) to batch multiple samples into a single network packet to increase throughput . . . 880
rti::core::bounded_sequence< T, MaxLength >
<<***value-type***>> *(p. 350)* A bounded sequence of elements . . . 887
dds::topic::BuiltinTopicKey
The key of the built-in topics . . . 905
rti::core::policy::BuiltinTopicReaderResourceLimits
<<***extension***>> *(p. 116)* Configures several resource management aspects of the built-in topic DataReaders . . . 906
dds::core::BytesTopicType
Built-in type consisting of a variable-length array of opaque bytes . . . 917
rti::core::policy::CdrPaddingKind_def
<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) CdrPaddingKind . 920
rti::core::ChannelSettings
<<***extension***>> *(p. 354)* Configures the properties of a channel in **rti::core::policy::Multi↩ Channel** (p. 1749) . . . 921
dds::rpc::ClientEndpoint< Request, Reply >
<<***reference-type***>> *(p. 351)* Manages the DDS entities required to make remote function calls . 925

dds::rpc::ClientParams
<<***value-type***>> *(p. 350)* The parameters used to configure a **ClientEndpoint** (p. 925) 928
dds::sub::CoherentAccess
<<***value-type***>> *(p. 350)* Controls whether RTI Connext will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_↩ changes 929
dds::pub::CoherentSet
<<***value-type***>> *(p. 350)* A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications 932
rti::core::CoherentSetInfo
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* A CoherentSampleInfo provides information about the coherent set associated with a sample 934
dds::core::xtypes::CollectionType
<<***value-type***>> *(p. 350)* The base class of all collection types 939
rti::core::CompressionIdMask
<<***extension***>> *(p. 354)* Mask that specifies which built-in compression method to used 940
rti::core::CompressionSettings
<<***extension***>> *(p. 354)* Compression Settings 943
dds::core::cond::Condition
<<***reference-type***>> *(p. 351)* Abstract base class of all the conditions 948
rti::queuing::ConsumerAvailabilityParams
Definition of the availability feedback information that can be provided by consumers to Queuing Service 949
rti::topic::ContentFilter< T, CompileData >
<<***extension***>> *(p. 354)* A class to inherit from when implementing a custom content filter 950
dds::topic::ContentFilteredTopic< T >
<<***reference-type***>> *(p. 351)* Specialization of **TopicDescription** (p. 2503) that allows for content-based subscriptions 954
rti::core::ContentFilterProperty
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Provides all the required information to enable content filtering 960
rti::util::network_capture::ContentKindMask
<<***extension***>> *(p. 354)* Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file 962
rti::core::Cookie
Unique identifier for a written data sample in the form of a sequence of bytes 965
rti::topic::CustomFilter< T >
<<***extension***>> *(p. 354)* <<***reference-type***>> *(p. 351)* A wrapper class for the user-defined implementation of a **ContentFilter** (p. 950) 967
rti::core::policy::Database
<<***extension***>> *(p. 116)* Configures threads and resource limits that RTI Connext uses to control its internal database 969
dds::sub::DataReader< T >
<<***reference-type***>> *(p. 351)* Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **dds::sub::Subscriber** (p. 2410) 976
rti::core::status::DataReaderCacheStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask**↩ **::datareader_cache()** (p. 2386) 1046
rti::core::policy::DataReaderInstanceRemovalKind_def
Sets the kinds of instances that can be replaced when instance resource limits (**dds::core::policy**↩ **::ResourceLimits::max_instances** (p. 2206)) are reached 1053

dds::sub::DataReaderListener< T >
The **Listener** (p. 1637) to notify status changes for a **dds::sub::DataReader** (p. 976) 1055
rti::core::policy::DataReaderProtocol
<<***extension***>> *(p. 116)* Configures DataReader-specific aspects of the RTPS protocol 1059
rti::core::status::DataReaderProtocolStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::datareader_protocol()** (p. 2387) 1065
dds::sub::qos::DataReaderQos
<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::sub::DataReader** (p. 976) supports 1072
rti::core::policy::DataReaderResourceLimits
<<***extension***>> *(p. 116)* Configures the memory usage of a dds::pub::DataReader 1081
rti::core::DataReaderResourceLimitsInstanceReplacementSettings
<<***extension***>> *(p. 354)* How instances are replaced in the DataReader queue when resource limits are reached 1108
rti::sub::cond::DataReaderStatusConditionHandler< T >
Realization of a **functor handler** (p. 2134) that handles the status of a **dds::sub::DataReader** (p. 976) 1111
dds::core::policy::DataRepresentation
Contains the data representations supported by entities 1113
dds::sub::status::DataState
Describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1615), **ViewState** (p. 2614), and **SampleState** (p. 2316) 1118
rti::sub::status::DataStateEx
<<***extension***>> (p. *354)* <<***value-type***>> *(p. 350)* An extended version of **dds::sub::status::DataState** (p. 1118) that also contains **StreamKind** (p. 2390) 1126
dds::core::policy::DataTag
Stores name-value (string) pairs that can be used to determine access permissions 1132
dds::pub::DataWriter< T >
<<***reference-type***>> *(p. 351)* Allows an application to publish data for a **dds::topic::Topic** (p. 2474) 1138
rti::core::status::DataWriterCacheStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::datawriter_cache()** (p. 2386) 1199
dds::pub::DataWriterListener< T >
The **Listener** (p. 1637) to notify status changes for a **dds::pub::DataWriter** (p. 1138) 1202
rti::core::policy::DataWriterProtocol
<<***extension***>> *(p. 116)* Configures aspects of an the RTPS protocol related to a **dds::pub::DataWriter** (p. 1138) 1210
rti::core::status::DataWriterProtocolStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::datawriter_protocol()** (p. 2386) 1219
dds::pub::qos::DataWriterQos
<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::pub::DataWriter** (p. 1138) supports 1226
rti::core::policy::DataWriterResourceLimits
<<***extension***>> *(p. 116)* Configures the memory usage of a **dds::pub::DataWriter** (p. 1138) . . 1235
rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind_def
<<***extension***>> *(p. 354)* The enumeration for DataWriter Resource Limits 1249
rti::core::DataWriterShmemRefTransferModeSettings
<<***extension***>> *(p. 354)* Configures aspects of the shared memory reference transfer mode related to a DataWriter 1251
rti::core::policy::DataWriterTransferMode
<<***extension***>> *(p. 116)* Configures the transfer mode of a **dds::pub::DataWriter** (p. 1138) . . . 1253

dds::core::policy::Deadline
Expresses the maximum duration (deadline) within which an instance is expected to be updated . 1255
dds::core::policy::DestinationOrder
Controls the logical order of updates to the same instance by a **dds::pub::Publisher** (p. 1993) . . 1258
dds::core::policy::DestinationOrderKind_def
The definition of the **dds::core::safe_enum** (p. 2265) DestinationOrderKind 1263
rti::core::policy::DestinationOrderScopeKind_def
<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) DestinationOrder↩ ScopeKind 1264
rti::test::DisableMonitoringLibraryGuard
RAII scope guard to temporarily disable monitoring library 1265
rti::core::policy::Discovery
<<***extension***>> *(p. 116)* Configures entity discovery 1265
rti::core::policy::DiscoveryConfig
<<***extension***>> *(p. 116)* Configures the discovery mechanism 1271
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask
<<***extension***>> *(p. 354)* A mask that selects the built-in channels to be used 1319
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask
<<***extension***>> *(p. 354)* A mask that selects the built-in discovery plugins to be used 1322
dds::domain::DomainParticipant
<<***reference-type***>> *(p. 351)* Container for all **dds::core::Entity** (p. 1520) objects . . 1326
rti::domain::DomainParticipantConfigParams
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration 1371
dds::domain::qos::DomainParticipantFactoryQos
<<***value-type***>> *(p. 350)* Container of the QoS policies that do not apply to a specific entity 1378
dds::domain::DomainParticipantListener
The listener class for a **DomainParticipant** (p. 1326) 1382
rti::core::status::DomainParticipantProtocolStatus 1383
dds::domain::qos::DomainParticipantQos
<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1326) supports 1384
rti::core::policy::DomainParticipantResourceLimits
<<***extension***>> *(p. 116)* Configures the memory usage of certain **dds::domain::Domain↩ Participant** (p. 1326) resources 1391
dds::core::policy::Durability
Specifies whether a **dds::pub::DataWriter** (p. 1138) will store and deliver previously published data samples to late-joining **dds::sub::DataReader** (p. 976) entities 1433
dds::core::policy::DurabilityKind_def
The definition of the **dds::core::safe_enum** (p. 2265) DurabilityKind 1441
dds::core::policy::DurabilityService
Configures the external RTI Persistence Service used by persistent and transient DataWriters . . . 1443
dds::core::Duration
<<***value-type***>> *(p. 350)* Represents a time interval 1448
rti::topic::dynamic_type< TopicType >
Provides a DynamicType that represents an IDL-generated type 1461
dds::core::xtypes::DynamicData
<<***value-type***>> *(p. 350)* A data sample of any complex data type, which can be inspected and manipulated reflectively 1461
rti::core::xtypes::DynamicDataInfo
Contains information about a DynamicData sample 1494

rti::core::xtypes::DynamicDataMemberInfo
Contains information about a DynamicData member 1495
rti::core::xtypes::DynamicDataProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Specifies the properties of a DynamicData object 1497
rti::core::xtypes::DynamicDataTypeSerializationProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Configures aspects of the memory management in the serialization of **dds::core::xtypes::DynamicData** (p. 1461) samples 1500
dds::core::xtypes::DynamicType
<<***value-type***>> (p. *350*) Represents a runtime type 1504
rti::core::xtypes::DynamicTypePrintFormatProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings 1509
rti::core::EndpointGroup
<<***extension***>> (p. *354*) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum 1515
rti::topic::trust::EndpointTrustAlgorithmInfo
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Trust Plugins algorithm information associated with the discovered endpoint 1516
rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Trust Plugins interception algorithm information associated with the discovered endpoint 1517
rti::topic::trust::EndpointTrustProtectionInfo
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Trust Plugins Protection information associated with the discovered endpoint 1519
dds::core::Entity
<<***reference-type***>> (p. *351*) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition 1520
dds::core::policy::EntityFactory
Configures a **dds::core::Entity** (p. 1520) that acts as factory of other entities 1527
rti::core::policy::EntityName
<<***extension***>> (p. *116*) Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader 1530
dds::core::xtypes::EnumMember
<<***value-type***>> (p. *350*) Represents a **EnumType** (p. 1535) member 1533
dds::core::xtypes::EnumType
<<***value-type***>> (p. *350*) Represents an IDL `enum` type 1535
rti::test::EnvVarToken 1539
dds::core::Error
A generic, unspecified **Error** (p. 1539) 1539
rti::core::policy::Event
<<***extension***>> (p. *116*) Configures the thread in a DomainParticipant that handles timed events 1541
rti::core::status::EventCount< IntegerType >
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Encapsulates an event count containing a total count and an incremental count since the last time a status was read 1544
dds::core::Exception
The abstract base class for all of the DDS exceptions which may be thrown by the API 1546
rti::topic::ExpressionProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Provides additional information about the filter expression passed to the writer_compile method of **rti::topic::WriterContentFilter** (p. 2652) . 1547
rti::topic::extensibility< TopicType >
<<***extension***>> (p. *354*) Indicates the extensibility kind of a topic-type 1550
dds::core::xtypes::ExtensibilityKind_def
The definition of the **dds::core::safe_enum** (p. 2265) ExtensibilityKind 1550

dds::core::external< T >
A managed reference to an object . . . 1551
dds::topic::Filter
Defines the filter to create a **ContentFilteredTopic** (p. 954) . . . 1558
rti::topic::FilterSampleInfo
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Provides meta information associated with the sample . . . 1562
rti::flat::FinalAlignedArrayOffset< ElementOffset, N >
Offset to an array of final elements . . . 1565
rti::flat::FinalArrayOffset< ElementOffset, N >
Offset to an array of final elements . . . 1567
rti::flat::FinalOffset< T >
The base class of all Offsets to a final struct type . . . 1568
rti::flat::FinalSequenceBuilder< ElementOffset >
Builds a sequence member of fixed-size elements . . . 1569
rti::flat::flat_type_traits< T >
Given a **Sample** (p. 2274), an Offset or a Builder, it allows obtaining the other types . . . 1571
rti::pub::FlowController
<<***extension***>> (p. *354*) <<***reference-type***>> (p. *351*) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 1138) instances are allowed to write data . . . 1572
rti::pub::FlowControllerProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Configures a **FlowController** (p. 1572) . . . 1577
rti::pub::FlowControllerSchedulingPolicy_def
<<***extension***>> (p. *354*) Kinds of flow controller shceduling policy . . . 1581
rti::pub::FlowControllerTokenBucketProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Configures a **FlowController** (p. 1572) based on a tocken-bucket mechanism . . . 1583
Foo
An example topic-type . . . 1588
dds::sub::GenerationCount
<<***value-type***>> (p. *350*) . . . 1589
dds::core::policy::GroupData . . . 1591
dds::core::cond::GuardCondition
<<***reference-type***>> (p. *351*) A condition whose trigger value is under the control of the application 1594
rti::core::Guid
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Class for GUID (Global Unique Identifier) representation
1596
rti::util::heap_monitoring::HeapMonitoringParams
Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot . . . 1599
dds::core::policy::History
Specifies how much historical data a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976) can store . . . 1602
dds::core::policy::HistoryKind_def
The definition of the **dds::core::safe_enum** (p. 2265) HistoryKind . . . 1606
rti::core::policy::IgnoredEntityReplacementKind_def
<<***extension***>> (p. *354*) The enumeration for **DomainParticipantResourceLimits** (p. 1391) ignored entity replacement kinds . . . 1607
dds::core::IllegalOperationError
Indicates that an operation was called under improper circumstances . . . 1608
dds::core::ImmutablePolicyError
Indicates that the application attempted to modify an immutable QoS policy . . . 1609

dds::core::InconsistentPolicyError
Indicates that the application specified a set of QoS policies that are not consistent with each other 1610
dds::core::status::InconsistentTopicStatus
Information about the status **dds::core::status::StatusMask::inconsistent_topic()** (p. 2379) . . 1611
dds::core::InstanceHandle
<<***value-type***>> *(p. 350)* Handle to identify different instances of the same **dds::topic::Topic** (p. 2474) of a certain type 1612
dds::sub::status::InstanceState
Indicates if the samples are from a live **dds::pub::DataWriter** (p. 1138) or not 1615
dds::core::InvalidArgumentError
Indicates that the application passed an illegal parameter value into an operation 1619
dds::core::InvalidDowncastError
Indicates that a downcast was incorrect 1620
rti::core::status::InvalidLocalAdvanceNoticeStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::invalid_local_advance_notice()** (p. 2388) 1621
dds::topic::is_topic_type< T >
Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2474) 1622
rti::request::IsReplyRelatedPredicate< T >
Functor to match replies by their related request 1622
rti::sub::IsValidData< T >
<<***extension***>> *(p. 354)* A functor that returns true when a sample has valid data 1624
dds::core::KeyedBytesTopicType
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key . . . 1626
dds::core::KeyedStringTopicType
Built-in type consisting of a string payload and a second string that is the key 1629
dds::core::policy::LatencyBudget
Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications 1631
rti::config::LibraryVersion
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* The version of a single library shipped as part of an RTI Connext distribution 1634
dds::core::policy::Lifespan
Specifies how long the data written by a **dds::pub::DataWriter** (p. 1138) is considered valid 1635
Listener
Entity listeners 1637
rti::core::ListenerBinder< Entity, Listener >
<<***reference-type***>> *(p. 351)* Automatically manages the association of an Entity and a **Listener** (p. 1637) 1641
dds::core::policy::Liveliness
Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 976)'s to detect when **dds::pub::DataWriter** (p. 1138)'s become disconnected 1645
dds::core::status::LivelinessChangedStatus
Information about the status **dds::core::status::StatusMask::liveliness_changed()** (p. 2383) . . 1652
dds::core::policy::LivelinessKind_def
The definition of the **dds::core::safe_enum** (p. 2265) LivelinessKind 1654
dds::core::status::LivelinessLostStatus
Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2383) 1655
rti::core::xtypes::LoanedDynamicData
<<***move-only-type***>> *(p. 353)* Gives temporary access to a member of another DynamicData object 1656
rti::sub::LoanedSample< T >
The element type of a **dds::sub::LoanedSamples** (p. 1663) collection 1659

dds::sub::LoanedSamples< T >
<<***move-only-type***>> *(p. 353)* Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 976) 1663
rti::core::Locator
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports . . 1673
rti::core::policy::LocatorFilter
<<***extension***>> *(p. 116)* Configures how the **dds::topic::PublicationBuiltinTopicData** (p. 1977) reports the configuration of a **MultiChannel** (p. 1749) DataWriter 1676
rti::core::LocatorFilterElement
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Specifies the configuration of an individual channel within a MultiChannel DataWriter 1678
rti::core::LocatorKind_def
The definition of the **dds::core::safe_enum** (p. 2265) LocatorKind 1681
rti::config::LogCategory_def
The definition of the **dds::core::safe_enum** (p. 2265) LogCategory 1682
rti::config::Logger
The singleton type used to configure RTI Connext logging 1683
rti::config::LogLevel_def
The definition of the **dds::core::safe_enum** (p. 2265) LogLevel; 1692
rti::config::LogMessage
A log message's input parameter to an output handler, including the text and additional information 1693
rti::core::LongDouble
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Encapsulates an IDL `long double` . . . 1696
dds::sub::DataReader< T >::ManipulatorSelector
A **Selector** (p. 2320) class enabling the streaming API 1697
rti::sub::ManipulatorSelector< T > 1700
dds::core::xtypes::Member
<<***value-type***>> *(p. 350)* Represents a **StructType** (p. 2400) member 1700
rti::core::policy::Monitoring
<<***extension***>> *(p. 116)* Configures the use of the RTI **Monitoring** (p. 1706) Library 2.0 to collect and distribute RTI Connext telemetry data 1706
rti::core::MonitoringDedicatedParticipantSettings
<<***extension***>> *(p. 354)* Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data 1712
rti::core::MonitoringDistributionSettings
<<***extension***>> *(p. 354)* Configures the distribution of telemetry data 1716
rti::core::MonitoringEventDistributionSettings
<<***extension***>> *(p. 354)* Configures the distribution of event metrics 1722
rti::core::MonitoringLoggingDistributionSettings
<<***extension***>> *(p. 354)* Configures the distribution of log messages 1727
rti::core::MonitoringLoggingForwardingSettings
<<***extension***>> *(p. 354)* Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 459) 1733
rti::core::MonitoringMetricSelection
<<***extension***>> *(p. 354)* Configures event and periodic metrics collection and distribution for a specific set of observable resources 1736
rti::core::MonitoringPeriodicDistributionSettings
<<***extension***>> *(p. 354)* Configures the distribution of periodic metrics 1740
rti::core::MonitoringTelemetryData
<<***extension***>> *(p. 354)* Configures the telemetry data that will be distributed 1744
rti::core::policy::MulticastMapping
<<***extension***>> *(p. 116)* Type representing a list of multicast mapping elements 1747

rti::core::policy::MultiChannel
<<***extension***>> *(p. 116)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data . . . 1749
rti::flat::MutableArrayBuilder< ElementBuilder, N >
Builds an array member of variable-size elements . . . 1753
rti::flat::MutableArrayOffset< ElementOffset, N >
Offset to an array of variable-size elements . . . 1755
rti::flat::MutableOffset
The base class of all Offsets to a final struct type . . . 1756
rti::flat::MutableSequenceBuilder< ElementBuilder >
Builds a sequence member of variable-size elements . . . 1757
MyFlatFinalOffset
Represents the Offset to an arbitrary user-defined FlatData final IDL struct . . . 1759
MyFlatMutableBuilder
Represents the Builder for an arbitrary user-defined mutable type . . . 1763
MyFlatMutableOffset
Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct . . . 1770
MyFlatUnionBuilder
Represents the Builder for an arbitrary user-defined mutable IDL union . . . 1777
MyFlatUnionOffset
Represents the Offset to an arbitrary user-defined FlatData mutable IDL union . . . 1780
NDDS_Transport_Address_t
Addresses are stored individually as network-ordered bytes . . . 1784
NDDS_Transport_Interface_t
Storage for the description of a network interface used by a Transport Plugin . . . 1785
NDDS_Transport_Property_t
Base configuration structure that must be inherited by derived Transport Plugin classes . . . 1786
NDDS_Transport_Shmem_Property_t
Subclass of **NDDS_Transport_Property_t** (p. 1786) allowing specification of parameters that are specific to the shared-memory transport . . . 1794
NDDS_Transport_UDP_WAN_CommPortsMappingInfo
Type for storing UDP WAN communication ports . . . 1797
NDDS_Transport_UDPv4_Property_t
Configurable IPv4/UDP Transport-Plugin properties . . . 1798
NDDS_Transport_UDPv4_WAN_Property_t
Configurable IPv4/UDP WAN Transport-Plugin properties . . . 1809
NDDS_Transport_UDPv6_Property_t
Configurable IPv6/UDP Transport-Plugin properties . . . 1819
NDDS_Transport_UUID
Unequivocally identifies a transport plugin instance . . . 1829
rti::util::network_capture::NetworkCaptureParams
<<***extension***>> *(p. 354)* Input parameters for starting Network Capture . . . 1829
rti::topic::no_compile_data_t
The type to specify as the CompileData template parameter to your **ContentFilter** (p. 950) if your compile function does not return any data . . . 1835
rti::queuing::NoMatchingQueueException
The entity lost matching with all the Queuing Service . . . 1835
rti::core::cond::NoOpAsyncWaitSetListener
A convenience implementation of **AsyncWaitSetListener** (p. 856) where all methods are overridden to do nothing . . . 1836
dds::sub::NoOpDataReaderListener< T >
A convenience implementation of **DataReaderListener** (p. 1055) where all methods are overridden to do nothing . . . 1838

dds::pub::NoOpDataWriterListener< T >
A convenience implementation of **DataWriterListener** (p. 1202) where all methods are overridden to do nothing . . . 1841
dds::domain::NoOpDomainParticipantListener
A convenience implementation of **DomainParticipantListener** (p. 1382) where all methods are overridden to do nothing . . . 1845
dds::pub::NoOpPublisherListener
A convenience implementation of **PublisherListener** (p. 2006) where all methods are overridden to do nothing . . . 1852
rti::queuing::NoOpQueueConsumerListener< T >
A listener with an empty implementation of all methods . . . 1856
rti::queuing::NoOpQueueProducerListener< T >
A listener with an empty implementation of all methods . . . 1858
rti::queuing::NoOpQueueReplierListener< TReq, TRep >
A listener with an empty implementation of all methods . . . 1859
rti::queuing::NoOpQueueRequesterListener< TReq, TRep >
A listener with an empty implementation of all methods . . . 1861
dds::sub::NoOpSubscriberListener
A convenience implementation of **SubscriberListener** (p. 2422) where all methods are overridden to do nothing . . . 1864
dds::topic::NoOpTopicListener< T >
A convenience implementation of **TopicListener** (p. 2508) where all methods are overridden to do nothing . . . 1867
dds::core::NotAllowedBySecurityError
Indicates that an operation on the DDS API fails because the security plugins do not allow it . . . 1868
dds::core::NotEnabledError
A **NotEnabledError** (p. 1869) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1520) that is not yet enabled . . . 1869
dds::core::NullReferenceError
Indicates an attempt to access a null object . . . 1870
rti::core::xtypes::octet_tag_t
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A special template type to obtain an IDL octet DynamicType from primitive_type . . . 1871
dds::core::status::OfferedDeadlineMissedStatus
Information about the status **dds::core::status::StatusMask::offered_deadline_missed()** (p. 2379) . . . 1871
dds::core::status::OfferedIncompatibleQosStatus
Information about the status **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380) . . . 1873
rti::flat::OffsetBase
Base class of all Offset types . . . 1875
dds::core::optional< T >
*<<**value-type**>> (p. 350)* Represents an object that may not contain a valid value . . . 1879
rti::core::optional_value< T >
*<<**extension**>> (p. 354)* Represents a value that can be initialized or not . . . 1892
OsapiFile . . . 1898
dds::core::OutOfResourcesError
Indicates that RTI Connext ran out of the resources needed to complete the operation . . . 1898
dds::core::policy::Ownership
Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 1138)'s to write the same instance of the data and if so, how these modifications should be arbitrated . . . 1899
dds::core::policy::OwnershipKind_def
The definition of the **dds::core::safe_enum** (p. 2265) OwnershipKind . . . 1905

dds::core::policy::OwnershipStrength
Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by its **dds::topic::Topic** (p. 2474) and key) . . . 1906
dds::topic::ParticipantBuiltinTopicData
Entry created when a **dds::domain::DomainParticipant** (p. 1326) is discovered . . . 1908
rti::test::ParticipantFactoryGuard
RAII guard for managing the DomainParticipantFactory lifecycle . . . 1916
rti::topic::trust::ParticipantTrustAlgorithmInfo
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins algorithm information associated with the discovered DomainParticipant . . . 1916
rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins interception algorithm information associated with the discovered DomainParticipant . . . 1917
rti::topic::trust::ParticipantTrustKeyEstablishmentAlgorithmInfo
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant . . . 1919
rti::topic::trust::ParticipantTrustProtectionInfo
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins Protection information associated with the discovered DomainParticipant . . . 1920
rti::topic::trust::ParticipantTrustSignatureAlgorithmInfo
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Trust Plugins signature algorithm information associated with the discovered DomainParticipant . . . 1922
dds::core::policy::Partition
Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities . . . 1923
rti::core::PersistentStorageSettings
*<<**extension**>> (p. 354)* Configures the persistent storage settings for durable writer history and durable reader state . . . 1927
rti::core::pointer< T > . . . 1938
dds::core::policy::policy_id< Policy >
Obtains the QosPolicyId of a QoS Policy . . . 1940
dds::core::policy::policy_name< Policy >
Obtains the policy name . . . 1941
dds::core::PreconditionNotMetError
A **PreconditionNotMetError** (p. 1941) is thrown when a pre-condition for the operation was not met 1941
dds::core::policy::Presentation
Specifies how the samples representing changes to data instances are presented to a subscribing application . . . 1942
dds::core::policy::PresentationAccessScopeKind_def
The definition of the **dds::core::safe_enum** (p. 2265) PresentationAccessScopeKind . . . 1950
rti::flat::PrimitiveArrayOffset< T, N >
Offset to an array of primitive elements . . . 1951
rti::flat::PrimitiveConstOffset< T >
A const Offset to an optional primitive member . . . 1952
rti::flat::PrimitiveOffset< T >
An Offset to an optional primitive member . . . 1953
rti::flat::PrimitiveSequenceBuilder< T >
Builds a sequence of primitive members . . . 1955
rti::flat::PrimitiveSequenceOffset< T >
Offset to a sequence of primitive elements . . . 1958
dds::core::xtypes::PrimitiveType
*<<**value-type**>> (p. 350)* Represents an IDL primitive type . . . 1959

rti::config::PrintFormat_def
The definition of the **dds::core::safe_enum** (p. 2265) PrintFormat . . . 1960
rti::topic::PrintFormatKind_def
The definition of the **dds::core::safe_enum** (p. 2265) PrintFormatKind . . . 1961
rti::topic::PrintFormatProperty
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A collection of attributes used to configure how data samples will be formatted when converted to a string . . . 1962
rti::core::ProductVersion
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Represents the current version of RTI Connext . . . 1967
rti::core::policy::Property
*<<**extension**>> (p. 116)* Stores key/value string pairs that can configure certain parameters of RTI Connext not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a **dds::core::Entity** (p. 1520) . . . 1969
rti::core::ProtocolVersion
*<<**extension**>> (p. 354)* Represents the current version of RTI Connext . . . 1975
dds::topic::PublicationBuiltinTopicData
Entry created when a **dds::pub::DataWriter** (p. 1138) is discovered in association with its **dds::pub::Publisher** (p. 1993) . . . 1977
dds::core::status::PublicationMatchedStatus
Information about the status **dds::core::status::StatusMask::publication_matched()** (p. 2384) . . . 1990
dds::pub::Publisher
*<<**reference-type**>> (p. 351)* A publisher is the object responsible for the actual dissemination of publications . . . 1993
dds::pub::PublisherListener
The listener to notify status changes for a **dds::pub::Publisher** (p. 1993) . . . 2006
dds::pub::qos::PublisherQos
*<<**value-type**>> (p. 350)* Container of the QoS policies that a **dds::pub::Publisher** (p. 1993) supports . . . 2007
rti::core::policy::PublishMode
*<<**extension**>> (p. 116)* Specifies whether a **dds::pub::DataWriter** (p. 1138) sends data synchronously or asynchronously . . . 2013
rti::core::policy::PublishModeKind_def
*<<**extension**>> (p. 354)* The enumeration for **PublishMode** (p. 2013) kinds . . . 2018
rti::core::qos_print_all_t
A tag type that selects the to_string overload that prints all the values of a Qos object . . . 2019
dds::core::policy::QosPolicyCount
*<<**value-type**>> (p. 350)* Holds a counter for a QosPolicyId . . . 2020
rti::core::QosPrintFormat
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* A collection of attributes used to configure how QoS will be formatted when converted to strings . . . 2021
dds::core::QosProvider
*<<**reference-type**>> (p. 351)* The **QosProvider** (p. 2025) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connext . . . 2025
rti::core::QosProviderParams
*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 2025) . . . 2049
dds::sub::Query
*<<**value-type**>> (p. 350)* Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 2059) 2053
dds::sub::cond::QueryCondition
*<<**reference-type**>> (p. 351)* Specialized **ReadCondition** (p. 2133) that allows applications to also specify a filter on the data available in a **dds::sub::DataReader** (p. 976) . . . 2059
rti::queuing::QueueConsumer< T >
Allows you to receive samples from a SharedReaderQueue . . . 2063

rti::queuing::QueueConsumerListener< T >
Called when certain events occur in a **QueueConsumer** (p. 2063) . . . 2075
rti::queuing::QueueConsumerParams
Contains the parameters for creating a **QueueConsumer** (p. 2063) . . . 2077
rti::queuing::QueueEntityParams< ActualEntity >
A parent class for all queue parameter classes . . . 2079
rti::queuing::QueueProducer< T >
Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service . . . 2080
rti::queuing::QueueProducerListener< T >
Called when certain events occur in a **QueueProducer** (p. 2080) . . . 2090
rti::queuing::QueueProducerParams
Contains the parameters for creating a **QueueProducer** (p. 2080) . . . 2092
rti::queuing::QueueReplier< TReq, TRep >
Allows receiving requests and sending replies . . . 2094
rti::queuing::QueueReplierListener< TReq, TRep >
Called when certain events occur in a **QueueReplier** (p. 2094) . . . 2107
rti::queuing::QueueReplierParams
Contains the parameters for creating a **QueueReplier** (p. 2094) . . . 2109
rti::queuing::QueueRequester< TReq, TRep >
Allows sending requests and receiving replies . . . 2111
rti::queuing::QueueRequesterListener< TReq, TRep >
Called when certain events occur in a **QueueRequester** (p. 2111) . . . 2126
rti::queuing::QueueRequesterParams
Contains the parameters for creating a **QueueRequester** (p. 2111) . . . 2128
dds::sub::Rank
<<***value-type***>> *(p. 350)* Contains the sample and generation ranks of a data-sample . . . 2130
dds::sub::cond::ReadCondition
<<***reference-type***>> *(p. 351)* Condition specifically dedicated to read operations and attached to one **dds::sub::DataReader** (p. 976) . . . 2133
dds::core::policy::ReaderDataLifecycle
Controls how a DataReader manages the lifecycle of the data that it has received . . . 2137
dds::sub::ReadModeDummyType . . . 2144
rti::core::policy::ReceiverPool
<<***extension***>> *(p. 116)* Configures threads that RTI Connext uses to receive and process data from the transport modules (such as UDP) . . . 2144
dds::core::Reference< DELEGATE >
Base class for all reference types . . . 2149
dds::core::policy::Reliability
Indicates the level of reliability in sample delivered that a **dds::pub::DataWriter** (p. 1138) offers or a **dds::sub::DataReader** (p. 976) requests . . . 2149
dds::core::policy::ReliabilityKind_def
The definition of the **dds::core::safe_enum** (p. 2265) ReliabilityKind . . . 2156
rti::core::status::ReliableReaderActivityChangedStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::reliable_reader_activity_changed()** (p. 2385) . . . 2157
rti::core::status::ReliableWriterCacheChangedStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) . . . 2159
dds::rpc::RemoteInvalidArgumentError
Thrown when a Client provides an invalid argument to a Service operation . . . 2162
dds::rpc::RemoteOutOfResourcesError
Thrown when the Service runs out of resources to fulfill a Client's operation . . . 2163

rti::core::policy::RemoteParticipantPurgeKind_def
<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) RemoteParticipantPurgeKind 2164
dds::rpc::RemoteUnknownExceptionError
Thrown when an unknown exception occurs in the Service 2165
dds::rpc::RemoteUnknownOperationError
Thrown when a Client calls an operation that doesn't exist in the Service 2166
dds::rpc::RemoteUnsupportedOperationError
Thrown when a Client calls an operation that is not supported by the Service 2167
rti::request::Replier< RequestType, ReplyType >
<<***reference-type***>> *(p. 351)* Allows receiving requests and sending replies 2168
rti::request::ReplierListener< RequestType, ReplyType >
Called when a **Replier** (p. 2168) has new available requests 2179
rti::request::ReplierParams
Contains the parameters for creating a **rti::request::Replier** (p. 2168) 2180
dds::core::status::RequestedDeadlineMissedStatus
Information about the status **dds::core::status::StatusMask::requested_deadline_missed()** (p. 2380) 2184
dds::core::status::RequestedIncompatibleQosStatus
Information about the status **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381) 2185
rti::request::Requester< RequestType, ReplyType >
<<***reference-type***>> *(p. 351)* Allows sending requests and receiving replies 2187
rti::request::RequesterParams
Contains the parameters for creating a **rti::request::Requester** (p. 2187) 2199
dds::core::policy::ResourceLimits
Controls the memory usage of **dds::pub::DataWriter** (p. 1138) or a **dds::sub::DataReader** (p. 976) 2203
rti::core::Result< T >
A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value 2209
rpc_example::RobotControl
The synchronous interface generated from the **RobotControl** (p. 97) IDL service 2213
rpc_example::RobotControlAsync
The asynchronous interface derived from the **RobotControl** (p. 2213) service 2215
rpc_example::RobotControlClient
<<***reference-type***>> *(p. 351)* Allows client applications to make remote function calls 2217
rti::config::compliance::RpcMask
XTypes compliance mask 2218
rti::core::RtpsReliableReaderProtocol
<<***extension***>> *(p. 354)* Configures aspects of the RTPS protocol related to a reliable DataReader 2221
rti::core::policy::RtpsReliableWriterProtocol
<<***extension***>> *(p. 116)* Configures aspects of an RTPS reliable writer 2229
rti::core::policy::RtpsReservedPortKindMask
<<***extension***>> *(p. 354)* Mask of reserved ports 2255
rti::core::RtpsWellKnownPorts
<<***extension***>> *(p. 354)* Configures the mapping of the RTPS well-known ports 2258
dds::core::safe_enum< def, inner >
<<***value-type***>> *(p. 350)* Provides a safe, scoped enumeration based on def::type 2265
dds::sub::Sample< T >
<<***value-type***>> *(p. 350)* This class encapsulate the data and meta-data associated with DDS samples 2270
rti::flat::Sample< OffsetType >
The generic definition of FlatData topic-types 2274

rti::core::SampleFlag
<<***extension***>> *(p. 354)* A set of flags that can be associated with a sample 2278
rti::core::SampleIdentity
<<***extension***>> (p. *354)* <<***value-type***>> *(p. 350)* A **SampleIdentity** (p. 2282) defines a pair (Virtual Writer **Guid** (p. 1596), **SequenceNumber** (p. 2335)) that uniquely identifies a sample within a DDS domain and a Topic 2282
dds::sub::SampleInfo
<<***value-type***>> *(p. 350)* Information that accompanies each sample received by a **DataReader** (p. 976) 2285
rti::sub::SampleIterator< T >
A random-access iterator of **LoanedSample** (p. 1659) 2296
rti::core::status::SampleLostState
<<***extension***>> (p. *354)* Reasons why a sample was lost 2296
dds::core::status::SampleLostStatus
Information about the status **dds::core::status::StatusMask::sample_lost()** (p. 2381) 2303
rti::sub::SampleProcessor
<<***extension***>> (p. *354)* <<***reference-type***>> *(p. 351)* Utility to read and process the data samples that one or more DataReaders receive using a sample handler 2305
dds::core::status::SampleRejectedState
Reasons why a sample was rejected 2310
dds::core::status::SampleRejectedStatus
Information about the status **dds::core::status::StatusMask::sample_rejected()** (p. 2382) 2315
dds::sub::status::SampleState
Indicates whether or not a sample has ever been read 2316
rti::config::ScopedLoggerVerbosity
Changes the logger verbosity temporarily during the scope of a variable 2319
dds::sub::DataReader< T >::Selector
Used by the **DataReader** (p. 976) to compose read and take operations 2320
rti::flat::SequenceIterator< E, OffsetKind >
Iterator for collections of Offsets 2328
rti::core::SequenceNumber
<<***extension***>> (p. *354)* <<***value-type***>> *(p. 350)* A class representing the DDS 64-bit Sequence Number 2335
rti::flat::SequenceOffset< ElementOffset >
Offset to a sequence of non-primitive elements 2343
dds::core::xtypes::SequenceType
<<***value-type***>> (p. *350)* Represents an IDL `sequence` type 2344
dds::rpc::Server
<<***reference-type***>> *(p. 351)* Provides the execution environment for one or more **Service↩ Endpoint** (p. 2354) 2346
dds::rpc::ServerParams
<<***value-type***>> *(p. 350)* The parameters used to configure a **Server** (p. 2346) 2348
rti::core::policy::Service
<<***extension***>> *(p. 116)* Indicates if an Entity is associated with a service or tool and if so, which one 2350
dds::rpc::ServiceEndpoint< Dispatcher >
Manages the DDS entities required to receive function calls and send the return values 2354
rti::core::policy::ServiceKind_def
<<***extension***>> (p. *354)* The definition of the **dds::core::safe_enum** (p. 2265) ServiceKind . . . 2357
rti::topic::ServiceRequest
<<***extension***>> (p. *354)* <<***value-type***>> *(p. 350)* A request coming from one of the built-in services 2358

rti::core::status::ServiceRequestAcceptedStatus
<<***extension***>> *(p. 354)* Information about the status **dds::core::status::StatusMask::service_request_accepted()** (p. 2388) . . . 2360
rti::core::ServiceRequestId_def
The definition of the rti::core::safe_enum ServiceRequestId . . . 2361
dds::sub::SharedSamples< T, DELEGATE >
<<***reference-type***>> *(p. 351)* A sharable and container-safe version of **LoanedSamples** (p. 1663) 2362
rti::sub::SharedSamples< T >
Provides access to a collection of middleware-loaned samples . . . 2367
rti::request::SimpleReplier< RequestType, ReplyType >
<<***reference-type***>> *(p. 351)* A callback-based replier . . . 2368
rti::util::heap_monitoring::SnapshotContentFormat_def
Bitmap used to decide which information of the snapshot will be displayed . . . 2370
rti::util::heap_monitoring::SnapshotOutputFormat_def
Specify the format of the output of the snapshot. RTI Connext . . . 2371
dds::core::cond::StatusCondition
<<***reference-type***>> *(p. 351)* A condition associated with each **dds::core::Entity** (p. 1520) . . . 2372
dds::core::status::StatusMask
A std::bitset (list) of statuses . . . 2375
rti::util::StreamFlagSaver . . . 2390
rti::sub::status::StreamKind
<<***extension***>> *(p. 354)* Indicates which stream to read from: live stream, topic-query stream or both . . . 2390
rti::flat::StringBuilder
Builds a string . . . 2392
rti::flat::StringOffset
Offset to a string . . . 2394
dds::core::StringTopicType
Built-in type consisting of a single character string . . . 2395
dds::core::xtypes::StringType
<<***value-type***>> *(p. 350)* Represents an IDL `string` type . . . 2399
dds::core::xtypes::StructType
<<***value-type***>> *(p. 350)* Represents an IDL `struct` type . . . 2400
dds::sub::Subscriber
<<***reference-type***>> *(p. 351)* A subscriber is the object responsible for actually receiving data from a subscription . . . 2410
dds::sub::SubscriberListener
The listener to notify status changes for a **dds::sub::Subscriber** (p. 2410) . . . 2422
dds::sub::qos::SubscriberQos
<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::sub::Subscriber** (p. 2410) supports . . . 2423
dds::topic::SubscriptionBuiltinTopicData
Entry created when a **dds::sub::DataReader** (p. 976) is discovered in association with its **dds::sub::Subscriber** (p. 2410) . . . 2428
dds::core::status::SubscriptionMatchedStatus
Information about the status **dds::core::status::StatusMask::subscription_matched()** (p. 2384) 2439
dds::pub::SuspendedPublication
<<***value-type***>> *(p. 350)* Indicates that the application is about to make multiple modifications using several **dds::pub::DataWriter** (p. 1138)'s belonging to the same **dds::pub::Publisher** (p. 1993) 2441
rti::core::policy::SystemResourceLimits
<<***extension***>> *(p. 116)* Configures resources that RTI Connext uses . . . 2443
dds::core::TEntityQos< DELEGATE >
Acts as a container for Qos policies allowing to set and retrieve all the policies of an entity as a unit 2446

rti::core::ThreadSettings
<<***extension***>> *(p. 354)* The properties of a thread of execution 2449
rti::core::ThreadSettingsCpuRotationKind_def
Determines how **rti::core::ThreadSettings::cpu_list** (p. 2451) affects processor affinity for thread-related QoS policies that apply to multiple threads 2453
rti::core::ThreadSettingsKindMask
<<***extension***>> *(p. 354)* A collection of flags used to configure threads of execution 2454
dds::core::Time
<<***extension***>> *(p. 354)* Represents a point in time 2457
dds::core::policy::TimeBasedFilter
Allows a **dds::sub::DataReader** (p. 976) to indicate that it is not interested in all the sample updates that occur within a time period 2469
dds::core::TimeoutError
Indicates that an operation has timed out 2473
dds::topic::Topic< **T** >
<<***reference-type***>> *(p. 351)* **Topic** (p. 2474) is the most basic description of the data to be published and subscribed 2474
rti::topic::topic_type_disabled_copy< **TopicType** >
<<***extension***>> *(p. 354)* Indicates whether a TopicType is uncopyable 2492
rti::topic::topic_type_has_external_members< **TopicType** >
<<***extension***>> *(p. 354)* Indicates if a topic type contains directly or indirectly IDL external members 2492
dds::topic::topic_type_name< **T** >
Provides the name of a topic-type 2493
dds::topic::topic_type_support< **T** >
Provides convenience operations for a topic-type 2493
dds::topic::TopicBuiltinTopicData
Entry created when a **dds::topic::Topic** (p. 2474) object is discovered 2493
dds::core::policy::TopicData 2500
dds::topic::TopicDescription< **T** >
Abstract base class of **Topic** (p. 2474) and **ContentFilteredTopic** (p. 954) 2503
dds::topic::TopicInstance< **T** >
Encapsulates a sample and its associated instance handle 2505
dds::topic::TopicListener< **T** >
The listener to notify status changes for a **dds::topic::Topic** (p. 2474) 2508
dds::topic::qos::TopicQos
<<***value-type***>> *(p. 350)* Container of the QoS policies that a **dds::topic::Topic** (p. 2474) supports 2509
rti::sub::TopicQuery
<<***extension***>> *(p. 354)* <<***reference-type***>> *(p. 351)* Allows a **dds::sub::DataReader** (p. 976) to query the sample cache of its matching dds::pub::DataWriters 2516
rti::sub::TopicQueryData
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Provides information about a **TopicQuery** (p. 2516) 2520
rti::core::policy::TopicQueryDispatch
<<***extension***>> *(p. 116)* Configures the ability of a **dds::pub::DataWriter** (p. 1138) to publish samples in response to a **rti::sub::TopicQuery** (p. 2516) 2522
rti::sub::TopicQuerySelection
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Specifies the data query that defines a **TopicQuery** (p. 2516) 2526
rti::sub::TopicQuerySelectionKind_def
The definition of the **dds::core::safe_enum** (p. 2265) **rti::sub::TopicQuerySelectionKind** (p. 71) 2528
rti::util::network_capture::TrafficKindMask
<<***extension***>> *(p. 354)* Mask indicating the traffic direction to capture 2529

TransportAllocationSettings_t
Allocation settings used by various internal buffers . . . 2533
rti::core::policy::TransportBuiltin
<<***extension***>> *(p. 116)* Specifies which built-in transports to use . . . 2533
rti::core::policy::TransportBuiltinMask
<<***extension***>> *(p. 354)* Mask that specifies which built-in transports are used . . . 2537
rti::core::TransportClassId_def
The definition of the **dds::core::safe_enum** (p. 2265) TransportClassId . . . 2540
rti::core::TransportInfo
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Contains the class id and message max size of an installed transport . . . 2541
rti::core::policy::TransportMulticast
<<***extension***>> *(p. 116)* Specifies the multicast address on which a **dds::sub::DataReader** (p. 976) wants to receive its data and other settings . . . 2543
rti::core::policy::TransportMulticastKind_def
<<***extension***>> *(p. 354)* The definition of the **dds::core::safe_enum** (p. 2265) TransportMulticastKind . . . 2547
rti::core::policy::TransportMulticastMapping
<<***extension***>> *(p. 116)* Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data . . . 2547
rti::core::TransportMulticastSettings
<<***extension***>> *(p. 354)* Represents a list of multicast locators . . . 2549
dds::core::policy::TransportPriority
Allows applications to take advantage of transports capable of sending messages with different priorities . . . 2552
rti::core::policy::TransportSelection
<<***extension***>> *(p. 116)* Specifies the transports that a **dds::pub::DataWriter** (p. 1138) or a **dds::sub::DataReader** (p. 976) may use to send or receive data . . . 2554
rti::core::policy::TransportUnicast
<<***extension***>> *(p. 116)* Specifies a subset of transports and a port number that can be used by a **dds::core::Entity** (p. 1520) to receive data . . . 2556
rti::core::TransportUnicastSettings
<<***extension***>> *(p. 354)* Represents a list of unicast locators . . . 2559
rti::topic::trust::TrustAlgorithmRequirements
<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Type to describe Trust Plugins algorithm requirements . . . 2562
dds::core::policy::TypeConsistencyEnforcement
Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it . . . 2563
dds::core::policy::TypeConsistencyEnforcementKind_def
The definition of the **dds::core::safe_enum** (p. 2265) TypeConsistencyEnforcementKind . . . 2570
dds::core::xtypes::TypeKind_def
The definition of TypeKind . . . 2571
rti::core::policy::TypeSupport
<<***extension***>> *(p. 116)* Allows attaching application-specific information to a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976) that is passed to the serilization and deserialization routines . . . 2574
dds::core::xtypes::UnidimensionalCollectionType
<<***value-type***>> *(p. 350)* The base class of collection types with only one dimension . . . 2576
rti::flat::UnionBuilder< Discriminator >
Base class of builders for user-defined mutable unions . . . 2577
dds::core::xtypes::UnionMember
<<***value-type***>> *(p. 350)* Represents a **UnionType** (p. 2584) member . . . 2578

dds::core::xtypes::UnionType
<<***value-type***>> (p. *350*) Represents an IDL `union` type 2584
rti::core::UnregisterThreadOnExit
<<***extension***>> (p. *354*) Utility that calls **rti::core::unregister_thread** (p. 437) when leaving scope 2589
dds::core::UnsupportedError
Indicates that the application used an unsupported operation 2590
dds::core::policy::UserData
Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 46) during discovery . . . 2591
rti::sub::ValidLoanedSamples< T >
<<***extension***>> (p. *354*) <<***C++11***>> (p. *353*) <<***move-only-type***>> (p. *353*) Provides access to only those samples that contain valid data 2595
rti::sub::ValidSampleIterator< T >
A forward iterator adapter that skips invalid samples 2600
dds::core::Value< D > 2601
dds::core::vector< T >
<<***value-type***>> (p. *350*) A vector convertible to std::vector and with similar functionality 2603
rti::core::VendorId
<<***extension***>> (p. *354*) Represents the vendor of the service implementing the RTPS protocol 2612
rti::config::Verbosity_def
The definition of the **dds::core::safe_enum** (p. 2265) Verbosity 2613
dds::sub::status::ViewState
Indicates whether or not an instance is new 2614
dds::core::cond::WaitSet
<<***reference-type***>> (p. *351*) Allows an application to wait until one or more of the attached **Condition** (p. 948) objects have a trigger_value of true or else until the timeout expires 2617
rti::core::cond::WaitSetProperty
<<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) Specifies the **dds::core::cond::WaitSet** (p. 2617) behavior for multiple trigger events 2627
dds::core::WeakReference< T > 2630
rti::core::policy::WireProtocol
<<***extension***>> (p. *116*) Configures the write protocol of a **dds::domain::DomainParticipant** (p. 1326) 2630

rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >
<<***extension***>> (p. *354*) A class to inherit from when implementing a writer-side custom content filter 2657
dds::core::policy::WriterDataLifecycle
Controls how a **dds::pub::DataWriter** (p. 1138) handles the lifecycle of the instances (keys) that it writes 2660
dds::core::xtypes::WStringType
<<***value-type***>> (p. *350*) Represents an IDL `wstring` type 2665
rti::config::compliance::XTypesMask
This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2) 2666

Chapter 6

Module Documentation

6.1 Clock Selection

APIs related to clock selection.

APIs related to clock selection.

RTI Connext uses clocks to measure time and generate timestamps.

RTI Connext uses three clocks, an "internal clock," an "external clock," and a "wall clock". The internal clock measures time internally. The external clock generates timestamps, such as the source timestamp and the reception timestamp, in addition to providing the current time given by the Domain Participant's API. The internal and external clocks can be configured via properties. The wall clock is not configurable and always shows the system time. It is used internally whenever a real-world time is necessary, such as for external document time verification.

6.1.1 Available Clocks

Two clock implementations are generally available, the monotonic clock and the realtime clock.

The monotonic clock provides times that are monotonic from a clock that is not adjustable. This clock is useful to use in order to not be subject to changes in the system or realtime clock, which may be adjusted by the user or via time synchronization protocols. However, this time generally starts from an arbitrary point in time, such as system startup. Note that this clock is not available for all architectures. Please see the `Platform Notes` for the architectures on which it is supported. For the purposes of clock selection, this clock can be referenced by the name "monotonic".

The realtime clock provides the real time of the system. This clock may generally be monotonic but may not be guaranteed to be so. It is adjustable and may be subject to small and large changes in time. The time obtained from this clock is generally a meaningful time in that it is the amount of time from a known epoch. For the purposes of clock selection, this clock can be referenced by the names "realtime" or "system".

6.1.2 Clock Selection Strategy

By default, the internal clock uses the monotonic clock and the external clocks uses the realtime clock. The default setup offers robustness to changes in the system time. Since the monotonic clock is not available on all platforms, by default, RTI Connext will attempt to use the monotonic clock, and will fall back to the realtime clock if the monotonic clock is not available.

If you want your application to be robust to changes in the system time, you are not relying on source timestamps, and you want to avoid obtaining times from both clocks, you may use the monotonic clock for both the internal and external clocks.

6.1.3 Configuring Clock Selection

To configure the clock selection, use the **PROPERTY** (p. 541) QoS policy associated with the **dds::domain::Domain↩ Participant** (p. 1326).

See also

rti::core::policy::Property (p. 1969)

The following table lists the supported clock selection properties.

Table 6.1 ***Clock Selection Properties***

Property	Description
dds.clock.external_clock	Comma-delimited list of clocks to use for the external clock, in order of preference. Valid clock names are "realtime", "system", and "monotonic". Default: "realtime"
dds.clock.internal_clock	Comma-delimited list of clocks to use for the internal clock, in order of preference. Valid clock names are "realtime", "system", and "monotonic". Default: "monotonic" if available, "realtime" if not

6.2 Domain Module

Contains the **dds::domain::DomainParticipant** (p. 1326) class that acts as an entrypoint of RTI Connext and acts as a factory for many of the classes. The **dds::domain::DomainParticipant** (p. 1326) also acts as a container for the other objects that make up RTI Connext.

Modules

- **DomainParticipants**

  dds::domain::DomainParticipant *(p. 1326) entity and associated elements*
- **Built-in Topics**

  Built-in objects created by RTI Connext but accessible to the application.

6.2.1 Detailed Description

Contains the **dds::domain::DomainParticipant** (p. 1326) class that acts as an entrypoint of RTI Connext and acts as a factory for many of the classes. The **dds::domain::DomainParticipant** (p. 1326) also acts as a container for the other objects that make up RTI Connext.

6.3 DomainParticipants

dds::domain::DomainParticipant (p. 1326) entity and associated elements

Classes

- class **dds::domain::DomainParticipantListener**

  The listener class for a ***DomainParticipant*** *(p. 1326).*
- class **dds::domain::NoOpDomainParticipantListener**

  A convenience implementation of ***DomainParticipantListener*** *(p. 1382) where all methods are overridden to do nothing.*
- class **dds::domain::DomainParticipant**

  << ***reference-type*** *>> (p. 351) Container for all* ***dds::core::Entity*** *(p. 1520) objects.*
- class **rti::core::status::DomainParticipantProtocolStatus**
- class **rti::core::status::InvalidLocalAdvanceNoticeStatus**

  << ***extension*** *>> (p. 354) Information about the status* ***dds::core::status::StatusMask::invalid_local_advance_notice()*** *(p. 2388)*
- class **rti::domain::DomainParticipantConfigParams**

  << ***extension*** *>> (p. 354) <<* ***value-type*** *>> (p. 350) Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration.*
- class **dds::domain::qos::DomainParticipantFactoryQos**

  << ***value-type*** *>> (p. 350) Container of the QoS policies that do not apply to a specific entity*
- class **dds::domain::qos::DomainParticipantQos**

  << ***value-type*** *>> (p. 350) Container of the QoS policies that a* ***dds::domain::DomainParticipant*** *(p. 1326) supports*

6.3.1 Detailed Description

dds::domain::DomainParticipant (p. 1326) entity and associated elements

6.4 Built-in Topics

Built-in objects created by RTI Connext but accessible to the application.

Modules

- **Participant Built-in Topics**

  Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.
- **Topic Built-in Topics**
- **Publication Built-in Topics**

  Builtin topic for accessing information about the Publications discovered by RTI Connext.
- **Subscription Built-in Topics**

  Builtin topic for accessing information about the Subscriptions discovered by RTI Connext.
- **ServiceRequest Built-in Topic**

  Builtin topic for accessing requests from different services within RTI Connext.

6.4.1 Detailed Description

Built-in objects created by RTI Connext but accessible to the application.

RTI Connext must discover and keep track of the remote entities, such as new participants in the domain. This information may also be important to the application, which may want to react to this discovery, or else access it on demand.

A set of built-in topics and corresponding **dds::sub::DataReader** (p. 976) objects are introduced to be used by the application to access this discovery information.

The information can be accessed as if it were normal application data. This allows the application to know when there are any changes in those values by means of the **Listener** (p. 1637) or the **dds::core::cond::Condition** (p. 948) mechanisms.

The built-in data-readers all belong to a built-in **dds::sub::Subscriber** (p. 2410), which can be retrieved by using the method **dds::sub::builtin_subscriber** (p. 671). The built-in **dds::sub::DataReader** (p. 976) objects can be retrieved by using the operation **dds::sub::find** (p. 672), with the topic name as a parameter.

Built-in entities have default listener settings as well. The built-in **dds::sub::Subscriber** (p. 2410) and all of its built-in topics have 'nil' listeners with all statuses appearing in their listener masks (acting as a NO-OP listener that does not reset communication status). The built-in DataReaders have null listeners with no statuses in their masks.

The information that is accessible about the remote entities by means of the built-in topics includes all the QoS policies that apply to the corresponding remote Entity. These QoS policies appear as normal 'data' fields inside the data read by means of the built-in Topic. Additional information is provided to identify the Entity and facilitate the application logic.

The built-in **dds::sub::DataReader** (p. 976) will not provide data pertaining to entities created from the same **dds::domain::DomainParticipant** (p. 1326) under the assumption that such entities are already known to the application that created them.

The discovery information provided by each built-in reader won't be received until it is first looked up. And if the DomainParticipant was created in a disabled state (see **dds::core::policy::EntityFactory** (p. 1527)), the built-in subscriber and readers will need to be enabled explicitly (by the **dds::core::Entity::enable** (p. 1524) operation).

Refer to **dds::topic::ParticipantBuiltinTopicData** (p. 1908), **dds::topic::TopicBuiltinTopicData** (p. 2493), **dds::topic::SubscriptionBuiltinTopicData** (p. 2428) and **dds::topic::PublicationBuiltinTopicData** (p. 1977) for a description of all the built-in topics and their contents.

The QoS of the built-in **dds::sub::Subscriber** (p. 2410) and **dds::sub::DataReader** (p. 976) objects is given by the following table:

Table 6.2 ***QoS of built-in dds::sub::Subscriber (*** p. ***2410) and dds::sub::DataReader (*** p. ***976)***

QoS	Value
dds::core::policy::UserData (p. 2591)	0-length sequence

6.5 Topic Module

Contains the **dds::topic::Topic** (p. 2474), **dds::topic::ContentFilteredTopic** (p. 954), and MultiTopic classes, the TopicListener interface, and more generally, all that is needed by an application to define **dds::topic::Topic** (p. 2474) objects and attach QoS policies to them.

Modules

- **Topics**

  dds::topic::Topic *(p. 2474) entity and associated elements*
- **Zero Copy Transfer Over Shared Memory**

  *<<**extension**>> (p. 354) Zero Copy transfer over shared memory*
- **Built-in Types**

  RTI Connext provides a set of very simple data types for you to use with the topics in your application.
- **Built-in Topic's Trust Types**

  *Types used as part of **dds::topic::ParticipantBuiltinTopicData** (p. 1908), **dds::topic::PublicationBuiltinTopicData** (p. 1977), **dds::topic::SubscriptionBuiltinTopicData** (p. 2428) to describe Trust Plugins configuration.*
- **FlatData Topic-Types**

  *<<**extension**>> (p. 354) FlatData Language Binding for IDL topic-types*
- **DynamicType and DynamicData**

  *Describes **dds::core::xtypes::DynamicType** (p. 1504), **dds::core::xtypes::DynamicData** (p. 1461) and related types and functions.*
- **Topic traits and data-type support**

  Traits and operations associated to topic-types.
- **Custom Content Filters**

  Classes and associated types used to implement custom content filters.

6.5.1 Detailed Description

Contains the **dds::topic::Topic** (p. 2474), **dds::topic::ContentFilteredTopic** (p. 954), and MultiTopic classes, the TopicListener interface, and more generally, all that is needed by an application to define **dds::topic::Topic** (p. 2474) objects and attach QoS policies to them.

6.6 Topics

dds::topic::Topic (p. 2474) entity and associated elements

Classes

- class **dds::core::status::InconsistentTopicStatus**

  *Information about the status **dds::core::status::StatusMask::inconsistent_topic()** (p. 2379)*
- class **dds::topic::AnyTopic**

  *<<**reference-type**>> (p. 351) This class provides an non-template holder for representing a **Topic** (p. 2474) of any type*
- class **dds::topic::ContentFilteredTopic< T >**

  *<<**reference-type**>> (p. 351) Specialization of **TopicDescription** (p. 2503) that allows for content-based subscriptions.*
- class **dds::topic::Filter**

  *Defines the filter to create a **ContentFilteredTopic** (p. 954).*
- class **dds::topic::TopicInstance< T >**

  Encapsulates a sample and its associated instance handle.
- class **dds::topic::TopicListener< T >**

*The listener to notify status changes for a **dds::topic::Topic** (p. 2474).*

- class **dds::topic::NoOpTopicListener< T >**

  *A convenience implementation of **TopicListener** (p. 2508) where all methods are overridden to do nothing.*

- class **dds::topic::Topic< T >**

  *<<**reference-type**>> (p. 351) **Topic** (p. 2474) is the most basic description of the data to be published and subscribed.*

- class **dds::topic::TopicDescription< T >**

  *Abstract base class of **Topic** (p. 2474) and **ContentFilteredTopic** (p. 954).*

- class **rti::topic::ExpressionProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Provides additional information about the filter expression passed to the writer_compile method of **rti::topic::WriterContentFilter** (p. 2652)*

- class **rti::topic::FilterSampleInfo**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Provides meta information associated with the sample.*

- class **rti::topic::PrintFormatProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A collection of attributes used to configure how data samples will be formatted when converted to a string.*

- class **dds::topic::qos::TopicQos**

  *<<**value-type**>> (p. 350) Container of the QoS policies that a **dds::topic::Topic** (p. 2474) supports*

Functions

- std::string **rti::topic::sql_filter_name** ()

  *<<**extension**>> (p. 354) The name of the built-in SQL filter*

- std::string **rti::topic::stringmatch_filter_name** ()

  *<<**extension**>> (p. 354) The name of the built-in StringMatch filter*

6.6.1 Detailed Description

dds::topic::Topic (p. 2474) entity and associated elements

6.6.2 Function Documentation

6.6.2.1 sql_filter_name()

```
std::string rti::topic::sql_filter_name ( )
```

*<<**extension**>> (p. 354)* The name of the built-in SQL filter

This filter can be used with a **dds::topic::ContentFilteredTopic** (p. 954) and a **rti::core::policy::MultiChannel** (p. 1749)-enabled **dds::pub::DataWriter** (p. 1138).

See also

dds::topic::Filter::name() (p. 1562)

rti::core::policy::MultiChannel::filter_name() (p. 1752)

6.6.2.2 stringmatch_filter_name()

```
std::string rti::topic::stringmatch_filter_name ( )
```

<<***extension***>> *(p. 354)* The name of the built-in StringMatch filter

This filter can be used with a **dds::topic::ContentFilteredTopic** (p. 954) and a **rti::core::policy::MultiChannel** (p. 1749)-enabled **dds::pub::DataWriter** (p. 1138).

The StringMatch Filter is a subset of the SQL filter; it only supports the MATCH relational operator on a single string field.

See also

dds::topic::Filter::name() (p. 1562)

rti::core::policy::MultiChannel::filter_name() (p. 1752)

Referenced by **rti::core::policy::LocatorFilter::filter_name()**.

6.7 Zero Copy Transfer Over Shared Memory

<<***extension***>> *(p. 354)* Zero Copy transfer over shared memory

<<***extension***>> *(p. 354)* Zero Copy transfer over shared memory

Note

For a description of Zero Copy transfer over shared memory and its benefits, and a tutorial, see the "Sending Large Data" chapter in the **RTI Connext User's Manual**.

For buildable **code examples**, see `https://community.rti.com/kb/flatdata-and-zerocopy-examples`.

Zero Copy transfer over shared memory is available in the C API, in the Traditional C++ API, and in the Modern C++ API.

6.8 Built-in Types

RTI Connext provides a set of very simple data types for you to use with the topics in your application.

Classes

- class **dds::core::BytesTopicType**

  Built-in type consisting of a variable-length array of opaque bytes.
- class **dds::core::StringTopicType**

  Built-in type consisting of a single character string.
- class **dds::core::KeyedStringTopicType**

  Built-in type consisting of a string payload and a second string that is the key.
- class **dds::core::KeyedBytesTopicType**

  Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

6.8.1 Detailed Description

RTI Connext provides a set of very simple data types for you to use with the topics in your application.

The middleware provides four built-in types:

- String: A payload consisting of a single string of characters. This type has no key.
- KeyedString: A payload consisting of a single string of characters and a second string, the key, that identifies the instance to which the sample belongs.
- Octets: A payload consisting of an opaque variable-length array of bytes. This type has no key.
- KeyedOctets: A payload consisting of an opaque variable-length array of bytes and a string, the key, that identifies the instance to which the sample belongs.

The String and KeyedString types are appropriate for simple text-based applications. The Octets and KeyedOctets types are appropriate for applications that perform their own custom data serialization, such as legacy applications still in the process of migrating to RTI Connext. In most cases, string-based or structured data is preferable to opaque data, because the latter cannot be easily visualized in tools or used with content-based filters (see **dds::topic::Content↩ FilteredTopic** (p. 954)).

The built-in types are very simple in order to get you up and running as quickly as possible. If you need a structured data type you can define your own type with exactly the fields you need in one of two ways:

- At compile time, by generating code from an IDL or XML file using the rtiddsgen utility
- At runtime, by using **dds::core::xtypes::DynamicData** (p. 1461)

6.8.2 Managing Memory for Builtin Types

When a sample is written, the DataWriter serializes it and stores the result in a buffer obtained from a pool of preallocated buffers. In the same way, when a sample is received, the DataReader deserializes it and stores the result in a sample coming from a pool of preallocated samples.

For builtin types, the maximum size of the buffers/samples and depends on the nature of the application using the builtin type.

You can configure the maximum size of the builtin types on a per-DataWriter and per-DataReader basis using the **rti::core::policy::Property** (p. 1969) in DataWriters, DataReaders or Participants.

The following table lists the supported builtin type properties to configure memory allocation. When the properties are defined in the DomainParticipant, they are applicable to all DataWriters and DataReaders belonging to the Domain↩ Participant unless they are overwrittem in the DataWriters and DataReaders.

Table 6.3 ***Builtin Types Allocation Properties***

Property	Description
dds.builtin_type.string.alloc_size	Maximum size of the strings published by the StringDataWriter or received the StringDataReader (includes the NULL-terminated character). Default: dds.builtin_type.string.max_size if defined. Otherwise, 1024.
dds.builtin_type.keyed_string.alloc_key_size	Maximum size of the keys used by the KeyedStringDataWriter or KeyedStringDataReader (includes the NULL-terminated character). Default: dds.builtin_type.keyed_string.max_key_size if defined. Otherwise, 1024.
dds.builtin_type.keyed_string.alloc_size	Maximum size of the strings published by the KeyedStringDataWriter or received by the KeyedStringDataReader (includes the NULL-terminated character). Default: dds.builtin_type.keyed_string.max_size if defined. Otherwise, 1024.
dds.builtin_type.octets.alloc_size	Maximum size of the octet sequences published the OctetsDataWriter or received by the OctetsDataReader. Default: dds.builtin_type.octets.max_size if defined. Otherwise, 2048.
dds.builtin_type.keyed_octets.alloc_key_size	Maximum size of the key published by the KeyedOctetsDataWriter or received by the KeyedOctetsDataReader (includes the NULL-terminated character). Default: dds.builtin_type.keyed_octets.max_key_size if defined. Otherwise, 1024.
dds.builtin_type.keyed_octets.alloc_size	Maximum size of the octets sequences published by a KeyedOctetsDataWriter or received by a KeyedOctetsDataReader. Default: dds.builtin_type.keyed_octets.max_size if defined. Otherwise, 2048.

The previous properties must be set consistently with respect to the corresponding $*$.max_size properties that set the maximum size of the builtin types in the typecode.

6.8.3 Typecodes for Builtin Types

The typecodes associated with the builtin types are generated from the following IDL type definitions:

```
module DDS {

    struct String {

        string value;

    };

    struct KeyedString {

        string key;

        string value;

    };
```

```
    struct Octets {
        sequence<octet> value;
    };

    struct KeyedOctets {
        string key;
        sequence<octet> value;
    };
};
```

The maximum size of the strings and sequences that will be included in the type code definitions can be configured on a per-DomainParticipant-basis by using the properties in following table.

Table 6.4 ***Properties for Allocating Size of Builtin Types, per DomainParticipant***

Property	Description
dds.builtin_type.string.max_size	Maximum size of the strings published by the StringDataWriters and received by the StringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_string.max_key_size	Maximum size of the keys used by the KeyedStringDataWriters and KeyedStringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_string.max_size	Maximum size of the strings published by the KeyedStringDataWriters and received by the KeyedStringDataReaders belonging to a DomainParticipant using the builtin type (includes the NULL-terminated character). Default: 1024
dds.builtin_type.octets.max_size	Maximum size of the octet sequences published by the OctetsDataWriters and received by the OctetsDataReader belonging to a DomainParticipant. Default: 2048
dds.builtin_type.keyed_octets.max_key_size	Maximum size of the keys used by the KeyedOctetsStringDataWriters and KeyedOctetsStringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_octets.max_size	Maximum size of the octet sequences published by the KeyedOctetsDataWriters and received by the KeyedOctetsDataReaders belonging to a DomainParticipant. Default: 2048

For more information about the built-in types, including how to control memory usage and maximum lengths, please see the "Data Types and DDS Data Samples" chapter in the `User's Manual`.

6.9 Built-in Topic's Trust Types

Types used as part of **dds::topic::ParticipantBuiltinTopicData** (p. 1908), **dds::topic::PublicationBuiltinTopicData** (p. 1977), **dds::topic::SubscriptionBuiltinTopicData** (p. 2428) to describe Trust Plugins configuration.

Classes

- class **rti::topic::trust::EndpointTrustAlgorithmInfo**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Trust Plugins signature algorithm information associated with the discovered DomainParticipant.*
- class **rti::topic::trust::TrustAlgorithmRequirements**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Type to describe Trust Plugins algorithm requirements.*

6.9.1 Detailed Description

Types used as part of **dds::topic::ParticipantBuiltinTopicData** (p. 1908), **dds::topic::PublicationBuiltinTopicData** (p. 1977), **dds::topic::SubscriptionBuiltinTopicData** (p. 2428) to describe Trust Plugins configuration.

These types are used to describe how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins.

The meaning of the contents of these types may vary depending on what Trust Plugins the DomainParticipant is using. For information about how these types interact with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

6.10 Publication Module

Contains the **rti::pub::FlowController** (p. 1572), **dds::pub::Publisher** (p. 1993), and **dds::pub::DataWriter** (p. 1138) classes as well as the PublisherListener and **dds::pub::DataWriterListener** (p. 1202) interfaces, and more generally, all that is needed on the publication side.

Modules

- **Publishers**

  dds::pub::Publisher *(p. 1993) entity and associated elements*
- **Data Writers**

  dds::pub::DataWriter *(p. 1138) entity and associated elements*
- **Flow Controllers**

  *<<**extension**>> (p. 354)* ***rti::pub::FlowController*** *(p. 1572) and associated elements*
- **Multi-channel DataWriters**

  APIs related to Multi-channel DataWriters.

6.10.1 Detailed Description

Contains the **rti::pub::FlowController** (p. 1572), **dds::pub::Publisher** (p. 1993), and **dds::pub::DataWriter** (p. 1138) classes as well as the PublisherListener and **dds::pub::DataWriterListener** (p. 1202) interfaces, and more generally, all that is needed on the publication side.

"DCPS Publication package"

6.11 Publishers

dds::pub::Publisher (p. 1993) entity and associated elements

Classes

- class **dds::pub::PublisherListener**

  The listener to notify status changes for a ***dds::pub::Publisher*** *(p. 1993).*
- class **dds::pub::NoOpPublisherListener**

  A convenience implementation of ***PublisherListener*** *(p. 2006) where all methods are overridden to do nothing.*
- class **dds::pub::CoherentSet**

  *<<**value-type**>> (p. 350) A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.*
- class **dds::pub::Publisher**

  *<<**reference-type**>> (p. 351) A publisher is the object responsible for the actual dissemination of publications.*
- class **dds::pub::SuspendedPublication**

  *<<**value-type**>> (p. 350) Indicates that the application is about to make multiple modifications using several* ***dds::pub::DataWriter*** *(p. 1138)'s belonging to the same* ***dds::pub::Publisher*** *(p. 1993)*
- class **dds::pub::qos::PublisherQos**

  *<<**value-type**>> (p. 350) Container of the QoS policies that a* ***dds::pub::Publisher*** *(p. 1993) supports*

6.11.1 Detailed Description

FlowControllerSchedulingPolicy_def (p. 1581)

6.13.3 Variable Documentation

6.13.3.1 DEFAULT_NAME

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::pub::FlowController::DEFAULT_NAME [static]
```

Name that identifies the built-in default **FlowController** (p. 1572).

RTI Connext provides several built-in **rti::pub::FlowController** (p. 1572) for use with an asynchronous **dds::pub::DataWriter** (p. 1138). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

By default, flow control is disabled. That is, the built-in **rti::pub::FlowController::DEFAULT_NAME** (p. 58) flow controller does not apply any flow control. Instead, it allows data to be sent asynchronously as soon as it is written by the **dds::pub::DataWriter** (p. 1138).

Essentially, this is equivalent to a user-created **rti::pub::FlowController** (p. 1572) with the following **rti::pub::FlowControllerProperty** (p. 1577) settings:

- **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) = **FlowControllerSchedulingPolicy_def::↩ EARLIEST_DEADLINE_FIRST** (p. 1582)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `max_tokens` = **dds::core::LENGTH_UNLIMITED** (p. 438)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `tokens_added_per_period` = **dds::core::↩ LENGTH_UNLIMITED** (p. 438)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `tokens_leaked_per_period` = 0

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `period` = 60 seconds

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `bytes_per_token` = **dds::core::LENGTH_↩ UNLIMITED** (p. 438)

See also

rti::core::policy::AsynchronousPublisher (p. 832)

6.13.3.2 FIXED_RATE_NAME

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::pub::FlowController::FIXED_RATE_NAME  [static]
```

Name that identifies the built-in fixed-rate **FlowController** (p. 1572).

RTI Connext provides several builtin **rti::pub::FlowController** (p. 1572) for use with an asynchronous **dds::pub::↩ DataWriter** (p. 1138). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **rti::pub::FlowController::FIXED_RATE_NAME** (p. 59) flow controller shapes the network traffic by allowing data to be sent only once every second. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

Essentially, this is equivalent to a user-created **rti::pub::FlowController** (p. 1572) with the following **rti::pub::Flow↩ ControllerProperty** (p. 1577) settings:

- **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) = **FlowControllerSchedulingPolicy_def::↩ EARLIEST_DEADLINE_FIRST** (p. 1582)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `max_tokens` = **dds::core::LENGTH_UNLIMITED** (p. 438)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `tokens_added_per_period` = **dds::core::LENGTH_UNLIMITED** (p. 438)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `tokens_leaked_per_period` = **dds::core::LENGTH_UNLIMITED** (p. 438)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `period` = 1 second

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `bytes_per_token` = **dds::core::LENGTH_UNLIMITED** (p. 438)

rti::core::policy::AsynchronousPublisher (p. 832)

6.13.3.3 ON_DEMAND_NAME

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::pub::FlowController::ON_DEMAND_NAME  [static]
```

Name that identifies the built-in on-demand **FlowController** (p. 1572).

RTI Connext provides several builtin **rti::pub::FlowController** (p. 1572) for use with an asynchronous **dds::pub::DataWriter** (p. 1138). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **rti::pub::FlowController::ON_DEMAND_NAME** (p. 60) allows data to be sent only when the user calls **rti::pub::FlowController::trigger_flow** (p. 1575). With each trigger, all accumulated data since the previous trigger is sent (across all **dds::pub::Publisher** (p. 1993) or **dds::pub::DataWriter** (p. 1138) instances). In other words, the network traffic shape is fully controlled by the user. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

This external trigger source is ideal for users who want to implement some form of closed-loop flow control or who want to only put data on the wire every so many samples (e.g. with the number of samples based on **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789)).

Essentially, this is equivalent to a user-created **rti::pub::FlowController** (p. 1572) with the following **rti::pub::FlowControllerProperty** (p. 1577) settings:

- **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1579) = **FlowControllerSchedulingPolicy_def::↩ EARLIEST_DEADLINE_FIRST** (p. 1582)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `max_tokens` = **dds::core::LENGTH_UNLIMITED** (p. 438)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `tokens_added_per_period` = **dds::core::↩ LENGTH_UNLIMITED** (p. 438)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `tokens_leaked_per_period` = **dds::core↩ ::LENGTH_UNLIMITED** (p. 438)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `period` = **dds::core::Duration::infinite()** (p. 1451)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1579) `bytes_per_token` = **dds::core::LENGTH_↩ UNLIMITED** (p. 438)

- **SampleProcessor**

  *<<**experimental**>> (p. 355) <<**extension**>> (p. 354) Utility to concurrently read and process the data samples received by* ***dds::sub::DataReader*** *(p. 976).*

6.14.1 Detailed Description

Contains the **dds::sub::Subscriber** (p. 2410), **dds::sub::DataReader** (p. 976), **dds::sub::cond::ReadCondition** (p. 2133), **dds::sub::cond::QueryCondition** (p. 2059), and **rti::sub::TopicQuery** (p. 2516) classes, as well as the **dds::sub::SubscriberListener** (p. 2422) and **dds::sub::DataReaderListener** (p. 1055) interfaces, and more generally, all that is needed on the subscription side.

"DCPS Subscription package"

6.14.2 Access to data samples

Data is made available to the application by the following operations on **dds::sub::DataReader** (p. 976) objects: **dds::sub::DataReader::read** (p. 996), **dds::sub::DataReader::take** (p. 997), **dds::sub::DataReader::select** (p. 1003). and the other variants of **read()** (p. 1024) and **take()** (p. 1024).

The general semantics of the **`read()`** (p. `1024`) operation is that the application only gets access to the corresponding data (i.e. a precise instance value); the data remains the responsibility of RTI Connext and can be read again.

The semantics of the **`take()`** (p. `1024`) operations is that the application takes full responsibility for the data; that data will no longer be available locally to RTI Connext. Consequently, it is possible to access the same information multiple times only if all previous accesses were **read()** (p. 1024) operations, not **take()** (p. 1024).

The `select()` operation allows specifying which samples to read or take depending on several parameters.

Each of these operations returns a collection of `Data` values and associated **dds::sub::SampleInfo** (p. 2285) objects. Each data value represents an atom of data information (i.e., a value for one instance). This collection may contain samples related to the same or different instances (identified by the key). Multiple samples can refer to the same instance if the settings of the **HISTORY** (p. 533) QoS allow for it.

These operations reset the read communication statuses; see **Changes in read communication status** (p. 432).

See also

Interpretation of the SampleInfo (p. 2286)

6.14.2.1 Data access patterns

Applications access data using the following **dds::sub::DataReader** (p. 976) operations and their variants: **dds::sub::DataReader::read()** (p. 996), **dds::sub::DataReader::take()** (p. 997), and **dds::sub::DataReader::select()** (p. 1003).

These operations return a collection, **dds::sub::LoanedSamples** (p. 1663), consisting of which contain the actual data and **dds::sub::SampleInfo** (p. 2285) objects.

The way RTI Connext builds the collection depends on QoS policies set on the **dds::sub::DataReader** (p. 976) and **dds::sub::Subscriber** (p. 2410), the `source_timestamp` of the samples, and, when using **dds::sub::DataReader::select()** (p. 1003), the parameters used to build the dds::sub::Selector.

These operations are non-blocking and just deliver what is currently available.

Once the data samples are available to the DataReader, the application can read or take them.

To access data coherently, or in order, the **PRESENTATION** (p. 540) QoS must be set properly.

6.15 Subscribers

dds::sub::Subscriber (p. 2410) entity and associated elements

Classes

- class **dds::sub::SubscriberListener**

  *The listener to notify status changes for a **dds::sub::Subscriber** (p. 2410).*
- class **dds::sub::NoOpSubscriberListener**

  *A convenience implementation of **SubscriberListener** (p. 2422) where all methods are overridden to do nothing.*
- class **dds::sub::CoherentAccess**

  *<<**value-type**>> (p. 350) Controls whether RTI Connext will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_changes.*
- class **dds::sub::Subscriber**

  *<<**reference-type**>> (p. 351) A subscriber is the object responsible for actually receiving data from a subscription.*
- class **dds::sub::qos::SubscriberQos**

  *<<**value-type**>> (p. 350) Container of the QoS policies that a **dds::sub::Subscriber** (p. 2410) supports*

6.15.1 Detailed Description

6.18.1 Detailed Description

dds::sub::cond::QueryCondition (p. 2059) and associated elements

6.18.2 Function Documentation

6.18.2.1 create_query_condition_ex() [1/2]

```
dds::sub::cond::detail::QueryCondition rti::sub::cond::create_query_condition_ex (
            const  dds::sub::Query & query,
            const  ::rti::sub::status::DataStateEx & status )  [inline]
```

<<***extension***>> *(p. 354)* Creates a QueryCondition with the extended DataStateEx.

Note

This is a standalone function in the namespace rti::sub::cond

The usual way to create a **dds::sub::cond::QueryCondition** (p. 2059) is the constructor that receives a **dds::sub↩ ::status::DataState** (p. 1118). This extension function allows using **rti::sub::status::DataStateEx** (p. 1126), which includes additional state masks.

6.18.2.2 create_query_condition_ex() [2/2]

```
template<typename Functor >
dds::sub::cond::detail::QueryCondition rti::sub::cond::create_query_condition_ex (
            const  dds::sub::Query & query,
            const  ::rti::sub::status::DataStateEx & status,
            const Functor & handler )
```

<<***extension***>> *(p. 354)* Creates a QueryCondition with the extended DataStateEx and a handler.

Note

This is a standalone function in the namespace rti::sub::cond

The usual way to create a **dds::sub::cond::QueryCondition** (p. 2059) is the constructor that receives a **dds::sub↩ ::status::DataState** (p. 1118). This extension function allows using **rti::sub::status::DataStateEx** (p. 1126), which includes additional state masks.

6.19 Data Samples

dds::sub::SampleInfo (p. 2285), **dds::sub::status::SampleState** (p. 2316), **dds::sub::status::ViewState** (p. 2614), **dds::sub::status::InstanceState** (p. 1615) and associated elements

Modules

- **Sample Information**
- **Data State**

  Describes DataState, which includes SampleState, ViewState and InstanceState. .

Classes

- class **dds::sub::SharedSamples< T, DELEGATE >**

  *<<**reference-type**>> (p. 351) A sharable and container-safe version of **LoanedSamples** (p. 1663).*
- class **dds::sub::Sample< T >**

  *<<**value-type**>> (p. 350) This class encapsulate the data and meta-data associated with DDS samples.*
- class **dds::sub::SampleInfo**

  *<<**value-type**>> (p. 350) Information that accompanies each sample received by a **DataReader** (p. 976)*
- class **rti::core::CoherentSetInfo**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A CoherentSampleInfo provides information about the coherent set associated with a sample.*
- class **rti::sub::LoanedSample< T >**

  *The element type of a **dds::sub::LoanedSamples** (p. 1663) collection.*
- class **dds::sub::LoanedSamples< T >**

  *<<**move-only-type**>> (p. 353) Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 976).*
- struct **rti::sub::IsValidData< T >**

  *<<**extension**>> (p. 354) A functor that returns true when a sample has valid data.*
- class **rti::sub::ValidLoanedSamples< T >**

  *<<**extension**>> (p. 354) <<**C++11**>> (p. 353) <<**move-only-type**>> (p. 353) Provides access to only those samples that contain valid data*
- class **rti::sub::SampleIterator< T >**

  *A random-access iterator of **LoanedSample** (p. 1659).*
- class **rti::sub::ValidSampleIterator< T >**

  A forward iterator adapter that skips invalid samples.

6.19.1 Detailed Description

dds::sub::SampleInfo (p. 2285), **dds::sub::status::SampleState** (p. 2316), **dds::sub::status::ViewState** (p. 2614), **dds::sub::status::InstanceState** (p. 1615) and associated elements

6.20 Topic Queries

rti::sub::TopicQuery (p. 2516) and associated elements.

Classes

- struct **rti::sub::TopicQuerySelectionKind_def**

  *The definition of the **dds::core::safe_enum*** (p. 2265) ***rti::sub::TopicQuerySelectionKind*** (p. 71).
- class **rti::sub::TopicQuerySelection**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Specifies the data query that defines a **TopicQuery*** (p. 2516).
- class **rti::sub::TopicQueryData**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Provides information about a **TopicQuery*** (p. 2516)
- class **rti::sub::TopicQuery**

  *<<**extension**>> (p. 354) <<**reference-type**>> (p. 351) Allows a **dds::sub::DataReader*** (p. 976) *to query the sample cache of its matching dds::pub::DataWriters.*

Typedefs

- typedef **dds::core::safe_enum**< **TopicQuerySelectionKind_def** > **rti::sub::TopicQuerySelectionKind**

  Safe Enumeration (p. 429) *of **TopicQuerySelectionKind_def*** (p. 2528)

6.20.1 Detailed Description

rti::sub::TopicQuery (p. 2516) and associated elements.

TopicQueries allow a **dds::sub::DataReader** (p. 976) to query the sample cache of its matching **dds::pub::DataWriter** (p. 1138). When the application
creates a TopicQuery, DDS will propagate it to other DomainParticipants and their DataWriters. When a DataWriter matching with the DataReader that created the TopicQuery receives it, it will send the cached samples that pass the TopicQuery's filter.

To configure how to dispatch a TopicQuery, the **dds::pub::qos::DataWriterQos** (p. 1226) includes the **rti::core::policy::TopicQueryDispatch** (p. 2522) policy. By default, a DataWriter ignores TopicQueries unless they are explicitly enabled using this policy.

The delivery of TopicQuery samples occurs in a separate RTPS channel. This allows DataReaders to receive TopicQuery samples and live samples in parallel. This is a key difference with respect to the Durability QoS policy.

Late-joining DataWriters will also discover existing TopicQueries.

After deleting a TopicQuery, new DataWriters won't discover it and existing DataWriters currently publishing cached samples may stop before delivering all of them. See **rti::sub::TopicQuery::close()** (p. 2518).

By default, a TopicQuery queries the samples that were in the DataWriter's queue at the time the DataWriter received the TopicQuery. These TopicQueries are snapshot TopicQueries. However, a TopicQuery can be created in "continuous" mode; in this case, a DataWriter will continue delivering samples that pass a continuous TopicQuery filter until the DataReader application explicitly deletes it. These TopicQueries are continuous TopicQueries.

The samples received in response to a TopicQuery are stored in the associated DataReader's cache. Any of the read/take operations can retrieve TopicQuery samples. The field **dds::sub::SampleInfo::topic_query_guid** (p. 2294) associates each sample to its TopicQuery. If the read sample is not in response to a TopicQuery then this field will be **rti::core::Guid::unknown()** (p. 1597). Note that the same data may be received several times, depending on how many TopicQueries the DataReader creates and their TopicQuerySelection.

You can choose to read or take only TopicQuery samples, only live samples, or both. To support this ReadConditions and QueryConditions provide the rti::sub::cond::create_query_condition_ex and rti::sub::cond::create_read_condition_ex APIs.

Each TopicQuery is identified by a GUID that can be accessed using the **rti::sub::TopicQuery::guid** (p. 2518) method.

6.20.2 Snapshot TopicQueries

A snapshot TopicQuery queries the samples that are in a DataWriter's queue when the DataWriter receives the TopicQuery.

When a DataWriter receives a snapshot TopicQuery, it registers the last sequence number available in the DataWriter queue (known as the cut-off SN). Then, the DataWriter applies the TopicQuery expression to all the samples up to the cut-off SN. If a sample with a SN smaller than or equal to the cut-off SN passes the filter expression, it will be included in the TopicQuery response.

When a DataWriter responds to a snapshot TopicQuery, it doesn't create any copies of the samples that are part of the response. As a result, a sample that passes the TopicQuery expression and should have been included in the response may be removed from the DataWriter queue before it reaches the DataReader that issued the TopicQuery. This can result in incomplete TopicQueries, which may or may not be necessary for your application to detect.

For instance, your application may issue a TopicQuery on a keyed topic using a filter on key-only fields and expect to receive the latest value for an instance that passes the filter. However, if the latest value for the instance is replaced with a newer value before the sample is delivered to the DataReader, it is important to detect this situation and re-issue the TopicQuery.

On the other hand, some applications may not care about which samples are returned in response to a TopicQuery, and are only interested in a snapshot of the DataWriter's queue. In such cases, the concept of incomplete TopicQueries can be ignored.

The application can detect incomplete TopicQueries by checking the **rti::core::SampleFlag::incomplete_snapshot_topic_query** (p. 2281) bit in the **dds::sub::SampleInfo::flag** (p. 2293) field of the last sample received for a snapshot TopicQuery.

To reduce the probability of receiving incomplete responses, DataWriters configured with **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607) recalculate the cut-off SN for a snapshot TopicQuery if a sample is replaced in the DataWriter queue due to KEEP_LAST replacement before the complete TopicQuery response is published.

Snapshot TopicQueries are not automatically deleted once the DataWriters that respond to the TopicQuery have finished delivering the samples included in the response. It is the responsibility of the user to delete the TopicQuery when it is no longer needed. To detect the end of a snapshot TopicQuery response, check for the **rti::core::SampleFlag::intermediate_topic_query_sample** (p. 2281) flag in the **dds::sub::SampleInfo::flag** (p. 2293) field of the samples included in the response. For more information on how to use this flag, see **Reading TopicQuery Samples** (p. 69).

6.20.3 Reading TopicQuery Samples

A TopicQuery response is the set of samples published by a DataWriter in response to a TopicQuery. Because multiple DataWriters may respond to a TopicQuery, a DataReader may receive multiple responses for a single TopicQuery.

Responses can be proxied by Routing Service DataWriters by setting <topic_query_proxy>/<mode> to PROPAGATION. These DataWriters forward a TopicQuery response, but they are not considered to be responding to the TopicQuery.

Samples that a DataReader receives in response to a TopicQuery have a value for **dds::sub::SampleInfo::topic_query_guid** (p. 2294) different than **rti::core::Guid::unknown()** (p. 1597).

In addition, the virtual GUID of the DataWriter(s) that responded to a TopicQuery is set in **dds::sub::SampleInfo::source_guid** (p. 2293).

Intermediate samples, not the final sample, have the flag **rti::core::SampleFlag::intermediate_topic_query_sample** (p. 2281) set in **dds::sub::SampleInfo::flag** (p. 2293) for a given response to a snapshot TopicQuery.

If two DataWriters respond to a snapshot TopicQuery, you should expect two final samples, one per unique **dds::sub↩ ::SampleInfo::source_guid** (p. 2293) responding to the TopicQuery, assuming that at least one sample passes the TopicQuery filter for each DataWriter.

The **dds::sub::SampleInfo::flag** (p. 2293) field of the last sample received for a snapshot TopicQuery may have the **rti::core::SampleFlag::incomplete_snapshot_topic_query** (p. 2281) bit set if the TopicQuery response is incomplete, which may or may not be necessary for your application to detect. See **Snapshot TopicQueries** (p. 69) for more information.

6.20.4 Debugging Topic Queries

There are a number of ways in which to gain more insight into what is happening in an application that is creating Topic Queries.

6.20.4.1 The Built-in ServiceRequest DataReader

TopicQueries are communicated to publishing applications through a built-in **rti::topic::ServiceRequest** (p. 2358) channel. The ServiceRequest channel is designed to be generic so that it can be used for many different purposes, one of which is TopicQueries.

When a DataReader creates a TopicQuery, a **rti::topic::ServiceRequest** (p. 2358) message is sent containing the TopicQuery information. Just as there are built-in DataReaders for **dds::topic::ParticipantBuiltinTopicData** (p. 1908), **dds::topic::SubscriptionBuiltinTopicData** (p. 2428), and **dds::topic::PublicationBuiltinTopicData** (p. 1977), there is a fourth built-in DataReader for ServiceRequests.

The new built-in DataReader can be retrieved using the built-in subscriber and **dds::sub::find** (p. 672). The topic name is **rti::topic::service_request_topic_name()** (p. 568). Installing a listener with the **dds::sub::DataReader↩ Listener::on_data_available** (p. 1058) callback implemented will allow a publishing application to be notified whenever a TopicQuery has been received from a subscribing application.

The **rti::topic::ServiceRequest::service_id** (p. 2359) of a **rti::topic::ServiceRequest** (p. 2358) corresponding to a **rti::sub::TopicQuery** (p. 2516) will be **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2362) and the **rti::topic↩ ::ServiceRequest::instance_id** (p. 2359) will be equal to the GUID of the **rti::sub::TopicQuery** (p. 2516) (see **rti↩ ::sub::TopicQuery::guid** (p. 2518)).

The **rti::topic::ServiceRequest::request_body** (p. 2359) is a sequence of bytes containing more information about the TopcQuery. This information can be retrieved using the **rti::sub::create_topic_query_data_from_service_↩ request()** (p. 768) function. The resulting **rti::sub::TopicQueryData** (p. 2520) contains the **rti::sub::TopicQuery↩ Selection** (p. 2526) that the **rti::sub::TopicQuery** (p. 2516) was created with, the GUID of the original DataReader that created the TopicQuery, and the topic name of that DataReader. Note: When TopicQueries are propagated through one or more Routing Services, the last DataReader that issued the TopicQuery will be a Routing Service DataReader. The **rti::sub::TopicQueryData::original_related_reader_guid** (p. 2521), however, will be that of the first DataReader to have created the TopicQuery.

6.20.4.2 The on_service_request_accepted DataWriter Listener Callback

It is possible that a **rti::topic::ServiceRequest** (p. 2358) for a **rti::sub::TopicQuery** (p. 2516) is received but is not immediately dispatched to a DataWriter. This can happen, for example, if a DataWriter was not matching with a DataReader at the time that the TopicQuery was received by the publishing application. The **dds::pub::DataWriter↩ Listener::on_service_request_accepted** (p. 1209) callback notifies a DataWriter when a ServiceRequest has been dispatched to that DataWriter. The **rti::core::status::ServiceRequestAcceptedStatus** (p. 2360) provides information about how many ServiceRequests have been accepted by the DataWriter since the last time that the status was read. The status also includes the **rti::core::status::ServiceRequestAcceptedStatus::last_request_handle** (p. 2361), which is the **dds::core::InstanceHandle** (p. 1612) of the last ServiceRequest that was accepted. This instance handle can be used to read samples per instance from the built-in ServiceRequest DataReader and correlate which ServiceRequests have been dispatched to which DataWriters.

6.20.5 Typedef Documentation

6.20.5.1 TopicQuerySelectionKind

`typedef` **`dds::core::safe_enum< TopicQuerySelectionKind_def> rti::sub::TopicQuerySelectionKind`**

Safe Enumeration (p. 429) of **TopicQuerySelectionKind_def** (p. 2528)

TopicQuerySelectionKind_def (p. 2528) for the enumerated values

6.21 Sample Information

Classes

- class **dds::sub::GenerationCount**
  *<<**value-type**>> (p. 350)*
- class **dds::sub::Rank**
  *<<**value-type**>> (p. 350) Contains the sample and generation ranks of a data-sample*
- class **dds::sub::SampleInfo**
  *<<**value-type**>> (p. 350) Information that accompanies each sample received by a **DataReader** (p. 976)*

6.21.1 Detailed Description

6.22 Data State

Describes DataState, which includes SampleState, ViewState and InstanceState. .

Classes

- class **dds::sub::status::SampleState**

  Indicates whether or not a sample has ever been read.
- class **dds::sub::status::ViewState**

  Indicates whether or not an instance is new.
- class **dds::sub::status::InstanceState**

  *Indicates if the samples are from a live **dds::pub::DataWriter** (p. 1138) or not.*
- class **dds::sub::status::DataState**

  *The **DataState** (p. 1118) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1615), **ViewState** (p. 2614), and **SampleState** (p. 2316).*
- class **rti::sub::status::StreamKind**

  *<<**extension**>> (p. 354) Indicates which stream to read from: live stream, topic-query stream or both*
- class **rti::sub::status::DataStateEx**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) An extended version of **dds::sub::status::DataState** (p. 1118) that also contains **StreamKind** (p. 2390)*

6.22.1 Detailed Description

Describes DataState, which includes SampleState, ViewState and InstanceState. .

6.23 Infrastructure Module

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

Modules

- **Clock Selection**

  APIs related to clock selection.
- **Conditions and WaitSets**

  ***dds::core::cond::Condition** (p. 948) and **dds::core::cond::WaitSet** (p. 2617).*
- **Time Support**

  Time and duration types.
- **Exceptions**
- **Safe Enumeration**

  *Describes the **safe_enum** (p. 2265) class.*
- **Status Kinds**

  Kinds of communication status.
- **Supporting Types and Constants**

  Miscellaneous, general-purpose types and constants.
- **Builtin Qos Profiles**

  *<<**extension**>> (p. 354) QoS libraries and profiles that are automatically built into RTI Connext.*
- **QoS**

  Quality of Service (QoS) policies.

Classes

- class **dds::core::Entity**

  *<<**reference-type**>> (p. 351) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.*
- class **rti::core::Cookie**

  Unique identifier for a written data sample in the form of a sequence of bytes.
- class **rti::core::Guid**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Class for GUID (Global Unique Identifier) representation*
- class **rti::core::QosPrintFormat**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A collection of attributes used to configure how QoS will be formatted when converted to strings.*
- class **rti::core::SampleFlag**

  *<<**extension**>> (p. 354) A set of flags that can be associated with a sample.*
- class **rti::core::SampleIdentity**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A **SampleIdentity** (p. 2282) defines a pair (Virtual Writer **Guid** (p. 1596), **SequenceNumber** (p. 2335)) that uniquely identifies a sample within a DDS domain and a Topic.*
- class **rti::core::SequenceNumber**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A class representing the DDS 64-bit Sequence Number*

6.23.1 Detailed Description

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

6.24 Multi-channel DataWriters

APIs related to Multi-channel DataWriters.

APIs related to Multi-channel DataWriters.

6.24.1 What is a Multi-channel DataWriter?

A Multi-channel **dds::pub::DataWriter** (p. 1138) is a **dds::pub::DataWriter** (p. 1138) that is configured to send data over multiple multicast addresses, according to some filtering criteria applied to the data.

To determine which multicast addresses will be used to send the data, the middleware evaluates a set of filters that are configured for the **dds::pub::DataWriter** (p. 1138). Each filter "guards" a channel (a set of multicast addresses). Each time a multi-channel **dds::pub::DataWriter** (p. 1138) writes data, the filters are applied. If a filter evaluates to true, the data is sent over that filter's associated channel (set of multicast addresses). We refer to this type of filter as a Channel Guard filter.

6.24.2 Configuration on the Writer Side

To configure a multi-channel **dds::pub::DataWriter** (p. 1138), simply define a list of all its channels in the **rti::core::policy::MultiChannel** (p. 1749).

The **rti::core::policy::MultiChannel** (p. 1749) is propagated along with discovery traffic. The value of this policy is available in **dds::topic::PublicationBuiltinTopicData::locator_filter** (p. 1988).

6.24.3 Configuration on the Reader Side

No special changes are required in a subscribing application to get data from a multichannel **dds::pub::DataWriter** (p. 1138). If you want the **dds::sub::DataReader** (p. 976) to subscribe to only a subset of the channels, use a **dds::topic::ContentFilteredTopic** (p. 954).

For more information on Multi-channel DataWriters, refer to the `User's Manual`.

6.24.4 Reliability with Multi-Channel DataWriters

6.24.4.1 Reliable Delivery

Reliable delivery is only guaranteed when the **dds::core::policy::Presentation::access_scope** (p. 1947) is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) and the filters in **rti::core::policy::MultiChannel** (p. 1749) are keyed-only based.

If any of the guard filters are based on non-key fields, RTI Connext only guarantees reception of the most recent data from the MultiChannel DataWriter.

6.24.4.2 Reliable Protocol Considerations

Reliability is maintained on a per-channel basis. Each channel has its own reliability channel send queue. The size of that queue is limited by **dds::core::policy::ResourceLimits::max_samples** (p. 2205) and/or **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1240).

The protocol parameters described in **rti::core::policy::DataWriterProtocol** (p. 1210) are applied per channel, with the following exceptions:

rti::core::policy::RtpsReliableWriterProtocol::low_watermark (p. 2232) and **rti::core::policy::RtpsReliableWriterProtocol::high_watermark** (p. 2233): The low watermark and high watermark control the queue levels (in number of samples) that determine when to switch between regular and fast heartbeat rates. With MultiChannel DataWriters, high_watermark and low_watermark refer to the DataWriter's queue (not the reliability channel queue). Therefore, periodic heartbeating cannot be controlled on a per-channel basis.

Important: With MultiChannel DataWriters, low_watermark and high_watermark refer to application samples even if batching is enabled. This behavior differs from the one without MultiChannel DataWriters (where low_watermark and high_watermark refer to batches).

rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_samples (p. 2240): This field defines the number of heartbeats per send queue. For MultiChannel DataWriters, the value is applied per channel. However, the send

queue size that is used to calculate the a piggyback heartbeat rate is defined per DataWriter (see **dds::core::policy::ResourceLimits::max_samples** (p. 2205))

Important: With MultiChannel DataWriters, heartbeats_per_max_samples refers to samples even if batching is enabled. This behavior differs from the one without MultiChannels DataWriters (where heartbeats_per_max_samples refers to batches).

With batching and MultiChannel DataWriters, the size of the DataWriter's send queue should be configured using **dds::core::policy::ResourceLimits::max_samples** (p. 2205) instead of max_batches **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1240) in order to take advantage of heartbeats_per_max_samples.

6.25 Transports

APIs related to RTI Connext pluggable transports.

Modules

- **Installing Transport Plugins**

  Installing and configuring transports used by RTI Connext.
- **Built-in Transport Plugins**

  Transport plugins delivered with RTI Connext.
- **Creating New Transport Plugins**

  Developing new transport plugins for RTI Connext.
- **Transport Plugins Configuration**

  Transport plugins configuration with RTI Connext.
- **Transport Address**

  Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

6.25.1 Detailed Description

APIs related to RTI Connext pluggable transports.

6.25.2 Overview

RTI Connext has a pluggable transports architecture. The core of RTI Connext is transport agnostic; it does not make any assumptions about the actual transports used to send and receive messages. Instead, the RTI Connext core uses an abstract "transport API" to interact with the **transport plugins** which implement that API.

A transport plugin implements the abstract transport API and performs the actual work of sending and receiving messages over a physical transport. A collection of **builtin plugins** (see **Built-in Transport Plugins** (p. 83)) is delivered with RTI Connext for commonly used transports. New transport plugins can easily be created, thus enabling RTI Connext applications to run over transports that may not even be conceived yet. This is a powerful capability and that distinguishes RTI Connext from competing middleware approaches.

RTI Connext also provides a set of APIs for installing and configuring transport plugins to be used in an application. So that RTI Connext applications work out of the box, a subset of the builtin transport plugins is preconfigured by default (see **rti::core::policy::TransportBuiltin** (p. 2533)). You can "turn-off" some or all of the builtin transport plugins. In addition, you can configure other transport plugins for use by the application.

6.25.3 Transport Aliases

In order to use a transport plugin instance in an RTI Connext application, it must be registered with a **dds::domain::DomainParticipant** (p. 1326). When you register a transport, you specify a sequence of "alias" strings to symbolically refer to the transport plugin. The same alias strings can be used to register more than one transport plugin.

You can register multiple transport plugins with a **dds::domain::DomainParticipant** (p. 1326). An **alias** symbolically refers to one or more transport plugins registered with the **dds::domain::DomainParticipant** (p. 1326). Builtin transport plugin instances can be referred to using preconfigured aliases (see **TRANSPORT_BUILTIN** (p. 548)).

A transport plugin's class name is automatically used as an implicit alias. It can be used to refer to all the transport plugin instances of that class.

You can use aliases to refer to transport plugins, in order to specify:

- the transport plugins to use for **discovery** (see **rti::core::policy::Discovery::enabled_transports** (p. 1267)), and for **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) entities (see **rti::core::policy::TransportSelection** (p. 2554)).

- the **multicast** addresses on which to receive discovery messages (see **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268)), and the multicast addresses and ports on which to receive user data (see **rti::core::policy::TransportMulticast** (p. 2543)).

- the **unicast ports** used for user data (see **rti::core::policy::TransportUnicast** (p. 2556)) on both **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) entities.

- the transport plugins used to parse an address string in a locator (**Locator Format** (p. 560) and **NDDS_DISCOVERY_PEERS** (p. 559)).

A **dds::domain::DomainParticipant** (p. 1326) (and contained its entities) start using a transport plugin after the **dds::domain::DomainParticipant** (p. 1326) is enabled (see **dds::core::Entity::enable** (p. 1524)). An entity will use *all* the transport plugins that match the specified transport QoS policy. All transport plugins are treated uniformly, regardless of how they were created or registered; there is no notion of some transports being more "special" that others.

6.25.4 Transport Lifecycle

A transport plugin is owned by whomever creates it. Thus, if you create and register a transport plugin with a **dds::domain::DomainParticipant** (p. 1326), you are responsible for deleting it by calling its destructor. Note that builtin transport plugins (**TRANSPORT_BUILTIN** (p. 548)) and transport plugins that are loaded through the **PROPERTY** (p. 541) QoS policy (see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 81)) are automatically managed by RTI Connext.

A user-created transport plugin must not be deleted while it is still in use by a **dds::domain::DomainParticipant** (p. 1326). This generally means that a user-created transport plugin instance can only be deleted after the **dds::domain::DomainParticipant** (p. 1326) with which it was registered is deleted (see DomainParticipantFactory::delete_participant). Note that a transport plugin *cannot* be "unregistered" from a **dds::domain::DomainParticipant** (p. 1326).

A transport plugin instance cannot be registered with more than one **dds::domain::DomainParticipant** (p. 1326) at a time. This requirement is necessary to guarantee the multi-threaded safety of the transport API.

If the same physical transport resources are to be used with more than one **dds::domain::DomainParticipant** (p. 1326) in the same address space, the transport plugin should be written in such a way so that it can be instantiated multiple times—once for each **dds::domain::DomainParticipant** (p. 1326) in the address space. Note that it is always possible to write the transport plugin so that multiple transport plugin instances share the same underlying resources; however the burden (if any) of guaranteeing multi-threaded safety to access shared resource shifts to the transport plugin developer.

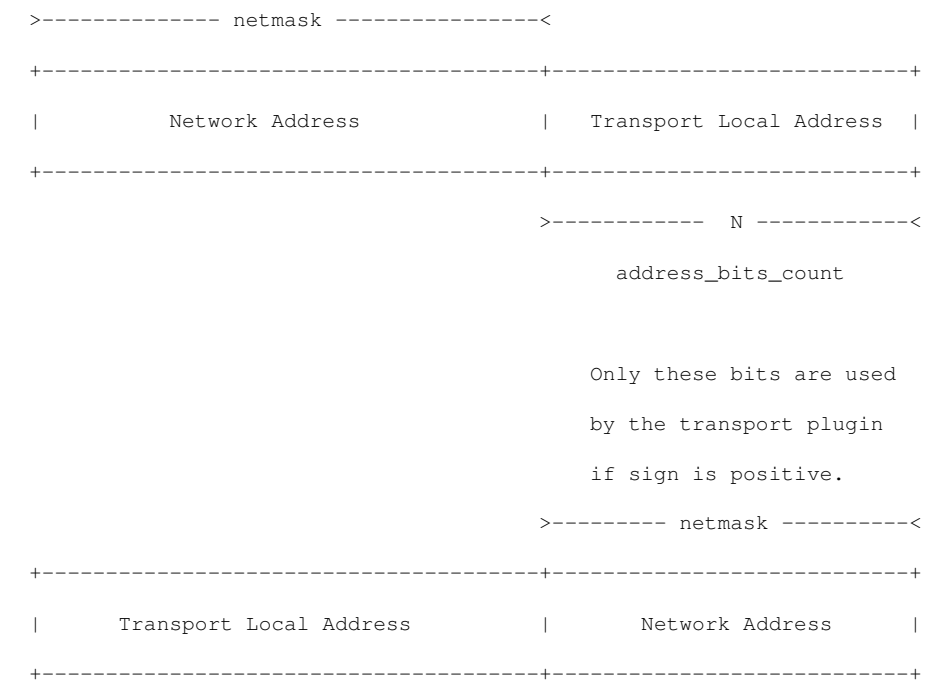
6.25.5 Transport Class Attributes

A transport plugin instance is associated with two kinds of attributes:

- the *class* attributes that are decided by the plugin writer; these are invariant across all instances of the transport plugin class, and
- the *instance* attributes that can be set on a per instance basis by the transport plugin user.

Every transport plugin must specify the following class attributes.

transport class id (see NDDS_Transport_Property_t::classid (p. **1787))** Identifies a transport plugin implementation class. It denotes a unique "class" to which the transport plugin instance belongs. The class is used to distinguish between different transport plugin implementations. Thus, a transport plugin vendor should ensure that its transport plugin implementation has a unique class.



Two transport plugin instances report the same class *iff* they have compatible implementations. Transport plugin instances with mismatching classes are not allowed (by the RTI Connext Core) to communicate with one another.

Multiple implementations (possibly from different vendors) for a physical transport mechanism can co-exist in an RTI Connext application, provided they use different transport class IDs.

The class ID can also be used to distinguish between different transport protocols over the same physical transport network (e.g., UDP vs. TCP over the IP routing infrastructure).

transport significant address bit count (see NDDS_Transport_Property_t::address_bit_count (p. **1788))** RTI Connext's addressing is modeled after the IPv6 and uses 128-bit addresses (**Transport Address** (p. 372)) to route messages.

A transport plugin is expected to map the transport's internal addressing scheme to 128-bit addresses. Depending on the sign of this attribute, this mapping uses only `N` least significant bits (LSB) if positive or `N` most significant bits (MSB) if negative; these bits are specified by this attribute.

```
>-----------------  N  -----------------<

           address_bits_count

         Only these bits are used

         by the transport plugin

         if sign is negative.
```

The remaining bits of an address using the 128 - abs(bit address) representation will be considered as part of the "network address" (see **Transport Network Address** (p. 79)) and thus ignored by the transport plugin's internal addressing scheme.

For *unicast* addresses, the transport plugin is expected to ignore the higher (128 - **NDDS_Transport_Property_t::address_bit_count** (p. 1788)) bits. RTI Connext is free to manipulate those bits freely in the addresses passed in/out to the transport plugin APIs.

Theoretically, the significant address bits count, N is related to the size of the underlying transport network as follows:

$$address_bits_count >= ceil(log_2(total_addressable_transport_unicast_interfaces))$$

The equality holds when the most compact (theoretical) internal address mapping scheme is used. A practical address mapping scheme may waste some bits.

6.25.6 Transport Instance Attributes

The *per instance* attributes to configure the plugin instance are generally passed in to the plugin constructor. These are defined by the transport plugin writer, and can be used to:

- customize the behavior of an instance of a transport plugin, including the send and the receiver buffer sizes, the maximum message size, various transport level classes of service (CoS), and so on.
- specify the resource values, network interfaces to use, various transport level policies, and so on.

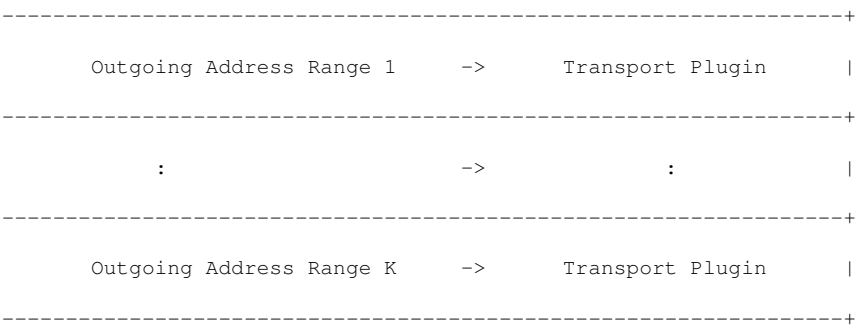
RTI Connext requires that every transport plugin instance must specify the **NDDS_Transport_Property_t::message_size_max** (p. 1789) and **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).

It is up to the transport plugin developer to make these available for configuration to transport plugin user.

Note that it is important that the instance attributes are "compatible" between the sending side and the receiving side of communicating applications using different instances of a transport plugin class. For example, if one side is configured to send messages larger than can be received by the other side, then communications via the plugin may fail.

6.25.7 Transport Network Address

The address bits not used by the transport plugin for its internal addressing constitute its network address bits.



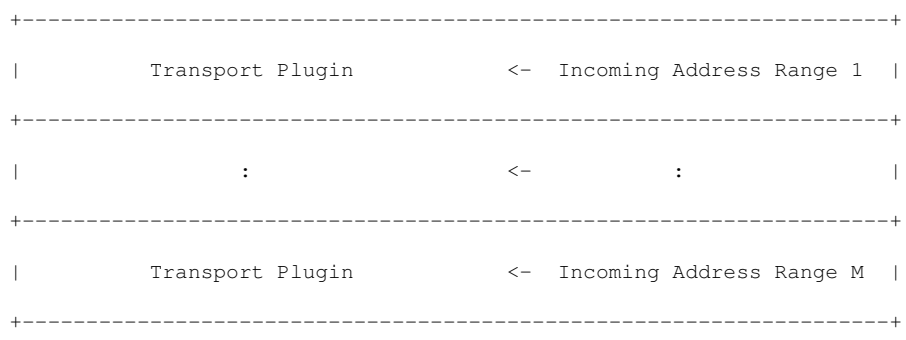
In order for RTI Connext to properly route the messages, each unicast interface in the RTI Connext *domain* must have a unique address. RTI Connext allows the user to specify the value of the network address when installing a transport plugin via the Transport_Support::register_transport() API.

The network address for a transport plugin should be chosen such that the resulting fully qualified 128-bit address will be unique in the RTI Connext domain. Thus, if two instances of a transport plugin are registered with a **dds::domain↩ ::DomainParticipant** (p. 1326), they will be at different network addresses in order for their unicast interfaces to have unique fully qualified 128-bit addresses. It is also possible to create multiple transports with the same network address, as it can be useful for certain use cases; note that this will require special entity configuration for most transports to avoid clashes in resource use (e.g. sockets for UDPv4 transport).

6.25.8 Transport Send Route

By default, a transport plugin is configured to send outgoing messages destined to addresses in the network address range at which the plugin was registered.

RTI Connext allows the user to configure the routing of outgoing messages via the Transport_Support::add_send_↩ route() API, so that a transport plugin will be used to send messages only to certain ranges of destination addresses. The method can be called multiple times for a transport plugin, with different address ranges.



The user can set up a routing table to restrict the use of a transport plugin to send messages to selected addresses ranges.

6.25.9 Transport Receive Route

By default, a transport plugin is configured to receive incoming messages destined to addresses in the network address range at which the plugin was registered.

RTI Connext allows the user to configure the routing of incoming messages via the Transport_Support::add_receive↩ _route() API, so that a transport plugin will be used to receive messages only on certain ranges of addresses. The method can be called multiple times for a transport plugin, with different address ranges.

The user can set up a routing table to restrict the use of a transport plugin to receive messages from selected ranges. For example, the user may restrict a transport plugin to

- receive messages from a certain multicast address range.
- receive messages only on certain unicast interfaces (when multiple unicast interfaces are available on the transport plugin).

6.26 Installing Transport Plugins

Installing and configuring transports used by RTI Connext.

Installing and configuring transports used by RTI Connext.

There is more than one way to install a transport plugin for use with RTI Connext:

- If it is a builtin transport plugin, by specifying a bitmask in **rti::core::policy::TransportBuiltin** (p. 2533) (see **Built-in Transport Plugins** (p. 83))
- For all other non-builtin transport plugins, by dynamically loading the plugin through **PROPERTY** (p. 541) QoS policy settings of **dds::domain::DomainParticipant** (p. 1326) (only supported on architectures that support dynamic libraries, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 81))

The lifecycle of the transport plugin is automatically managed by RTI Connext. See **Transport Lifecycle** (p. 76) for details.

6.26.1 Loading Transport Plugins through Property QoS Policy of Domain Participant

On architectures that support dynamic libraries, a non-builtin transport plugin written in C/C++ and built as a dynamic-link library (∗.dll/∗.so) can be loaded by RTI Connext through the **PROPERTY** (p. 541) QoS policy settings of the **dds::domain::DomainParticipant** (p. 1326).

Dynamic libraries are supported on all architectures except INTEGRITY and certain VxWorks platforms. For VxWorks, dynamic libraries are only supported for architectures that are on Pentium/Arm CPUs AND use kernel mode.

The dynamic-link library (and all the dependent libraries) need to be in the library search path during runtime (in the **LD_LIBRARY_PATH** environment variable on Linux systems, DYLD_LIBRARY_PATH on macOS systems, or **Path** on Windows systems).

To allow dynamic loading of the transport plugin, the transport plugin must implement the RTI Connext abstract transport API and must provide a function with the signature Transport_create_plugin that can be called by RTI Connext to create an instance of the transport plugin. The name of the dynamic library that contains the transport plugin implementation, the name of the function and properties that can be used to create the plugin, and the aliases and network address that are used to register the plugin can all be specified through the **PROPERTY** (p. 541) QoS policy of the **dds::domain::DomainParticipant** (p. 1326).

The following table lists the property names that are used to load the transport plugins dynamically:

Table 6.5 ***Properties for dynamically loading and registering transport plugins***

Property Name	Description	Required?
dds.transport.load_plugins	Comma-separated strings indicating the prefix names of all plugins that will be loaded by RTI Connext. Up to 8 plugins may be specified. For example, "dds.transport.TCPv4.tcp1, dds.transport.TCPv4.tcp2", In the following examples, <TRANSPORT_PREFIX> is used to indicate one element of this string that is used as a prefix in the property names for all the settings that are related to the plugin. <TRANSPORT_PREFIX> must begin with "dds.transport." (such as "dds.transport.mytransport").	**YES**
<TRANSPORT_PREFIX>.library	Should be set to the name of the dynamic library (∗.so for Linux systems, ∗.dylib for macOS systems, and ∗.dll for Windows systems) that contains the transport plugin implementation. This library (and all the other dependent dynamic libraries) needs to be in the library search path used by RTI Connext during run time (pointed to by the environment variable **LD_LIBRARY_PATH** on Linux systems, DYLD_LIBRARY_PATH on macOS systems, or **Path** on Windows systems).	**YES**
<TRANSPORT_PREFIX>.create_function	Should be set to the name of the function with the prototype of Transport_create_plugin that can be called by RTI Connext to create an instance of the plugin. The resulting transport plugin will then be registered by RTI Connext through Transport_Support::register_transport	**YES**

Property Name	Description	Required?
<TRANSPORT_PREFIX>.aliases	Used to register the transport plugin returned by Transport_create_plugin (as specified by <**TRANSPORT_PREFIX**>**.create_function**) to the **dds::domain::DomainParticipant** (p. 1326). Refer to **aliases_in** parameter in Transport_↩ Support::register_transport for details. Aliases should be specified as a comma-separated string, with each comma delimiting an alias. If it is not specified, <TRANSPORT_PREFIX> – without the leading "dds.transport" – is used as the default alias for the plugin.	NO
<TRANSPORT_PREFIX>.network_address	Used to register the transport plugin returned by Transport_create_plugin (as specified by <**TRANSPORT_PREFIX**>**.create_function**) to the **dds::domain::DomainParticipant** (p. 1326). Refer to **network_address_in** parameter in Transport_Support::register_transport for details. If it is not specified, the **network_address_out** output parameter from Transport_create_plugin is used. The default value is a zeroed out network address.	NO
<TRANSPORT_PREFIX>.<property_name>	Property that is passed into Transport_↩ create_plugin (as specified by <**TRANSPORT**↩ **_PREFIX**>**.create_function**) for creating the transport plugin. This property name-value pair will be passed to Transport_create_plugin after stripping out <TRANSPORT_PREFIX> from the property name. The parsing of this property and configuring the transport using this property should be handled by the implementation of each transport plugin. Multiple <TRANSPORT↩ _PREFIX>.<property_name> can be specified. Note: "library", "create_function", "aliases" and "network_address" cannot be used as the <property_name> due to conflicts with other builtin property names.	NO

A transport plugin is dynamically created and registered to the **dds::domain::DomainParticipant** (p. 1326) by RTI Connext when:

- the **dds::domain::DomainParticipant** (p. 1326) is enabled,
- the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**dds::sub::find** (p. 672)),

whichever happens first.

Any changes to the transport plugin related properties in the **PROPERTY** (p. 541) QoS policy after the transport plugin has been registered with the **dds::domain::DomainParticipant** (p. 1326) will have no effect.

6.27 Built-in Transport Plugins

Transport plugins delivered with RTI Connext.

Modules

- **UDP Transport Plugin definitions**

  UDP Transport Plugin definitions.
- **Shared Memory Transport**

  Built-in transport plug-in for inter-process communications using shared memory.
- **UDPv4 Transport**

  Transport plug-in using UDP/IPv4.
- **Real-Time WAN Transport**

  Transport plug-in using UDP/IPv4 for WAN communications..
- **UDPv6 Transport**

  Transport plug-in using UDP/IPv6.

6.27.1 Detailed Description

Transport plugins delivered with RTI Connext.

The **TRANSPORT_BUILTIN** (p. 548) specifies the collection of transport plugins that can be automatically configured and managed by RTI Connext as a convenience to the user.

These transport plugins can simply be turned "on" or "off" by a specifying a bitmask in **rti::core::policy::Transport↩ Builtin** (p. 2533), thus bypassing the steps for setting up a transport plugin. RTI Connext preconfigures the transport plugin properties, the network address, and the aliases to "factory defined" values.

If a builtin transport plugin is turned "on" in **rti::core::policy::TransportBuiltin** (p. 2533), the plugin is implicitly created and registered to the corresponding **dds::domain::DomainParticipant** (p. 1326) by RTI Connext when:

- the **dds::domain::DomainParticipant** (p. 1326) is enabled,
- the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**dds::sub::find** (p. 672)),

whichever happens first.

Each builtin transport contains its own set of properties. For example, the UDPv4Transport allows the application to specify whether or not multicast is supported, the maximum size of the message, and provides a mechanism for the application to filter out network interfaces.

The builtin transport plugin properties can be changed by the method Transport_Support::set_builtin_transport_↩ property() or by using the **PROPERTY** (p. 541) QoS policy associated with the **dds::domain::DomainParticipant** (p. 1326). Builtin transport plugin properties specified in **rti::core::policy::Property** (p. 1969) always overwrite the ones specified through Transport_Support::set_builtin_transport_property(). Refer to the specific builtin transport for the list of property names that can be specified through **PROPERTY** (p. 541) QoS policy.

Any changes to the builtin transport properties after the builtin transports have been registered with will have no effect.

Transport_Support::set_builtin_transport_property() **rti::core::policy::Property** (p. 1969)

6.28 Creating New Transport Plugins

Developing new transport plugins for RTI Connext.

Developing new transport plugins for RTI Connext.

RTI Connext provides an abstract "C" language API for creating new transport plugins. If you are interested in creating a new transport plugin for RTI Connext, please contact your RTI representative or email `sales@rti.com`.

6.29 Queries and Filters Syntax

6.29.1 Syntax for DDS Queries and Filters

A subset of the WHERE clause in SQL is used in several parts of the specification:

- The `filter_expression` in the **dds::topic::ContentFilteredTopic** (p. 954)
- The `query_expression` in the **dds::sub::cond::QueryCondition** (p. 2059)
- <<***extension***>> *(p. 354)* The `filter_expression` in the **rti::sub::TopicQuerySelection** (p. 2526)
- <<***extension***>> *(p. 354)* The `filter_expression` in the **rti::core::ChannelSettings** (p. 921)

Those expressions may use a subset of SQL, extended with the possibility to use program variables in the SQL expression. The allowed SQL expressions are defined with the BNF-grammar below.

The following notational conventions are made:

- *NonTerminals* are typeset in italics.
- `'Terminals'` are quoted and typeset in a fixed width font. They are written in upper case in most cases in the BNF-grammar below, but should be case insensitive.
- **TOKENS** are typeset in bold.
- The notation (*element* // ',') represents a non-empty comma-separated list of *elements*.

6.29.2 SQL grammar in BNF

```
FilterExpression ::=  Condition
Condition   ::=  Predicate
           |    Condition  'AND'  Condition
           |    Condition  'OR'  Condition
           |    'NOT'  Condition
           |    '('  Condition  ')'
Predicate   ::=  ComparisonPredicate
           |    BetweenPredicate
ComparisonPredicate ::=  ComparisonTerm  RelOp  ComparisonTerm
ComparisonTerm      ::= FieldIdentifier
                   |  Parameter
BetweenPredicate    ::=  FieldIdentifier  'BETWEEN'  Range
                   |    FieldIdentifier  'NOT BETWEEN'  Range
FieldIdentifier      ::= FIELDNAME
                   | IDENTIFIER
RelOp     ::=  '=' |  '>' |  '>=' |  '<' |  '<=' |  '<>' |  'LIKE' |  'MATCH'
Range     ::=  Parameter  'AND'  Parameter
Parameter ::= INTEGERVALUE
         |   CHARVALUE
         |   FLOATVALUE
         |   STRING
         |   ENUMERATEDVALUE
         |   BOOLEANVALUE
         |   NULLVALUE
         |   PARAMETER
```

6.29.3 Token expression

The syntax and meaning of the tokens used in the SQL grammar is described as follows:

- **IDENTIFIER** - An identifier for a FIELDNAME, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

```
IDENTIFIER:  LETTER ( PART_LETTER)*
where  LETTER: [ "A"-"Z","_","a"-"z" ]
       PART_LETTER: [ "A"-"Z","_","a"-"z","0"-"9" ]
```

- **FIELDNAME** - A fieldname is a reference to a field in the data structure. The dot '.' is used to navigate through nested structures. The number of dots that may be used in a FIELDNAME is unlimited. The FIELDNAME can refer to fields at any depth in the data structure. The names of the field are those specified in the IDL definition of the corresponding structure, which may or may not match the fieldnames that appear on the language-specific (e.g., C/C++, Java) mapping of the structure. To reference to the *n*+1 element in an array or sequence, use the notation '[*n*]', where *n* is a natural number (zero included). FIELDNAME must resolve to a primitive IDL type; that is either boolean, octet, (unsigned) short, (unsigned) long, (unsigned) long long, float double, char, wchar, string, wstring, or enum.

Formal notation:

```
FIELDNAME:  FieldNamePart ( "."  FieldNamePart )*
where  FieldNamePart : IDENTIFIER ( "["  Index "]" )*
       Index> : (["0"-"9"])+
              | ["0x","0X"](["0"-"9", "A"-"F", "a"-"f"])+
```

Primitive IDL types referenced by FIELDNAME are treated as different types in *Predicate* according to the following table:

Predicate Data Type	IDL Type
BOOLEANVALUE	boolean
INTEGERVALUE	octet, (unsigned) short, (unsigned) long, (unsigned) long long
FLOATVALUE	float, double
CHARVALUE	char, wchar
STRING	string, wstring
ENUMERATEDVALUE	enum

- **INTEGERVALUE** - Any series of digits, optionally preceded by a plus or minus sign, representing a decimal integer value within the range of the system. 64-bit integers (int64 and uint64) must be followed by either l or L, otherwise the value is treated as a 32-bit integer. A hexadecimal number is preceded by 0x and must be a valid hexadecimal expression.

Formal notation:

```
INTEGERVALUE : (["+","-"])? (["0"-"9"])+ [("L","l")]?
             | (["+","-"])? ["0x","0X"](["0"-"9", "A"-"F", "a"-"f"])+ [("L","l")]?
```

- **CHARVALUE** - A single character enclosed between single quotes.

Formal notation:

```
CHARVALUE : "'" (~["'"])? "'"
```

- **FLOATVALUE** - Any series of digits, optionally preceded by a plus or minus sign and optionally including a floating point ('.'). A power-of-ten expression may be postfixed, which has the syntax e*n* or E*n*, where *n* is a number, optionally preceded by a plus or minus sign.

Formal notation:

```
FLOATVALUE : (["+","-"])? (["0"-"9"])* (".")? (["0"-"9"])+ ( EXPONENT)?
where  EXPONENT: ["e","E"] (["+","-"])? (["0"-"9"])+
```

- **STRING** - Any series of characters encapsulated in single quotes, except the single quote itself.

Formal notation:

```
STRING : "'" (~["'"])* "'"
```

- **ENUMERATEDVALUE** - An enumerated value is a reference to a value declared within an enumeration. Enumerated values consist of the name of the enumeration label enclosed in single quotes. The name used for the enumeration label must correspond to the label names specified in the IDL definition of the enumeration.

Formal notation:

```
ENUMERATEDVALUE : "'" ["A" - "Z", "a" - "z"] ["A" - "Z", "a" - "z", "_", "0" - "9"]* "'"
```

- **BOOLEANVALUE** - Can either be 'TRUE' or 'FALSE', case insensitive.

Formal notation (case insensitive):

```
BOOLEANVALUE : ["TRUE","FALSE"]
```

- **NULLVALUE** - Can be null, and is case insensitive.

Formal notation (case insensitive):

```
NULLVALUE : "null"
```

- **PARAMETER** - A parameter is of the form %*n*, where *n* represents a natural number (zero included) smaller than 100. It refers to the n + 1 th argument in the given context. Argument can only in primitive type value format. It cannot be a FIELDNAME.

Formal notation:

```
PARAMETER : "%" (["0"-"9"])+
```

6.29.4 String Parameters

Strings used as parameter values must contain the enclosing quotation marks (') within the parameter value, and not place the quotation marks within the expression statement. For example, the following expression is legal:

```
" symbol MATCH %0 " with parameter 0 = " 'IBM' "
```

whereas the following expression will not compile:

```
" symbol MATCH '%0' " with parameter 0 = " IBM "
```

6.29.5 Type compatability in Predicate

Only certain combination of type comparisons are valid in *Predicate*. The following table marked all the compatible pairs with 'YES':

	BOOLEANVALUE	INTEGERVALUE	FLOATVALUE	CHARVALUE	STRING	ENUMERATEDVALUE
BOOLEAN	YES					
INTEGERVALUE		YES	YES			
FLOATVALUE		YES	YES			
CHARVALUE				YES	YES	YES
STRING				YES	YES(∗1)	YES
ENUMERATEDVALUE		YES		YES(∗2)	YES(∗2)	YES(∗3)

- (∗1) See **SQL Extension: Regular Expression Matching** (p. 88)
- (∗2) Because the formal notation of the Enumeration values, they are compatible with string and char literals, but they are not compatible with string or char variables, i.e., "MyEnum='EnumValue'" would be correct, but "My↩ Enum=MyString" is not allowed.
- (∗3) Only for same type Enums.

6.29.6 SQL Extension: Regular Expression Matching

The relational operator MATCH may only be used with string fields. The right-hand operator is a string *pattern*. A string pattern specifies a template that the left-hand field value must match. The characters ,/\?∗[]-^!% have special meanings unless they are escaped by the escape character '\'.

MATCH is case-sensitive.

The pattern allows limited "wild card" matching under the following rules:

Character	Meaning
,	"," separates a list of alternate patterns. The field string is matched if it matches one or more of the patterns.
/	"/" in the pattern string matches a / in the field string. This character is used to separate a sequence of mandatory substrings.
?	"?" in the pattern string matches any single *non-special* characters in the field string.
∗	"∗" in the pattern string matches 0 or more *non-special* characters in field string.
[*charlist*]	Matches any one of the characters from the list of characters in *charlist*.
[*s-e*]	Matches any character any character from *s* to *e*, inclusive.
%	"%" is used to designate filter expressions parameters.
[!*charlist*] or [^*charlist*]	Matches any characters not in *charlist* (not supported).
[!*s-e*] or [^*s-e*]	Matches any characters not in the interval [s-e] (not supported).
\	Escape character for special characters.

The syntax is similar to the POSIX fnmatch syntax (1003.2-1992 section B.6). The MATCH syntax is also similar to the 'subject' strings of TIBCO Rendezvous.

Note: To use special characters as regular characters in regular expressions, you must escape them using the character '\'. For example, 'A[' is considered a malformed expression and the result is undefined.

6.29.7 Character Encoding

The default encoding for IDL strings is UTF-8. RTI Connext offers ISO 8859-1 as an alternative encoding for IDL strings.

In order to configure ISO 8859-1 as the encoding for filtering of IDL strings, you can set the DomainParticipant property **dds.domain_participant.filtering_character_encoding** to ISO-8859:

The possible values for **dds.domain_participant.filtering_character_encoding** are:

- **UTF-8** (default value)
- **ISO-8859-1**

6.29.8 Unicode Normalization

Unicode supports multiple ways to encode some characters, most notably accented characters. A composed character in Unicode can often have a number of different ways of representing the character. For example:

- Precomposed is represented by \u1e3c
- Composed = L + ^ is represented by \u004c + \u032d

The lexical comparison of the two characters above will return false. In order to do the correct comparison the characters need to be normalized, that is, reduced to the same character composition.

When the character encoding for filtering of IDL strings is UTF-8, the Unicode normalization behavior can be controlled using a DomainParticipant property called **dds.domain_participant.filtering_unicode_normalization**.

The possible values of the normalization property are:

- **OFF**: Disables normalization
- **NFD**: Canonical Decomposition
- **NFC (default value)**: Canonical Decomposition, followed by Canonical Composition
- **NFK**: Compatibility Decomposition, followed by Canonical Composition
- **NFKC_Casefold**: Casefold followed by NFKC normalization

Because normalization may affect performance, and it is enabled by default, the property allows disabling the normalization process per DomainParticipant using the value OFF. However, you should be aware that doing this may lead to unexpected behavior.

6.29.9 Examples

Assuming Topic "Location" has as an associated type a structure with fields "flight_id, x, y, z", and Topic "FlightPlan" has as fields "flight_id, source, destination". The following are examples of using these expressions.

Example of a **filter_expression** (for **dds::topic::ContentFilteredTopic** (p. 954)) or a **query_expression** (for **dds::sub::cond::QueryCondition** (p. 2059)):

- `"z < 1000 AND x < 23"`

Examples of a **filter_expression** using **MATCH** (for **dds::topic::ContentFilteredTopic** (p. 954)) operator:

- `"symbol MATCH 'NASDAQ/GOOG'"`
- `"symbol MATCH 'NASDAQ/[A-M]*'"`

6.30 Logging and Version

APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connext.

Modules

- **Logging**

  Configure how much debugging information is reported during runtime and where it is logged.
- **Version**

  Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

6.30.1 Detailed Description

APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connext.

6.31 General Utilities and Compliance Configuration

API of general utilities used in the RTI Connext distribution.

Modules

- **Compliance Configuration**

  APIs to configure compliance with certain standard specifications.
- **Discovery Snapshot**

  Utilities to print discovery snapshots of DDS entities.
- **Network Capture**

  Save network traffic into a capture file for further analysis.
- **Heap Monitoring**

  Monitor memory allocations done by the middleware on the native heap.
- **Other Utilities**

  *Other Utilities, such as **rti::util::spin()** (p. 597)*

6.31.1 Detailed Description

API of general utilities used in the RTI Connext distribution.

6.32 Observability Framework

RTI Connext Observability Framework modules and APIs.

Modules

- **Monitoring Library 2.0**

  RTI Monitoring Library 2.0 public API.

6.32.1 Detailed Description

RTI Connext Observability Framework modules and APIs.

RTI Connext Observability Framework is a holistic solution that uses telemetry data to provide deep visibility into the current and past states of your RTI Connext applications.

6.33 Request-Reply Pattern

Support for the request-reply communication pattern.

Modules

- **Requester**

  rti::request::Requester *(p. 2187) and associated elements*
- **Replier**

  rti::request::Replier *(p. 2168), SimpleReplier and associated elements*

6.33.1 Detailed Description

Support for the request-reply communication pattern.

There are two basic entities that enable this pattern:

- **rti::request::Requester** (p. 2187)
- **rti::request::Replier** (p. 2168) (and a simpler version SimpleReplier)

This functionality is built on top of RTI Connext.

A Requester publishes a request topic and subscribes to a reply topic. A Replier subscribes to the request topic and publishes the reply topic.

You can find more information about this pattern in `Request-Reply`, in the Core Libraries User's Manual.

See also

Request-Reply Examples (p. 344).

6.34 Requester

rti::request::Requester (p. 2187) and associated elements

Classes

- class **rti::request::Requester**< **RequestType, ReplyType** >

  <<***reference-type***>> *(p. 351) Allows sending requests and receiving replies*
- class **rti::request::RequesterParams**

  Contains the parameters for creating a ***rti::request::Requester*** *(p. 2187).*

6.34.1 Detailed Description

rti::request::Requester (p. 2187) and associated elements

6.35 Replier

rti::request::Replier (p. 2168), SimpleReplier and associated elements

Classes

- class **rti::request::Replier**< **RequestType, ReplyType** >
  <<***reference-type***>> *(p. 351) Allows receiving requests and sending replies*
- class **rti::request::ReplierListener**< **RequestType, ReplyType** >
  *Called when a **Replier** (p. 2168) has new available requests.*
- class **rti::request::ReplierParams**
  *Contains the parameters for creating a **rti::request::Replier** (p. 2168).*
- class **rti::request::SimpleReplier**< **RequestType, ReplyType** >
  <<***reference-type***>> *(p. 351) A callback-based replier*

6.35.1 Detailed Description

rti::request::Replier (p. 2168), SimpleReplier and associated elements

6.36 Queuing Pattern

Support for the queuing communication pattern.

Modules

- **QueueProducer**
  QueueProducer and associated elements .
- **QueueConsumer**
  QueueConsumer and associated elements .
- **QueueRequester**
  QueueRequester and associated elements .
- **QueueReplier**
  QueueReplier and associated elements .

6.36.1 Detailed Description

Support for the queuing communication pattern.

The queuing communication patterns provides a load-balancing communication model in which a sample sent by a QueueProducer is received exactly by one QueueConsumer.

This pattern requires running RTI Queuing Service.

If there are no QueueConsumers available when the sample is sent, the sample will be stored in a SharedReaderQueue hosted by RTI Queuing Service until a QueueConsumer is available to process the sample.

If a QueueConsumer receives a sample and does not acknowledge it before a specified amount of time or it acknowledges it negatively, the sample will be redelivered to a different QueueConsumer.

A SharedReaderQueue is the result of the association of a Topic with a SharedSubscriber, where a SharedSubscriber is a container that hosts SharedReaderQueues within RTI Queuing Service.

The queuing API implements four basic entities:

- QueueProducer
- QueueConsumer
- QueueRequester
- QueueReplier

Note

It is possible to include all the Queuing API at once with `#include <rti/queuing/rtiqueuing.hpp>` or by including each header file individually.

A QueueProducer sends samples to a Queuing Service instance, which stores them in a SharedReaderQueue.

A QueueConsumer receives samples from a SharedReaderQueue hosted by a Queuing Service instance.

QueueProducers and QueueConsumers do not communicate directly; they need the mediation of Queuing Service.

QueueProducers and QueueConsumers communicate with Queuing Service using different Topics.

A QueueProducer has an underlying DataWriter that publishes samples on Topic 'aTopicName'. This is the SharedReaderQueue Topic.

A QueueConsumer has an underlying DataReader that receives samples on Topic 'aTopicName@aSharedSubscriberName'.

QueueProducer and QueueConsumer are simple components that provide basic queuing communication in one direction: from QueueProducer to QueueConsumer.

The RTI Connext DDS Queuing API also supports the request-reply use case, in which samples sent by a QueueRequester are expected to generate a reply from the QueueReplier that consumed the request.

The QueueReplier produces a reply for each request that it consumes. Queuing Service correlates and delivers that reply to the QueueRequester that produced the request.

QueueRequester and QueueReplier are the components that provide the request-reply functionality. QueueRequesters and QueueRepliers do not communicate directly. They always require the mediation of Queuing Service:

- A QueueRequester sends requests to a request SharedReaderQueue and receives a reply for each request from a reply SharedReaderQueue.
- A QueueReplier receives requests from a request SharedReaderQueue and sends a reply for each request to a reply SharedReaderQueue.

QueueRequesters and QueueRepliers communicate with Queuing Service through regular SharedReaderQueues. The communication from a QueueRequester to a QueueReplier is identical to the basic queuing use-case for Producers and Consumers. The communication from a QueueReplier to a QueueRequester is also similar, with the key difference that replies from the reply SharedReaderQueue are only delivered to the QueueRequester that originally sent the associated request.

The queuing request-reply pattern can also be implemented by using the simple QueueProducer and QueueConsumer components. In this case, your application must create the necessary QueueProducers and QueueConsumers to communicate with the request and reply SharedReaderQueues, as well as perform the correlation of the request and reply samples.

All the available entities and associated infrastructure are built on top of RTI Connext. You can find detailed information about this pattern and the DDS mapping in the RTI Queuing Service User's Manual.

6.37 QueueProducer

QueueProducer and associated elements .

Classes

- class **rti::queuing::QueueProducerParams**

  *Contains the parameters for creating a **QueueProducer** (p. 2080).*
- class **rti::queuing::QueueProducer**< **T** >

  Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service.
- class **rti::queuing::QueueProducerListener**< **T** >

  *Called when certain events occur in a **QueueProducer** (p. 2080).*
- class **rti::queuing::NoOpQueueProducerListener**< **T** >

  A listener with an empty implementation of all methods.

6.37.1 Detailed Description

QueueProducer and associated elements .

6.38 QueueConsumer

QueueConsumer and associated elements .

Classes

- class **rti::queuing::QueueConsumer< T >**

  Allows you to receive samples from a SharedReaderQueue.
- class **rti::queuing::QueueConsumerListener< T >**

  *Called when certain events occur in a **QueueConsumer** (p. 2063).*
- class **rti::queuing::NoOpQueueConsumerListener< T >**

  A listener with an empty implementation of all methods.
- class **rti::queuing::QueueConsumerParams**

  *Contains the parameters for creating a **QueueConsumer** (p. 2063).*
- class **rti::queuing::ConsumerAvailabilityParams**

  Definition of the availability feedback information that can be provided by consumers to Queuing Service.

6.38.1 Detailed Description

QueueConsumer and associated elements .

6.39 QueueRequester

QueueRequester and associated elements .

Classes

- class **rti::queuing::QueueRequesterParams**

  *Contains the parameters for creating a **QueueRequester** (p. 2111).*
- class **rti::queuing::QueueRequester< TReq, TRep >**

  Allows sending requests and receiving replies.
- class **rti::queuing::QueueRequesterListener< TReq, TRep >**

  *Called when certain events occur in a **QueueRequester** (p. 2111).*
- class **rti::queuing::NoOpQueueRequesterListener< TReq, TRep >**

  A listener with an empty implementation of all methods.

6.39.1 Detailed Description

QueueRequester and associated elements .

6.40 QueueReplier

QueueReplier and associated elements .

Classes

- class **rti::queuing::QueueReplierParams**

  *Contains the parameters for creating a **QueueReplier** (p. 2094).*
- class **rti::queuing::QueueReplier< TReq, TRep >**

  Allows receiving requests and sending replies.
- class **rti::queuing::QueueReplierListener< TReq, TRep >**

  *Called when certain events occur in a **QueueReplier** (p. 2094).*
- class **rti::queuing::NoOpQueueReplierListener< TReq, TRep >**

  A listener with an empty implementation of all methods.

6.40.1 Detailed Description

QueueReplier and associated elements .

6.41 Remote Procedure Call

Remote Procedure call (RPC) communication pattern.

Modules

- **Client-side API**

  Part of the RPC API that relates to the client.
- **Server-side API**

  *Part of the RPC API that relates to the **Server** (p. 2346) and **ServiceEndpoint** (p. 2354).*

Classes

- class **dds::rpc::RemoteUnknownOperationError**

  Thrown when a Client calls an operation that doesn't exist in the Service.
- class **dds::rpc::RemoteUnsupportedOperationError**

  Thrown when a Client calls an operation that is not supported by the Service.
- class **dds::rpc::RemoteInvalidArgumentError**

  Thrown when a Client provides an invalid argument to a Service operation.
- class **dds::rpc::RemoteOutOfResourcesError**

  Thrown when the Service runs out of resources to fulfill a Client's operation.
- class **dds::rpc::RemoteUnknownExceptionError**

  Thrown when an unknown exception occurs in the Service.
- class **rpc_example::RobotControl**

  *The synchronous interface generated from the **RobotControl** (p. 97) IDL service.*
- class **rpc_example::RobotControlAsync**

  *The asynchronous interface derived from the **RobotControl** (p. 2213) service.*

6.41.1 Detailed Description

Remote Procedure call (RPC) communication pattern.

With RPC you can write client and service applications that make and process function calls according to interfaces defined in IDL. The clients and the services communicate using DDS topics.

Note

To get started follow the **RPC Tutorial** (p. 421).

The classes involved in RPC include types generated by `rtiddsgen` and supporting types in the `dds::rpc` and `rti::rpc` namespaces. This API reference assumes that an example IDL service interface is defined as follows:

```
exception WalkError {
    string<32> message;
};
exception TooFastError {
};
@final
struct Coordinates {
    int32 x;
    int32 y;
};
@service
interface RobotControl {
    Coordinates walk_to(Coordinates destination, float speed)
            raises(WalkError, TooFastError);
    float get_speed();
    attribute string<128> name;
};
```

From this IDL the following types are generated:

- **rpc_example::RobotControl** (p. 2213) (a pure-virtual abstract class)
- **rpc_example::RobotControlAsync** (p. 2215) (a pure-virtual abstract class)
- **rpc_example::RobotControlService** (p. 408) (an instantiation of **dds::rpc::ServiceEndpoint** (p. 2354))
- **rpc_example::RobotControlClient** (p. 2217) (derived from **dds::rpc::ClientEndpoint** (p. 925))

In addition, the class **dds::rpc::Server** (p. 2346) provides the execution context for one or more services.

RPC Tutorial (p. 421)

6.42 Utilities

Utilities for the RTI Connext Messaging module.

Utilities for the RTI Connext Messaging module.

Connext Messaging Utilities

6.43 Durability and Persistence

APIs related to RTI Connext Durability and Persistence.

APIs related to RTI Connext Durability and Persistence.

RTI Connext offers the following mechanisms for achieving durability and persistence:

- **Durable Writer History** (p. 99)
- **Durable Reader State** (p. 99)
- **Data Durability** (p. 100)

To use the first two features, you need a relational database, which is not included with RTI Connext. Supported databases are listed in the `Release Notes`.

The third feature, provided by RTI Persistence Service, can use the filesystem or a relational database to persist information.

These three features can be used separately or in combination.

6.43.1 Durable Writer History

This feature allows a **dds::pub::DataWriter** (p. 1138) to locally persist its local history cache so that it can survive shutdowns, crashes and restarts. When an application restarts, each **dds::pub::DataWriter** (p. 1138) that has been configured to have durable writer history automatically loads all the data in its history cache from disk and can carry on sending data as if it had never stopped executing. To the rest of the system, it will appear as if the **dds::pub::DataWriter** (p. 1138) had been temporarily disconnected from the network and then reappeared.

See also

Configuring Durable Writer History (p. 101)

6.43.2 Durable Reader State

This feature allows a **dds::sub::DataReader** (p. 976) to locally persists its state and remember the sequence numbers it has already received. When an application restarts, each **dds::sub::DataReader** (p. 976) that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the **dds::sub::DataReader** (p. 976) before the restart will will not be provided to the application again.

See also

Configuring Durable Reader State (p. 102)

6.43.3 Data Durability

This feature is a full implementation of the OMG DDS Persistence Profile. The **DURABILITY** (p. 529) QoS lets an application configure a **dds::pub::DataWriter** (p. 1138) such that the information written by the **dds::pub::DataWriter** (p. 1138) survives beyond the lifetime of the **dds::pub::DataWriter** (p. 1138). In this manner, a late-joining **dds::sub::DataReader** (p. 976) can subscribe and receive the information even after the **dds::pub::DataWriter** (p. 1138) application is no longer executing. To use this feature, you need RTI Persistence Service – an optional product that can be purchased separately.

6.43.4 Durability and Persistence Based on Virtual GUID

Every modification to the global dataspace made by a **dds::pub::DataWriter** (p. 1138) is identified by a pair (virtual GUID, sequence number).

- The virtual GUID (Global Unique Identifier) is a 16-byte character identifier associated with a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976); it is used to uniquely identify this entity in the global data space.
- The sequence number is a 64-bit identifier that identifies changes published by a specific **dds::pub::DataWriter** (p. 1138).

Several **dds::pub::DataWriter** (p. 1138) entities can be configured with the same virtual GUID. If each of these **dds::pub::DataWriter** (p. 1138) entities publishes a sample with sequence number '0', the sample will only be received once by the **dds::sub::DataReader** (p. 976) entities subscribing to the content published by the **dds::pub::DataWriter** (p. 1138) entities.

RTI Connext also uses the virtual GUID (Global Unique Identifier) to associate a persisted state (state in permanent storage) to the corresponding DDS entity.

For example, the history of a **dds::pub::DataWriter** (p. 1138) will be persisted in a database table with a name generated from the virtual GUID of the **dds::pub::DataWriter** (p. 1138). If the **dds::pub::DataWriter** (p. 1138) is restarted, it must have associated the same virtual GUID to restore its previous history.

Likewise, the state of a **dds::sub::DataReader** (p. 976) will be persisted in a database table whose name is generated from the **dds::sub::DataReader** (p. 976) virtual GUID

A **dds::pub::DataWriter** (p. 1138)'s virtual GUID can be configured using **rti::core::policy::DataWriterProtocol::virtual_guid** (p. 1212). Similarly, a **dds::sub::DataReader** (p. 976)'s virtual GUID can be configured using **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 1060).

The **dds::topic::PublicationBuiltinTopicData** (p. 1977) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428) structures include the virtual GUID associated with the discovered publication or subscription.

Refer to the `User's Manual` for additional use cases.

See also

rti::core::policy::DataWriterProtocol::virtual_guid (p. 1212) **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 1060).

6.43.5 Configuring Durable Writer History

To configure a **dds::pub::DataWriter** (p. 1138) to have durable writer history, use the **PROPERTY** (p. 541) QoS policy associated with the **dds::pub::DataWriter** (p. 1138) or the **dds::domain::DomainParticipant** (p. 1326).

Properties defined for the **dds::domain::DomainParticipant** (p. 1326) will be applied to all the **dds::pub::DataWriter** (p. 1138) objects belonging to the **dds::domain::DomainParticipant** (p. 1326), unless the property is overwritten by the **dds::pub::DataWriter** (p. 1138).

See also

rti::core::policy::Property (p. 1969)

The following table lists the supported durable writer history properties.

Table 6.9 ***Durable Writer History Properties***

Property	Description
dds.data_writer.history.plugin_name	Must be set to "dds.data_writer.history.odbc_plugin.↩ builtin" to enable durable writer history in the DataWriter. This property is required.
dds.data_writer.history.odbc_plugin.builtin.dsn	The ODBC DSN (Data Source Name) associated with the database where the writer history must be persisted. This property is required.
dds.data_writer.history.odbc_plugin.builtin.driver	This property tells RTI Connext which ODBC driver to load. If the property is not specified, RTI Connext will try to use the standard ODBC driver manager library↩ : UnixOdbc (odbc32.dll) on Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems.
dds.data_writer.history.odbc_plugin.builtin.username	Configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_writer.history.odbc_plugin.builtin.password	Configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_writer.history.odbc_plugin.builtin.shared	If set to 1, RTI Connext creates a single connection per DSN that will be shared across DataWriters within the same Publisher. If set to 0 (the default), a **dds::pub↩ ::DataWriter** (p. 1138) will create its own database connection. Default: 0
dds.data_writer.history.odbc_plugin.builtin.instance_↩ cache_max_size	These properties configure the resource limits associated with the ODBC writer history caches. To minimize the number of accesses to the database, RTI Connext uses two caches, one for samples and one for instances. The initial and maximum sizes of these caches are configured using these properties. The resource limits initial_instances, max_instances, initial_samples, max_samples and max_samples_per_instance in the **dds::core::policy::ResourceLimits** (p. 2203) are used to configure the maximum number of samples and instances that can be stored in the relational database. Default: **dds::core::policy::ResourceLimits::max_↩ instances** (p. 2206)

Property	Description
dds.data_writer.history.odbc_plugin.builtin.instance_↩ cache_init_size	See description above. Default: **dds::core::policy::↩ ResourceLimits::initial_instances** (p. 2208)
dds.data_writer.history.odbc_plugin.builtin.sample_↩ cache_max_size	See description above. Default: 32 (the minimum)
dds.data_writer.history.odbc_plugin.builtin.sample_↩ cache_init_size	See description above. Default: 32
dds.data_writer.history.odbc_plugin.builtin.restore	This property indicates whether or not the persisted writer history must be restored once the **dds::pub::↩ DataWriter** (p. 1138) is restarted. If the value is 0, the content of the database associated with the **dds::pub↩ ::DataWriter** (p. 1138) being restarted will be deleted. If the value is 1, the **dds::pub::DataWriter** (p. 1138) will restore its previous state from the database content. Default: 1
dds.data_writer.history.odbc_plugin.builtin.in_memory↩ _state	This property determines how much state will be kept in memory by the ODBC writer history in order to avoid accessing the database. When in_memory_state is equal to 1, instance_cache↩ _max_size is always equal to **dds::core::policy::↩ ResourceLimits::max_instances** (p. 2206) (it cannot be changed). In addition, the ODBC writer history will keep in memory a fixed state overhead of 24 bytes per sample. In this operating mode, the ODBC writer history provides the best performance. However, the restore operation will be slower and the maximum number of samples that the writer history can manage will be limited by the available physical memory. If in_memory_state is equal to 0, all the state will be kept in the underlying database. In this operating mode, the maximum number of samples in the writer history will not be limited by the physical memory available unless the underlying database is an in-memory database (Times↩ Ten). Default: 1

6.43.6 Configuring Durable Reader State

To configure a **dds::sub::DataReader** (p. 976) with durable reader state, use the **PROPERTY** (p. 541) QoS policy associated with the **dds::sub::DataReader** (p. 976) or **dds::domain::DomainParticipant** (p. 1326).

A property defined in the **dds::domain::DomainParticipant** (p. 1326) will be applicable to all the **dds::sub::Data↩ Reader** (p. 976) belonging to the **dds::domain::DomainParticipant** (p. 1326) unless it is overwritten by the **dds::sub↩ ::DataReader** (p. 976).

See also

rti::core::policy::Property (p. 1969)

The following table lists the supported durable reader state properties.

Table 6.10 ***Durable Reader State Properties***

Property	Description
dds.data_reader.state.odbc.dsn	The ODBC DSN (Data Source Name) associated with the database where the **dds::sub::DataReader** (p. 976) state must be persisted. This property is required.
dds.data_reader.state.filter_redundant_samples	To enable durable reader state, this property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Connext does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1.
dds.data_reader.state.odbc.driver	This property is used to indicate which ODBC driver to load. If the property is not specified, RTI Connext will try to use the standard ODBC driver manager library↩ : UnixOdbc (odbc32.dll) on Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems).
dds.data_reader.state.odbc.username	This property configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_reader.state.odbc.password	This property configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_reader.state.restore	This property indicates if the persisted **dds::sub::Data↩ Reader** (p. 976) state must be restored or not once the **dds::sub::DataReader** (p. 976) is restarted. If this property is 0, the previous state will be deleted from the database. If it is 1, the **dds::sub::DataReader** (p. 976) will restore its previous state from the database content. Default: 1
dds.data_reader.state.checkpoint_frequency	This property controls how often the reader state is stored in the database. A value of N means to store the state once every N samples. A high value will provide better performance. However, if the reader is restarted it may receive some duplicate samples. These samples will be filtered by the middleware and they will not be propagated to the application. Default: 1
dds.data_reader.state.persistence_service.request_↩ depth	This property indicates the number of most recent historical samples that the persisted **dds::sub::DataReader** (p. 976) wants to receive when it starts up. Default: 0

6.43.7 Configuring Data Durability

RTI Connext implements **dds::core::policy::DurabilityKind_def::TRANSIENT** (p. 1442) and **dds::core::policy::↩ DurabilityKind_def::PERSISTENT** (p. 1442) durability using RTI Persistence Service, available for purchase as a separate RTI product.

For more information on RTI Persistence Service, refer to the `User's Manual`, or the RTI Persistence Service API Reference HTML documentation.

DURABILITY (p. 529)

6.44 Basic QoS

QoS that are considered basic and fundamental to RTI Connext.

QoS that are considered basic and fundamental to RTI Connext.

This page lists all QoS that are considered Basic. Basic QoS are applicable to many different use cases, are widely applicable to almost any customer, and should be relatively easy to understand and set.

These are QoS policies and fields that you should be aware of even if you are not setting them today. These QoS are fundamental to DDS and to RTI Connext, and showcase RTI Connext capabilities and features.

All other Qos are applicable to a smaller subset of use cases and customers, or are finer-grained controls for a Basic QoS.

dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of durability.
dds::core::policy::Durability (p. 1433)	**writer_depth** (p. 1439)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Indicates the number of samples per instance that a durable **dds::pub::DataWriter** (p. 1138) will send to a late-joining **dds::sub::DataReader** (p. 976).
dds::core::policy::DataRepresentation (p. 1113)	**compression_settings** (p. 1117)

	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Kind of reliability.
dds::core::policy::Reliability (p. 2149)	**max_blocking_time** (p. 2153)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The maximum time a DataWriter can block on a **write()** (p. 1179) call.
dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the desired kind of destination order.
dds::core::policy::History (p. 1602)	**kind** (p. 1604)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the kind of history to be kept.
dds::core::policy::History (p. 1602)	**depth** (p. 1605)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP↩ _LAST** (p. 1607)
dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum samples the middleware can store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::↩ DataReader** (p. 976)).

dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Represents the maximum number of instances a **dds::pub::Data↩ Writer** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**initial_samples** (p. 2207)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Represents the initial samples the middleware will store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub↩ ::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**initial_instances** (p. 2208)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Represents the initial number of instances a **dds↩ ::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) will manage.
dds::core::policy::EntityFactory (p. 1527)	**autoenable_created_entities** (p. 1529)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies whether the entity acting as a factory automatically enables the instances it creates.
dds::core::policy::Lifespan (p. 1635)	**duration** (p. 1637)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Maximum duration for the data's validity.
rti::core::policy::PublishMode (p. 2013)	**kind** (p. 2016)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Publishing mode
rti::core::policy::WireProtocol (p. 2630)	**participant_id** (p. 2635)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A value used to distinguish among different participants belonging to the same domain on the same host.
rti::core::policy::TransportBuiltin (p. 2533)	**mask** (p. 2536)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the built-in transports that are registered automatically when the **dds::domain::DomainParticipant** (p. 1326) is enabled.
rti::core::policy::TransportMulticast (p. 2543)	**value** (p. 2545)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A sequence of multicast communications settings.
rti::core::policy::Discovery (p. 1265)	**initial_peers** (p. 1268)

	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.
rti::core::policy::Discovery (p. 1265)	**multicast_receive_addresses** (p. 1268)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain↩ Participant.
rti::core::policy::Discovery (p. 1265)	**accept_unknown_peers** (p. 1270)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Whether to accept a new participant that is not in the initial peers list.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_lease_duration** (p. 1279)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The liveliness lease duration for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_assert_period** (p. 1279)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The period to assert liveliness for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_announcement_period** (p. 1280)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).
rti::core::policy::DiscoveryConfig (p. 1271)	**initial_participant_announcements** (p. 1282)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of initial announcements sent when a participant is first enabled.
rti::core::policy::DiscoveryConfig (p. 1271)	**new_remote_participant_announcements** (p. 1283)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of participant announcements sent when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**min_initial_participant_announcement_period** (p. 1283)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_initial_participant_announcement_period** (p. 1284)

	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeat_period** (p. 2234)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The period at which to send heartbeats.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**fast_heartbeat_period** (p. 2235)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**late_joiner_heartbeat_period** (p. 2236)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_send_window_size** (p. 2249)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Minimum size of send window of unacknowledged samples
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_send_window_size** (p. 2250)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Maximum size of send window of unacknowledged samples
rti::core::policy::Property (p. 1969)	**value** (p. 1973)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of properties.
rti::core::policy::EntityName (p. 1530)	**name** (p. 1531)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The name of the entity.
rti::core::policy::Batch (p. 880)	**enable** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies whether or not batching is enabled.
rti::core::policy::Batch (p. 880)	**max_data_bytes** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum cumulative length of all serialized samples in a batch.

rti::core::policy::Batch (p. 880)	**max_samples** (p. 883)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum number of samples in a batch.
rti::core::QosProviderParams (p. 2049)	**string_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of strings containing a XML document to load.
rti::core::QosProviderParams (p. 2049)	**url_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of **URL groups** (p. 304) containing a set of XML documents to load.
rti::core::QosProviderParams (p. 2049)	**ignore_user_profile** (p. 2051)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file USER_QOS_PROFILES.xml in the current working directory.
rti::core::QosProviderParams (p. 2049)	**ignore_environment_profile** (p. 2052)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the value of the **NDDS_QOS_PROFILES** (p. 304).
rti::core::QosProviderParams (p. 2049)	**ignore_resource_profile** (p. 2052)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file NDDS_QOS_PROFILES.xml.
rti::config::Logger (p. 1683)	**verbosity** (p. 1685)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The verbosities at which RTI Connext diagnostic information is logged.
rti::config::Logger (p. 1683)	**category** (p. 1685)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Categories of logged messages.
rti::config::Logger (p. 1683)	**output_file** (p. 1686)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies the file to which log messages will be redirected to.
rti::config::Logger (p. 1683)	**output_file_suffix** (p. 1687)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sets the file suffix when logging to a set of files
rti::core::MonitoringEventDistributionSettings (p. 1722)	**publication_period** (p. 1726)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.

rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**polling_period** (p. 1744)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the periodic metric thread polls and publishes the periodic metrics.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**max_historical_logs** (p. 1729)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**publication_period** (p. 1732)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the logging thread publishes log messages.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**enable** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Enables the use of a dedicated **dds::domain::Domain↩ Participant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**domain_id** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**collector_initial_peers** (p. 1715)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistribution↩ Settings::dedicated_participant** (p. 1719).
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**middleware_forwarding_level** (p. 1734)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::middleware** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**security_event_forwarding_level** (p. 1734)

	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::security_event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**service_forwarding_level** (p. 1735)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::service** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**user_forwarding_level** (p. 1736)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::user** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringTelemetryData (p. 1744)	**metrics** (p. 1745)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of **rti::core::MonitoringMetricSelection** (p. 1736) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.
rti::core::MonitoringTelemetryData (p. 1744)	**logs** (p. 1746)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* **rti::core::MonitoringLoggingForwardingSettings** (p. 1733) containing the **rti::config::SyslogVerbosity** (p. 458) levels that will be forwarded for the different **rti::config::LogFacility** (p. 459).
rti::core::policy::Monitoring (p. 1706)	**enable** (p. 1708)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.
rti::core::policy::Monitoring (p. 1706)	**application_name** (p. 1709)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The name of the resource that represents this RTI Connext application.
rti::core::policy::TopicQueryDispatch (p. 2522)	**publication_period** (p. 2525)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sets the periodic interval at which samples are published.

6.45 DDS Specification QoS

QoS that are defined in one of the OMG DDS Specifications.

QoS that are defined in one of the OMG DDS Specifications.

This page lists the QoS that are included in an OMG DDS specification. The standards are listed here: https://www.omg.org/spec/category/omg-data-distribution-service/.

dds::core::policy::UserData (p. 2591)	**value** (p. 2593)
	<<***spec***>> *(p. 112)* a sequence of octets
dds::core::policy::GroupData (p. 1591)	**value** (p. 1593)
	<<***spec***>> *(p. 112)* a sequence of octets
dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The kind of durability.
dds::core::policy::DurabilityService (p. 1443)	**service_cleanup_delay** (p. 1445)
	<<***spec***>> *(p. 112)* Controls when the service is able to remove all information regarding a data instances.
dds::core::policy::DurabilityService (p. 1443)	**history_kind** (p. 1445)
	<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**history_depth** (p. 1446)
	<<***spec***>> *(p. 112)* Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1439) when recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DataRepresentation (p. 1113)	**value** (p. 1116)
	<<***spec***>> *(p. 112)* Sequence of representation identifiers.
dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)

	<<***spec***>> *(p. 112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**coherent_access** (p. 1947)
	<<***spec***>> *(p. 112)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(p. 112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::Deadline (p. 1255)	**period** (p. 1258)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Duration of the deadline period.
dds::core::policy::LatencyBudget (p. 1631)	**duration** (p. 1633)
	<<***spec***>> *(p. 112)* Duration of the maximum acceptable delay.
dds::core::policy::Ownership (p. 1899)	**kind** (p. 1904)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The kind of ownership
dds::core::policy::OwnershipStrength (p. 1906)	**value** (p. 1908)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The strength value used to arbitrate among multiple writers.
dds::core::policy::Liveliness (p. 1645)	**kind** (p. 1649)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The kind of liveliness desired.
dds::core::policy::Liveliness (p. 1645)	**lease_duration** (p. 1649)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The duration within which a **dds::pub::DataWriter** (p. 1138) must be asserted, or else it is assumed to be not alive.
dds::core::policy::TimeBasedFilter (p. 2469)	**minimum_separation** (p. 2472)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The minimum separation duration between subsequent samples.
dds::core::policy::Partition (p. 1923)	**name** (p. 1926)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* A list of partition names
dds::core::policy::Reliability (p. 2149)	**kind** (p. 2153)

	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Kind of reliability.
dds::core::policy::Reliability (p. 2149)	**max_blocking_time** (p. 2153)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The maximum time a DataWriter can block on a **write()** (p. 1179) call.
dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the desired kind of destination order.
dds::core::policy::DestinationOrder (p. 1258)	**scope** (p. 1262)
	*<<**spec**>> (p. 112)* Specifies the desired scope of the source destination order.
dds::core::policy::History (p. 1602)	**kind** (p. 1604)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the kind of history to be kept.
dds::core::policy::History (p. 1602)	**depth** (p. 1605)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607)
dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum samples the middleware can store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	*<<**spec**>> (p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::EntityFactory (p. 1527)	**autoenable_created_entities** (p. 1529)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies whether the entity acting as a factory automatically enables the instances it creates.
dds::core::policy::TransportPriority (p. 2552)	**value** (p. 2553)

	<<***spec***>> *(p. 112)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.
dds::core::policy::Lifespan (p. 1635)	**duration** (p. 1637)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Maximum duration for the data's validity.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autodispose_unregistered_instances** (p. 2661)
	<<***spec***>> *(p. 112)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **dds::pub::DataWriter** (p. 1138) unregisters from the instance by means of the unregister operations.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_samples_delay** (p. 2140)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ no_writers()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_samples_delay** (p. 2141)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ disposed()** (p. 1617).
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**kind** (p. 2565)
	<<***spec***>> *(p. 112)* Type consistency kind.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_sequence_bounds** (p. 2566)
	<<***spec***>> *(p. 112)* Controls whether sequence bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_string_bounds** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether string bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_member_names** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether member names are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**prevent_type_widening** (p. 2568)

	<<***spec***>> *(p. 112)* Controls whether type widening is allowed.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**force_type_validation** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976).
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_enum_literal_names** (p. 2569)
	<<***spec***>> *(p. 112)* Controls whether enumeration constant names are taken into consideration for type assignability.
dds::core::policy::DataTag (p. 1132)	**tags** (p. 1137)
	<<***spec***>> *(p. 112)* Sequence of data tags.

6.46 DDS Extension QoS

QoS that are RTI extensions to the DDS standard.

QoS that are RTI extensions to the DDS standard.

This page lists all of the QoS that are RTI extensions of the DDS Standard. The extension QoS complement the standard QoS specified by the OMG DDS specifications. They are provided to improve product usability and enable access to product-specific features.

rti::core::policy::Availability (p. 868)	**enable_required_subscriptions** (p. 871)
	<<***extension***>> *(p. 116)* Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::Availability (p. 868)	**max_data_availability_waiting_time** (p. 871)
	<<***extension***>> *(p. 116)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
rti::core::policy::Availability (p. 868)	**max_endpoint_availability_waiting_time** (p. 872)
	<<***extension***>> *(p. 116)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
rti::core::policy::Availability (p. 868)	**required_matched_endpoint_groups** (p. 873)
	<<***extension***>> *(p. 116)* A sequence of endpoint groups.

dds::core::policy::Durability (p. 1433)	**direct_communication** (p. 1438)
	<<***extension***>> *(p. 116)* Indicates whether or not a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) should receive samples directly from a TRANSIENT or PERSISTENT **dds::pub::DataWriter** (p. 1138)
dds::core::policy::Durability (p. 1433)	**writer_depth** (p. 1439)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Indicates the number of samples per instance that a durable **dds::pub::DataWriter** (p. 1138) will send to a late-joining **dds::sub::DataReader** (p. 976).
dds::core::policy::Durability (p. 1433)	**storage_settings** (p. 1440)
	<<***extension***>> *(p. 116)* Configures durable writer history and durable reader state.
rti::core::PersistentStorageSettings (p. 1927)	**enable** (p. 1929)
	<<***extension***>> *(p. 116)* Enables durable writer history in a **dds::pub::DataWriter** (p. 1138) and durable reader state in a **dds::sub::DataReader** (p. 976).
rti::core::PersistentStorageSettings (p. 1927)	**file_name** (p. 1929)
	<<***extension***>> *(p. 116)* The file name where the durable writer history or durable reader state will be stored.
rti::core::PersistentStorageSettings (p. 1927)	**trace_file_name** (p. 1931)
	<<***extension***>> *(p. 116)* The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
rti::core::PersistentStorageSettings (p. 1927)	**journal_kind** (p. 1932)
	<<***extension***>> *(p. 116)* Sets the journal mode of the persistent storage.
rti::core::PersistentStorageSettings (p. 1927)	**synchronization_kind** (p. 1933)
	<<***extension***>> *(p. 116)* Sets the level of synchronization with the physical disk.
rti::core::PersistentStorageSettings (p. 1927)	**vacuum** (p. 1933)
	<<***extension***>> *(p. 116)* Sets the auto-vacuum status of the storage.
rti::core::PersistentStorageSettings (p. 1927)	**restore** (p. 1934)
	<<***extension***>> *(p. 116)* Indicates if the persisted writer history or reader state must be restored.
rti::core::PersistentStorageSettings (p. 1927)	**writer_instance_cache_allocation** (p. 1934)

	<<***extension***>> *(*p. *116)* Configures the resource limits associated with the instance durable writer history cache.
rti::core::PersistentStorageSettings (p. 1927)	**writer_sample_cache_allocation** (p. 1935)
	<<***extension***>> *(*p. *116)* Configures the resource limits associated with the sample durable writer history cache.
rti::core::PersistentStorageSettings (p. 1927)	**writer_memory_state** (p. 1936)
	<<***extension***>> *(*p. *116)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
rti::core::PersistentStorageSettings (p. 1927)	**reader_checkpoint_frequency** (p. 1937)
	<<***extension***>> *(*p. *116)* Controls how often the reader state is stored into the database.
rti::core::CompressionSettings (p. 943)	**compression_ids** (p. 945)
	<<***extension***>> *(*p. *116)* Mask that represents the compression algorithms enabled.
rti::core::CompressionSettings (p. 943)	**writer_compression_level** (p. 946)
	<<***extension***>> *(*p. *116)* The level of compression to use when compressing data.
rti::core::CompressionSettings (p. 943)	**writer_compression_threshold** (p. 947)
	<<***extension***>> *(*p. *116)* The threshold, in bytes, above which a serialized sample will be eligible to be compressed.
dds::core::policy::DataRepresentation (p. 1113)	**compression_settings** (p. 1117)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Structure that contains the compression settings.
dds::core::policy::Presentation (p. 1942)	**drop_incomplete_coherent_set** (p. 1949)
	<<***extension***>> *(*p. *116)* Indicates whether or not a **dds::sub::DataReader** (p. 976) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.
dds::core::policy::Liveliness (p. 1645)	**assertions_per_lease_duration** (p. 1651)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* The number of assertions a **dds::pub::DataWriter** (p. 1138) will send during a its **dds::core::policy::Liveliness**↩ **::lease_duration** (p. 1649).
dds::core::policy::Reliability (p. 2149)	**acknowledgment_kind** (p. 2154)
	<<***extension***>> *(*p. *116)* Kind of reliable acknowledgment

dds::core::policy::Reliability (p. 2149)	**instance_state_consistency_kind** (p. 2155)
	<<***extension***>> *(p. 116)* Whether instance state consistency is enabled
dds::core::policy::Reliability (p. 2149)	**exact_reliability_kind_match** (p. 2155)
	<<***extension***>> *(p. 116)* Whether an exact reliability kind match is required for endpoint matching.
dds::core::policy::DestinationOrder (p. 1258)	**source_timestamp_tolerance** (p. 1262)
	<<***extension***>> *(p. 116)* Allowed tolerance between source timestamps of consecutive samples.
dds::core::policy::ResourceLimits (p. 2203)	**initial_samples** (p. 2207)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Represents the initial samples the middleware will store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**initial_instances** (p. 2208)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Represents the initial number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) will manage.
dds::core::policy::ResourceLimits (p. 2203)	**instance_hash_buckets** (p. 2208)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Number of hash buckets for instances.
rti::core::policy::TypeSupport (p. 2574)	**plugin_data** (p. 2575)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Value to pass into the type plugin's de-/serialization function
rti::core::policy::TypeSupport (p. 2574)	**cdr_padding_kind** (p. 2576)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Determines whether or not the padding bytes will be set to zero during CDR serialization.
rti::core::policy::PublishMode (p. 2013)	**kind** (p. 2016)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Publishing mode
rti::core::policy::PublishMode (p. 2013)	**flow_controller_name** (p. 2016)
	<<***extension***>> *(p. 116)* Name of the associated flow controller
rti::core::policy::PublishMode (p. 2013)	**priority** (p. 2017)
	<<***extension***>> *(p. 116)* Publication priority

rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_write** (p. 835)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous publishing.
rti::core::policy::AsynchronousPublisher (p. 832)	**thread** (p. 835)
	<<***extension***>> *(p. 116)* Settings of the publishing thread.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_batch** (p. 836)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous batch flushing.
rti::core::policy::AsynchronousPublisher (p. 832)	**asynchronous_batch_thread** (p. 837)
	<<***extension***>> *(p. 116)* Settings of the batch flushing thread.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_topic_query_publication** (p. 838)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable topic query publication.
rti::core::policy::AsynchronousPublisher (p. 832)	**topic_query_publication_thread** (p. 838)
	<<***extension***>> *(p. 116)* Settings of the **rti::sub::TopicQuery** (p. 2516) publication thread.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_unregistered_instances_delay** (p. 2662)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has unregistered the instance.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_disposed_instances_delay** (p. 2664)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has disposed the instance.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_instances_delay** (p. 2142)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) and there are no samples for the instance in the DataReader queue.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_instances_delay** (p. 2143)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) and there are no samples for the instance in the DataReader queue.

rti::core::policy::WireProtocol (p. 2630)	**participant_id** (p. 2635)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A value used to distinguish among different participants belonging to the same domain on the same host.
rti::core::policy::WireProtocol (p. 2630)	**rtps_host_id** (p. 2636)
	<<***extension***>> *(p. 116)* The RTPS Host ID of the domain participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_app_id** (p. 2636)
	<<***extension***>> *(p. 116)* The RTPS App ID of the domain participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_instance_id** (p. 2637)
	<<***extension***>> *(p. 116)* The RTPS Instance ID of the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::WireProtocol (p. 2630)	**rtps_well_known_ports** (p. 2638)
	<<***extension***>> *(p. 116)* Configures the RTPS well-known port mappings.
rti::core::policy::WireProtocol (p. 2630)	**rtps_reserved_port_mask** (p. 2639)
	<<***extension***>> *(p. 116)* Specifies which well-known ports to reserve when enabling the participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_auto_id_kind** (p. 2639)
	<<***extension***>> *(p. 116)* Kind of auto mechanism used to calculate the GUID prefix.
rti::core::policy::WireProtocol (p. 2630)	**compute_crc** (p. 2640)
	<<***extension***>> *(p. 116)* Adds RTPS CRC submessage to every message when this field is set to true.
rti::core::policy::WireProtocol (p. 2630)	**check_crc** (p. 2640)
	<<***extension***>> *(p. 116)* Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to true.
rti::core::policy::TransportSelection (p. 2554)	**enabled_transports** (p. 2555)
	<<***extension***>> *(p. 116)* A sequence of transport aliases that specifies the transport instances available for use by the entity.
rti::core::policy::TransportBuiltin (p. 2533)	**mask** (p. 2536)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the built-in transports that are registered automatically when the **dds::domain::DomainParticipant** (p. 1326) is enabled.

rti::core::policy::TransportUnicast (p. 2556)	**value** (p. 2558)
	<<***extension***>> *(p. 116)* A sequence of unicast communication settings.
rti::core::policy::TransportMulticastMapping (p. 2547)	**value** (p. 2549)
	<<***extension***>> *(p. 116)* A sequence of multicast communication mappings.
rti::core::policy::TransportMulticast (p. 2543)	**value** (p. 2545)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A sequence of multicast communications settings.
rti::core::policy::TransportMulticast (p. 2543)	**kind** (p. 2546)
	<<***extension***>> *(p. 116)* A value that specifies a way to determine how to obtain the multicast address.
rti::core::policy::Discovery (p. 1265)	**enabled_transports** (p. 1267)
	<<***extension***>> *(p. 116)* The transports available for use by the Discovery mechanism.
rti::core::policy::Discovery (p. 1265)	**initial_peers** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.
rti::core::policy::Discovery (p. 1265)	**multicast_receive_addresses** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain↩ Participant.
rti::core::policy::Discovery (p. 1265)	**metatraffic_transport_priority** (p. 1269)
	<<***extension***>> *(p. 116)* The transport priority to use for the Discovery meta-traffic.
rti::core::policy::Discovery (p. 1265)	**accept_unknown_peers** (p. 1270)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Whether to accept a new participant that is not in the initial peers list.
rti::core::policy::Discovery (p. 1265)	**enable_endpoint_discovery** (p. 1271)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers** (p. 1085)

	<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers_per_instance** (p. 1086)
	<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_samples_per_remote_writer** (p. 1087)
	<<***extension***>> *(p. 116)* The maximum number of out-of-order samples from a given remote **dds::pub::DataWriter** (p. 1138) that a **dds::sub::DataReader** (p. 976) may store when maintaining a reliable connection to the **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_infos** (p. 1087)
	<<***extension***>> *(p. 116)* The maximum number of info units that a **dds::sub::DataReader** (p. 976) can use to store **dds::sub::SampleInfo** (p. 2285).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_writers** (p. 1088)
	<<***extension***>> *(p. 116)* The initial number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_writers_per_instance** (p. 1089)
	<<***extension***>> *(p. 116)* The initial number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_infos** (p. 1089)
	<<***extension***>> *(p. 116)* The initial number of info units that a **dds::sub::DataReader** (p. 976) can have, which are used to store **dds::sub::SampleInfo** (p. 2285).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_outstanding_reads** (p. 1090)
	<<***extension***>> *(p. 116)* The initial number of outstanding calls to read/take (or one of their variants) on the same **dds::sub::DataReader** (p. 976) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1667).

rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_outstanding_reads** (p. 1091)
	<<***extension***>> *(p. 116)* The maximum number of outstanding read/take calls (or one of their variants) on the same **dds::sub::DataReader** (p. 976) for which memory has not been returned by calling **dds::sub::Loaned↩ Samples::return_loan()** (p. 1667).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_samples_per_read** (p. 1091)
	<<***extension***>> *(p. 116)* The maximum number of data samples that the application can receive from the middleware in a single call to **dds::sub::DataReader↩ ::read** (p. 996) or **dds::sub::DataReader::take** (p. 997). If more data exists in the middleware, the application will need to issue multiple read/take calls.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**disable_fragmentation_support** (p. 1092)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) can receive fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples** (p. 1092)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_fragmented_samples** (p. 1093)
	<<***extension***>> *(p. 116)* The initial number of samples for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples_per_remote_writer** (p. 1094)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a **dds::sub::Data↩ Reader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragments_per_sample** (p. 1094)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**dynamically_allocate_fragmented_samples** (p. 1095)
	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.

rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_total_instances** (p. 1096)
	<<***extension***>> *(p. 116)* Maximum number of instances for which a DataReader will keep state.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_virtual_writers** (p. 1097)
	<<***extension***>> *(p. 116)* The maximum number of remote virtual writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_virtual_writers** (p. 1097)
	<<***extension***>> *(p. 116)* The initial number of remote virtual writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_virtual_writers_per_instance** (p. 1098)
	<<***extension***>> *(p. 116)* The maximum number of virtual remote writers that can be associated with an instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_virtual_writers_per_instance** (p. 1099)
	<<***extension***>> *(p. 116)* The initial number of virtual remote writers per instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers_per_sample** (p. 1099)
	<<***extension***>> *(p. 116)* The maximum number of remote writers allowed to write the same sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_query_condition_filters** (p. 1100)
	<<***extension***>> *(p. 116)* The maximum number of query condition filters a reader is allowed.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_app_ack_response_length** (p. 1101)
	<<***extension***>> *(p. 116)* Maximum length of application-level acknowledgment response data
rti::core::policy::DataReaderResourceLimits (p. 1081)	**keep_minimum_state_for_instances** (p. 1101)
	<<***extension***>> *(p. 116)* Whether or not keep a minimum instance state for up to **rti::core::policy::↩ DataReaderResourceLimits::max_total_instances** (p. 1096).

rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_topic_queries** (p. 1102)
	<<***extension***>> *(p. 116)* The initial number of Topic↩ Queries allocated by a **dds::sub::DataReader** (p. 976).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_topic_queries** (p. 1103)
	<<***extension***>> *(p. 116)* The maximum number of active TopicQueries that a **dds::sub::DataReader** (p. 976) can create.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**shmem_ref_transfer_mode_attached_segment_↩ allocation** (p. 1106)
	<<***extension***>> *(p. 116)* Allocation resource for the shared memory segments attached by the **dds::sub↩ ::DataReader** (p. 976).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**instance_replacement** (p. 1106)
	<<***extension***>> *(p. 116)* Sets the kind of instances allowed to be replaced for each instance state (**dds↩ ::sub::status::InstanceState** (p. 1615)) when a Data↩ Reader reaches **dds::core::policy::ResourceLimits↩ ::max_instances** (p. 2206).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**autopurge_remote_not_alive_writer_delay** (p. 1103)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become not alive.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**lazily_allocate_batch_resources** (p. 1105)
	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::Data↩ Writer** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::↩ DataWriter** (p. 1138).

rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_reader_filters** (p. 1239)
	<<***extension***>> *(p. 116)* The maximum number of remote DataReaders for which the **dds::pub::DataWriter** (p. 1138) will perform content-based filtering.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_batches** (p. 1239)
	<<***extension***>> *(p. 116)* Represents the initial number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_batches** (p. 1240)
	<<***extension***>> *(p. 116)* Represents the maximum number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**instance_replacement** (p. 1241)
	<<***extension***>> *(p. 116)* Sets the kinds of instances allowed to be replaced when instance resource limits are reached.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**replace_empty_instances** (p. 1242)
	<<***extension***>> *(p. 116)* Whether or not to replace empty instances during instance replacement
rti::core::policy::DataWriterResourceLimits (p. 1235)	**autoregister_instances** (p. 1242)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Whether or not to automatically register new instances
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_virtual_writers** (p. 1244)
	<<***extension***>> *(p. 116)* The maximum number of virtual writers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_virtual_writers** (p. 1243)
	<<***extension***>> *(p. 116)* The initial number of virtual writers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_remote_readers** (p. 1244)
	<<***extension***>> *(p. 116)* Controls the initial memory allocation for the matched remote readers of a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_readers** (p. 1244)
	<<***extension***>> *(p. 116)* The maximum number of remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_app_ack_remote_readers** (p. 1245)

	<<***extension***>> *(p. 116)* The maximum number of application-level acknowledging remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_active_topic_queries** (p. 1246)
	<<***extension***>> *(p. 116)* Represents the initial number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_active_topic_queries** (p. 1246)
	<<***extension***>> *(p. 116)* Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**writer_loaned_sample_allocation** (p. 1247)
	<<***extension***>> *(p. 116)* Represents the allocation settings of loaned samples managed by a **dds::pub↩ ::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initialize_writer_loaned_sample** (p. 1248)
	<<***extension***>> *(p. 116)* Whether or not to initialize loaned samples returned by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterTransferMode (p. 1253)	**shmem_ref_settings** (p. 1254)
	<<***extension***>> *(p. 116)* Settings related to transferring data using shared memory references.
rti::core::policy::DataReaderProtocol (p. 1059)	**virtual_guid** (p. 1060)
	<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataReaderProtocol (p. 1059)	**rtps_object_id** (p. 1061)
	<<***extension***>> *(p. 116)* The RTPS Object ID.
rti::core::policy::DataReaderProtocol (p. 1059)	**rtps_reliable_reader** (p. 1064)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **dds::sub::DataReader** (p. 976). This parameter only has effect if the reader is configured with **dds::core::policy::ReliabilityKind_def::↩ RELIABLE** (p. 2157) **dds::core::policy::Reliability↩ Kind_def** (p. 2156).
rti::core::policy::DataReaderProtocol (p. 1059)	**expects_inline_qos** (p. 1062)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Specifies whether this DataReader expects inline QoS with every sample.
rti::core::policy::DataReaderProtocol (p. 1059)	**disable_positive_acks** (p. 1062)

	<<***extension***>> *(p. 116)* Whether the reader sends positive acknowledgements to writers.
rti::core::policy::DataReaderProtocol (p. 1059)	**propagate_dispose_of_unregistered_instances** (p. 1063)
	<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) state without being in the **dds::sub::status::InstanceState::alive()** (p. 1617) state.
rti::core::policy::DataReaderProtocol (p. 1059)	**propagate_unregister_of_disposed_instances** (p. 1064)
	<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) state directly from the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).
rti::core::policy::DataWriterProtocol (p. 1210)	**virtual_guid** (p. 1212)
	<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataWriterProtocol (p. 1210)	**rtps_object_id** (p. 1212)
	<<***extension***>> *(p. 116)* The RTPS Object ID.
rti::core::policy::DataWriterProtocol (p. 1210)	**push_on_write** (p. 1213)
	<<***extension***>> *(p. 116)* Whether to push sample out when write is called.
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_positive_acks** (p. 1214)
	<<***extension***>> *(p. 116)* Controls whether or not the writer expects positive acknowledgements from matching readers.
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_inline_keyhash** (p. 1214)
	<<***extension***>> *(p. 116)* Controls whether or not a keyhash is propagated on the wire with each sample.
rti::core::policy::DataWriterProtocol (p. 1210)	**serialize_key_with_dispose** (p. 1215)
	<<***extension***>> *(p. 116)* Controls whether or not the serialized key is propagated on the wire with dispose samples.
rti::core::policy::DataWriterProtocol (p. 1210)	**propagate_app_ack_with_no_response** (p. 1216)
	<<***extension***>> *(p. 116)* Controls whether or not a **dds::pub::DataWriter** (p. 1138) receives **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207) notifications with an empty or invalid response.

rti::core::policy::DataWriterProtocol (p. 1210)	**rtps_reliable_writer** (p. 1217)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **dds::pub::DataWriter** (p. 1138). This parameter only has effect if both the writer and the matching reader are configured with **dds::core::policy::↩ ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core↩ ::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DataWriterProtocol (p. 1210)	**initial_virtual_sequence_number** (p. 1218)
	<<***extension***>> *(p. 116)* Determines, the initial virtual sequence number for this DataWriter.
rti::core::policy::SystemResourceLimits (p. 2443)	**max_objects_per_thread** (p. 2445)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* The maximum number of objects that can be stored per thread for a DomainParticipantFactory.
rti::core::policy::SystemResourceLimits (p. 2443)	**initial_objects_per_thread** (p. 2445)
	<<***extension***>> *(p. 116)* The number of objects per thread for a DomainParticipantFactory for which infrastructure will initially be allocated.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_allocation** (p. 1398)
	<<***extension***>> *(p. 116)* Allocation settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_allocation** (p. 1398)
	<<***extension***>> *(p. 116)* Allocation settings applied to local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Publisher.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_allocation** (p. 1400)

	<<***extension***>> *(p. 116)* Allocation settings applied to remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_allocation** (p. 1401)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_allocation** (p. 1401)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_allocation** (p. 1402)
	<<***extension***>> *(p. 116)* Allocation settings applied to matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_allocation** (p. 1402)
	<<***extension***>> *(p. 116)* Allocation settings applied to matching local reader and remote/local writer pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_allocation** (p. 1403)
	<<***extension***>> *(p. 116)* Allocation settings applied to ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_allocation** (p. 1403)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_allocation** (p. 1404)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**read_condition_allocation** (p. 1404)
	<<***extension***>> *(p. 116)* Allocation settings applied to read condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**query_condition_allocation** (p. 1405)
	<<***extension***>> *(p. 116)* Allocation settings applied to query condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**outstanding_asynchronous_sample_allocation** (p. 1405)

	<<***extension***>> *(p. 116)* Allocation settings applied to the maximum number of samples (from all **dds::pub::↩ DataWriter** (p. 1138)) waiting to be asynchronously written.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_allocation** (p. 1406)
	<<***extension***>> *(p. 116)* Allocation settings applied to flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_hash_buckets** (p. 1406)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Hash_Buckets settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_hash_buckets** (p. 1407)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_hash_buckets** (p. 1407)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for local Publisher.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_hash_buckets** (p. 1408)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_hash_buckets** (p. 1408)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for local Topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_hash_buckets** (p. 1409)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_hash_buckets** (p. 1409)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_hash_buckets** (p. 1410)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_hash_buckets** (p. 1410)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local reader and remote/local writer pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for content filtered topics.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for content filters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_hash_buckets** (p. 1413)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_gather_destinations** (p. 1413)
	<<***extension***>> *(p. 116)* Maximum number of destinations per RTI Connext send.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_user_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::domain::qos::DomainParticipantQos** (p. 1384) and **dds::topic::ParticipantBuiltinTopicData** (p. 1908)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**topic_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of topic data in **dds::topic::qos::TopicQos** (p. 2509), **dds::topic::TopicBuiltinTopicData** (p. 2493), **dds::topic::PublicationBuiltinTopicData** (p. 1977) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**publisher_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::pub::qos::PublisherQos** (p. 2007) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**subscriber_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::sub::qos::SubscriberQos** (p. 2423) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::pub::qos::DataWriterQos** (p. 1226) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::sub::qos::DataReaderQos** (p. 1072) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partitions** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1923).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partition_cumulative_characters** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of combined characters allowable in all partition names in a **dds::core::policy::Partition** (p. 1923).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_code_max_serialized_length** (p. 1418)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Maximum size of serialized string for type code.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_serialized_length** (p. 1419)
	<<***extension***>> *(p. 116)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_deserialized_length** (p. 1420)
	<<***extension***>> *(p. 116)* The maximum number of bytes that a deserialized TypeObject v1 can consume.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**deserialized_type_object_dynamic_allocation_threshold** (p. 1420)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**serialized_type_object_dynamic_allocation_threshold** (p. 1421)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**contentfilter_property_max_length** (p. 1422)
	<<***extension***>> *(p. 116)* This field is the maximum length of all data related to a Content-filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_seq_max_length** (p. 1423)
	<<***extension***>> *(p. 116)* Maximum number of channels that can be specified in **rti::core::policy::MultiChannel** (p. 1749) for MultiChannel DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_filter_expression_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum length of a channel **rti::core::ChannelSettings::filter_expression** (p. 923) in a MultiChannel DataWriter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_list_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_string_max_length** (p. 1425)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_list_max_length** (p. 1425)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_string_max_length** (p. 1426)

	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_list_max_length** (p. 1426)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_string_max_length** (p. 1427)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_endpoint_groups** (p. 1427)
	<<***extension***>> *(p. 116)* Maximum number of **rti::core::EndpointGroup** (p. 1515) allowable in a **rti::core::policy::Availability** (p. 868).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_endpoint_group_cumulative_characters** (p. 1428)
	<<***extension***>> *(p. 116)* Maximum number of combined role_name characters allowed in all **rti::core::EndpointGroup** (p. 1515) in a **rti::core::policy::Availability** (p. 868).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**transport_info_list_max_length** (p. 1428)
	<<***extension***>> *(p. 116)* Maximum number of installed transports to send and receive information about in **dds::topic::ParticipantBuiltinTopicData::transport_info** (p. 1914).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_replacement_kind** (p. 1429)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **rti::core::policy::DomainParticipantResourceLimits::ignored_entity_allocation** (p. 1403) are reached.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_allocation** (p. 1429)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_hash_buckets** (p. 1430)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_data_tag_list_max_length** (p. 1431)
	<<***extension***>> *(p. 116)* Maximum number of data tags associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_data_tag_string_max_length** (p. 1431)
	<<***extension***>> *(p. 116)* Maximum string length of the data tags associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_data_tag_list_max_length** (p. 1432)
	<<***extension***>> *(p. 116)* Maximum number of data tags associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_data_tag_string_max_length** (p. 1432)
	<<***extension***>> *(p. 116)* Maximum string length of the data tags associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**shmem_ref_transfer_mode_max_segments** (p. 1433)
	<<***extension***>> *(p. 116)* Maximum number of segments created by all DataWriters belonging to a **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::Event (p. 1541)	**thread** (p. 1542)
	<<***extension***>> *(p. 116)* Event thread QoS.
rti::core::policy::Event (p. 1541)	**initial_count** (p. 1543)
	<<***extension***>> *(p. 116)* The initial number of events.
rti::core::policy::Event (p. 1541)	**max_count** (p. 1543)
	<<***extension***>> *(p. 116)* The maximum number of events.
rti::core::policy::Database (p. 969)	**thread** (p. 971)
	<<***extension***>> *(p. 116)* Database thread settings.
rti::core::policy::Database (p. 969)	**shutdown_timeout** (p. 972)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum wait time during a shutdown.
rti::core::policy::Database (p. 969)	**cleanup_period** (p. 972)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The period at which the database thread wakes up to remove deleted records.
rti::core::policy::Database (p. 969)	**shutdown_cleanup_period** (p. 973)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The clean-up period used during database shut-down.
rti::core::policy::Database (p. 969)	**initial_records** (p. 974)
	<<***extension***>> *(p. 116)* The initial number of total records.
rti::core::policy::Database (p. 969)	**max_skiplist_level** (p. 974)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum level of the skiplist.
rti::core::policy::Database (p. 969)	**initial_weak_references** (p. 975)
	<<***extension***>> *(p. 116)* The initial number of weak references.
rti::core::policy::Database (p. 969)	**max_weak_references** (p. 974)
	<<***extension***>> *(p. 116)* The maximum number of weak references.
rti::core::policy::ReceiverPool (p. 2144)	**thread** (p. 2146)
	<<***extension***>> *(p. 116)* Receiver pool thread(s).
rti::core::policy::ReceiverPool (p. 2144)	**buffer_size** (p. 2147)
	<<***extension***>> *(p. 116)* The receive buffer size in bytes.
rti::core::policy::ReceiverPool (p. 2144)	**buffer_alignment** (p. 2148)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The receive buffer alignment.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_lease_duration** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The liveliness lease duration for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_assert_period** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period to assert liveliness for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_announcement_period** (p. 1280)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).
rti::core::policy::DiscoveryConfig (p. 1271)	**remote_participant_purge_kind** (p. 1281)

	[DEPRECATED] (p. **296**) *<<**extension**>> (p. 116)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_liveliness_loss_detection_period** (p. 1281)
	[DEPRECATED] (p. **296**) *<<**extension**>> (p. 116)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
rti::core::policy::DiscoveryConfig (p. 1271)	**initial_participant_announcements** (p. 1282)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of initial announcements sent when a participant is first enabled.
rti::core::policy::DiscoveryConfig (p. 1271)	**new_remote_participant_announcements** (p. 1283)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of participant announcements sent when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**min_initial_participant_announcement_period** (p. 1283)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_initial_participant_announcement_period** (p. 1284)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_reader_resource_limits** (p. 1285)
	*<<**extension**>> (p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader** (p. 1286)
	*<<**extension**>> (p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader_resource_limits** (p. 1287)
	*<<**extension**>> (p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader** (p. 1288)
	*<<**extension**>> (p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.

rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader_resource_limits** (p. 1289)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_writer** (p. 1296)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_publish_mode** (p. 1298)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_publish_mode** (p. 1298)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**asynchronous_publisher** (p. 1299)
	<<***extension***>> *(p. 116)* Asynchronous publishing settings for the discovery **dds::pub::Publisher** (p. 1993) and all entities that are created by it.
rti::core::policy::DiscoveryConfig (p. 1271)	**default_domain_announcement_period** (p. 1300)
	<<***extension***>> *(p. 116)* The period to announce a participant to the default domain 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**ignore_default_domain_announcements** (p. 1301)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader_reliability_kind** (p. 1295)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Reliability policy for a built-in participant message reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader** (p. 1295)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind** (p. 1295) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer** (p. 1289)

	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_data_lifecycle** (p. 1291)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer** (p. 1291)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_data_lifecycle** (p. 1293)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**builtin_discovery_plugins** (p. 1293)
	<<***extension***>> *(*p. *116)* Mask of built-in discovery plugin kinds.
rti::core::policy::DiscoveryConfig (p. 1271)	**enabled_builtin_channels** (p. 1294)
	<<***extension***>> *(*p. *116)* The mask specifying which built-in channels should be enabled.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer** (p. 1301)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_data_lifecycle** (p. 1303)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_publish_mode** (p. 1303)
	<<***extension***>> *(*p. *116)* Publish mode policy for the built-in service request writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_reader** (p. 1304)
	<<***extension***>> *(*p. *116)* RTPS reliable reader protocol-related configuration settings for a built-in **rti::topic::ServiceRequest** (p. 2358) reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_lease_duration** (p. 1306)
	<<***extension***>> *(*p. *116)* The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_assert_period** (p. 1305)
	<<***extension***>> *(p. 116)* Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.
rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_change_detection_period** (p. 1306)
	<<***extension***>> *(p. 116)* Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer** (p. 1307)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer_publish_mode** (p. 1309)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_reader** (p. 1309)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**endpoint_type_object_lb_serialization_threshold** (p. 1310)
	<<***extension***>> *(p. 116)* Controls when/if the Type↩ Object v1 is compressed when propagated in Simple Endpoint Discovery.
rti::core::policy::DiscoveryConfig (p. 1271)	**dns_tracker_polling_period** (p. 1311)
	<<***extension***>> *(p. 116)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader** (p. 1312)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader_resource_limits** (p. 1313)
	<<***extension***>> *(p. 116)* Resource limits for the built-in topic participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_publish_mode** (p. 1316)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in participant configuration writer.

rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer** (p. 1314)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_data_lifecycle** (p. 1316)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**request_types_filter** (p. 1317)
	<<***extension***>> *(p. 116)* Topic name pattern for requesting all types via Type Lookup Service.
rti::core::RtpsWellKnownPorts (p. 2258)	**port_base** (p. 2262)
	<<***extension***>> *(p. 116)* The base port offset.
rti::core::RtpsWellKnownPorts (p. 2258)	**domain_id_gain** (p. 2262)
	<<***extension***>> *(p. 116)* Tunable domain gain parameter.
rti::core::RtpsWellKnownPorts (p. 2258)	**participant_id_gain** (p. 2263)
	<<***extension***>> *(p. 116)* Tunable participant gain parameter.
rti::core::RtpsWellKnownPorts (p. 2258)	**builtin_multicast_port_offset** (p. 2263)
	<<***extension***>> *(p. 116)* Additional offset for **metatraffic** multicast port.
rti::core::RtpsWellKnownPorts (p. 2258)	**builtin_unicast_port_offset** (p. 2264)
	<<***extension***>> *(p. 116)* Additional offset for **metatraffic** unicast port.
rti::core::RtpsWellKnownPorts (p. 2258)	**user_multicast_port_offset** (p. 2264)
	<<***extension***>> *(p. 116)* Additional offset for **usertraffic** multicast port.
rti::core::RtpsWellKnownPorts (p. 2258)	**user_unicast_port_offset** (p. 2265)
	<<***extension***>> *(p. 116)* Additional offset for **usertraffic** unicast port.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_heartbeat_response_delay** (p. 2223)
	<<***extension***>> *(p. 116)* The minimum delay to respond to a heartbeat.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**max_heartbeat_response_delay** (p. 2224)
	<<***extension***>> *(p. 116)* The maximum delay to respond to a heartbeat.

rti::core::RtpsReliableReaderProtocol (p. 2221)	**heartbeat_suppression_duration** (p. 2224)
	<<***extension***>> *(p. 116)* The duration a reader ignores consecutively received heartbeats
rti::core::RtpsReliableReaderProtocol (p. 2221)	**nack_period** (p. 2225)
	<<***extension***>> *(p. 116)* The period at which to send NACKs
rti::core::RtpsReliableReaderProtocol (p. 2221)	**receive_window_size** (p. 2226)
	<<***extension***>> *(p. 116)* The number of received out-of-order samples a reader can keep at a time
rti::core::RtpsReliableReaderProtocol (p. 2221)	**round_trip_time** (p. 2226)
	<<***extension***>> *(p. 116)* The duration from sending a NACK to receiving a repair of a sample
rti::core::RtpsReliableReaderProtocol (p. 2221)	**app_ack_period** (p. 2227)
	<<***extension***>> *(p. 116)* The period at which application-level acknowledgment messages are sent
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_app_ack_response_keep_duration** (p. 2227)
	<<***extension***>> *(p. 116)* Minimum duration for which application-level acknowledgment response data is kept
rti::core::RtpsReliableReaderProtocol (p. 2221)	**samples_per_app_ack** (p. 2228)
	<<***extension***>> *(p. 116)* The minimum number of samples acknowledged by one application-level acknowledgment message
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**low_watermark** (p. 2232)
	<<***extension***>> *(p. 116)* When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) is considered to have changed.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**high_watermark** (p. 2233)
	<<***extension***>> *(p. 116)* When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) is considered to have changed.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeat_period** (p. 2234)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period at which to send heartbeats.

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**fast_heartbeat_period** (p. 2235)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**late_joiner_heartbeat_period** (p. 2236)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**virtual_heartbeat_period** (p. 2237)
	<<***extension***>> *(p. 116)* The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**samples_per_virtual_heartbeat** (p. 2238)
	<<***extension***>> *(p. 116)* The number of samples that a reliable writer has to publish before sending a virtual heartbeat.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_heartbeat_retries** (p. 2239)
	<<***extension***>> *(p. 116)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**inactivate_nonprogressing_readers** (p. 2239)
	<<***extension***>> *(p. 116)* Whether to treat remote readers as inactive when their NACKs do not progress
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeats_per_max_samples** (p. 2240)
	<<***extension***>> *(p. 116)* The number of piggyback heartbeats sent per max send window.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_nack_response_delay** (p. 2242)
	<<***extension***>> *(p. 116)* The minimum delay to respond to a NACK or NACK_FRAG.

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_nack_response_delay** (p. 2242)
	<<***extension***>> *(p. 116)* The maximum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**nack_suppression_duration** (p. 2243)
	<<***extension***>> *(p. 116)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_bytes_per_nack_response** (p. 2244)
	<<***extension***>> *(p. 116)* The maximum total message size when resending rejected samples or data fragments.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_enable_adaptive_sample_↩ keep_duration** (p. 2247)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Enables dynamic adjustment of sample keep duration in response to congestion.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_min_sample_keep_duration** (p. 2245)
	<<***extension***>> *(p. 116)* The minimum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_max_sample_keep_duration** (p. 2246)
	<<***extension***>> *(p. 116)* The maximum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_decrease_sample_keep_↩ duration_factor** (p. 2248)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Controls rate of contraction of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_increase_sample_keep_↩ duration_factor** (p. 2248)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Controls rate of growth of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_send_window_size** (p. 2249)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Minimum size of send window of unacknowledged samples

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_send_window_size** (p. 2250)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Maximum size of send window of unacknowledged samples
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_update_period** (p. 2251)
	<<***extension***>> *(p. 116)* Period in which send window may be dynamically changed
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_increase_factor** (p. 2252)
	<<***extension***>> *(p. 116)* Increases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_decrease_factor** (p. 2253)
	<<***extension***>> *(p. 116)* Decreases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**enable_multicast_periodic_heartbeat** (p. 2254)
	<<***extension***>> *(p. 116)* Whether periodic heartbeat messages are sent over multicast
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**multicast_resend_threshold** (p. 2254)
	<<***extension***>> *(p. 116)* The minimum number of requesting readers needed to trigger a multicast resend
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_repair_piggyback_heartbeat** (p. 2255)
	<<***extension***>> *(p. 116)* Prevents piggyback heartbeats from being sent with repair samples
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_samples** (p. 909)
	<<***extension***>> *(p. 116)* Initial number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples** (p. 909)
	<<***extension***>> *(p. 116)* Maximum number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_infos** (p. 910)
	<<***extension***>> *(p. 116)* Initial number of sample infos.

rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_infos** (p. 911)
	<<***extension***>> *(p. 116)* Maximum number of sample infos.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_outstanding_reads** (p. 911)
	<<***extension***>> *(p. 116)* The initial number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_outstanding_reads** (p. 912)
	<<***extension***>> *(p. 116)* The maximum number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples_per_read** (p. 912)
	<<***extension***>> *(p. 116)* Maximum number of samples that can be read/taken on a same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**disable_fragmentation_support** (p. 913)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether the built-in topic **dds::sub::Data↩ Reader** (p. 976) can receive fragmented samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples** (p. 913)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the built-in topic **dds::sub::Data↩ Reader** (p. 976) may store fragments at a given point in time.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_fragmented_samples** (p. 914)
	<<***extension***>> *(p. 116)* The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples_per_remote_writer** (p. 915)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a built-in topic **dds↩ ::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragments_per_sample** (p. 916)

	<<***extension***>> *(*p. *116)* Maximum number of fragments for a single sample.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**dynamically_allocate_fragmented_samples** (p. 916)
	<<***extension***>> *(*p. *116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::TransportUnicastSettings (p. 2559)	**transports** (p. 2561)
	<<***extension***>> *(*p. *116)* A sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.
rti::core::TransportUnicastSettings (p. 2559)	**receive_port** (p. 2561)
	<<***extension***>> *(*p. *116)* The unicast port on which the entity can receive data.
rti::core::TransportMulticastSettings (p. 2549)	**transports** (p. 2550)
	<<***extension***>> *(*p. *116)* A sequence of transport aliases that specifies the transports on which to receive *multicast* traffic for the entity.
rti::core::TransportMulticastSettings (p. 2549)	**receive_address** (p. 2551)
	<<***extension***>> *(*p. *116)* The multicast group address on which the entity can receive data.
rti::core::TransportMulticastSettings (p. 2549)	**receive_port** (p. 2551)
	<<***extension***>> *(*p. *116)* The multicast port on which the entity can receive data.
rti::core::policy::MulticastMapping (p. 1747)	**addresses** (p. 1748)
	<<***extension***>> *(*p. *116)* A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive *multicast* traffic for the entity with a topic that matches the **rti::core::policy::Multicast↩ Mapping::topic_expression** (p. 1748).
rti::core::policy::MulticastMapping (p. 1747)	**topic_expression** (p. 1748)
	<<***extension***>> *(*p. *116)* A regular expression that will be used to map topic names to corresponding multicast receive addresses.
rti::core::policy::MulticastMapping (p. 1747)	**mapping_function** (p. 1749)
	<<***extension***>> *(*p. *116)* Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.
rti::core::policy::Property (p. 1969)	**value** (p. 1973)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Sequence of properties.

rti::core::policy::EntityName (p. 1530)	**name** (p. 1531)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The name of the entity.
rti::core::policy::EntityName (p. 1530)	**role_name** (p. 1532)
	*<<**extension**>> (p. 116)* The entity role name.
rti::core::policy::Service (p. 2350)	**kind** (p. 2354)
	*<<**extension**>> (p. 116)* The kind of service.
rti::core::policy::Batch (p. 880)	**enable** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies whether or not batching is enabled.
rti::core::policy::Batch (p. 880)	**max_data_bytes** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum cumulative length of all serialized samples in a batch.
rti::core::policy::Batch (p. 880)	**max_samples** (p. 883)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum number of samples in a batch.
rti::core::policy::Batch (p. 880)	**max_flush_delay** (p. 884)
	*<<**extension**>> (p. 116)* The maximum flush delay.
rti::core::policy::Batch (p. 880)	**source_timestamp_resolution** (p. 885)
	*<<**extension**>> (p. 116)* Batch source timestamp resolution.
rti::core::policy::Batch (p. 880)	**thread_safe_write** (p. 886)
	*<<**extension**>> (p. 116)* Determines whether or not the write operation is thread safe.
rti::core::QosProviderParams (p. 2049)	**string_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of strings containing a XML document to load.
rti::core::QosProviderParams (p. 2049)	**url_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of **URL groups** (p. 304) containing a set of XML documents to load.
rti::core::QosProviderParams (p. 2049)	**ignore_user_profile** (p. 2051)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file USER_QOS_PROFILES.xml in the current working directory.

rti::core::QosProviderParams (p. 2049)	**ignore_environment_profile** (p. 2052)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Ignores the value of the **NDDS_QOS_PROFILES** (p. 304).
rti::core::QosProviderParams (p. 2049)	**ignore_resource_profile** (p. 2052)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Ignores the file NDDS_QOS_PROFILES.xml.
rti::config::Logger (p. 1683)	**verbosity** (p. 1685)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) The verbosities at which RTI Connext diagnostic information is logged.
rti::config::Logger (p. 1683)	**category** (p. 1685)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Categories of logged messages.
rti::config::Logger (p. 1683)	**print_format** (p. 1688)
	*<<**extension**>>* (p. *116*) The format used to output RTI Connext diagnostic information.
rti::config::Logger (p. 1683)	**output_file** (p. 1686)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Specifies the file to which log messages will be redirected to.
rti::config::Logger (p. 1683)	**output_file_suffix** (p. 1687)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Sets the file suffix when logging to a set of files
rti::config::Logger (p. 1683)	**max_bytes_per_file** (p. 1687)
	*<<**extension**>>* (p. *116*) Specifies the maximum number of bytes a single file can contain
rti::config::Logger (p. 1683)	**max_files** (p. 1687)
	*<<**extension**>>* (p. *116*) Specifies the maximum number of files to create before overwritting the previous ones.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**concurrency_level** (p. 1723)
	*<<**extension**>>* (p. *116*) Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**datawriter_qos_profile_name** (p. 1724)
	*<<**extension**>>* (p. *116*) The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes event metrics.

rti::core::MonitoringEventDistributionSettings (p. 1722)	**thread** (p. 1726)
	<<***extension***>> *(p. 116)* The settings of the event metric thread.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**publication_period** (p. 1726)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**datawriter_qos_profile_name** (p. 1742)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes periodic metrics.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**thread** (p. 1743)
	<<***extension***>> *(p. 116)* The settings of the periodic metric thread.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**polling_period** (p. 1744)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Period at which the periodic metric thread polls and publishes the periodic metrics.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**concurrency_level** (p. 1729)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**max_historical_logs** (p. 1729)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**datawriter_qos_profile_name** (p. 1730)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes log messages.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**thread** (p. 1731)
	<<***extension***>> *(p. 116)* The settings of the logging thread.

rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**publication_period** (p. 1732)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the logging thread publishes log messages.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**enable** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Enables the use of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**domain_id** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**participant_qos_profile_name** (p. 1714)
	*<<**extension**>> (p. 116)* The fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1326) that will be used to distribute telemetry data.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**collector_initial_peers** (p. 1715)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistributionSettings::dedicated_participant** (p. 1719).
rti::core::MonitoringDistributionSettings (p. 1716)	**dedicated_participant** (p. 1719)
	*<<**extension**>> (p. 116)* Configures the use of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**publisher_qos_profile_name** (p. 1718)
	*<<**extension**>> (p. 116)* The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**event_settings** (p. 1720)
	*<<**extension**>> (p. 116)* Configures the distribution of event metrics.
rti::core::MonitoringDistributionSettings (p. 1716)	**periodic_settings** (p. 1720)
	*<<**extension**>> (p. 116)* Configures the distribution of periodic metrics.

rti::core::MonitoringDistributionSettings (p. 1716)	**logging_settings** (p. 1721)
	<<***extension***>> *(p. 116)* Configures the distribution of logging messages.
rti::core::MonitoringMetricSelection (p. 1736)	**resource_selection** (p. 1737)
	<<***extension***>> *(p. 116)* An expression pattern that selects a subset of resources by matching the pattern to the resource names. **rti::core::MonitoringMetric↩ Selection::enabled_metrics_selection** (p. 1738) and **rti::core::MonitoringMetricSelection::disabled_↩ metrics_selection** (p. 1739) are applied to this subset of resources.
rti::core::MonitoringMetricSelection (p. 1736)	**enabled_metrics_selection** (p. 1738)
	<<***extension***>> *(p. 116)* A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **rti::core::Monitoring↩ MetricSelection::resource_selection** (p. 1737).
rti::core::MonitoringMetricSelection (p. 1736)	**disabled_metrics_selection** (p. 1739)
	<<***extension***>> *(p. 116)* A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **rti::core::Monitoring↩ MetricSelection::resource_selection** (p. 1737).
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**middleware_forwarding_level** (p. 1734)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::middleware** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**security_event_forwarding_level** (p. 1734)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::security_↩ event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**service_forwarding_level** (p. 1735)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::service** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**user_forwarding_level** (p. 1736)

	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::user** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringTelemetryData (p. 1744)	**metrics** (p. 1745)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Sequence of **rti::core::MonitoringMetricSelection** (p. 1736) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.
rti::core::MonitoringTelemetryData (p. 1744)	**logs** (p. 1746)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* **rti::core::MonitoringLoggingForwardingSettings** (p. 1733) containing the **rti::config::SyslogVerbosity** (p. 458) levels that will be forwarded for the different **rti::config::LogFacility** (p. 459).
rti::core::policy::Monitoring (p. 1706)	**enable** (p. 1708)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.
rti::core::policy::Monitoring (p. 1706)	**application_name** (p. 1709)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The name of the resource that represents this RTI Connext application.
rti::core::policy::Monitoring (p. 1706)	**distribution_settings** (p. 1710)
	<<***extension***>> *(p. 116)* Configures the distribution of telemetry data.
rti::core::policy::Monitoring (p. 1706)	**telemetry_data** (p. 1711)
	<<***extension***>> *(p. 116)* Configures the telemetry data that will be distributed.
rti::core::LocatorFilterElement (p. 1678)	**locators** (p. 1679)
	<<***extension***>> *(p. 116)* Sequence containing from one to 16 Locator_t, used to specify the multicast address locators of an individual channel within a Multi↩ Channel DataWriter.
rti::core::LocatorFilterElement (p. 1678)	**filter_expression** (p. 1680)
	<<***extension***>> *(p. 116)* A logical expression used to determine the data that will be published in the channel.
rti::core::policy::LocatorFilter (p. 1676)	**locator_filters** (p. 1677)

	<<***extension***>> *(p. 116)* A sequence of **rti::core::LocatorFilterElement** (p. 1678). Each **rti::core::LocatorFilterElement** (p. 1678) reports the configuration of a single channel of a MultiChannel DataWriter.
rti::core::policy::LocatorFilter (p. 1676)	**filter_name** (p. 1678)
	<<***extension***>> *(p. 116)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.
rti::core::ChannelSettings (p. 921)	**multicast_settings** (p. 922)
	<<***extension***>> *(p. 116)* A sequence of **rti::core::TransportMulticastSettings** (p. 2549) used to configure the multicast addresses associated with a channel.
rti::core::ChannelSettings (p. 921)	**filter_expression** (p. 923)
	<<***extension***>> *(p. 116)* A logical expression used to determine the data that will be published in the channel.
rti::core::ChannelSettings (p. 921)	**priority** (p. 924)
	<<***extension***>> *(p. 116)* Publication priority
rti::core::policy::MultiChannel (p. 1749)	**channels** (p. 1751)
	<<***extension***>> *(p. 116)* A sequence of **rti::core::ChannelSettings** (p. 921) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.
rti::core::policy::MultiChannel (p. 1749)	**filter_name** (p. 1752)
	<<***extension***>> *(p. 116)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.
rti::core::policy::TopicQueryDispatch (p. 2522)	**enable** (p. 2524)
	<<***extension***>> *(p. 116)* Allows this writer to dispatch TopicQueries
rti::core::policy::TopicQueryDispatch (p. 2522)	**publication_period** (p. 2525)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Sets the periodic interval at which samples are published.
rti::core::policy::TopicQueryDispatch (p. 2522)	**samples_per_period** (p. 2525)
	<<***extension***>> *(p. 116)* Sets the maximum number of samples to publish in each publication_period.

6.47 Functional Categories

These categories help you to discover which QoS may be relevant or related to a desired functionality or feature. For example, if you are interested in **Sending Large Data** (p. 197), then looking at any QoS in that category will be helpful.

Modules

- **Application Acknowledgement**

  This page lists all QoS related to application acknowledgement.
- **Application-Defined Metadata**

  This page lists QoS fields that can be used to send application-specific data during participant and endpoint discovery.
- **Application Startup**

  Use these QoS fields to configure entity creation and application startup settings.
- **Batching**

  Use these QoS fields to configure the batching feature.
- **Concurrency**

  Use these QoS fields to configure threads and concurrency settings in RTI Connext.
- **Content Filtering**

  Use these QoS fields if you are using content filtering on your data.
- **Data Availability**

  Use these QoS fields to configure how much data, which data, and when that data is available to an application.
- **Debuggability**

  Use these QoS to configure logging and observability capabilities to help debug RTI Connext applications.
- **Discovery**

  Use these QoS fields to configure how applications discover each other.
- **Discovery Isolation**

  Use these QoS fields to isolate applications from each other.
- **Durability**

  Use these QoS fields to configure how much and how long data remains retrievable in the system.
- **Flow Control**

  Use these QoS fields to configure features which help to control the rate at which data is sent, preventing network congestion.
- **Fragmentation**

  QoS related to DDS-level data fragmentation.
- **Instance Lifecycle**

  QoS that control the lifecycle of instances.
- **Sending Large Data**

  Use these QoS fields to optimize the process of sending large data.
- **Liveliness**

  Use these QoS fields to manage the liveliness of participants and endpoints, ensuring active communication and timely updates of the system state.
- **Logging**

  Use these QoS fields to configure the RTI Connext logging infrastructure.
- **Middleware Memory Management**

  Use these QoS fields to configure the memory usage of the middleware, including various initial and max limits.
- **QoS Profile Management**

  Use these QoS fields to configure how QoS profiles are loaded and which ones should be used when entities are created.
- **Reliability QoS**

  Reliability related QoS.
- **Sample Memory Management QoS**

  Use these QoS fields to configure how Connext manages memory related to the samples that are stored and managed by the DataReader and DataWriter queues.
- **Sample Ordering**

Use these QoS fields to configure how samples are ordered when stored and accessed by a DataReader.

- **Security**

  Use these QoS fields to enable and configure some security-related capabilities in RTI Connext.
- **Throughput**

  Use these QoS fields to configure features which may be helpful to increase throughput.
- **Transports**

  Use these QoS fields to configure aspects of the transports (udp, shared memory, etc.) used for communication.
- **Topic Queries**

  Use these QoS fields to configure the topic query feature.
- **Type System**

  Use these QoS fields to configure aspects of the type system.

6.47.1 Detailed Description

These categories help you to discover which QoS may be relevant or related to a desired functionality or feature. For example, if you are interested in **Sending Large Data** (p. 197), then looking at any QoS in that category will be helpful.

6.48 Application Acknowledgement

This page lists all QoS related to application acknowledgement.

This page lists all QoS related to application acknowledgement.

See `Application Acknowledgment`, in the *Core Libraries User's Manual*, for more information about this feature.

Advanced Settings

dds::core::policy::Reliability (p. 2149)	**acknowledgment_kind** (p. 2154)
	<<***extension***>> *(p. 116)* Kind of reliable acknowledgment
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_app_ack_response_length** (p. 1101)
	<<***extension***>> *(p. 116)* Maximum length of application-level acknowledgment response data
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_app_ack_remote_readers** (p. 1245)
	<<***extension***>> *(p. 116)* The maximum number of application-level acknowledging remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterProtocol (p. 1210)	**propagate_app_ack_with_no_response** (p. 1216)

	<<***extension***>> *(p. 116)* Controls whether or not a **dds::pub::DataWriter** (p. 1138) receives **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207) notifications with an empty or invalid response.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**app_ack_period** (p. 2227)
	<<***extension***>> *(p. 116)* The period at which application-level acknowledgment messages are sent
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_app_ack_response_keep_duration** (p. 2227)
	<<***extension***>> *(p. 116)* Minimum duration for which application-level acknowledgment response data is kept
rti::core::RtpsReliableReaderProtocol (p. 2221)	**samples_per_app_ack** (p. 2228)
	<<***extension***>> *(p. 116)* The minimum number of samples acknowledged by one application-level acknowledgment message

6.49 Application-Defined Metadata

This page lists QoS fields that can be used to send application-specific data during participant and endpoint discovery.

This page lists QoS fields that can be used to send application-specific data during participant and endpoint discovery.

There are also various resource limits related to these QoS which are also listed below.

Basic Settings

rti::core::policy::Property (p. 1969)	**value** (p. 1973)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Sequence of properties.

Advanced Settings

dds::core::policy::UserData (p. 2591)	**value** (p. 2593)
	<<***spec***>> *(p. 112)* a sequence of octets
dds::core::policy::GroupData (p. 1591)	**value** (p. 1593)
	<<***spec***>> *(p. 112)* a sequence of octets
rti::core::policy::TypeSupport (p. 2574)	**plugin_data** (p. 2575)
	[DEPRECATED] **(p. 296)** <<***extension***>> *(p. 116)* Value to pass into the type plugin's de-/serialization function

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_user_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::domain::qos::DomainParticipantQos** (p. 1384) and **dds::topic::ParticipantBuiltinTopicData** (p. 1908)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**topic_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of topic data in **dds::topic::qos::TopicQos** (p. 2509), **dds::topic::TopicBuiltinTopicData** (p. 2493), **dds::topic::PublicationBuiltinTopicData** (p. 1977) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**publisher_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::pub::qos::PublisherQos** (p. 2007) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**subscriber_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::sub::qos::SubscriberQos** (p. 2423) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::pub::qos::DataWriterQos** (p. 1226) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::sub::qos::DataReaderQos** (p. 1072) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_list_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_string_max_length** (p. 1425)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with the **dds::domain::DomainParticipant** (p. 1326).

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_list_max_length** (p. 1425)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_string_max_length** (p. 1426)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_list_max_length** (p. 1426)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_string_max_length** (p. 1427)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with a **dds::sub::DataReader** (p. 976).

6.50 Application Startup

Use these QoS fields to configure entity creation and application startup settings.

Use these QoS fields to configure entity creation and application startup settings.

Basic Settings

dds::core::policy::EntityFactory (p. 1527)	**autoenable_created_entities** (p. 1529)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies whether the entity acting as a factory automatically enables the instances it creates.

6.51 Batching

Use these QoS fields to configure the batching feature.

Use these QoS fields to configure the batching feature.

See `BATCH QosPolicy (DDS Extension)`, in the *Core Libraries User's Manual*, for more information about this feature.

Basic Settings

rti::core::policy::Batch (p. 880)	**enable** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies whether or not batching is enabled.
rti::core::policy::Batch (p. 880)	**max_data_bytes** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum cumulative length of all serialized samples in a batch.
rti::core::policy::Batch (p. 880)	**max_samples** (p. 883)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum number of samples in a batch.

Advanced Settings

rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_batch** (p. 836)
	[DEPRECATED] (p. 296) *<<**extension**>> (p. 116)* Disable asynchronous batch flushing.
rti::core::policy::AsynchronousPublisher (p. 832)	**asynchronous_batch_thread** (p. 837)
	*<<**extension**>> (p. 116)* Settings of the batch flushing thread.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_batches** (p. 1239)
	*<<**extension**>> (p. 116)* Represents the initial number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_batches** (p. 1240)
	*<<**extension**>> (p. 116)* Represents the maximum number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::Batch (p. 880)	**max_flush_delay** (p. 884)
	*<<**extension**>> (p. 116)* The maximum flush delay.
rti::core::policy::Batch (p. 880)	**source_timestamp_resolution** (p. 885)
	*<<**extension**>> (p. 116)* Batch source timestamp resolution.
rti::core::policy::Batch (p. 880)	**thread_safe_write** (p. 886)
	*<<**extension**>> (p. 116)* Determines whether or not the write operation is thread safe.

6.52 Concurrency

Use these QoS fields to configure threads and concurrency settings in RTI Connext.

Use these QoS fields to configure threads and concurrency settings in RTI Connext.

See `Connext Threading Model`, in the *Core Libraries User's Manual*, for more information.

This community article gives a thorough overview of how and why to use many of the QoS listed below: `https://community.rti.com/kb/achieving-low-jitter-performance-connext-pro`.

Advanced Settings

dds::core::policy::TransportPriority (p. 2552)	**value** (p. 2553)
	<<***spec***>> *(p. 112)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_write** (p. 835)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous publishing.
rti::core::policy::AsynchronousPublisher (p. 832)	**thread** (p. 835)
	<<***extension***>> *(p. 116)* Settings of the publishing thread.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_batch** (p. 836)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous batch flushing.
rti::core::policy::AsynchronousPublisher (p. 832)	**asynchronous_batch_thread** (p. 837)
	<<***extension***>> *(p. 116)* Settings of the batch flushing thread.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_topic_query_publication** (p. 838)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable topic query publication.
rti::core::policy::AsynchronousPublisher (p. 832)	**topic_query_publication_thread** (p. 838)
	<<***extension***>> *(p. 116)* Settings of the **rti::sub::TopicQuery** (p. 2516) publication thread.
rti::core::policy::Discovery (p. 1265)	**metatraffic_transport_priority** (p. 1269)
	<<***extension***>> *(p. 116)* The transport priority to use for the Discovery meta-traffic.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).

rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::↩ DataWriter** (p. 1138).
rti::core::policy::Event (p. 1541)	**thread** (p. 1542)
	<<***extension***>> *(p. 116)* Event thread QoS.
rti::core::policy::Database (p. 969)	**thread** (p. 971)
	<<***extension***>> *(p. 116)* Database thread settings.
rti::core::policy::ReceiverPool (p. 2144)	**thread** (p. 2146)
	<<***extension***>> *(p. 116)* Receiver pool thread(s).
rti::core::policy::Batch (p. 880)	**thread_safe_write** (p. 886)
	<<***extension***>> *(p. 116)* Determines whether or not the write operation is thread safe.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**concurrency_level** (p. 1723)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**thread** (p. 1726)
	<<***extension***>> *(p. 116)* The settings of the event metric thread.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**thread** (p. 1743)
	<<***extension***>> *(p. 116)* The settings of the periodic metric thread.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**concurrency_level** (p. 1729)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**thread** (p. 1731)
	<<***extension***>> *(p. 116)* The settings of the logging thread.

6.53 Content Filtering

Use these QoS fields if you are using content filtering on your data.

Use these QoS fields if you are using content filtering on your data.

Content filtering most commonly refers to using a **dds::topic::ContentFilteredTopic** (p. 954), but data can also be filtered using **rti::sub::TopicQuery** (p. 2516) to run a new filter over the data in a DataWriter's cache, or **dds::sub↩ ::cond::QueryCondition** (p. 2059) to read a subset of the data that is currently stored in the DataReader's cache.

See also

Queries and Filters Syntax (p. 84).

Advanced Settings

rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_query_condition_filters** (p. 1100)
	<<***extension***>> *(p. 116)* The maximum number of query condition filters a reader is allowed.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_reader_filters** (p. 1239)
	<<***extension***>> *(p. 116)* The maximum number of remote DataReaders for which the **dds::pub::DataWriter** (p. 1138) will perform content-based filtering.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_allocation** (p. 1403)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_allocation** (p. 1404)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**query_condition_allocation** (p. 1405)
	<<***extension***>> *(p. 116)* Allocation settings applied to query condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_hash_buckets** (p. 1412)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for content filtered topics.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_hash_buckets** (p. 1412)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for content filters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**contentfilter_property_max_length** (p. 1422)

	<<***extension***>> *(*p. *116)* This field is the maximum length of all data related to a Content-filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_seq_max_length** (p. 1423)
	<<***extension***>> *(*p. *116)* Maximum number of channels that can be specified in **rti::core::policy::Multi↩ Channel** (p. 1749) for MultiChannel DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_filter_expression_max_length** (p. 1424)
	<<***extension***>> *(*p. *116)* Maximum length of a channel **rti::core::ChannelSettings::filter_expression** (p. 923) in a MultiChannel DataWriter.
rti::core::ChannelSettings (p. 921)	**multicast_settings** (p. 922)
	<<***extension***>> *(*p. *116)* A sequence of **rti::core::↩ TransportMulticastSettings** (p. 2549) used to configure the multicast addresses associated with a channel.
rti::core::ChannelSettings (p. 921)	**filter_expression** (p. 923)
	<<***extension***>> *(*p. *116)* A logical expression used to determine the data that will be published in the channel.
rti::core::policy::MultiChannel (p. 1749)	**filter_name** (p. 1752)
	<<***extension***>> *(*p. *116)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

6.54 Data Availability

Use these QoS fields to configure how much data, which data, and when that data is available to an application.

Use these QoS fields to configure how much data, which data, and when that data is available to an application.

Data availability refers to configurations such as ownership and lifespan.

Basic Settings

dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	<<***basic***>> *(*p. *104)* <<***spec***>> *(*p. *112)* The kind of durability.
dds::core::policy::Durability (p. 1433)	**writer_depth** (p. 1439)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Indicates the number of samples per instance that a durable **dds::pub::DataWriter** (p. 1138) will send to a late-joining **dds::sub::DataReader** (p. 976).

dds::core::policy::Deadline (p. 1255)	**period** (p. 1258)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Duration of the deadline period.
dds::core::policy::Ownership (p. 1899)	**kind** (p. 1904)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of ownership
dds::core::policy::OwnershipStrength (p. 1906)	**value** (p. 1908)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The strength value used to arbitrate among multiple writers.
dds::core::policy::TimeBasedFilter (p. 2469)	**minimum_separation** (p. 2472)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The minimum separation duration between subsequent samples.
dds::core::policy::History (p. 1602)	**kind** (p. 1604)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the kind of history to be kept.
dds::core::policy::History (p. 1602)	**depth** (p. 1605)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607)
dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum samples the middleware can store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::Lifespan (p. 1635)	**duration** (p. 1637)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Maximum duration for the data's validity.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**publication_period** (p. 1726)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.

rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**polling_period** (p. 1744)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the periodic metric thread polls and publishes the periodic metrics.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**publication_period** (p. 1732)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the logging thread publishes log messages.

Advanced Settings

rti::core::policy::Availability (p. 868)	**enable_required_subscriptions** (p. 871)
	*<<**extension**>> (p. 116)* Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::Availability (p. 868)	**max_data_availability_waiting_time** (p. 871)
	*<<**extension**>> (p. 116)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
rti::core::policy::Availability (p. 868)	**max_endpoint_availability_waiting_time** (p. 872)
	*<<**extension**>> (p. 116)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
rti::core::policy::Availability (p. 868)	**required_matched_endpoint_groups** (p. 873)
	*<<**extension**>> (p. 116)* A sequence of endpoint groups.
dds::core::policy::Durability (p. 1433)	**direct_communication** (p. 1438)
	*<<**extension**>> (p. 116)* Indicates whether or not a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) should receive samples directly from a TRANSIENT or PERSISTENT **dds::pub::DataWriter** (p. 1138)
dds::core::policy::Durability (p. 1433)	**storage_settings** (p. 1440)
	*<<**extension**>> (p. 116)* Configures durable writer history and durable reader state.
dds::core::policy::DurabilityService (p. 1443)	**service_cleanup_delay** (p. 1445)
	*<<**spec**>> (p. 112)* Controls when the service is able to remove all information regarding a data instances.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	*<<**spec**>> (p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.

dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)
	<<***spec***>> *(p. 112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**coherent_access** (p. 1947)
	<<***spec***>> *(p. 112)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(p. 112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**drop_incomplete_coherent_set** (p. 1949)
	<<***extension***>> *(p. 116)* Indicates whether or not a **dds::sub::DataReader** (p. 976) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.
dds::core::policy::LatencyBudget (p. 1631)	**duration** (p. 1633)
	<<***spec***>> *(p. 112)* Duration of the maximum acceptable delay.
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	<<***spec***>> *(p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_samples_delay** (p. 2140)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ no_writers()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_samples_delay** (p. 2141)

	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_instances_delay** (p. 2142)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) and there are no samples for the instance in the DataReader queue.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_instances_delay** (p. 2143)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) and there are no samples for the instance in the DataReader queue.
rti::core::policy::TransportMulticastMapping (p. 2547)	**value** (p. 2549)
	<<***extension***>> *(p. 116)* A sequence of multicast communication mappings.
rti::core::policy::TransportMulticast (p. 2543)	**kind** (p. 2546)
	<<***extension***>> *(p. 116)* A value that specifies a way to determine how to obtain the multicast address.
rti::core::policy::DataWriterProtocol (p. 1210)	**virtual_guid** (p. 1212)
	<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataWriterProtocol (p. 1210)	**push_on_write** (p. 1213)
	<<***extension***>> *(p. 116)* Whether to push sample out when write is called.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_outstanding_reads** (p. 911)
	<<***extension***>> *(p. 116)* The initial number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_outstanding_reads** (p. 912)
	<<***extension***>> *(p. 116)* The maximum number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).

rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples_per_read** (p. 912)
	*<<**extension**>> (p. 116)* Maximum number of samples that can be read/taken on a same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::Batch (p. 880)	**source_timestamp_resolution** (p. 885)
	*<<**extension**>> (p. 116)* Batch source timestamp resolution.
rti::core::ChannelSettings (p. 921)	**priority** (p. 924)
	*<<**extension**>> (p. 116)* Publication priority
rti::core::policy::MultiChannel (p. 1749)	**channels** (p. 1751)
	*<<**extension**>> (p. 116)* A sequence of **rti::core::ChannelSettings** (p. 921) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.
rti::core::policy::MultiChannel (p. 1749)	**filter_name** (p. 1752)
	*<<**extension**>> (p. 116)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

6.55 Debuggability

Use these QoS to configure logging and observability capabilities to help debug RTI Connext applications.

Use these QoS to configure logging and observability capabilities to help debug RTI Connext applications.

Basic Settings

rti::core::policy::EntityName (p. 1530)	**name** (p. 1531)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The name of the entity.
rti::config::Logger (p. 1683)	**verbosity** (p. 1685)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The verbosities at which RTI Connext diagnostic information is logged.
rti::config::Logger (p. 1683)	**category** (p. 1685)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Categories of logged messages.
rti::config::Logger (p. 1683)	**output_file** (p. 1686)

	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies the file to which log messages will be redirected to.
rti::config::Logger (p. 1683)	**output_file_suffix** (p. 1687)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sets the file suffix when logging to a set of files
rti::core::MonitoringEventDistributionSettings (p. 1722)	**publication_period** (p. 1726)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**polling_period** (p. 1744)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the periodic metric thread polls and publishes the periodic metrics.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**max_historical_logs** (p. 1729)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**publication_period** (p. 1732)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the logging thread publishes log messages.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**enable** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Enables the use of a dedicated **dds::domain::Domain↩ Participant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**domain_id** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**collector_initial_peers** (p. 1715)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistribution↩ Settings::dedicated_participant** (p. 1719).

rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**middleware_forwarding_level** (p. 1734)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Log messages with **rti::config::LogFacility::middleware** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**security_event_forwarding_level** (p. 1734)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Log messages with **rti::config::LogFacility::security_event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**service_forwarding_level** (p. 1735)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Log messages with **rti::config::LogFacility::service** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**user_forwarding_level** (p. 1736)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Log messages with **rti::config::LogFacility::user** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringTelemetryData (p. 1744)	**metrics** (p. 1745)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Sequence of **rti::core::MonitoringMetricSelection** (p. 1736) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.
rti::core::MonitoringTelemetryData (p. 1744)	**logs** (p. 1746)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) **rti::core::MonitoringLoggingForwardingSettings** (p. 1733) containing the **rti::config::SyslogVerbosity** (p. 458) levels that will be forwarded for the different **rti::config::LogFacility** (p. 459).
rti::core::policy::Monitoring (p. 1706)	**enable** (p. 1708)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.
rti::core::policy::Monitoring (p. 1706)	**application_name** (p. 1709)

	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The name of the resource that represents this RTI Connext application.

Advanced Settings

rti::core::policy::DiscoveryConfig (p. 1271)	**default_domain_announcement_period** (p. 1300)
	<<***extension***>> *(p. 116)* The period to announce a participant to the default domain 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**ignore_default_domain_announcements** (p. 1301)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
rti::core::policy::EntityName (p. 1530)	**role_name** (p. 1532)
	<<***extension***>> *(p. 116)* The entity role name.
rti::core::policy::Service (p. 2350)	**kind** (p. 2354)
	<<***extension***>> *(p. 116)* The kind of service.
rti::config::Logger (p. 1683)	**print_format** (p. 1688)
	<<***extension***>> *(p. 116)* The format used to output RTI Connext diagnostic information.
rti::config::Logger (p. 1683)	**max_bytes_per_file** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of bytes a single file can contain
rti::config::Logger (p. 1683)	**max_files** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of files to create before overwritting the previous ones.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**concurrency_level** (p. 1723)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**datawriter_qos_profile_name** (p. 1724)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes event metrics.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**thread** (p. 1726)

	<<***extension***>> *(p. 116)* The settings of the event metric thread.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**datawriter_qos_profile_name** (p. 1742)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes periodic metrics.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**thread** (p. 1743)
	<<***extension***>> *(p. 116)* The settings of the periodic metric thread.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**concurrency_level** (p. 1729)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**datawriter_qos_profile_name** (p. 1730)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes log messages.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**thread** (p. 1731)
	<<***extension***>> *(p. 116)* The settings of the logging thread.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**participant_qos_profile_name** (p. 1714)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1326) that will be used to distribute telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**dedicated_participant** (p. 1719)
	<<***extension***>> *(p. 116)* Configures the use of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**publisher_qos_profile_name** (p. 1718)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**event_settings** (p. 1720)
	<<***extension***>> *(p. 116)* Configures the distribution of event metrics.

rti::core::MonitoringDistributionSettings (p. 1716)	**periodic_settings** (p. 1720)
	<<***extension***>> *(p. 116)* Configures the distribution of periodic metrics.
rti::core::MonitoringDistributionSettings (p. 1716)	**logging_settings** (p. 1721)
	<<***extension***>> *(p. 116)* Configures the distribution of logging messages.
rti::core::MonitoringMetricSelection (p. 1736)	**resource_selection** (p. 1737)
	<<***extension***>> *(p. 116)* An expression pattern that selects a subset of resources by matching the pattern to the resource names. **rti::core::MonitoringMetric↩ Selection::enabled_metrics_selection** (p. 1738) and **rti::core::MonitoringMetricSelection::disabled_↩ metrics_selection** (p. 1739) are applied to this subset of resources.
rti::core::MonitoringMetricSelection (p. 1736)	**enabled_metrics_selection** (p. 1738)
	<<***extension***>> *(p. 116)* A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **rti::core::Monitoring↩ MetricSelection::resource_selection** (p. 1737).
rti::core::MonitoringMetricSelection (p. 1736)	**disabled_metrics_selection** (p. 1739)
	<<***extension***>> *(p. 116)* A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **rti::core::Monitoring↩ MetricSelection::resource_selection** (p. 1737).
rti::core::policy::Monitoring (p. 1706)	**distribution_settings** (p. 1710)
	<<***extension***>> *(p. 116)* Configures the distribution of telemetry data.
rti::core::policy::Monitoring (p. 1706)	**telemetry_data** (p. 1711)
	<<***extension***>> *(p. 116)* Configures the telemetry data that will be distributed.

6.56 Discovery

Use these QoS fields to configure how applications discover each other.

Use these QoS fields to configure how applications discover each other.

See `Discovery Overview`, in the *Core Libraries User's Manual*, for more information about discovery.

Basic Settings

rti::core::policy::WireProtocol (p. 2630)	**participant_id** (p. 2635)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A value used to distinguish among different participants belonging to the same domain on the same host.
rti::core::policy::Discovery (p. 1265)	**initial_peers** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.
rti::core::policy::Discovery (p. 1265)	**multicast_receive_addresses** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain↩ Participant.
rti::core::policy::Discovery (p. 1265)	**accept_unknown_peers** (p. 1270)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Whether to accept a new participant that is not in the initial peers list.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_lease_duration** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The liveliness lease duration for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_assert_period** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period to assert liveliness for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_announcement_period** (p. 1280)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).
rti::core::policy::DiscoveryConfig (p. 1271)	**initial_participant_announcements** (p. 1282)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The number of initial announcements sent when a participant is first enabled.
rti::core::policy::DiscoveryConfig (p. 1271)	**new_remote_participant_announcements** (p. 1283)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The number of participant announcements sent when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**min_initial_participant_announcement_period** (p. 1283)

	<<***basic***>> (p. *104)* <<***extension***>> (p. *116)* The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_initial_participant_announcement_period** (p. 1284)
	<<***basic***>> (p. *104)* <<***extension***>> (p. *116)* The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**domain_id** (p. 1713)
	<<***basic***>> (p. *104)* <<***extension***>> (p. *116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**collector_initial_peers** (p. 1715)
	<<***basic***>> (p. *104)* <<***extension***>> (p. *116)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistribution↩ Settings::dedicated_participant** (p. 1719).

Advanced Settings

rti::core::policy::WireProtocol (p. 2630)	**rtps_host_id** (p. 2636)
	<<***extension***>> (p. *116)* The RTPS Host ID of the domain participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_app_id** (p. 2636)
	<<***extension***>> (p. *116)* The RTPS App ID of the domain participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_instance_id** (p. 2637)
	<<***extension***>> (p. *116)* The RTPS Instance ID of the **dds↩ ::domain::DomainParticipant** (p. 1326).
rti::core::policy::WireProtocol (p. 2630)	**rtps_well_known_ports** (p. 2638)
	<<***extension***>> (p. *116)* Configures the RTPS well-known port mappings.
rti::core::policy::WireProtocol (p. 2630)	**rtps_reserved_port_mask** (p. 2639)
	<<***extension***>> (p. *116)* Specifies which well-known ports to reserve when enabling the participant.

rti::core::policy::WireProtocol (p. 2630)	**rtps_auto_id_kind** (p. 2639)
	<<***extension***>> *(p. 116)* Kind of auto mechanism used to calculate the GUID prefix.
rti::core::policy::Discovery (p. 1265)	**enabled_transports** (p. 1267)
	<<***extension***>> *(p. 116)* The transports available for use by the Discovery mechanism.
rti::core::policy::Discovery (p. 1265)	**metatraffic_transport_priority** (p. 1269)
	<<***extension***>> *(p. 116)* The transport priority to use for the Discovery meta-traffic.
rti::core::policy::Discovery (p. 1265)	**enable_endpoint_discovery** (p. 1271)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.
rti::core::policy::DiscoveryConfig (p. 1271)	**remote_participant_purge_kind** (p. 1281)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_liveliness_loss_detection_period** (p. 1281)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_reader_resource_limits** (p. 1285)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader** (p. 1286)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader_resource_limits** (p. 1287)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader** (p. 1288)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader_resource_limits** (p. 1289)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_writer** (p. 1296)

	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_publish_mode** (p. 1298)
	<<***extension***>> *(*p. *116)* Publish mode policy for the built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_publish_mode** (p. 1298)
	<<***extension***>> *(*p. *116)* Publish mode policy for the built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**asynchronous_publisher** (p. 1299)
	<<***extension***>> *(*p. *116)* Asynchronous publishing settings for the discovery **dds::pub::Publisher** (p. 1993) and all entities that are created by it.
rti::core::policy::DiscoveryConfig (p. 1271)	**default_domain_announcement_period** (p. 1300)
	<<***extension***>> *(*p. *116)* The period to announce a participant to the default domain 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**ignore_default_domain_announcements** (p. 1301)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader_reliability_kind** (p. 1295)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Reliability policy for a built-in participant message reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader** (p. 1295)
	<<***extension***>> *(*p. *116)* RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind** (p. 1295) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer** (p. 1289)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_data_lifecycle** (p. 1291)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer** (p. 1291)

	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_data_lifecycle** (p. 1293)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**builtin_discovery_plugins** (p. 1293)
	<<***extension***>> *(p. 116)* Mask of built-in discovery plugin kinds.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer** (p. 1301)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_data_lifecycle** (p. 1303)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_publish_mode** (p. 1303)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in service request writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_reader** (p. 1304)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for a built-in **rti::topic::ServiceRequest** (p. 2358) reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer** (p. 1307)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer_publish_mode** (p. 1309)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_reader** (p. 1309)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**endpoint_type_object_lb_serialization_threshold** (p. 1310)
	<<***extension***>> *(p. 116)* Controls when/if the TypeObject v1 is compressed when propagated in Simple Endpoint Discovery.
rti::core::policy::DiscoveryConfig (p. 1271)	**dns_tracker_polling_period** (p. 1311)
	<<***extension***>> *(p. 116)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader** (p. 1312)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader_resource_limits** (p. 1313)
	<<***extension***>> *(p. 116)* Resource limits for the built-in topic participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_publish_mode** (p. 1316)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer** (p. 1314)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_data_lifecycle** (p. 1316)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**request_types_filter** (p. 1317)
	<<***extension***>> *(p. 116)* Topic name pattern for requesting all types via Type Lookup Service.

6.57 Discovery Isolation

Use these QoS fields to isolate applications from each other.

Use these QoS fields to isolate applications from each other.

Applications can be isolated through mechanisms such as domain ids, domain tags, and partitions.

See `Discovery Overview`, in the *Core Libraries User's Manual*, for more information about discovery.

Basic Settings

dds::core::policy::Partition (p. 1923)	**name** (p. 1926)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* A list of partition names
rti::core::policy::Discovery (p. 1265)	**initial_peers** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

rti::core::policy::Discovery (p. 1265)	**accept_unknown_peers** (p. 1270)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Whether to accept a new participant that is not in the initial peers list.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**domain_id** (p. 1713)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**collector_initial_peers** (p. 1715)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistribution↩ Settings::dedicated_participant** (p. 1719).

Advanced Settings

rti::core::policy::Discovery (p. 1265)	**enable_endpoint_discovery** (p. 1271)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partitions** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1923).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partition_cumulative_characters** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of combined characters allowable in all partition names in a **dds::core::policy::Partition** (p. 1923).

6.58 Durability

Use these QoS fields to configure how much and how long data remains retrievable in the system.

Use these QoS fields to configure how much and how long data remains retrievable in the system.

Basic Settings

dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The kind of durability.
dds::core::policy::Durability (p. 1433)	**writer_depth** (p. 1439)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Indicates the number of samples per instance that a durable **dds::pub::Data↩ Writer** (p. 1138) will send to a late-joining **dds::sub::DataReader** (p. 976).
dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Represents the maximum samples the middleware can store for any one **dds::pub::↩ DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Represents the maximum number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::Lifespan (p. 1635)	**duration** (p. 1637)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Maximum duration for the data's validity.

Advanced Settings

rti::core::policy::Availability (p. 868)	**enable_required_subscriptions** (p. 871)
	<<***extension***>> *(p. 116)* Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::Availability (p. 868)	**max_data_availability_waiting_time** (p. 871)
	<<***extension***>> *(p. 116)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
rti::core::policy::Availability (p. 868)	**max_endpoint_availability_waiting_time** (p. 872)
	<<***extension***>> *(p. 116)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
rti::core::policy::Availability (p. 868)	**required_matched_endpoint_groups** (p. 873)
	<<***extension***>> *(p. 116)* A sequence of endpoint groups.
dds::core::policy::Durability (p. 1433)	**direct_communication** (p. 1438)

	<<***extension***>> *(*p. *116)* Indicates whether or not a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) should receive samples directly from a TRANSIENT or PERSISTENT **dds::pub::DataWriter** (p. 1138)
dds::core::policy::Durability (p. 1433)	**storage_settings** (p. 1440)
	<<***extension***>> *(*p. *116)* Configures durable writer history and durable reader state.
rti::core::PersistentStorageSettings (p. 1927)	**enable** (p. 1929)
	<<***extension***>> *(*p. *116)* Enables durable writer history in a **dds::pub::DataWriter** (p. 1138) and durable reader state in a **dds::sub::DataReader** (p. 976).
rti::core::PersistentStorageSettings (p. 1927)	**file_name** (p. 1929)
	<<***extension***>> *(*p. *116)* The file name where the durable writer history or durable reader state will be stored.
rti::core::PersistentStorageSettings (p. 1927)	**trace_file_name** (p. 1931)
	<<***extension***>> *(*p. *116)* The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
rti::core::PersistentStorageSettings (p. 1927)	**journal_kind** (p. 1932)
	<<***extension***>> *(*p. *116)* Sets the journal mode of the persistent storage.
rti::core::PersistentStorageSettings (p. 1927)	**synchronization_kind** (p. 1933)
	<<***extension***>> *(*p. *116)* Sets the level of synchronization with the physical disk.
rti::core::PersistentStorageSettings (p. 1927)	**vacuum** (p. 1933)
	<<***extension***>> *(*p. *116)* Sets the auto-vacuum status of the storage.
rti::core::PersistentStorageSettings (p. 1927)	**restore** (p. 1934)
	<<***extension***>> *(*p. *116)* Indicates if the persisted writer history or reader state must be restored.
rti::core::PersistentStorageSettings (p. 1927)	**writer_instance_cache_allocation** (p. 1934)
	<<***extension***>> *(*p. *116)* Configures the resource limits associated with the instance durable writer history cache.
rti::core::PersistentStorageSettings (p. 1927)	**writer_sample_cache_allocation** (p. 1935)
	<<***extension***>> *(*p. *116)* Configures the resource limits associated with the sample durable writer history cache.
rti::core::PersistentStorageSettings (p. 1927)	**writer_memory_state** (p. 1936)

	<<***extension***>> *(p. 116)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
rti::core::PersistentStorageSettings (p. 1927)	**reader_checkpoint_frequency** (p. 1937)
	<<***extension***>> *(p. 116)* Controls how often the reader state is stored into the database.
dds::core::policy::DurabilityService (p. 1443)	**service_cleanup_delay** (p. 1445)
	<<***spec***>> *(p. 112)* Controls when the service is able to remove all information regarding a data instances.
dds::core::policy::DurabilityService (p. 1443)	**history_kind** (p. 1445)
	<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**history_depth** (p. 1446)
	<<***spec***>> *(p. 112)* Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1439) when recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	<<***spec***>> *(p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
rti::core::policy::DataWriterProtocol (p. 1210)	**propagate_app_ack_with_no_response** (p. 1216)
	<<***extension***>> *(p. 116)* Controls whether or not a **dds::pub::DataWriter** (p. 1138) receives **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207) notifications with an empty or invalid response.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 2247)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Enables dynamic adjustment of sample keep duration in response to congestion.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_min_sample_keep_duration** (p. 2245)
	<<***extension***>> *(p. 116)* The minimum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_max_sample_keep_duration** (p. 2246)
	<<***extension***>> *(p. 116)* The maximum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_decrease_sample_keep_↩ duration_factor** (p. 2248)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Controls rate of contraction of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_increase_sample_keep_↩ duration_factor** (p. 2248)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Controls rate of growth of dynamic sample keep duration.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_samples** (p. 909)
	<<***extension***>> *(p. 116)* Initial number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples** (p. 909)
	<<***extension***>> *(p. 116)* Maximum number of samples.
rti::core::policy::EntityName (p. 1530)	**role_name** (p. 1532)
	<<***extension***>> *(p. 116)* The entity role name.

6.59 Flow Control

Use these QoS fields to configure features which help to control the rate at which data is sent, preventing network congestion.

Use these QoS fields to configure features which help to control the rate at which data is sent, preventing network congestion.

Basic Settings

dds::core::policy::Reliability (p. 2149)	**max_blocking_time** (p. 2153)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The maximum time a DataWriter can block on a **write()** (p. 1179) call.
rti::core::policy::PublishMode (p. 2013)	**kind** (p. 2016)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Publishing mode
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_send_window_size** (p. 2249)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Minimum size of send window of unacknowledged samples
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_send_window_size** (p. 2250)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Maximum size of send window of unacknowledged samples

Advanced Settings

rti::core::policy::PublishMode (p. 2013)	**flow_controller_name** (p. 2016)
	*<<**extension**>> (p. 116)* Name of the associated flow controller
rti::core::policy::PublishMode (p. 2013)	**priority** (p. 2017)
	*<<**extension**>> (p. 116)* Publication priority
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_write** (p. 835)
	[DEPRECATED] (p. 296) *<<**extension**>> (p. 116)* Disable asynchronous publishing.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**outstanding_asynchronous_sample_allocation** (p. 1405)
	*<<**extension**>> (p. 116)* Allocation settings applied to the maximum number of samples (from all **dds::pub::↩ DataWriter** (p. 1138)) waiting to be asynchronously written.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_allocation** (p. 1406)
	*<<**extension**>> (p. 116)* Allocation settings applied to flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_hash_buckets** (p. 1413)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for flow controllers.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_publish_mode** (p. 1298)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_publish_mode** (p. 1298)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**asynchronous_publisher** (p. 1299)
	<<***extension***>> *(p. 116)* Asynchronous publishing settings for the discovery **dds::pub::Publisher** (p. 1993) and all entities that are created by it.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_publish_mode** (p. 1303)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in service request writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer_publish_mode** (p. 1309)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_publish_mode** (p. 1316)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in participant configuration writer.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_bytes_per_nack_response** (p. 2244)
	<<***extension***>> *(p. 116)* The maximum total message size when resending rejected samples or data fragments.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_update_period** (p. 2251)
	<<***extension***>> *(p. 116)* Period in which send window may be dynamically changed
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_increase_factor** (p. 2252)
	<<***extension***>> *(p. 116)* Increases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_decrease_factor** (p. 2253)
	<<***extension***>> *(p. 116)* Decreases send window size by this percentage when reacting dynamically to network conditions

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_repair_piggyback_heartbeat** (p. 2255)
	<<***extension***>> *(p. 116)* Prevents piggyback heartbeats from being sent with repair samples

6.60 Fragmentation

QoS related to DDS-level data fragmentation.

QoS related to DDS-level data fragmentation.

See `Data Fragmentation`, in the *Core Libraries User's Manual*, for more information about DDS-level fragmentation.

Advanced Settings

rti::core::policy::DataReaderResourceLimits (p. 1081)	**disable_fragmentation_support** (p. 1092)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) can receive fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples** (p. 1092)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_fragmented_samples** (p. 1093)
	<<***extension***>> *(p. 116)* The initial number of samples for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples_per_remote_writer** (p. 1094)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a **dds::sub::Data↩ Reader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragments_per_sample** (p. 1094)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**dynamically_allocate_fragmented_samples** (p. 1095)

	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_nack_response_delay** (p. 2242)
	<<***extension***>> *(p. 116)* The minimum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_nack_response_delay** (p. 2242)
	<<***extension***>> *(p. 116)* The maximum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**nack_suppression_duration** (p. 2243)
	<<***extension***>> *(p. 116)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_bytes_per_nack_response** (p. 2244)
	<<***extension***>> *(p. 116)* The maximum total message size when resending rejected samples or data fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**disable_fragmentation_support** (p. 913)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether the built-in topic **dds::sub::Data↩ Reader** (p. 976) can receive fragmented samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples** (p. 913)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the built-in topic **dds::sub::Data↩ Reader** (p. 976) may store fragments at a given point in time.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_fragmented_samples** (p. 914)
	<<***extension***>> *(p. 116)* The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples_per_remote_writer** (p. 915)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a built-in topic **dds↩ ::sub::DataReader** (p. 976) may store fragments.

rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragments_per_sample** (p. 916)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**dynamically_allocate_fragmented_samples** (p. 916)
	<<***extension***>> *(p. 116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.

6.61 Instance Lifecycle

QoS that control the lifecycle of instances.

QoS that control the lifecycle of instances.

Use these QoS fields to configure how RTI Connext manages instance lifecycles and resources in the DataReader and DataWriter queues.

Basic Settings

dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Represents the maximum number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**initial_instances** (p. 2208)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Represents the initial number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) will manage.

Advanced Settings

dds::core::policy::DurabilityService (p. 1443)	**service_cleanup_delay** (p. 1445)
	<<***spec***>> *(p. 112)* Controls when the service is able to remove all information regarding a data instances.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)

	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::Reliability (p. 2149)	**instance_state_consistency_kind** (p. 2155)
	<<***extension***>> *(p. 116)* Whether instance state consistency is enabled
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	<<***spec***>> *(p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**instance_hash_buckets** (p. 2208)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Number of hash buckets for instances.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autodispose_unregistered_instances** (p. 2661)
	<<***spec***>> *(p. 112)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **dds::pub::DataWriter** (p. 1138) unregisters from the instance by means of the unregister operations.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_unregistered_instances_delay** (p. 2662)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has unregistered the instance.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_disposed_instances_delay** (p. 2664)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has disposed the instance.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_samples_delay** (p. 2140)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ no_writers()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_samples_delay** (p. 2141)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ disposed()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_instances_delay** (p. 2142)

	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) and there are no samples for the instance in the DataReader queue.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_instances_delay** (p. 2143)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) and there are no samples for the instance in the DataReader queue.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_total_instances** (p. 1096)
	<<***extension***>> *(p. 116)* Maximum number of instances for which a DataReader will keep state.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**keep_minimum_state_for_instances** (p. 1101)
	<<***extension***>> *(p. 116)* Whether or not keep a minimum instance state for up to **rti::core::policy::DataReaderResourceLimits::max_total_instances** (p. 1096).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**instance_replacement** (p. 1106)
	<<***extension***>> *(p. 116)* Sets the kind of instances allowed to be replaced for each instance state (**dds::sub::status::InstanceState** (p. 1615)) when a DataReader reaches **dds::core::policy::ResourceLimits::max_instances** (p. 2206).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**autopurge_remote_not_alive_writer_delay** (p. 1103)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become not alive.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**instance_replacement** (p. 1241)
	<<***extension***>> *(p. 116)* Sets the kinds of instances allowed to be replaced when instance resource limits are reached.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**replace_empty_instances** (p. 1242)
	<<***extension***>> *(p. 116)* Whether or not to replace empty instances during instance replacement

rti::core::policy::DataWriterResourceLimits (p. 1235)	**autoregister_instances** (p. 1242)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Whether or not to automatically register new instances
rti::core::policy::DataReaderProtocol (p. 1059)	**propagate_dispose_of_unregistered_instances** (p. 1063)
	<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) state without being in the **dds::sub::status::InstanceState::alive()** (p. 1617) state.
rti::core::policy::DataReaderProtocol (p. 1059)	**propagate_unregister_of_disposed_instances** (p. 1064)
	<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) state directly from the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_inline_keyhash** (p. 1214)
	<<***extension***>> *(p. 116)* Controls whether or not a keyhash is propagated on the wire with each sample.
rti::core::policy::DataWriterProtocol (p. 1210)	**serialize_key_with_dispose** (p. 1215)
	<<***extension***>> *(p. 116)* Controls whether or not the serialized key is propagated on the wire with dispose samples.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_data_lifecycle** (p. 1291)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_data_lifecycle** (p. 1293)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_data_lifecycle** (p. 1303)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_data_lifecycle** (p. 1316)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in participant configuration writer.

6.62 Sending Large Data

Use these QoS fields to optimize the process of sending large data.

Use these QoS fields to optimize the process of sending large data.

This includes QoS which help to reduce the number of copies needed and manage fragmentation.

See `Sending Large Data`, in the *Core Libraries User's Manual*, for more information.

Basic Settings

dds::core::policy::DataRepresentation (p. 1113)	**compression_settings** (p. 1117)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Structure that contains the compression settings.

Advanced Settings

rti::core::CompressionSettings (p. 943)	**compression_ids** (p. 945)
	<<***extension***>> *(p. 116)* Mask that represents the compression algorithms enabled.
rti::core::CompressionSettings (p. 943)	**writer_compression_level** (p. 946)
	<<***extension***>> *(p. 116)* The level of compression to use when compressing data.
rti::core::CompressionSettings (p. 943)	**writer_compression_threshold** (p. 947)
	<<***extension***>> *(p. 116)* The threshold, in bytes, above which a serialized sample will be eligible to be compressed.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**disable_fragmentation_support** (p. 1092)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) can receive fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples** (p. 1092)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_fragmented_samples** (p. 1093)

	<<***extension***>> *(p. 116)* The initial number of samples for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples_per_remote_writer** (p. 1094)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a **dds::sub::Data↩ Reader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragments_per_sample** (p. 1094)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**dynamically_allocate_fragmented_samples** (p. 1095)
	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**shmem_ref_transfer_mode_attached_segment_↩ allocation** (p. 1106)
	<<***extension***>> *(p. 116)* Allocation resource for the shared memory segments attached by the **dds::sub↩ ::DataReader** (p. 976).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**writer_loaned_sample_allocation** (p. 1247)
	<<***extension***>> *(p. 116)* Represents the allocation settings of loaned samples managed by a **dds::pub↩ ::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initialize_writer_loaned_sample** (p. 1248)
	<<***extension***>> *(p. 116)* Whether or not to initialize loaned samples returned by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterTransferMode (p. 1253)	**shmem_ref_settings** (p. 1254)
	<<***extension***>> *(p. 116)* Settings related to transferring data using shared memory references.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**shmem_ref_transfer_mode_max_segments** (p. 1433)
	<<***extension***>> *(p. 116)* Maximum number of segments created by all DataWriters belonging to a **dds↩ ::domain::DomainParticipant** (p. 1326).
rti::core::policy::DiscoveryConfig (p. 1271)	**endpoint_type_object_lb_serialization_threshold** (p. 1310)

	<<***extension***>> *(*p. *116)* Controls when/if the TypeObject v1 is compressed when propagated in Simple Endpoint Discovery.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**disable_fragmentation_support** (p. 913)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) can receive fragmented samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples** (p. 913)
	<<***extension***>> *(*p. *116)* The maximum number of samples for which the built-in topic **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_fragmented_samples** (p. 914)
	<<***extension***>> *(*p. *116)* The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples_per_remote_writer** (p. 915)
	<<***extension***>> *(*p. *116)* The maximum number of samples per remote writer for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragments_per_sample** (p. 916)
	<<***extension***>> *(*p. *116)* Maximum number of fragments for a single sample.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**dynamically_allocate_fragmented_samples** (p. 916)
	<<***extension***>> *(*p. *116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.

6.63 Liveliness

Use these QoS fields to manage the liveliness of participants and endpoints, ensuring active communication and timely updates of the system state.

Use these QoS fields to manage the liveliness of participants and endpoints, ensuring active communication and timely updates of the system state.

Basic Settings

dds::core::policy::Liveliness (p. 1645)	**kind** (p. 1649)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of liveliness desired.
dds::core::policy::Liveliness (p. 1645)	**lease_duration** (p. 1649)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The duration within which a **dds::pub::DataWriter** (p. 1138) must be asserted, or else it is assumed to be not alive.
dds::core::policy::Liveliness (p. 1645)	**assertions_per_lease_duration** (p. 1651)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of assertions a **dds::pub::DataWriter** (p. 1138) will send during a its **dds::core::policy::Liveliness::lease_duration** (p. 1649).
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_lease_duration** (p. 1279)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The liveliness lease duration for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_assert_period** (p. 1279)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The period to assert liveliness for the participant.

Advanced Settings

rti::core::policy::DataReaderResourceLimits (p. 1081)	**autopurge_remote_not_alive_writer_delay** (p. 1103)
	*<<**extension**>> (p. 116)* Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become not alive.
rti::core::policy::DiscoveryConfig (p. 1271)	**remote_participant_purge_kind** (p. 1281)
	[DEPRECATED] (p. 296) *<<**extension**>> (p. 116)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_liveliness_loss_detection_period** (p. 1281)
	[DEPRECATED] (p. 296) *<<**extension**>> (p. 116)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_writer** (p. 1296)

	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **dds::core::policy::↩ ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core↩ ::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader_reliability_kind** (p. 1295)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Reliability policy for a built-in participant message reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader** (p. 1295)
	<<***extension***>> *(*p. *116)* RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **rti::core::policy::DiscoveryConfig::participant_↩ message_reader_reliability_kind** (p. 1295) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_heartbeat_retries** (p. 2239)
	<<***extension***>> *(*p. *116)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**inactivate_nonprogressing_readers** (p. 2239)
	<<***extension***>> *(*p. *116)* Whether to treat remote readers as inactive when their NACKs do not progress

6.64 Logging

Use these QoS fields to configure the RTI Connext logging infrastructure.

Use these QoS fields to configure the RTI Connext logging infrastructure.

This includes settings for configuring the verbosity and directing the output.

See `Logging`, in the *Core Libraries User's Manual*, for more information.

Basic Settings

rti::config::Logger (p. 1683)	**verbosity** (p. 1685)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The verbosities at which RTI Connext diagnostic information is logged.
rti::config::Logger (p. 1683)	**category** (p. 1685)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Categories of logged messages.
rti::config::Logger (p. 1683)	**output_file** (p. 1686)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies the file to which log messages will be redirected to.
rti::config::Logger (p. 1683)	**output_file_suffix** (p. 1687)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sets the file suffix when logging to a set of files
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**max_historical_logs** (p. 1729)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**publication_period** (p. 1732)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Period at which the logging thread publishes log messages.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**middleware_forwarding_level** (p. 1734)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::middleware** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**security_event_forwarding_level** (p. 1734)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::security_event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**service_forwarding_level** (p. 1735)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Log messages with **rti::config::LogFacility::service** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**user_forwarding_level** (p. 1736)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::user** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringTelemetryData (p. 1744)	**logs** (p. 1746)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* **rti::core::MonitoringLoggingForwardingSettings** (p. 1733) containing the **rti::config::SyslogVerbosity** (p. 458) levels that will be forwarded for the different **rti::config::LogFacility** (p. 459).

Advanced Settings

rti::config::Logger (p. 1683)	**print_format** (p. 1688)
	<<***extension***>> *(p. 116)* The format used to output RTI Connext diagnostic information.
rti::config::Logger (p. 1683)	**max_bytes_per_file** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of bytes a single file can contain
rti::config::Logger (p. 1683)	**max_files** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of files to create before overwritting the previous ones.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**concurrency_level** (p. 1729)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**datawriter_qos_profile_name** (p. 1730)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes log messages.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**thread** (p. 1731)
	<<***extension***>> *(p. 116)* The settings of the logging thread.
rti::core::MonitoringDistributionSettings (p. 1716)	**logging_settings** (p. 1721)
	<<***extension***>> *(p. 116)* Configures the distribution of logging messages.

6.65 Middleware Memory Management

Use these QoS fields to configure the memory usage of the middleware, including various initial and max limits.

Use these QoS fields to configure the memory usage of the middleware, including various initial and max limits.

Basic Settings

dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum samples the middleware can store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Represents the maximum number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**initial_samples** (p. 2207)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Represents the initial samples the middleware will store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**initial_instances** (p. 2208)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Represents the initial number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) will manage.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**max_historical_logs** (p. 1729)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.

Advanced Settings

rti::core::PersistentStorageSettings (p. 1927)	**writer_memory_state** (p. 1936)

	<<***extension***>> *(p. 116)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	<<***spec***>> *(p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers** (p. 1085)
	<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers_per_instance** (p. 1086)
	<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_samples_per_remote_writer** (p. 1087)
	<<***extension***>> *(p. 116)* The maximum number of out-of-order samples from a given remote **dds::pub::Data↩ Writer** (p. 1138) that a **dds::sub::DataReader** (p. 976) may store when maintaining a reliable connection to the **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_infos** (p. 1087)
	<<***extension***>> *(p. 116)* The maximum number of info units that a **dds::sub::DataReader** (p. 976) can use to store **dds::sub::SampleInfo** (p. 2285).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_writers** (p. 1088)

	<<***extension***>> *(p. 116)* The initial number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_writers_per_instance** (p. 1089)
	<<***extension***>> *(p. 116)* The initial number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_infos** (p. 1089)
	<<***extension***>> *(p. 116)* The initial number of info units that a **dds::sub::DataReader** (p. 976) can have, which are used to store **dds::sub::SampleInfo** (p. 2285).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_outstanding_reads** (p. 1090)
	<<***extension***>> *(p. 116)* The initial number of outstanding calls to read/take (or one of their variants) on the same **dds::sub::DataReader** (p. 976) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1667).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_outstanding_reads** (p. 1091)
	<<***extension***>> *(p. 116)* The maximum number of outstanding read/take calls (or one of their variants) on the same **dds::sub::DataReader** (p. 976) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1667).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_samples_per_read** (p. 1091)
	<<***extension***>> *(p. 116)* The maximum number of data samples that the application can receive from the middleware in a single call to **dds::sub::DataReader::read** (p. 996) or **dds::sub::DataReader::take** (p. 997). If more data exists in the middleware, the application will need to issue multiple read/take calls.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples** (p. 1092)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_fragmented_samples** (p. 1093)

	<<***extension***>> *(p. 116)* The initial number of samples for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples_per_remote_writer** (p. 1094)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragments_per_sample** (p. 1094)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**dynamically_allocate_fragmented_samples** (p. 1095)
	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_total_instances** (p. 1096)
	<<***extension***>> *(p. 116)* Maximum number of instances for which a DataReader will keep state.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_virtual_writers** (p. 1097)
	<<***extension***>> *(p. 116)* The maximum number of remote virtual writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_virtual_writers** (p. 1097)
	<<***extension***>> *(p. 116)* The initial number of remote virtual writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_virtual_writers_per_instance** (p. 1098)
	<<***extension***>> *(p. 116)* The maximum number of virtual remote writers that can be associated with an instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_virtual_writers_per_instance** (p. 1099)
	<<***extension***>> *(p. 116)* The initial number of virtual remote writers per instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers_per_sample** (p. 1099)

	<<***extension***>> *(*p. *116)* The maximum number of remote writers allowed to write the same sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_query_condition_filters** (p. 1100)
	<<***extension***>> *(*p. *116)* The maximum number of query condition filters a reader is allowed.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_app_ack_response_length** (p. 1101)
	<<***extension***>> *(*p. *116)* Maximum length of application-level acknowledgment response data
rti::core::policy::DataReaderResourceLimits (p. 1081)	**keep_minimum_state_for_instances** (p. 1101)
	<<***extension***>> *(*p. *116)* Whether or not keep a minimum instance state for up to **rti::core::policy::DataReaderResourceLimits::max_total_instances** (p. 1096).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_topic_queries** (p. 1102)
	<<***extension***>> *(*p. *116)* The initial number of TopicQueries allocated by a **dds::sub::DataReader** (p. 976).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_topic_queries** (p. 1103)
	<<***extension***>> *(*p. *116)* The maximum number of active TopicQueries that a **dds::sub::DataReader** (p. 976) can create.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**shmem_ref_transfer_mode_attached_segment_allocation** (p. 1106)
	<<***extension***>> *(*p. *116)* Allocation resource for the shared memory segments attached by the **dds::sub::DataReader** (p. 976).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**instance_replacement** (p. 1106)
	<<***extension***>> *(*p. *116)* Sets the kind of instances allowed to be replaced for each instance state (**dds::sub::status::InstanceState** (p. 1615)) when a DataReader reaches **dds::core::policy::ResourceLimits::max_instances** (p. 2206).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**autopurge_remote_not_alive_writer_delay** (p. 1103)

	<<***extension***>> *(*p. *116)* Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become not alive.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**lazily_allocate_batch_resources** (p. 1105)
	<<***extension***>> *(*p. *116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::Data↩ Writer** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::↩ DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_reader_filters** (p. 1239)
	<<***extension***>> *(*p. *116)* The maximum number of remote DataReaders for which the **dds::pub::DataWriter** (p. 1138) will perform content-based filtering.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_batches** (p. 1239)
	<<***extension***>> *(*p. *116)* Represents the initial number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_batches** (p. 1240)
	<<***extension***>> *(*p. *116)* Represents the maximum number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**instance_replacement** (p. 1241)
	<<***extension***>> *(*p. *116)* Sets the kinds of instances allowed to be replaced when instance resource limits are reached.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**replace_empty_instances** (p. 1242)
	<<***extension***>> *(*p. *116)* Whether or not to replace empty instances during instance replacement
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_virtual_writers** (p. 1244)

	<<***extension***>> *(p. 116)* The maximum number of virtual writers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_virtual_writers** (p. 1243)
	<<***extension***>> *(p. 116)* The initial number of virtual writers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_remote_readers** (p. 1244)
	<<***extension***>> *(p. 116)* Controls the initial memory allocation for the matched remote readers of a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_readers** (p. 1244)
	<<***extension***>> *(p. 116)* The maximum number of remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_app_ack_remote_readers** (p. 1245)
	<<***extension***>> *(p. 116)* The maximum number of application-level acknowledging remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_active_topic_queries** (p. 1246)
	<<***extension***>> *(p. 116)* Represents the initial number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_active_topic_queries** (p. 1246)
	<<***extension***>> *(p. 116)* Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**writer_loaned_sample_allocation** (p. 1247)
	<<***extension***>> *(p. 116)* Represents the allocation settings of loaned samples managed by a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::SystemResourceLimits (p. 2443)	**max_objects_per_thread** (p. 2445)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* The maximum number of objects that can be stored per thread for a DomainParticipantFactory.
rti::core::policy::SystemResourceLimits (p. 2443)	**initial_objects_per_thread** (p. 2445)
	<<***extension***>> *(p. 116)* The number of objects per thread for a DomainParticipantFactory for which infrastructure will initially be allocated.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_allocation** (p. 1398)

	<<***extension***>> *(p. 116)* Allocation settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_allocation** (p. 1398)
	<<***extension***>> *(p. 116)* Allocation settings applied to local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Publisher.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_allocation** (p. 1400)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_allocation** (p. 1401)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_allocation** (p. 1401)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_allocation** (p. 1402)
	<<***extension***>> *(p. 116)* Allocation settings applied to matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_allocation** (p. 1402)
	<<***extension***>> *(p. 116)* Allocation settings applied to matching local reader and remote/local writer pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_allocation** (p. 1403)

	<<***extension***>> *(p. 116)* Allocation settings applied to ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_allocation** (p. 1403)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_allocation** (p. 1404)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**read_condition_allocation** (p. 1404)
	<<***extension***>> *(p. 116)* Allocation settings applied to read condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**query_condition_allocation** (p. 1405)
	<<***extension***>> *(p. 116)* Allocation settings applied to query condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**outstanding_asynchronous_sample_allocation** (p. 1405)
	<<***extension***>> *(p. 116)* Allocation settings applied to the maximum number of samples (from all **dds::pub::↩ DataWriter** (p. 1138)) waiting to be asynchronously written.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_allocation** (p. 1406)
	<<***extension***>> *(p. 116)* Allocation settings applied to flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_hash_buckets** (p. 1406)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Hash_Buckets settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_hash_buckets** (p. 1407)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_hash_buckets** (p. 1407)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Publisher.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_hash_buckets** (p. 1408)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_hash_buckets** (p. 1408)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_hash_buckets** (p. 1409)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_hash_buckets** (p. 1409)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_hash_buckets** (p. 1410)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_hash_buckets** (p. 1410)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local reader and remote/local writer pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for content filtered topics.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for content filters.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_hash_buckets** (p. 1413)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_gather_destinations** (p. 1413)
	<<***extension***>> *(p. 116)* Maximum number of destinations per RTI Connext send.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_user_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::domain::qos::DomainParticipantQos** (p. 1384) and **dds::topic::ParticipantBuiltinTopicData** (p. 1908)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**topic_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of topic data in **dds::topic::qos::TopicQos** (p. 2509), **dds::topic::TopicBuiltinTopicData** (p. 2493), **dds::topic::PublicationBuiltinTopicData** (p. 1977) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**publisher_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::pub::qos::PublisherQos** (p. 2007) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**subscriber_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::sub::qos::SubscriberQos** (p. 2423) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::pub::qos::DataWriterQos** (p. 1226) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::sub::qos::DataReaderQos** (p. 1072) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partitions** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1923).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partition_cumulative_characters** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of combined characters allowable in all partition names in a **dds::core::policy::Partition** (p. 1923).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_code_max_serialized_length** (p. 1418)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Maximum size of serialized string for type code.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_serialized_length** (p. 1419)
	<<***extension***>> *(p. 116)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_deserialized_length** (p. 1420)
	<<***extension***>> *(p. 116)* The maximum number of bytes that a deserialized TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**deserialized_type_object_dynamic_allocation_threshold** (p. 1420)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**serialized_type_object_dynamic_allocation_threshold** (p. 1421)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**contentfilter_property_max_length** (p. 1422)
	<<***extension***>> *(p. 116)* This field is the maximum length of all data related to a Content-filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_seq_max_length** (p. 1423)
	<<***extension***>> *(p. 116)* Maximum number of channels that can be specified in **rti::core::policy::MultiChannel** (p. 1749) for MultiChannel DataWriters.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_filter_expression_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum length of a channel **rti::core::ChannelSettings::filter_expression** (p. 923) in a MultiChannel DataWriter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_list_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_string_max_length** (p. 1425)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_list_max_length** (p. 1425)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_string_max_length** (p. 1426)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_list_max_length** (p. 1426)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_string_max_length** (p. 1427)
	<<***extension***>> *(p. 116)* Maximum string length of the properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_endpoint_groups** (p. 1427)
	<<***extension***>> *(p. 116)* Maximum number of **rti::core::EndpointGroup** (p. 1515) allowable in a **rti::core::policy::Availability** (p. 868).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_endpoint_group_cumulative_characters** (p. 1428)

	<<***extension***>> *(*p. *116)* Maximum number of combined role_name characters allowed in all **rti::core↩ ::EndpointGroup** (p. 1515) in a **rti::core::policy::↩ Availability** (p. 868).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**transport_info_list_max_length** (p. 1428)
	<<***extension***>> *(*p. *116)* Maximum number of installed transports to send and receive information about in **dds::topic::ParticipantBuiltinTopic↩ Data::transport_info** (p. 1914).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_replacement_kind** (p. 1429)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **rti::core::policy::DomainParticipant↩ ResourceLimits::ignored_entity_allocation** (p. 1403) are reached.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_allocation** (p. 1429)
	<<***extension***>> *(*p. *116)* Allocation settings applied to remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_hash_buckets** (p. 1430)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Number of hash buckets for remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_data_tag_list_max_length** (p. 1431)
	<<***extension***>> *(*p. *116)* Maximum number of data tags associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_data_tag_string_max_length** (p. 1431)
	<<***extension***>> *(*p. *116)* Maximum string length of the data tags associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_data_tag_list_max_length** (p. 1432)
	<<***extension***>> *(*p. *116)* Maximum number of data tags associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_data_tag_string_max_length** (p. 1432)

	<<***extension***>> *(*p. *116)* Maximum string length of the data tags associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**shmem_ref_transfer_mode_max_segments** (p. 1433)
	<<***extension***>> *(*p. *116)* Maximum number of segments created by all DataWriters belonging to a **dds↩ ::domain::DomainParticipant** (p. 1326).
rti::core::policy::Event (p. 1541)	**initial_count** (p. 1543)
	<<***extension***>> *(*p. *116)* The initial number of events.
rti::core::policy::Event (p. 1541)	**max_count** (p. 1543)
	<<***extension***>> *(*p. *116)* The maximum number of events.
rti::core::policy::Database (p. 969)	**initial_records** (p. 974)
	<<***extension***>> *(*p. *116)* The initial number of total records.
rti::core::policy::Database (p. 969)	**max_skiplist_level** (p. 974)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* The maximum level of the skiplist.
rti::core::policy::Database (p. 969)	**initial_weak_references** (p. 975)
	<<***extension***>> *(*p. *116)* The initial number of weak references.
rti::core::policy::Database (p. 969)	**max_weak_references** (p. 974)
	<<***extension***>> *(*p. *116)* The maximum number of weak references.
rti::core::policy::ReceiverPool (p. 2144)	**buffer_size** (p. 2147)
	<<***extension***>> *(*p. *116)* The receive buffer size in bytes.
rti::core::policy::ReceiverPool (p. 2144)	**buffer_alignment** (p. 2148)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* The receive buffer alignment.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_reader_resource_limits** (p. 1285)
	<<***extension***>> *(*p. *116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader_resource_limits** (p. 1287)
	<<***extension***>> *(*p. *116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader_resource_limits** (p. 1289)
	<<***extension***>> *(*p. *116)* Resource limits.

rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader_resource_limits** (p. 1313)
	<<***extension***>> *(p. 116)* Resource limits for the built-in topic participant configuration reader.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_samples** (p. 909)
	<<***extension***>> *(p. 116)* Initial number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples** (p. 909)
	<<***extension***>> *(p. 116)* Maximum number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_infos** (p. 910)
	<<***extension***>> *(p. 116)* Initial number of sample infos.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_infos** (p. 911)
	<<***extension***>> *(p. 116)* Maximum number of sample infos.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_outstanding_reads** (p. 911)
	<<***extension***>> *(p. 116)* The initial number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_outstanding_reads** (p. 912)
	<<***extension***>> *(p. 116)* The maximum number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples_per_read** (p. 912)
	<<***extension***>> *(p. 116)* Maximum number of samples that can be read/taken on a same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**disable_fragmentation_support** (p. 913)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether the built-in topic **dds::sub::Data↩ Reader** (p. 976) can receive fragmented samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples** (p. 913)

	<<***extension***>> *(p. 116)* The maximum number of samples for which the built-in topic **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_fragmented_samples** (p. 914)
	<<***extension***>> *(p. 116)* The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples_per_remote_writer** (p. 915)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragments_per_sample** (p. 916)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**dynamically_allocate_fragmented_samples** (p. 916)
	<<***extension***>> *(p. 116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::ThreadSettings (p. 2449)	**stack_size** (p. 2451)
	The thread stack-size.
rti::config::Logger (p. 1683)	**max_bytes_per_file** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of bytes a single file can contain
rti::config::Logger (p. 1683)	**max_files** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of files to create before overwritting the previous ones.

6.66 QoS Profile Management

Use these QoS fields to configure how QoS profiles are loaded and which ones should be used when entities are created.

Use these QoS fields to configure how QoS profiles are loaded and which ones should be used when entities are created.

Basic Settings

rti::core::QosProviderParams (p. 2049)	**string_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of strings containing a XML document to load.
rti::core::QosProviderParams (p. 2049)	**url_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of **URL groups** (p. 304) containing a set of XML documents to load.
rti::core::QosProviderParams (p. 2049)	**ignore_user_profile** (p. 2051)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file USER_QOS_PROFILES.xml in the current working directory.
rti::core::QosProviderParams (p. 2049)	**ignore_environment_profile** (p. 2052)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the value of the **NDDS_QOS_PROFILES** (p. 304).
rti::core::QosProviderParams (p. 2049)	**ignore_resource_profile** (p. 2052)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file NDDS_QOS_PROFILES.xml.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**enable** (p. 1713)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Enables the use of a dedicated **dds::domain::Domain↩ Participant** (p. 1326) to distribute the RTI Connext application telemetry data.

Advanced Settings

rti::core::MonitoringEventDistributionSettings (p. 1722)	**datawriter_qos_profile_name** (p. 1724)
	*<<**extension**>> (p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes event metrics.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**datawriter_qos_profile_name** (p. 1742)
	*<<**extension**>> (p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes periodic metrics.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**datawriter_qos_profile_name** (p. 1730)
	*<<**extension**>> (p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes log messages.

rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**participant_qos_profile_name** (p. 1714)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1326) that will be used to distribute telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**dedicated_participant** (p. 1719)
	<<***extension***>> *(p. 116)* Configures the use of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**publisher_qos_profile_name** (p. 1718)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.

6.67 Reliability QoS

Reliability related QoS.

Reliability related QoS.

Use these QoS fields to configure the reliable delivery of your application data – this includes those settings that configure the reliability protocol.

See `Reliable Delivery Model`, in the *Core Libraries User's Manual*, for more information about the DDS reliability protocol.

Basic Settings

dds::core::policy::Reliability (p. 2149)	**kind** (p. 2153)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Kind of reliability.
dds::core::policy::Reliability (p. 2149)	**max_blocking_time** (p. 2153)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The maximum time a DataWriter can block on a **write()** (p. 1179) call.
dds::core::policy::History (p. 1602)	**kind** (p. 1604)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the kind of history to be kept.
dds::core::policy::History (p. 1602)	**depth** (p. 1605)

	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP↩ _LAST** (p. 1607)
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeat_period** (p. 2234)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period at which to send heartbeats.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**fast_heartbeat_period** (p. 2235)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**late_joiner_heartbeat_period** (p. 2236)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_send_window_size** (p. 2249)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Minimum size of send window of unacknowledged samples
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_send_window_size** (p. 2250)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Maximum size of send window of unacknowledged samples

Advanced Settings

rti::core::policy::Availability (p. 868)	**enable_required_subscriptions** (p. 871)
	<<***extension***>> *(p. 116)* Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::Availability (p. 868)	**max_data_availability_waiting_time** (p. 871)
	<<***extension***>> *(p. 116)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
rti::core::policy::Availability (p. 868)	**max_endpoint_availability_waiting_time** (p. 872)

	<<***extension***>> *(p. 116)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
rti::core::policy::Availability (p. 868)	**required_matched_endpoint_groups** (p. 873)
	<<***extension***>> *(p. 116)* A sequence of endpoint groups.
dds::core::policy::Reliability (p. 2149)	**acknowledgment_kind** (p. 2154)
	<<***extension***>> *(p. 116)* Kind of reliable acknowledgment
dds::core::policy::Reliability (p. 2149)	**instance_state_consistency_kind** (p. 2155)
	<<***extension***>> *(p. 116)* Whether instance state consistency is enabled
dds::core::policy::Reliability (p. 2149)	**exact_reliability_kind_match** (p. 2155)
	<<***extension***>> *(p. 116)* Whether an exact reliability kind match is required for endpoint matching.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_app_ack_response_length** (p. 1101)
	<<***extension***>> *(p. 116)* Maximum length of application-level acknowledgment response data
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_app_ack_remote_readers** (p. 1245)
	<<***extension***>> *(p. 116)* The maximum number of application-level acknowledging remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataReaderProtocol (p. 1059)	**rtps_reliable_reader** (p. 1064)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **dds::sub::DataReader** (p. 976). This parameter only has effect if the reader is configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DataReaderProtocol (p. 1059)	**disable_positive_acks** (p. 1062)
	<<***extension***>> *(p. 116)* Whether the reader sends positive acknowledgements to writers.
rti::core::policy::DataWriterProtocol (p. 1210)	**push_on_write** (p. 1213)
	<<***extension***>> *(p. 116)* Whether to push sample out when write is called.
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_positive_acks** (p. 1214)
	<<***extension***>> *(p. 116)* Controls whether or not the writer expects positive acknowledgements from matching readers.

rti::core::policy::DataWriterProtocol (p. 1210)	**propagate_app_ack_with_no_response** (p. 1216)
	<<***extension***>> *(p. 116)* Controls whether or not a **dds::pub::DataWriter** (p. 1138) receives **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207) notifications with an empty or invalid response.
rti::core::policy::DataWriterProtocol (p. 1210)	**rtps_reliable_writer** (p. 1217)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **dds::pub::DataWriter** (p. 1138). This parameter only has effect if both the writer and the matching reader are configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader** (p. 1286)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader** (p. 1288)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_writer** (p. 1296)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader_reliability_kind** (p. 1295)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Reliability policy for a built-in participant message reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader** (p. 1295)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind** (p. 1295) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer** (p. 1289)

	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer** (p. 1291)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer** (p. 1301)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_reader** (p. 1304)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for a built-in **rti::topic::ServiceRequest** (p. 2358) reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer** (p. 1307)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_reader** (p. 1309)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader** (p. 1312)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer** (p. 1314)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_heartbeat_response_delay** (p. 2223)
	<<***extension***>> *(p. 116)* The minimum delay to respond to a heartbeat.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**max_heartbeat_response_delay** (p. 2224)
	<<***extension***>> *(p. 116)* The maximum delay to respond to a heartbeat.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**heartbeat_suppression_duration** (p. 2224)

	<<***extension***>> *(p. 116)* The duration a reader ignores consecutively received heartbeats
rti::core::RtpsReliableReaderProtocol (p. 2221)	**nack_period** (p. 2225)
	<<***extension***>> *(p. 116)* The period at which to send NACKs
rti::core::RtpsReliableReaderProtocol (p. 2221)	**receive_window_size** (p. 2226)
	<<***extension***>> *(p. 116)* The number of received out-of-order samples a reader can keep at a time
rti::core::RtpsReliableReaderProtocol (p. 2221)	**round_trip_time** (p. 2226)
	<<***extension***>> *(p. 116)* The duration from sending a NACK to receiving a repair of a sample
rti::core::RtpsReliableReaderProtocol (p. 2221)	**app_ack_period** (p. 2227)
	<<***extension***>> *(p. 116)* The period at which application-level acknowledgment messages are sent
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_app_ack_response_keep_duration** (p. 2227)
	<<***extension***>> *(p. 116)* Minimum duration for which application-level acknowledgment response data is kept
rti::core::RtpsReliableReaderProtocol (p. 2221)	**samples_per_app_ack** (p. 2228)
	<<***extension***>> *(p. 116)* The minimum number of samples acknowledged by one application-level acknowledgment message
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**low_watermark** (p. 2232)
	<<***extension***>> *(p. 116)* When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) is considered to have changed.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**high_watermark** (p. 2233)
	<<***extension***>> *(p. 116)* When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) is considered to have changed.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**virtual_heartbeat_period** (p. 2237)

	<<***extension***>> *(*p. *116)* The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**samples_per_virtual_heartbeat** (p. 2238)
	<<***extension***>> *(*p. *116)* The number of samples that a reliable writer has to publish before sending a virtual heartbeat.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_heartbeat_retries** (p. 2239)
	<<***extension***>> *(*p. *116)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**inactivate_nonprogressing_readers** (p. 2239)
	<<***extension***>> *(*p. *116)* Whether to treat remote readers as inactive when their NACKs do not progress
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeats_per_max_samples** (p. 2240)
	<<***extension***>> *(*p. *116)* The number of piggyback heartbeats sent per max send window.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_nack_response_delay** (p. 2242)
	<<***extension***>> *(*p. *116)* The minimum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_nack_response_delay** (p. 2242)
	<<***extension***>> *(*p. *116)* The maximum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**nack_suppression_duration** (p. 2243)
	<<***extension***>> *(*p. *116)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_bytes_per_nack_response** (p. 2244)
	<<***extension***>> *(*p. *116)* The maximum total message size when resending rejected samples or data fragments.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_enable_adaptive_sample_↩ keep_duration** (p. 2247)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Enables dynamic adjustment of sample keep duration in response to congestion.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_min_sample_keep_duration** (p. 2245)
	<<***extension***>> *(p. 116)* The minimum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_max_sample_keep_duration** (p. 2246)
	<<***extension***>> *(p. 116)* The maximum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_decrease_sample_keep_duration_factor** (p. 2248)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Controls rate of contraction of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_increase_sample_keep_duration_factor** (p. 2248)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Controls rate of growth of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_update_period** (p. 2251)
	<<***extension***>> *(p. 116)* Period in which send window may be dynamically changed
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_increase_factor** (p. 2252)
	<<***extension***>> *(p. 116)* Increases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_decrease_factor** (p. 2253)
	<<***extension***>> *(p. 116)* Decreases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**enable_multicast_periodic_heartbeat** (p. 2254)
	<<***extension***>> *(p. 116)* Whether periodic heartbeat messages are sent over multicast
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**multicast_resend_threshold** (p. 2254)

	<<***extension***>> *(*p. *116)* The minimum number of requesting readers needed to trigger a multicast resend
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_repair_piggyback_heartbeat** (p. 2255)
	<<***extension***>> *(*p. *116)* Prevents piggyback heartbeats from being sent with repair samples

6.68 Sample Memory Management QoS

Use these QoS fields to configure how Connext manages memory related to the samples that are stored and managed by the DataReader and DataWriter queues.

Use these QoS fields to configure how Connext manages memory related to the samples that are stored and managed by the DataReader and DataWriter queues.

Basic Settings

dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	<<***basic***>> *(*p. *104)* <<***spec***>> *(*p. *112)* Represents the maximum samples the middleware can store for any one **dds::pub::↩ DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	<<***basic***>> *(*p. *104)* <<***spec***>> *(*p. *112)* Represents the maximum number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**initial_samples** (p. 2207)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Represents the initial samples the middleware will store for any one **dds::pub::↩ DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**initial_instances** (p. 2208)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Represents the initial number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) will manage.

Advanced Settings

rti::core::PersistentStorageSettings (p. 1927)	**writer_instance_cache_allocation** (p. 1934)
	<<***extension***>> *(*p. *116)* Configures the resource limits associated with the instance durable writer history cache.

rti::core::PersistentStorageSettings (p. 1927)	**writer_sample_cache_allocation** (p. 1935)
	<<***extension***>> *(p. 116)* Configures the resource limits associated with the sample durable writer history cache.
dds::core::policy::DurabilityService (p. 1443)	**history_kind** (p. 1445)
	<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**history_depth** (p. 1446)
	<<***spec***>> *(p. 112)* Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1439) when recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	<<***spec***>> *(p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autodispose_unregistered_instances** (p. 2661)
	<<***spec***>> *(p. 112)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **dds::pub::DataWriter** (p. 1138) unregisters from the instance by means of the unregister operations.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_unregistered_instances_delay** (p. 2662)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has unregistered the instance.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_disposed_instances_delay** (p. 2664)
	<<***extension***>> *(p. 116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has disposed the instance.

dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_samples_delay** (p. 2140)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ no_writers()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_samples_delay** (p. 2141)
	<<***spec***>> *(p. 112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_↩ disposed()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_instances_delay** (p. 2142)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance↩ _state` becomes **dds::sub::status::InstanceState↩ ::not_alive_disposed()** (p. 1617) and there are no samples for the instance in the DataReader queue.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_instances_delay** (p. 2143)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance↩ _state` becomes **dds::sub::status::InstanceState↩ ::not_alive_no_writers()** (p. 1617) and there are no samples for the instance in the DataReader queue.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples** (p. 1092)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_fragmented_samples** (p. 1093)
	<<***extension***>> *(p. 116)* The initial number of samples for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples_per_remote_writer** (p. 1094)
	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a **dds::sub::Data↩ Reader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragments_per_sample** (p. 1094)

	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**dynamically_allocate_fragmented_samples** (p. 1095)
	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_batches** (p. 1239)
	<<***extension***>> *(p. 116)* Represents the initial number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_batches** (p. 1240)
	<<***extension***>> *(p. 116)* Represents the maximum number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**writer_loaned_sample_allocation** (p. 1247)
	<<***extension***>> *(p. 116)* Represents the allocation settings of loaned samples managed by a **dds::pub↩ ::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initialize_writer_loaned_sample** (p. 1248)
	<<***extension***>> *(p. 116)* Whether or not to initialize loaned samples returned by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_reader_resource_limits** (p. 1285)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader_resource_limits** (p. 1287)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader_resource_limits** (p. 1289)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader_resource_limits** (p. 1313)
	<<***extension***>> *(p. 116)* Resource limits for the built-in topic participant configuration reader.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_samples** (p. 909)
	<<***extension***>> *(p. 116)* Initial number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples** (p. 909)

	<<***extension***>> *(*p. *116)* Maximum number of samples.

6.69 Sample Ordering

Use these QoS fields to configure how samples are ordered when stored and accessed by a DataReader.

Use these QoS fields to configure how samples are ordered when stored and accessed by a DataReader.

Basic Settings

dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	<<***basic***>> *(*p. *104)* <<***spec***>> *(*p. *112)* Specifies the desired kind of destination order.

Advanced Settings

dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)
	<<***spec***>> *(*p. *112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**coherent_access** (p. 1947)
	<<***spec***>> *(*p. *112)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(*p. *112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**drop_incomplete_coherent_set** (p. 1949)
	<<***extension***>> *(*p. *116)* Indicates whether or not a **dds::sub::DataReader** (p. 976) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.
dds::core::policy::DestinationOrder (p. 1258)	**scope** (p. 1262)
	<<***spec***>> *(*p. *112)* Specifies the desired scope of the source destination order.
dds::core::policy::DestinationOrder (p. 1258)	**source_timestamp_tolerance** (p. 1262)

	<<***extension***>> *(p. 116)* Allowed tolerance between source timestamps of consecutive samples.

6.70 Security

Use these QoS fields to enable and configure some security-related capabilities in RTI Connext.

Use these QoS fields to enable and configure some security-related capabilities in RTI Connext.

For a complete security solution, you should use the Security Plugins. See the `RTI Security Plugins User's Manual` for more information.

The QoS listed on this page mostly relate to features that are enabled when the Security Plugins are being used.

Basic Settings

rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**security_event_forwarding_level** (p. 1734)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::security_event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Advanced Settings

rti::core::policy::TypeSupport (p. 2574)	**cdr_padding_kind** (p. 2576)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether or not the padding bytes will be set to zero during CDR serialization.
rti::core::policy::WireProtocol (p. 2630)	**compute_crc** (p. 2640)
	<<***extension***>> *(p. 116)* Adds RTPS CRC submessage to every message when this field is set to true.
rti::core::policy::WireProtocol (p. 2630)	**check_crc** (p. 2640)
	<<***extension***>> *(p. 116)* Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to true.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer** (p. 1307)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.

rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer_publish_mode** (p. 1309)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_reader** (p. 1309)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
dds::core::policy::DataTag (p. 1132)	**tags** (p. 1137)
	<<***spec***>> *(p. 112)* Sequence of data tags.

6.71 Throughput

Use these QoS fields to configure features which may be helpful to increase throughput.

Use these QoS fields to configure features which may be helpful to increase throughput.

Basic Settings

rti::core::policy::Batch (p. 880)	**enable** (p. 882)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies whether or not batching is enabled.
rti::core::policy::Batch (p. 880)	**max_data_bytes** (p. 882)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The maximum cumulative length of all serialized samples in a batch.
rti::core::policy::Batch (p. 880)	**max_samples** (p. 883)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The maximum number of samples in a batch.

Advanced Settings

rti::core::policy::Batch (p. 880)	**max_flush_delay** (p. 884)
	<<***extension***>> *(p. 116)* The maximum flush delay.
rti::core::policy::Batch (p. 880)	**source_timestamp_resolution** (p. 885)
	<<***extension***>> *(p. 116)* Batch source timestamp resolution.
rti::core::policy::Batch (p. 880)	**thread_safe_write** (p. 886)
	<<***extension***>> *(p. 116)* Determines whether or not the write operation is thread safe.

6.72 Transports

Use these QoS fields to configure aspects of the transports (udp, shared memory, etc.) used for communication.

Use these QoS fields to configure aspects of the transports (udp, shared memory, etc.) used for communication.

Basic Settings

rti::core::policy::TransportBuiltin (p. 2533)	**mask** (p. 2536)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* Specifies the built-in transports that are registered automatically when the **dds::domain::DomainParticipant** (p. 1326) is enabled.
rti::core::policy::TransportMulticast (p. 2543)	**value** (p. 2545)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* A sequence of multicast communications settings.
rti::core::policy::Discovery (p. 1265)	**initial_peers** (p. 1268)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.
rti::core::policy::Discovery (p. 1265)	**multicast_receive_addresses** (p. 1268)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* Specifies the multicast group addresses on which discovery-related **metatraffic** can be received by the DomainParticipant.
rti::core::policy::Discovery (p. 1265)	**accept_unknown_peers** (p. 1270)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* Whether to accept a new participant that is not in the initial peers list.

Advanced Settings

dds::core::policy::TransportPriority (p. 2552)	**value** (p. 2553)
	*<<**spec**>>* (p. *112)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.
rti::core::policy::TransportSelection (p. 2554)	**enabled_transports** (p. 2555)
	*<<**extension**>>* (p. *116)* A sequence of transport aliases that specifies the transport instances available for use by the entity.
rti::core::policy::TransportUnicast (p. 2556)	**value** (p. 2558)
	*<<**extension**>>* (p. *116)* A sequence of unicast communication settings.

rti::core::policy::TransportMulticastMapping (p. 2547)	**value** (p. 2549)
	<<***extension***>> *(p. 116)* A sequence of multicast communication mappings.
rti::core::policy::TransportMulticast (p. 2543)	**kind** (p. 2546)
	<<***extension***>> *(p. 116)* A value that specifies a way to determine how to obtain the multicast address.
rti::core::policy::Discovery (p. 1265)	**enabled_transports** (p. 1267)
	<<***extension***>> *(p. 116)* The transports available for use by the Discovery mechanism.
rti::core::policy::Discovery (p. 1265)	**metatraffic_transport_priority** (p. 1269)
	<<***extension***>> *(p. 116)* The transport priority to use for the Discovery meta-traffic.
rti::core::policy::Discovery (p. 1265)	**enable_endpoint_discovery** (p. 1271)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**transport_info_list_max_length** (p. 1428)
	<<***extension***>> *(p. 116)* Maximum number of installed transports to send and receive information about in **dds::topic::ParticipantBuiltinTopic↩ Data::transport_info** (p. 1914).
rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_assert_period** (p. 1305)
	<<***extension***>> *(p. 116)* Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.
rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_change_detection_period** (p. 1306)
	<<***extension***>> *(p. 116)* Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.
rti::core::policy::DiscoveryConfig (p. 1271)	**dns_tracker_polling_period** (p. 1311)
	<<***extension***>> *(p. 116)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**enable_multicast_periodic_heartbeat** (p. 2254)
	<<***extension***>> *(p. 116)* Whether periodic heartbeat messages are sent over multicast

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**multicast_resend_threshold** (p. 2254)
	<<***extension***>> *(p. 116)* The minimum number of requesting readers needed to trigger a multicast resend
rti::core::ChannelSettings (p. 921)	**multicast_settings** (p. 922)
	<<***extension***>> *(p. 116)* A sequence of **rti::core::TransportMulticastSettings** (p. 2549) used to configure the multicast addresses associated with a channel.
rti::core::ChannelSettings (p. 921)	**priority** (p. 924)
	<<***extension***>> *(p. 116)* Publication priority

6.73 Topic Queries

Use these QoS fields to configure the topic query feature.

Use these QoS fields to configure the topic query feature.

See `Querying Data`, in the *Core Libraries User's Manual*, for more information about this feature.

Basic Settings

rti::core::policy::TopicQueryDispatch (p. 2522)	**publication_period** (p. 2525)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Sets the periodic interval at which samples are published.

Advanced Settings

rti::core::policy::AsynchronousPublisher (p. 832)	**disable_topic_query_publication** (p. 838)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Disable topic query publication.
rti::core::policy::AsynchronousPublisher (p. 832)	**topic_query_publication_thread** (p. 838)
	<<***extension***>> *(p. 116)* Settings of the **rti::sub::TopicQuery** (p. 2516) publication thread.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_topic_queries** (p. 1102)
	<<***extension***>> *(p. 116)* The initial number of TopicQueries allocated by a **dds::sub::DataReader** (p. 976).

rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_topic_queries** (p. 1103)
	<<***extension***>> *(p. 116)* The maximum number of active TopicQueries that a **dds::sub::DataReader** (p. 976) can create.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_active_topic_queries** (p. 1246)
	<<***extension***>> *(p. 116)* Represents the initial number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_active_topic_queries** (p. 1246)
	<<***extension***>> *(p. 116)* Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_allocation** (p. 1429)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_hash_buckets** (p. 1430)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for remote TopicQueries.
rti::core::policy::TopicQueryDispatch (p. 2522)	**enable** (p. 2524)
	<<***extension***>> *(p. 116)* Allows this writer to dispatch TopicQueries
rti::core::policy::TopicQueryDispatch (p. 2522)	**samples_per_period** (p. 2525)
	<<***extension***>> *(p. 116)* Sets the maximum number of samples to publish in each publication_period.

6.74 Type System

Use these QoS fields to configure aspects of the type system.

Use these QoS fields to configure aspects of the type system.

These settings include how types are sent during discovery, what criteria is used when types should be matched, and how data should be serialized.

Advanced Settings

dds::core::policy::DataRepresentation (p. 1113)	**value** (p. 1116)
	<<***spec***>> *(p. 112)* Sequence of representation identifiers.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**kind** (p. 2565)
	<<***spec***>> *(p. 112)* Type consistency kind.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_sequence_bounds** (p. 2566)
	<<***spec***>> *(p. 112)* Controls whether sequence bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_string_bounds** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether string bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_member_names** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether member names are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**prevent_type_widening** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type widening is allowed.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**force_type_validation** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976).
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_enum_literal_names** (p. 2569)
	<<***spec***>> *(p. 112)* Controls whether enumeration constant names are taken into consideration for type assignability.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_code_max_serialized_length** (p. 1418)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Maximum size of serialized string for type code.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_serialized_length** (p. 1419)

	<<***extension***>> *(p. 116)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_deserialized_length** (p. 1420)
	<<***extension***>> *(p. 116)* The maximum number of bytes that a deserialized TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**deserialized_type_object_dynamic_allocation_threshold** (p. 1420)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**serialized_type_object_dynamic_allocation_threshold** (p. 1421)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.
rti::core::policy::DiscoveryConfig (p. 1271)	**endpoint_type_object_lb_serialization_threshold** (p. 1310)
	<<***extension***>> *(p. 116)* Controls when/if the TypeObject v1 is compressed when propagated in Simple Endpoint Discovery.

6.75 QoS Mutability

Some QoS are mutable after an entity is enabled, and others are not.

Modules

- **Immutable QoS**

  This page lists all QoS that are immutable after an entity has been enabled.
- **Mutable QoS**

  This page lists all QoS that are always mutable.

6.75.1 Detailed Description

Some QoS are mutable after an entity is enabled, and others are not.

6.76 Immutable QoS

This page lists all QoS that are immutable after an entity has been enabled.

This page lists all QoS that are immutable after an entity has been enabled.

QoS fall into one of three mutability categories:

- Always mutable, wheter an entity is enabled or not (see **Mutable QoS** (p. 280)).
- Immutable after entity creation.
- *Mutable* after creation but *immutable* after an entity is enabled.

The QoS that fall into the second two categories are listed on this page.

Changeable (p. 514)

Basic Settings

dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of durability.
dds::core::policy::Durability (p. 1433)	**writer_depth** (p. 1439)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Indicates the number of samples per instance that a durable **dds::pub::DataWriter** (p. 1138) will send to a late-joining **dds::sub::DataReader** (p. 976).
dds::core::policy::DataRepresentation (p. 1113)	**compression_settings** (p. 1117)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Structure that contains the compression settings.
dds::core::policy::Ownership (p. 1899)	**kind** (p. 1904)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of ownership
dds::core::policy::Liveliness (p. 1645)	**kind** (p. 1649)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of liveliness desired.
dds::core::policy::Liveliness (p. 1645)	**lease_duration** (p. 1649)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The duration within which a **dds::pub::DataWriter** (p. 1138) must be asserted, or else it is assumed to be not alive.

dds::core::policy::Liveliness (p. 1645)	**assertions_per_lease_duration** (p. 1651)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The number of assertions a **dds::pub::DataWriter** (p. 1138) will send during a its **dds::core::policy::Liveliness**↩ **::lease_duration** (p. 1649).
dds::core::policy::Reliability (p. 2149)	**kind** (p. 2153)
	<<***basic***>> (p. *104)* <<***spec***>> (p. *112)* Kind of reliability.
dds::core::policy::Reliability (p. 2149)	**max_blocking_time** (p. 2153)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The maximum time a DataWriter can block on a **write()** (p. 1179) call.
dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the desired kind of destination order.
dds::core::policy::History (p. 1602)	**kind** (p. 1604)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the kind of history to be kept.
dds::core::policy::History (p. 1602)	**depth** (p. 1605)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP**↩ **_LAST** (p. 1607)
dds::core::policy::ResourceLimits (p. 2203)	**max_samples** (p. 2205)
	<<***basic***>> (p. *104)* <<***spec***>> *(p. 112)* Represents the maximum samples the middleware can store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub::**↩ **DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**max_instances** (p. 2206)
	<<***basic***>> *(p. 104)* <<***spec***>> (p. *112)* Represents the maximum number of instances a **dds::pub::Data**↩ **Writer** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**initial_samples** (p. 2207)
	<<***basic***>> (p. *104)* <<***extension***>> *(p. 116)* Represents the initial samples the middleware will store for any one **dds::pub::DataWriter** (p. 1138) (or **dds::sub**↩ **::DataReader** (p. 976)).
dds::core::policy::ResourceLimits (p. 2203)	**initial_instances** (p. 2208)

	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Represents the initial number of instances a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) will manage.
rti::core::policy::PublishMode (p. 2013)	**kind** (p. 2016)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Publishing mode
rti::core::policy::WireProtocol (p. 2630)	**participant_id** (p. 2635)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A value used to distinguish among different participants belonging to the same domain on the same host.
rti::core::policy::TransportBuiltin (p. 2533)	**mask** (p. 2536)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the built-in transports that are registered automatically when the **dds::domain::DomainParticipant** (p. 1326) is enabled.
rti::core::policy::TransportMulticast (p. 2543)	**value** (p. 2545)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A sequence of multicast communications settings.
rti::core::policy::Discovery (p. 1265)	**initial_peers** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.
rti::core::policy::Discovery (p. 1265)	**multicast_receive_addresses** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the DomainParticipant.
rti::core::policy::Discovery (p. 1265)	**accept_unknown_peers** (p. 1270)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Whether to accept a new participant that is not in the initial peers list.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_lease_duration** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The liveliness lease duration for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_assert_period** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The period to assert liveliness for the participant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_announcement_period** (p. 1280)

	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).
rti::core::policy::DiscoveryConfig (p. 1271)	**initial_participant_announcements** (p. 1282)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* The number of initial announcements sent when a participant is first enabled.
rti::core::policy::DiscoveryConfig (p. 1271)	**new_remote_participant_announcements** (p. 1283)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* The number of participant announcements sent when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**min_initial_participant_announcement_period** (p. 1283)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_initial_participant_announcement_period** (p. 1284)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeat_period** (p. 2234)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* The period at which to send heartbeats.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**fast_heartbeat_period** (p. 2235)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**late_joiner_heartbeat_period** (p. 2236)
	*<<**basic**>>* (p. *104)* *<<**extension**>>* (p. *116)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_send_window_size** (p. 2249)

	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Minimum size of send window of unacknowledged samples
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_send_window_size** (p. 2250)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Maximum size of send window of unacknowledged samples
rti::core::policy::EntityName (p. 1530)	**name** (p. 1531)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The name of the entity.
rti::core::policy::Batch (p. 880)	**enable** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Specifies whether or not batching is enabled.
rti::core::policy::Batch (p. 880)	**max_data_bytes** (p. 882)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum cumulative length of all serialized samples in a batch.
rti::core::policy::Batch (p. 880)	**max_samples** (p. 883)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* The maximum number of samples in a batch.
rti::core::QosProviderParams (p. 2049)	**string_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of strings containing a XML document to load.
rti::core::QosProviderParams (p. 2049)	**url_profile** (p. 2050)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sequence of **URL groups** (p. 304) containing a set of XML documents to load.
rti::core::QosProviderParams (p. 2049)	**ignore_user_profile** (p. 2051)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file USER_QOS_PROFILES.xml in the current working directory.
rti::core::QosProviderParams (p. 2049)	**ignore_environment_profile** (p. 2052)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the value of the **NDDS_QOS_PROFILES** (p. 304).
rti::core::QosProviderParams (p. 2049)	**ignore_resource_profile** (p. 2052)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Ignores the file NDDS_QOS_PROFILES.xml.
rti::core::policy::TopicQueryDispatch (p. 2522)	**publication_period** (p. 2525)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Sets the periodic interval at which samples are published.

Advanced Settings

rti::core::policy::Availability (p. 868)	**enable_required_subscriptions** (p. 871)
	<<***extension***>> *(p. 116)* Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 1138)
dds::core::policy::Durability (p. 1433)	**direct_communication** (p. 1438)
	<<***extension***>> *(p. 116)* Indicates whether or not a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) should receive samples directly from a TRANSIENT or PERSISTENT **dds::pub::DataWriter** (p. 1138)
dds::core::policy::Durability (p. 1433)	**storage_settings** (p. 1440)
	<<***extension***>> *(p. 116)* Configures durable writer history and durable reader state.
rti::core::PersistentStorageSettings (p. 1927)	**enable** (p. 1929)
	<<***extension***>> *(p. 116)* Enables durable writer history in a **dds::pub::DataWriter** (p. 1138) and durable reader state in a **dds::sub::DataReader** (p. 976).
rti::core::PersistentStorageSettings (p. 1927)	**file_name** (p. 1929)
	<<***extension***>> *(p. 116)* The file name where the durable writer history or durable reader state will be stored.
rti::core::PersistentStorageSettings (p. 1927)	**trace_file_name** (p. 1931)
	<<***extension***>> *(p. 116)* The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
rti::core::PersistentStorageSettings (p. 1927)	**journal_kind** (p. 1932)
	<<***extension***>> *(p. 116)* Sets the journal mode of the persistent storage.
rti::core::PersistentStorageSettings (p. 1927)	**synchronization_kind** (p. 1933)
	<<***extension***>> *(p. 116)* Sets the level of synchronization with the physical disk.
rti::core::PersistentStorageSettings (p. 1927)	**vacuum** (p. 1933)
	<<***extension***>> *(p. 116)* Sets the auto-vacuum status of the storage.
rti::core::PersistentStorageSettings (p. 1927)	**restore** (p. 1934)
	<<***extension***>> *(p. 116)* Indicates if the persisted writer history or reader state must be restored.

rti::core::PersistentStorageSettings (p. 1927)	**writer_instance_cache_allocation** (p. 1934)
	<<***extension***>> *(p. 116)* Configures the resource limits associated with the instance durable writer history cache.
rti::core::PersistentStorageSettings (p. 1927)	**writer_sample_cache_allocation** (p. 1935)
	<<***extension***>> *(p. 116)* Configures the resource limits associated with the sample durable writer history cache.
rti::core::PersistentStorageSettings (p. 1927)	**writer_memory_state** (p. 1936)
	<<***extension***>> *(p. 116)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
rti::core::PersistentStorageSettings (p. 1927)	**reader_checkpoint_frequency** (p. 1937)
	<<***extension***>> *(p. 116)* Controls how often the reader state is stored into the database.
dds::core::policy::DurabilityService (p. 1443)	**service_cleanup_delay** (p. 1445)
	<<***spec***>> *(p. 112)* Controls when the service is able to remove all information regarding a data instances.
dds::core::policy::DurabilityService (p. 1443)	**history_kind** (p. 1445)
	<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**history_depth** (p. 1446)
	<<***spec***>> *(p. 112)* Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1439) when recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
rti::core::CompressionSettings (p. 943)	**compression_ids** (p. 945)
	<<***extension***>> *(p. 116)* Mask that represents the compression algorithms enabled.
rti::core::CompressionSettings (p. 943)	**writer_compression_level** (p. 946)

	<<***extension***>> *(*p. *116)* The level of compression to use when compressing data.
rti::core::CompressionSettings (p. 943)	**writer_compression_threshold** (p. 947)
	<<***extension***>> *(*p. *116)* The threshold, in bytes, above which a serialized sample will be eligible to be compressed.
dds::core::policy::DataRepresentation (p. 1113)	**value** (p. 1116)
	<<***spec***>> *(*p. *112)* Sequence of representation identifiers.
dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)
	<<***spec***>> *(*p. *112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**coherent_access** (p. 1947)
	<<***spec***>> *(*p. *112)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(*p. *112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**drop_incomplete_coherent_set** (p. 1949)
	<<***extension***>> *(*p. *116)* Indicates whether or not a **dds::sub::DataReader** (p. 976) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.
dds::core::policy::Reliability (p. 2149)	**acknowledgment_kind** (p. 2154)
	<<***extension***>> *(*p. *116)* Kind of reliable acknowledgment
dds::core::policy::Reliability (p. 2149)	**instance_state_consistency_kind** (p. 2155)
	<<***extension***>> *(*p. *116)* Whether instance state consistency is enabled
dds::core::policy::Reliability (p. 2149)	**exact_reliability_kind_match** (p. 2155)
	<<***extension***>> *(*p. *116)* Whether an exact reliability kind match is required for endpoint matching.
dds::core::policy::DestinationOrder (p. 1258)	**scope** (p. 1262)
	<<***spec***>> *(*p. *112)* Specifies the desired scope of the source destination order.

dds::core::policy::DestinationOrder (p. 1258)	**source_timestamp_tolerance** (p. 1262)
	<<***extension***>> *(p. 116)* Allowed tolerance between source timestamps of consecutive samples.
dds::core::policy::ResourceLimits (p. 2203)	**max_samples_per_instance** (p. 2207)
	<<***spec***>> *(p. 112)* Represents the maximum number of samples of any one instance a **dds::pub::DataWriter** (p. 1138) (or **dds::sub::DataReader** (p. 976)) can manage.
dds::core::policy::ResourceLimits (p. 2203)	**instance_hash_buckets** (p. 2208)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for instances.
dds::core::policy::TransportPriority (p. 2552)	**value** (p. 2553)
	<<***spec***>> *(p. 112)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.
rti::core::policy::TypeSupport (p. 2574)	**plugin_data** (p. 2575)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Value to pass into the type plugin's de-/serialization function
rti::core::policy::TypeSupport (p. 2574)	**cdr_padding_kind** (p. 2576)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Determines whether or not the padding bytes will be set to zero during CDR serialization.
rti::core::policy::PublishMode (p. 2013)	**flow_controller_name** (p. 2016)
	<<***extension***>> *(p. 116)* Name of the associated flow controller
rti::core::policy::PublishMode (p. 2013)	**priority** (p. 2017)
	<<***extension***>> *(p. 116)* Publication priority
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_write** (p. 835)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous publishing.
rti::core::policy::AsynchronousPublisher (p. 832)	**thread** (p. 835)
	<<***extension***>> *(p. 116)* Settings of the publishing thread.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_batch** (p. 836)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous batch flushing.
rti::core::policy::AsynchronousPublisher (p. 832)	**asynchronous_batch_thread** (p. 837)

	<<***extension***>> *(*p. *116)* Settings of the batch flushing thread.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_topic_query_publication** (p. 838)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Disable topic query publication.
rti::core::policy::AsynchronousPublisher (p. 832)	**topic_query_publication_thread** (p. 838)
	<<***extension***>> *(*p. *116)* Settings of the **rti::sub::TopicQuery** (p. 2516) publication thread.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autodispose_unregistered_instances** (p. 2661)
	<<***spec***>> *(*p. *112)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **dds::pub::DataWriter** (p. 1138) unregisters from the instance by means of the unregister operations.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_unregistered_instances_delay** (p. 2662)
	<<***extension***>> *(*p. *116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has unregistered the instance.
dds::core::policy::WriterDataLifecycle (p. 2660)	**autopurge_disposed_instances_delay** (p. 2664)
	<<***extension***>> *(*p. *116)* Maximum duration for which the **dds::pub::DataWriter** (p. 1138) will maintain information regarding an instance once it has disposed the instance.
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_samples_delay** (p. 2140)
	<<***spec***>> *(*p. *112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_samples_delay** (p. 2141)
	<<***spec***>> *(*p. *112)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain samples for an instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).
dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_disposed_instances_delay** (p. 2142)
	<<***extension***>> *(*p. *116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) and there are no samples for the instance in the DataReader queue.

dds::core::policy::ReaderDataLifecycle (p. 2137)	**autopurge_nowriter_instances_delay** (p. 2143)
	<<***extension***>> *(p. 116)* Minimum duration for which the **dds::sub::DataReader** (p. 976) will maintain information about a received instance once its `instance_state` becomes **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) and there are no samples for the instance in the DataReader queue.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**kind** (p. 2565)
	<<***spec***>> *(p. 112)* Type consistency kind.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_sequence_bounds** (p. 2566)
	<<***spec***>> *(p. 112)* Controls whether sequence bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_string_bounds** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether string bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_member_names** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether member names are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**prevent_type_widening** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type widening is allowed.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**force_type_validation** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976).
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_enum_literal_names** (p. 2569)
	<<***spec***>> *(p. 112)* Controls whether enumeration constant names are taken into consideration for type assignability.
rti::core::policy::WireProtocol (p. 2630)	**rtps_host_id** (p. 2636)
	<<***extension***>> *(p. 116)* The RTPS Host ID of the domain participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_app_id** (p. 2636)

	<<***extension***>> *(*p. *116)* The RTPS App ID of the domain participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_instance_id** (p. 2637)
	<<***extension***>> *(*p. *116)* The RTPS Instance ID of the **dds::domain::DomainParticipant** (p. 1326).
rti::core::policy::WireProtocol (p. 2630)	**rtps_well_known_ports** (p. 2638)
	<<***extension***>> *(*p. *116)* Configures the RTPS well-known port mappings.
rti::core::policy::WireProtocol (p. 2630)	**rtps_reserved_port_mask** (p. 2639)
	<<***extension***>> *(*p. *116)* Specifies which well-known ports to reserve when enabling the participant.
rti::core::policy::WireProtocol (p. 2630)	**rtps_auto_id_kind** (p. 2639)
	<<***extension***>> *(*p. *116)* Kind of auto mechanism used to calculate the GUID prefix.
rti::core::policy::WireProtocol (p. 2630)	**compute_crc** (p. 2640)
	<<***extension***>> *(*p. *116)* Adds RTPS CRC submessage to every message when this field is set to true.
rti::core::policy::WireProtocol (p. 2630)	**check_crc** (p. 2640)
	<<***extension***>> *(*p. *116)* Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to true.
rti::core::policy::TransportSelection (p. 2554)	**enabled_transports** (p. 2555)
	<<***extension***>> *(*p. *116)* A sequence of transport aliases that specifies the transport instances available for use by the entity.
rti::core::policy::TransportUnicast (p. 2556)	**value** (p. 2558)
	<<***extension***>> *(*p. *116)* A sequence of unicast communication settings.
rti::core::policy::TransportMulticastMapping (p. 2547)	**value** (p. 2549)
	<<***extension***>> *(*p. *116)* A sequence of multicast communication mappings.
rti::core::policy::TransportMulticast (p. 2543)	**kind** (p. 2546)
	<<***extension***>> *(*p. *116)* A value that specifies a way to determine how to obtain the multicast address.
rti::core::policy::Discovery (p. 1265)	**enabled_transports** (p. 1267)
	<<***extension***>> *(*p. *116)* The transports available for use by the Discovery mechanism.

rti::core::policy::Discovery (p. 1265)	**metatraffic_transport_priority** (p. 1269)
	<<***extension***>> *(p. 116)* The transport priority to use for the Discovery meta-traffic.
rti::core::policy::Discovery (p. 1265)	**enable_endpoint_discovery** (p. 1271)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers** (p. 1085)
	<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers_per_instance** (p. 1086)
	<<***extension***>> *(p. 116)* The maximum number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_samples_per_remote_writer** (p. 1087)
	<<***extension***>> *(p. 116)* The maximum number of out-of-order samples from a given remote **dds::pub::DataWriter** (p. 1138) that a **dds::sub::DataReader** (p. 976) may store when maintaining a reliable connection to the **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_infos** (p. 1087)
	<<***extension***>> *(p. 116)* The maximum number of info units that a **dds::sub::DataReader** (p. 976) can use to store **dds::sub::SampleInfo** (p. 2285).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_writers** (p. 1088)
	<<***extension***>> *(p. 116)* The initial number of remote writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_writers_per_instance** (p. 1089)
	<<***extension***>> *(p. 116)* The initial number of remote writers from which a **dds::sub::DataReader** (p. 976) may read a single instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_infos** (p. 1089)

	<<***extension***>> *(p. 116)* The initial number of info units that a **dds::sub::DataReader** (p. 976) can have, which are used to store **dds::sub::SampleInfo** (p. 2285).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_outstanding_reads** (p. 1090)
	<<***extension***>> *(p. 116)* The initial number of outstanding calls to read/take (or one of their variants) on the same **dds::sub::DataReader** (p. 976) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1667).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_outstanding_reads** (p. 1091)
	<<***extension***>> *(p. 116)* The maximum number of outstanding read/take calls (or one of their variants) on the same **dds::sub::DataReader** (p. 976) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1667).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_samples_per_read** (p. 1091)
	<<***extension***>> *(p. 116)* The maximum number of data samples that the application can receive from the middleware in a single call to **dds::sub::DataReader::read** (p. 996) or **dds::sub::DataReader::take** (p. 997). If more data exists in the middleware, the application will need to issue multiple read/take calls.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**disable_fragmentation_support** (p. 1092)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) can receive fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples** (p. 1092)
	<<***extension***>> *(p. 116)* The maximum number of samples for which the **dds::sub::DataReader** (p. 976) may store fragments at a given point in time.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_fragmented_samples** (p. 1093)
	<<***extension***>> *(p. 116)* The initial number of samples for which a **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragmented_samples_per_remote_writer** (p. 1094)

	<<***extension***>> *(p. 116)* The maximum number of samples per remote writer for which a **dds::sub::Data↩ Reader** (p. 976) may store fragments.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_fragments_per_sample** (p. 1094)
	<<***extension***>> *(p. 116)* Maximum number of fragments for a single sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**dynamically_allocate_fragmented_samples** (p. 1095)
	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_total_instances** (p. 1096)
	<<***extension***>> *(p. 116)* Maximum number of instances for which a DataReader will keep state.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_virtual_writers** (p. 1097)
	<<***extension***>> *(p. 116)* The maximum number of remote virtual writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_virtual_writers** (p. 1097)
	<<***extension***>> *(p. 116)* The initial number of remote virtual writers from which a **dds::sub::DataReader** (p. 976) may read, including all instances.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_virtual_writers_per_instance** (p. 1098)
	<<***extension***>> *(p. 116)* The maximum number of virtual remote writers that can be associated with an instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_remote_virtual_writers_per_instance** (p. 1099)
	<<***extension***>> *(p. 116)* The initial number of virtual remote writers per instance.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_remote_writers_per_sample** (p. 1099)
	<<***extension***>> *(p. 116)* The maximum number of remote writers allowed to write the same sample.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_query_condition_filters** (p. 1100)

	<<***extension***>> *(*p. *116)* The maximum number of query condition filters a reader is allowed.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_app_ack_response_length** (p. 1101)
	<<***extension***>> *(*p. *116)* Maximum length of application-level acknowledgment response data
rti::core::policy::DataReaderResourceLimits (p. 1081)	**keep_minimum_state_for_instances** (p. 1101)
	<<***extension***>> *(*p. *116)* Whether or not keep a minimum instance state for up to **rti::core::policy::↩ DataReaderResourceLimits::max_total_instances** (p. 1096).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**initial_topic_queries** (p. 1102)
	<<***extension***>> *(*p. *116)* The initial number of Topic↩ Queries allocated by a **dds::sub::DataReader** (p. 976).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**max_topic_queries** (p. 1103)
	<<***extension***>> *(*p. *116)* The maximum number of active TopicQueries that a **dds::sub::DataReader** (p. 976) can create.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**shmem_ref_transfer_mode_attached_segment_↩ allocation** (p. 1106)
	<<***extension***>> *(*p. *116)* Allocation resource for the shared memory segments attached by the **dds::sub↩ ::DataReader** (p. 976).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**instance_replacement** (p. 1106)
	<<***extension***>> *(*p. *116)* Sets the kind of instances allowed to be replaced for each instance state (**dds↩ ::sub::status::InstanceState** (p. 1615)) when a Data↩ Reader reaches **dds::core::policy::ResourceLimits↩ ::max_instances** (p. 2206).
rti::core::policy::DataReaderResourceLimits (p. 1081)	**autopurge_remote_not_alive_writer_delay** (p. 1103)
	<<***extension***>> *(*p. *116)* Maximum duration for which the **dds::sub::DataReader** (p. 976) will maintain information regarding a **dds::pub::DataWriter** (p. 1138) once the **dds::pub::DataWriter** (p. 1138) has become not alive.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**lazily_allocate_batch_resources** (p. 1105)

	<<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) pre-allocates resources for receiving batches of samples or lazily allocates them when needed.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_reader_filters** (p. 1239)
	<<***extension***>> *(p. 116)* The maximum number of remote DataReaders for which the **dds::pub::DataWriter** (p. 1138) will perform content-based filtering.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_batches** (p. 1239)
	<<***extension***>> *(p. 116)* Represents the initial number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_batches** (p. 1240)
	<<***extension***>> *(p. 116)* Represents the maximum number of batches a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**instance_replacement** (p. 1241)
	<<***extension***>> *(p. 116)* Sets the kinds of instances allowed to be replaced when instance resource limits are reached.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**replace_empty_instances** (p. 1242)
	<<***extension***>> *(p. 116)* Whether or not to replace empty instances during instance replacement
rti::core::policy::DataWriterResourceLimits (p. 1235)	**autoregister_instances** (p. 1242)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Whether or not to automatically register new instances
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_virtual_writers** (p. 1244)
	<<***extension***>> *(p. 116)* The maximum number of virtual writers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_virtual_writers** (p. 1243)

	<<***extension***>> *(*p. *116)* The initial number of virtual writers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_remote_readers** (p. 1244)
	<<***extension***>> *(*p. *116)* Controls the initial memory allocation for the matched remote readers of a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_remote_readers** (p. 1244)
	<<***extension***>> *(*p. *116)* The maximum number of remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_app_ack_remote_readers** (p. 1245)
	<<***extension***>> *(*p. *116)* The maximum number of application-level acknowledging remote readers supported by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_active_topic_queries** (p. 1246)
	<<***extension***>> *(*p. *116)* Represents the initial number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_active_topic_queries** (p. 1246)
	<<***extension***>> *(*p. *116)* Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 1138) will manage.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**writer_loaned_sample_allocation** (p. 1247)
	<<***extension***>> *(*p. *116)* Represents the allocation settings of loaned samples managed by a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initialize_writer_loaned_sample** (p. 1248)
	<<***extension***>> *(*p. *116)* Whether or not to initialize loaned samples returned by a **dds::pub::DataWriter** (p. 1138)
rti::core::policy::DataWriterTransferMode (p. 1253)	**shmem_ref_settings** (p. 1254)
	<<***extension***>> *(*p. *116)* Settings related to transferring data using shared memory references.
rti::core::policy::DataReaderProtocol (p. 1059)	**virtual_guid** (p. 1060)
	<<***extension***>> *(*p. *116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataReaderProtocol (p. 1059)	**rtps_object_id** (p. 1061)
	<<***extension***>> *(*p. *116)* The RTPS Object ID.

rti::core::policy::DataReaderProtocol (p. 1059)	**rtps_reliable_reader** (p. 1064)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **dds::sub::DataReader** (p. 976). This parameter only has effect if the reader is configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DataReaderProtocol (p. 1059)	**expects_inline_qos** (p. 1062)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Specifies whether this DataReader expects inline QoS with every sample.
rti::core::policy::DataReaderProtocol (p. 1059)	**disable_positive_acks** (p. 1062)
	<<***extension***>> *(p. 116)* Whether the reader sends positive acknowledgements to writers.
rti::core::policy::DataReaderProtocol (p. 1059)	**propagate_dispose_of_unregistered_instances** (p. 1063)
	<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617) state without being in the **dds::sub::status::InstanceState::alive()** (p. 1617) state.
rti::core::policy::DataReaderProtocol (p. 1059)	**propagate_unregister_of_disposed_instances** (p. 1064)
	<<***extension***>> *(p. 116)* Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) state directly from the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1617).
rti::core::policy::DataWriterProtocol (p. 1210)	**virtual_guid** (p. 1212)
	<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataWriterProtocol (p. 1210)	**rtps_object_id** (p. 1212)
	<<***extension***>> *(p. 116)* The RTPS Object ID.
rti::core::policy::DataWriterProtocol (p. 1210)	**push_on_write** (p. 1213)
	<<***extension***>> *(p. 116)* Whether to push sample out when write is called.
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_positive_acks** (p. 1214)
	<<***extension***>> *(p. 116)* Controls whether or not the writer expects positive acknowledgements from matching readers.
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_inline_keyhash** (p. 1214)

	<<***extension***>> *(p. 116)* Controls whether or not a keyhash is propagated on the wire with each sample.
rti::core::policy::DataWriterProtocol (p. 1210)	**serialize_key_with_dispose** (p. 1215)
	<<***extension***>> *(p. 116)* Controls whether or not the serialized key is propagated on the wire with dispose samples.
rti::core::policy::DataWriterProtocol (p. 1210)	**propagate_app_ack_with_no_response** (p. 1216)
	<<***extension***>> *(p. 116)* Controls whether or not a **dds::pub::DataWriter** (p. 1138) receives **dds::pub::DataWriterListener::on_application_acknowledgment** (p. 1207) notifications with an empty or invalid response.
rti::core::policy::DataWriterProtocol (p. 1210)	**rtps_reliable_writer** (p. 1217)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **dds::pub::DataWriter** (p. 1138). This parameter only has effect if both the writer and the matching reader are configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DataWriterProtocol (p. 1210)	**initial_virtual_sequence_number** (p. 1218)
	<<***extension***>> *(p. 116)* Determines, the initial virtual sequence number for this DataWriter.
rti::core::policy::SystemResourceLimits (p. 2443)	**max_objects_per_thread** (p. 2445)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum number of objects that can be stored per thread for a DomainParticipantFactory.
rti::core::policy::SystemResourceLimits (p. 2443)	**initial_objects_per_thread** (p. 2445)
	<<***extension***>> *(p. 116)* The number of objects per thread for a DomainParticipantFactory for which infrastructure will initially be allocated.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_allocation** (p. 1398)
	<<***extension***>> *(p. 116)* Allocation settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_allocation** (p. 1398)
	<<***extension***>> *(p. 116)* Allocation settings applied to local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_allocation** (p. 1399)

	<<***extension***>> *(p. 116)* Allocation settings applied to local Publisher.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_allocation** (p. 1399)
	<<***extension***>> *(p. 116)* Allocation settings applied to local Topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_allocation** (p. 1400)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_allocation** (p. 1401)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_allocation** (p. 1401)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_allocation** (p. 1402)
	<<***extension***>> *(p. 116)* Allocation settings applied to matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_allocation** (p. 1402)
	<<***extension***>> *(p. 116)* Allocation settings applied to matching local reader and remote/local writer pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_allocation** (p. 1403)
	<<***extension***>> *(p. 116)* Allocation settings applied to ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_allocation** (p. 1403)
	<<***extension***>> *(p. 116)* Allocation settings applied to content filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_allocation** (p. 1404)

	<<***extension***>> *(p. 116)* Allocation settings applied to content filter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**read_condition_allocation** (p. 1404)
	<<***extension***>> *(p. 116)* Allocation settings applied to read condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**query_condition_allocation** (p. 1405)
	<<***extension***>> *(p. 116)* Allocation settings applied to query condition pool.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**outstanding_asynchronous_sample_allocation** (p. 1405)
	<<***extension***>> *(p. 116)* Allocation settings applied to the maximum number of samples (from all **dds::pub::↩ DataWriter** (p. 1138)) waiting to be asynchronously written.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_allocation** (p. 1406)
	<<***extension***>> *(p. 116)* Allocation settings applied to flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_hash_buckets** (p. 1406)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Hash_Buckets settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_hash_buckets** (p. 1407)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_hash_buckets** (p. 1407)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Publisher.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_hash_buckets** (p. 1408)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_hash_buckets** (p. 1408)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Topic.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_hash_buckets** (p. 1409)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_hash_buckets** (p. 1409)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_hash_buckets** (p. 1410)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_hash_buckets** (p. 1410)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local reader and remote/local writer pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for content filtered topics.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for content filters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_hash_buckets** (p. 1413)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_gather_destinations** (p. 1413)
	<<***extension***>> *(p. 116)* Maximum number of destinations per RTI Connext send.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_user_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::domain::qos::DomainParticipantQos** (p. 1384) and **dds::topic::ParticipantBuiltinTopicData** (p. 1908)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**topic_data_max_length** (p. 1414)
	<<***extension***>> *(p. 116)* Maximum length of topic data in **dds::topic::qos::TopicQos** (p. 2509), **dds::topic::TopicBuiltinTopicData** (p. 2493), **dds::topic::PublicationBuiltinTopicData** (p. 1977) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**publisher_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::pub::qos::PublisherQos** (p. 2007) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**subscriber_group_data_max_length** (p. 1415)
	<<***extension***>> *(p. 116)* Maximum length of group data in **dds::sub::qos::SubscriberQos** (p. 2423) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::pub::qos::DataWriterQos** (p. 1226) and **dds::topic::PublicationBuiltinTopicData** (p. 1977)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_user_data_max_length** (p. 1416)
	<<***extension***>> *(p. 116)* Maximum length of user data in **dds::sub::qos::DataReaderQos** (p. 1072) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partitions** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1923).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_partition_cumulative_characters** (p. 1417)
	<<***extension***>> *(p. 116)* Maximum number of combined characters allowable in all partition names in a **dds::core::policy::Partition** (p. 1923).

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_code_max_serialized_length** (p. 1418)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Maximum size of serialized string for type code.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_serialized_length** (p. 1419)
	<<***extension***>> *(p. 116)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_object_max_deserialized_length** (p. 1420)
	<<***extension***>> *(p. 116)* The maximum number of bytes that a deserialized TypeObject v1 can consume.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**deserialized_type_object_dynamic_allocation_threshold** (p. 1420)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**serialized_type_object_dynamic_allocation_threshold** (p. 1421)
	<<***extension***>> *(p. 116)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**contentfilter_property_max_length** (p. 1422)
	<<***extension***>> *(p. 116)* This field is the maximum length of all data related to a Content-filtered topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_seq_max_length** (p. 1423)
	<<***extension***>> *(p. 116)* Maximum number of channels that can be specified in **rti::core::policy::MultiChannel** (p. 1749) for MultiChannel DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**channel_filter_expression_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum length of a channel **rti::core::ChannelSettings::filter_expression** (p. 923) in a MultiChannel DataWriter.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_list_max_length** (p. 1424)
	<<***extension***>> *(p. 116)* Maximum number of properties associated with the **dds::domain::DomainParticipant** (p. 1326).

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**participant_property_string_max_length** (p. 1425)
	<<***extension***>> *(*p. *116)* Maximum string length of the properties associated with the **dds::domain::Domain**↩ **Participant** (p. 1326).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_list_max_length** (p. 1425)
	<<***extension***>> *(*p. *116)* Maximum number of properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_property_string_max_length** (p. 1426)
	<<***extension***>> *(*p. *116)* Maximum string length of the properties associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_list_max_length** (p. 1426)
	<<***extension***>> *(*p. *116)* Maximum number of properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_property_string_max_length** (p. 1427)
	<<***extension***>> *(*p. *116)* Maximum string length of the properties associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_endpoint_groups** (p. 1427)
	<<***extension***>> *(*p. *116)* Maximum number of **rti**↩ **::core::EndpointGroup** (p. 1515) allowable in a **rti**↩ **::core::policy::Availability** (p. 868).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**max_endpoint_group_cumulative_characters** (p. 1428)
	<<***extension***>> *(*p. *116)* Maximum number of combined role_name characters allowed in all **rti::core**↩ **::EndpointGroup** (p. 1515) in a **rti::core::policy::**↩ **Availability** (p. 868).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**transport_info_list_max_length** (p. 1428)
	<<***extension***>> *(*p. *116)* Maximum number of installed transports to send and receive information about in **dds::topic::ParticipantBuiltinTopic**↩ **Data::transport_info** (p. 1914).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_replacement_kind** (p. 1429)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **rti::core::policy::DomainParticipant↩ ResourceLimits::ignored_entity_allocation** (p. 1403) are reached.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_allocation** (p. 1429)
	<<***extension***>> *(p. 116)* Allocation settings applied to remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_hash_buckets** (p. 1430)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote TopicQueries.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_data_tag_list_max_length** (p. 1431)
	<<***extension***>> *(p. 116)* Maximum number of data tags associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**writer_data_tag_string_max_length** (p. 1431)
	<<***extension***>> *(p. 116)* Maximum string length of the data tags associated with a **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_data_tag_list_max_length** (p. 1432)
	<<***extension***>> *(p. 116)* Maximum number of data tags associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**reader_data_tag_string_max_length** (p. 1432)
	<<***extension***>> *(p. 116)* Maximum string length of the data tags associated with a **dds::sub::DataReader** (p. 976).
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**shmem_ref_transfer_mode_max_segments** (p. 1433)
	<<***extension***>> *(p. 116)* Maximum number of segments created by all DataWriters belonging to a **dds↩ ::domain::DomainParticipant** (p. 1326).
rti::core::policy::Event (p. 1541)	**thread** (p. 1542)
	<<***extension***>> *(p. 116)* Event thread QoS.
rti::core::policy::Event (p. 1541)	**initial_count** (p. 1543)
	<<***extension***>> *(p. 116)* The initial number of events.

rti::core::policy::Event (p. 1541)	**max_count** (p. 1543)
	<<***extension***>> *(p. 116)* The maximum number of events.
rti::core::policy::Database (p. 969)	**thread** (p. 971)
	<<***extension***>> *(p. 116)* Database thread settings.
rti::core::policy::Database (p. 969)	**shutdown_timeout** (p. 972)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum wait time during a shutdown.
rti::core::policy::Database (p. 969)	**cleanup_period** (p. 972)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The period at which the database thread wakes up to remove deleted records.
rti::core::policy::Database (p. 969)	**shutdown_cleanup_period** (p. 973)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The clean-up period used during database shut-down.
rti::core::policy::Database (p. 969)	**initial_records** (p. 974)
	<<***extension***>> *(p. 116)* The initial number of total records.
rti::core::policy::Database (p. 969)	**max_skiplist_level** (p. 974)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum level of the skiplist.
rti::core::policy::Database (p. 969)	**initial_weak_references** (p. 975)
	<<***extension***>> *(p. 116)* The initial number of weak references.
rti::core::policy::Database (p. 969)	**max_weak_references** (p. 974)
	<<***extension***>> *(p. 116)* The maximum number of weak references.
rti::core::policy::ReceiverPool (p. 2144)	**thread** (p. 2146)
	<<***extension***>> *(p. 116)* Receiver pool thread(s).
rti::core::policy::ReceiverPool (p. 2144)	**buffer_size** (p. 2147)
	<<***extension***>> *(p. 116)* The receive buffer size in bytes.
rti::core::policy::ReceiverPool (p. 2144)	**buffer_alignment** (p. 2148)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The receive buffer alignment.
rti::core::policy::DiscoveryConfig (p. 1271)	**remote_participant_purge_kind** (p. 1281)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_liveliness_loss_detection_period** (p. 1281)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_reader_resource_limits** (p. 1285)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader** (p. 1286)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_reader_resource_limits** (p. 1287)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader** (p. 1288)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_reader_resource_limits** (p. 1289)
	<<***extension***>> *(p. 116)* Resource limits.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_writer** (p. 1296)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) **dds::core::policy::ReliabilityKind_def** (p. 2156).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_publish_mode** (p. 1298)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_publish_mode** (p. 1298)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**asynchronous_publisher** (p. 1299)

	<<***extension***>> *(*p. *116)* Asynchronous publishing settings for the discovery **dds::pub::Publisher** (p. 1993) and all entities that are created by it.
rti::core::policy::DiscoveryConfig (p. 1271)	**default_domain_announcement_period** (p. 1300)
	<<***extension***>> *(*p. *116)* The period to announce a participant to the default domain 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**ignore_default_domain_announcements** (p. 1301)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader_reliability_kind** (p. 1295)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Reliability policy for a built-in participant message reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader** (p. 1295)
	<<***extension***>> *(*p. *116)* RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind** (p. 1295) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157).
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer** (p. 1289)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**publication_writer_data_lifecycle** (p. 1291)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in publication writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer** (p. 1291)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**subscription_writer_data_lifecycle** (p. 1293)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in subscription writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**builtin_discovery_plugins** (p. 1293)
	<<***extension***>> *(*p. *116)* Mask of built-in discovery plugin kinds.

rti::core::policy::DiscoveryConfig (p. 1271)	**enabled_builtin_channels** (p. 1294)
	<<***extension***>> *(p. 116)* The mask specifying which built-in channels should be enabled.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer** (p. 1301)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_data_lifecycle** (p. 1303)
	<<***extension***>> *(p. 116)* Writer data lifecycle settings for a built-in **rti::topic::ServiceRequest** (p. 2358) writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_writer_publish_mode** (p. 1303)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in service request writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**service_request_reader** (p. 1304)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for a built-in **rti::topic::ServiceRequest** (p. 2358) reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_assert_period** (p. 1305)
	<<***extension***>> *(p. 116)* Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.
rti::core::policy::DiscoveryConfig (p. 1271)	**locator_reachability_change_detection_period** (p. 1306)
	<<***extension***>> *(p. 116)* Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer** (p. 1307)
	<<***extension***>> *(p. 116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_writer_publish_mode** (p. 1309)
	<<***extension***>> *(p. 116)* Publish mode policy for the built-in secure volatile writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**secure_volatile_reader** (p. 1309)
	<<***extension***>> *(p. 116)* RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**endpoint_type_object_lb_serialization_threshold** (p. 1310)

	<<***extension***>> *(*p. *116)* Controls when/if the Type↩ Object v1 is compressed when propagated in Simple Endpoint Discovery.
rti::core::policy::DiscoveryConfig (p. 1271)	**dns_tracker_polling_period** (p. 1311)
	<<***extension***>> *(*p. *116)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader** (p. 1312)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_reader_resource_limits** (p. 1313)
	<<***extension***>> *(*p. *116)* Resource limits for the built-in topic participant configuration reader.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_publish_mode** (p. 1316)
	<<***extension***>> *(*p. *116)* Publish mode policy for the built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer** (p. 1314)
	<<***extension***>> *(*p. *116)* RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_configuration_writer_data_lifecycle** (p. 1316)
	<<***extension***>> *(*p. *116)* Writer data lifecycle settings for a built-in participant configuration writer.
rti::core::policy::DiscoveryConfig (p. 1271)	**request_types_filter** (p. 1317)
	<<***extension***>> *(*p. *116)* Topic name pattern for requesting all types via Type Lookup Service.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_heartbeat_response_delay** (p. 2223)
	<<***extension***>> *(*p. *116)* The minimum delay to respond to a heartbeat.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**max_heartbeat_response_delay** (p. 2224)
	<<***extension***>> *(*p. *116)* The maximum delay to respond to a heartbeat.
rti::core::RtpsReliableReaderProtocol (p. 2221)	**heartbeat_suppression_duration** (p. 2224)
	<<***extension***>> *(*p. *116)* The duration a reader ignores consecutively received heartbeats

rti::core::RtpsReliableReaderProtocol (p. 2221)	**nack_period** (p. 2225)
	<<***extension***>> *(p. 116)* The period at which to send NACKs
rti::core::RtpsReliableReaderProtocol (p. 2221)	**receive_window_size** (p. 2226)
	<<***extension***>> *(p. 116)* The number of received out-of-order samples a reader can keep at a time
rti::core::RtpsReliableReaderProtocol (p. 2221)	**round_trip_time** (p. 2226)
	<<***extension***>> *(p. 116)* The duration from sending a NACK to receiving a repair of a sample
rti::core::RtpsReliableReaderProtocol (p. 2221)	**app_ack_period** (p. 2227)
	<<***extension***>> *(p. 116)* The period at which application-level acknowledgment messages are sent
rti::core::RtpsReliableReaderProtocol (p. 2221)	**min_app_ack_response_keep_duration** (p. 2227)
	<<***extension***>> *(p. 116)* Minimum duration for which application-level acknowledgment response data is kept
rti::core::RtpsReliableReaderProtocol (p. 2221)	**samples_per_app_ack** (p. 2228)
	<<***extension***>> *(p. 116)* The minimum number of samples acknowledged by one application-level acknowledgment message
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**low_watermark** (p. 2232)
	<<***extension***>> *(p. 116)* When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) is considered to have changed.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**high_watermark** (p. 2233)
	<<***extension***>> *(p. 116)* When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385) is considered to have changed.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**virtual_heartbeat_period** (p. 2237)
	<<***extension***>> *(p. 116)* The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**samples_per_virtual_heartbeat** (p. 2238)
	<<***extension***>> *(*p. *116)* The number of samples that a reliable writer has to publish before sending a virtual heartbeat.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_heartbeat_retries** (p. 2239)
	<<***extension***>> *(*p. *116)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**inactivate_nonprogressing_readers** (p. 2239)
	<<***extension***>> *(*p. *116)* Whether to treat remote readers as inactive when their NACKs do not progress
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**heartbeats_per_max_samples** (p. 2240)
	<<***extension***>> *(*p. *116)* The number of piggyback heartbeats sent per max send window.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**min_nack_response_delay** (p. 2242)
	<<***extension***>> *(*p. *116)* The minimum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_nack_response_delay** (p. 2242)
	<<***extension***>> *(*p. *116)* The maximum delay to respond to a NACK or NACK_FRAG.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**nack_suppression_duration** (p. 2243)
	<<***extension***>> *(*p. *116)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**max_bytes_per_nack_response** (p. 2244)
	<<***extension***>> *(*p. *116)* The maximum total message size when resending rejected samples or data fragments.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_enable_adaptive_sample_↩ keep_duration** (p. 2247)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Enables dynamic adjustment of sample keep duration in response to congestion.

rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_min_sample_keep_duration** (p. 2245)
	<<***extension***>> *(p. 116)* The minimum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_max_sample_keep_duration** (p. 2246)
	<<***extension***>> *(p. 116)* The maximum duration a sample is queued for ACK-disabled readers.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_decrease_sample_keep_duration_factor** (p. 2248)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Controls rate of contraction of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_increase_sample_keep_duration_factor** (p. 2248)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Controls rate of growth of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_update_period** (p. 2251)
	<<***extension***>> *(p. 116)* Period in which send window may be dynamically changed
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_increase_factor** (p. 2252)
	<<***extension***>> *(p. 116)* Increases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**send_window_decrease_factor** (p. 2253)
	<<***extension***>> *(p. 116)* Decreases send window size by this percentage when reacting dynamically to network conditions
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**enable_multicast_periodic_heartbeat** (p. 2254)
	<<***extension***>> *(p. 116)* Whether periodic heartbeat messages are sent over multicast
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**multicast_resend_threshold** (p. 2254)
	<<***extension***>> *(p. 116)* The minimum number of requesting readers needed to trigger a multicast resend
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_repair_piggyback_heartbeat** (p. 2255)

	<<***extension***>> *(*p. *116)* Prevents piggyback heartbeats from being sent with repair samples
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_samples** (p. 909)
	<<***extension***>> *(*p. *116)* Initial number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples** (p. 909)
	<<***extension***>> *(*p. *116)* Maximum number of samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_infos** (p. 910)
	<<***extension***>> *(*p. *116)* Initial number of sample infos.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_infos** (p. 911)
	<<***extension***>> *(*p. *116)* Maximum number of sample infos.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_outstanding_reads** (p. 911)
	<<***extension***>> *(*p. *116)* The initial number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_outstanding_reads** (p. 912)
	<<***extension***>> *(*p. *116)* The maximum number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_samples_per_read** (p. 912)
	<<***extension***>> *(*p. *116)* Maximum number of samples that can be read/taken on a same built-in topic **dds::sub::DataReader** (p. 976).
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**disable_fragmentation_support** (p. 913)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Determines whether the built-in topic **dds::sub::Data↩ Reader** (p. 976) can receive fragmented samples.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples** (p. 913)

	<<***extension***>> *(*p. *116)* The maximum number of samples for which the built-in topic **dds::sub::Data↩ Reader** (p. 976) may store fragments at a given point in time.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**initial_fragmented_samples** (p. 914)
	<<***extension***>> *(*p. *116)* The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragmented_samples_per_remote_writer** (p. 915)
	<<***extension***>> *(*p. *116)* The maximum number of samples per remote writer for which a built-in topic **dds↩ ::sub::DataReader** (p. 976) may store fragments.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**max_fragments_per_sample** (p. 916)
	<<***extension***>> *(*p. *116)* Maximum number of fragments for a single sample.
rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**dynamically_allocate_fragmented_samples** (p. 916)
	<<***extension***>> *(*p. *116)* Determines whether the built-in topic **dds::sub::DataReader** (p. 976) pre-allocates storage for storing fragmented samples.
dds::core::policy::DataTag (p. 1132)	**tags** (p. 1137)
	<<***spec***>> *(*p. *112)* Sequence of data tags.
rti::core::policy::EntityName (p. 1530)	**role_name** (p. 1532)
	<<***extension***>> *(*p. *116)* The entity role name.
rti::core::policy::Service (p. 2350)	**kind** (p. 2354)
	<<***extension***>> *(*p. *116)* The kind of service.
rti::core::policy::Batch (p. 880)	**max_flush_delay** (p. 884)
	<<***extension***>> *(*p. *116)* The maximum flush delay.
rti::core::policy::Batch (p. 880)	**source_timestamp_resolution** (p. 885)
	<<***extension***>> *(*p. *116)* Batch source timestamp resolution.
rti::core::policy::Batch (p. 880)	**thread_safe_write** (p. 886)
	<<***extension***>> *(*p. *116)* Determines whether or not the write operation is thread safe.
rti::core::ChannelSettings (p. 921)	**multicast_settings** (p. 922)

	<<***extension***>> *(*p. *116)* A sequence of **rti::core::↩ TransportMulticastSettings** (p. 2549) used to configure the multicast addresses associated with a channel.
rti::core::ChannelSettings (p. 921)	**filter_expression** (p. 923)
	<<***extension***>> *(*p. *116)* A logical expression used to determine the data that will be published in the channel.
rti::core::ChannelSettings (p. 921)	**priority** (p. 924)
	<<***extension***>> *(*p. *116)* Publication priority
rti::core::policy::MultiChannel (p. 1749)	**channels** (p. 1751)
	<<***extension***>> *(*p. *116)* A sequence of **rti::core::↩ ChannelSettings** (p. 921) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.
rti::core::policy::MultiChannel (p. 1749)	**filter_name** (p. 1752)
	<<***extension***>> *(*p. *116)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.
rti::core::policy::TopicQueryDispatch (p. 2522)	**enable** (p. 2524)
	<<***extension***>> *(*p. *116)* Allows this writer to dispatch TopicQueries
rti::core::policy::TopicQueryDispatch (p. 2522)	**samples_per_period** (p. 2525)
	<<***extension***>> *(*p. *116)* Sets the maximum number of samples to publish in each publication_period.

6.77 Mutable QoS

This page lists all QoS that are always mutable.

This page lists all QoS that are always mutable.

Mutable QoS can always be changed regardless of whether the entity has been enabled or not. QoS that are immutable after an entity has been enabled are listed on the **Immutable QoS** (p. 243) page.

Basic Settings

dds::core::policy::Deadline (p. 1255)	**period** (p. 1258)
	<<***basic***>> *(*p. *104)* <<***spec***>> *(*p. *112)* Duration of the deadline period.
dds::core::policy::OwnershipStrength (p. 1906)	**value** (p. 1908)

	<<***basic***>> (p. *104*) <<***spec***>> (p. *112*) The strength value used to arbitrate among multiple writers.
dds::core::policy::TimeBasedFilter (p. 2469)	**minimum_separation** (p. 2472)
	<<***basic***>> (p. *104*) <<***spec***>> (p. *112*) The minimum separation duration between subsequent samples.
dds::core::policy::Partition (p. 1923)	**name** (p. 1926)
	<<***basic***>> (p. *104*) <<***spec***>> (p. *112*) A list of partition names
dds::core::policy::EntityFactory (p. 1527)	**autoenable_created_entities** (p. 1529)
	<<***basic***>> (p. *104*) <<***spec***>> (p. *112*) Specifies whether the entity acting as a factory automatically enables the instances it creates.
dds::core::policy::Lifespan (p. 1635)	**duration** (p. 1637)
	<<***basic***>> (p. *104*) <<***spec***>> (p. *112*) Maximum duration for the data's validity.
rti::core::policy::Property (p. 1969)	**value** (p. 1973)
	<<***basic***>> (p. *104*) <<***extension***>> (p. *116*) Sequence of properties.
rti::config::Logger (p. 1683)	**verbosity** (p. 1685)
	<<***basic***>> (p. *104*) <<***extension***>> (p. *116*) The verbosities at which RTI Connext diagnostic information is logged.
rti::config::Logger (p. 1683)	**category** (p. 1685)
	<<***basic***>> (p. *104*) <<***extension***>> (p. *116*) Categories of logged messages.
rti::config::Logger (p. 1683)	**output_file** (p. 1686)
	<<***basic***>> (p. *104*) <<***extension***>> (p. *116*) Specifies the file to which log messages will be redirected to.
rti::config::Logger (p. 1683)	**output_file_suffix** (p. 1687)
	<<***basic***>> (p. *104*) <<***extension***>> (p. *116*) Sets the file suffix when logging to a set of files
rti::core::MonitoringEventDistributionSettings (p. 1722)	**publication_period** (p. 1726)
	<<***basic***>> (p. *104*) <<***extension***>> (p. *116*) Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**polling_period** (p. 1744)

	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Period at which the periodic metric thread polls and publishes the periodic metrics.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**max_historical_logs** (p. 1729)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* The number of log messages that RTI Monitoring Library 2.0 will keep as history.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**publication_period** (p. 1732)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Period at which the logging thread publishes log messages.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**enable** (p. 1713)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Enables the use of a dedicated **dds::domain::Domain↩ Participant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**domain_id** (p. 1713)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1326).
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**collector_initial_peers** (p. 1715)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **rti::core::MonitoringDistribution↩ Settings::dedicated_participant** (p. 1719).
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**middleware_forwarding_level** (p. 1734)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Log messages with **rti::config::LogFacility::middleware** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**security_event_forwarding_level** (p. 1734)
	<<***basic***>> *(*p. *104)* <<***extension***>> *(*p. *116)* Log messages with **rti::config::LogFacility::security_↩ event** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**service_forwarding_level** (p. 1735)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::service** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringLoggingForwardingSettings (p. 1733)	**user_forwarding_level** (p. 1736)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Log messages with **rti::config::LogFacility::user** (p. 459) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.
rti::core::MonitoringTelemetryData (p. 1744)	**metrics** (p. 1745)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Sequence of **rti::core::MonitoringMetricSelection** (p. 1736) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.
rti::core::MonitoringTelemetryData (p. 1744)	**logs** (p. 1746)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* **rti::core::MonitoringLoggingForwardingSettings** (p. 1733) containing the **rti::config::SyslogVerbosity** (p. 458) levels that will be forwarded for the different **rti::config::LogFacility** (p. 459).
rti::core::policy::Monitoring (p. 1706)	**enable** (p. 1708)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.
rti::core::policy::Monitoring (p. 1706)	**application_name** (p. 1709)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The name of the resource that represents this RTI Connext application.

Advanced Settings

dds::core::policy::UserData (p. 2591)	**value** (p. 2593)
	<<***spec***>> *(p. 112)* a sequence of octets
dds::core::policy::GroupData (p. 1591)	**value** (p. 1593)
	<<***spec***>> *(p. 112)* a sequence of octets
rti::core::policy::Availability (p. 868)	**max_data_availability_waiting_time** (p. 871)

	<<***extension***>> *(p. 116)* Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
rti::core::policy::Availability (p. 868)	**max_endpoint_availability_waiting_time** (p. 872)
	<<***extension***>> *(p. 116)* Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
rti::core::policy::Availability (p. 868)	**required_matched_endpoint_groups** (p. 873)
	<<***extension***>> *(p. 116)* A sequence of endpoint groups.
dds::core::policy::LatencyBudget (p. 1631)	**duration** (p. 1633)
	<<***spec***>> *(p. 112)* Duration of the maximum acceptable delay.
rti::config::Logger (p. 1683)	**print_format** (p. 1688)
	<<***extension***>> *(p. 116)* The format used to output RTI Connext diagnostic information.
rti::config::Logger (p. 1683)	**max_bytes_per_file** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of bytes a single file can contain
rti::config::Logger (p. 1683)	**max_files** (p. 1687)
	<<***extension***>> *(p. 116)* Specifies the maximum number of files to create before overwritting the previous ones.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**concurrency_level** (p. 1723)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**datawriter_qos_profile_name** (p. 1724)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes event metrics.
rti::core::MonitoringEventDistributionSettings (p. 1722)	**thread** (p. 1726)
	<<***extension***>> *(p. 116)* The settings of the event metric thread.
rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**datawriter_qos_profile_name** (p. 1742)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes periodic metrics.

rti::core::MonitoringPeriodicDistributionSettings (p. 1740)	**thread** (p. 1743)
	<<***extension***>> *(p. 116)* The settings of the periodic metric thread.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**concurrency_level** (p. 1729)
	<<***extension***>> *(p. 116)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**datawriter_qos_profile_name** (p. 1730)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 1138) that distributes log messages.
rti::core::MonitoringLoggingDistributionSettings (p. 1727)	**thread** (p. 1731)
	<<***extension***>> *(p. 116)* The settings of the logging thread.
rti::core::MonitoringDedicatedParticipantSettings (p. 1712)	**participant_qos_profile_name** (p. 1714)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1326) that will be used to distribute telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**dedicated_participant** (p. 1719)
	<<***extension***>> *(p. 116)* Configures the use of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**publisher_qos_profile_name** (p. 1718)
	<<***extension***>> *(p. 116)* The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.
rti::core::MonitoringDistributionSettings (p. 1716)	**event_settings** (p. 1720)
	<<***extension***>> *(p. 116)* Configures the distribution of event metrics.
rti::core::MonitoringDistributionSettings (p. 1716)	**periodic_settings** (p. 1720)
	<<***extension***>> *(p. 116)* Configures the distribution of periodic metrics.
rti::core::MonitoringDistributionSettings (p. 1716)	**logging_settings** (p. 1721)
	<<***extension***>> *(p. 116)* Configures the distribution of logging messages.

rti::core::MonitoringMetricSelection (p. 1736)	**resource_selection** (p. 1737)
	<<***extension***>> *(p. 116)* An expression pattern that selects a subset of resources by matching the pattern to the resource names. **rti::core::MonitoringMetric↩ Selection::enabled_metrics_selection** (p. 1738) and **rti::core::MonitoringMetricSelection::disabled_↩ metrics_selection** (p. 1739) are applied to this subset of resources.
rti::core::MonitoringMetricSelection (p. 1736)	**enabled_metrics_selection** (p. 1738)
	<<***extension***>> *(p. 116)* A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **rti::core::Monitoring↩ MetricSelection::resource_selection** (p. 1737).
rti::core::MonitoringMetricSelection (p. 1736)	**disabled_metrics_selection** (p. 1739)
	<<***extension***>> *(p. 116)* A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **rti::core::Monitoring↩ MetricSelection::resource_selection** (p. 1737).
rti::core::policy::Monitoring (p. 1706)	**distribution_settings** (p. 1710)
	<<***extension***>> *(p. 116)* Configures the distribution of telemetry data.
rti::core::policy::Monitoring (p. 1706)	**telemetry_data** (p. 1711)
	<<***extension***>> *(p. 116)* Configures the telemetry data that will be distributed.

6.78 Other QoS Attributes

These attributes are characteristics of the QoS – for example if they are **mutable** (p. 280) or **immutable** (p. 243), or if they **apply per-instance** (p. 287).

Modules

- **Applied Per-Instance**

  These QoS are applied per-instance.
- **Discovery Metadata**

  These QoS are sent as part of one of the built-in discovery topics.
- **Matching**

  These QoS affect participant and endpoint matching.

6.78.1 Detailed Description

These attributes are characteristics of the QoS – for example if they are **mutable** (p. 280) or **immutable** (p. 243), or if they **apply per-instance** (p. 287).

6.79 Applied Per-Instance

These QoS are applied per-instance.

These QoS are applied per-instance.

For example, the **dds::core::policy::History::depth** (p. 1605) configures the number of samples that are stored in the DataWriter and DataReader queues *per-instance*.

Basic Settings

dds::core::policy::Durability (p. 1433)	**writer_depth** (p. 1439)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Indicates the number of samples per instance that a durable **dds::pub::↩ DataWriter** (p. 1138) will send to a late-joining **dds::sub::↩ DataReader** (p. 976).
dds::core::policy::Deadline (p. 1255)	**period** (p. 1258)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Duration of the deadline period.
dds::core::policy::Ownership (p. 1899)	**kind** (p. 1904)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The kind of ownership
dds::core::policy::OwnershipStrength (p. 1906)	**value** (p. 1908)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The strength value used to arbitrate among multiple writers.
dds::core::policy::TimeBasedFilter (p. 2469)	**minimum_separation** (p. 2472)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* The minimum separation duration between subsequent samples.
dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the desired kind of destination order.
dds::core::policy::History (p. 1602)	**kind** (p. 1604)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the kind of history to be kept.
dds::core::policy::History (p. 1602)	**depth** (p. 1605)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Specifies the number of samples per instance to be kept, when the `kind` is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607)

Advanced Settings

dds::core::policy::DurabilityService (p. 1443)	**history_kind** (p. 1445)
	<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**history_depth** (p. 1446)
	<<***spec***>> *(p. 112)* Setting to use for the **dds::core::policy::↩ Durability::writer_depth** (p. 1439) when recouping durable data.
dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)
	<<***spec***>> *(p. 112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(p. 112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::DestinationOrder (p. 1258)	**scope** (p. 1262)
	<<***spec***>> *(p. 112)* Specifies the desired scope of the source destination order.
dds::core::policy::DestinationOrder (p. 1258)	**source_timestamp_tolerance** (p. 1262)
	<<***extension***>> *(p. 116)* Allowed tolerance between source timestamps of consecutive samples.

6.80 Discovery Metadata

These QoS are sent as part of one of the built-in discovery topics.

These QoS are sent as part of one of the built-in discovery topics.

Basic Settings

dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of durability.
dds::core::policy::DataRepresentation (p. 1113)	**compression_settings** (p. 1117)
	*<<**basic**>> (p. 104) <<**extension**>> (p. 116)* Structure that contains the compression settings.
dds::core::policy::Deadline (p. 1255)	**period** (p. 1258)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Duration of the deadline period.
dds::core::policy::Ownership (p. 1899)	**kind** (p. 1904)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of ownership
dds::core::policy::OwnershipStrength (p. 1906)	**value** (p. 1908)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The strength value used to arbitrate among multiple writers.
dds::core::policy::Liveliness (p. 1645)	**kind** (p. 1649)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The kind of liveliness desired.
dds::core::policy::Liveliness (p. 1645)	**lease_duration** (p. 1649)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The duration within which a **dds::pub::DataWriter** (p. 1138) must be asserted, or else it is assumed to be not alive.
dds::core::policy::TimeBasedFilter (p. 2469)	**minimum_separation** (p. 2472)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The minimum separation duration between subsequent samples.
dds::core::policy::Partition (p. 1923)	**name** (p. 1926)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* A list of partition names
dds::core::policy::Reliability (p. 2149)	**kind** (p. 2153)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Kind of reliability.
dds::core::policy::Reliability (p. 2149)	**max_blocking_time** (p. 2153)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* The maximum time a DataWriter can block on a **write()** (p. 1179) call.
dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	*<<**basic**>> (p. 104) <<**spec**>> (p. 112)* Specifies the desired kind of destination order.

dds::core::policy::Lifespan (p. 1635)	**duration** (p. 1637)
	<<***basic***>> *(p. 104)* <<***spec***>> *(p. 112)* Maximum duration for the data's validity.
rti::core::policy::TransportMulticast (p. 2543)	**value** (p. 2545)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* A sequence of multicast communications settings.
rti::core::policy::Discovery (p. 1265)	**multicast_receive_addresses** (p. 1268)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the DomainParticipant.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_liveliness_lease_duration** (p. 1279)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The liveliness lease duration for the participant.
rti::core::policy::Property (p. 1969)	**value** (p. 1973)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* Sequence of properties.
rti::core::policy::EntityName (p. 1530)	**name** (p. 1531)
	<<***basic***>> *(p. 104)* <<***extension***>> *(p. 116)* The name of the entity.

Advanced Settings

dds::core::policy::UserData (p. 2591)	**value** (p. 2593)
	<<***spec***>> *(p. 112)* a sequence of octets
dds::core::policy::GroupData (p. 1591)	**value** (p. 1593)
	<<***spec***>> *(p. 112)* a sequence of octets
dds::core::policy::Durability (p. 1433)	**direct_communication** (p. 1438)
	<<***extension***>> *(p. 116)* Indicates whether or not a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 976) should receive samples directly from a TRANSIENT or PERSISTENT **dds::pub::DataWriter** (p. 1138)
dds::core::policy::DurabilityService (p. 1443)	**service_cleanup_delay** (p. 1445)
	<<***spec***>> *(p. 112)* Controls when the service is able to remove all information regarding a data instances.
dds::core::policy::DurabilityService (p. 1443)	**history_kind** (p. 1445)
	<<***spec***>> *(p. 112)* The kind of history to apply in recouping durable data.

dds::core::policy::DurabilityService (p. 1443)	**history_depth** (p. 1446)
	<<***spec***>> *(p. 112)* Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1439) when recouping durable data.
dds::core::policy::DurabilityService (p. 1443)	**max_samples** (p. 1446)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_instances** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
dds::core::policy::DurabilityService (p. 1443)	**max_samples_per_instance** (p. 1447)
	<<***spec***>> *(p. 112)* Part of resource limits QoS policy to apply when feeding a late joiner.
rti::core::CompressionSettings (p. 943)	**compression_ids** (p. 945)
	<<***extension***>> *(p. 116)* Mask that represents the compression algorithms enabled.
dds::core::policy::DataRepresentation (p. 1113)	**value** (p. 1116)
	<<***spec***>> *(p. 112)* Sequence of representation identifiers.
dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)
	<<***spec***>> *(p. 112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**coherent_access** (p. 1947)
	<<***spec***>> *(p. 112)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(p. 112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::LatencyBudget (p. 1631)	**duration** (p. 1633)
	<<***spec***>> *(p. 112)* Duration of the maximum acceptable delay.
dds::core::policy::Reliability (p. 2149)	**acknowledgment_kind** (p. 2154)
	<<***extension***>> *(p. 116)* Kind of reliable acknowledgment
dds::core::policy::Reliability (p. 2149)	**instance_state_consistency_kind** (p. 2155)

	<<***extension***>> *(p. 116)* Whether instance state consistency is enabled
dds::core::policy::Reliability (p. 2149)	**exact_reliability_kind_match** (p. 2155)
	<<***extension***>> *(p. 116)* Whether an exact reliability kind match is required for endpoint matching.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**kind** (p. 2565)
	<<***spec***>> *(p. 112)* Type consistency kind.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_sequence_bounds** (p. 2566)
	<<***spec***>> *(p. 112)* Controls whether sequence bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_string_bounds** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether string bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_member_names** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether member names are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**prevent_type_widening** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type widening is allowed.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**force_type_validation** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::↩ DataReader** (p. 976).
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_enum_literal_names** (p. 2569)
	<<***spec***>> *(p. 112)* Controls whether enumeration constant names are taken into consideration for type assignability.
rti::core::policy::TransportUnicast (p. 2556)	**value** (p. 2558)
	<<***extension***>> *(p. 116)* A sequence of unicast communication settings.
rti::core::policy::DataReaderProtocol (p. 1059)	**virtual_guid** (p. 1060)

	<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataReaderProtocol (p. 1059)	**expects_inline_qos** (p. 1062)
	[DEPRECATED] (p. **296)** <<***extension***>> *(p. 116)* Specifies whether this DataReader expects inline QoS with every sample.
rti::core::policy::DataReaderProtocol (p. 1059)	**disable_positive_acks** (p. 1062)
	<<***extension***>> *(p. 116)* Whether the reader sends positive acknowledgements to writers.
rti::core::policy::DataWriterProtocol (p. 1210)	**virtual_guid** (p. 1212)
	<<***extension***>> *(p. 116)* The virtual GUID (Global Unique Identifier).
rti::core::policy::DataWriterProtocol (p. 1210)	**disable_positive_acks** (p. 1214)
	<<***extension***>> *(p. 116)* Controls whether or not the writer expects positive acknowledgements from matching readers.
dds::core::policy::DataTag (p. 1132)	**tags** (p. 1137)
	<<***spec***>> *(p. 112)* Sequence of data tags.
rti::core::policy::EntityName (p. 1530)	**role_name** (p. 1532)
	<<***extension***>> *(p. 116)* The entity role name.
rti::core::policy::Service (p. 2350)	**kind** (p. 2354)
	<<***extension***>> *(p. 116)* The kind of service.
rti::core::policy::MultiChannel (p. 1749)	**channels** (p. 1751)
	<<***extension***>> *(p. 116)* A sequence of **rti::core::↩ ChannelSettings** (p. 921) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.
rti::core::policy::MultiChannel (p. 1749)	**filter_name** (p. 1752)
	<<***extension***>> *(p. 116)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.
rti::core::policy::TopicQueryDispatch (p. 2522)	**enable** (p. 2524)
	<<***extension***>> *(p. 116)* Allows this writer to dispatch TopicQueries

6.81 Matching

These QoS affect participant and endpoint matching.

These QoS affect participant and endpoint matching.

See the pages of each individual QoS for a desription of how the QoS must be set in order for two applications to be considered matching. Look for information about compatibility or request-offered (**RxO** (p. 514)) semantics.

Basic Settings

dds::core::policy::Durability (p. 1433)	**kind** (p. 1437)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) The kind of durability.
dds::core::policy::DataRepresentation (p. 1113)	**compression_settings** (p. 1117)
	*<<**basic**>>* (p. *104*) *<<**extension**>>* (p. *116*) Structure that contains the compression settings.
dds::core::policy::Deadline (p. 1255)	**period** (p. 1258)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) Duration of the deadline period.
dds::core::policy::Ownership (p. 1899)	**kind** (p. 1904)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) The kind of ownership
dds::core::policy::Liveliness (p. 1645)	**kind** (p. 1649)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) The kind of liveliness desired.
dds::core::policy::Liveliness (p. 1645)	**lease_duration** (p. 1649)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) The duration within which a **dds::pub::DataWriter** (p. 1138) must be asserted, or else it is assumed to be not alive.
dds::core::policy::Partition (p. 1923)	**name** (p. 1926)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) A list of partition names
dds::core::policy::Reliability (p. 2149)	**kind** (p. 2153)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) Kind of reliability.
dds::core::policy::DestinationOrder (p. 1258)	**kind** (p. 1261)
	*<<**basic**>>* (p. *104*) *<<**spec**>>* (p. *112*) Specifies the desired kind of destination order.

Advanced Settings

rti::core::CompressionSettings (p. 943)	**compression_ids** (p. 945)
	*<<**extension**>>* (p. *116*) Mask that represents the compression algorithms enabled.

dds::core::policy::DataRepresentation (p. 1113)	**value** (p. 1116)
	<<***spec***>> *(p. 112)* Sequence of representation identifiers.
dds::core::policy::Presentation (p. 1942)	**access_scope** (p. 1947)
	<<***spec***>> *(p. 112)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
dds::core::policy::Presentation (p. 1942)	**coherent_access** (p. 1947)
	<<***spec***>> *(p. 112)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.
dds::core::policy::Presentation (p. 1942)	**ordered_access** (p. 1948)
	<<***spec***>> *(p. 112)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
dds::core::policy::LatencyBudget (p. 1631)	**duration** (p. 1633)
	<<***spec***>> *(p. 112)* Duration of the maximum acceptable delay.
dds::core::policy::Reliability (p. 2149)	**acknowledgment_kind** (p. 2154)
	<<***extension***>> *(p. 116)* Kind of reliable acknowledgment
dds::core::policy::Reliability (p. 2149)	**instance_state_consistency_kind** (p. 2155)
	<<***extension***>> *(p. 116)* Whether instance state consistency is enabled
dds::core::policy::Reliability (p. 2149)	**exact_reliability_kind_match** (p. 2155)
	<<***extension***>> *(p. 116)* Whether an exact reliability kind match is required for endpoint matching.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**kind** (p. 2565)
	<<***spec***>> *(p. 112)* Type consistency kind.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_sequence_bounds** (p. 2566)
	<<***spec***>> *(p. 112)* Controls whether sequence bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_string_bounds** (p. 2567)

	<<***spec***>> *(p. 112)* Controls whether string bounds are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_member_names** (p. 2567)
	<<***spec***>> *(p. 112)* Controls whether member names are taken into consideration for type assignability.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**prevent_type_widening** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type widening is allowed.
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**force_type_validation** (p. 2568)
	<<***spec***>> *(p. 112)* Controls whether type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976).
dds::core::policy::TypeConsistencyEnforcement (p. 2563)	**ignore_enum_literal_names** (p. 2569)
	<<***spec***>> *(p. 112)* Controls whether enumeration constant names are taken into consideration for type assignability.

6.82 Deprecated QoS

Deprecated QoS.

Deprecated QoS.

This page lists the QoS that are deprecated. Deprecated QoS are still supported, but RTI will not support them in future releases.

dds::core::policy::ResourceLimits (p. 2203)	**instance_hash_buckets** (p. 2208)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Number of hash buckets for instances.
rti::core::policy::TypeSupport (p. 2574)	**plugin_data** (p. 2575)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Value to pass into the type plugin's de-/serialization function
rti::core::policy::TypeSupport (p. 2574)	**cdr_padding_kind** (p. 2576)
	[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Determines whether or not the padding bytes will be set to zero during CDR serialization.

rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_write** (p. 835)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous publishing.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_asynchronous_batch** (p. 836)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable asynchronous batch flushing.
rti::core::policy::AsynchronousPublisher (p. 832)	**disable_topic_query_publication** (p. 838)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Disable topic query publication.
rti::core::policy::Discovery (p. 1265)	**enable_endpoint_discovery** (p. 1271)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Whether to automatically enable endpoint discovery for all the remote participants.
rti::core::policy::DataReaderResourceLimits (p. 1081)	**disable_fragmentation_support** (p. 1092)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Determines whether the **dds::sub::DataReader** (p. 976) can receive fragmented samples.
rti::core::policy::DataWriterResourceLimits (p. 1235)	**initial_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**max_concurrent_blocking_threads** (p. 1238)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 1138).
rti::core::policy::DataWriterResourceLimits (p. 1235)	**autoregister_instances** (p. 1242)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Whether or not to automatically register new instances
rti::core::policy::DataReaderProtocol (p. 1059)	**expects_inline_qos** (p. 1062)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Specifies whether this DataReader expects inline QoS with every sample.
rti::core::policy::SystemResourceLimits (p. 2443)	**max_objects_per_thread** (p. 2445)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum number of objects that can be stored per thread for a DomainParticipantFactory.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_writer_hash_buckets** (p. 1406)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Hash_Buckets settings applied to local DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_reader_hash_buckets** (p. 1407)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_publisher_hash_buckets** (p. 1407)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Publisher.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_subscriber_hash_buckets** (p. 1408)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Subscriber.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**local_topic_hash_buckets** (p. 1408)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for local Topic.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_writer_hash_buckets** (p. 1409)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataWriters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_reader_hash_buckets** (p. 1409)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DataReaders.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_participant_hash_buckets** (p. 1410)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for remote DomainParticipants.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_writer_reader_pair_hash_buckets** (p. 1410)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local writer and remote/local reader pairs.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**matching_reader_writer_pair_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Number of hash buckets for matching local reader and remote/local writer pairs.

rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_hash_buckets** (p. 1411)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Number of hash buckets for ignored entities.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filtered_topic_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Number of hash buckets for content filtered topics.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**content_filter_hash_buckets** (p. 1412)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Number of hash buckets for content filters.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**flow_controller_hash_buckets** (p. 1413)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Number of hash buckets for flow controllers.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**type_code_max_serialized_length** (p. 1418)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Maximum size of serialized string for type code.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**ignored_entity_replacement_kind** (p. 1429)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **rti::core::policy::DomainParticipant↩ ResourceLimits::ignored_entity_allocation** (p. 1403) are reached.
rti::core::policy::DomainParticipantResourceLimits (p. 1391)	**remote_topic_query_hash_buckets** (p. 1430)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) Number of hash buckets for remote TopicQueries.
rti::core::policy::Database (p. 969)	**shutdown_timeout** (p. 972)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) The maximum wait time during a shutdown.
rti::core::policy::Database (p. 969)	**cleanup_period** (p. 972)
	[DEPRECATED] (p. **296**) <<***extension***>> (p. *116*) The period at which the database thread wakes up to remove deleted records.
rti::core::policy::Database (p. 969)	**shutdown_cleanup_period** (p. 973)

	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The clean-up period used during database shut-down.
rti::core::policy::Database (p. 969)	**max_skiplist_level** (p. 974)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum level of the skiplist.
rti::core::policy::ReceiverPool (p. 2144)	**buffer_alignment** (p. 2148)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The receive buffer alignment.
rti::core::policy::DiscoveryConfig (p. 1271)	**remote_participant_purge_kind** (p. 1281)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
rti::core::policy::DiscoveryConfig (p. 1271)	**max_liveliness_loss_detection_period** (p. 1281)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
rti::core::policy::DiscoveryConfig (p. 1271)	**ignore_default_domain_announcements** (p. 1301)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
rti::core::policy::DiscoveryConfig (p. 1271)	**participant_message_reader_reliability_kind** (p. 1295)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Reliability policy for a built-in participant message reader.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 2247)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Enables dynamic adjustment of sample keep duration in response to congestion.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_decrease_sample_keep_duration_factor** (p. 2248)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Controls rate of contraction of dynamic sample keep duration.
rti::core::policy::RtpsReliableWriterProtocol (p. 2229)	**disable_positive_acks_increase_sample_keep_duration_factor** (p. 2248)
	[DEPRECATED] (p. **296**) <<***extension***>> *(p. 116)* Controls rate of growth of dynamic sample keep duration.

rti::core::policy::BuiltinTopicReaderResourceLimits (p. 906)	**disable_fragmentation_support** (p. 913)
	[DEPRECATED] (p. **296)** <<***extension***>> *(*p. *116)* Determines whether the built-in topic **dds::sub::Data↩ Reader** (p. 976) can receive fragmented samples.

6.83 System Properties

System Properties.

System Properties.

RTI Connext uses the **rti::core::policy::Property** (p. 1969) of a DomainParticipant to maintain a set of properties that provide system information such as hostname.

Unless the default **dds::domain::qos::DomainParticipantQos** (p. 1384) value is overwritten, the system properties are automatically set in the **dds::domain::qos::DomainParticipantQos** (p. 1384) obtained by calling the method **dds::domain::DomainParticipant::default_participant_qos()** (p. 1341) or using the constant PARTICIPANT_QOS↩ _DEFAULT.

System properties are also automatically set in the **dds::domain::qos::DomainParticipantQos** (p. 1384) loaded from an XML QoS profile unless you disable property inheritance using the attribute **inherit** in the XML tag <**property**>.

By default, the system properties are propagated to other DomainParticipants in the system and can be accessed through **dds::topic::ParticipantBuiltinTopicData::property** (p. 1910).

You can disable the propagation of individual properties by setting the flag Property_t::propagate to false or by removing the property using the method PropertyQosPolicyHelper::remove_property.

The number of system properties set on the **dds::domain::qos::DomainParticipantQos** (p. 1384) is platform specific.

6.83.1 System Properties List

The following table lists the supported system properties. For more information, see `System Properties`, in the Core Libraries User's Manual.

Property Name	Description
dds.sys_info.hostname	Name of the host where the process is running
dds.sys_info.process_id	Process ID
dds.sys_info.username	Name of the user running the process
dds.sys_info.execution_timestamp	Time when the execution started
dds.sys_info.creation_timestamp	Time when the executable was created
dds.sys_info.executable_filepath	Name and full path of the executable
dds.sys_info.target	Architecture for which the library was compiled

6.83.2 System Resource Consideration

System properties are affected by the resource limits **rti::core::policy::DomainParticipantResourceLimits↩ ::participant_property_list_max_length** (p. 1424) and **rti::core::policy::DomainParticipantResourceLimits↩ ::participant_property_string_max_length** (p. 1425).

6.84 Configuring QoS Profiles with XML

APIs related to XML QoS Profiles.

Classes

- class **dds::core::QosProvider**

  *<<**reference-type**>> (p. 351) The **QosProvider** (p. 2025) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connext*
- class **rti::core::QosProviderParams**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 2025).*

6.84.1 Detailed Description

APIs related to XML QoS Profiles.

6.84.2 Loading QoS Profiles from XML Resources

A 'QoS profile' is a group of QoS settings, specified in XML format. By using QoS profiles, you can change QoS settings without recompiling the application.

The Qos profiles are loaded the first time any of the following operations are called:

- Whenever a **dds::domain::DomainParticipant** (p. 1326) is created
- **dds::core::QosProvider::participant_qos(const std::string& id)** (p. 2031)
- **dds::domain::DomainParticipant::default_participant_qos()** (p. 1341)
- **dds::core::QosProvider::default_library(const std::string& library_name)** (p. 2041)
- **dds::core::QosProvider::default_profile(const std::string& profile_name)** (p. 2041)
- **dds::core::QosProvider::participant_qos(const std::string& id)** (p. 2031)
- **dds::core::QosProvider::topic_qos(const std::string& id)** (p. 2032)

- **dds::core::QosProvider::topic_qos_w_topic_name(const std::string& topic_name) const** (p. 2038)
- **dds::core::QosProvider::topic_qos_w_topic_name(const std::string& id, const std::string& topic_name) const** (p. 2038)
- **dds::core::QosProvider::publisher_qos(const std::string& id)** (p. 2034)
- **dds::core::QosProvider::subscriber_qos(const std::string& id)** (p. 2033)
- **dds::core::QosProvider::datawriter_qos(const std::string& id)** (p. 2035)
- **dds::core::QosProvider::datawriter_qos_w_topic_name(const std::string& topic_name) const** (p. 2040)
- **dds::core::QosProvider::datawriter_qos_w_topic_name(const std::string& id, const std::string& topic_name) const** (p. 2040)
- **dds::core::QosProvider::datareader_qos(const std::string& id)** (p. 2033)
- **dds::core::QosProvider::datareader_qos_w_topic_name(const std::string& topic_name) const** (p. 2039)
- **dds::core::QosProvider::topic_qos_w_topic_name(const std::string& id, const std::string& topic_name) const** (p. 2038)
- **dds::core::QosProvider::qos_profile_libraries()** (p. 2043)
- **dds::core::QosProvider::qos_profiles()** (p. 2043)
- **dds::core::QosProvider::load_profiles()** (p. 2045)

The QoS profiles are reloaded replacing previously loaded profiles when the following operations are called:

- **dds::domain::DomainParticipant::participant_factory_qos(const dds::domain::qos::DomainParticipantFactoryQos& qos)** (p. 1340)
- **dds::core::QosProvider::reload_profiles()** (p. 2045)

The **dds::core::QosProvider::unload_profiles()** (p. 2045) operation will free the resources associated with the XML QoS profiles.

There are five ways to configure the XML resources (listed by load order):

- The file NDDS_QOS_PROFILES.xml in $NDDSHOME/resource/xml is loaded if it exists and **rti::core::QosProviderParams::ignore_resource_profile** (p. 2052) in **rti::core::QosProviderParams** (p. 2049) is set to false (first to be loaded). An example file, `NDDS_QOS_PROFILES.example.xml`, is available for reference.

- The URL groups separated by semicolons referenced by the enviroment variable NDDS_QOS_PROFILES are loaded if they exist and **rti::core::QosProviderParams::ignore_environment_profile** (p. 2052) in **rti::core::QosProviderParams** (p. 2049) is set to false.

- The file USER_QOS_PROFILES.xml in the working directory will be loaded if it exists and **rti::core::QosProviderParams::ignore_user_profile** (p. 2051) in **rti::core::QosProviderParams** (p. 2049) is set to false.

- The URL groups referenced by **rti::core::QosProviderParams::url_profile** (p. 2050) in **rti::core::QosProviderParams** (p. 2049) will be loaded if specified.

- The sequence of XML strings referenced by **rti::core::QosProviderParams::string_profile** (p. 2050) will be loaded if specified (last to be loaded).

The above methods can be combined together.

6.84.3 URL

The location of the XML resources (only files and strings are supported) is specified using a URL (Uniform Resource Locator) format. For example:

File Specification: `file:///usr/local/default_dds.xml`

String Specification: str://"<dds><qos_library> . . . lt;/qos_library>&lt/dds>"

If the URL schema name is omitted, RTI Connext will assume a file name. For example:

File Specification: /usr/local/default_dds.xml

6.84.3.1 URL groups

To provide redundancy and fault tolerance, you can specify multiple locations for a single XML document via URL groups. The syntax of a URL group is as follows:

[URL1 | URL2 | URL2 | . . .| URLn]

For example:

[`file:///usr/local/default_dds.xml` | `file:///usr/local/alternative_default_dds.xml`]

Only one of the elements in the group will be loaded by RTI Connext, starting from the left.

Brackets are not required for groups with a single URL.

6.84.3.2 NDDS_QOS_PROFILES environment variable

The environment variable NDDS_QOS_PROFILES contains a list of URL groups separated by ';'

The URL groups referenced by the environment variable are loaded if they exist and **rti::core::QosProviderParams::ignore_environment_profile** (p. 2052) is set to false

6.84.3.3 Built-In QoS Profiles

There are also a number of built-in QoS profiles that can be used without having to load any configurations from outside XML resources. For more information on these built-in profiles see **Built-in Qos Profiles** (p. 462).

For more information on XML Configuration, refer to the `User's Manual`.

6.85 Publication Example

A data publication example.

A data publication example.

6.85.1 A typical publication example

Prep

- Create user data types using rtiddsgen. See the `Code Generator User's Manual`.

Set up

- **Set up participant** (p. 307)
- **Set up publisher** (p. 310)
- **Register user data type(s)** (p. 308)
- **Set up topic(s)** (p. 308)
- **Set up data writer(s)** (p. 311)

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 325)

Send data

- **Send data** (p. 312)

Tear down

- **Tear down all entities** (p. 328)

6.86 Subscription Example

A data subscription example.

A data subscription example.

6.86.1 A typical subscription example

Prep

- Create user data types using rtiddsgen. See the `Code Generator User's Manual`.

Set up

- **Set up participant** (p. 307)
- **Set up subscriber** (p. 315)
- **Register user data type(s)** (p. 308)
- **Set up topic(s)** (p. 308)
- **Set up data reader(s)** (p. 316)
- **Set up DataReader** (p. 317) to receive data

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 325)

Receive data

- **Read all samples** (p. 318) or **select which samples** (p. 319) to read from the DataReader queue

Tear down

- **Tear down all entities** (p. 328)

6.87 Participant Use Cases

Working with domain participants.

Working with domain participants.

6.87.1 Turning off auto-enable of newly created participant(s)

- Change the value of the **ENTITY_FACTORY** (p. 532) for the DomainParticipantFactory

  The following #includes are needed for the examples on this page
  ```
  #include <dds/domain/ddsdomain.hpp>
  ```

6.87.2 Setting up a DomainParticipant

- How to create DomainParticipants with each of the available constructors

```
// Creating a DomainParticipants on domain 0, with default Qos, and no
// listener
dds::domain::DomainParticipant participant1(0) ;
// Creating a DomainParticipants with a non-default QoS values
dds::domain::qos::DomainParticipantQos qos;
 // Set the initial peers.
 // The peers stored in initial_peers are merely potential peers--there is
 // no requirement that the peer DomainParticipants are actually up and
 // running or even will eventually exist. The Connext discovery process
 // will try to contact all potential peer participants in the list
 // periodically using unicast transports.
 const char * initial_peers_array[] = {
   "host1",
   "10.10.30.192",
   "1@localhost",
   "2@host2",
   "my://", /* all unicast addrs on transport plugins with alias "my" */
   "2@shmem://", /* shared memory */
   "FF00:ABCD::0",
   "1@FF00:0:1234::0",
   "225.1.2.3",
   "3@225.1.0.55",
   "FAA0::0#0/0/R"};
const dds::core::StringSeq initial_peers_list(initial_peers_array, initial_peers_array+11);
// Add the initial peers list to the DiscoveryQosPolicy while modifying
// the participant's qos inline
qos << rti::core::policy::Discovery().initial_peers(initial_peers_list);
// Creating a DomainParticipants on domain 1 with modified QoS
dds::domain::DomainParticipant participant2(1, qos);
// Creating a DomainParticipants on domain 2, with modified QoS, and a
// listener
auto listener = std::make_shared<ExampleParticipantListener>();
dds::domain::DomainParticipant participant3(2, qos, listener);
// Creating a DomainParticipants on domain 3, with modified QoS, a listener
// and a data_available() status mask
dds::domain::DomainParticipant participant4(
        3,
        qos,
        listener,
        dds::core::status::StatusMask::data_available());
```

- Setting the DomainParticipantFactoryQos so that participants are created disabled (optional)

```
dds::domain::qos::DomainParticipantFactoryQos qos;
qos << dds::core::policy::EntityFactory::ManuallyEnable();
dds::domain::DomainParticipant::participant_factory_qos(qos);
```

6.87.3 Looking up DomainParticipants

- Lookup DomainParticipants by domain id

```
// Create and retain two DomainParticipants on domain 0 and one on domain 1
create_and_retain_participant(0);
create_and_retain_participant(0);
create_and_retain_participant(1);
// We don't have any references to the created DomainParticipants but we
// can look them up using the domain id they were created on
// If there is more than one participant on the same domain then this
// operation will return only one of them. It is unspecified which one it
// will return
dds::domain::DomainParticipant participant1 = dds::domain::find(0);
dds::domain::DomainParticipant participant2 = dds::domain::find(1);
```

6.87.4 Tearing down a Participant

- See **Tearing Down An Entity** (p. 328) for eamples of the various ways to teardown a Participant

6.87.5 Finalizing the factory

- Finalizing the factory

```
// The DomainParticipantFactory is a singleton that the C++ API uses
// implicitly to create participants. RTI Connext provides
// dds::domain::DomainParticipant::finalize_participant_factory()
// for users who want to release memory used by the participant factory.
dds::domain::DomainParticipant::finalize_participant_factory();
```

6.88 Topic Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
#include <dds/topic/ddstopic.hpp>
#include "Foo.hpp"
```

6.88.1 Registering a user data type

- Types are implicitly registered during Topic construction, see **Setting up a Topic** (p. 308)

6.88.2 Setting up a Topic

- **Set up a DomainParticipant** (p. 307)
- Create a Topic with each of the available constructors

```
// Create the participant
dds::domain::DomainParticipant participant(0);
// Creating a topic with user-defined type Foo and topic name MyTopic1,
// with default Qos and no listener
dds::topic::Topic<Foo> topic1(participant, "MyTopic1");
// Creating a topic with user-defined type Foo, topic name MyTopic2,
// type name MyTypeName2
dds::topic::Topic<Foo> topic2(participant, "MyTopic2", "MyTypeName2");
// Creating a topic with user-defined type Foo, topic name MyTopic3, and
// modified QoS
dds::topic::qos::TopicQos qos;
qos << dds::core::policy::Durability::TransientLocal();
dds::topic::Topic<Foo> topic3(participant, "MyTopic3", qos);
// Creating a topic with user-defined type Foo, topic name MyTopic4, type
// name MyTypeName4 and modified QoS
dds::topic::Topic<Foo> topic4(participant, "MyTopic4", "MyTypeName4", qos);
// Creating a topic with user-defined type Foo, topic name MyTopic5,
// modified QoS, and a listener
auto listener = std::make_shared<ExampleTopicListener>();
dds::topic::Topic<Foo> topic5(participant, "MyTopic5", qos, listener);
// Creating a topic with user-defined type Foo, topic name MyTopic6, type
// name MyTypeName6, modified QoS, and a listener
dds::topic::Topic<Foo> topic6(
   participant, "MyTopic6", "MyTypeName6", qos, listener);
// Creating a topic with user-defined type Foo, topic name MyTopic7,
// modified QoS, a non-NULL listener, and a inconsistent_topic status mask
dds::topic::Topic<Foo> topic7(
   participant, "MyTopic7", qos, listener,
   dds::core::status::StatusMask::inconsistent_topic());
// Creating a topic with user-defined type Foo, topic name MyTopic8, type
// name MyTypeName8, modified QoS, a listener, and
// a inconsistent_topic status mask
dds::topic::Topic<Foo> topic8(
   participant, "MyTopic8", "MyTypeName8", qos, listener,
   dds::core::status::StatusMask::inconsistent_topic());
```

6.88.3 Discovering Topics

- Lookup local Topics by their topic name

```
void howto_lookup_topics()
{
    dds::domain::DomainParticipant participant(0);
    // Create two Topics and retain them
    create_and_retain_topic(participant, "Topic1");
    create_and_retain_topic(participant, "Topic2");
    // We don't have any references to the created Topics but we can look
    // them up using topic name that they were created with
    dds::topic::Topic<Foo> topic1 =
        dds::topic::find<dds::topic::Topic<Foo> >(participant, "Topic1");
    dds::topic::Topic<Foo> topic2 =
        dds::topic::find<dds::topic::Topic<Foo> >(participant, "Topic2");
    // We retained the topics so we must close them now
    topic1.close();
    topic2.close();
}
void create_and_retain_topic(
   dds::domain::DomainParticipant &participant, const std::string& topic_name)
{
    dds::topic::Topic<Foo> topic(participant, topic_name);
    topic.retain();
}
```

- The next two examples assume the following setup

```
    // Create two DomainParticipants on the same domain
    dds::domain::DomainParticipant participant1(1);
    dds::domain::DomainParticipant participant2(1);

    // Create some Topics for both of the Participants
    dds::topic::Topic<Foo> topic1(participant1, "Topic1");
    dds::topic::Topic<Foo> topic2(participant1, "Topic2");
    dds::topic::Topic<Foo> topic3(participant2, "Topic3");
```

- Discover all Topics in a domain

```
    // Get a list of the InstanceHandles of all of the topics in the
    // domain. topic_count will = 3
    dds::core::InstanceHandleSeq handles1;
    int topic_count = dds::topic::discover_any_topic(
       participant1, std::back_inserter(handles1));
    // discover_any_topic also takes a forward iterator and a max number of
    // topics to discover. topic_count will = 2. There is no guarantee
    // as to which two topics' handles will be retrieved
    dds::core::InstanceHandleSeq handles2(10, dds::core::InstanceHandle::nil());
    topic_count = dds::topic::discover_any_topic(participant2, handles2.begin(), 2);
```

- Retrieve the TopicBuiltinTopicData for a Topic

```
    std::vector<dds::topic::TopicBuiltinTopicData> topic_data1;
    // Get the TopicBuiltinTopicData for all of the participant's local topics
    // topic_count will = 2 because participant1 has 2 associated Topics
    topic_count = dds::topic::discover_topic_data(participant1, std::back_inserter(topic_data1));
    std::vector<dds::topic::TopicBuiltinTopicData> topic_data2(10);
    // discover_any_topic also takes a forward iterator and a max number of
    // topics to get the data for. Because we're using participant2,
    // topic_count will = 1
    topic_count = dds::topic::discover_topic_data(participant2, topic_data2.begin());
    // You can also retrieve data about a specific Topic or Topics with their
    // InstanceHandles. Because discover_topic_data will only retrieve data
    // about local topics, using an InstanceHandle that refers to a remote
    // Topic will cause an UnsupportedError to be thrown in either of the
    // following cases
    // Retrieve the TopicBuiltinTopicData for topic3
    dds::topic::TopicBuiltinTopicData topic_data =
        dds::topic::discover_topic_data(participant2, topic3.instance_handle());
    // Pass in a container with multiple handles and retrieve the
```

```
// TopicBuiltinTopicData for each of the Topics associated with each of the
// InstanceHandles
std::vector<dds::topic::TopicBuiltinTopicData> topic_data3(10);
dds::core::InstanceHandleSeq local_handles;
local_handles.push_back(topic1.instance_handle());
local_handles.push_back(topic2.instance_handle());
// topic_count will equal 2
topic_count = dds::topic::discover_topic_data(
   participant1, topic_data3.begin(), local_handles);
```

6.88.4 Tearing down a topic

- See **Tearing Down An Entity** (p. 328) for eamples of the various ways to teardown a Topic

6.89 Publisher Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/pub/ddspub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
```

6.89.1 Setting up a publisher

- **Set up participant** (p. 307)
- Create a Publisher with each of the available constructors

```
// Create the participant
dds::domain::DomainParticipant participant(0);
// When not explicitly provided to the constructor, the
// created publisher's QoS is default, has a NULL listener, and a status mask
// dds::core::status::StatusMask::all()
// Creating a publisher
dds::pub::Publisher publisher1(participant);
// Creating a publisher with modified QoS
dds::pub::qos::PublisherQos qos;
qos << rti::core::policy::EntityName("PublisherName");
dds::pub::Publisher publisher2(participant, qos);
// Creating a publisher with modified QoS and a listener
auto listener = std::make_shared<ExamplePublisherListener>();
dds::pub::Publisher publisher3(participant, qos, listener);
// Creating a publisher with modified QoS, a listener, and a
// sample_rejected() status mask
dds::pub::Publisher publisher4(
        participant,
        qos,
        listener,
        dds::core::status::StatusMask::offered_deadline_missed());
```

6.89.2 Looking up Publishers

- Lookup Publishers

```
void howto_lookup_publishers()
{
    dds::domain::DomainParticipant participant(0);
    // Create three Publishers and retain them
    create_and_retain_publisher(participant);
    create_and_retain_publisher(participant);
    create_and_retain_publisher(participant);
    // We don't have any references to the created Publishers but we can look
    // them up using the participant that they were created with
```

```
    std::vector<dds::pub::Publisher> publishers1;
    // publisher_count will equal 3 and publishers1 will hold a reference to
    // each of the three publishers that were created
    int publisher_count =
        rti::pub::find_publishers(participant, std::back_inserter(publishers1));
    // rti::pub::publishers also takes a forward iterator and a max number of
    // publishers to look up
    std::vector<dds::pub::Publisher> publishers2(2, dds::pub::Publisher(dds::core::null));
    // publisher_count will equal 2 because we're only asking for 2
    publisher_count =
        rti::pub::find_publishers(participant, publishers2.begin(), 2);
    std::cout << "Publisher count: " << publisher_count << std::endl;
    // We retained the publishers so we must close them now
    for (std::vector<dds::pub::Publisher>::iterator it = publishers1.begin();
          it != publishers1.end();
          it++) {
        (*it).close();
    }
}
void create_and_retain_publisher(dds::domain::DomainParticipant &participant)
{
    dds::pub::Publisher publisher(participant);
    publisher.retain();
}
```

6.89.3 Tearing down a publisher

- See **Tearing Down An Entity** (p. 328) for eamples of the various ways to teardown a Publisher

6.90 DataWriter Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/pub/ddspub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
#include <dds/topic/ddstopic.hpp>
#include <dds/sub/ddssub.hpp>
#include "Foo.hpp"
```

6.90.1 Setting up a DataWriter

- **Set up a Publisher** (p. 310)
- **Set up a Topic** (p. 308)
- Create a DataWriter of user-defined type **Foo** (p. 1588) with each of the available constructors

```
    // Create the Participant
    dds::domain::DomainParticipant participant(0);
    // Create a Topic
    dds::topic::Topic<Foo> topic(participant, "MyTopicName");
    // When not explicitly provided to the constructor, the
    // created DataWriter's QoS is default, has a NULL listener, and a status mask
    // dds::core::status::StatusMask::all()
    // Creating a DataWriter, creating the subscriber inline
    dds::pub::DataWriter<Foo> writer1(dds::pub::Publisher(participant), topic);
    // Create a Publisher
    dds::pub::Publisher publisher(participant);
    // Create a DataWriter with modified QoS
    dds::pub::qos::DataWriterQos writer_qos =
            dds::core::QosProvider::Default().datawriter_qos();
    writer_qos << dds::core::policy::Liveliness::ManualByParticipant();
    dds::pub::DataWriter<Foo> writer2(publisher, topic, writer_qos);
    // Create a DataWriter with the Qos of a topic
    writer_qos = topic.qos(); // Copy the policies in TopicQos into a DataWriterQos
```

```
dds::pub::DataWriter<Foo> writer3(publisher, topic, writer_qos);
// Create a DataWriter with modified QoS and a listener
auto listener = std::make_shared<ExampleDataWriterListener<Foo»();
dds::pub::DataWriter<Foo> writer4(
   publisher,
   topic,
   writer_qos,
   listener);
// Create a DataWriter with modified QoS, a listener, and a liveliness_lost()
// status mask
dds::pub::DataWriter<Foo> writer5(
   publisher,
   topic,
   writer_qos,
   listener,
   dds::core::status::StatusMask::liveliness_lost());
```

6.90.2 Managing instances

- The snippets in this section assume the following setup
```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "MyTopic");
dds::pub::DataWriter<Foo> writer(dds::pub::Publisher(participant), topic);
Foo sample;
sample.x(100);
```

- Getting an instance "key" value of user data type **Foo** (p. 1588)
```
// Instead of a sample of type Foo, key_value() could also take a
// TopicInstance<Foo> object. key_value only populates the key field in the
// sample
Foo retrieved_sample_key;
writer.key_value(retrieved_sample_key, handle);
```

- Registering an instance of type **Foo** (p. 1588)
```
dds::core::InstanceHandle handle = writer.register_instance(sample);
```

- Unregistering an instance of type **Foo** (p. 1588)
```
writer.unregister_instance(handle);
```

- Disposing of an instance of type **Foo** (p. 1588)
```
writer.dispose_instance(handle);
```

6.90.3 Sending data

- **Set up a DataWriter** (p. 311)
- **Register an instance** (p. 312)

- Write instances of type **Foo** (p. 1588) (see also **Working with IDL types** (p. 606))

```
Foo data;
dds::core::InstanceHandle handle =
    dds::core::InstanceHandle::nil();
dds::core::Time timestamp(123);
// Write a sample
writer.write(data);
// You can also write a sample with a timestamp that will be used as the
// source timestamp for this sample
writer.write(data, timestamp);
// You can also write a sample with an InstanceHandle
writer.write(data, handle);
// The above call to write is equivalent to the following
writer.write(dds::topic::TopicInstance<Foo>(handle, data));
// Or a combination of handle and timestamp
writer.write(data, handle, timestamp);
// The above call to write is equivalent to the following
writer.write(dds::topic::TopicInstance<Foo>(handle, data), timestamp);
// Create a vector of three default-constructed samples
std::vector<Foo> samples(3, Foo());
// You can also write samples that are stored in a container by
// passing in an iterator range to write()
writer.write(samples.begin(), samples.end());
// You can add a timestamp to the above call to write
writer.write(samples.begin(), samples.end(), timestamp);
// Create a vector of three instance handles
std::vector<dds::core::InstanceHandle> handles(
   3, dds::core::InstanceHandle::nil());
// Write 3 samples along with their handles
writer.write(samples.begin(), samples.end(),
             handles.begin(), handles.end());
// You can add a timestamp to the above call to write
writer.write(samples.begin(), samples.end(),
             handles.begin(), handles.end(),
             timestamp);
// You can also use operator << to write samples
writer << Foo(1, 2)
       << std::make_pair(Foo(3, 4), timestamp) // add a timestamp
       << std::make_pair(Foo(5, 6), handle); // add an instance handle
```

6.90.4 DataWriter Listeners

- Implementing a DataWriterListener class

```
// To create a DataWriterListener, inherit from the NoOpDataWriterListener class
// and then override any of the listener callback functions
template <typename T>
class ExampleDataWriterListener : public dds::pub::NoOpDataWriterListener<T>
{
public:
    ExampleDataWriterListener() {}
public:
    void on_publication_matched(
       dds::pub::DataWriter<T>&,
       const dds::core::status::PublicationMatchedStatus &status)
    {
        std::cout << "on_publication_matched callback" << std::endl;
        // Access information from the status
        std::cout << "total_count = " << status.total_count() << std::endl;
        std::cout << "total_count_change = " << status.total_count_change() << std::endl;
        std::cout << "current_count = " << status.current_count() << std::endl;
        std::cout << "current_count_change = " << status.current_count_change() << std::endl;
        dds::core::InstanceHandle handle = status.last_subscription_handle();
        // Extension
        std::cout << "current_count_peak = "
                  << status.extensions().current_count_peak() << std::endl;
    }
    void on_offered_incompatible_qos(
       dds::pub::DataWriter<T>&,
       const dds::core::status::OfferedIncompatibleQosStatus &status)
    {
        std::cout << "on_offered_incompatible_qos callback" << std::endl;
        // Access information from the status
        std::cout << "total_count = " << status.total_count() << std::endl;
        std::cout << "total_count_change = " << status.total_count_change() << std::endl;
        std::cout << "last_policy_id = " << status.last_policy_id() << std::endl;
        dds::core::policy::QosPolicyCountSeq qos_seq = status.policies();
```

```
            if (qos_seq.size() > 0) {
                std::cout « "policy_id of one first incompatible Qos policy = "
                    « qos_seq[0].policy_id() « std::endl;
            }
        }
        void on_offered_deadline_missed(
           dds::pub::DataWriter<T>&,
           const dds::core::status::OfferedDeadlineMissedStatus &status)
        {
            std::cout « "on_offered_deadline_missed callback" « std::endl;
            // Access information from the status
            std::cout « "total_count = " « status.total_count() « std::endl;
            std::cout « "total_count_change = " « status.total_count_change() « std::endl;
            dds::core::InstanceHandle handle = status.last_instance_handle();
        }
        void on_liveliness_lost(
           dds::pub::DataWriter<T>&,
           const dds::core::status::LivelinessLostStatus &status)
        {
            std::cout « "on_liveliness_lost callback" « std::endl;
            // Access information from the status
            std::cout « "total_count = " « status.total_count() « std::endl;
            std::cout « "total_count_change = " « status.total_count_change() « std::endl;
        }
    };
```

- Setting a listener on a DataWriter

```
    dds::domain::DomainParticipant participant(0);
    dds::topic::Topic<Foo> topic(participant, "Topic1");
    auto listener = std::make_shared<ExampleDataWriterListener<Foo»();
    // Create a DataWriter with a listener and default
    // dds::core::status::StatusMask::all()
    dds::pub::DataWriter<Foo> writer1(
            dds::pub::Publisher(participant),
            topic,
            dds::pub::qos::DataWriterQos(),
            listener);
    // Create a DataWriter without a listener
    dds::pub::DataWriter<Foo> writer2(dds::pub::Publisher(participant), topic);
    // Set the listener after creation, specifying a status mask
    writer2.set_listener(
            listener,
            dds::core::status::StatusMask::offered_incompatible_qos());
```

6.90.5 Looking up DataWriters

- Lookup DataWriters by topic name

```
    dds::domain::DomainParticipant participant(0);
    dds::pub::Publisher publisher(participant);
    dds::topic::Topic<Foo> topic1(participant, "Topic1");
    dds::topic::Topic<Foo> topic2(participant, "Topic2");
    // Create three DataWriters for topic1 and one for topic2 and retain them
    create_and_retain_writer(publisher, topic1);
    create_and_retain_writer(publisher, topic1);
    create_and_retain_writer(publisher, topic2);
    // We don't have any references to the created DataWriters but we can look
    // them up using the publisher and topic name that they were created with
    std::vector<dds::pub::DataWriter<Foo> > writers;
    // writer_count will equal 1. If more than one DataWriter belongs to a
    // publisher with the same topic name then find may return any one of them
    int writer_count =
        dds::pub::find<dds::pub::DataWriter<Foo> >(
           publisher,
           "Topic1",
           std::back_inserter(writers));
    writer_count =
        dds::pub::find<dds::pub::DataWriter<Foo> >(
           publisher,
           "Topic2",
           std::back_inserter(writers));
```

For more examples, see **Looking up DataReaders** (p. 322)

6.90.6 Getting Matched Subscriptions

- Lookup a DataWriter's matched subscriptions

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
dds::pub::DataWriter<Foo> writer(dds::pub::Publisher(participant), topic);
// Create two readers that will match with the above writer
dds::sub::DataReader<Foo> reader1(dds::sub::Subscriber(participant), topic);
dds::sub::DataReader<Foo> reader2(dds::sub::Subscriber(participant), topic);
// Get a list of the InstanceHandles corresponding to the DataWriter's
// matched subscriptions.
dds::core::InstanceHandleSeq subscription_handles1 =
    dds::pub::matched_subscriptions(writer);
// matched_subscriptions also takes in an iterator range and will return
// an InstanceHandle iterator to the end of the InstanceHandleSeq
dds::core::InstanceHandleSeq subscription_handles2(2, dds::core::null);
dds::core::InstanceHandleSeq::iterator last =
    dds::pub::matched_subscriptions(
       writer,
       subscription_handles2.begin(),
       subscription_handles2.end());
// now last == subscription_handles2.end()
```

- Use the InstanceHandles obtained from **matched_subscriptions()** (p. 1187) to get the SubscriptionBuiltinTopic↩ Data for the subscriptions

```
dds::topic::SubscriptionBuiltinTopicData subscription_data =
    dds::pub::matched_subscription_data(writer, subscription_handles1[0]);
```

6.90.7 Tearing down a DataWriter

- See **Tearing Down An Entity** (p. 328) for eamples of the various ways to teardown a DataWriter

6.91 Subscriber Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/sub/ddssub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
```

6.91.1 Setting up a subscriber

- **Set up participant** (p. 307)
- Create a Subscriber with each of the available constructors

```
// Create the participant
dds::domain::DomainParticipant participant(0);
// Creating a Subscriber with default QoS and no listener
dds::sub::Subscriber subscriber1(participant);
// Creating a Subscriber with modified QoS
dds::sub::qos::SubscriberQos qos;
qos << dds::core::policy::Presentation::GroupAccessScope(true, false);
dds::sub::Subscriber subscriber2(participant, qos);
// Creating a Subscriber with modified QoS and a listener
auto listener = std::make_shared<ExampleSubscriberListener>();
dds::sub::Subscriber subscriber3(participant, qos, listener);
// Creating a Subscriber with modified QoS, a listener, and a sample_rejected()
// status mask
dds::sub::Subscriber subscriber4(
        participant,
        qos,
        listener,
        dds::core::status::StatusMask::sample_rejected());
```

6.91.2 Looking up Subscribers

- Lookup Subscribers

```
void howto_lookup_subscribers()
{
    dds::domain::DomainParticipant participant(0);
    // Create three Subscribers and retain them
    create_and_retain_subscriber(participant);
    create_and_retain_subscriber(participant);
    create_and_retain_subscriber(participant);
    // We don't have any references to the created Subscribers but we can look
    // them up using the participant that they were created with
    std::vector<dds::sub::Subscriber> subscribers1;
    // subscriber_count will equal 3 and subscribers1 will hold a reference to
    // each of the three subscribers that were created
    int subscriber_count =
        rti::sub::find_subscribers(participant, std::back_inserter(subscribers1));
    std::cout « "Subscriber count: " « subscriber_count « std::endl;
    // rti::sub::subscribers also takes a forward iterator and a max number of
    // subscribers to look up
    std::vector<dds::sub::Subscriber> subscribers2(2, dds::sub::Subscriber(dds::core::null));
    // subscriber_count will equal 2 because we're only asking for 2
    subscriber_count =
        rti::sub::find_subscribers(participant, subscribers2.begin(), 2);
    // We retained the subscribers so we must close them now
    for (std::vector<dds::sub::Subscriber>::iterator it = subscribers1.begin();
          it != subscribers1.end();
          it++) {
        (*it).close();
    }
}
void create_and_retain_subscriber(dds::domain::DomainParticipant &participant)
{
    dds::sub::Subscriber subscriber(participant);
    subscriber.retain();
}
```

6.91.3 Tearing down a subscriber

- See **Tearing Down An Entity** (p. 328) for eamples of the various ways to teardown a Subscriber

6.92 DataReader Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/sub/ddssub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
#include <dds/topic/ddstopic.hpp>
#include <dds/pub/ddspub.hpp>
#include "Foo.hpp"
```

6.92.1 Setting up a DataReader

- **Set up a Subscriber** (p. 315)
- **Set up a Topic** (p. 308)

- Create a DataReader of user-defined type **Foo** (p. 1588) with each of the available constructors

```
// Create the Participant
dds::domain::DomainParticipant participant(0);
// Create a Topic
dds::topic::Topic<Foo> topic(participant, "MyTopicName");
// When not explicitly provided to the constructor, the
// created DataReader's QoS is default, has a NULL listener, and a status mask
// dds::core::status::StatusMask::all()
// In all of the following constructors 'topic' could also be an instance
// of dds::topic::ContentFilteredTopic

// Creating a DataReader, creating the subscriber inline
dds::sub::DataReader<Foo> reader1(dds::sub::Subscriber(participant), topic);
// Create a Subscriber
dds::sub::Subscriber subscriber(participant);
// Create a DataReader with modified QoS
dds::sub::qos::DataReaderQos reader_qos =
        dds::core::QosProvider::Default().datareader_qos();
reader_qos << dds::core::policy::History::KeepAll();
dds::sub::DataReader<Foo> reader2(subscriber, topic, reader_qos);
// Create a DataReader with the Qos of a topic
reader_qos = topic.qos(); // Copy the policies in TopicQos into a DataReaderQos
dds::sub::DataReader<Foo> reader3(subscriber, topic, reader_qos);
// Create a DataReader with modified QoS and a listener
std::shared_ptr<ExampleDataReaderListener> listener =
        std::make_shared<ExampleDataReaderListener>();
dds::sub::DataReader<Foo> reader4(
        subscriber,
        topic,
        reader_qos,
        listener);
// Create a DataReader with modified QoS, a listener, and a
// liveliness_changed() status mask
dds::sub::DataReader<Foo> reader5(
        subscriber,
        topic,
        reader_qos,
        listener,
        dds::core::status::StatusMask::liveliness_changed());
```

6.92.2 Managing instances

- Getting an instance key value of user data type **Foo** (p. 1588)

```
// Instead of a sample of type Foo, key_value() could also take a
// TopicInstance<Foo> object. key_value only populates the key field in the
// sample
Foo retrieved_sample_key;
reader.key_value(retrieved_sample_key, handle);
```

6.92.3 Set up a DataReader to access received data

- **Set up a DataReader** (p. 316)
- Set up the DataReader to handle the DDS_DATA_AVAILABLE_STATUS status, in one or both of the following two ways.
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSDataReaderListener associated with the data reader** (p. 325)
  - The processing to handle the status change is done in the DataReaderListener on_data_available() method of the attached listener.
  - Typical processing will **access the received data** (p. 318).
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSStatusCondition associated with the data reader** (p. 327)

– The processing to handle the status change is done **when the data reader's attached status condition is triggered** (p. 330) and the DDS_DATA_AVAILABLE_STATUS status on the data reader is changed.
– Typical processing will **access the received data** (p. 318).

6.92.4 Accessing Received Data

6.92.4.1 Reading data samples

You can read data samples from a DataReader by receiving a loan, inspecting the samples and then returning the loan, or you can directly copy them.

- To iterate through loaned data samples in your application you will use a LoanedSamples container. The following code shows different ways to use this container

```
// Take all the samples in the reader queue (if you don't want to remove
// them from the queue and read them later again, use reader.read() instead)
dds::sub::LoanedSamples<Foo> samples = reader.take();
// LoanedSamples<Foo> is a container of LoanedSample<Foo> elements, which
// contain the actual data (Foo) and the SampleInfo
for (dds::sub::LoanedSamples<Foo>::iterator sample_it = samples.begin();
     sample_it != samples.end();
     ++sample_it) {
    if (sample_it->info().valid()) {
        std::cout « "Received: " « sample_it->data() « std::endl;
    }
}
// The previous code is simpler with a range-based for-loop (C++11)
for (auto sample : samples) {
    if (sample.info().valid()) {
        std::cout « "Received: " « sample.data() « std::endl;
    }
}
// If you don't need to access the SampleInfo in invalid-data samples,
// use valid_data() to simplify the for loop
auto valid_samples = rti::sub::valid_data(reader.take());
for (auto sample : valid_samples) {
    // No need to check sample.info().valid()
    std::cout « "Received: " « sample.data() « std::endl;
}
// You can also access samples using the subscript operator
if (samples.length() >= 2) {
    if (samples[1].info().valid()) {
        std::cout « "Second sample is " « samples[1].data() « std::endl;
    } else {
        std::cout « "Second sample is invalid\n";
    }
}
// You can copy the samples using std::copy:
std::vector<rti::sub::LoanedSample<Foo> > samples_copy;
std::copy(samples.begin(), samples.end(), std::back_inserter(samples_copy));
// You can also access the data directly. A sample can be implicitly
// converted into a reference to its data type as long as it contains
// valid data.
//
// The iterator returned by this other overload of valid_data provides
// another way to skip invalid-data samples
//
std::vector<Foo> data_copy;
std::copy(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(data_copy));
// Attempting to access invalid data will result in an exception.
try {
    // The following will throw if !samples[0].info().valid()
    Foo data = samples[0].data();
    std::cout « data « std::endl;
    // The following will throw if any sample contains invalid data
    std::copy(samples.begin(), samples.end(), std::back_inserter(data_copy));
} catch (const dds::core::PreconditionNotMetError& ex) {
    std::cerr « "Attempted to access sample containing invalid data: "
```

```
            « ex.what() « std::endl;
}
// You can also apply other iterator-based algorithms,
// like this example that prints just one field of the data type
// (assuming that Foo contains an integer field called 'x')
std::transform(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::ostream_iterator<int>(std::cout, ", "),
    [](const Foo& data) { return data.x(); });
// Once a LoanedSamples object goes out of scope its destructor
// automatically returns the loan to the middleware. If you need to
// explicitly return it, call return_loan()
//
// samples.return_loan()
```

- Although the LoanedSamples is the most generic way to access data in a DataReader, for convinience other overloaded versions of read/take allow to directly copy the data

```
// The first version of read/take receives a back-insert iterator
std::vector<dds::sub::Sample<Foo> > my_vector1;
reader.take(std::back_inserter(my_vector1));
// The second version receives a forward iterator and the maximum size
std::vector<dds::sub::Sample<Foo> > my_vector2(10);
reader.take(my_vector2.begin(), 10);
```

- See also **Working with IDL types** (p. 606)

6.92.4.2 Selecting what samples to read

The functions **read()** (p. 1024) and **take()** (p. 1024) select all samples in the DataReader queue. The function select() allows specifying different criteria about the data to read. A equivalent API, using the streaming >> operator is available too.

- select() example

```
// To select what samples you want to read (or take) from a DataReader
// queue, you can use a Selector. When you don't specify a parameter in the
// Selector, the default applies.
dds::sub::LoanedSamples<Foo> samples =
    // Call select() to create a Selector and then specify its parameters
    reader.select()
        // Specifies the maximum number of samples to read/take
        // in this function call. Default: set by Qos.
        .max_samples(20)
        // Specifies the sample, view and instance states - default: all.
        .state(dds::sub::status::DataState::new_instance())
        // Specifies a query on the data sample - default: all
        .content(dds::sub::Query(reader, "x > 10"))
        // Specifies what instance to read - default: all instances
        .instance(my_instance_handle)
        // And finally call read() or take()
        .take();
// You can also specify state and content by using a Condition. Reusing
// a Condition for multiple reads is more efficient than specifying the
// content() every time.
dds::sub::cond::QueryCondition query_condition(
    dds::sub::Query(reader, "x > 10"),
    dds::sub::status::DataState(
        dds::sub::status::SampleState::not_read(),
        dds::sub::status::ViewState::new_view(),
        dds::sub::status::InstanceState::alive()));
samples = reader.select()
    .condition(query_condition)
    .take();
// And you can read instance by instance using next_instance().
//
// To read the first instance, use InstanceHandle::nil()
dds::core::InstanceHandle previous_handle = dds::core::InstanceHandle::nil();
do {
    samples = reader.select()
        .next_instance(previous_handle)
        .take();
    if (samples.length() > 0) {
```

```
            // do something with samples ...
            // Update previous_handle to read the instance following this one
            previous_handle = samples[0].info().instance_handle();
        }
    } while (samples.length() > 0);
    // select() returns an object you can reuse
    dds::sub::DataReader<Foo>::Selector selector = reader.select().max_samples(20);
    samples = selector.read();
    // ...
    selector.state(dds::sub::status::DataState::new_instance());
    samples = selector.take();
```

- Streaming example

```
    using namespace dds::sub;
    // The overloaded shift operator defines a domain-specific language to
    // specify what samples to read. The following code has the same effect as
    // the first select() example from the previous code snippet
    LoanedSamples<Foo> samples;
    reader » take // first indicate if you want to read or take;
           » max_samples(20) // then specify the parameters you want...
           » state(status::DataState::new_instance())
           » content(Query(reader, "x > 10"))
           » instance(my_instance_handle)
           » samples; // and finally, the destination LoanedSamples container.
```

6.92.4.3 Reading samples using coherent access

If a Subscriber's PresentationQosPolicy access_scope is GROUP and ordered_access is true, the application can access the samples in order across DataWriters of the same group (Publisher with access_scope GROUP). The queue is ordered/sorted per topic across all instances belonging to DataWriters (or DataReaders) within the same Publisher (or Subscriber).

- Read samples using CoherentAccess

```
void howto_read_coherently()
{
    dds::domain::DomainParticipant participant(0);
    dds::topic::Topic<Foo> topic1(participant, "Topic1");
    dds::topic::Topic<Foo> topic2(participant, "Topic2");
    // Create a Subscriber with group presentation. The Publisher must also
    // have group presentation set in its QoS
    dds::sub::qos::SubscriberQos subscriber_qos;
    subscriber_qos « dds::core::policy::Presentation::GroupAccessScope(false, true);
    dds::sub::Subscriber subscriber(participant, subscriber_qos);
    dds::sub::DataReader<Foo> reader1(subscriber, topic1);
    dds::sub::DataReader<Foo> reader2(subscriber, topic2);
    // Assuming that a writer of "Topic1" wrote before the writer of "Topic2"
    // reader2 will only be able to access it's samples after reader1 takes
    // its sample as long as CoherentAccess to the samples has been started
    int sample_count = read_coherently(subscriber, reader2);
    std::cout « sample_count « std::endl; // will be 0
    // The CoherentAccess destructor called when read_coherently exited
    // will end coherent access to the samples.
    // You can also explicitly call coherent_access.end() to end coherent access
    // reader2 can now access its sample
    // ordered_samples.size() will = 1
    dds::sub::LoanedSamples<Foo> ordered_samples = reader2.take();
}
template <typename T>
int read_coherently(dds::sub::Subscriber& subscriber, dds::sub::DataReader<T>& reader)
{
    dds::sub::CoherentAccess coherent_access(subscriber);
    dds::sub::LoanedSamples<T> ordered_samples = reader.take();
    return ordered_samples.length();
}
```

6.92.5 DataReader Listeners

- Implementing a DataReaderListener class

```
// To create a DataReaderListener, inherit from the NoOpDataReaderListener class
// and then override any of the listener callback functions
class ExampleDataReaderListener : public dds::sub::NoOpDataReaderListener<Foo>
{
public:
    ExampleDataReaderListener() {}
public:
    void on_sample_lost(
       dds::sub::DataReader<Foo>&,
       const dds::core::status::SampleLostStatus &status)
    {
        std::cout « "on_sample_lost callback" « std::endl;
        // Access information from the status
        std::cout « "total_count = " « status.total_count() « std::endl;
        std::cout « "total_count_change = " « status.total_count_change() « std::endl;
    }
    void on_subscription_matched(
       dds::sub::DataReader<Foo>&,
       const dds::core::status::SubscriptionMatchedStatus &status)
    {
        std::cout « "on_subscription_matched callback" « std::endl;
        // Access information from the status
        std::cout « "total_count = " « status.total_count() « std::endl;
        std::cout « "total_count_change = " « status.total_count_change() « std::endl;
        std::cout « "current_count = " « status.current_count() « std::endl;
        std::cout « "current_count_change = " « status.current_count_change() « std::endl;
        dds::core::InstanceHandle handle = status.last_publication_handle();
        // Extension
        std::cout « "current_count_peak = "
                  « status.extensions().current_count_peak() « std::endl;
    }
    void on_sample_rejected(
       dds::sub::DataReader<Foo>&,
       const dds::core::status::SampleRejectedStatus &status)
    {
        std::cout « "on_sample_rejected callback" « std::endl;
        // Access information from the status
        std::cout « "total_count = " « status.total_count() « std::endl;
        std::cout « "total_count_change = " « status.total_count_change() « std::endl;
        std::cout « "last_reason = " « status.last_reason() « std::endl;
        dds::core::InstanceHandle handle = status.last_instance_handle();
    }
    void on_requested_incompatible_qos(
       dds::sub::DataReader<Foo>&,
       const dds::core::status::RequestedIncompatibleQosStatus &status)
    {
        std::cout « "on_requested_incompatible_qos callback" « std::endl;
        // Access information from the status
        std::cout « "total_count = " « status.total_count() « std::endl;
        std::cout « "total_count_change = " « status.total_count_change() « std::endl;
        std::cout « "last_policy_id = " « status.last_policy_id() « std::endl;
        dds::core::policy::QosPolicyCountSeq qos_seq = status.policies();
        if (qos_seq.size() > 0) {
            std::cout « "policy_id of one first incompatible Qos policy = "
                « qos_seq[0].policy_id() « std::endl;
        }
    }
    void on_requested_deadline_missed(
       dds::sub::DataReader<Foo>&,
       const dds::core::status::RequestedDeadlineMissedStatus &status)
    {
        std::cout « "on_requested_deadline_missed callback" « std::endl;
        // Access information from the status
        std::cout « "total_count = " « status.total_count() « std::endl;
        std::cout « "total_count_change = " « status.total_count_change() « std::endl;
        dds::core::InstanceHandle handle = status.last_instance_handle();
    }
    void on_liveliness_changed(
       dds::sub::DataReader<Foo>&,
       const dds::core::status::LivelinessChangedStatus &status)
    {
        std::cout « "on_liveliness_changed callback" « std::endl;
        // Access information from the status
        std::cout « "alive_count = " « status.alive_count() « std::endl;
        std::cout « "not_alive_count = " « status.not_alive_count() « std::endl;
        std::cout « "alive_count_change = " « status.alive_count_change() « std::endl;
        std::cout « "not_alive_count_change = " « status.not_alive_count_change() « std::endl;
        dds::core::InstanceHandle handle = status.last_publication_handle();
    }
    void on_data_available(dds::sub::DataReader<Foo> &reader)
    {
```

```
        std::cout « "on_data_available callback" « std::endl;
        // Read the available data
        dds::sub::LoanedSamples<Foo> samples = reader.read();
        // Print samples by copying to std::cout
        std::copy(
            samples.begin(),
            samples.end(),
            dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
    }
};
```

- Setting a listener on a DataReader

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
auto listener = std::make_shared<ExampleDataReaderListener>();
// Create a DataReader with a listener and default
// dds::core::status::StatusMask::all()
dds::sub::DataReader<Foo> reader1(
   dds::sub::Subscriber(participant),
   topic,
   dds::sub::qos::DataReaderQos(),
   listener);
// Create a DataReader with a null listener
dds::sub::DataReader<Foo> reader2(
   dds::sub::Subscriber(participant),
   topic);
// Set the listener for the DataReader after creation
reader2.set_listener(
   listener,
   dds::core::status::StatusMask::sample_rejected());
// ...
// You can reset the listener to stop receiving status updates:
reader2.set_listener(nullptr);
```

6.92.6 Looking up DataReaders

- Lookup DataReaders by topic name

```
dds::domain::DomainParticipant participant(0);
dds::sub::Subscriber subscriber(participant);
dds::topic::Topic<Foo> topic1(participant, "Topic1");
dds::topic::Topic<Foo> topic2(participant, "Topic2");
// Create three DataReaders for topic1 and one for topic2 and retain them
create_and_retain_reader(subscriber, topic1);
create_and_retain_reader(subscriber, topic1);
create_and_retain_reader(subscriber, topic2);
// We don't have any references to the created DataReaders but we can look
// them up using the subscriber and topic name that they were created with
std::vector<dds::sub::DataReader<Foo> > readers;
// reader_count will equal 1. If more than one DataReader belongs to a
// subscriber with the same topic name then find may return any one of them
int reader_count =
    dds::sub::find<dds::sub::DataReader<Foo> >(
       subscriber,
       "Topic1",
       std::back_inserter(readers));
reader_count =
    dds::sub::find<dds::sub::DataReader<Foo> >(
       subscriber,
       "Topic2",
       std::back_inserter(readers));
```

- Lookup DataReaders by reader name

```
// Create a Subscriber with the name "MySubscriber"
dds::sub::qos::SubscriberQos subscriber_qos;
subscriber_qos « rti::core::policy::EntityName("MySubscriber");
dds::sub::Subscriber subscriber2(participant, subscriber_qos);
// Create a DataReader with the name "MyDataReader"
dds::sub::qos::DataReaderQos reader_qos;
reader_qos « rti::core::policy::EntityName("MyDataReader");
dds::sub::DataReader<Foo> reader(subscriber2, topic1, reader_qos);
// Retrieve the DataReader from the subscriber:
auto found_reader = rti::sub::find_datareader_by_name<dds::sub::DataReader<Foo> >(
```

```
        subscriber2,
        "MyDataReader");
assert(found_reader == reader);
// Retrieve the DataReader from the DomainParticipant, using also the
// name of the Subscriber:
found_reader = rti::sub::find_datareader_by_name<dds::sub::DataReader<Foo> >(
        participant,
        "MySubscriber::MyDataReader");
assert(found_reader == reader);
```

- Lookup all DataReaders

```
// To retrieve all the DataReaders at once, we use a collection of
// AnyDataReader. Each AnyDataReader may have a different template argument
std::vector<dds::sub::AnyDataReader> all_readers;
rti::sub::find_datareaders(subscriber, std::back_inserter(all_readers));
for (auto& r : all_readers) {
    // We can retrieve the typed DataReader if we know the type
    if (r.type_name() == "Foo") {
        dds::sub::DataReader<Foo> foo_reader = r.get<Foo>();
        // ...
    }
}
```

6.92.7 Getting Matched Publications

- Lookup a DataReader's matched publications

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
dds::sub::DataReader<Foo> reader(dds::sub::Subscriber(participant), topic);
// Create two writers that will match with the above reader
dds::pub::DataWriter<Foo> writer1(dds::pub::Publisher(participant), topic);
dds::pub::DataWriter<Foo> writer2(dds::pub::Publisher(participant), topic);
// Get a list of the InstanceHandles corresponding to the DataReader's
// matched publications.
dds::core::InstanceHandleSeq publication_handles1 =
    dds::sub::matched_publications(reader);
// matched_publications also takes in an iterator range and will return
// an InstanceHandle iterator to the end of the InstanceHandleSeq
dds::core::InstanceHandleSeq publication_handles2(2, dds::core::null);
dds::core::InstanceHandleSeq::iterator last =
    dds::sub::matched_publications(
       reader,
       publication_handles2.begin(),
       publication_handles2.end());
// now last == publication_handles2.end()
```

- Use the InstanceHandles obtained from **matched_publications()** (p. 1031) to get the PublicationBuiltinTopicData for the publications

```
dds::topic::PublicationBuiltinTopicData publication_data =
    dds::sub::matched_publication_data(reader, publication_handles1[0]);
```

6.92.8 Accessing the Built-in Subscriber and DataReaders

- The next two examples assume the following setup

```
// It is common to create entities disbaled when accessing and setting
// listeners on the built-in DataReaders so that information about
// discovery traffic is missed
dds::domain::qos::DomainParticipantFactoryQos qos;
qos << dds::core::policy::EntityFactory(false);
dds::domain::DomainParticipant::participant_factory_qos(qos);
dds::domain::DomainParticipant participant(0);
```

- Access the built-in Subscriber
```
dds::sub::Subscriber builtin_subscriber = dds::sub::builtin_subscriber(participant);
```

- Access the built-in DataReaders
```
// There are constants for each of the built-in topics accessible through
// the dds::topic namespace--see below for their use
// Access the built-in DataReader for ParticipantBuiltinTopicData
std::vector<dds::sub::DataReader<dds::topic::ParticipantBuiltinTopicData> > participant_reader;
int reader_count =
    dds::sub::find<dds::sub::DataReader<dds::topic::ParticipantBuiltinTopicData> >(
       builtin_subscriber,
       dds::topic::participant_topic_name(),
       std::back_inserter(participant_reader));
// Access the built-in DataReader for PublicationBuiltinTopicData
std::vector<dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData> > publication_reader;
reader_count =
    dds::sub::find<dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData> >(
       builtin_subscriber,
       dds::topic::publication_topic_name(),
       std::back_inserter(publication_reader));
// Access the built-in DataReader for SubscriptionBuiltinTopicData
std::vector<dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData> > subscription_reader;
reader_count =
    dds::sub::find<dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData> >(
       builtin_subscriber,
       dds::topic::subscription_topic_name(),
       std::back_inserter(subscription_reader));
// participant_reader[0], publication_reader[0] and subscription_reader[0]
// will now hold reference to the built-in DataReaders.
```

6.92.9 Using untyped DataReaders

When you want to hold a reference to a DataReader and the type T doesn't matter, you can use the class **dds::sub::AnyDataReader** (p. 807), which provides type-independent methods.

- For example, this function receives any DataReader
```
// This function can receive any DataReader, independently of the template types
void example_untyped(const dds::sub::AnyDataReader& untyped_reader)
{
    // Use type-independent operations
    std::cout << "The topic name is: " << untyped_reader.topic_name() << std::endl;
    if (untyped_reader.type_name() == "Foo") {
        // Get back the typed DataReader.
        //
        // If the reader's type is not Foo, this operation throws
        // dds::core::InvalidDowncastError.
        //
        // typed_reader and untyped_reader share references to the same object.
        dds::sub::DataReader<Foo> typed_reader = untyped_reader.get<Foo>();
    }
}
```

- And this is how you can call it
```
dds::sub::DataReader<Foo> reader(subscriber, topic);
example_untyped(reader); // automatic conversion to AnyDataReader
```

6.92.10 Tearing down a DataReader

- See **Tearing Down An Entity** (p. 328) for examples of the various ways to teardown a DataReader

6.93 Entity Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/domain/ddsdomain.hpp>
```

6.93.1 Changing the QoS for an entity

The QoS for an entity can be specified at entity creation time. Once an entity has been created, its QoS can be manipulated as the following examples illustrate. A DataWriter is used in these examples, but the same can be applied to any <<***reference-type***>> *(*p. *351)*, such as DomainParticipants, Subscribers, Publishers, DataReaders, and Topics.

- See **QosProvider** (p. 604) for examples on how to manage user-defined QoS profiles.

- See **Qos Use Cases** (p. 602) for examples on how to work with the Qos policy classes.

- Get an entity's QoS settings

```
dds::pub::DataWriter<Foo> writer(dds::pub::Publisher(participant), a_topic);
// Get the DataWriter's QoS
dds::pub::qos::DataWriterQos writer_qos = writer.qos();
```

- Change the desired qos policy fields

```
// Change the History QoS for the DataWriter using the History QoS's
// KeepAll named constructor
writer_qos << dds::core::policy::History::KeepAll();
```

- Set the qos

```
// Set the modified QoS for the DataWriter
writer.qos(writer_qos);
```

6.93.2 Changing the listener and enabling/disabling statuses associated with it

The listener for an entity can be specified at the entity creation time. By default the listener is *enabled* for all the statuses supported by the entity.

Once an entity has been created, its listener and/or the statuses for which it is enabled can be manipulated as follows.

The following examples use a DomainParticipant but the same examples can be applied to all other entities (Subscribers, Publishers, DataReaders, DataWriters, and Topics)

- User defines entity listener methods

```
class ExampleDomainParticipantListener : public dds::domain::NoOpDomainParticipantListener
{
public:
    ExampleDomainParticipantListener() {}
public:
    void on_liveliness_lost(
       dds::pub::AnyDataWriter&,
       const::dds::core::status::LivelinessLostStatus&)
    {
        std::cout « "on_liveliness_lost" « std::endl;
    }
    void on_liveliness_changed(
       dds::sub::AnyDataReader&,
       const dds::core::status::LivelinessChangedStatus&)
    {
        std::cout « "on_liveliness_changed" « std::endl;
    }
    void on_inconsistent_topic(
       dds::topic::AnyTopic&,
       const dds::core::status::InconsistentTopicStatus&)
    {
        std::cout « "on_inconsistent_topic" « std::endl;
    }
    void on_data_on_readers(
       dds::sub::Subscriber&)
    {
        std::cout « "on_data_on_readers" « std::endl;
    }
    void on_offered_deadline_missed(
       dds::pub::AnyDataWriter&,
       const::dds::core::status::OfferedDeadlineMissedStatus&)
    {
        std::cout « "on_offered_deadline_missed" « std::endl;
    }
    void on_offered_incompatible_qos(
       dds::pub::AnyDataWriter&,
       const::dds::core::status::OfferedIncompatibleQosStatus&)
    {
        std::cout « "on_offered_incompatible_qos" « std::endl;
    }
    void on_publication_matched(
       dds::pub::AnyDataWriter&,
       const::dds::core::status::PublicationMatchedStatus&)
    {
        std::cout « "on_publication_matched" « std::endl;
    }
    void on_requested_deadline_missed(
       dds::sub::AnyDataReader&,
       const dds::core::status::RequestedDeadlineMissedStatus&)
    {
        std::cout « "on_requested_deadline_missed" « std::endl;
    }
    void on_requested_incompatible_qos(
       dds::sub::AnyDataReader&,
       const dds::core::status::RequestedIncompatibleQosStatus&)
    {
        std::cout « "on_requested_incompatible_qos" « std::endl;
    }
    void on_sample_lost(
       dds::sub::AnyDataReader&,
       const dds::core::status::SampleLostStatus&)
    {
        std::cout « "on_sample_lost" « std::endl;
    }
    void on_sample_rejected(
       dds::sub::AnyDataReader&,
       const dds::core::status::SampleRejectedStatus&)
    {
        std::cout « "on_sample_rejected" « std::endl;
    }
    void on_subscription_matched(
       dds::sub::AnyDataReader&,
       const dds::core::status::SubscriptionMatchedStatus&)
    {
        std::cout « "on_subscription_matched" « std::endl;
    }
    void on_data_available(
       dds::sub::AnyDataReader&)
    {
        std::cout « "on_data_available" « std::endl;
```

```
    }
};
```

- Get an entity's listener
```
ExampleDomainParticipantListener *listener = new ExampleDomainParticipantListener;
dds::domain::DomainParticipant participant(
   0, dds::domain::qos::DomainParticipantQos(), listener);
dds::domain::DomainParticipantListener *retrieved_listener = participant.listener();
```

- Enable statuses for the `listener`
```
// The default constructor creates an empty StatusMask
dds::core::status::StatusMask enabled_status_list;
// ...
// Add more statuses to the enabled_status_list
enabled_status_list |= dds::core::status::StatusMask::liveliness_changed() |
    dds::core::status::StatusMask::offered_incompatible_qos();
```

- Disable a status for the `listener`
```
enabled_status_list &= ~dds::core::status::StatusMask::offered_incompatible_qos();
```

- Set an entity's listener and only enable the listener for the statuses specified by the `enabled_status_list`.
```
participant.listener(listener, enabled_status_list);
```

6.93.3 Enabling/Disabling statuses associated with a status condition

Upon entity creation, by default, all the statuses are *enabled* for the DDS_StatusCondition associated with the entity.

Once an entity has been created, the list of statuses for which the DDS_StatusCondition is triggered can be manipulated as follows.

- Given an `entity` and the associated `status_condition`
```
ExampleDomainParticipantListener *listener = new ExampleDomainParticipantListener;
dds::domain::DomainParticipant participant(
   0, dds::domain::qos::DomainParticipantQos(), listener);
dds::core::cond::StatusCondition status_condition(participant);
```

- Get the list of statuses enabled for the `status_condition`
```
dds::core::status::StatusMask enabled_status_list = status_condition.enabled_statuses();
```

- Check if a given status is enabled for the `status_condition`
```
// StatusMask inherits from std::bitset. You can use std::bitset's any()
// method to check if a given status is enabled
if ((enabled_status_list & dds::core::status::StatusMask::data_on_readers()).any()) {
    // Do something to handle the on_data_on_readers status...
}
```

- Enable statuses for the `status_condition`

```
status_condition.enabled_statuses(
   dds::core::status::StatusMask::inconsistent_topic() |
   dds::core::status::StatusMask::sample_rejected());
```

- Disable statuses for the `status_condition`

```
status_condition.enabled_statuses(
   ~dds::core::status::StatusMask::inconsistent_topic());
```

6.93.4 Ignoring Entities

A Topic is used in this example, but each of the other entities (DomainParticipants, Publishers, Subscribers, and Data↩ Writers) also have an **ignore()** (p. 1359) method which takes the DomainParticipant and InstanceHandle(s) of the entities that are to be ignored

- Ignore Topics

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic1(participant, "Topic1");
dds::topic::Topic<Foo> topic2(participant, "Topic2");
dds::topic::Topic<Foo> topic3(participant, "Topic3");
// This participant will now ignore this topic
dds::topic::ignore(participant, topic1.instance_handle());
dds::core::InstanceHandleSeq handles;
handles.push_back(topic2.instance_handle());
handles.push_back(topic3.instance_handle());
// This participant will now ignore the other two topics too
dds::topic::ignore(participant, handles.begin(), handles.end());
```

6.93.5 Tearing Down An Entity

The following examples use a DomainParticipant to show the various patterns which exist to tear down an entity, but the same examples can also be applied when shutting down Subscribers, Publishers, DataReaders, DataWriters, and Topics

- Let all references to a given entity go out-of-scope and let the destructor take care of entity clean up

```
{
    {
        // Create a participant on domain 0
        dds::domain::DomainParticipant participant(0);

        // ...
    } // participant destroyed here
    // found_participant will equal dds::core::null because the participant's
    // destructor was called when the only reference to it went out of scope
    dds::domain::DomainParticipant found_participant = dds::domain::find(0);
}
```

- Explicitly call **close()** (p. 1024) on one of the existing references to an Entity

```
// Create a participant on domain 0
dds::domain::DomainParticipant participant(0);
// All Entities are Reference types, meaning that the assignment operator
// will not make a copy of the participant, but instead will just create
// another reference to the previously created participant
dds::domain::DomainParticipant same_participant = participant;
// Call close() on same_participant to explicitly destroy the participant.
// Both references (participant and same_participant) are now invalid.
same_participant.close();
```

```
    try {
        // Any attempt to use the closed participant, will cause a
        // dds::core::AlreadyClosedError exception
        participant.enable();
    }
    catch (dds::core::AlreadyClosedError& ex) {
        std::cout « "Expected AlreadyClosedError: " « ex.what() « std::endl;
    }
```

- Assigning **dds::core::null** (p. 438) to a variable has the same effect as if the reference went ouf of scope. Assigning **dds::core::null** (p. 438) to the last reference destroys the underlying object.

```
    // Create a reference to a null participant
    dds::domain::DomainParticipant participant1(dds::core::null);
    // Now create a participant on domain 0
    dds::domain::DomainParticipant participant2(0);
    // Assign participant1 to this valid participant
    participant1 = participant2;
    // Assign dds::core:null to participant2. The participant will not be
    // destroyed because participant1 is still a valid reference
    participant2 = dds::core::null;
    // We can still use the participant because participant1 is still a
    // valid reference
    dds::domain::qos::DomainParticipantQos qos =
        participant1.default_participant_qos();
    // Assigning dds::core::null to the only remaining reference to the
    // participant will now cause its destructor to be called
    participant1 = dds::core::null;
    // found_participant will equal dds::core::null because the previous
    // assignment to dds::core::null caused the participant to be destroyed
    dds::domain::DomainParticipant found_participant = dds::domain::find(0);
```

- Retaining and then destroying an Entity

```
void howto_teardown_retain()
{
    // To prevent participant destruction when all references go out of scope
    // you can call retain().
    const uint32_t domain_id_0 = 0;
    const uint32_t domain_id_1 = 1;
    create_and_retain_participant(domain_id_0, false);
    create_and_retain_participant(domain_id_1, true);
    // We did not retain the participant with domain_id_0, so the following
    // will result in participant0 == dds::core::null
    dds::domain::DomainParticipant participant0 = dds::domain::find(domain_id_0);
    // We can recover the participant with domain_id_1 using find() because we
    // retained it. participant1 will be a valid reference to
    // the participant that was created on domain 1
    dds::domain::DomainParticipant participant1 = dds::domain::find(domain_id_1);
    // Because we called retain on the participant, the only way to destroy
    // the participant is to explicitly call close() on a reference to the
    // participant. Any attempt to use the participant after calling
    // close will cause a dds::core::AlreadyClosedError exception to be thrown
    // Destroy the participant
    participant1.close();
    try {
        // This call will cause a dds::core::AlreadyClosedError exception
        participant1.enable();
    }
    catch (dds::core::AlreadyClosedError& ex) {
        std::cout « "Expected AlreadyClosedError: " « ex.what() « std::endl;
    }

}
void create_and_retain_participant(const uint32_t domain_id, bool retain)
{
    // Create and retain a participant. If retained, the participant will not
    // be destroyed when it goes out of scope and can be retrieved again
    dds::domain::DomainParticipant participant(domain_id);
    if (retain) {
        participant.retain();
    }
}
```

6.94 Waitset Use Cases

Using WaitSets and Conditions.

Using WaitSets and Conditions.

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/core/ddscore.hpp>
#include <dds/sub/ddssub.hpp>
```

6.94.1 Setting up a WaitSet

- Create a WaitSet and attach Conditions

```
// Create a WaitSet
dds::core::cond::WaitSet waitset;
// Create a GuardCondition
dds::core::cond::GuardCondition guard_cond;
// Create a StatusCondition for a given Entity
dds::core::cond::StatusCondition status_cond(entity);
// Create a ReadCondition for a reader with a specific DataState
dds::sub::cond::ReadCondition read_cond(
    reader, dds::sub::status::DataState(
        dds::sub::status::SampleState::not_read(),
        dds::sub::status::ViewState::any(),
        dds::sub::status::InstanceState::any()));
// Attach conditions
waitset += guard_cond; // using += operator
waitset += status_cond;
waitset.attach_condition(read_cond); // or using attach_condition()
```

6.94.2 Waiting for Condition(s) to trigger

You have two ways to wait for Conditions to trigger: wait or dispatch.

- Wait example

```
// Wait for at most 20 seconds until one or more conditions are active and
// then return them.
// In case of timeout, active_conditions will be empty.
dds::core::cond::WaitSet::ConditionSeq active_conditions =
    waitset.wait(dds::core::Duration::from_secs(20));
for (uint32_t i = 0; i < active_conditions.size(); i++) {
    if (active_conditions[i] == guard_cond) {
        std::cout « "guard_cond was triggered\n";
    } else if (active_conditions[i] == status_cond) {
        std::cout « "status_cond was triggered\n";
    } // ...
}
```

- Dispatch example

```
using dds::core::cond::Condition;
using dds::sub::cond::ReadCondition;
// create a WaitSet
dds::core::cond::WaitSet waitset;
// Create a ReadCondition for reader1 with a functor handler
ReadCondition read_cond1(reader1, dds::sub::status::DataState::any(), []() {
    std::cout « "read_cond1 was triggered\n";
});
ReadCondition read_cond2(
        reader2,
        dds::sub::status::DataState::any(),
        [](Condition c) {  // The handler can optionally
                           // receive the condition
            auto rc = dds::core::polymorphic_cast<ReadCondition>(c);
            auto reader = rc.data_reader();  // reader == reader2
            std::cout « "read_cond2 was triggered (topic is "
                      « reader.topic_name() « ")" « std::endl;
        });
// Attach conditions
waitset += read_cond1;
waitset += read_cond2;
// Wait at most 20 seconds until one or more conditions are active and
// then call the handler of the active conditions. You can repeat this in
// a loop.
waitset.dispatch(dds::core::Duration::from_secs(20));
```

Filtering with Query Conditions (p. 332)

6.95 Filter Use Cases

Working with data filters.

Working with data filters.

6.95.1 Introduction

RTI Connext supports filtering data either during the exchange from **dds::pub::DataWriter** (p. 1138) to **dds::sub::DataReader** (p. 976), or after the data has been stored at the **dds::sub::DataReader** (p. 976).

Filtering during the exchange process is performed by a **dds::topic::ContentFilteredTopic** (p. 954), which is created by the **dds::sub::DataReader** (p. 976) as a way of specifying a subset of the data samples that it wishes to receive.

Filtering samples that have already been received by the **dds::sub::DataReader** (p. 976) is performed by creating a **dds::sub::cond::QueryCondition** (p. 2059), which can then used to check for matching samples, be alerted when matching samples arrive, or retrieve matching samples.

Filtering may be performed on any topic, either keyed or un-keyed, except the built-in topics. Filtering may be performed on any field, subset of fields, or combination of fields, subject only to the limitations of the filter syntax.

6.95.2 Code Examples

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/topic/ddstopic.hpp>
#include <dds/sub/ddssub.hpp>
#include "Foo.hpp"
```

6.95.3 Filtering with ContentFilteredTopic

- **Set up a Subscriber** (p. 315)
- **Set up a Topic** (p. 308)
- Create a ContentFilteredTopic, of user data type **`Foo`** (p. 1588):

```
// Create the DomainParticipant
dds::domain::DomainParticipant participant(0);
// Create a Topic
dds::topic::Topic<Foo> topic(participant, "MyTopicName");
// Create the parameter list
std::vector<std::string> cft_parameters(2);
cft_parameters[0] = "1";
cft_parameters[1] = "100";
// Create the ContentFilteredTopic
dds::topic::ContentFilteredTopic<Foo> cft(
    topic, // related topic
    "ContentFilteredTopic", // local name for the CFT
    dds::topic::Filter( // filter (constructed in-line in this example)
        "x > %0 AND x < %1", // expression
        cft_parameters)); // parameter vector
// Parameters are optional
dds::topic::ContentFilteredTopic<Foo> cft2(
    topic,
    "ContentFilteredTopic2",
    dds::topic::Filter("x = 100 AND y < 20"));
```

- Create a DataReader using the ContentFilteredTopic:

```
dds::sub::DataReader<Foo> reader(subscriber, cft);
```

  Once setup, reading samples with a **`dds::topic::ContentFilteredTopic`** (p. 954) is exactly the same as normal reads or takes, as described in **DataReader Use Cases** (p. 316).

- Changing filter criteria:

```
std::vector<std::string> new_cft_parameters(2);
new_cft_parameters[0] = "5";
new_cft_parameters[1] = "9";
cft.filter_parameters(new_cft_parameters.begin(), new_cft_parameters.end());
```

6.95.4 Filtering with Query Conditions

- Creating a QueryCondition

```
// Create parameter list
std::vector<std::string> query_parameters(2);
query_parameters[0] = "1";
query_parameters[1] = "100";
// Create query condition
dds::sub::cond::QueryCondition query_condition(
    dds::sub::Query(reader, "x > %0 AND x < %1", query_parameters),
    dds::sub::status::DataState::any_data());
```

- You can use a QueryCondition in a WaitSet: see **Waiting for Condition(s) to trigger** (p. 330)
- And to query for data in a DataReader: see **Selecting what samples to read** (p. 319)
- To modify the filter criteria you can use **dds::sub::cond::QueryCondition::parameters** (p. 2062) (similar to **dds::topic::ContentFilteredTopic::filter_parameters** (p. 956))
- This example shows how to create a condition with a handler that takes the samples received by a DataReader and selected by the QueryCondition's filter.

```
using dds::sub::cond::QueryCondition;

QueryCondition query_condition2(
    dds::sub::Query(reader, "x > %0 AND x < %1", query_parameters),
    dds::sub::status::DataState::any_data(),
    // The handler function singature allows receiving the related condition
    // as a parameter (it also allows zero arguments).
    [&reader](dds::core::cond::Condition condition)
    {
        // Downcast a Condition (a reference type) into a QueryCondition
        auto condition_as_qc =
                dds::core::polymorphic_cast<QueryCondition>(condition);
        // Use the condition's filter to select specific samples
        auto samples = reader.select().condition(condition_as_qc).take();
        for (auto& sample : samples) {
            std::cout << "Sample received: " << sample << std::endl;
        }
    });
```

6.95.5 Filtering Performance

Although RTI Connext supports filtering on any field or combination of fields using the SQL syntax of the built-in filter, filters for keyed topics that filter solely on the contents of key fields have the potential for much higher performance. This is because for key-only filters, the **dds::sub::DataReader** (p. 976) caches the results of the filter (pass or not pass) for each instance. When another sample of the same instance is seen at the **dds::sub::DataReader** (p. 976), the filter results are retrieved from the cache, dispensing with the need to call the filter function.

This optimization applies to all filtering using the built-in SQL filter, performed by the **dds::sub::DataReader** (p. 976), for either **dds::topic::ContentFilteredTopic** (p. 954) or **dds::sub::cond::QueryCondition** (p. 2059). This does *not* apply to filtering perfomed for **dds::topic::ContentFilteredTopic** (p. 954) by the **dds::pub::DataWriter** (p. 1138).

6.96 Creating Custom Content Filters

Creating a custom content filter.

Creating a custom content filter.

6.96.1 Introduction

By default, RTI Connext creates content filters with the DDS SQL filter, which implements a superset of the DDS-specified SQL WHERE clause. However, in many cases this filter may not be what you want. Some examples are:

- The default filter can only filter based on the content of a sample, not on a computation on the content of a sample. You can use a custom filter that is customized for a specific type and can filter based on a computation of the type members.
- You want to use a different filter language then SQL

This HOW-TO explains how to write your own custom filter and is divided into the following sections:

- **The Custom Content Filter API** (p. 334)
- **Example Custom Writer Content Filter** (p. 336)

6.96.2 The Custom Content Filter API

A custom content filter is created by calling the **dds::domain::DomainParticipant::register_contentfilter** (p. 1349) function with a **rti::topic::CustomFilter** (p. 967). A CustomFilter is created with either a **rti::topic::ContentFilter** (p. 950) or **rti::topic::WriterContentFilter** (p. 2652).

A ContentFilter contains a **compile**, an **evaluate** and a **finalize** function.

A WriterContentFilter contains a **compile**, an **evaluate**, a **finalize**, a **writer_attach**, **writer_compile**, **writer_evaluate**, **wrtier_detach**, and **writer_finalize** functions.

To use a custom filter in a **dds::topic::ContentFilteredTopic** (p. 954) or a dds::sub::QueryCondition, the name used to register it with the participant has to be set in the **dds::topic::Filter** (p. 1558)
or in the **dds::sub::Query** (p. 2053) that is used to create the corresponding ContentFilteredTopic or QueryCondition.

A custom ContentFilter is used by RTI Connext at the following times during the life-time of a ContentFilteredTopic (the function called is shown in parenthesis).

- When a ContentFilteredTopic is created (**compile** (p. 334))
- When the filter parameters are changed on the ContentFilteredTopic (**compile** (p. 334))
- When a sample is filtered (**evaluate** (p. 335)). This function is called by the RTI Connext core with a de-serialized sample
- When a ContentFilteredTopic is deleted (**finalize** (p. 335))

A custom WriterContentFilter is used by RTI Connext at the following times during the life-time of a ContentFilteredTopic (the function called is shown in parenthesis).

- When a DataWriter discovers a DataReader with a ContentFilteredTopic or when a DataWriter is notified of a change in the DataReader's filter parameter (**writer_compile** (p. 335))
- When the DataWriter matches a DataReader using the specified filter for the first time (**writer_attach** (p. 335))
- When a DataWriter writes a new sample (**writer_evaluate** (p. 335)). This function is called by the RTI Connext core with a de-serialized sample
- When RTI Connext is finished using the sequence of Cookies returned by writer_evaluate (**writer_return_loan** (p. 335))
- When a DataWriter is no longer matching with a DataReader for which it was previously performing writer-side filtering (**writer_finalize** (p. 336))

6.96.2.1 The compile function

The "compile" function is used to **compile** a filter expression and expression parameters. Please note that the term **compile** is intentionally loosely defined. It is up to the user to decide what this function should do and return.

6.96.2.2 The evaluate function

When using a ContentFilter, the "evaluate" function is called each time a sample is received to determine if a sample should be filtered out and discarded.

When using a WriterContentFilter, the "evaluate" function is called each time a sample is written to determine if a sample should be filtered out and discarded. It is called for each DataReader for which the DataWriter is filtering and for which the writer_compile function set the ExpressionProperty.writer_side_filter_optimization to false.

6.96.2.3 The finalize function

The "finalize" function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

6.96.2.4 The writer_attach function

The "writer_attach" function is called the first time that a DataWriter matches with a DataReader with the same Content↩ Filter. It will not be called for subsequent DataReaders that are using the same filter. This function is used to create some state required to perform filtering on the writer-side. It is entirely up to you, as the implementer of the filter, to decide if the filter requires this state.

6.96.2.5 The writer_compile function

The "writer_compile" function is called when a DataWriter matches with a DataReader with the same ContentFilter. It is called every time that the DataWriter matches a DataReader that is using the same filter as well as each time the DataWriter is notified that a DataReader's filter parameters have changed. This function will receive as an input a **rti::core::Cookie** (p. 965) which uniquely identifies the DataReader for which the function was invoked.

6.96.2.6 The writer_evaluate function

The "writer_evaluate" function is called every time that a DataWriter writes a new sample. Its purpose is to evaluate the sample for all the readers for which the DataWriter is performing writer-side filtering and return the sequence of **rti::core::Cookie** (p. 965) associated with the DataReaders whose filter pass the sample.

6.96.2.7 The writer_detach function

The "writer_detach" function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

6.96.2.8 The writer_return_loan function

The "writer_return_loan" function is called to return the loan on the rti::core::CookieSeq provided by the writer_evaluate function.

6.96.2.9 The writer_finalize function

The "writer_finalize" function will be called by Connext to notify the filter implementation that the DataWriter is no longer matching with a DataReader for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the DataReader.

6.96.3 Example Custom Writer Content Filter

Assume that you have a type **Foo** (p. 1588).

Our filter will show how to enable the writer-side filter optimization for some readers and not for others. The ones with writer-side filter optimization will only pass samples where Foo.x == y where y is a value determined by an expression parameter, see the writer_evaluate function. Readers without the optimization turned on will pass all samples where Foo.x $>$ 7, see the evaluate function. The filter will **only** be used to filter samples of type **Foo** (p. 1588).

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/topic/ddstopic.hpp>
#include <rti/topic/findImpl.hpp>
#include <dds/sub/ddssub.hpp>
#include <dds/pub/ddspub.hpp>
#include <dds/core/ddscore.hpp>
#include "Foo.hpp"
```

The following is the definition of the WriterFilterData, the state that is created and returned by the writer_attach method:

```
class WriterFilterData
{
public:
    typedef std::pair<rti::core::Cookie, int32_t> CookieValue;
    typedef std::vector<CookieValue> CookieValueSeq;
public:
    WriterFilterData()
    {
    }
    void add_pair(const CookieValue& cookie_value_pair)
    {
        reader_pairs_.push_back(cookie_value_pair);
    }
    CookieValueSeq& reader_pairs()
    {
        return reader_pairs_;
    }
private:
    CookieValueSeq reader_pairs_;
};
```

And here is the declaration of our custom writer content filter. Notice, we are inheriting from **rti::topic::WriterContentFilter** (p. 2652). We could have inherited from **rti::topic::ContentFilter** (p. 950) or **rti::topic::WriterContentFilterHelper** (p. 2657) here too to create other custom content filters.

```
// A custom WriterContentFilter
class ExampleWriterContentFilter :
        public rti::topic::WriterContentFilter<
            Foo,
            rti::topic::no_compile_data_t,
            WriterFilterData>
{
public:
    ExampleWriterContentFilter() {}
    ~ExampleWriterContentFilter() {}
    rti::topic::no_compile_data_t& compile(
       const std::string& expression,
       const dds::core::StringSeq& parameters,
       const dds::core::optional<dds::core::xtypes::DynamicType>& type_code,
       const std::string& type_class_name,
       rti::topic::no_compile_data_t* old_compile_data);
    bool evaluate(
       rti::topic::no_compile_data_t& compile_data,
```

```
       const Foo& sample,
       const rti::topic::FilterSampleInfo& meta_data);
    void finalize(rti::topic::no_compile_data_t& compile_data);
    WriterFilterData& writer_attach();
    void writer_compile(
        WriterFilterData& writer_filter_data,
        rti::topic::ExpressionProperty& prop,
        const std::string& expression,
        const dds::core::StringSeq& parameters,
        const dds::core::optional<dds::core::xtypes::DynamicType>& type_code,
        const std::string& type_class_name,
        const rti::core::Cookie& cookie);
    rti::core::CookieSeq& writer_evaluate(
       WriterFilterData& writer_filter_data,
       const Foo& sample,
       const rti::topic::FilterSampleInfo &meta_data);
    void writer_finalize(
        WriterFilterData& writer_filter_data,
        const rti::core::Cookie& cookie);
    void writer_detach(WriterFilterData& writer_filter_data);
    void writer_return_loan(
        WriterFilterData& writer_filter_data,
        rti::core::CookieSeq& cookies);
    void writer_data(const WriterFilterData& is_writer_data) { writer_data_ = is_writer_data; }
    WriterFilterData& writer_data() { return writer_data_; }
    void reset_cookie_seq()
    {
        cookie_seq_.clear();
    }
    void add_cookie(rti::core::Cookie& cookie)
    {
        cookie_seq_.resize(cookie_seq_.size() + 1);
        cookie_seq_[cookie_seq_.size() - 1] = cookie;
    }
    rti::core::CookieSeq& cookie_seq()
    {
        return cookie_seq_;
    }
private:
    rti::core::CookieSeq cookie_seq_;
    WriterFilterData writer_data_;
};
```

6.96.3.1 Writing the Compile Function

Since we already know what the expression is (Foo.x $>$ 7), we can simply return rti::topic::no_compile_data.

Below is the entire **compile** (p. 334) function.

```
rti::topic::no_compile_data_t& ExampleWriterContentFilter::compile(
       const std::string&,
       const dds::core::StringSeq&,
       const dds::core::optional<dds::core::xtypes::DynamicType>&,
       const std::string&,
       rti::topic::no_compile_data_t*)
{
    // We don't have any compile data to setup in this compile function. We
    // will do all necessary setup in the writer_compile function
    return rti::topic::no_compile_data;
}
```

6.96.3.2 Writing the Evaluate Function

The next step is to implement the **evaluate** function. The evaluate function receives no_compile_data because it is unecessary in this example. The function then evaluates the received sample against our filter expression and passes the sample if Foo.x $>$ 7. Below is the entire **evaluate** (p. 335) function.

```
bool ExampleWriterContentFilter::evaluate(
   rti::topic::no_compile_data_t&,
   const Foo& sample,
   const rti::topic::FilterSampleInfo&)
{
```

```
    if (sample.x() > 7) {
        return true;
    }
    return false;
}
```

6.96.3.3 Writing the Finalize Function

The next function to write is the finalize function. It is safe to free all resources used by this particular instance of the custom content filter that is allocated in **compile**. Because we did not create any resources in the **compile** function, we have nothing to do in the **finalize**. Below is the entire **finalize** (p. 335) function.

```
void ExampleWriterContentFilter::finalize(
   rti::topic::no_compile_data_t&)
{
    // There is nothing to finalize in this example
}
```

6.96.3.4 Writing the Writer Attach Function

The **writer_attach** is used to create some state required to perform filtering on the writer-side. In our example filter, this state is kept as part of our custom filter class, ExampleWriterContentFilter, so we therefore simply return a reference to our writer data that will be used during the **writer_compile** and **writer_evaluate** functions.

```
WriterFilterData& ExampleWriterContentFilter::writer_attach()
{
    // Setup the writer_filter_data to point to our WriterFilterData
    return writer_data();
}
```

6.96.3.5 Writing the Writer Compile Function

The **writer_compile** function is called when a DataWriter matches with a DataReader with the same ContentFilter. In our case, we use the parameters to determine if we should turn on the writer-side filtering optimization. If parameters[0] == 1, then we store the provided **rti::core::Cookie** (p. 965) along with parameters[1] in our writer_filter_data to be accessed during the writer_evaluate function whenever we receive a new sample.

```
void ExampleWriterContentFilter::writer_compile(
   WriterFilterData& writer_filter_data,
   rti::topic::ExpressionProperty& prop,
   const std::string& /* expression */,
   const dds::core::StringSeq& parameters,
   const dds::core::optional<dds::core::xtypes::DynamicType>& /* type */,
   const std::string& /* type_class_name */,
   const rti::core::Cookie& cookie)
{
    int length = parameters.size();
    bool optimize = false;
    int32_t x = 0;
    if (length == 2) {
        std::istringstream(parameters[0]) >> optimize;
        std::istringstream(parameters[1]) >> x;
    }
    // Add this DataReader's cookie to our writer filter data
    if (optimize) {
        writer_filter_data.add_pair(std::make_pair(cookie, x));
    }
    prop.writer_side_filter_optimization(optimize);
}
```

6.96.3.6 Writing the Writer Evaluate Function

The writer_evaluate function receives our stored writer_filter_data and a sample to evaluate. We iterate through our (**rti::core::Cookie** (p. 965), value) pairs and add any Cookie with a matching value of x to the sample's Foo.x to the rti::core::CookieSeq that we return. Any Cookie in this sequence then represents a DataReader to which this sample will be sent.

```
rti::core::CookieSeq& ExampleWriterContentFilter::writer_evaluate(
   WriterFilterData& writer_filter_data,
   const Foo& sample,
   const rti::topic::FilterSampleInfo&)
{
    WriterFilterData::CookieValueSeq& reader_pairs =
           writer_filter_data.reader_pairs();
    // If x == value, pass the reader
    for (uint32_t i = 0; i < reader_pairs.size(); i++) {
        if (sample.x() == reader_pairs[i].second) {
            add_cookie(reader_pairs[i].first);
        }
    }
    return cookie_seq();
}
```

6.96.3.7 Writing the Writer Detach Function

It is safe to free all resources used by this particular instance of the custom content filter that is allocated in **writer_attach**. Because we did not allocate any resources in the **writer_attach** function, there is nothing to release in the writer_finalize. Below is the entire **writer_detach** (p. 335) function.

```
void ExampleWriterContentFilter::writer_detach(
   WriterFilterData&)
{
    // Nothing to do in writer detach for this example
}
```

6.96.3.8 Writing the Writer Return Loan Function

RTI Connext uses the writer_return_loan function specified in the WriterContentFilter to indicate to the filter implementation that it has finished using the sequence of cookies returned by the filter writer_evaluate function. Your filter implementation should not free the memory associated with the cookie sequence before the writer_return_loan function is called. You can also create your custom content filter by inheriting from the **rti::topic::WriterContentFilterHelper** (p. 2657), which manages the DataReader CookieSeq for you. If you do that, then the writer_return_loan is implemented for you. Below is the entire **writer_return_loan** (p. 335) function.

```
void ExampleWriterContentFilter::writer_return_loan(
    WriterFilterData&,
    rti::core::CookieSeq&)
{
    // The cookie sequence's destructor will take care of returning the loan
    // to the middleware, but we will reset the size to 0
    const_cast<rti::core::CookieSeq&>(cookie_seq()).resize(0);
}
```

6.96.3.9 Writing the Writer Finalize Function

The writer_finalize function specified in the WriterContentFilter will be called when the DataWriter no longer matches with a DataReader that was created with ContentFilteredTopic. This will allow the filter implementation to delete any state it was maintaining for the DataReader. Because we did not create any resources in the **writer_compile** function, we have nothing to do in the **writer_finalize**. Below is the entire **writer_finalize** (p. 336) function.

```
void ExampleWriterContentFilter::writer_finalize(
   WriterFilterData&,
   const rti::core::Cookie&)
{
    // There is nothing to finalize in this example
}
```

6.96.3.10 Creating a CustomFilter

The first thing that an application needs to do when using a custom filter is to give it a name and wrap an instance of their custom filter with a **rti::topic::CustomFilter** (p. 967). The CustomFilter class receives shared pointer to an instance of your custom filter and ensures that your filter does not go out-of-scope while it is being used. This means that you do not have to retain a reference to your filter throughout its lifetime, the CustomFilter class handles this detail for you.

```
// Create an instance of the ExampleWriterContentFilter and then
// create a CustomFilter object which holds a shared pointer to your
// ContentFilter.
std::string my_filter_name = "my_custom_filter";
rti::topic::CustomFilter<ExampleWriterContentFilter>
    my_custom_filter(new ExampleWriterContentFilter());
dds::domain::DomainParticipant participant1(0);
dds::domain::DomainParticipant participant2(0);
// To make sure that we don't miss any samples in this example,
// setup there DataWriter and DataReaders to be reliable
dds::pub::qos::DataWriterQos writer_qos;
writer_qos << dds::core::policy::Reliability::Reliable();
writer_qos << dds::core::policy::Durability::TransientLocal();
writer_qos << dds::core::policy::History::KeepAll();
dds::sub::qos::DataReaderQos reader_qos;
reader_qos << dds::core::policy::Reliability::Reliable();
reader_qos << dds::core::policy::Durability::TransientLocal();
reader_qos << dds::core::policy::History::KeepAll();
```

6.96.3.11 Registering the Filter

After wrapping your content filter with the CustomFilter class, and before the custom filter can be used, it must be registered with RTI Connext:

```
// Register the filter with both participants. Doing this will
// automatically enable writer-side filtering if any DataWriters match with
// any DataReaders that are using the same filter
participant1.extensions().register_contentfilter(my_custom_filter, my_filter_name);
participant2.extensions().register_contentfilter(my_custom_filter, my_filter_name);
```

6.96.3.12 Unregistering the Filter

When the filter is no longer needed, it can be unregistered from RTI Connext:

```
// You do not have to unregister your content filter unless you want to
// register a different filter with the same name
participant1.extensions().unregister_contentfilter(my_filter_name);
participant2.extensions().unregister_contentfilter(my_filter_name);
```

6.96.3.13 Using a CustomFilter

After the custom filter has been registered, you must create **dds::topic::Filter** (p. 1558) that contain the filter expressions and parameters that will be used in your filter. You must give these Filters names that match the name with which the CustomFilter was registered in order to associate the two.

Next, create the readers that will be using the custom filter with dds::topic::ContentFilteredTopics that have been created with the Filters you created.

After that, everything is set up for you. Now, your readers will only receive samples matching the filter that you have set up for them.

```
dds::topic::Topic<Foo> topic1(participant1, "ExampleTopic");
dds::topic::Topic<Foo> topic2(participant2, "ExampleTopic");
// Create the parameter lists for the filters
std::vector<std::string> cft_parameters(2);
// In this example, the first parameter dictates whether or not the
```

```
// writer-side filter optimization will be turned on. Parameter 2
// tells the writer_evaluate which single value of x this reader wants to
// receive samples for
cft_parameters[0] = "1";
cft_parameters[1] = "5";
dds::topic::Filter filter1("x = %1", cft_parameters);
cft_parameters[0] = "1";
cft_parameters[1] = "10";
dds::topic::Filter filter2("x = %1", cft_parameters);
// Any reader that is not using the writer-side filter optimization will
// receive samples where x > 7. The second parameter in this case is
// ignored, but is set here just as a reminder
cft_parameters[0] = "0";
cft_parameters[1] = "7";
dds::topic::Filter filter3("x > %1", cft_parameters);
// Create a DataWriter that will perform writer-side filtering
dds::pub::DataWriter<Foo> writer(
   dds::pub::Publisher(participant1), topic1, writer_qos);
// Assign filters a name or else the default, rti::topic::sql_filter_name,
// will be used
filter1.extensions().name(my_filter_name);
filter2.extensions().name(my_filter_name);
filter3.extensions().name(my_filter_name);
// Create the ContentFilteredTopics that will be used when creating the
// DataReaders
dds::topic::ContentFilteredTopic<Foo> cft1(
   topic2, "MyContentFilteredTopic1", filter1);
dds::topic::ContentFilteredTopic<Foo> cft2(
   topic2, "MyContentFilteredTopic2", filter2);
dds::topic::ContentFilteredTopic<Foo> cft3(
   topic2, "MyContentFilteredTopic3", filter3);
// Create two readers that will make use of the writer-side filter
// optimization and one that won't
dds::sub::DataReader<Foo> optimizedReader1(
   dds::sub::Subscriber(participant2), cft1, reader_qos);
dds::sub::DataReader<Foo> optimizedReader2(
   dds::sub::Subscriber(participant2), cft2, reader_qos);
dds::sub::DataReader<Foo> reader3(
   dds::sub::Subscriber(participant2), cft3, reader_qos);
// Wait for the writer to match all readers before writing any samples
dds::core::cond::StatusCondition status_condition(writer);
int32_t matched_publications = 0;
while (matched_publications != 3) {
    dds::core::status::PublicationMatchedStatus status =
        writer.publication_matched_status();
    matched_publications = status.total_count();
}
// Write 11 samples with x = 0 through 10
for (int i = 0; i < 11; i++) {
    writer.write(Foo(i, i));
}
// optimizedReader1 will only receive samples with x == 5
std::cout « "optimizedReader1's samples: " « std::endl;
dds::sub::LoanedSamples<Foo> samples = optimizedReader1.take();
std::copy(
    samples.begin(),
    samples.end(),
    dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
// optimizedReader2 will only receive samples with x == 10
std::cout « "optimizedReader2's samples: " « std::endl;
samples = optimizedReader2.take();
std::copy(
    samples.begin(),
    samples.end(),
    dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
// reader3 will receive samples with x == 8, 9, 10
std::cout « "reader3's samples: " « std::endl;
samples = reader3.take();
std::copy(
    samples.begin(),
    samples.end(),
    dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
```

6.96.3.14 Looking up the Filter

A custom filter that is registered with a DomainParticipant can be looked up:

```
rti::topic::CustomFilter<ExampleWriterContentFilter> retrieved_custom_filter =
       rti::topic::find_content_filter<ExampleWriterContentFilter>(
           participant1, my_filter_name);
// You can retrieve your ContentFilter from the CustomFilter:
ExampleWriterContentFilter* retrieved_content_filter =
          retrieved_custom_filter.get();
```

6.97 XML Application Creation

Defining DDS systems in XML.

Defining DDS systems in XML.

6.97.1 Introduction

XML-Based Application Creation is a mechanism to simplify the development and programming of RTI Connext applications. RTI Connext supports the use of XML for the complete system definition. This includes not only the definition of the data types and Quality of Service settings, but also the definition of the Topics, DomainParticipants, and all the Entities they contain (Publishers, Subscribers, DataWriters and DataReaders).

The application code simply indicates the participant configuration name of the DomainParticipant that the application wants to create. The XML-Based Application Creation infrastructure takes care of the rest: creating the DomainParticipant, registering the types and Topics, and populating all the configured Entities. When the application needs to read or write data, register listeners, or perform any other action, it simply looks up the appropriate Entity by name and uses it.

See the RTI_ConnextDDS_CoreLibraries_XML_AppCreation_GettingStarted.pdf for a more exhaustive description XML Application Creation, most notably, how to set up the XML Configuration files.

The example on this page shows a basic use of the APIs that are necessary in order to access the entities that have been created in an XML file.

Relevant functions that enable the use of XML Application Creation are:

- **dds::core::QosProvider::create_participant_from_config** (p. 2046)
- **rti::domain::find_participant_by_name** (p. 731)
- **rti::sub::find_subscriber(const dds::domain::DomainParticipant participant,const std::string& subscriber_name)** (p. 758);
- **rti::sub::find_datareader_by_name(dds::sub::Subscriber subscriber, const std::string& datareader_name)** (p. 762)
- **rti::sub::find_datareader_by_name(dds::domain::DomainParticipant participant, const std::string& datareader_name)** (p. 763)
- **rti::pub::find_publisher(const dds::domain::DomainParticipant participant,const std::string& publisher_name)** (p. 744);
- **rti::pub::find_datawriter_by_name(dds::pub::Publisher publisher, const std::string& datawriter_name)** (p. 748)
- **rti::pub::find_datawriter_by_name(dds::domain::DomainParticipant participant, const std::string& datawriter_name)** (p. 749)

6.97.2 Setting up this Example

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/core/QosProvider.hpp>
#include <dds/sub/DataReader.hpp>
#include <dds/sub/find.hpp>
#include <dds/pub/DataWriter.hpp>
#include <dds/pub/find.hpp>
#include "Foo.hpp"
```

The following is the configuration that we will be using in this example:

```
<dds>
    <types>
         <struct name="Foo">
             <member name="x" type="long"/>
          </struct>
    </types>
    <domain_library name="ExampleDomainLibrary" >
        <domain name="ExampleDomain" domain_id="0">
         <register_type name="Foo" kind ="userGenerated"/>
         <topic name="ExampleTopic" register_type_ref="Foo"/>
        </domain>
    </domain_library>
    <participant_library name="ExampleParticipantLibrary">
        <domain_participant name="ExamplePublicationParticipant"
       domain_ref="ExampleDomainLibrary::ExampleDomain">
            <publisher name="ExamplePublisher">
                <data_writer name="ExampleWriter" topic_ref="ExampleTopic"/>
            </publisher>
        </domain_participant>
         <domain_participant name="ExampleSubscriptionParticipant"
       domain_ref="ExampleDomainLibrary::ExampleDomain">
             <data_reader name="ExampleReader" topic_ref="ExampleTopic">
                <content_filter name="ExampleTopic" kind="builtin.sql">
                    <expression> foo > 5 </expression>
                </content_filter>
            </data_reader>
        </domain_participant>
    </participant_library>
</dds>
```

6.97.2.1 Using XML Application Creation

You must first make sure that your configuration file is loaded by RTI Connext by using the QosProvider:

```
    rti::core::QosProviderParams provider_params;
    // Configure the default QosProvider to load the configuration
    // config_file == "/the/path/to/your/xml/configuration.xml"
    provider_params.url_profile({ config_file });
    rti::core::default_qos_provider_params(provider_params);
```

Then, if you are using a user-generated type, you must register the type with RTI Connext:

```
    // When using user-generated types, you must register the type with RTI
    // Connext DDS before creating the participants and the rest of the entities
    // in your system
    rti::domain::register_type<Foo>("Foo");
```

To create and access the system that you have defined in your system, call **dds::core::QosProvider::create_↩ participant_from_config** (p. 2046):

```
    // Create the participants, changing the domain id from the one in the
    // configuration
    rti::domain::DomainParticipantConfigParams params(10);
    // Create the participants
    auto default_provider = dds::core::QosProvider::Default();
    dds::domain::DomainParticipant publication_participant =
            default_provider.extensions().create_participant_from_config(
                    "ExampleParticipantLibrary::ExamplePublicationParticipant",
                    params);
    dds::domain::DomainParticipant subscription_participant =
            default_provider.extensions().create_participant_from_config(
                    "ExampleParticipantLibrary::ExampleSubscriptionParticipant",
```

```
                params);
```

After you have created the participants which were defined in your configuration, you can use various find functions to access the other entities that you have configured. For example, to lookup the DataWriter and DataReader from the example configuration:

```
// Lookup the DataWriter and DataReader from the configuration
dds::pub::DataWriter<Foo> found_writer =
        rti::pub::find_datawriter_by_name<dds::pub::DataWriter<Foo»(
                publication_participant,
                "ExamplePublisher::ExampleWriter");
// The implicit subscriber was used to create this reader so we only
// provide the reader's name, and not a fully qualified name as we did to
// look up the DataWriter
dds::sub::DataReader<Foo> found_reader =
        rti::sub::find_datareader_by_name<dds::sub::DataReader<Foo»(
                subscription_participant,
                "ExampleReader");
```

6.98 Request-Reply Examples

Examples on how to use the request-reply API .

Examples on how to use the request-reply API .

Request-Reply code examples.

6.98.1 Request-Reply Examples

Requesters and Repliers provide a way to use the Request-Reply communication pattern on top of the DDS entities. An application uses a Requester to send requests to a Replier; another application using a Replier receives a request and can send one or more replies for that request. The Requester that sent the request (and only that one) will receive the reply (or replies).

DDS Types

RTI Connext uses DDS data types for sending and receiving requests and replies. Valid types are those generated by the rtiddsgen code generator, the DDS built-in types, and `DynamicData`. Refer to the `Core Libraries User's Manual` and the following links for more information:

- `Code Generator User's Manual`,
- **Using the DDS built-in types** (p. 50),
- **Using DynamicData** (p. 439)

Set up

- **Create a DomainParticipant** (p. 307)
- **Create a requester** (p. 345)
- **Create a requester with parameters** (p. 345)

- **Create a replier** (p. 347)

Requester: sending requests and receiving replies

- **Basic Requester example** (p. 346)
- **Correlation between requests and replies** (p. 346)

Replier: receiving requests and sending replies

- **Basic Replier example** (p. 348)
- **SimpleReplier example** (p. 348)

Note

To use Request-Reply you need to build and link your application with the additional `rticonnextmsgcpp2` library.

6.98.2 Requester Creation

- **Setting up a DomainParticipant** (p. 307)
- Creating a Requester

```
using namespace rti::request;
dds::domain::DomainParticipant participant(domain_id);
Requester<Foo, Bar> requester(participant, "TestService");
```

6.98.3 Creating a Requester with optional parameters

- **Setting up a DomainParticipant** (p. 307)
- Creating a Requester with additional parameters

```
using namespace rti::request;
// Create a DomainParticipant
dds::domain::DomainParticipant participant(domain_id);
// Create a Requester with a QoS profile (located for example in
// USER_QOS_PROFILES.xml, in the current working directory, which the
// default QosProvider will load)
RequesterParams requester_params(participant);
requester_params.service_name("TestService");
dds::core::QosProvider qos_provider = dds::core::QosProvider::Default();
requester_params.datareader_qos(
        qos_provider.datareader_qos("RequestReplyExampleProfiles::RequesterExampleProfile"));
requester_params.datawriter_qos(
        qos_provider.datawriter_qos("RequestReplyExampleProfiles::RequesterExampleProfile"));
Requester<Foo, Bar> requester(requester_params);
```

Configuring Request-Reply QoS profiles (p. 348)

6.98.4 Basic Requester example

- **Requester Creation** (p. 345)
- **Creating a Requester with optional parameters** (p. 345)
- Basic Requester example

```
using namespace rti::request;
// Send request
Foo request("A Request");
requester.send_request(request);
// Receive reply (wait for it and get the sample)
auto replies = requester.receive_replies(MAX_WAIT);
if (replies.length() == 0) {
    std::cout « "Reply not received\n";
}
for (const auto& reply : replies) {
    if (reply.info().valid()) {
        std::cout « "Received reply: " « reply.data() « std::endl;
    } else {
        std::cout « "Received invalid reply\n";
    }
}
```

SimpleReplier example (p. 348)

6.98.5 Correlating requests and replies

- **Requester Creation** (p. 345)
- Example 1) Waiting for a reply to a specific request

```
using namespace rti::request;
// Create requests
Foo request1("Request 1"), request2("Request 2");
// Send requests and save request ID
rti::core::SampleIdentity request_id1 = requester.send_request(request1);
rti::core::SampleIdentity request_id2 = requester.send_request(request2);
// Wait for a reply to the second request
bool received = requester.wait_for_replies(1, MAX_WAIT, request_id2);
if (!received) {
    std::cout « "Did not receive reply for request 2" « std::endl;
    return;
}
// Take that reply
dds::sub::LoanedSamples<Bar> replies = requester.take_replies(request_id2);
if (replies.length() == 0) {
    throw std::runtime_error("did not receive any replies");
}
// This postcondition should always be true
if (replies[0].info()->related_original_publication_virtual_sample_identity()
        != request_id2) {
    throw std::runtime_error("postcondition failed");
}
if (replies[0].info().valid()) {
    std::cout « "Received reply for request 2: "
              « replies[0].data() « std::endl;
}
// Wait for a reply to the first request
received = requester.wait_for_replies(1, MAX_WAIT, request_id1);
if (!received) {
    std::cout « "Did not receive reply for request 1" « std::endl;
    return;
}
// Take that reply
replies = requester.take_replies(request_id1);
if (replies.length() == 0) {
    throw std::runtime_error("did not receive any replies");
}
// This postcondition should always be true
```

```
if (replies[0].info()->related_original_publication_virtual_sample_identity()
        != request_id1) {
    throw std::runtime_error("postcondition failed");
}
if (replies[0].info().valid()) {
    std::cout « "Received reply for request 1: "
              « replies[0].data() « std::endl;
}
```

- Example 2) Correlating a reply after receiving it

```
using namespace rti::request;
// Create requests
Foo request1("Request 1"), request2("Request 2");
// Send requests and save request ID
rti::core::SampleIdentity request_id1 = requester.send_request(request1);
rti::core::SampleIdentity request_id2 = requester.send_request(request2);
// Wait for two replies. In this case we don't mind the
// reception order
bool received = requester.wait_for_replies(2, MAX_WAIT);
if (!received) {
    std::cout « "Replies not received" « std::endl;
    return;
}
// Get all the replies
auto replies = requester.take_replies();
// Find the reply for request 1.
//
// We search using the STL find_if algorithm. The search range is all
// the elements in the replies container (from beginning to end).
// We use a predicate included in the API that evaluates to
// true when a Sample's related_identity equals the identity that
// is passed to the constructor (request_id1, in this case)
auto it = std::find_if(
        replies.begin(),
        replies.end(),
        IsReplyRelatedPredicate<Bar>(request_id1));
if (it != replies.end()) {
    std::cout « "Received reply for request 1: "
              « it->data() « std::endl;
}
// Find the reply for request 2
it = std::find_if(
        replies.begin(),
        replies.end(),
        IsReplyRelatedPredicate<Bar>(request_id2));
if (it != replies.end()) {
    std::cout « "Received reply for request 2: "
              « it->data() « std::endl;
}
```

6.98.9 Configuring Request-Reply QoS profiles

If you do not specify your own QoS parameters (in RequesterParams and ReplierParams), a **rti::request::Requester** (p. 2187) and **rti::request::Replier** (p. 2168) are created using a default configuration defined in the built-in profile **rti::core::builtin_profiles::qos_snippet_lib::pattern_rpc()** (p. 480). You use this built-in profile as the base for your own profiles:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xsi:noNamespaceSchemaLocation="http://community.rti.com/schema/current/rti_dds_profiles.xsd">
    <qos_library name="RequestReplyExampleProfiles">
        <!-- Use these profiles to customize the Requester or Replier QoS -->
        <!-- These profiles inherit from the built-in profile
             BuiltinQosLib::Pattern.RPC, which defines the default values for
             the DataWriters and DataReaders created by a Requester or Replier
        -->
        <qos_profile name="RequesterExampleProfile" base_name="BuiltinQosLib::Pattern.RPC">
            <!-- Set the QoS for the DataReader created by the Requester -->
            <!--
            <datareader_qos>
                ...
            </datareader_qos>
            -->
```

```
            <!-- Set the QoS for the DataWriter created by the Requester -->
            <!--
            <datawriter_qos>
                ...
            </datawriter_qos>
            -->
        </qos_profile>
        <qos_profile name="ReplierExampleProfile" base_name="BuiltinQosLib::Pattern.RPC">
            <!-- Set the QoS for the DataReader created by the Replier -->
            <!--
            <datareader_qos>
                ...
            </datareader_qos>
            -->
            <!-- Set the QoS for the DataWriter created by the Replier -->
            <!--
            <datawriter_qos>
                ...
            </datawriter_qos>
            -->
        </qos_profile>
    </qos_library>
</dds>
```

The example **Creating a Requester with optional parameters** (p. 345) shows how to create a **rti::request::Requester** (p. 2187) using this profile.

6.99 Documentation Roadmap

This section contains a roadmap for the new user with pointers on what to read first.

If you are new to RTI Connext, we recommend starting in the following order:

- See the `Getting Started Guide`. This document provides download and installation instructions. It also lays out the core value and concepts behind the product and takes you step-by-step through the creation of a simple example application.
- The `User's Manual` describes the features of the product and how to use them. It is organized around the structure of the DDS APIs and certain common high-level tasks.
- The documentation in the **RTI Connext DDS API Reference** (p. 357) provides an overview of API classes and modules for the DDS data-centric publish-subscribe (DCPS) package from a programmer's perspective. Start by reading the documentation on the main page.
- After reading the high level module documentation, look at the **Publication Example** (p. 304) and **Subscription Example** (p. 305) for step-by-step examples of creating a publication and subscription. These are hyperlinked code snippets to the full API documentation, and provide a good place to begin learning the APIs.
- Next, work through your own application using the example code files generated by rtiddsgen. See the `Code Generator User's Manual`.
- To integrate similar code into your own application and build system, you will likely need to refer to the `Platform Notes`.

6.100 Conventions

Basic concepts required to use the API correctly.

Basic concepts required to use the API correctly.

There are a few basic conventions that you need to understand to use this API correctly:

- The type system, including value types and reference types
- How to use standard and extension APIs
- Error management through exceptions
- C++11 support

6.100.1 Type system

All types in the API are **value types**, **reference types**, or **move-only types**. In this documentation a type is a value type, unless explicitly marked with <<***reference-type***>> *(*p. *351)* or <<***move-only-type***>> *(*p. *353)*. In some cases the type may be marked with <<***value-type***>> *(*p. *350)* for clarity.

6.100.1.1 Value types

<<***value-type***>> *(*p. *350)*Value types implement value semantics.

Note that in this API, types that don't specify their type semantics are value types by default. **IDL-generated types** (p. 606) are also value types.

Value types provide the following functionality:

- Deep-copy copy constructor and assignment operator.
- Move constructor and move-assignment operator <<***C++11***>> *(*p. *353)*.
- Destructor.
- Equality operators.
- Namespace-level **`swap()`** (p. 1460) function.

Those operations are not documented for each type unless they deviate from their usual behavior.

6.100.1.2 Reference types

<<***reference-type***>> *(*p. *351)*Reference types implement *reference semantics*.

In a reference type copy operations, such as copy-construction and copy-assignment
are *shallow*. The reference types are modeled after shared pointers. Similar to pointers, it is important to distinguish between an entity and a reference (or handle) to it. A single entity may have multiple references. Copying a reference does not copy the entity it is referring to—creating additional references from the existing reference(s) is a relatively inexpensive operation.

The lifecycle of references and the entity they are referring to is not the same. In general, the entity lives as long as there is at least one reference to it. When the last reference to the entity ceases to exists, the entity it is referring to is destroyed.

However, there are some exceptions. It is possible—and often convenient—to *retain* an entity even though it has no references, for example to look it up later. An reference can also be explicitly closed, deleting the object it references, regardless of the existence of other references.

An entity is considered to still be *in use* (i.e., retained) if any of the following conditions are met:

- The entity has one or more references.
- The entity has been explicitly retained with the `retain()` member function.
- The entity created another object that is still in use. For example, while a `Topic` exist, its related `Domain↩ Participant` won't be deleted.
- **[DEPRECATED]** The entity has a non-null listener pointer. (Using a raw pointer as a listener is deprecated. The way to assign a listener is using a `std::shared_ptr<`**`Listener`** (p. `1637)>`. When a `shared_ptr` is used, the entity is not retained.)

All reference types inherit from **`dds::core::Reference`** (p. `2149)`. The reference semantics are implemented using a shared count.

Reference types provide the following functionality:

- **Constructors specific to the type**

  Creates a new object and a reference to it. For example:
  ```
  // Create a domain participant and one reference to it.
  dds::domain::DomainParticipant participant(MY_DOMAIN_ID);
  ```
- **Copy constructor**

  Creates a new reference to an existing object, increasing the reference count. For example:
  ```
  dds::domain::DomainParticipant same_participant = participant;
  ```
- **Assignment operator**

  Replaces the object that was referenced to with a new one, possibly decreasing the reference count of the former object and increasing it for the new one.
- **Constructor from `dds::core::null` (**p. **`438`**`)` (or `nullptr` <<***C++11***>> *(*p. ***353***)**)**

  Creates an instance that doesn't reference any object. For example:
  ```
  dds::domain::DomainParticipant null_participant = dds::core::null;
  ```

- **Assignment operator from `dds::core::null` (p. 438) (or `nullptr` <<*C++11*>> (p. *353*))**

  Makes the reference empty, decreasing the reference count.
  ```
  dds::domain::DomainParticipant participant(MY_DOMAIN_ID);
  participant = dds::core::null; // This will destroy the participant object
  ```

- **Equal operator (to another reference)**

  Returns true only if the referenced object is the same. For example:
  ```
  dds::domain::DomainParticipant participant1(MY_DOMAIN_ID);
  dds::domain::DomainParticipant participant2(MY_DOMAIN_ID);
  if (participant1 != participant2) {
      std::cout « "References to different objects\n";
  }
  // Note that this also destroys the former object referenced to by participant2
  participant2 = participant1;
  if (participant1 == participant2) {
      std::cout « "References to the same object\n";
  }
  ```

  The operators <, <=, >, >= are also supported, and compare the underlying pointer.

- **Equal operator to `dds::core::null` (p. 438) (or `nullptr` <<*C++11*>> (p. *353*))**

  Returns true only if this reference is empty. For example:
  ```
  dds::domain::DomainParticipant participant = dds::core::null;
   // dds::core::null and nullptr are interchangeable in C++11
  if (participant == nullptr) {
      std::cout « "Empty reference\n";
  }
  ```

Some reference types, including **dds::core::Entity** (p. 1520) and its subclasses, also provide:

- **`close()` (p. 1024)**

  Forces the destruction of the underlying object. After this, calling a method on the destroyed object throws **`dds::core::AlreadyClosedError`** (p. 806). For example:
  ```
  dds::domain::DomainParticipant participant1(MY_DOMAIN_ID);
  dds::domain::DomainParticipant participant2 = participant1;
  participant2.close(); // Destroys the underlying object
  int id = participant1.domain_id(); // throws dds::core::AlreadyClosedError
  ```

- **`retain()`**

  Disables the destruction of the underlying object. When all references are destroyed the underlying object still exists and can be looked up. To finally destroy a retained object you need to explicitly call **close()** (p. 1024).

  For example:
  ```
  using namespace dds::domain;
  void create_participant()
  {
      DomainParticipant participant(MY_DOMAIN_ID);
      participant.retain();
  } // participant goes out of scope
  void test_retain()
  {
      create_participant();
      DomainParticipant participant = find(MY_DOMAIN_ID);

      // ...

      // Since the participant has been retained, we need to explicitly close it:
      participant.close();
  }
  ```

Reference types with an inheritance relationship such as **dds::core::Entity** (p. 1520) or **dds::core::cond::Condition** (p. 948) can use **dds::core::polymorphic_cast** (p. 620) to cast from a base to a derived class.

For more examples on reference types see **Entity Use Cases** (p. 325)

6.100.1.3 Move-only types

<<***move-only-type***>> *(p. 353)*Move-only types are types that can't be copied, only "moved." A move-only type encapsulates a view of an internal resource. Only one reference to that resource may exist at a time.

6.100.2 C++11 Support

<<***C++11***>> *(p. 353)*Functionality supported only in C++11.

This API is designed to integrate with and make use of C++11. The API headers are prepared to detect at application-compile time what C++11 features are available and make use of them.

Different compilers support different C++11 features, and some require
explicitly activating C++11 support. If your compiler activates C++11 by default (for example, Visual Studio 2010 and later), you dont need to do anything. Whatever features are available will be used. If your compiler requires an explicit activation, you will need to pass a flag (for example, -std=c++0x or -std=c++11 in gcc and clang). The `Platform Notes` can help with that.

The API provides the following C++11 features when available:

- Defines move constructors and move-assignment operators for most types, both in the API and in types generated from IDL.
- Enables the use of the range for-loop in classes like **`dds::sub::LoanedSamples`** (p. 1663).
- Enables the use of lambda functions in places like **`dds::sub::cond::ReadCondition`** (p. 2133)
- Specifies some key functions as `noexcept`, like move constructors.
- Enables the use of `std::initializer_list` in several functions. For example see **`rti::core::policy::Property`** (p. 1969). <<***extension***>> *(p. 354)*
- Provides utilities to manipulate **`dds::core::xtypes::DynamicType`** (p. 1504) and **`dds::core::xtypes::DynamicData`** (p. 1461) **using tuples** (p. 612). <<***extension***>> *(p. 354)* <<***experimental***>> *(p. 355)*
- Supports the interchangeable use of `std::chrono::duration` and **`dds::core::Duration`** (p. 1448). <<***extension***>> *(p. 354)*
- Supports the interchangeable use of `nullptr` and **`dds::core::null`** (p. 438).

6.100.3 Exceptions in the API

The modern C++ API uses exceptions to report errors.

If a function doesn't document what exceptions it may throw and is not declared `noexcept`, then it may throw any of the **standard exceptions** (p. 427).

Destructors won't throw exceptions. There are cases however where you may need to handle an error during an object destruction. Some classes, like the **reference types** (p. 351) provide a **close()** (p. 1024) operation–which can throw–that destroys the underlying entity.

Note that the API can also throw C++ standard exceptions such as `std::bad_alloc`.

For a few critical operations both a regular exception-throwing function and a noexcept function are provided. The noexcept versions always return an **rti::core::Result** (p. 2209) object, and are always extension functions that need to be accessed with the -> operator. For example, a **dds::sub::DataReader** (p. 976) provides both **`take()`** (p. 1024) and **`take_noexcept()`** (p. 1018):

```
auto samples = reader.take(); // may throw
auto result = reader->take_noexcept(); // never throws
if (result.is_ok()) {
     auto& samples = result.get();
     // ...
}
```

See also

Exceptions (p. 427)

6.100.4 Extensions to the standard API

*<<**extension**>> (p. 354)*The stereotype *<<**extension**>> (p. 354)* indicates that a type or a function is RTI Connext product extension to the standard DDS specification.

The RTI extension APIs complement the standard APIs specified by the OMG DDS specification.

There are the following kinds of extensions: extension methods for a standard class, extension types, and extension standalone functions.

To call an extension methods for an standard class use the **`extensions()`** method or the overloaded **arrow operator (->)**. For example:

```
// Standard class (in dds namespace)
dds::domain::DomainParticipant participant(MY_DOMAIN_ID);
// Call a standard method
participant.assert_liveliness();
// Call an extension method:
participant.extensions().register_durable_subscription(...);
// or:
participant->register_durable_subscription(...);
```

Note that the arrow operator is `noexcept` but the `extensions()` method of a reference type is not (it may throw **dds::core::NullReferenceError** (p. 1870) if the object is **dds::core::null** (p. 438)).

In this documentation extension members in a standard type appear as members of that type, although they are members of a delegate type called through the standard type (calling `extensions()` or the arrow operator). We omit this implementation detail from the API documentation for simplicity.

Extension types reside in the `rti` namespace instead of the `dds` namespace. For example:

```
// FlowController is an extension class and it resides in the rti namespace
rti::pub::FlowController flow_controller(participant);
// All methods in an extension class are called using the usual dot operator
flow_controller.trigger_flow();
```

The following example combines an extension function for a standard type (`Reliability`) and an extension type (`AcknowledgmentKind`):

```
// Standard class (in dds namespace)
dds::core::policy::Reliability reliability;
// Call a standard method
reliability.kind(dds::core::policy::ReliabilityKind::RELIABLE);
// Call an extension method, passing an extension enumeration:
reliabilty.extensions().acknowledgment_kind(
        rti::core::policy::AcknowledgmentKind::APPLICATION_AUTO);
// or:
reliabilty->acknowledgment_kind(
        rti::core::policy::AcknowledgmentKind::APPLICATION_AUTO);
```

Extension standalone functions are also in the `rti` namespace. For example:

```
// Standard function (in the dds namespace)
dds::sub::find<dds::sub::DataReader<Foo> >(
    subscriber, "Foo Topic", std::back_inserter(readers));

// Extension function (in the rti namespace)
rti::sub::find_datareaders(subscriber, std::back_inserter(readers));
```

6.100.5 Experimental

<<***experimental***>> *(*p. *355)*Experimental features subject to change.

- RTI Connext experimental features are used to evaluate new features and get user feedback.
- These features are not guaranteed to be fully supported and might be implemented only for some of the programming languages supported by RTI Connext
- Experimental features may or may not appear in future product releases.
- Experimental features should not be used in production.

6.100.6 Method Parameters

Some times the parameter may have one of the following stereotypes, but in most cases the function signature reveals if the parameter is an input parameter (by value or const-reference), or output parameter (non-const reference).

- <<***in***>> *(*p. *355)*
  - An *input* parameter.
- <<***out***>> *(*p. *355)*
  - An *output* parameter.
- <<***inout***>> *(*p. *355)*
  - An *input* and *output* parameter.

6.101 Namespaces and headers

This section describes the headers and namespaces in the modern C++ API.

6.101.1 Header Files

The modern C++ API is organized using a set of standard header files that you will find in the $NDDSHOME/include/hpp/dds directory of your installation. The headers in this directory are organized into 5 modules defined by the DDS v1.2 Platform Independent Mapping (PIM):

- **domain:** DomainParticipant specific headers
- **pub:** Publisher, DataWriter and other headers specific to the publication of data
- **sub:** Subscriber, DataReader and other headers specific to the consumption of data
- **topic:** Topic management specific headers

- **core:** headers that define classes and DDS types that are used by all of the other modules

You will also find an $NDDSHOME/include/hpp/rti directory in your installation. This directory contains RTI Connext implementation specific details along with **extensions** (p. 354) to the standard API.

To import the DDS API into your application you must include these header files. There are several ways to do this:

1. Include the entire standard API:
```
#include <dds/dds.hpp>
```
2. Include the standard API plus all the extensions:
```
#include <rti/rti.hpp>
```
3. Include complete namespaces, for example:
```
#include <dds/domain/ddsdomain.hpp>
#include <dds/sub/ddssub.hpp>
```
4. Include individual headers, for example:
```
#include <dds/domain/DomainParticipant.hpp>
#include <dds/sub/DataReader.hpp>
```

All of the **Programming How-To** (p. 362) pages start with a section showing which header that the code snippets on that page require.

6.101.2 Namespaces

There are a number of different namespaces in the modern C++ API that organize the API into logical groups. The two main namespaces are `dds` and `rti`.

The `dds` namespace includes all of the standard types, classes and methods. The `rti` namespace includes all RTI **extensions** (p. 354) to the standard API.

The `dds` and `rti` namespaces both contain several nested namespaces. There is a namespace for each of the 5 modules: **dds::core** (p. 616), **dds::domain** (p. 634), **dds::topic** (p. 688), **dds::pub** (p. 645), **dds::sub** (p. 658) (and the corresponding **rti::core** (p. 701), **rti::domain** (p. 727), **rti::topic** (p. 771), **rti::pub** (p. 736), **rti::sub** (p. 751)).

The rti namespace also contains **rti::util** (p. 777) and **rti::config** (p. 699).

There are further specialized namespaces within each module namespace.

All of the modules, excluding core, contain a `qos` namespace that contains the Qos classes for the entities contained in that module:

- **`dds::domain::qos`** (p. 640)
  - `DomainParticipantQos`
  - `DomainParticipantFactoryQos`
- **`dds::pub::qos`** (p. 653)

  - PublisherQos
  - DataWriterQos
- **dds::sub::qos** (p. 681)
  - SubscriberQos
  - DataReaderQos
- **dds::topic::qos** (p. 695)
  - TopicQos

All of the individual Qos policies can be accessed from either the **dds::core::policy** (p. 627) namespace for standard Qos policies or the rti::core::policy namespace for RTI extension Qos policies.

In addition to the policy namespace, the core namespace contains two other nested namespaces.

- **dds::core::status** (p. 630)
  - Contains all communication statuses and StatusMask
- **dds::core::cond** (p. 627)
  - Condition
  - GuardCondidtion
  - StatusCondition
  - Waitset

The sub namespace also contains the status and cond nested namespaces.

- **dds::sub::status** (p. 686)
  - DataState
- **dds::sub::cond** (p. 680)
  - QueryCondition
  - ReadCondition

Two convenience namespaces bring all the symbols into a single place: **dds::all** (p. 615) and **rti::all** (p. 699).

6.102 RTI Connext DDS API Reference

RTI Connext modules following the DDS module definitions.

Modules

- **Domain Module**

  *Contains the **dds::domain::DomainParticipant** (p. 1326) class that acts as an entrypoint of RTI Connext and acts as a factory for many of the classes. The **dds::domain::DomainParticipant** (p. 1326) also acts as a container for the other objects that make up RTI Connext.*
- **Topic Module**

  *Contains the **dds::topic::Topic** (p. 2474), **dds::topic::ContentFilteredTopic** (p. 954), and MultiTopic classes, the TopicListener interface, and more generally, all that is needed by an application to define **dds::topic::Topic** (p. 2474) objects and attach QoS policies to them.*
- **Publication Module**

  *Contains the **rti::pub::FlowController** (p. 1572), **dds::pub::Publisher** (p. 1993), and **dds::pub::DataWriter** (p. 1138) classes as well as the PublisherListener and **dds::pub::DataWriterListener** (p. 1202) interfaces, and more generally, all that is needed on the publication side.*
- **Subscription Module**

  *Contains the **dds::sub::Subscriber** (p. 2410), **dds::sub::DataReader** (p. 976), **dds::sub::cond::ReadCondition** (p. 2133), **dds::sub::cond::QueryCondition** (p. 2059), and **rti::sub::TopicQuery** (p. 2516) classes, as well as the **dds::sub::SubscriberListener** (p. 2422) and **dds::sub::DataReaderListener** (p. 1055) interfaces, and more generally, all that is needed on the subscription side.*
- **Infrastructure Module**

  Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.
- **Transports**

  APIs related to RTI Connext pluggable transports.
- **Queries and Filters Syntax**
- **Logging and Version**

  APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connext.
- **General Utilities and Compliance Configuration**

  API of general utilities used in the RTI Connext distribution.
- **Observability Framework**

  RTI Connext Observability Framework modules and APIs.
- **Durability and Persistence**

  APIs related to RTI Connext Durability and Persistence.
- **System Properties**

  System Properties.
- **Configuring QoS Profiles with XML**

  APIs related to XML QoS Profiles.
- **Additional RTI Connext Communication Patterns**

  Extensions to the RTI Connext publish-subscribe functionality.

6.102.1 Detailed Description

RTI Connext modules following the DDS module definitions.

6.102.2 Overview

Information flows with the aid of the following constructs: **dds::pub::Publisher** (p. 1993) and **dds::pub::DataWriter** (p. 1138) on the sending side, **dds::sub::Subscriber** (p. 2410) and **dds::sub::DataReader** (p. 976) on the receiving side.

- A **dds::pub::Publisher** (p. 1993) is an object responsible for data distribution. It may publish data of different data types. A TDataWriter acts as a *typed* (i.e. each **dds::pub::DataWriter** (p. 1138) object is dedicated to one application data type) accessor to a publisher. A **dds::pub::DataWriter** (p. 1138) is the object the application must use to communicate to a publisher the existence and value of data objects of a given type. When data object values have been communicated to the publisher through the appropriate data-writer, it is the publisher's responsibility to perform the distribution (the publisher will do this according to its own QoS, or the QoS attached to the corresponding data-writer). A *publication* is defined by the association of a data-writer to a publisher. This association expresses the intent of the application to publish the data described by the data-writer in the context provided by the publisher.
- A **dds::sub::Subscriber** (p. 2410) is an object responsible for receiving published data and making it available (according to the Subscriber's QoS) to the receiving application. It may receive and dispatch data of different specified types. To access the received data, the application must use a *typed* TDataReader attached to the subscriber. Thus, a *subscription* is defined by the association of a data-reader with a subscriber. This association expresses the intent of the application to subscribe to the data described by the data-reader in the context provided by the subscriber.

dds::topic::Topic (p. 2474) objects conceptually fit between publications and subscriptions. Publications must be known in such a way that subscriptions can refer to them unambiguously. A **dds::topic::Topic** (p. 2474) is meant to fulfill that purpose: it associates a name (unique in the domain i.e. the set of applications that are communicating with each other), a data type, and QoS related to the data itself. In addition to the topic QoS, the QoS of the **dds::pub::↩ DataWriter** (p. 1138) associated with that Topic and the QoS of the **dds::pub::Publisher** (p. 1993) associated to the **dds::pub::DataWriter** (p. 1138) control the behavior on the publisher's side, while the corresponding **dds::topic::↩ Topic** (p. 2474), **dds::sub::DataReader** (p. 976) and **dds::sub::Subscriber** (p. 2410) QoS control the behavior on the subscriber's side.

When an application wishes to publish data of a given type, it must create a **dds::pub::Publisher** (p. 1993) (or reuse an already created one) and a **dds::pub::DataWriter** (p. 1138) with all the characteristics of the desired publication. Similarly, when an application wishes to receive data, it must create a **dds::sub::Subscriber** (p. 2410) (or reuse an already created one) and a **dds::sub::DataReader** (p. 976) to define the subscription.

6.102.3 Conceptual Model

The overall conceptual model is shown below.

Notice that all the main communication objects (the specializations of Entity) follow unified patterns of:

- Supporting QoS (made up of several QosPolicy); QoS provides a generic mechanism for the application to control the behavior of the Service and tailor it to its needs. Each **dds::core::Entity** (p. 1520) supports its own specialized kind of QoS policies (see **All QoS Policies** (p. 508)).

- Accepting a **Listener** (p. 1637); listeners provide a generic mechanism for the middleware to notify the application of relevant asynchronous events, such as arrival of data corresponding to a subscription, violation of a QoS setting, etc. Each **dds::core::Entity** (p. 1520) supports its own specialized kind of listener. Listeners are related to changes in status conditions (see **Status Kinds** (p. 429)).

  Note that only one **Listener** (p. 1637) per entity is allowed (instead of a list of them). The reason for that choice is that this allows a much simpler (and, thus, more efficient) implementation as far as the middleware is concerned. Moreover, if it were required, the application could easily implement a listener that, when triggered, triggers in return attached 'sub-listeners'.

- Accepting a **dds::core::cond::StatusCondition** (p. 2372) (and a set of **dds::sub::cond::ReadCondition** (p. 2133) objects for the **dds::sub::DataReader** (p. 976)); conditions (in conjunction with **dds::core::cond::WaitSet** (p. 2617) objects) provide support for an alternate communication style between the middleware and the application (i.e., wait-based rather than notification-based).

All DCPS entities are attached to a **dds::domain::DomainParticipant** (p. 1326). A domain participant represents the local membership of the application in a domain. A *domain* is a distributed concept that links all the applications able to communicate with each other. It represents a communication plane: only the publishers and the subscribers attached to the same domain may interact.

DomainEntity is an intermediate object whose only purpose is to state that a DomainParticipant cannot contain other domain participants.

At the DCPS level, data types represent information that is sent atomically. For performance reasons, only plain data structures are handled by this level.

By default, each data modification is propagated individually, independently, and uncorrelated with other modifications. However, an application may request that several modifications be sent as a whole and interpreted as such at the recipient side. This functionality is offered on a Publisher/Subscriber basis. That is, these relationships can only be specified among **dds::pub::DataWriter** (p. 1138) objects attached to the same **dds::pub::Publisher** (p. 1993) and retrieved among **dds::sub::DataReader** (p. 976) objects attached to the same **dds::sub::Subscriber** (p. 2410).

By definition, a **dds::topic::Topic** (p. 2474) corresponds to a single data type. However, several topics may refer to the same data type. Therefore, a **dds::topic::Topic** (p. 2474) identifies data of a single type, ranging from one single instance to a whole collection of instances of that given type. This is shown below for the hypothetical data type **Foo** (p. 1588).

In case a set of instances is gathered under the same topic, different instances must be distinguishable. This is achieved by means of the values of some data fields that form the **key** to that data set. The *key description* (i.e., the list of data fields whose value forms the key) has to be indicated to the middleware. The rule is simple: *different data samples with the same key value represent successive values for the same instance, while different data samples with different key values represent different instances*. If no key is provided, the data set associated with the **dds::topic::Topic** (p. 2474) is restricted to a *single instance*.

Topics need to be known by the middleware and potentially propagated. Topic objects are created using the create operations provided by **dds::domain::DomainParticipant** (p. 1326).

The interaction style is straightforward on the publisher's side: when the application decides that it wants to make data available for publication, it calls the appropriate operation on the related **dds::pub::DataWriter** (p. 1138) (this, in turn, will trigger its **dds::pub::Publisher** (p. 1993)).

On the subscriber's side however, there are more choices: relevant information may arrive when the application is busy doing something else or when the application is just waiting for that information. Therefore, depending on the way the application is designed, asynchronous notifications or synchronous access may be more appropriate. Both interaction

modes are allowed, a **Listener** (p. 1637) is used to provide a callback for synchronous access and a **dds::core::cond↩ ::WaitSet** (p. 2617) associated with one or several **dds::core::cond::Condition** (p. 948) objects provides asynchronous data access.

The same synchronous and asynchronous interaction modes can also be used to access changes that affect the middleware communication status (see **Status Kinds** (p. 429)). For instance, this may occur when the middleware asynchronously detects an inconsistency. In addition, other middleware information that may be relevant to the application (such as the list of the existing topics) is made available by means of **built-in topics** (p. 46) that the application can access as plain application data, using built-in data-readers.

6.102.4 Modules

DCPS consists of five modules:

- **Infrastructure module** (p. 72) defines the abstract classes and the interfaces that are refined by the other modules. It also provides support for the two interaction styles (notification-based and wait-based) with the middleware.
- **Domain module** (p. 44) contains the **dds::domain::DomainParticipant** (p. 1326) class that acts as an entrypoint of the Service and acts as a factory for many of the classes. The **dds::domain::DomainParticipant** (p. 1326) also acts as a container for the other objects that make up the Service.
- **Topic module** (p. 47) contains the **dds::topic::Topic** (p. 2474) class, the TopicListener interface, and more generally, all that is needed by the application to define **dds::topic::Topic** (p. 2474) objects and attach QoS policies to them.
- **Publication module** (p. 55) contains the **dds::pub::Publisher** (p. 1993) and **dds::pub::DataWriter** (p. 1138) classes as well as the PublisherListener and **dds::pub::DataWriterListener** (p. 1202) interfaces, and more generally, all that is needed on the publication side.
- **Subscription module** (p. 61) contains the **dds::sub::Subscriber** (p. 2410), **dds::sub::DataReader** (p. 976), **dds::sub::cond::ReadCondition** (p. 2133), and **dds::sub::cond::QueryCondition** (p. 2059) classes, as well as the **dds::sub::SubscriberListener** (p. 2422) and **dds::sub::DataReaderListener** (p. 1055) interfaces, and more generally, all that is needed on the subscription side.

6.103 Additional RTI Connext Communication Patterns

Extensions to the RTI Connext publish-subscribe functionality.

Modules

- **Request-Reply Pattern**

  Support for the request-reply communication pattern.
- **Queuing Pattern**

  Support for the queuing communication pattern.
- **Remote Procedure Call**

  Remote Procedure call (RPC) communication pattern.
- **Utilities**

  Utilities for the RTI Connext Messaging module.

6.103.1 Detailed Description

Extensions to the RTI Connext publish-subscribe functionality.

6.104 Programming How-To's

These "How To"s illustrate how to apply RTI Connext APIs to common use cases.

Modules

- **Publication Example**

  A data publication example.
- **Subscription Example**

  A data subscription example.
- **Participant Use Cases**

  Working with domain participants.
- **Topic Use Cases**
- **Publisher Use Cases**
- **DataWriter Use Cases**
- **Subscriber Use Cases**
- **DataReader Use Cases**
- **Entity Use Cases**
- **Waitset Use Cases**

  Using WaitSets and Conditions.
- **Filter Use Cases**

  Working with data filters.
- **Creating Custom Content Filters**

  Creating a custom content filter.
- **XML Application Creation**

  Defining DDS systems in XML.
- **Request-Reply Examples**

  Examples on how to use the request-reply API .
- **RPC Tutorial**

  Getting Started with Remote Procedure Call with DDS.
- **Built-in Types Examples**

  Using Built-in Types.
- **Exceptions**

  How DDS return codes map to C++ exceptions.
- **Qos Use Cases**
- **Qos Provider Use Cases**

  *How to use **dds::core::QosProvider*** (p. 2025) *to access XML QoS profiles.*
- **Working with IDL types**

  How IDL types map to C++ classes.
- **DynamicType and DynamicData Use Cases**

  Using DynamicType and DynamicData.

6.104.1 Detailed Description

These "How To"s illustrate how to apply RTI Connext APIs to common use cases.

These are a good starting point to familiarize yourself with DDS. You can use these code fragments as "templates" for writing your own code.

6.105 Interface

Abstraction of a Transport Plugin network interface.

Classes

- struct **NDDS_Transport_Interface_t**

  Storage for the description of a network interface used by a Transport Plugin.

Enumerations

- enum **NDDS_Transport_Interface_Status_t** {
  NDDS_TRANSPORT_INTERFACE_OFF = 0 ,
  NDDS_TRANSPORT_INTERFACE_ON = 1 }

  Interface status.

6.105.1 Detailed Description

Abstraction of a Transport Plugin network interface.

A Transport Plugin may be able to use several logical or physical network interfaces in a single node (machine). For example, there may be multiple NICs for IP networks or multiple serial ports for serial networks.

An instance of a Transport Plugin is a conduit to one or more network interfaces associated with the transport.

Instances of a Transport Plugin must assign a unique unicast address to each of the network interfaces that it can use to send and receive messages. The unicast address should be within the range of addresses that are addressable by the Transport Plugin (as defined by the plugin itself).

Then, when RTI Connext sends a message to an unicast destination address, the destination address will be made of two parts. The network address and an interface address. The network address portion will be used by RTI Connext to select the Transport Plugin instance that will send the message. The interface address portion is passed to the Transport Plugin instance as the destination interface to which the message should be sent.

NDDS_Transport_Address_t (p. 1784) **NDDS_Transport_ClassId_t** (p. 371)

6.105.2 Enumeration Type Documentation

6.105.2.1 NDDS_Transport_Interface_Status_t

enum **NDDS_Transport_Interface_Status_t**

Interface status.

Enumerator

NDDS_TRANSPORT_INTERFACE_OFF	The transport interface is OFF.
NDDS_TRANSPORT_INTERFACE_ON	The transport interface is ON.

6.106 Transport Plugins Configuration

Transport plugins configuration with RTI Connext.

Classes

- struct **NDDS_Transport_UUID**

  Unequivocally identifies a transport plugin instance.
- struct **TransportAllocationSettings_t**

  Allocation settings used by various internal buffers.
- struct **NDDS_Transport_Property_t**

  Base configuration structure that must be inherited by derived Transport Plugin classes.

Macros

- #define **NDDS_TRANSPORT_PORT_INVALID** ((**NDDS_Transport_Port_t**) 0)

  Port 0 is considered to be invalid.
- #define **NDDS_TRANSPORT_UUID_SIZE** 12

  *Size of a **NDDS_Transport_UUID** (p. 1829).*
- #define **NDDS_TRANSPORT_LENGTH_UNLIMITED** -1

  Represent an unlimited length.
- #define **NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN** 0

  Rank interface as unknown or not yet set.
- #define **NDDS_TRANSPORT_UUID_UNKNOWN**

  Value for UUIDs that have no known value. Used as default.
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (-1)

  *The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 2533).*
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC** (-1)

  *The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 2533).*
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT**

  *The constant used as default value for the struct **TransportAllocationSettings_t** (p. 2533).*
- #define **NDDS_TRANSPORT_CLASSID_INVALID** (-1)

  Invalid Transport Class ID.
- #define **NDDS_TRANSPORT_CLASSID_UDPv4** (1)

  Builtin IPv4 UDP/IP Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_SHMEM** (0x01000000)

  Builtin Shared-Memory Transport Plugin class ID.

- #define **NDDS_TRANSPORT_CLASSID_SHMEM_510** (2)

  Builtin Shared-Memory Transport Plugin class ID for Connext 5.1.0 and earlier.
- #define **NDDS_TRANSPORT_CLASSID_UDPv6** (2)

  Builtin IPv6 UDP/IP Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_UDPv6_510** (5)

  Builtin IPv6 UDP/IP Transport Plugin class ID for Connext 5.1.0 and earlier.
- #define **NDDS_TRANSPORT_CLASSID_TCPV4_LAN** (8)

  IPv4 TCP/IP Transport Plugin class ID for LAN case.
- #define **NDDS_TRANSPORT_CLASSID_TCPV4_WAN** (9)

  IPv4 TCP/IP Transport Plugin class ID for WAN case.
- #define **NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN** "tcpv4_wan"

  IPv4 TCP/IP Transport Plugin class name for WAN case.
- #define **NDDS_TRANSPORT_CLASSID_TLSV4_LAN** (10)

  IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.
- #define **NDDS_TRANSPORT_CLASSID_TLSV4_WAN** (11)

  IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.
- #define **NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (0x01000001)

  Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (1000)

  Transport Plugin class IDs below this are reserved by RTI.
- #define **NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED** (0x2)

  Specified zero-copy behavior of transport.
- #define **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN** (3)

  Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

Typedefs

- typedef RTI_UINT32 **NDDS_Transport_Port_t**

  Type for storing RTI Connext RTPS ports.
- typedef RTI_INT32 **NDDS_Transport_ClassId_t**

  Type for storing RTI Connext Transport Plugin class IDs.

6.106.1 Detailed Description

Transport plugins configuration with RTI Connext.

Transport plugins are configured using properties. Each transport plugin must derive its property from a base configuration structure **NDDS_Transport_Property_t** (p. 1786).

To see how to configure the Built-in Transport Plugins, see **Built-in Transport Plugins** (p. 83).

See also

Built-in Transport Plugins (p. 83)

6.106.2 Macro Definition Documentation

6.106.2.1 NDDS_TRANSPORT_PORT_INVALID

```
#define NDDS_TRANSPORT_PORT_INVALID (( NDDS_Transport_Port_t) 0)
```

Port 0 is considered to be invalid.

6.106.2.2 NDDS_TRANSPORT_UUID_SIZE

```
#define NDDS_TRANSPORT_UUID_SIZE 12
```

Size of a **NDDS_Transport_UUID** (p. 1829).

6.106.2.3 NDDS_TRANSPORT_LENGTH_UNLIMITED

```
#define NDDS_TRANSPORT_LENGTH_UNLIMITED -1
```

Represent an unlimited length.

6.106.2.4 NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN

```
#define NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN 0
```

Rank interface as unknown or not yet set.

6.106.2.5 NDDS_TRANSPORT_UUID_UNKNOWN

```
#define NDDS_TRANSPORT_UUID_UNKNOWN
```

Value:

```
{ \
  { \
    0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0 \
  } \
}
```

Value for UUIDs that have no known value. Used as default.

6.106.2.6 NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED (-1)
```

The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 2533).

6.106.2.7 NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC (-1)
```

The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 2533).

Automatic means the buffer size will double at every reallocation.

6.106.2.8 NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT
```

Value:

```
        {                                   \
        2L, /* initial_count */                                         \
        NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED, /* max_count */     \
        NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC /* incremental_count */ \
}
```

The constant used as default value for the struct **TransportAllocationSettings_t** (p. 2533).

The default value defined in this constant, sets the buffer to have:

- initial_count = 2 elements
- max_count = **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (p. 367)
- incremental_count = NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC

6.106.2.9 NDDS_TRANSPORT_CLASSID_INVALID

```
#define NDDS_TRANSPORT_CLASSID_INVALID (-1)
```

Invalid Transport Class ID.

Transport-Plugins implementations should set their class ID to a value different than this.

6.106.2.10 NDDS_TRANSPORT_CLASSID_UDPv4

```
#define NDDS_TRANSPORT_CLASSID_UDPv4 (1)
```

Builtin IPv4 UDP/IP Transport Plugin class ID.

6.106.2.11 NDDS_TRANSPORT_CLASSID_SHMEM

```
#define NDDS_TRANSPORT_CLASSID_SHMEM (0x01000000)
```

Builtin Shared-Memory Transport Plugin class ID.

6.106.2.12 NDDS_TRANSPORT_CLASSID_SHMEM_510

```
#define NDDS_TRANSPORT_CLASSID_SHMEM_510 (2)
```

Builtin Shared-Memory Transport Plugin class ID for Connext 5.1.0 and earlier.

6.106.2.13 NDDS_TRANSPORT_CLASSID_UDPv6

```
#define NDDS_TRANSPORT_CLASSID_UDPv6 (2)
```

Builtin IPv6 UDP/IP Transport Plugin class ID.

6.106.2.14 NDDS_TRANSPORT_CLASSID_UDPv6_510

```
#define NDDS_TRANSPORT_CLASSID_UDPv6_510 (5)
```

Builtin IPv6 UDP/IP Transport Plugin class ID for Connext 5.1.0 and earlier.

6.106.2.15 NDDS_TRANSPORT_CLASSID_TCPV4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_LAN (8)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case.

6.106.2.16 NDDS_TRANSPORT_CLASSID_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_WAN (9)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case.

6.106.2.17 NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN "tcpv4_wan"
```

IPv4 TCP/IP Transport Plugin class name for WAN case.

6.106.2.18 NDDS_TRANSPORT_CLASSID_TLSV4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TLSV4_LAN (10)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.

6.106.2.19 NDDS_TRANSPORT_CLASSID_TLSV4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TLSV4_WAN (11)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.

6.106.2.20 NDDS_TRANSPORT_CLASSID_UDPv4_WAN

```
#define NDDS_TRANSPORT_CLASSID_UDPv4_WAN (0x01000001)
```

Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.

6.106.2.21 NDDS_TRANSPORT_CLASSID_RESERVED_RANGE

```
#define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (1000)
```

Transport Plugin class IDs below this are reserved by RTI.

User-defined Transport-Plugins should use a class ID greater than this number.

6.106.2.22 NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED

```
#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (0x2)
```

Specified zero-copy behavior of transport.

A Transport Plugin may commit to one of three behaviors for zero copy receives:

1. Always does zero copy.
2. Sometimes does zero copy, up to the transport discretion.
3. Never does zero copy.

This bit should be set only if the Transport Plugin commits to always doing a zero copy receive, or more specifically, always loaning a buffer through its `receive_rEA()` call.

In that case, RTI Connext will not need to allocate storage for a message that it retrieves with the `receive_rEA()` call.

6.106.2.23 NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN

```
#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN (3)
```

Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

For the **NDDS_Transport_Property_t** (p. 1786) structure to be valid, the value of **NDDS_Transport_Property_t↩ ::gather_send_buffer_count_max** (p. 1789) must be greater than or equal to this value.

6.106.3 Typedef Documentation

6.106.3.1 NDDS_Transport_Port_t

```
typedef RTI_UINT32  NDDS_Transport_Port_t
```

Type for storing RTI Connext RTPS ports.

Unlike IPv4 Socket API ports, which are 2 bytes long, the RTI Connext representation of an RTPS port is 4 bytes.

6.106.3.2 NDDS_Transport_ClassId_t

```
typedef RTI_INT32 NDDS_Transport_ClassId_t
```

Type for storing RTI Connext Transport Plugin class IDs.

Each implementation of a Transport Plugin must have a unique ID. For example, a UDP/IP Transport Plugin implementation must have a different ID than a Shared Memory Transport Plugin.

User-implemented Transport Plugins must have an ID higher than **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 370).

6.107 Transport Address

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

Classes

- struct **NDDS_Transport_Address_t**

  Addresses are stored individually as network-ordered bytes.

Macros

- #define **NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER**

  An invalid transport address. Used as an initializer.
- #define **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (72)

  *The minimum size of the buffer that should be passed to **NDDS_Transport_Address_to_string** (p. 374).*

Functions

- RTIBool **NDDS_Transport_Address_to_string** (const **NDDS_Transport_Address_t** *self, char *buffer_inout, size_t buffer_size_in)

  Converts a numerical address to a printable string representation.
- RTIBool **NDDS_Transport_Address_to_string_with_protocol_family_format** (const **NDDS_Transport_Address_t** *me, char *buffer, size_t buffer_size_in, RTIOsapiSocketAFKind family)

  Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.
- RTI_INT32 **NDDS_Transport_Address_from_string** (**NDDS_Transport_Address_t** *address_out, const char *address_in)

  Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.
- void **NDDS_Transport_Address_print** (const **NDDS_Transport_Address_t** *address_in, const char *desc_in, RTI_INT32 indent_in)

  Prints an address to standard out.
- RTI_INT32 **NDDS_Transport_Address_is_ipv4** (const **NDDS_Transport_Address_t** *address_in)

  Checks if an address is an IPv4 address.
- RTI_INT32 **NDDS_Transport_Address_is_multicast** (const **NDDS_Transport_Address_t** *address_in)

  Checks if an address is an IPv4 or IPv6 multicast address.

Variables

- const **NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID**

  An invalid transport address.

6.107.1 Detailed Description

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

The APIs of RTI Connext uses IPv6 address notation for all transports.

Transport Plugin implementations that are not IP-based are required to map whatever addressing scheme natively used by the physical transport (if any) to an address in IPv6 notation and vice versa.

IPv6 addresses are numerically stored in 16 bytes. An IPv6 address can be presented In string notation in a variety of ways. For example,

```
"00AF:0000:0037:FE01:0000:0000:034B:0089"
"AF:0:37:FE01:0:0:34B:89"
"AF:0:37:FE01::34B:89"
```

are all valid IPv6 presentation of the same address.

IPv4 address in dot notation can be used to specify the last 4 bytes of the address. For example,

```
"0000:0000:0000:0000:0000:0000:192.168.0.1"
"0:0:0:0:0:0:192.168.0.1"
"::192.168.0.1"
```

are all valid IPv6 presentation of the same address.

For a complete description of valid IPv6 address notation, consult the IPv6 Addressing Architecture (RFC 2373).

Addresses are divided into unicast addresses and multicast addresses.

Multicast addresses are defined as

- Addresses that start with 0xFF. That is `FFxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`.

or an IPv4 multicast address

- Address in the range [::224.0.0.0, ::239.255.255.255]

Multicast addresses do not refer to any specific destination (network interface). Instead, they usually refer to a group of network interfaces, often called a "multicast group".

Unicast addresses always refer to a specific network interface.

6.107.2 Macro Definition Documentation

6.107.2.1 NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER

```
#define NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER
```

Value:

```
{ \
  { \
    0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0 \
  } \
}
```

An invalid transport address. Used as an initializer.

For example: **NDDS_Transport_Address_t** (p. 1784) address = NDDS_TRANSPORT_ADDRESS_INVALID_↩ INITIALIZER;

6.107.2.2 NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE

```
#define NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (72)
```

The minimum size of the buffer that should be passed to **NDDS_Transport_Address_to_string** (p. 374).

For regular addresses, the string size needs to be at least 40 to include space for 8 tuples of 4 characters each plus 7 delimiting colons plus a terminating NULL.

To support UDPv4_WAN strings, it has been adjusted to 72 to fit the following representation (plus NULL terminator): f=XXXXRBPU,u={FF,FF,FF,FF,FF,FF,FF,FF},p=255.255.255.255:65555:65555

6.107.3 Function Documentation

6.107.3.1 NDDS_Transport_Address_to_string()

```
RTIBool NDDS_Transport_Address_to_string (
            const  NDDS_Transport_Address_t * self,
            char * buffer_inout,
            size_t buffer_size_in )
```

Converts a numerical address to a printable string representation.

Precondition

The `buffer_inout` provided must be at least **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 374) characters long.

Parameters

self	<<***in***>> *(p. 355)* The address to be converted.
buffer_inout	<<***inout***>> *(p. 355)* Storage passed in which to return the string corresponding to the address.
buffer_size_in	<<***in***>> *(p. 355)* The size of the storage buffer. Must be >= **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 374)

Returns

1 upon success; 0 upon failure (not enough space in the provided buffer)

6.107.3.2 NDDS_Transport_Address_to_string_with_protocol_family_format()

```
RTIBool NDDS_Transport_Address_to_string_with_protocol_family_format (
            const  NDDS_Transport_Address_t * me,
            char * buffer,
            size_t buffer_size_in,
            RTIOsapiSocketAFKind family )
```

Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.

Precondition

The `buffer_inout` provided must be at least **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 374) characters long.

Parameters

me	<<***in***>> *(p. 355)* The address to be converted.
buffer	<<***inout***>> *(p. 355)* Storage passed in which to return the string corresponding to the address.
buffer_size_in	<<***in***>> *(p. 355)* The size of the storage buffer. Must be >= **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 374)
family	<<***in***>> *(p. 355)* The protocol family RTI_OSAPI_SOCKET_AF_INET or RTI_OSAPI_SOCKET_AF_INET6

Returns

RTI_TRUE upon success; 0 upon failure (not enough space in the provided buffer)

6.107.3.3 NDDS_Transport_Address_from_string()

```
RTI_INT32 NDDS_Transport_Address_from_string (
              NDDS_Transport_Address_t * address_out,
             const char * address_in )
```

Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.

The address string must be in IPv4 dotted notation (X.X.X.X) or IPv6 presentation notation. The string cannot be a hostname since this function does not perform a hostname lookup.

Parameters

address_out	<<***out***>> *(*p. *355)* Numerical value of the address.
address_in	<<***in***>> *(*p. *355)* String representation of an address.

Returns

1 if address_out contains a valid address, 0 if it was not able to convert the string into an address.

6.107.3.4 NDDS_Transport_Address_print()

```
void NDDS_Transport_Address_print (
             const  NDDS_Transport_Address_t * address_in,
             const char * desc_in,
             RTI_INT32 indent_in )
```

Prints an address to standard out.

Parameters

address_in	<<***in***>> *(*p. *355)* Address to be printed.
desc_in	<<***in***>> *(*p. *355)* A prefix to be printed before the address.
indent_in	<<***in***>> *(*p. *355)* Indentation level for the printout.

6.107.3.5 NDDS_Transport_Address_is_ipv4()

```
RTI_INT32 NDDS_Transport_Address_is_ipv4 (
             const  NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 address.

Parameters

address_in	<<**in**>> *(p. 355)* Address to be tested.

Note

May be implemented as a macro for efficiency.

Returns

1 if address is an IPv4 address, 0 otherwise.

6.107.3.6 NDDS_Transport_Address_is_multicast()

```
RTI_INT32 NDDS_Transport_Address_is_multicast (
            const  NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 or IPv6 multicast address.

Parameters

address_in	<<**in**>> *(p. 355)* Address to be tested.

May be implemented as a macro for efficiency.

Returns

1 if address is a multicast address, 0 otherwise.

6.107.4 Variable Documentation

6.107.4.1 NDDS_TRANSPORT_ADDRESS_INVALID

```
const  NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID  [extern]
```

An invalid transport address.

6.108 UDP Transport Plugin definitions

UDP Transport Plugin definitions.

Classes

- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo**

  Type for storing UDP WAN communication ports.

Macros

- #define **NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT** (0)

  *Default value of **NDDS_Transport_Property_t::properties_bitmap*** (p. *1788*).
- #define **NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (16)

  *Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max*** (p. *1789*).
- #define **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX** RTI_OSAPI_UDP_SOCKET_↩ BUFFER_SIZE_OS_MAX

  Used to specify that os maximum be used to specify socket buffer size.
- #define **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT** RTI_OSAPI_UDP_SOCKET↩ _BUFFER_SIZE_OS_DEFAULT

  Used to specify that os default be used to specify socket buffer size.
- #define **NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT** RTI_OSAPI_UDP_SEND↩ _SOCKET_BUFFER_SIZE_DEFAULT

  Default value of send_socket_buffer_size.
- #define **NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT** RTI_OSAPI_UDP_RECV↩ _SOCKET_BUFFER_SIZE_DEFAULT

  Default value of recv_socket_buffer_size.
- #define **NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT** (1)

  Default value of multicast_ttl.

Typedefs

- typedef RTI_UINT16 **NDDS_Transport_UDP_Port**

  UDP port.

6.108.1 Detailed Description

UDP Transport Plugin definitions.

6.108.2 Macro Definition Documentation

6.108.2.1 NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT (0)
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1788).

6.108.2.2 NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (16)
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).

This is also the maximum value that can be used when instantiating the udp transport.

16 is sufficient for RTI Connext, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

6.108.2.3 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX

```
#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX  RTI_OSAPI_UDP_SOCKET_BUFFER_SIZE_OS_MAX
```

Used to specify that os maximum be used to specify socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. If the platform does not support this property, then the property will be set to **NDDS_Transport_UDP_Plugin::NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 379) or **NDDS_Transport_UDP_Plugin::NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 380), depending on the property being set. See the Platform Notes to determine if this property is supported on your platform.

This value is -2.

6.108.2.4 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT  RTI_OSAPI_UDP_SOCKET_BUFFER_SIZE_OS_↩
DEFAULT
```

Used to specify that os default be used to specify socket buffer size.

This property, if set, uses the default size set in your OS for send and receive socket buffer sizes. If you update the default size in your OS settings, then RTI Connext will automatically pick up that change.

This value is -1.

6.108.2.5 NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT  RTI_OSAPI_UDP_SEND_SOCKET_BUFFER_↩
SIZE_DEFAULT
```

Default value of send_socket_buffer_size.

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

6.108.2.6 NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT  RTI_OSAPI_UDP_RECV_SOCKET_BUFFER_↩
SIZE_DEFAULT
```

Default value of recv_socket_buffer_size.

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

6.108.2.7 NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT (1)
```

Default value of multicast_ttl.

6.108.3 Typedef Documentation

6.108.3.1 NDDS_Transport_UDP_Port

```
typedef RTI_UINT16  NDDS_Transport_UDP_Port
```

UDP port.

6.109 Shared Memory Transport

Built-in transport plug-in for inter-process communications using shared memory.

Classes

- struct **NDDS_Transport_Shmem_Property_t**

  *Subclass of **NDDS_Transport_Property_t** (p. 1786) allowing specification of parameters that are specific to the shared-memory transport.*

Macros

- #define **NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT** (-96)

  *Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788).*
- #define **NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT** (**NDDS_TRANSPORT_↩ PROPERTY_BIT_BUFFER_ALWAYS_LOANED**)

  *Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1788).*
- #define **NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (1024)

  *Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).*
- #define **NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT** (65536)

  *Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).*
- #define **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (64)

  *Default value of **NDDS_Transport_Shmem_Property_t::received_message_count_max** (p. 1795).*
- #define **NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT**

  *Default value of **NDDS_Transport_Shmem_Property_t::receive_buffer_size** (p. 1795).*
- #define **NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX** (2)

  Major version for the transport plugin after fixing bug 14240 (RTI-28)
- #define **NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT**

  Use this to initialize stack variable.

Functions

- NDDS_Transport_Plugin ∗ **NDDS_Transport_Shmem_new** (const struct **NDDS_Transport_Shmem_↩ Property_t** ∗property_in)

  Create a new shmem process transport.

6.109.1 Detailed Description

Built-in transport plug-in for inter-process communications using shared memory.

This transport plugin uses System Shared Memory to send messages between processes on the same node. This transport is installed as a built-in transport plugin with the alias **rti::core::policy::TransportBuiltin::SHMEM_ALIAS** (p. 2536).

6.109.2 Compatibility of Sender and Receiver Transports

Opening a receiver "port" on shared memory corresponds to creating a shared memory segment using a name based on the port number. The transport plugin's properties are embedded in the shared memory segment.

When a sender tries to send to the shared memory port, it verifies that properties of the receiver's shared memory transport are compatible with those specified in its transport plugin. If not, the sender will fail to attach to the port and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_attachShmem:failed to initialize incompatible properties

NDDS_Transport_Shmem_attachShmem:countMax 0 > -19417345 or max size -19416188 > 2147482624
```

In this scenario, the properties of the sender or receiver transport plugin instances should be adjusted, so that they are compatible.

6.109.3 Crashing and Restarting Programs

If a process using shared memory crashes (say because the user typed in ^C), resources associated with its shared memory ports may not be properly cleaned up. Later, if another RTI Connext process needs to open the same ports (say, the crashed program is restarted), it will attempt to reuse the shared memory segment left behind by the crashed process.

The reuse is allowed iff the properties of transport plugin are compatible with those embedded in the shared memory segment (i.e., of the original creator). Otherwise, the process will fail to open the ports, and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_create_recvresource_rrEA:failed to initialize shared

    memory resource Cannot recycle existing shmem: size not compatible for key 0x1234
```

In this scenario, the shared memory segments must be cleaned up using appropriate platform specific commands. For details, please refer to the `Platform Notes`.

6.109.4 Shared Resource Keys

The transport uses the **shared memory segment keys**, given by the formula below.
`0x400000 + port`

The transport also uses signaling **shared semaphore** keys given by the formula below.
`0x800000 + port`

The transport also uses mutex **shared semaphore keys** given by the formula below.
`0xb00000 + port`

wher the `port` is a function of the `domain_id` and the `participant_id`, as described in **rti::core::policy::↩ WireProtocol::participant_id** (p. 2635)

See also

rti::core::policy::WireProtocol::participant_id (p. 2635)

Transport_Support::set_builtin_transport_property()

6.109.5 Creating and Registering Shared Memory Transport Plugin

RTI Connext can implicitly create this plugin and register with the **dds::domain::DomainParticipant** (p. 1326) if this transport is specified in **rti::core::policy::TransportBuiltin** (p. 2533).

To specify the properties of the builtin shared memory transport that is implicitly registered, you can either:

- call Transport_Support::set_builtin_transport_property or
- specify the pre-defined property names in **rti::core::policy::Property** (p. 1969) associated with the **dds↩ ::domain::DomainParticipant** (p. 1326). (see **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 383)).

Builtin transport plugin properties specified in **rti::core::policy::Property** (p. 1969) always overwrite the ones specified through Transport_Support::set_builtin_transport_property(). The default value is assumed on any unspecified property. Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

6.109.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the dds::domain::qos::DomainParticipant↩ Qos::property to to configure the builtin shared memory transport plugin.

Table 6.81 ***Property Strings for Shared Memory Transport***

Name	Descriptions
dds.transport.shmem.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_↩ count** (p. 1788)
dds.transport.shmem.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_↩ bitmap** (p. 1788)
dds.transport.shmem.builtin.parent.gather_send_↩ buffer_count_max	See **NDDS_Transport_Property_t::gather_send_↩ buffer_count_max** (p. 1789)
dds.transport.shmem.builtin.parent.message_size_max	See **NDDS_Transport_Property_t::message_size_↩ max** (p. 1789)
dds.transport.shmem.builtin.parent.allow_interfaces	See **NDDS_Transport_Property_t::allow_↩ interfaces_list** (p. 1789) and **NDDS_Transport_↩ Property_t::allow_interfaces_list_length** (p. 1790). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_interfaces	See **NDDS_Transport_Property_t::deny_interfaces↩ _list** (p. 1790) and **NDDS_Transport_Property_t↩ ::deny_interfaces_list_length** (p. 1791). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.allow_multicast_↩ interfaces	See **NDDS_Transport_Property_t::allow_multicast↩ _interfaces_list** (p. 1791) and **NDDS_Transport_↩ Property_t::allow_multicast_interfaces_list_length** (p. 1792). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_multicast_↩ interfaces	See **NDDS_Transport_Property_t::deny_multicast↩ _interfaces_list** (p. 1792) and **NDDS_Transport_↩ Property_t::deny_multicast_interfaces_list_length** (p. 1792). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.max_interface_↩ count	See **NDDS_Transport_Property_t::max_interface_↩ count** (p. 1793)
dds.transport.shmem.builtin.parent.thread_name_prefix	See **NDDS_Transport_Property_t::thread_name_↩ prefix** (p. 1793)
dds.transport.shmem.builtin.received_message_↩ count_max	See ShmemTransport_Property_t::received_message↩ _count_max

Name	Descriptions
dds.transport.shmem.builtin.receive_buffer_size	See ShmemTransport_Property_t::receive_buffer_size
dds.transport.shmem.builtin.enable_udp_debugging	See ShmemTransport_Property_t::enable_udp_↩ debugging
dds.transport.shmem.builtin.udp_debugging_address	See ShmemTransport_Property_t::udp_debugging_↩ address
dds.transport.shmem.builtin.udp_debugging_port	See ShmemTransport_Property_t::udp_debugging_port

6.109.7 Macro Definition Documentation

6.109.7.1 NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT (-96)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788).

6.109.7.2 NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT ( NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_↩
ALWAYS_LOANED)
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1788).

6.109.7.3 NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (1024)
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).

6.109.7.4 NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT (65536)
```

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).

6.109.7.5 NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT (64)
```

Default value of **NDDS_Transport_Shmem_Property_t::received_message_count_max** (p. 1795).

6.109.7.6 NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT
```

Value:

```
(NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT \
 * NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT / 4)
```

Default value of **NDDS_Transport_Shmem_Property_t::receive_buffer_size** (p. 1795).

6.109.7.7 NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX

```
#define NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX (2)
```

Major version for the transport plugin after fixing bug 14240 (RTI-28)

6.109.7.8 NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT
```

Use this to initialize stack variable.

6.109.8 Function Documentation

6.109.8.1 NDDS_Transport_Shmem_new()

```
NDDS_Transport_Plugin * NDDS_Transport_Shmem_new (
            const struct  NDDS_Transport_Shmem_Property_t * property_in )
```

Create a new shmem process transport.

An application may create multiple transports, possibly for use in different domains.

Parameters

property_in	<<**in**>> *(p. 355)* Desired behavior of this transport. May be NULL for default property. The transport plugin can only support one unicast receive interface; therefore the interface selection lists are ignored.

Returns

handle to a Shmem inter-process Transport Plugin on success

NULL on failure.

6.110 UDPv4 Transport

Transport plug-in using UDP/IPv4.

Classes

- struct **NDDS_Transport_UDPv4_Property_t**

  Configurable IPv4/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT** (32)

  *Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788).*
- #define **NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT** (128)

  *Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788) for UDPv4 asymmetric transport.*
- #define **NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT**

  *Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1788).*
- #define **NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** **NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT**

  *Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).*
- #define **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX** **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_MAX**

  OS maximum to be used to specify the socket buffer size.
- #define **NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT** **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT**

  OS default to be used to specify the socket buffer size.
- #define **NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT**

  *Default value for **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size** (p. 1800) and **NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size** (p. 1810).*
- #define **NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT**

*Default value for **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size** (p. 1800) and **NDDS_Transport_↩ UDPv4_WAN_Property_t::recv_socket_buffer_size** (p. 1810).*

- #define **NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX** (65507)

  *Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).*
- #define **NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT** **NDDS_TRANSPORT_UDPV4_↩ PAYLOAD_SIZE_MAX**

  *Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).*
- #define **NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT** **NDDS_TRANSPORT_UDP_↩ MULTICAST_TTL_DEFAULT**

  *Default value of **NDDS_Transport_UDPv4_Property_t::multicast_ttl** (p. 1801).*
- #define **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER**

  *Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1804) to specify non-blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS**

  ***[default]** Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1804) to specify blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT** NDDS_TRANSPORT_UDP_BLOCKING_↩ DEFAULT

  *Default value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1804) to specify blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT**

  *Use this to initialize a **NDDS_Transport_UDPv4_Property_t** (p. 1798) structure.*
- #define **NDDS_Transport_UDPv4_string_to_address_cEA** NDDS_Transport_UDP_string_to_address_cEA

  Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_new** (const struct **NDDS_Transport_UDPv4_↩ Property_t** *property_in)

  Create an instance of a UDPv4 Transport Plugin.

6.110.1 Detailed Description

Transport plug-in using UDP/IPv4.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **rti::core::policy::TransportBuiltin::UDPv4_ALIAS** (p. 2537).

You can configure an instance of this plugin to only use unicast or only use multicast, see **NDDS_Transport_UDPv4↩ _Property_t::unicast_enabled** (p. 1801) and **NDDS_Transport_UDPv4_Property_t::multicast_enabled** (p. 1801).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **NDDS_Transport_↩ Property_t::max_interface_count** (p. 1793) and the "white" and "black" lists in the base property's fields (**NDDS↩ _Transport_Property_t::allow_interfaces_list** (p. 1789), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790), **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1791), **NDDS_Transport_Property_↩ t::deny_multicast_interfaces_list** (p. 1792)).

RTI Connext can implicitly create this plugin and register with the **dds::domain::DomainParticipant** (p. 1326) if this transport is specified in **rti::core::policy::TransportBuiltin** (p. 2533).

To specify the properties of the builtin UDPv4 transport that is implicitly registered, you can either:

- call Transport_Support::set_builtin_transport_property or
- specify the predefined property names in **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::DomainParticipant** (p. 1326). (see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 388)). Builtin transport plugin properties specified in **rti::core::policy::Property** (p. 1969) always overwrite the ones specified through Transport_Support::set_builtin_transport_property(). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

6.110.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the dds::domain::qos::DomainParticipantQos::property to configure the builtin UDPv4 transport plugin.

Table 6.83 ***Property Names for UDPv4 Transport Plugin***

Property Name	Description
dds.transport.UDPv4.builtin.parent.classid	See **NDDS_Transport_Property_t::classid** (p. 1787)
dds.transport.UDPv4.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_count** (p. 1788)
dds.transport.UDPv4.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_bitmap** (p. 1788)
dds.transport.UDPv4.builtin.parent.gather_send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789)
dds.transport.UDPv4.builtin.parent.message_size_max	See **NDDS_Transport_Property_t::message_size_max** (p. 1789)
dds.transport.UDPv4.builtin.parent.allow_interfaces	See **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789) and **NDDS_Transport_Property_t::allow_interfaces_list_length** (p. 1790). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_interfaces	See **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790) and **NDDS_Transport_Property_t::deny_interfaces_list_length** (p. 1791). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.allow_multicast_interfaces	See **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1791) and **NDDS_Transport_Property_t::allow_multicast_interfaces_list_length** (p. 1792). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0

Property Name	Description
dds.transport.UDPv4.builtin.parent.deny_multicast_↩ interfaces	See **NDDS_Transport_Property_t::deny_multicast↩ _interfaces_list** (p. 1792) and **NDDS_Transport_↩ Property_t::deny_multicast_interfaces_list_length** (p. 1792). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.max_interface_count	See **NDDS_Transport_Property_t::max_interface_↩ count** (p. 1793)
dds.transport.UDPv4.builtin.parent.thread_name_prefix	See **NDDS_Transport_Property_t::thread_name_↩ prefix** (p. 1793)

Transport_Support::set_builtin_transport_property()

6.110.3 Macro Definition Documentation

6.110.3.1 NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT (32)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788).

6.110.3.2 NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT (128)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788) for UDPv4 asymmetric transport.

6.110.3.3 NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT   NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1788).

6.110.3.4 NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT NDDS_TRANSPORT_UDP_GATHER_↩
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for RTI Connext, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

6.110.3.5 NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX

```
#define NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_MAX NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_↩
OS_MAX
```

OS maximum to be used to specify the socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. See the `Platform Notes` to determine if this property is supported on your platform.

6.110.3.6 NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↩
SIZE_OS_DEFAULT
```

OS default to be used to specify the socket buffer size.

6.110.3.7 NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_SEND_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size** (p. 1800) and **NDDS_Transport↩ _UDPv4_WAN_Property_t::send_socket_buffer_size** (p. 1810).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

6.110.3.8 NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_RECV_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size** (p. 1800) and **NDDS_Transport↩ _UDPv4_WAN_Property_t::recv_socket_buffer_size** (p. 1810).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

6.110.3.9 NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX (65507)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).

6.110.3.10 NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT   NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).

6.110.3.11 NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT   NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv4_Property_t::multicast_ttl** (p. 1801).

6.110.3.12 NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1804) to specify non-blocking sockets.

6.110.3.13 NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS
```

[default] Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1804) to specify blocking sockets.

6.110.3.14 NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT  NDDS_TRANSPORT_UDP_BLOCKING_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1804) to specify blocking sockets.

6.110.3.15 NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv4_Property_t** (p. 1798) structure.

6.110.3.16 NDDS_Transport_UDPv4_string_to_address_cEA

```
#define NDDS_Transport_UDPv4_string_to_address_cEA  NDDS_Transport_UDP_string_to_address_cEA
```

Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Converts a host name string to a IPv4 address.

Parameters

self	NOT USED. May be NULL.
address_out	<<***out***>> *(p. 355)* The corresponding numerical value in IPv4 format.
address_in	<<***in***>> *(p. 355)* The name of the IPv4 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

6.110.4 Function Documentation

6.110.4.1 NDDS_Transport_UDPv4_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_new (
            const struct  NDDS_Transport_UDPv4_Property_t * property_in )
```

Create an instance of a UDPv4 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDP_↩ Property_t::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1791),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1792)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.∗.∗
- 192.168.1.∗
- etc. Strings not in the correct format will be ignored.

Parameters

property↩ _in	<<***in***>> *(p. 355)* Desired behavior of this transport. May be NULL for default property.

Returns

A UDPv4 Transport Plugin instance on success; or NULL on failure.

6.111 Real-Time WAN Transport

Transport plug-in using UDP/IPv4 for WAN communications..

Classes

- struct **NDDS_Transport_UDPv4_WAN_Property_t**

  Configurable IPv4/UDP WAN Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPV4_WAN_MESSAGE_SIZE_MAX_DEFAULT** (1400)

  *Maximum value of **NDDS_Transport_Property_t::message_size_max*** (p. *1789*).
- #define **NDDS_TRANSPORT_UDPV4_WAN_PROPERTY_DEFAULT**

  *Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t*** (p. *1809*) *structure.*

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_new** (const struct **NDDS_Transport_UDPv4_↩ WAN_Property_t** *property_in)

  Create an instance of a UDPv4_WAN Transport Plugin.

6.111.1 Detailed Description

Transport plug-in using UDP/IPv4 for WAN communications..

RTI Real-Time WAN Transport (RWT) is a transport that enables secure, scalable, and high-performance communication over wide area networks (WANs), including public networks.

It extends RTI Connext capabilities to WAN environments. Real-Time WAN Transport uses UDPv4 as the underlying IP transport-layer protocol to better anticipate and adapt to the challenges of diverse network conditions, device mobility, and the dynamic nature of WAN system architectures.

Real-Time WAN Transport, in combination with RTI Cloud Discovery Service (CDS), provides a complete, seamless solution out of the box for WAN connectivity.

This transport is not installed as part of an RTI Connext package; it must be downloaded and installed separately.

Real-Time WAN Transport replaces the transport capabilities of the Secure WAN Transport optionally available with previous RTI Connext releases (prior to 7.0.0), and provides the following capabilities:

- NAT (Network Address Translator) traversal: Ability to communicate between DomainParticipants running in a Local Area Network (LAN) that is behind a NAT-enabled router, and DomainParticipants on the outside of the NAT across a WAN. This functionality is provided in combination with Cloud Discovery Service.

- IP mobility: Support for network transitions and changes in IP addresses in any of the DomainParticipants participating in the communication.

- Security: Secure communications between DomainParticipants using Security Plugins.

Real-Time WAN Transport does not require third-party components, such as STUN servers, or protocols like SIP to handle session establishment. Using a single API and security model, you can leverage the extensive capabilities of the RTI Connext framework and ecosystem, including tools and infrastructure services, even for real-time connectivity from edge to cloud and back in highly distributed systems that communicate across wide area networks.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports unicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **rti::core::policy::TransportBuiltin::UDPv4_WAN_ALIAS** (p. 2537).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 1793) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790)).

RTI Connext can implicitly create this plugin and register with the **dds::domain::DomainParticipant** (p. 1326) if this transport is specified in **rti::core::policy::TransportBuiltin** (p. 2533).

To specify the properties of the Real-Time WAN Transport that is implicitly registered, you can either:

- call Transport_Support::set_builtin_transport_property or
- specify the predefined property names in **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::DomainParticipant** (p. 1326). (see **Real-Time WAN Transport Property** (p. 396)). Builtin transport plugin properties specified in **rti::core::policy::Property** (p. 1969) always overwrite the ones specified through Transport_Support::set_builtin_transport_property(). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

For additional details on how to configure and use the Real-Time WAN Transport, see the `Core Libraries User's Manual`.

6.111.2 Real-Time WAN Transport Property

Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the dds::domain::qos::DomainParticipantQos::property to configure the Real-Time WAN Transport plugin.

Table 6.86 ***Property Names for Real-Time WAN Transport Plugin***

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.classid	See **NDDS_Transport_Property_t::classid** (p. 1787)
dds.transport.UDPv4_WAN.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_count** (p. 1788)
dds.transport.UDPv4_WAN.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_bitmap** (p. 1788)

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.gather_↩ send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_↩ buffer_count_max** (p. 1789)
dds.transport.UDPv4_WAN.builtin.parent.message_↩ size_max	See **NDDS_Transport_Property_t::message_size_↩ max** (p. 1789)
dds.transport.UDPv4_WAN.builtin.parent.allow_↩ interfaces	See **NDDS_Transport_Property_t::allow_↩ interfaces_list** (p. 1789) and **NDDS_Transport_↩ Property_t::allow_interfaces_list_length** (p. 1790). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.deny_↩ interfaces	See **NDDS_Transport_Property_t::deny_interfaces↩ _list** (p. 1790) and **NDDS_Transport_Property_t↩ ::deny_interfaces_list_length** (p. 1791). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.max_↩ interface_count	See **NDDS_Transport_Property_t::max_interface_↩ count** (p. 1793)
dds.transport.UDPv4_WAN.builtin.parent.thread_↩ name_prefix	See **NDDS_Transport_Property_t::thread_name_↩ prefix** (p. 1793)
dds.transport.UDPv4_WAN.builtin.send_socket_↩ buffer_size	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::send_socket_buffer_size** (p. 1810)
dds.transport.UDPv4_WAN.builtin.recv_socket_buffer↩ _size	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::recv_socket_buffer_size** (p. 1810)
dds.transport.UDPv4_WAN.builtin.ignore_loopback_↩ interface	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::ignore_loopback_interface** (p. 1811)
dds.transport.UDPv4_WAN.builtin.ignore_nonrunning↩ _interfaces	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::ignore_nonrunning_interfaces** (p. 1812)
dds.transport.UDPv4_WAN.builtin.ignore_nonup_↩ interfaces	**[DEPRECATED]** See **NDDS_Transport_UDPv4_↩ WAN_Property_t::ignore_nonup_interfaces** (p. 1811)
dds.transport.UDPv4_WAN.builtin.no_zero_copy	**[DEPRECATED]** See **NDDS_Transport_UDPv4_↩ WAN_Property_t::no_zero_copy** (p. 1812)
dds.transport.UDPv4_WAN.builtin.send_blocking	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::send_blocking** (p. 1813)
dds.transport.UDPv4_WAN.builtin.transport_priority_↩ mask	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::transport_priority_mask** (p. 1813)
dds.transport.UDPv4_WAN.builtin.transport_priority_↩ mapping_low	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::transport_priority_mapping_low** (p. 1814)
dds.transport.UDPv4_WAN.builtin.transport_priority_↩ mapping_high	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::transport_priority_mapping_high** (p. 1814)
dds.transport.UDPv4_WAN.builtin.send_ping	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::send_ping** (p. 1814)
dds.transport.UDPv4_WAN.builtin.force_interface_↩ poll_detection	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::force_interface_poll_detection** (p. 1815)
dds.transport.UDPv4_WAN.builtin.interface_poll_period	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::interface_poll_period** (p. 1815)
dds.transport.UDPv4_WAN.builtin.protocol_overhead↩ _max	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::protocol_overhead_max** (p. 1815)

Property Name	Description
dds.transport.UDPv4_WAN.builtin.disable_interface_↩ tracking	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::disable_interface_tracking** (p. 1815)
dds.transport.UDPv4_WAN.builtin.public_address	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::public_address** (p. 1816)
dds.transport.UDPv4_WAN.builtin.comm_ports	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::comm_ports_list** (p. 1816)
dds.transport.UDPv4_WAN.builtin.port_offset	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::port_offset** (p. 1818)
dds.transport.UDPv4_WAN.builtin.binding_ping_period	See **NDDS_Transport_UDPv4_WAN_Property_t↩ ::binding_ping_period** (p. 1818)

6.111.3 Macro Definition Documentation

6.111.3.1 NDDS_TRANSPORT_UDPV4_WAN_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_WAN_MESSAGE_SIZE_MAX_DEFAULT (1400)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).

6.111.3.2 NDDS_TRANSPORT_UDPV4_WAN_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_WAN_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t** (p. 1809) structure.

6.111.4 Function Documentation

6.111.4.1 NDDS_Transport_UDPv4_WAN_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_new (
            const struct  NDDS_Transport_UDPv4_WAN_Property_t * property_in )
```

Create an instance of a UDPv4_WAN Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface "white" and "black" lists specified in the NDDS_Transport_UDP_Property_t↩ ::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790),

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.∗.∗
- 192.168.1.∗
- etc. Strings not in the correct format will be ignored.

Parameters

property↩ _in	<<***in***>> *(*p. *355)* Desired behavior of this transport. May be NULL for default property.

Returns

A UDPv4_WAN Transport Plugin instance on success; or NULL on failure.

6.112 UDPv6 Transport

Transport plug-in using UDP/IPv6.

Classes

- struct **NDDS_Transport_UDPv6_Property_t**

  Configurable IPv6/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_COUNT** (128)

  *Default value of **NDDS_Transport_Property_t::address_bit_count*** (p. *1788*).
- #define **NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_↩ PROPERTIES_BITMAP_DEFAULT**

  *Default value of **NDDS_Transport_Property_t::properties_bitmap*** (p. *1788*).
- #define **NDDS_TRANSPORT_UDPV6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** **NDDS_↩ TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT**

  *Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max*** (p. *1789*).
- #define **NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX** **NDDS_TRANSPORT_UDP_↩ SOCKET_BUFFER_SIZE_OS_MAX**

  OS maximum to be used to specify the socket buffer size.
- #define **NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT** **NDDS_TRANSPORT_↩ UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT**

  OS default to be used to specify the socket buffer size.
- #define **NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_↩ UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT**

  *Default value for **NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size*** (p. *1820*).
- #define **NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_↩ UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT**

  *Default value for **NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size*** (p. *1821*).
- #define **NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX** (65487)

  *Maximum value of **NDDS_Transport_Property_t::message_size_max*** (p. *1789*).
- #define **NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT** **NDDS_TRANSPORT_UDPV6_↩ PAYLOAD_SIZE_MAX**

  *Default value of **NDDS_Transport_Property_t::message_size_max*** (p. *1789*).
- #define **NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT** **NDDS_TRANSPORT_UDP_↩ MULTICAST_TTL_DEFAULT**

  *Default value of **NDDS_Transport_UDPv6_Property_t::multicast_ttl*** (p. *1822*).
- #define **NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER**

  *Value for **NDDS_Transport_UDPv6_Property_t::send_blocking*** (p. *1824*) *to specify non-blocking sockets.*
- #define **NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS**

  [default]** Value for **NDDS_Transport_UDPv6_Property_t::send_blocking (p. *1824*) *to specify blocking sockets.*
- #define **NDDS_Transport_UDPv6_string_to_address_cEA** NDDS_Transport_UDP_string_to_address_cEA

  Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv6_new** (const struct **NDDS_Transport_UDPv6_↩ Property_t** *property_in)

  Create an instance of a UDPv6 Transport Plugin.

6.112.1 Detailed Description

Transport plug-in using UDP/IPv6.

This transport plugin uses UDPv6 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **rti::core::policy::TransportBuiltin::UDPv6_ALIAS** (p. 2537).

You can configure an instance of this plugin to only use unicast or only use multicast, see **NDDS_Transport_UDPv6_Property_t::unicast_enabled** (p. 1821) and **NDDS_Transport_UDPv6_Property_t::multicast_enabled** (p. 1822).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 1793) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790), **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1791), **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1792)).

RTI Connext can implicitly create this plugin and register it with the **dds::domain::DomainParticipant** (p. 1326) if this transport is specified in the **rti::core::policy::TransportBuiltin** (p. 2533).

To specify the properties of the builtin UDPv6 transport that is implicitly registered, you can either:

- call Transport_Support::set_builtin_transport_property or
- specify the predefined property names in **rti::core::policy::Property** (p. 1969) associated with the **dds::domain::DomainParticipant** (p. 1326). (see **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 401)). Builtin transport plugin properties specified in **rti::core::policy::Property** (p. 1969) always overwrite the ones specified through Transport_Support::set_builtin_transport_property(). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties that are set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered.

6.112.2 UDPv6 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in **rti::core::policy::Property** (p. 1969) of a **dds::domain::DomainParticipant** (p. 1326) to configure the builtin UDPv6 transport plugin.

Table 6.88 ***Property Names for UDPv6 Transport Plugin***

Property Name	Description
dds.transport.UDPv6.builtin.parent.address_bit_count	See **NDDS_Transport_Property_t::address_bit_count** (p. 1788)
dds.transport.UDPv6.builtin.parent.properties_bitmap	See **NDDS_Transport_Property_t::properties_bitmap** (p. 1788)
dds.transport.UDPv6.builtin.parent.gather_send_buffer_count_max	See **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789)

Property Name	Description
dds.transport.UDPv6.builtin.parent.message_size_max	See **NDDS_Transport_Property_t::message_size_max** (p. 1789)
dds.transport.UDPv6.builtin.parent.allow_interfaces	See **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789) and **NDDS_Transport_Property_t::allow_interfaces_list_length** (p. 1790). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_interfaces	See **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790) and **NDDS_Transport_Property_t::deny_interfaces_list_length** (p. 1791). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.allow_multicast_interfaces	See **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1791) and **NDDS_Transport_Property_t::allow_multicast_interfaces_list_length** (p. 1792). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_multicast_interfaces	See **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1792) and **NDDS_Transport_Property_t::deny_multicast_interfaces_list_length** (p. 1792). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.max_interface_count	See **NDDS_Transport_Property_t::max_interface_count** (p. 1793)
dds.transport.UDPv6.builtin.parent.thread_name_prefix	See **NDDS_Transport_Property_t::thread_name_prefix** (p. 1793)
dds.transport.UDPv6.builtin.send_socket_buffer_size	See **NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size** (p. 1820)
dds.transport.UDPv6.builtin.recv_socket_buffer_size	See **NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size** (p. 1821)
dds.transport.UDPv6.builtin.unicast_enabled	See **NDDS_Transport_UDPv6_Property_t::unicast_enabled** (p. 1821)
dds.transport.UDPv6.builtin.multicast_enabled	See **NDDS_Transport_UDPv6_Property_t::multicast_enabled** (p. 1822)
dds.transport.UDPv6.builtin.multicast_ttl	See **NDDS_Transport_UDPv6_Property_t::multicast_ttl** (p. 1822)
dds.transport.UDPv6.builtin.multicast_loopback_disabled	See **NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled** (p. 1822)
dds.transport.UDPv6.builtin.ignore_loopback_interface	See **NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface** (p. 1822)
dds.transport.UDPv6.builtin.ignore_nonrunning_interfaces	See **NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces** (p. 1823)
dds.transport.UDPv6.builtin.no_zero_copy	**[DEPRECATED]** See **NDDS_Transport_UDPv6_Property_t::no_zero_copy** (p. 1823)

Property Name	Description
dds.transport.UDPv6.builtin.send_blocking	See **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 1824)
dds.transport.UDPv6.builtin.enable_v4mapped	See **NDDS_Transport_UDPv6_Property_t::enable_v4mapped** (p. 1824)
dds.transport.UDPv6.builtin.transport_priority_mask	See **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p. 1824)
dds.transport.UDPv6.builtin.transport_priority_mapping_low	See **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p. 1825)
dds.transport.UDPv6.builtin.transport_priority_mapping_high	See **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p. 1825)
dds.transport.UDPv6.builtin.send_ping	See **NDDS_Transport_UDPv6_Property_t::send_ping** (p. 1825) interface_poll_detection_kind
dds.transport.UDPv6.builtin.force_interface_poll_detection	See **NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection** (p. 1826)
dds.transport.UDPv6.builtin.interface_poll_period	See **NDDS_Transport_UDPv6_Property_t::interface_poll_period** (p. 1826)
dds.transport.UDPv6.builtin.reuse_multicast_receive_resource	See **NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource** (p. 1826)
dds.transport.UDPv6.builtin.protocol_overhead_max	See **NDDS_Transport_UDPv6_Property_t::protocol_overhead_max** (p. 1826)
dds.transport.UDPv6.builtin.disable_interface_tracking	See **NDDS_Transport_UDPv6_Property_t::disable_interface_tracking** (p. 1827)
dds.transport.UDPv6.builtin.public_address	See **NDDS_Transport_UDPv6_Property_t::public_address** (p. 1827)
dds.transport.UDPv6.builtin.join_multicast_group_timeout	See **NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout** (p. 1827)
dds.transport.UDPv6.builtin.port_offset	See **NDDS_Transport_UDPv6_Property_t::port_offset** (p. 1828)

6.112.3 Macro Definition Documentation

6.112.3.1 NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_COUNT (128)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1788).

6.112.3.2 NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT   NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_↩
DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1788).

6.112.3.3 NDDS_TRANSPORT_UDPV6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT   NDDS_TRANSPORT_UDP_GATHER_↩
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1789).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for NDDS, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

6.112.3.4 NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX

```
#define NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_MAX   NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_↩
OS_MAX
```

OS maximum to be used to specify the socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. See the `Platform Notes` to determine if this property is supported on your platform.

6.112.3.5 NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT   NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↩
SIZE_OS_DEFAULT
```

OS default to be used to specify the socket buffer size.

6.112.3.6 NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_SEND_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_SEND_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size** (p. 1820).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

6.112.3.7 NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT   NDDS_TRANSPORT_UDP_RECV_SOCKET_↩
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size** (p. 1821).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

6.112.3.8 NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX (65487)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).

6.112.3.9 NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT   NDDS_TRANSPORT_UDPV6_PAYLOAD_SIZE_MAX
```

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1789).

6.112.3.10 NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT   NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv6_Property_t::multicast_ttl** (p. 1822).

6.112.3.11 NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 1824) to specify non-blocking sockets.

6.112.3.12 NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS
```

[default] Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 1824) to specify blocking sockets.

6.112.3.13 NDDS_Transport_UDPv6_string_to_address_cEA

```
#define NDDS_Transport_UDPv6_string_to_address_cEA  NDDS_Transport_UDP_string_to_address_cEA
```

Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports.

Converts a host name string to a IPv6 address.

Parameters

self	NOT USED. May be NULL.
address_out	<<***out***>> *(*p. *355)* The corresponding numerical value in IPv6 format.
address_in	<<***in***>> *(*p. *355)* The name of the IPv6 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

6.112.4 Function Documentation

6.112.4.1 NDDS_Transport_UDPv6_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_new (
            const struct  NDDS_Transport_UDPv6_Property_t * property_in )
```

Create an instance of a UDPv6 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv6_Property_t::parent** (p. 1820):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1789),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1790),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1791),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1792)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

property_in	<<***in***>> *(p. 355)* Desired behavior of this transport. May be NULL for default property.

Returns

A UDPv6 Transport Plugin instance on success; or NULL on failure.

6.113 Client-side API

Part of the RPC API that relates to the client.

Classes

- class **dds::rpc::ClientEndpoint**< **Request, Reply** >

  <<***reference-type***>> *(p. 351) Manages the DDS entities required to make remote function calls.*
- class **rpc_example::RobotControlClient**

  <<***reference-type***>> *(p. 351) Allows client applications to make remote function calls*
- class **dds::rpc::ClientParams**

  <<***value-type***>> *(p. 350) The parameters used to configure a* ***ClientEndpoint*** *(p. 925)*

Typedefs

- using **rpc_example::RobotControlClientEndpoint** = **dds::rpc::ClientEndpoint**< RobotControl_Call, RobotControl_Return >

  An instantiation of ***dds::rpc::ClientEndpoint*** *(p. 925) for the DDS types that allow making function calls to the* ***Robot Control*** *(p. 2213) service interface.*

6.113.1 Detailed Description

Part of the RPC API that relates to the client.

6.113.2 Typedef Documentation

6.113.2.1 RobotControlClientEndpoint

```
using rpc_example::RobotControlClientEndpoint = typedef dds::rpc::ClientEndpoint<RobotControl_Call, RobotControl_Return>
```

An instantiation of **dds::rpc::ClientEndpoint** (p. 925) for the DDS types that allow making function calls to the **Robot Control** (p. 2213) service interface.

6.114 Server-side API

Part of the RPC API that relates to the **Server** (p. 2346) and **ServiceEndpoint** (p. 2354).

Classes

- class **dds::rpc::ServiceEndpoint**< **Dispatcher** >

  Manages the DDS entities required to receive function calls and send the return values.
- class **dds::rpc::Server**

  <<***reference-type***>> *(p. 351) Provides the execution environment for one or more* ***ServiceEndpoint*** *(p. 2354).*
- class **dds::rpc::ServerParams**

  <<***value-type***>> *(p. 350) The parameters used to configure a* ***Server*** *(p. 2346)*

Typedefs

- using **rpc_example::RobotControlService** = **dds::rpc::ServiceEndpoint**< RobotControlDispatcher >

  Executes a ***RobotControl*** *(p. 2213) interface implementation.*
- using **dds::rpc::ServiceParams** = **rti::request::ReplierParams**

  The parameters used to configure a ***ServiceEndpoint*** *(p. 2354).*

6.114.1 Detailed Description

Part of the RPC API that relates to the **Server** (p. 2346) and **ServiceEndpoint** (p. 2354).

6.114.2 Typedef Documentation

6.114.2.1 RobotControlService

```
using rpc_example::RobotControlService = typedef dds::rpc::ServiceEndpoint<RobotControlDispatcher>
```

Executes a **RobotControl** (p. 2213) interface implementation.

6.114.2.2 ServiceParams

```
typedef dds::rpc::detail::ServiceParams dds::rpc::ServiceParams
```

The parameters used to configure a **ServiceEndpoint** (p. 2354).

6.115 FlatData Builders

A Builder allows creating and initializing variable-size data.

Classes

- class **rti::flat::AggregationBuilder**
  Base class of struct and union builders.
- class **rti::flat::UnionBuilder< Discriminator >**
  Base class of builders for user-defined mutable unions.
- class **MyFlatMutableBuilder**
  Represents the Builder for an arbitrary user-defined mutable type.
- class **MyFlatUnionBuilder**
  Represents the Builder for an arbitrary user-defined mutable IDL union.
- class **rti::flat::AbstractBuilder**
  *Base class of all **Builders** (p. 409).*
- class **rti::flat::AbstractListBuilder< DHeaderGen >**
  Base class of all array and sequence builders.
- class **rti::flat::MutableArrayBuilder< ElementBuilder, N >**
  Builds an array member of variable-size elements.
- class **rti::flat::AbstractSequenceBuilder< DHeaderGen >**
  Base class of Builders for sequence members.
- class **rti::flat::MutableSequenceBuilder< ElementBuilder >**
  Builds a sequence member of variable-size elements.
- class **rti::flat::FinalSequenceBuilder< ElementOffset >**
  Builds a sequence member of fixed-size elements.
- class **rti::flat::PrimitiveSequenceBuilder< T >**
  Builds a sequence of primitive members.
- class **rti::flat::StringBuilder**
  Builds a string.

Functions

- template<typename TopicType >
  rti::flat::flat_type_traits< TopicType >::builder **rti::flat::build_data** (**dds::pub::DataWriter**< TopicType > &writer)
  Begins building a new sample.
- template<typename TopicType >
  void **rti::flat::discard_builder** (**dds::pub::DataWriter**< TopicType > &writer, typename **rti::flat::flat_type_↩ traits**< TopicType >::builder &builder)
  Discards a sample builder.

6.115.1 Detailed Description

A Builder allows creating and initializing variable-size data.

Builders allow creating variable-size **FlatData samples** (p. 412), as described in **Publishing FlatData** (p. 420).

There are the following Builder types:

Category	Builder type
User types	For example: • **MyFlatMutableBuilder** (p. 1763), a mutable struct • **MyFlatUnionBuilder** (p. 1777), a union • Final structs are fixed-size and do not have a Builder (see for example **MyFlatMutable↩ Builder::add_my_final()** (p. 1768)).
Arrays	• **rti::flat::MutableArrayBuilder** (p. 1753) • Arrays of final elements are fixed-size and do not have a Builder (see for example **MyFlat↩ MutableBuilder::add_my_final_array()** (p. 1768)).
Sequences	• **rti::flat::MutableSequenceBuilder** (p. 1757) for sequences of mutable elements • **rti::flat::FinalSequenceBuilder** (p. 1569) for sequences of final elements • **rti::flat::PrimitiveSequenceBuilder** (p. 1955) for sequences of primitive elements • **rti::flat::StringBuilder** (p. 2392)
Primitive types	• Primitive members are added using one of the member functions of the Builder of the type that contains them. See for example **MyFlatMutableBuilder::add_my_primitive()** (p. 1767)<

Builder for user types, such as **MyFlatMutableBuilder** (p. 1763), can behave as **sample builders**, when they build a sample, or **member builders** when they build a member for another Builder (such as the Builder returned by **MyFlat↩ MutableBuilder::build_my_mutable()** (p. 1769)). All the other Builder types (sequences, arrays) are always member builders (such as the Builder returned by **MyFlatMutableBuilder::build_my_final_seq()** (p. 1768)).

Builders are **move-only** types. They cannot be copied, only moved. When you assign a Builder as the return value of a function, this happens automatically.

```
// the return value of 'build_data' is moved into 'builder'
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
```

To explicitly move a Builder variable use `std::move()` in C++11 platforms or call the **`move()`** (p. 1669) member function in pre-C++11 platforms.

6.115.2 Builder Error Management

In the Modern C++ API errors are notified with exceptions. Builder operations may throw the following exceptions

- **dds::core::PreconditionNotMetError** (p. 1941), for any precondition failure.
- **dds::core::OutOfResourcesError** (p. 1898), when the Builder's underlying buffer runs out of space (this should not happen when the Builder has been created with **rti::flat::build_data()** (p. 411)).

See also **Offset Error Management** (p. 416).

See also

MyFlatMutableBuilder (p. 1763) for more information specific to builders for user types.

6.115.3 Function Documentation

6.115.3.1 build_data()

```
template<typename TopicType >
rti::flat::flat_type_traits< TopicType >::builder rti::flat::build_data (
              dds::pub::DataWriter< TopicType > & writer )
```

Begins building a new sample.

Template Parameters

TopicType	A FlatData mutable type that corresponds to the type of the DataWriter argument.

Parameters

writer	The writer that will be used to write this sample.

Returns

The Builder to build the sample. For example if TopicType is **MyFlatMutable** (p. 413), this function returns a **MyFlatMutableBuilder** (p. 1763).

Once you have completed the sample, call **finish_sample()** (p. 1766) to obtain a **MyFlatMutable** (p. 413) sample that can be written with `writer`.

If the building of this sample needs to be aborted before calling finish_sample(), use **rti::flat::discard_builder()** (p. 411). If, after obtaining a sample with finish_sample(), this sample is not written, then discard it with **dds::pub::DataWriter::discard_loan()** (p. 1185).

See also

dds::pub::DataWriter::get_loan (p. 1183), the function that **build_data()** (p. 411) uses to obtain the memory required to build the sample.

Publishing FlatData (p. 420)

References **dds::pub::DataWriter< T >::get_loan()**.

6.115.3.2 discard_builder()

```
template<typename TopicType >
void rti::flat::discard_builder (
              dds::pub::DataWriter< TopicType > & writer,
             typename  rti::flat::flat_type_traits< TopicType >::builder & builder )
```

Discards a sample builder.

Template Parameters

TopicType	An IDL-defined FlatData type that corresponds to the type of the DataWriter argument.

This function invalidates and discards a builder before it is finished() and before the sample it would have created was written.

Parameters

writer	The writer that was used to create the builder
builder	The builder, created with `rti::flat::build_data(writer);`

References **dds::pub::DataWriter< T >::discard_loan()**.

6.116 FlatData Samples

A Sample represents an instance of the IDL topic-type and contains the data in serialized format.

Classes

- class **rti::flat::Sample< OffsetType >**
  The generic definition of FlatData topic-types.
- struct **rti::flat::flat_type_traits< T >**
  *Given a **Sample** (p. 2274), an Offset or a Builder, it allows obtaining the other types.*

Typedefs

- typedef **rti::flat::Sample< MyFlatFinalOffset > MyFlatFinal**
  Represents an arbitrary user-defined FlatData final IDL struct.
- typedef **rti::flat::Sample< MyFlatMutableOffset > MyFlatMutable**
  Represents an arbitrary user-defined flat mutable IDL struct.
- typedef **rti::flat::Sample< MyFlatUnionOffset > MyFlatUnion**
  Represents an arbitrary user-defined flat mutable IDL union.

6.116.1 Detailed Description

A Sample represents an instance of the IDL topic-type and contains the data in serialized format.

All FlatData topic-types are instantiations of **rti::flat::Sample** (p. 2274). This documentation uses the following three example types to illustrate the different ways FlatData IDL types map to C++:

- **MyFlatFinal** (p. 413), the type generated for a final IDL struct
- **MyFlatMutable** (p. 413), the type generated for a mutable IDL struct
- **MyFlatUnion** (p. 413), the type generated for an IDL union

6.116.2 Typedef Documentation

6.116.2.1 MyFlatFinal

```
typedef rti::flat::Sample< MyFlatFinalOffset> MyFlatFinal
```

Represents an arbitrary user-defined FlatData final IDL struct.

This documentation uses the following example IDL definition of MyFlatFinal:

```
@language_binding(FLAT_DATA)
@final
struct MyFlatFinal {
    long my_primitive;
    FlatFinalBar my_complex; // Another arbitrary final FlatData type
    long my_primitive_array[10];
    FlatFinalBar my_complex_array[10];
};
```

For this type, **rtiddsgen** generates:

- MyFlatFinal (this instantiation of Sample),
- **MyFlatFinalOffset** (p. 1759).

Note that, as a final FlatData type, MyFlatFinal can only contain fixed-size types, such as primitives, other final FlatData structs, and arrays of fixed-size types.

Samples of MyFlatFinal are created with **dds::pub::DataWriter::get_loan** (p. 1183). After creating a final Sample, modify its values using the **MyFlatFinalOffset** (p. 1759) returned by **root()** (p. 2276).

6.116.2.2 MyFlatMutable

```
typedef rti::flat::Sample< MyFlatMutableOffset> MyFlatMutable
```

Represents an arbitrary user-defined flat mutable IDL struct.

This documentation uses the following example IDL definition of MyFlatMutable:

```
@language_binding(FLAT_DATA)
@mutable
struct MyFlatMutable {
    long my_primitive;
    @optional long my_optional_primitive;
    long my_primitive_array[10];
    sequence<long, 10> my_primitive_seq;
    MyFlatFinal my_final;
    MyFlatFinal my_final_array[10];
    sequence<MyFlatFinal, 10> my_final_seq;
    FlatMutableBar my_mutable;
    FlatMutableBar my_mutable_array[10];
    sequence<FlatMutableBar, 10> my_mutable_seq;
    string<255> my_string;
    sequence<string<255>, 10> my_string_seq;
};
```

For this type, **rtiddsgen** generates:

- MyFlatMutable (this instantiation of Sample),
- **MyFlatMutableOffset** (p. 1770),
- **MyFlatMutableBuilder** (p. 1763).

As a mutable FlatData type, MyFlatMutable is not restricted to fixed-size members. Samples of MyFlatMutable are created with **rti::flat::build_data()** (p. 411), which returns a **MyFlatMutableBuilder** (p. 1763). Once built, a mutable Sample can't change in size, but the value of members that already exist can be changed using the **MyFlatMutable↩ Offset** (p. 1770) returned by **root()** (p. 2276).

6.116.2.3 MyFlatUnion

```
typedef rti::flat::Sample< MyFlatUnionOffset> MyFlatUnion
```

Represents an arbitrary user-defined flat mutable IDL union.

This documentation uses the following example IDL definition of MyFlatUnion:

```
@language_binding(FLAT_DATA)
@mutable
union MyFlatUnion switch (long) {
    case 0:
        long my_primitive;
    case 1:
    case 2:
        MyFlatMutable my_mutable;
    case 3:
        MyFlatFinal my_final;
};
```

Note

FlatData unions can only be **mutable** since unions are, by definition, variable-size types.

For this type, **rtiddsgen** generates:

- MyFlatUnion (this instantiation of Sample),
- **MyFlatUnionOffset** (p. 1780),
- **MyFlatUnionBuilder** (p. 1777).

6.117 FlatData Offsets

Offsets provide access to the members of a FlatData Sample.

Classes

- class **MyFlatFinalOffset**

  Represents the Offset to an arbitrary user-defined FlatData final IDL struct.
- class **MyFlatMutableOffset**

  Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.
- class **MyFlatUnionOffset**

  Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.
- class **rti::flat::OffsetBase**

  Base class of all Offset types.
- class **rti::flat::FinalOffset**< **T** >

  The base class of all Offsets to a final struct type.
- class **rti::flat::MutableOffset**

  The base class of all Offsets to a final struct type.
- struct **rti::flat::PrimitiveConstOffset**< **T** >

  A const Offset to an optional primitive member.

- struct **rti::flat::PrimitiveOffset< T >**
  An Offset to an optional primitive member.
- class **rti::flat::SequenceIterator< E, OffsetKind >**
  Iterator for collections of Offsets.
- class **rti::flat::AbstractPrimitiveList< T >**
  Base class for Offsets to sequences and arrays of primitive types.
- class **rti::flat::PrimitiveSequenceOffset< T >**
  Offset to a sequence of primitive elements.
- class **rti::flat::PrimitiveArrayOffset< T, N >**
  Offset to an array of primitive elements.
- class **rti::flat::StringOffset**
  Offset to a string.
- class **rti::flat::AbstractAlignedList< ElementOffset >**
  Base class of Offsets to sequences and arrays of non-primitive members.
- class **rti::flat::SequenceOffset< ElementOffset >**
  Offset to a sequence of non-primitive elements.
- class **rti::flat::MutableArrayOffset< ElementOffset, N >**
  Offset to an array of variable-size elements.
- class **rti::flat::FinalArrayOffset< ElementOffset, N >**
  Offset to an array of final elements.
- class **rti::flat::FinalAlignedArrayOffset< ElementOffset, N >**
  Offset to an array of final elements.

Functions

- template<typename OffsetType >
  flat_type_traits< OffsetType >::plain_type * **rti::flat::plain_cast** (OffsetType &offset)
  Casts into an equivalent plain C++ type.
- template<typename OffsetType >
  const **flat_type_traits**< OffsetType >::plain_type * **rti::flat::plain_cast** (const OffsetType &offset)
  Const version of plain_cast.

6.117.1 Detailed Description

Offsets provide access to the members of a FlatData Sample.

An Offset represents a position within a **FlatData Sample** (p. 412) that allows accessing a member of that Sample, or the Sample's **root** (p. 2276).

Offsets can be described as **iterators**. They represent a position in a buffer, not the value itself. As such, they're lightweight objects that can be copied to point to the same data.

There are the following Offset types to access the different IDL types:

Category	Offset type
User types	For example: • **MyFlatFinalOffset** (p. 1759), an Offset to a final struct • **MyFlatMutableOffset** (p. 1770), an Offset to a mutable struct • **MyFlatUnionOffset** (p. 1780), an Offset to a union
Arrays	• **rti::flat::PrimitiveArrayOffset** (p. 1951) • **rti::flat::FinalArrayOffset** (p. 1567) (array of final elements in a final type) • **rti::flat::FinalAlignedArrayOffset** (p. 1565) (array of final elements in a mutable type) • **rti::flat::MutableArrayOffset** (p. 1755)
Sequences	• **rti::flat::PrimitiveSequenceOffset** (p. 1958) • **rti::flat::SequenceOffset** (p. 2343)
Primitive types	• The type itself, such as `double` • **rti::flat::PrimitiveOffset** (p. 1953) (when the member is optional)

Offsets for user types are generated by **rtiddsgen** and provide methods to access the type's members by their names. Offsets for arrays and sequences provide methods to access each element.

Some offsets allow accessing the data through a pointer to the equivalent plain C++ type, which generally provides better performance. See **rti::flat::plain_cast()** (p. 417).

6.117.2 Offset Error Management

Functions that return an Offset may return a "null" Offset (one such that **is_null()** (p. 1876) returns `true`).

An Offset may be null if a member doesn't exist in the **Sample** (p. 412). For example, if the member 'my_final' in **MyFlatMutable** (p. 413) doesn't exist (because it wasn't added while building the Sample, or because it wasn't received in the subscribing application), **MyFlatMutableOffset::my_final()** (p. 1775) returns an null Offset. Note that a **member in a final type** (for example, **MyFlatFinalOffset::my_complex()** (p. 1762)) always exists, except in the case of an error.

Other than that, any error condition will cause one of the following exceptions, not a null Offset:

- **dds::core::NullReferenceError** (p. 1870), when accessing a null Offset
- **dds::core::PreconditionNotMetError** (p. 1941), for any precondition failure.
- **dds::core::OutOfResourcesError** (p. 1898), when a **Builder** (p. 409) runs out of space while adding a member.

6.117.3 Function Documentation

6.117.3.1 plain_cast() [1/2]

```
template<typename OffsetType >
flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (
            OffsetType & offset )
```

Casts into an equivalent plain C++ type.

Some FlatData types can be cast to their equivalent **plain** definition as a regular non-FlatData C++ type. This is a more efficient way to access the data. This function casts, if possible, the member pointed to by the offset argument to an equivalent plain C++ type. Any changes made through the plain type are reflected in the FlatData sample.

Template Parameters

OffsetType	The Offset type

Precondition

plain_cast requires the type to meet the following restrictions:

- The type must be a final struct, or an array or sequence of members of a type that meets these restrictions (including primitive types)
- The type must be defined in a way such that the packing of the plain C++ type doesn't differ from the padding in XCDR2.
- The type may not inherit from another type.
- In addition, the sample must be serialized in the native endianness. For example, if a subscribing application on a little-endian platform receives a sample published from a big-endian system, it is not possible to plain↩ _cast the sample or any of its members, except if the member is a primitive array or sequence of 1-byte elements.

offset.is_cpp_compatible() (p. 1876) indicates if the member meets the requirements. If the type doesn't, this function throws **dds::core::PreconditionNotMetError** (p. 1941).

Parameters

offset	The offset to the member to cast.

Returns

The data that `offset` referred to, cast as a plain C++ type with the same definition. If `offset` is an array or sequence member, the returned pointer represents a C++ array with the same number of elements.

The following table summarizes the possible parameters to this function (assuming that they meet the previous requirements), and the return type in each case:

OffsetType	return type
Offset to a final struct, such as **MyFlatFinalOffset** (p. 1759)	MyFlatFinalPlainHelper* (pointer to a single element). This is a type with the same IDL definition, but without @language_binding(FLAT_DATA).
Offset to an array of final structs, such as **FinalArrayOffset** (p. 1567)<**MyFlatFinalOffset** (p. 1759), N>	MyFlatFinalPlainHelper* (array of N elements)
Offset to a sequence of final structs, such as **SequenceOffset** (p. 2343)<**MyFlatFinalOffset** (p. 1759)>	MyFlatFinalPlainHelper* (array of offset.element_count() elements)
Offset to an array of primitive types, such as **PrimitiveArrayOffset** (p. 1951)<int32_t, N>	int32_t* (array of N elements)
Offset to a sequence of primitive types, such as **PrimitiveSequenceOffset** (p. 1958)<int32_t>	int32_t* (array of offset.element_count() elements)

Due to the performance advantages that plain_cast offers, it is recommended to define FlatData types in a way that their largest member(s) can be plain_cast.

The following example shows how to use plain_cast to cast a **MyFlatFinalOffset** (p. 1759) into the type with the same IDL definition as **MyFlatFinal** (p. 413), but without the @language_binding(FLAT_DATA) annotation:

```
MyFlatMutable *my_sample = ...;
auto my_root = my_sample->root();
auto my_final = my_root.my_final();
// Get the plain C++ type and modify an array
auto my_final_plain = rti::flat::plain_cast(my_final);
my_final_plain->my_primitive(3); // this is using the plain C++ setter
my_final_plain->my_complex_array()[1].x(20); // this is a std::array
// The change to my_complex_array is reflected in the FlatData sample
std::cout « my_final.my_primitive() « std::endl; // 3
std::cout « my_final.my_complex_array().get_element(1).x() « std::endl; // 20
```

This example shows how to use plain_cast to efficiently build a sequence of final elements and a sequence of integers, both members of a mutable type:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
// 1)
//
// Build a sequence of 5 elements with add_n() instead of 5 calls to
// add_next()
rti::flat::FinalSequenceBuilder<MyFlatFinalOffset> seq_builder =
            builder.build_my_final_seq();
seq_builder.add_n(5);
// Finish the member, getting the offset to the member
rti::flat::SequenceOffset<MyFlatFinalOffset> seq_offset = seq_builder.finish();
// Cast it to an array of plain C++ type and initialize it.
// This way to initialize it is more efficient than add_next().
auto seq_elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 5; i++) {
    seq_elements[i].my_primitive(i);
    // ...
}
// 2)
//
// Build a sequence of 1000 integers
auto seq_builder = builder.build_my_primitive_seq();
// make space for 1000 elements, but leave them uninitialized
seq_builder.add_n(1000);
auto seq_offset = seq_builder.finish();
// Initialize the elements:
int32_t *elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 1000; i++) {
    elements[i] = ...;
}
// ... continue building the sample using 'builder'
```

6.117.3.2 plain_cast() [2/2]

```
template<typename OffsetType >
const  flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (
             const OffsetType & offset )
```

Const version of plain_cast.

6.118 FlatData Topic-Types

<<***extension***>> *(p. 354)* FlatData Language Binding for IDL topic-types

Modules

- **FlatData Builders**

  A Builder allows creating and initializing variable-size data.
- **FlatData Samples**

  A Sample represents an instance of the IDL topic-type and contains the data in serialized format.
- **FlatData Offsets**

  Offsets provide access to the members of a FlatData Sample.

6.118.1 Detailed Description

<<***extension***>> *(p. 354)* FlatData Language Binding for IDL topic-types

Note

For a complete description of the FlatData language binding and its benefits, and a tutorial, see the "Sending Large Data" chapter in the **RTI Connext User's Manual**.

For buildable **code examples**, see `https://community.rti.com/kb/flatdata-and-zerocopy-examples`.

The FlatData language binding is available in the Traditional C++ API and in the Modern C++ API.

RTI FlatData™ is a language binding for IDL types in which the in-memory representation of a sample matches the wire representation. Therefore, the cost of serialization/deserialization is zero.

To select FlatData as the language binding of a type, annotate it with `@language_binding(FLAT_DATA)` in IDL or apply the attribute `languageBinding="flat_data"` in XML.

There are some restrictions regarding the kinds of types to which the FlatData language binding can be applied.

- For final types, the FlatData language binding can be applied only to fixed-size types. A fixed-size type is a type whose wire representation always has the same size. This includes primitive types, arrays of fixed-size types, and structs containing only members of fixed-size types. Unions are not fixed-size types.
- For mutable types, any member is permitted.

- Extensible types cannot be marked as FlatData.

Final types are more efficient, but more restrictive. In general, a good compromise is to define mutable top-level types, but making sure their largest data members are final.

When a type is marked with the FlatData language binding, its mapping into C++ is different than that of a regular type (plain language binding). Rather than a single C++ class with direct access to its members, for a FlatData type **rtiddsgen** generates the following:

- A **Sample** (p. 412), the data in serialized format
- An **Offset** (p. 414), which allows reading the data members of that type inside a Sample, and modifying them without changing the size
- A **Builder** (p. 409), if the type is mutable, which allows creating a variable-size Sample

For example, for the IDL types **MyFlatFinal** (p. 413) and **MyFlatMutable** (p. 413) **rtiddsgen** generates the following C++ types:

- The Sample types **MyFlatFinal** (p. 413) and **MyFlatMutable** (p. 413)
- The Offset types **MyFlatFinalOffset** (p. 1759) and **MyFlatMutableOffset** (p. 1770).
- The Builder type **MyFlatMutableBuilder** (p. 1763).

6.118.2 Publishing FlatData

The typical way to publish FlatData samples includes the following steps:

- Create a **dds::pub::DataWriter** (p. 1138) as you would for a non-FlatData (plain) topic-type (see **Setting up a DataWriter** (p. 311)).

(For final topic-types such as **MyFlatFinal** (p. 413))

- Obtain a FlatData sample with **dds::pub::DataWriter::get_loan** (p. 1183).
```
MyFlatFinal *foo_sample = writer.get_loan();
```
- Initialize the sample, starting from the **root()** (p. 2276) offset.
```
MyFlatFinalOffset foo_root = foo_sample->root();
foo_root.my_primitive(3);
auto my_complex_offset = foo_root.my_complex();
// ... initialize my_complex_offset
```

(For mutable topic-types such as **MyFlatMutable** (p. 413))

- Obtain a **Builder** (p. 409) to create a variable-size sample with **rti::flat::build_data()** (p. 411).
```
MyFlatMutableBuilder foo_builder = rti::flat::build_data(writer);
```

- Use this builder (and possibly nested member builders) to initialize the members.
```
foo_builder.add_my_primitive(3);
auto my_mutable_builder = foo_builder.build_my_mutable();
// ... build 'my_mutable' (a member with a mutable type)
my_mutable_builder.finish(); // completes a member
auto my_final_offset = foo_builder.add_my_final();
// ... initialize 'my_final' (a member with a final type)
```
- Obtain the completed sample with **MyFlatMutableBuilder::finish_sample()** (p. 1766). After that, the builder is no longer usable, and the sample size cannot change.
```
MyFlatMutable *foo_sample = foo_builder.finish_sample();
```
- Optionally, it is possible to change the values of the sample accessing its root(), as long as the size doesn't change. For example, if the sample was built with a sequence member with two elements, it is possible to modify any of those elements, but it's not possible to add a third element.

(For both final and mutable topic-types)

- Write the sample with **dds::pub::DataWriter::write()** (p. 1148).
```
writer.write(*foo_sample);
```

After write, the DataWriter owns the FlatData sample. This allows avoiding additional copies, the main goal of the Flat↩ Data language binding. This means that the sample cannot be reused. The DataWriter will return it to the sample pool when appropriate, as described in **dds::pub::DataWriter::get_loan** (p. 1183).

6.118.3 Subscribing to FlatData

To subscribe to a topic using a FlatData topic-type:

- Create a **dds::sub::DataReader** (p. 976) normally (see **Setting up a DataReader** (p. 316)).
- Read or take the samples using a loaning operation, such as **dds::sub::DataReader::take** (p. 997) (copying read/take operations cannot be used with FlatData types).
- Access the **root()** (p. 2276) offset, and any of the sample's members from there.

Note that the language binding is a local concept. It is possible to publish with a FlatData topic-type and subscribe to it with a **plain** topic-type with the same (or assignable) definition. It is also possible to use a plain topic-type on the publisher side and subscribe to it using FlatData. The DataWriter or DataReader of the plain topic-type has to use **dds::core::policy::DataRepresentation::xcdr2()** (p. 521) in **dds::core::policy::DataRepresentation** (p. 1113).

6.119 RPC Tutorial

Getting Started with Remote Procedure Call with DDS.

Getting Started with Remote Procedure Call with DDS.

This tutorial will walk you through the steps to define an interface and write the service and client applications:

- **Defining a service interface in IDL** (p. 422)
- **Writing the Service application** (p. 422)
- **Writing the Client application** (p. 424)
- **Advanced interface definition** (p. 424)

6.119.1 Defining a service interface in IDL

The first step is to define a `@service`-annotated `interface` in IDL:

```
@final
struct Coordinates {
    int32 x;
    int32 y;
};
@service
interface RobotControl {
    Coordinates walk_to(Coordinates destination, float speed);
    float get_speed();
};
```

This IDL file defines an interface with two methods:

- `walk_to` receives two arguments and returns a `Coordinates` structure
- `get_speed` takes no arguments and returns a `float`.

These are the methods that we will implement in the Service application, and the methods we will call in the Client application.

To generate the supporting code and example client and service applications, copy the IDL code above into a file called RobotControl.idl and run rtiddsgen as follows (see the `Code Generator User's Manual` for more information):

```
<Connext DDS installation directory>/bin/rtiddsgen -language C++11 -example <your architecture> RobotControl.idl
```

This will generate the following files:

- `RobotControl.hpp`, `RobotControl.cxx`, `RobotControlPlugin.hpp`, `RobotControlPlugin.cxx`. These files contain the supporting types. You should not edit these files.
- `RobotControl_service.cxx` contains the example service application
- `RobotControl_client.cxx` contains the example client application

In the following sections we will modify `RobotControl_service.cxx` and `RobotControl_client.cxx`.

6.119.2 Writing the Service application

`RobotControl_service.cxx` contains an implementation of the `RobotControl` interface:

```
class RobotControlExample : public RobotControl {
public:
    Coordinates walk_to(const Coordinates& destination, float speed) override
    {
        std::cout « "calling walk_to" « std::endl;
        // Implement walk_to function here
        return Coordinates();
    }
    float get_speed() override
    {
        std::cout « "calling get_speed" « std::endl;
        // Implement get_speed function here
        return 0.0f;
    }
};
```

The generated methods simply print a message and return a default value. You can modify it to do something a little more interesting:

```
class RobotControlExample : public RobotControl {
public:
    Coordinates walk_to(const Coordinates& destination, float speed) override
    {
        if (speed_ > 0.0f) {
            std::cout « "already moving" « std::endl;
            return position_; // return previously known position
        }
        if (speed > 100.0f) {
            speed_ = 100; // maximum speed
        } else if (speed <= 0.0f) {
            std::cout « "staying put at position " « position_ « std::endl;
            return position_;
        } else {
            speed_ = speed;
        }
        std::cout « "walking to " « destination « " at a speed of "
                  « speed_ « "...\n";
        // sleep for 0 to 10 seconds, depending on the speed
        std::this_thread::sleep_for(std::chrono::milliseconds(
                10000 - static_cast<int>(100 * speed_)));
        std::cout « "arrived!\n";
        speed_ = 0.0f;
        position_ = destination;
        return destination;
    }
    float get_speed() override
    {
        return speed_;
    }
private:
    Coordinates position_ {0, 0};
    std::atomic<float> speed_ {0.0f};
};
```

The next step is to create a `Server` and a `RobotControlService` that uses an instance of `MyRobotControl`.

```
// Create a DomainParticipant with default Qos. The Service will communicate
// only with Clients that join the same domain_id
dds::domain::DomainParticipant participant(domain_id);
// Create an instance of the service interface
auto service_impl = std::make_shared<RobotControlExample>();
// A server provides the execution environment (a thread pool) for one or
// more services
dds::rpc::ServerParams server_params;
// Use a thread_pool_size > 1 to dispatch incoming function calls in
// parallel
server_params.extensions().thread_pool_size(4);
// Create the server with the server_params configuration
dds::rpc::Server server(server_params);
// Create a service with an instance of the service interface, and attach
// it to a server. The service will wait for remote calls, call the
// service interface to compute the results, and send them back.
dds::rpc::ServiceParams params(participant);
params.service_name("Example RobotControl Service");
RobotControlService service(service_impl, server, params);
std::cout « "RobotControlService running... " « std::endl;
server.run();
```

A Service instance creates the necessary DDS entities (**dds::topic::Topic** (p. 2474), **dds::sub::DataReader** (p. 976), **dds::pub::DataWriter** (p. 1138)) to receive function calls, process them using an interface implementation, and send back the return values. Several Service instances (of the same or different interfaces) can share the same **dds↩ ::domain::DomainParticipant** (p. 1326).

This `RobotControlService` will communicate with clients that run on the same domain id and specify the same service name, `"Example RobotControl Service"`.

The execution of Service instances is managed by a `Server`. A `Server` provides a thread pool for one or more Service instances (of the same or different interfaces). By default, a `Server` creates only one thread, and therefore all the function calls are processed sequentially. In the example, the thread pool size is set to 4. Keep in mind that now the `MyRobotControl` methods can be executed in parallel, so you may need to provide mutual exclusion for shared variables and critical areas.

The RobotControlService is ready to receive remote calls as soon as you instantiate it. Server and RobotControlService are **reference types** (p. 351), and will be destroyed when they're not referenced by any variable. The call to server.run() simply sleeps so that server and service don't go out scope.

6.119.3 Writing the Client application

In RobotControl_client.cxx, we create a RobotControlClient that allows making remote function calls to the service:

```
// Create a DomainParticipant with default Qos
dds::domain::DomainParticipant client_participant(domain_id);
// Create a ClientParams
dds::rpc::ClientParams client_params(client_participant);
// And register the service
client_params.service_name("Example RobotControl Service");
// Create a client and assign the ClientParams
RobotControlClient client(client_params);
// Wait until the service is started
client.wait_for_service();
```

The client is configured with the same service name we used for the service, "Example RobotControl Service". With wait_for_service we wait until the client's readers and writers have matched with the service's own readers and writers. If the client sends a request before we have matched with a service's endpoints, the request will fail and throw an exception.

Next, we're ready to make function calls. Function calls can be synchronous or asynchronous. Synchronous function calls block until a response is received:

```
Coordinates final_position = client.walk_to(Coordinates(150, 200), 85.0f);
std::cout « "Robot walked to " « final_position « std::endl;
```

Asynchronous funcion calls send the request immediately but return a std::future that will contain the result when it's received:

```
std::future<Coordinates> final_position_future =
        client.walk_to_async(Coordinates(10, 0), 40.0f);
std::this_thread::sleep_for(std::chrono::seconds(1));
// The walk_to function may still be running, but we can get the speed
// before we receive the result:
std::cout « "Current speed is " « client.get_speed() « std::endl;
final_position = final_position_future.get();
std::cout « "Robot walked to " « final_position « std::endl;
```

The call to std::future::get() provides the result if it's already available or blocks until it is.

You can configure the maximum wait time for function calls in the ClientParams. By default the wait is infinite. When set to a finite value, operations that do not receive the return value on time throw **dds::core::TimeoutError** (p. 2473).

RobotControlClient is also a **reference type** (p. 351) and will be destroyed automatically when it's no longer referenced by any variable.

6.119.4 Advanced interface definition

In this section we will explore other features you can use to define service interfaces:

- Attributes
- Exceptions
- Out and in/out parameters

An attributes is a data member that generates a getter and a setter function.

Exceptions allow reporting errors in remote function calls.

We will modify our previous IDL to add a `name` attribute for `RobotControl` and an exception for the `walk_to` operation.

```
exception WalkError {
    string<32> message;
};
exception TooFastError {
};
@final
struct Coordinates {
    int32 x;
    int32 y;
};
@service
interface RobotControl {
    Coordinates walk_to(Coordinates destination, float speed)
            raises(WalkError, TooFastError);
    float get_speed();
    attribute string<128> name;
};
```

Now run `rtiddsgen` to update the type files:

```
<Connext DDS installation directory>/bin/rtiddsgen -language C++11 -update
typefiles RobotControl.idl
```

We can now modify `MyRobotControl` to report errors in `walk_to` as exceptions and add the `name` getters and setters:

```
class RobotControlExample : public RobotControl {
public:
    Coordinates walk_to(const Coordinates& destination, float speed) override
    {
        if (speed_ > 0.0f) {
            throw WalkError("Already moving");
        }
        if (speed > 100.0f) {
            throw TooFastError();
        }
        if (speed <= 0.0f) {
            throw WalkError("Invalid speed");
        }
        speed_ = speed;
        std::cout << "walking to " << destination << " at a speed of "
                  << speed_ << "...\n";
        // sleep for 0 to 10 seconds, depending on the speed
        std::this_thread::sleep_for(std::chrono::milliseconds(
                10000 - static_cast<int>(100 * speed_)));
        std::cout << "arrived!\n";
        speed_ = 0.0f;
        position_ = destination;
        return destination;
    }
    float get_speed() override
    {
        return speed_;
    }
    void set_attribute_name(const std::string& name) override
    {
        name_ = name;
    }
    std::string get_attribute_name() override
    {
        return name_;
    }
private:
    std::string name_ {"Unknown"};
    Coordinates position_ {0, 0};
    std::atomic<float> speed_ {0.0f};
};
```

These exceptions are propagated and rethrown in the client:

```
try {
    client.walk_to(Coordinates(5, 20), 105);
```

```
} catch (const TooFastError&) {
    std::cout « "walk_to failed: too fast\n";
} catch (const WalkError& walk_error) {
    std::cout « "walk_to failed: " « walk_error.message() « std::endl;
}
```

In asynchronous calls, exceptions are thrown in `std::future::get()`.

If you need to return more than one value in a method, you can wrap the values in a struct and use that as the return type (as we do in `walk_to`) but you can also specify `out` and `inout` parameters (by default parameters are `in`).

For example, an alternative definition of `walk_to` can use an inout parameter to pass the target position and return the final position, and return a boolean indicating whether the operation succeeded.

```
boolean walk_to(inout Coordinates destination, float speed);
```

This changes how the interfaces are generated. The synchronous interface (`RobotControl`) now receives the `destination` argument by non-const reference so it can be modified. The asynchronous interface (`RobotControlAsync`) returns a future that wraps all the output values: the return type, and all the out and inout parameters.

6.120 Conditions and WaitSets

dds::core::cond::Condition (p. 948) and **dds::core::cond::WaitSet** (p. 2617).

Modules

- **AsyncWaitSet**

  *<<**extension**>> (p. 354) A specialization of **dds::core::cond::WaitSet** (p. 2617) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **dds::core::cond::Condition** (p. 948).*

Classes

- class **dds::core::cond::Condition**

  *<<**reference-type**>> (p. 351) Abstract base class of all the conditions*
- class **dds::core::cond::GuardCondition**

  *<<**reference-type**>> (p. 351) A condition whose trigger value is under the control of the application.*
- class **dds::core::cond::StatusCondition**

  *<<**reference-type**>> (p. 351) A condition associated with each **dds::core::Entity** (p. 1520)*
- class **dds::core::cond::WaitSet**

  *<<**reference-type**>> (p. 351) Allows an application to wait until one or more of the attached **Condition** (p. 948) objects have a trigger_value of true or else until the timeout expires.*
- class **rti::core::cond::WaitSetProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Specifies the **dds::core::cond::WaitSet** (p. 2617) behavior for multiple trigger events*

6.120.1 Detailed Description

dds::core::cond::Condition (p. 948) and **dds::core::cond::WaitSet** (p. 2617).

6.121 Time Support

Time and duration types.

Classes

- class **dds::core::Duration**

  <<***value-type***>> (p. *350*) *Represents a time interval*
- class **dds::core::Time**

  <<***extension***>> (p. *354*) *Represents a point in time*

6.121.1 Detailed Description

Time and duration types.

6.122 Exceptions

Classes

- class **dds::core::Exception**

  The abstract base class for all of the DDS exceptions which may be thrown by the API.
- class **dds::core::Error**

  A generic, unspecified ***Error*** (p. *1539*).
- class **dds::core::AlreadyClosedError**

  Indicates that an object has been closed.
- class **dds::core::IllegalOperationError**

  Indicates that an operation was called under improper circumstances.
- class **dds::core::NotAllowedBySecurityError**

  Indicates that an operation on the DDS API fails because the security plugins do not allow it.
- class **dds::core::ImmutablePolicyError**

  Indicates that the application attempted to modify an immutable QoS policy.
- class **dds::core::InconsistentPolicyError**

  Indicates that the application specified a set of QoS policies that are not consistent with each other.
- class **dds::core::InvalidArgumentError**

  Indicates that the application passed an illegal parameter value into an operation.
- class **dds::core::NotEnabledError**

  A ***NotEnabledError*** (p. *1869*) *is thrown when an operation is invoked on a* ***dds::core::Entity*** (p. *1520*) *that is not yet enabled.*
- class **dds::core::OutOfResourcesError**

  Indicates that RTI Connext ran out of the resources needed to complete the operation.
- class **dds::core::PreconditionNotMetError**

  A ***PreconditionNotMetError*** (p. *1941*) *is thrown when a pre-condition for the operation was not met.*
- class **dds::core::TimeoutError**

Indicates that an operation has timed out.

- class **dds::core::UnsupportedError**

  Indicates that the application used an unsupported operation.
- class **dds::core::InvalidDowncastError**

  Indicates that a downcast was incorrect.
- class **dds::core::NullReferenceError**

  Indicates an attempt to access a null object.
- class **rti::core::Result**< **T** >

  A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.

6.122.1 Detailed Description

6.122.2 Standard Exceptions

Any operation can can throw one of the following "standard exceptions" unless it indicates the opposite:

- **dds::core::Error** (p. 1539)
- **dds::core::IllegalOperationError** (p. 1608)
- **dds::core::AlreadyClosedError** (p. 806)
- **dds::core::InvalidArgumentError** (p. 1619)
- **dds::core::UnsupportedError** (p. 2590)

Operations that throw other exceptions will document them explicitly.

As a general rule constructors may only throw **dds::core::Error** (p. 1539). Destructors never throw, even in case of error.

Note that any operation can throw C++ standard exceptions such as `std::bad_alloc`.

6.122.3 Catching exceptions

The class **dds::core::Exception** (p. 1546) is the abstract base class for all DDS exceptions. All concrete exceptions inherit also from subclasses of `std::exception`, so when you need to catch an exception you have flexibility on the level of detail you need. For example, if you are setting the DomainParticipant QoS:

```
try {
    my_participant.qos(my_participant_qos);
} catch (const dds::core::InconsistentPolicyError& ipe) {
    // catch a specific exception (documented in DomainParticipant::qos())
} catch (const std::exception& ex) {
    // catch any other exception here, including other DDS exceptions
}
```

6.123 QoS Policy Traits

The traits types **policy_id** (p. 1940) and **policy_name** (p. 1941) provide information about a QoS policy.

Classes

- class **dds::core::policy::policy_id**< **Policy** >
  Obtains the QosPolicyId of a QoS Policy.
- class **dds::core::policy::policy_name**< **Policy** >
  Obtains the policy name.

6.123.1 Detailed Description

The traits types **policy_id** (p. 1940) and **policy_name** (p. 1941) provide information about a QoS policy.

6.124 Safe Enumeration

Describes the **safe_enum** (p. 2265) class.

Classes

- class **dds::core::safe_enum**< **def, inner** >
  <<***value-type***>> *(p. 350) Provides a safe, scoped enumeration based on def::type*

6.124.1 Detailed Description

Describes the **safe_enum** (p. 2265) class.

6.125 Status Kinds

Kinds of communication status.

Classes

- class **dds::core::status::StatusMask**
  A std::bitset (list) of statuses.
- class **dds::core::status::InconsistentTopicStatus**
  *Information about the status **dds::core::status::StatusMask::inconsistent_topic()** (p. 2379)*
- class **dds::core::status::SampleLostStatus**
  *Information about the status **dds::core::status::StatusMask::sample_lost()** (p. 2381)*
- class **dds::core::status::SampleRejectedStatus**
  *Information about the status **dds::core::status::StatusMask::sample_rejected()** (p. 2382)*
- class **dds::core::status::LivelinessLostStatus**
  *Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2383)*

- class **dds::core::status::LivelinessChangedStatus**

  *Information about the status **dds::core::status::StatusMask::liveliness_changed()** (p. 2383)*
- class **dds::core::status::OfferedDeadlineMissedStatus**

  *Information about the status **dds::core::status::StatusMask::offered_deadline_missed()** (p. 2379)*
- class **dds::core::status::RequestedDeadlineMissedStatus**

  *Information about the status **dds::core::status::StatusMask::requested_deadline_missed()** (p. 2380)*
- class **dds::core::status::OfferedIncompatibleQosStatus**

  *Information about the status **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380)*
- class **dds::core::status::RequestedIncompatibleQosStatus**

  *Information about the status **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381)*
- class **dds::core::status::PublicationMatchedStatus**

  *Information about the status **dds::core::status::StatusMask::publication_matched()** (p. 2384)*
- class **dds::core::status::SubscriptionMatchedStatus**

  *Information about the status **dds::core::status::StatusMask::subscription_matched()** (p. 2384)*
- class **rti::core::status::EventCount< IntegerType >**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Encapsulates an event count containing a total count and an incremental count since the last time a status was read.*
- class **rti::core::status::DataReaderCacheStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::datareader_cache()** (p. 2386)*
- class **rti::core::status::DataReaderProtocolStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::datareader_protocol()** (p. 2387)*
- class **rti::core::status::DataWriterCacheStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::datawriter_cache()** (p. 2386)*
- class **rti::core::status::ReliableWriterCacheChangedStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2385)*
- class **rti::core::status::ReliableReaderActivityChangedStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::reliable_reader_activity_changed()** (p. 2385)*
- class **rti::core::status::DataWriterProtocolStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::datawriter_protocol()** (p. 2386)*
- class **rti::core::status::DomainParticipantProtocolStatus**
- class **rti::core::status::ServiceRequestAcceptedStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::service_request_accepted()** (p. 2388)*
- class **rti::core::status::InvalidLocalAdvanceNoticeStatus**

  *<<**extension**>> (p. 354) Information about the status **dds::core::status::StatusMask::invalid_local_advance_notice()** (p. 2388)*

6.125.1 Detailed Description

Kinds of communication status.

Entity:

dds::core::Entity (p. 1520)

QoS:

All QoS Policies (p. 508)

Listener:

Listener (p. 1637)

Each concrete **dds::core::Entity** (p. 1520) is associated with a set of Status objects whose value represents the communication status of that entity. Each status value can be accessed with a corresponding method on the **dds::core::Entity** (p. 1520).

When these status values change, the corresponding **dds::core::cond::StatusCondition** (p. 2372) objects are activated and the proper **Listener** (p. 1637) objects are invoked to asynchronously inform the application.

An application is notified of communication status by means of the **Listener** (p. 1637) or the **dds::core::cond::WaitSet** (p. 2617) / **dds::core::cond::Condition** (p. 948) mechanism. The two mechanisms may be combined in the application (e.g., using **dds::core::cond::WaitSet** (p. 2617) (s) / **dds::core::cond::Condition** (p. 948) (s) to access the data and **Listener** (p. 1637) (s) to be warned asynchronously of erroneous communication statuses).

It is likely that the application will choose one or the other mechanism for each particular communication status (not both). However, if both mechanisms are enabled, then the **Listener** (p. 1637) mechanism is used first and then the **dds::core::cond::WaitSet** (p. 2617) objects are signalled.

The statuses may be classified into:

- *read communication statuses*: i.e., those that are related to arrival of data, namely **dds::core::status::StatusMask::data_on_readers()** (p. 2382) and **dds::core::status::StatusMask::data_available()** (p. 2383).

- *plain communication statuses*: i.e., all the others.

Read communication statuses are treated slightly differently than the others because they don't change independently. In other words, at least two changes will appear at the same time (**dds::core::status::StatusMask::data_on_readers()** (p. 2382) and **dds::core::status::StatusMask::data_available()** (p. 2383)) and even several of the last kind may be part of the set. This 'grouping' has to be communicated to the application.

For each plain communication status, there is a corresponding structure to hold the status value. These values contain the information related to the change of status, as well as information related to the statuses themselves (e.g., contains cumulative counts).

"Status Values"

6.125.2 Changes in Status

Associated with each one of an **dds::core::Entity** (p. 1520)'s communication status is a logical `StatusChangedFlag`. This flag indicates whether that particular communication status has changed since the last time the status was read by the application. The way the status changes is slightly different for the Plain Communication Status and the Read Communication status.

"\p StatusChangedFlag indicates if status has changed"

6.125.2.1 Changes in plain communication status

For the plain communication status, the `StatusChangedFlag` flag is initially set to FALSE. It becomes TRUE whenever the plain communication status changes and it is reset to false each time the application accesses the plain communication status via the proper getter operation on the **dds::core::Entity** (p. 1520).

The communication status is also reset to FALSE whenever the associated listener operation is called as the listener implicitly accesses the status which is passed as a parameter to the operation. The fact that the status is reset prior to calling the listener means that if the application calls the getter from inside the listener it will see the status already reset.

An exception to this rule is when the associated listener is the 'nil' listener. The 'nil' listener is treated as a NOOP and the act of calling the 'nil' listener does not reset the communication status.

For example, the value of the `StatusChangedFlag` associated with the **dds::core::status::StatusMask↩ ::requested_deadline_missed()** (p. 2380) will become TRUE each time new deadline occurs (which increases **dds::core::status::RequestedDeadlineMissedStatus::total_count** (p. 2184)). The value changes to FALSE when the application accesses the status via the corresponding **dds::sub::DataReader::requested_deadline_missed_↩ status** (p. 1011) method on the proper **Entity** (p. 1520)

"Changes in \p StatusChangedFlag for plain communication status"

6.125.2.2 Changes in read communication status

For the read communication status, the `StatusChangedFlag` flag is initially set to FALSE. The `Status↩ ChangedFlag` becomes TRUE when either a data-sample arrives or else the **dds::sub::status::ViewState** (p. 2614), **dds::sub::status::SampleState** (p. 2316), or **dds::sub::status::InstanceState** (p. 1615) of any existing sample changes for any reason other than a call to **dds::sub::DataReader::read** (p. 996), **dds::sub::DataReader::take** (p. 997) or their variants. Specifically any of the following events will cause the `StatusChangedFlag` to become TRUE:

- The arrival of new data.
- A change in the **dds::sub::status::InstanceState** (p. 1615) of a contained instance. This can be caused by either:
  - The arrival of the notification that an instance has been disposed by:
    - the **dds::pub::DataWriter** (p. 1138) that owns it if **OWNERSHIP** (p. 538) QoS kind= **dds::core↩ ::policy::OwnershipKind_def::EXCLUSIVE** (p. 1906)
    - or by any **dds::pub::DataWriter** (p. 1138) if **OWNERSHIP** (p. 538) QoS kind= **dds::core::policy::↩ OwnershipKind_def::SHARED** (p. 1906)
  - The loss of liveliness of the **dds::pub::DataWriter** (p. 1138) of an instance for which there is no other **dds↩ ::pub::DataWriter** (p. 1138).
  - The arrival of the notification that an instance has been unregistered by the only **dds::pub::DataWriter** (p. 1138) that is known to be writing the instance.

Depending on the kind of `StatusChangedFlag`, the flag transitions to FALSE again as follows:

- The **dds::core::status::StatusMask::data_available()** (p. 2383) `StatusChangedFlag` becomes FALSE when either the corresponding listener operation (on_data_available) is called or the read or take operation (or their variants) is called on the associated **dds::sub::DataReader** (p. 976).
- The **dds::core::status::StatusMask::data_on_readers()** (p. 2382) `StatusChangedFlag` becomes FALSE when any of the following events occurs:
  - The corresponding listener operation (on_data_on_readers) is called.
  - The on_data_available listener operation is called on any **dds::sub::DataReader** (p. 976) belonging to the **dds::sub::Subscriber** (p. 2410).
  - The read or take operation (or their variants) is called on any **dds::sub::DataReader** (p. 976) belonging to the **dds::sub::Subscriber** (p. 2410).

6.126 Supporting Types and Constants

Miscellaneous, general-purpose types and constants.

Classes

- class **dds::core::external**< **T** >

  A managed reference to an object.
- class **dds::core::basic_string**< **CharType, Allocator** >

  <<***value-type***>> *(p. 350) A string convertible to std::string and with similar functionality*
- class **rti::core::bounded_sequence**< **T, MaxLength** >

  <<***value-type***>> *(p. 350) A bounded sequence of elements*
- class **rti::core::ListenerBinder**< **Entity, Listener** >

  <<***reference-type***>> *(p. 351) Automatically manages the association of an Entity and a* ***Listener*** *(p. 1637)*
- class **rti::core::LongDouble**

  <<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350) Encapsulates an IDL* `long double`
- struct **rti::core::xtypes::octet_tag_t**

  <<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350) A special template type to obtain an IDL octet DynamicType from primitive_type*
- class **dds::core::optional**< **T** >

  <<***value-type***>> *(p. 350) Represents an object that may not contain a valid value*
- class **rti::core::optional_value**< **T** >

  <<***extension***>> *(p. 354) Represents a value that can be initialized or not*
- class **rti::core::UnregisterThreadOnExit**

  <<***extension***>> *(p. 354) Utility that calls* ***rti::core::unregister_thread*** *(p. 437) when leaving scope*
- struct **rti::core::qos_print_all_t**

  A tag type that selects the to_string overload that prints all the values of a Qos object.
- class **dds::core::vector**< **T** >

  <<***value-type***>> *(p. 350) A vector convertible to std::vector and with similar functionality*

Typedefs

- using **dds::core::external< T >::shared_ptr** = std::shared_ptr< T >

  The smart pointer that external<T> uses.
- typedef **basic_string**< char, rti::core::memory::OsapiAllocator< char > > **dds::core::string**

  A string convertible to std::string and with similar functionality.
- typedef **basic_string**< DDS_Wchar, rti::core::memory::OsapiAllocator< DDS_Wchar > > **dds::core::wstring**

  An IDL-derived wide string.
- typedef std::vector< uint8_t > **dds::core::ByteSeq**

  A vector of bytes.
- typedef std::vector< std::string > **dds::core::StringSeq**

  A vector of strings.
- typedef std::nullptr_t **dds::core::null_type**

  <<***C++11***>> *(*p. *353) The type of* ***dds::core::null*** *(*p. *438)*
- template<typename T >
  using **omg::types::optional** = **dds::core::optional**< T >

  Optional type according to the IDL4-C++ OMG specification. Alias of ***dds::core::optional*** *(*p. *1879).*
- template<typename T >
  using **omg::types::sequence** = std::vector< T >

  Unbounded sequence type according to the IDL4-C++ OMG specification. Alias of std::vector.
- template<typename T , size_t N>
  using **omg::types::bounded_sequence** = **rti::core::bounded_sequence**< T, N >

  Bounded sequence type according to the IDL4-C++ OMG specification. Alias of ***rti::core::bounded_sequence*** *(*p. *887).*
- using **omg::types::string_view** = std::string_view

  String view type according to the IDL4-C++ OMG specification. Alias of std::string_view when the compiler supports it.
- using **omg::types::wstring_view** = std::wstring_view

  Wstring view type according to the IDL4-C++ OMG specification. Alias of std::wstring_view when the compiler supports it.

Functions

- void **rti::core::unregister_thread** ()

  <<***extension***>> *(*p. *354) Allows you to release thread-specific resources kept by RTI Connext on platforms that do not support automatic thread-specific storage (TSS) cleanup.*

Variables

- const int32_t **dds::core::LENGTH_UNLIMITED** = -1

  A special value indicating an unlimited quantity.
- const **null_type dds::core::null**

  Indicates an empty reference.
- constexpr int32_t **rti::core::length_auto** = -2

  A special value indicating an auto quantity.
- const **qos_print_all_t rti::core::qos_print_all**

  Sentinel value that selects the to_string overload that prints all of the values of a Qos object.

6.126.1 Detailed Description

Miscellaneous, general-purpose types and constants.

6.126.2 Typedef Documentation

6.126.2.1 shared_ptr

```
template<typename T >
using  dds::core::external< T >::shared_ptr = std::shared_ptr<T>
```

The smart pointer that external<T> uses.

6.126.2.2 string

```
typedef  basic_string<char, rti::core::memory::OsapiAllocator<char> >  dds::core::string
```

A string convertible to std::string and with similar functionality.

See also

basic_string (p. 875)

Examples

Foo.hpp.

6.126.2.3 wstring

```
typedef  basic_string<DDS_Wchar, rti::core::memory::OsapiAllocator<DDS_Wchar> >  dds::core↩
::wstring
```

An IDL-derived wide string.

IDL `wstring` maps to this type in the C++ API.

It's character type is `DDS_Wchar`, a portable 4-byte character type.

See also

basic_string (p. 875)

6.126.2.4 ByteSeq

```
typedef std::vector<uint8_t>  dds::core::ByteSeq
```

A vector of bytes.

6.126.2.5 StringSeq

```
typedef std::vector<std::string>  dds::core::StringSeq
```

A vector of strings.

6.126.2.6 null_type

```
typedef std::nullptr_t  dds::core::null_type
```

<<***C++11***>> *(p. 353)* The type of **dds::core::null** (p. 438)

6.126.2.7 optional

```
template<typename T >
using  omg::types::optional = typedef  dds::core::optional<T>
```

Optional type according to the IDL4-C++ OMG specification. Alias of **dds::core::optional** (p. 1879).

6.126.2.8 sequence

```
template<typename T >
using  omg::types::sequence = typedef std::vector<T>
```

Unbounded sequence type according to the IDL4-C++ OMG specification. Alias of std::vector.

6.126.2.9 bounded_sequence

```
template<typename T , size_t N>
using  omg::types::bounded_sequence = typedef  rti::core::bounded_sequence<T, N>
```

Bounded sequence type according to the IDL4-C++ OMG specification. Alias of **rti::core::bounded_sequence** (p. 887).

6.126.2.10 string_view

```
using  omg::types::string_view = typedef std::string_view
```

String view type according to the IDL4-C++ OMG specification. Alias of std::string_view when the compiler supports it.

Examples

Foo.hpp.

6.126.2.11 wstring_view

```
using  omg::types::wstring_view = typedef std::wstring_view
```

Wstring view type according to the IDL4-C++ OMG specification. Alias of std::wstring_view when the compiler supports it.

6.126.3 Function Documentation

6.126.3.1 unregister_thread()

```
void rti::core::unregister_thread ( )
```

<<***extension***>> *(p. 354)* Allows you to release thread-specific resources kept by RTI Connext on platforms that do not support automatic thread-specific storage (TSS) cleanup.

Refer to the `Platform Notes` to see if your platform supports automatic TSS cleanup. It will be mentioned in the 'Thread Configuration' sub-section of the platform you are using.

On platforms that do not support automatic TSS cleanup, you should call this function right before exiting a thread where any DDS API was used. It is safe to call this function even if no DDS API was used, in cases where you are unsure if a DDS API was called or not. It is also safe, although unnecessary, to call this API on platforms that support automatic TSS cleanup.

RTI Connext stores some resources in TSS. For internal threads, these resources are cleaned up by the middleware when the threads exit. For user threads, calling this API will free all the resources related to the specific thread.

The best approach is to call the function during the thread deletion after all the DDS APIs have been called.

See `Unregistering Threads`, in the Core Libraries User's Manual, for the equivalent API call in each of the supported language bindings.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

UnregisterThreadOnExit (p. 2589)

Referenced by **rti::core::UnregisterThreadOnExit::~UnregisterThreadOnExit()**.

6.126.4 Variable Documentation

6.126.4.1 LENGTH_UNLIMITED

```
const int32_t dds::core::LENGTH_UNLIMITED = -1
```

A special value indicating an unlimited quantity.

Referenced by **dds::topic::Topic< T >::discover_any_topic()**, and **dds::topic::Topic< T >::discover_topic_data()**.

6.126.4.2 null

```
const null_type dds::core::null [extern]
```

Indicates an empty reference.

See also

*<<**reference-type**>> (p. 351)*

Referenced by **rti::topic::find_content_filter()**, **dds::sub::DataReader< T >::find_datareader_by_name()**, **dds::sub::DataReader< T >::find_datareader_by_topic_description()**, **dds::sub::DataReader< T >::find_datareader_by_topic_name()**, **dds::pub::DataWriter< T >::find_datawriter_by_name()**, **dds::pub::DataWriter< T >::find_datawriter_by_topic_name()**, and **rti::core::operator<<()**.

6.126.4.3 length_auto

```
constexpr int32_t rti::core::length_auto = -2  [constexpr]
```

A special value indicating an auto quantity.

6.126.4.4 qos_print_all

```
const  qos_print_all_t rti::core::qos_print_all  [extern]
```

Sentinel value that selects the to_string overload that prints all of the values of a Qos object.

See also

rti::sub::qos::to_string

6.127 DynamicType and DynamicData

Describes **dds::core::xtypes::DynamicType** (p. 1504), **dds::core::xtypes::DynamicData** (p. 1461) and related types and functions.

Classes

- struct **dds::core::xtypes::TypeKind_def**
  The definition of TypeKind.
- class **dds::core::xtypes::AliasType**
  *<<**value-type**>> (p. 350) Represents an IDL `typedef`*
- class **dds::core::xtypes::CollectionType**
  *<<**value-type**>> (p. 350) The base class of all collection types*
- class **dds::core::xtypes::UnidimensionalCollectionType**
  *<<**value-type**>> (p. 350) The base class of collection types with only one dimension.*
- class **dds::core::xtypes::SequenceType**
  *<<**value-type**>> (p. 350) Represents an IDL `sequence` type.*
- class **dds::core::xtypes::StringType**
  *<<**value-type**>> (p. 350) Represents an IDL `string` type.*
- class **dds::core::xtypes::WStringType**
  *<<**value-type**>> (p. 350) Represents an IDL `wstring` type.*
- class **dds::core::xtypes::ArrayType**
  *<<**value-type**>> (p. 350) Represents an IDL array type.*
- class **dds::core::xtypes::DynamicData**
  *<<**value-type**>> (p. 350) A data sample of any complex data type, which can be inspected and manipulated reflectively.*
- class **rti::core::xtypes::LoanedDynamicData**
  *<<**move-only-type**>> (p. 353) Gives temporary access to a member of another DynamicData object.*

- class **rti::core::xtypes::DynamicDataInfo**

  Contains information about a DynamicData sample.
- class **rti::core::xtypes::DynamicDataMemberInfo**

  Contains information about a DynamicData member.
- class **rti::core::xtypes::DynamicDataProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Specifies the properties of a DynamicData object*
- class **rti::core::xtypes::DynamicDataTypeSerializationProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Configures aspects of the memory management in the serialization of **dds::core::xtypes::DynamicData** (p. 1461) samples.*
- class **dds::core::xtypes::DynamicType**

  *<<**value-type**>> (p. 350) Represents a runtime type.*
- class **rti::core::xtypes::DynamicTypePrintFormatProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings.*
- class **dds::core::xtypes::EnumType**

  *<<**value-type**>> (p. 350) Represents an IDL `enum` type*
- class **dds::core::xtypes::Member**

  *<<**value-type**>> (p. 350) Represents a **StructType** (p. 2400) member*
- class **dds::core::xtypes::UnionMember**

  *<<**value-type**>> (p. 350) Represents a **UnionType** (p. 2584) member*
- class **dds::core::xtypes::EnumMember**

  *<<**value-type**>> (p. 350) Represents a **EnumType** (p. 1535) member*
- class **dds::core::xtypes::PrimitiveType**

  *<<**value-type**>> (p. 350) Represents an IDL primitive type*
- class **dds::core::xtypes::StructType**

  *<<**value-type**>> (p. 350) Represents an IDL `struct` type*
- class **dds::core::xtypes::UnionType**

  *<<**value-type**>> (p. 350) Represents an IDL `union` type*

Typedefs

- typedef **dds::core::safe_enum**< **TypeKind_def** > **dds::core::xtypes::TypeKind**

  The different type kinds.

6.127.1 Detailed Description

Describes **dds::core::xtypes::DynamicType** (p. 1504), **dds::core::xtypes::DynamicData** (p. 1461) and related types and functions.

DynamicType is a mechanism for representing a type at runtime and DynamicData the way to instantiate data samples of a DynamicType and manipulate data reflectively.

6.127.2 Typedef Documentation

6.127.2.1 TypeKind

```
typedef dds::core::safe_enum< TypeKind_def> dds::core::xtypes::TypeKind
```

The different type kinds.

The actual enumeration is in **TypeKind_def** (p. 2571).

See also

DynamicType::kind() (p. 1506)

6.128 Participant Built-in Topics

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.

Classes

- class **dds::topic::ParticipantBuiltinTopicData**
  *Entry created when a **dds::domain::DomainParticipant** (p. 1326) is discovered.*

Functions

- std::string **dds::topic::participant_topic_name** ()
  Participant builtin topic name.

6.128.1 Detailed Description

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.

6.128.2 Function Documentation

6.128.2.1 participant_topic_name()

```
std::string dds::topic::participant_topic_name ( )
```

Participant builtin topic name.

Topic (p. 2474) name of the builtin **dds::sub::DataReader** (p. 976) for the **dds::topic::ParticipantBuiltinTopicData** (p. 1908) type

6.129 Topic Built-in Topics

Classes

- class **dds::topic::TopicBuiltinTopicData**

  *Entry created when a **dds::topic::Topic** (p. 2474) object is discovered.*

Functions

- std::string **dds::topic::topic_topic_name** ()

  ***Topic** (p. 2474) topic name.*

6.129.1 Detailed Description

Builtin topic for accessing information about the Topics discovered by RTI Connext.

6.129.2 Function Documentation

6.129.2.1 topic_topic_name()

```
std::string dds::topic::topic_topic_name ( )
```

Topic (p. 2474) topic name.

Topic (p. 2474) name of the builtin **dds::sub::DataReader** (p. 976) for the **dds::topic::TopicBuiltinTopicData** (p. 2493) type

6.130 Publication Built-in Topics

Builtin topic for accessing information about the Publications discovered by RTI Connext.

Classes

- class **dds::topic::PublicationBuiltinTopicData**

  *Entry created when a **dds::pub::DataWriter** (p. 1138) is discovered in association with its **dds::pub::Publisher** (p. 1993).*

Functions

- std::string **dds::topic::publication_topic_name** ()

  Publication topic name.

6.130.1 Detailed Description

Builtin topic for accessing information about the Publications discovered by RTI Connext.

6.130.2 Function Documentation

6.130.2.1 publication_topic_name()

```
std::string dds::topic::publication_topic_name ( )
```

Publication topic name.

Topic (p. 2474) name of the builtin **dds::sub::DataReader** (p. 976) for the **dds::topic::PublicationBuiltinTopicData** (p. 1977) type

6.131 Subscription Built-in Topics

Builtin topic for accessing information about the Subscriptions discovered by RTI Connext.

Classes

- class **dds::topic::SubscriptionBuiltinTopicData**

  *Entry created when a **dds::sub::DataReader** (p. 976) is discovered in association with its **dds::sub::Subscriber** (p. 2410).*

Functions

- std::string **dds::topic::subscription_topic_name** ()

  Subscription topic name.

6.131.1 Detailed Description

Builtin topic for accessing information about the Subscriptions discovered by RTI Connext.

6.131.2 Function Documentation

6.131.2.1 subscription_topic_name()

```
std::string dds::topic::subscription_topic_name ( )
```

Subscription topic name.

Topic (p. 2474) name of the builtin **dds::sub::DataReader** (p. 976) for the **dds::topic::SubscriptionBuiltinTopicData** (p. 2428) type

6.132 Topic traits and data-type support

Traits and operations associated to topic-types.

Modules

- **Topic-type serialization and deserialization**

  Provides functions to serialize and deserialize user data types to and from Common Data Representation (CDR) format.

Classes

- struct **dds::topic::is_topic_type< T >**

  *Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2474).*
- struct **dds::topic::topic_type_support< T >**

  Provides convenience operations for a topic-type.
- struct **dds::topic::topic_type_name< T >**

  Provides the name of a topic-type.
- struct **rti::topic::PrintFormatKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) PrintFormatKind.*
- class **rti::topic::PrintFormatProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A collection of attributes used to configure how data samples will be formatted when converted to a string.*
- struct **rti::topic::extensibility< TopicType >**

  *<<**extension**>> (p. 354) Indicates the extensibility kind of a topic-type*
- struct **rti::topic::topic_type_disabled_copy< TopicType >**

  *<<**extension**>> (p. 354) Indicates whether a TopicType is uncopyable*
- struct **rti::topic::topic_type_has_external_members< TopicType >**

  *<<**extension**>> (p. 354) Indicates if a topic type contains directly or indirectly IDL external members.*
- struct **rti::topic::dynamic_type< TopicType >**

  Provides a DynamicType that represents an IDL-generated type.

Typedefs

- typedef **dds::core::safe_enum**< **PrintFormatKind_def** > **rti::topic::PrintFormatKind**

  Safe Enumeration *(p. 429) of* ***PrintFormatKind_def*** *(p. 1961) Format kinds available when converting data samples to string representations.*

Functions

- template<typename TopicType >
  std::ostream & **rti::topic::to_string** (std::ostream &out, const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormatProperty::Default**())

  Prints a data sample to an output stream.
- template<typename TopicType >
  std::string **rti::topic::to_string** (const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormatProperty::Default**())

  Tranforms a data sample into a human-readable string format.
- template<typename TopicType >
  TopicType **rti::topic::from_string** (RTI_STRING_IN str, **PrintFormatKind** format_kind=PrintFormatKind::JSON)

  Creates a data sample from a JSON string representation.

6.132.1 Detailed Description

Traits and operations associated to topic-types.

6.132.2 Typedef Documentation

6.132.2.1 PrintFormatKind

```
typedef dds::core::safe_enum< PrintFormatKind_def> rti::topic::PrintFormatKind
```

Safe Enumeration (p. 429) of **PrintFormatKind_def** (p. 1961) Format kinds available when converting data samples to string representations.

See also

PrintFormatKind_def (p. 1961)

6.132.3 Function Documentation

6.132.3.1 to_string() [1/2]

```
template<typename TopicType >
std::ostream & rti::topic::to_string (
             std::ostream & out,
             const TopicType & sample,
             const  PrintFormatProperty & print_format =  PrintFormatProperty::Default() )
```

Prints a data sample to an output stream.

```
#include <rti/topic/to_string.hpp>
```

Template Parameters

TopicType	A valid topic-type. Valid types are **IDL-generated types** (p. 606) that were generated with typecodes enabled, the **built-in types** (p. 50) and **dds::core::xtypes::DynamicData** (p. 1461).

Parameters

out	The output stream to print to
sample	The sample to print to the output stream
print_format	Properties describing the format with which to print the sample. For example, a sample may be printed in a default format, JSON format or XML format.

Referenced by **dds::topic::qos::TopicQos::operator>>()**.

6.132.3.2 to_string() [2/2]

```
template<typename TopicType >
std::string rti::topic::to_string (
             const TopicType & sample,
             const  PrintFormatProperty & print_format =  PrintFormatProperty::Default() )
```

Tranforms a data sample into a human-readable string format.

```
#include <rti/topic/to_string.hpp>
```

Template Parameters

TopicType	A valid topic-type. Valid types are **IDL-generated types** (p. 606) that were generated with typecodes enabled, the **built-in types** (p. 50) and **dds::core::xtypes::DynamicData** (p. 1461).

Parameters

sample	The sample to get the string representation of
print_format	Properties describing the format with which to print the sample. For example, a sample may be printed in a default format, JSON format or XML format.

6.132.3.3 from_string()

```
template<typename TopicType >
TopicType rti::topic::from_string (
             RTI_STRING_IN str,
              PrintFormatKind format_kind = PrintFormatKind::JSON )
```

Creates a data sample from a JSON string representation.

```
#include <rti/topic/to_string.hpp>
```

Template Parameters

TopicType	An **IDL-generated type** (p. 606), generated with typecodes enabled.

For example:

```
Point p = rti::core::xtypes::from_string<Point>("{ \"x\": 1, \"y\": 2 }");
```

Parameters

str	The JSON string to convert to a sample
format_kind	The only supported value is PrintFormatKind::JSON

Returns

The sample created from the JSON string

See also

dds::core::xtypes::DynamicData::from_string (p. 1489)

References **dds::core::xtypes::DynamicData::from_string()**.

6.133 Activity Context

Add contextual information to log messages.

Classes

- class **rti::config::activity_context::AttributeKindMask**

  The attributes used in the string representation of the Activity Context can be configured through this mask.

Functions

- void **rti::config::activity_context::set_attribute_mask** (**AttributeKindMask** attribute_mask)

  Set the ActivityContextAttributeKindMask of the Activity Context.

6.133.1 Detailed Description

Add contextual information to log messages.

The Activity Context is a group of resources and activities associated with an action such as the creation of an entity.

- A resource is a abstraction of an entity. It can contain attributes such as Topic or domain ID.
- An activity is a general task that the resource is doing, such as "Getting QoS".

Logging context is one of the formats RTI Connext logging infrastructure supports. It is used by default in PrintFormat↩ _def::DEFAULT. It provides information about resources and activities. The activity context is used in two places:

- Logging: activity context is one of the PrintFormat_def DDS logging infrastructure supports. If that format is set every time RTI Connext logs a message, it will contain the contextual information.
- Heap monitoring: every time memory is allocated and heap monitoring is enabled, the string representation of the activity context will be associated with the allocation. This information will be available when taking the snapshot.

For example, in the creation of a DataWriter, the activity context will provide information about:

- Resource: the Publisher creating the DataWriter. Attributes of the publisher will be GUID, kind, name and domain ID.
- Activity: entity creation. It will have two parameters, the entity kind and the Topic. In the example below, these are "Writer" and "TestTopic".

The string representation of the above activity context would be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000088{Entity=Pu,Name=TestPublisher,Domain=1}|CREATE Writer WITH TOPIC
       TestTopic]
```

Another example could be when a DataWriter writes a sample. The activity context will provide information about:

- Resource: the DataWriter writing the sample. The attributes of the DataWriter will be GUID, name, kind, Topic, data type, and the domain ID.
- Activity will be "write a sample".

The string representation of the activity context will be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
```

6.133.2 Function Documentation

6.133.2.1 set_attribute_mask()

```
void rti::config::activity_context::set_attribute_mask (
              AttributeKindMask attribute_mask )
```

Set the ActivityContextAttributeKindMask of the Activity Context.

Set the **AttributeKindMask** (p. 863) of the Activity Context.

6.134 Compliance Configuration

APIs to configure compliance with certain standard specifications.

Classes

- class **rti::config::compliance::XTypesMask**

  This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2).
- class **rti::config::compliance::RpcMask**

  XTypes compliance mask.

Functions

- **XTypesMask rti::config::compliance::get_xtypes_mask** ()

  Gets the XTypes compliance mask value for the application.
- void **rti::config::compliance::set_xtypes_mask** (**XTypesMask** mask)

  Sets the level of compliance of the application with the XTypes specification.
- void **rti::config::compliance::load_compliance_masks** ()

  Load the compliance masks from the environment variables.
- **RpcMask rti::config::compliance::get_rpc_mask** ()

  Gets the RPC compliance mask value for the application.
- void **rti::config::compliance::set_rpc_mask** (**RpcMask** mask)

  Sets the level of compliance of the application with the Rpc specification.

6.134.1 Detailed Description

APIs to configure compliance with certain standard specifications.

6.134.2 Function Documentation

6.134.2.1 get_xtypes_mask()

```
XTypesMask rti::config::compliance::get_xtypes_mask ( )
```

Gets the XTypes compliance mask value for the application.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace rti::config::compliance

The **rti::config::compliance::XTypesMask** (p. 2666) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Returns

The **rti::config::compliance::XTypesMask** (p. 2666) value.

See also

rti::config::compliance::XTypesMask (p. 2666)

rti::config::compliance::get_xtypes_mask() (p. 451)

rti::config::compliance::load_compliance_masks() (p. 453)

6.134.2.2 set_xtypes_mask()

```
void rti::config::compliance::set_xtypes_mask (
            XTypesMask mask )
```

Sets the level of compliance of the application with the XTypes specification.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace rti::config::compliance

The **rti::config::compliance::XTypesMask** (p. 2666) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Once you call this function the value of the mask will apply to all the entities created after the call. It won't apply to entities created before the call.

In general, applications should only set the mask once, before executing any other RTI Connext API. The mask can also be set using the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**.

Parameters

mask	<<***in***>> *(*p. *355)* Compliance mask.

See also

rti::config::compliance::XTypesMask (p. 2666)

rti::config::compliance::get_xtypes_mask() (p. 451)

rti::config::compliance::load_compliance_masks() (p. 453)

6.134.2.3 load_compliance_masks()

```
void rti::config::compliance::load_compliance_masks ( )
```

Load the compliance masks from the environment variables.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace rti::config::compliance

This function loads the XTypes and RPC compliance masks from the environment, which can be set using the environment variables **NDDS_XTYPES_COMPLIANCE_MASK** and **NDDS_RPC_COMPLIANCE_MASK**.

See also

rti::config::compliance::XTypesMask (p. 2666)

rti::config::compliance::set_xtypes_mask() (p. 452)

rti::config::compliance::get_xtypes_mask() (p. 451)

rti::config::compliance::RpcMask (p. 2218)

rti::config::compliance::set_rpc_mask() (p. 454)

rti::config::compliance::get_rpc_mask() (p. 453)

6.134.2.4 get_rpc_mask()

```
RpcMask rti::config::compliance::get_rpc_mask ( )
```

Gets the RPC compliance mask value for the application.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace rti::config::compliance

The **rti::config::compliance::RpcMask** (p. 2218) configures different aspects of RPC communication.

Returns

The **rti::config::compliance::RpcMask** (p. 2218) value.

See also

rti::config::compliance::RpcMask (p. 2218)

rti::config::compliance::get_rpc_mask() (p. 453)

rti::config::compliance::load_compliance_masks() (p. 453)

6.134.2.5 set_rpc_mask()

```
void rti::config::compliance::set_rpc_mask (
            RpcMask mask )
```

Sets the level of compliance of the application with the Rpc specification.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace rti::config::compliance

The **rti::config::compliance::RpcMask** (p. 2218) configures different aspects of RPC communication.

Once you call this function the value of the mask will apply to all the entities created after the call. It won't apply to entities created before the call.

In general, applications should only set the mask once, before executing any other RTI Connext API. The mask can also be set using the environment variable **NDDS_RPC_COMPLIANCE_MASK**.

Parameters

mask	<<***in***>> *(*p. *355)* Compliance mask.

See also

rti::config::compliance::RpcMask (p. 2218)

rti::config::compliance::get_rpc_mask() (p. 453)

rti::config::compliance::load_compliance_masks() (p. 453)

6.135 Logging

Configure how much debugging information is reported during runtime and where it is logged.

Modules

- **Activity Context**

  Add contextual information to log messages.

Classes

- struct **rti::config::LogLevel_def**

  The definition of the ***dds::core::safe_enum*** *(*p. *2265) LogLevel;.*
- struct **rti::config::Verbosity_def**

  The definition of the ***dds::core::safe_enum*** *(*p. *2265) Verbosity.*
- struct **rti::config::LogCategory_def**

  The definition of the ***dds::core::safe_enum*** *(*p. *2265) LogCategory.*
- struct **rti::config::PrintFormat_def**

  The definition of the ***dds::core::safe_enum*** *(*p. *2265) PrintFormat.*
- struct **rti::config::LogMessage**

  A log message's input parameter to an output handler, including the text and additional information.
- class **rti::config::Logger**

  The singleton type used to configure RTI Connext logging.
- class **rti::config::ScopedLoggerVerbosity**

  Changes the logger verbosity temporarily during the scope of a variable.

Typedefs

- typedef **dds::core::safe_enum**< **LogLevel_def** > **rti::config::LogLevel**

  The log level at which RTI Connext diagnostic information is logged.
- typedef **dds::core::safe_enum**< **Verbosity_def** > **rti::config::Verbosity**

  The verbosities at which RTI Connext diagnostic information is logged.
- typedef **dds::core::safe_enum**< **LogCategory_def** > **rti::config::LogCategory**

  Categories of logged messages.
- typedef **dds::core::safe_enum**< **PrintFormat_def** > **rti::config::PrintFormat**

  The format used to output RTI Connext diagnostic information.

Enumerations

- enum class **rti::config::SyslogLevel** {
  rti::config::SyslogLevel::emergency ,
  rti::config::SyslogLevel::alert ,
  rti::config::SyslogLevel::critical ,
  rti::config::SyslogLevel::error ,
  rti::config::SyslogLevel::warning ,
  rti::config::SyslogLevel::notice ,
  rti::config::SyslogLevel::informational ,
  rti::config::SyslogLevel::debug }
- enum class **rti::config::SyslogVerbosity** {
  rti::config::SyslogVerbosity::silent ,
  rti::config::SyslogVerbosity::emergency ,
  rti::config::SyslogVerbosity::alert ,
  rti::config::SyslogVerbosity::critical ,
  rti::config::SyslogVerbosity::error ,
  rti::config::SyslogVerbosity::warning ,
  rti::config::SyslogVerbosity::notice ,
  rti::config::SyslogVerbosity::informational ,
  rti::config::SyslogVerbosity::debug }
- enum class **rti::config::LogFacility** {
  rti::config::LogFacility::user ,
  rti::config::LogFacility::security_event ,
  rti::config::LogFacility::service ,
  rti::config::LogFacility::middleware }

6.135.1 Detailed Description

Configure how much debugging information is reported during runtime and where it is logged.

6.135.2 Typedef Documentation

6.135.2.1 LogLevel

```
typedef dds::core::safe_enum< LogLevel_def> rti::config::LogLevel
```

The log level at which RTI Connext diagnostic information is logged.

See also

LogLevel_def (p. 1692)

6.135.2.2 Verbosity

typedef **dds::core::safe_enum**< **Verbosity_def**> **rti::config::Verbosity**

The verbosities at which RTI Connext diagnostic information is logged.

See also

Verbosity_def (p. 2613)

6.135.2.3 LogCategory

typedef **dds::core::safe_enum**< **LogCategory_def**> **rti::config::LogCategory**

Categories of logged messages.

See also

LogCategory_def (p. 1682)

6.135.2.4 PrintFormat

typedef **dds::core::safe_enum**< **PrintFormat_def**> **rti::config::PrintFormat**

The format used to output RTI Connext diagnostic information.

See also

PrintFormat_def (p. 1960)

6.135.3 Enumeration Type Documentation

6.135.3.1 SyslogLevel

enum class **rti::config::SyslogLevel** [strong]

Syslog level category assigned to RTI Connext log messages. See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

Enumerator

emergency	System is unusable. Maps to **rti::config::LogLevel_def::FATAL_ERROR** (p. 1693).
alert	Should be corrected immediately. Maps to **rti::config::LogLevel_def::EXCEPTION** (p. 1693).
critical	Critical conditions. Maps to **rti::config::LogLevel_def::EXCEPTION** (p. 1693).
error	Error conditions. Maps to **rti::config::LogLevel_def::EXCEPTION** (p. 1693).
warning	May indicate that an error will occur if action is not taken. Maps to **rti::config::LogLevel_def::WARNING** (p. 1693).
notice	Events that are unusual, but not error conditions. Maps to **rti::config::LogLevel_def::STATUS_LOCAL** (p. 1693).
informational	Normal operational messages that require no action. Maps to **rti::config::LogLevel_def::STATUS_LOCAL** (p. 1693).
debug	Information useful to developers for debugging the application. Maps to **rti::config::LogLevel_def::STATUS_ALL** (p. 1693).

6.135.3.2 SyslogVerbosity

`enum class` **`rti::config::SyslogVerbosity`** `[strong]`

The Syslog verbosities at which RTI Connext diagnostic information is logged. These Syslog verbosities are mapped to **rti::config::Verbosity_def** (p. 2613). See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

Enumerator

silent	No messages will be logged. (lowest verbosity) Equivalent to **rti::config::Verbosity_def::silent** (p. 2614).
emergency	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::exception** (p. 2614) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency messages.)
alert	Emergency, critical, and alert messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::exception** (p. 2614) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency, critical and alert messages.)
critical	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::exception** (p. 2614) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency and critical messages.)
error	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::exception** (p. 2614) when interpreted by RTI Connext.
warning	Emergency, critical, alert, error, and warning messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::warning** (p. 2614) when interpreted by RTI Connext.
notice	Emergency, critical, alert, error, warning, notice and informational messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::status_remote** (p. 2614) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency, critical, alert, error, warning and notice messages.)
informational	Emergency, critical, alert, error, warning, notice, and informational messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::status_remote** (p. 2614) when interpreted by RTI Connext.
debug	All messages will be logged. This Syslog verbosity level is translated to **rti::config::Verbosity_def::status_all** (p. 2614) when interpreted by RTI Connext.

6.135.3.3 LogFacility

enum class **rti::config::LogFacility** [strong]

A number that identifies the source of a log message.

In the Syslog Protocol, the Facility is a numerical code that represents the machine process that created a Syslog event. RTI Connext uses the facility to represent the source of a given log message.

Enumerator

user	A log message produced by the APIs that log user messages in **rti::config::Logger** (p. 1683) (e.g, **rti::config::Logger::emergency** (p. 1689)). Numerical code: 1
security_event	A security-related message logged by the RTI Security Plugins Logging Plugin. Numerical code: 10
service	A log message produced by an Infrastructure Service, such as Routing Service. Infrastructure Services operate using the Core Libraries. The messages that the Core Libraries create are categorized under the MIDDLEWARE facility. Log messages that are directly generated by the Infrastructure Service itself are marked with the SERVICE facility. Numerical code: 22
middleware	A log message produced by RTI Connext Core Libraries. Numerical code: 23

6.136 Version

Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

Classes

- class **rti::config::LibraryVersion**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) The version of a single library shipped as part of an RTI Connext distribution.*

Functions

- XMQCPP2DllExport **rti::core::ProductVersion rti::config::request_reply_api_version** ()

  Get the version of the C++ API library.
- XMQCPP2DllExport std::string **rti::config::request_reply_build_number** ()

  Get the build number of the C++ API library.
- **LibraryVersion rti::config::core_version** ()

  Get the version of the core library.
- std::string **rti::config::core_build_number** ()

  Get the build number of the core library.

- **LibraryVersion rti::config::c_api_version** ()

  Get the version of the C API library.
- std::string **rti::config::c_build_number** ()

  Get the build number of the C API library.
- **LibraryVersion rti::config::cpp_api_version** ()

  Get the version of the C++ API library.
- std::string **rti::config::cpp_build_number** ()

  Get the build number of the C++ API library.
- **rti::core::ProductVersion rti::config::product_version** ()

  Get the RTI Connext product version.

6.136.1 Detailed Description

Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

There are three ways to obtain version information: looking at the revision files, using Visual Studio or the command line, or programmatically at run time. This HTML documentation includes a reference for consulting the APIs that allow you to get version information programmatically. For more information see the RTI Connext DDS Core Libraries User's Manual.

The version information includes four fields:

- Major product version.
- Minor product version.
- Release letter for product version.
- Revision number of product.

6.136.2 Function Documentation

6.136.2.1 request_reply_api_version()

```
XMQCPP2DllExport  rti::core::ProductVersion rti::config::request_reply_api_version ( )
```

Get the version of the C++ API library.

6.136.2.2 request_reply_build_number()

```
XMQCPP2DllExport std::string rti::config::request_reply_build_number ( )
```

Get the build number of the C++ API library.

6.136.2.3 core_version()

```
LibraryVersion rti::config::core_version ( )
```

Get the version of the core library.

6.136.2.4 core_build_number()

```
std::string rti::config::core_build_number ( )
```

Get the build number of the core library.

6.136.2.5 c_api_version()

```
LibraryVersion rti::config::c_api_version ( )
```

Get the version of the C API library.

6.136.2.6 c_build_number()

```
std::string rti::config::c_build_number ( )
```

Get the build number of the C API library.

6.136.2.7 cpp_api_version()

```
LibraryVersion rti::config::cpp_api_version ( )
```

Get the version of the C++ API library.

6.136.2.8 cpp_build_number()

```
std::string rti::config::cpp_build_number ( )
```

Get the build number of the C++ API library.

6.136.2.9 product_version()

```
rti::core::ProductVersion rti::config::product_version ( )
```

Get the RTI Connext product version.

6.137 Builtin Qos Profiles

<<***extension***>> *(p. 354)* QoS libraries and profiles that are automatically built into RTI Connext.

Functions

- std::string **rti::core::builtin_profiles::qos_lib::library_name** ()
  A library of non-experimental QoS profiles.
- std::string **rti::core::builtin_profiles::qos_lib::baseline** ()
  The most up-to-date QoS default values.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_5_0_0** ()
  The QoS default values for version 5.0.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_5_1_0** ()
  The QoS default values for version 5.1.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_5_2_0** ()
  The QoS default values for version 5.2.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_5_3_0** ()
  The QoS default values for version 5.3.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_6_0_0** ()
  The QoS default values for version 6.0.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_6_1_0** ()
  The QoS default values for version 6.1.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_7_0_0** ()
  The QoS default values for version 7.0.0.
- std::string **rti::core::builtin_profiles::qos_lib::baseline_7_1_0** ()
  The QoS default values for version 7.1.0.
- std::string **rti::core::builtin_profiles::qos_lib::generic_common** ()
  A common Participant base profile.
- std::string **rti::core::builtin_profiles::qos_lib::generic_monitoring_common** ()
  Enables RTI Monitoring Library.
- std::string **rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility** ()
  Sets the values necessary to communicate with RTI Connext Micro.
- std::string **rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility_2_4_9** ()
  Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.
- std::string **rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility_2_4_3** ()
  Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and ealier.
- std::string **rti::core::builtin_profiles::qos_lib::generic_other_dds_vendor_compatibility** ()
  Sets the values necessary to interoperate with other DDS vendors.
- std::string **rti::core::builtin_profiles::qos_lib::generic_510_transport_compatibility** ()

Sets the values necessary to interoperate with RTI Connext 5.1.0 using the UDPv6 and/or SHMEM transports.

- std::string **rti::core::builtin_profiles::qos_lib::generic_security** ()

  Loads the DDS Secure builtin plugins.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable** ()

  Enables strict reliability.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable** ()

  Enables keep-last reliability.
- std::string **rti::core::builtin_profiles::qos_lib::generic_best_effort** ()

  Enables best-effort reliability kind.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_high_throughput** ()

  A profile that can be used to achieve high throughput.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_low_latency** ()

  A profile that can be used to achieve low latency.
- std::string **rti::core::builtin_profiles::qos_lib::generic_participant_large_data** ()

  A common Participant base profile to facilitate sending large data.
- std::string **rti::core::builtin_profiles::qos_lib::generic_participant_large_data_monitoring** ()

  Configures Participants for large data and monitoring.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data** ()

  Configures endpoints for sending large data with strict reliability.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data** ()

  Configures endpoints for sending large data with keep-last reliability.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_fast_flow** ()

  Configures strictly reliable communication for large data with a fast flow controller.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_medium_flow** ()

  Configures strictly reliable communication for large data with a medium flow controller.
- std::string **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_slow_flow** ()

  Configures strictly reliable communication for large data with a slow flow controller.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_fast_flow** ()

  Configures keep-last reliable communication for large data with a fast flow controller.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_medium_flow** ()

  Configures keep-last reliable communication for large data with a medium flow controller.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_slow_flow** ()

  Configures keep-last reliable communication for large data with a slow flow controller.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local** ()

  Persists the samples of a DataWriter as long as the entity exists.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient** ()

  Persists samples using RTI Persistence Service.
- std::string **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_persistent** ()

  Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- std::string **rti::core::builtin_profiles::qos_lib::generic_auto_tuning** ()

  Enables the Turbo Mode batching and Auto Throttle experimental features.
- std::string **rti::core::builtin_profiles::qos_lib::generic_minimal_memory_footprint** ()

  Uses a set of QoS which reduces the memory footprint of the application.
- std::string **rti::core::builtin_profiles::qos_lib::generic_monitoring2** ()

  The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.
- std::string **rti::core::builtin_profiles::qos_lib::generic_monitoring2_wan** ()

The QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use to communicate over WAN with a Collector Service.

- std::string **rti::core::builtin_profiles::qos_lib::pattern_rpc** ()

  This profile contains the default RPC and Request-Reply QoS settings.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_periodic_data** ()

  Used for applications that expect periodic data.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_streaming** ()

  Used for applications that stream data.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_reliable_streaming** ()

  Used for applications that stream data and require reliable communication.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_event** ()

  Used for applications that handle events.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_alarm_event** ()

  Used for applications that handle alarm events.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_status** ()

  Used for applications whose samples represent statuses.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_alarm_status** ()

  Used for applications in which samples represent alarm statuses.
- std::string **rti::core::builtin_profiles::qos_lib::pattern_last_value_cache** ()

  Used for applications that only need the last published value.
- std::string **rti::core::builtin_profiles::qos_lib_exp::library_name** ()

  A library of experimental QoS profiles.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable** ()

  Enables strict reliability.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable** ()

  Enables keep-last reliability.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_best_effort** ()

  Enables best-effort reliability kind.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_high_throughput** ()

  A profile that can be used to achieve high throughput.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_low_latency** ()

  A profile that can be used to achieve low latency.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data** ()

  A common Participant base profile to facilitate sending large data.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data_monitoring** ()

  Configures Participants for large data and monitoring.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data** ()

  Configures endpoints for sending large data with strict reliability.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data** ()

  Configures endpoints for sending large data with keep-last reliability.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_fast_flow** ()

  Configures strictly reliable communication for large data with a fast flow controller.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_medium_flow** ()

  Configures strictly reliable communication for large data with a medium flow controller.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_slow_flow** ()

  Configures strictly reliable communication for large data with a slow flow controller.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_fast_flow** ()

Configures keep-last reliable communication for large data with a fast flow controller.

- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_medium_flow** ()

  Configures keep-last reliable communication for large data with a medium flow controller.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_slow_flow** ()

  Configures keep-last reliable communication for large data with a slow flow controller.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient_local** ()

  Persists the samples of a DataWriter as long as the entity exists.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient** ()

  Persists samples using RTI Persistence Service.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_persistent** ()

  Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_auto_tuning** ()

  Enables the Turbo Mode batching and Auto Throttle experimental features.
- std::string **rti::core::builtin_profiles::qos_lib_exp::generic_minimal_memory_footprint** ()

  Uses a set of QoS which reduces the memory footprint of the application.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_periodic_data** ()

  Used for applications that expect periodic data.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_streaming** ()

  Used for applications that stream data.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_reliable_streaming** ()

  Used for applications that stream data and require reliable communication.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_event** ()

  Used for applications that handle events.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_event** ()

  Used for applications that handle alarm events.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_status** ()

  Used for applications whose samples represent statuses.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_status** ()

  Used for applications in which samples represent alarm statuses.
- std::string **rti::core::builtin_profiles::qos_lib_exp::pattern_last_value_cache** ()

  Used for applications that only need the last published value.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::library_name** ()

  A library of QoS Snippets.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_common** ()

  QoS Snippet that configures the reliability protocol with a common configuration.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_all** ()

  QoS Snippet that configures the reliability protocol for KEEP_ALL.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_last** ()

  QoS Snippet that configures the reliability protocol for KEEP_LAST.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_high_rate** ()

  QoS Snippet that configures the reliability protocol for sending data at a high rate.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_low_latency** ()

  QoS Snippet that configures the reliability protocol for sending data at low latency.

- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_large_↩ data** ()

  QoS Snippet that configures the reliability protocol for large data.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_↩ dynamicmemalloc** ()

  Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_common** ()

  QoS Snippet that optimizes discovery with a common configuration.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_participant_↩ compact** ()

  QoS Snippet that optimizes the Participant QoS to send less discovery information.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_endpoint_fast** ()

  QoS Snippet that optimizes the Endpoint Discovery to be faster.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_transport_large_buffers** ()

  QoS Snippet that increases the Participant default buffer that shmem and udpv4 use.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable** ()

  QoS Snippet that sets RELIABILITY QoS to RELIABLE.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_best_effort** ()

  QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1** ()

  QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all** ()

  QoS Snippet that sets HISTORY QosPolicy to KEEP_ALL kind.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_publish_mode_asynchronous** ()

  QoS Snippet that sets PUBLISH_MODE QosPolicy to ASYNCHRONOUS kind.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient_local** ()

  QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT_LOCAL kind.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient** ()

  QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT kind.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_persistent** ()

  QoS Snippet that sets DURABILITY QosPolicy to PERSISTENT kind.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_batching_enable** ()

  QoS Snippet that sets BATCH QosPolicy to true.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_838mbps** ()

  QoS Snippet that configures and set a FlowController of 838 Mbps.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_209mbps** ()

  QoS Snippet that configures and sets a FlowController of 209 Mbps.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_52mbps** ()

  QoS Snippet that configures and sets a FlowController of 52 Mbps.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_auto_tuning_enable** ()

  QoS Snippet that enables auto_throttle and turbo_mode to true.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable** ()

  QoS Snippet that enables the use of the RTI Monitoring Library.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable** ()

  QoS Snippet that enables the use of the RTI Monitoring Library 2.0.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_security_enable** ()

QoS Snippet that enables security using the Builtin Security Plugins.

- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_topic_query_enable** ()

  QoS Snippet that enables Topic Query.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v1_enable** ()

  QoS Snippet that enables TypeObject V1 propagation.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v1_disable** ()

  QoS Snippet that disables TypeObject V1 propagation.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v2_enable** ()

  QoS Snippet that enables TypeObject V2 propagation.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v2_disable** ()

  QoS Snippet that disables TypeObject V2 propagation.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_lan_client** ()

  QoS Snippet that configures a TCP LAN Client over DDS.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_symmetric_client** ()

  QoS Snippet that configures a symmetric WAN TCP Client over DDS.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_server** ()

  QoS Snippet that an asymmetric WAN TCP Server over DDS.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_client** ()

  QoS Snippet that configures an asymmetric WAN TCP Client over DDS.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_avoid_ip_fragmentation** ()

  QoS Snippet that configures RTI Connext and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_wan** ()

  QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_connext_micro_version_2_4_3** ()

  QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connext Micro 2.4.3.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_other_dds_vendors_enable** ()

  QoS Snippet that configures RTI Connext to interoperate with other DDS vendors.
- std::string **rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_5_1_0_transport_enable** ()

  QoS Snippet that configures RTI Connext to interoperate with RTI Connext 5.1.0 and below for UDPv6 and SHMEM transports.

6.137.1 Detailed Description

<<***extension***>> *(*p. *354)* QoS libraries and profiles that are automatically built into RTI Connext.

The built-in profiles can be accessed in QoS XML configuration files and by using any of the APIs that accept library and profiles names by using the constants or string versions as documented on this page.

The built-in profiles are provided as a way to quickly and easily configure RTI Connext applications with a set of QoS values aimed at achieving a specific behavior.

There are three built-in QoS libraries:

- BuiltinQosLib: A library containing built-in QoS Profiles.

- BuiltinQosLibExp: A library containing experimental QoS Profiles. Experimental QoS Profiles are new QoS Profiles that have been tested internally but have not gone through an extensive validation period. Therefore, some of the settings may change in future releases based on customer and internal feedback. After validation, experimental QoS Profiles will be moved into the non-experimental library.

- BuiltinQosSnippetLib: A library containing QoS Snippets that are ready to use as elements for the QoS Profile composition pattern. For further information about this pattern visit the following article: `https://community.rti.com/best-practices/qos-profile-inheritance-and-composition-guidance`

There are three types of profiles:

- Baseline.X.X.X: These profiles represent the QoS defaults for /ndds version X.X.X. To access the defaults for the latest RTI Connext version, use the BuiltinQosLib::Baseline profile.
- Generic.X: These profiles allow you to easily configure different features and communication use-cases with RTI Connext. For example, there is a Generic.StrictReliable profile for use when your application has a requirement for no data loss.
- Pattern.X: These profiles inherit from the Generic.X profiles and allow you to configure various domain-specific communication use cases. For example, there is a Pattern.Alarm profile that can be used to manage the generation and consumption of alarm events.

There are several types of QoS Snippets. These are the current QoS Snippets available:

- Optimization.X: these QoS Snippets optimize one or more parameters related to the X QoS Policy or a specific use-case.
- QosPolicy.X.Y: these QoS Snippets set a specific QoS Policy X to the value Y.
- Feature.X: these QoS Snippets set all the needed QoS values to enable/modify a specific feature.
- Transport.X: these QoS Snippets set a specific transport defined by X. This transport may have specific scenarios that are also specified in the name.
- Compatibility.X: these QoS Snippets change the specific QoS policies to ensure compatibility with specific products or versions specified by X.

These QoS Profiles can be used as base profiles in XML configuration, then QoS Snippets can modify specific aspects of this base QoS Profile, and finally files and values can be modified to fit a specific system's needs. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.Common">

   <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">

     <base_name>

       <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>

     </base_name>

     <!-- Override and add values -->

   </domain_participant_qos>

</qos_profile>
```

These names can also be used to look up the built-in QoS Profiles and QoS Snippets in the default QosProvider (**dds::core::QosProvider::Default()** (p. 2036)), for example:

```
dds::sub::qos::DataReaderQos reader_qos =
```

```
    dds::core::QosProvider::Default().datareader_qos(
        rti::core::builtin_profiles::qos_lib::strict_reliable());
dds::sub::qos::DataReaderQos reader_qos =
    dds::core::QosProvider::Default().datareader_qos(
        rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable());
```

Note that the QoS Profile and QoS Snippets names also contain the library name. For example `strict_reliable()` returns "`BuiltinQosLib::Generic.StrictReliable`"

The QoS Profiles and QoS Snippets are contained in three different libraries, in three namespaces:

- **rti::core::builtin_profiles::qos_lib** (p. 712),
- **rti::core::builtin_profiles::qos_lib_exp** (p. 714), and
- **rti::core::builtin_profiles::qos_snippet_lib** (p. 716)

All the built-in QoS Profiles and QoS Snippets are documented in the BaselineRoot.documentationONLY.xml and BuiltinProfiles.documentationONLY.xml files that are included in the NDDSHOME/xml directory of the RTI Connext installation.

- BaselineRoot.documentationONLY.xml contains the root baseline QoS profile that corresponds to the default values of RTI Connext 5.0.0.
- BuiltinProfiles.documentationONLY.xml contains the rest of the built-in Qos Profiles and QoS Snippets.

6.137.2 Function Documentation

6.137.2.1 library_name() [1/3]

```
std::string rti::core::builtin_profiles::qos_lib::library_name ( )
```

A library of non-experimental QoS profiles.

String-version: "BuiltinQosLib"

6.137.2.2 baseline()

```
std::string rti::core::builtin_profiles::qos_lib::baseline ( )
```

The most up-to-date QoS default values.

You can use this profile if you want your application to pick up and use any new QoS default settings each time a new RTI Connext version is released – without changing your application code.

String-version: "Baseline"

6.137.2.3 baseline_5_0_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_0_0 ( )
```

The QoS default values for version 5.0.0.

String-version: "Baseline.5.0.0"

6.137.2.4 baseline_5_1_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_1_0 ( )
```

The QoS default values for version 5.1.0.

String-version: "Baseline.5.1.0"

6.137.2.5 baseline_5_2_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_2_0 ( )
```

The QoS default values for version 5.2.0.

String-version: "Baseline.5.2.0"

6.137.2.6 baseline_5_3_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_3_0 ( )
```

The QoS default values for version 5.3.0.

String-version: "Baseline.5.3.0"

6.137.2.7 baseline_6_0_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_6_0_0 ( )
```

The QoS default values for version 6.0.0.

String-version: "Baseline.6.0.0"

6.137.2.8 baseline_6_1_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_6_1_0 ( )
```

The QoS default values for version 6.1.0.

String-version: "Baseline.6.1.0"

6.137.2.9 baseline_7_0_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_7_0_0 ( )
```

The QoS default values for version 7.0.0.

String-version: "Baseline.7.0.0"

6.137.2.10 baseline_7_1_0()

```
std::string rti::core::builtin_profiles::qos_lib::baseline_7_1_0 ( )
```

The QoS default values for version 7.1.0.

String-version: "Baseline.7.1.0"

6.137.2.11 generic_common()

```
std::string rti::core::builtin_profiles::qos_lib::generic_common ( )
```

A common Participant base profile.

All Generic.X and Pattern.X profiles inherit from this profile.

String-version: "Generic.Common"

6.137.2.12 generic_monitoring_common()

```
std::string rti::core::builtin_profiles::qos_lib::generic_monitoring_common ( )
```

Enables RTI Monitoring Library.

Generic Base participant QoS Profile that enables RTI Monitoring Library.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Monitoring.Common", apply the QoS Snippet "BuiltinQos↩ SnippetLib::Feature.Monitoring.Enable" via composition. For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>

    </base_name>

</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">

    <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">

</qos_profile>
```

String-version: "Generic.Monitoring.Common"

6.137.2.13 generic_connext_micro_compatibility()

```
std::string rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility ( )
```

Sets the values necessary to communicate with RTI Connext Micro.

This profile will always represent the QoS values required for interoperability between the most recent version of RTI Connext Micro at the time of release of the most recent version of RTI Connext.

String-version: "Generic.ConnextMicroCompatibility"

6.137.2.14 generic_connext_micro_compatibility_2_4_9()

```
std::string rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility_2_4_9 ( )
```

Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.

At the time of the release of RTI Connext 5.3.0 it was not necessary to set any QoS values in order to interoperate with RTI Connext Micro. This applies to RTI Connext Micro versions 2.4.4 and later. The most recent version of RTI Connext Micro at the time of release of RTI Connext 5.3.0 was 2.4.9. There is no guarantee that this profile will interoperate with versions of RTI Connext Micro after 2.4.9.

String-version: "Generic.ConnextMicroCompatibility.2.4.9"

6.137.2.15 generic_connext_micro_compatibility_2_4_3()

```
std::string rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility_2_4_3 ( )
```

Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and ealier.

RTI Connext Micro versions 2.4.3 and earlier only supported the **dds::core::policy::LivelinessKind_def::MANUAL↩_BY_TOPIC** (p. 1655) LivelinessQos kind. In order to be compatible with these versions of RTI Connext Micro, the **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) must have their Liveliness kind changed to this value because the default kind in RTI Connext is **dds::core::policy::LivelinessKind_def::AUTOMATIC** (p. 1655).

String-version: "Generic.ConnextMicroCompatibility.2.4.3"

6.137.2.16 generic_other_dds_vendor_compatibility()

```
std::string rti::core::builtin_profiles::qos_lib::generic_other_dds_vendor_compatibility ( )
```

Sets the values necessary to interoperate with other DDS vendors.

String-version: "Generic.OtherDDSVendorCompatibility"

6.137.2.17 generic_510_transport_compatibility()

```
std::string rti::core::builtin_profiles::qos_lib::generic_510_transport_compatibility ( )
```

Sets the values necessary to interoperate with RTI Connext 5.1.0 using the UDPv6 and/or SHMEM transports.

String-version: "Generic.510TransportCompatibility"

6.137.2.18 generic_security()

```
std::string rti::core::builtin_profiles::qos_lib::generic_security ( )
```

Loads the DDS Secure builtin plugins.

Generic Base Participant Profile that enables the builtin DDS Security Plugins.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Security", apply the QoS Snippet "BuiltinQosSnippetLib::↩ Feature.Security.Enable" via composition. For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosSnippetLib::Feature.Security.Enable</element>

    </base_name>

</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">

    <domain_participant_qos base_name="BuiltinQosLib::Generic.Security">

</qos_profile>
```

String-version: "Generic.Security"

6.137.2.19 generic_strict_reliable() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable ( )
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) for **dds::core::policy::↩ Reliability** (p. 2149) with a **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607) for the **dds::core::policy::↩ HistoryKind_def** (p. 1606).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

String-version: "Generic.StrictReliable"

6.137.2.20 generic_keep_last_reliable() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable ( )
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

String-version: "Generic.KeepLastReliable"

6.137.2.21 generic_best_effort() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_best_effort ( )
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

String-version: "Generic.BestEffort"

6.137.2.22 generic_strict_reliable_high_throughput() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_high_throughput ( )
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_strict_reliable()** (p. 473) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **rti::core::builtin_profiles::qos_lib↩ ::generic_strict_reliable()** (p. 473) QoS Profile..

String-version: "Generic.StrictReliable.HighThroughput"

6.137.2.23 generic_strict_reliable_low_latency() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_low_latency ( )
```

A profile that can be used to achieve low latency.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_strict_reliable()** (p. 473) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **rti::core::builtin_profiles::qos_lib↩ ::generic_strict_reliable()** (p. 473) QoS Profile.

String-version: "Generic.StrictReliable.LowLatency"

6.137.2.24 generic_participant_large_data() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_participant_large_data ( )
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

String-version: "Generic.Participant.LargeData"

6.137.2.25 generic_participant_large_data_monitoring() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_participant_large_data_monitoring ( )
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable()** (p. 501)

Enable Large Data optimizations

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_large_data()** (p. 493)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_dynamicmemalloc()** (p. 494)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

rti::core::builtin_profiles::qos_lib::generic_participant_large_data() (p. 474)

rti::core::builtin_profiles::qos_lib::generic_monitoring_common() (p. 471)

6.137.2.26 generic_strict_reliable_large_data() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data ( )
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_participant_large_data()** (p. 474) QoS Profile to handle sending large samples reliably. This QoS Profile optimizes memory usage per sample within RTI Connext. You can use this QoS Profile directly, which doesn't perform any flow control, or you can use one of the three QoS Profiles below (Generic.StrictReliable.LargeData.∗Flow), which use this QoS Profile as a common base QoS Profile, but additionally enable asynchronous publication. Each of these three QoS Profiles uses one of the three flow controllers defined in **rti::core::builtin_profiles::qos_lib::generic_participant_large_data()** (p. 474) in order to throttle application data flow.

String-version: "Generic.StrictReliable.LargeData"

6.137.2.27 generic_keep_last_reliable_large_data() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data ( )
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) QoS Profile, but also adds QoS Snippets to handle sending large samples reliably. You can use this QoS Profile directly, which doesn't perform any flow control, or you can use one of the three QoS Profiles below (Generic.KeepLastReliable.↩ LargeData.∗Flow), which use this QoS Profile as a common base QoS Profile, but additionally enable asynchronous publication. Each of these three QoS Profiles uses one of the three flow controllers defined in **rti::core::builtin_↩ profiles::qos_lib::generic_participant_large_data()** (p. 474) in order to throttle application data flow.

String-version: "Generic.KeepLastReliable.LargeData"

6.137.2.28 generic_strict_reliable_large_data_fast_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_fast_flow ( )
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps ($\sim$ 100 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.FastFlow"

6.137.2.29 generic_strict_reliable_large_data_medium_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_medium_flow (
)
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps ($\sim$ 25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

6.137.2.30 generic_strict_reliable_large_data_slow_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_slow_flow ( )
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec (∼ 6.25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

6.137.2.31 generic_keep_last_reliable_large_data_fast_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_fast_flow
( )
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps (∼ 100 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

6.137.2.32 generic_keep_last_reliable_large_data_medium_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_medium_↩
flow ( )
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps (∼ 25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

6.137.2.33 generic_keep_last_reliable_large_data_slow_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_slow_flow
( )
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec (∼ 6.25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

6.137.2.34 generic_keep_last_reliable_transient_local() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local ( )
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) profile, but persists the samples of a **dds::pub::DataWriter** (p. 1138) as long as the entity exists in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.TransientLocal"

6.137.2.35 generic_keep_last_reliable_transient() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient ( )
```

Persists samples using RTI Persistence Service.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.Transient"

6.137.2.36 generic_keep_last_reliable_persistent() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_persistent ( )
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining Data↩ Readers.

String-version: "Generic.KeepLastReliable.Persistent"

6.137.2.37 generic_auto_tuning() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_auto_tuning ( )
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

String-version: "Generic.AutoTuning"

6.137.2.38 generic_minimal_memory_footprint() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_minimal_memory_footprint ( )
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

String-version: "Generic.MinimalMemoryFootprint"

6.137.2.39 generic_monitoring2()

```
std::string rti::core::builtin_profiles::qos_lib::generic_monitoring2 ( )
```

The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.

This profile inherits from **rti::core::builtin_profiles::qos_lib::generic_minimal_memory_footprint()** (p. 478).

The following DomainParticipant QoS policy of this profile cannot be modified and it is overwritten by the RTI Monitoring Library 2.0:

- Discovery Config Built-in Channel Kind.

The following DataWriter and DataReader QoS policies of this profile cannot be modified and they are overwritten by the RTI Monitoring Library 2.0:

- Reliability Kind.
- Durability Kind.
- History Kind.
- Publish Mode Kind.
- Protocol -> RTPS Reliable Writer -> Max Heartbeat Retries.

This profile uses Topic Filters to select the DataWriter and DataReader QoS depending on the Observability Distribution Topic.

You should be using this profile or a profile inheriting from it when you configure the distribution of telemetry data using the <distribution_settings> tag under <monitoring> for the <participant_factory_qos>.

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable()** (p. 501).

String-version: "Generic.Monitoring2"

See also

MONITORING_PERIODIC_TOPIC_NAME
MONITORING_EVENT_TOPIC_NAME
MONITORING_LOGGING_TOPIC_NAME

6.137.2.40 generic_monitoring2_wan()

```
std::string rti::core::builtin_profiles::qos_lib::generic_monitoring2_wan ( )
```

The QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use to communicate over WAN with a Collector Service.

This profile inherits from **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 479).

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable()** (p. 501).

String-version: "Generic.Monitoring2.WAN"

See also

rti::core::builtin_profiles::qos_lib::generic_monitoring2() (p. 479)

6.137.2.41 pattern_rpc()

```
std::string rti::core::builtin_profiles::qos_lib::pattern_rpc ( )
```

This profile contains the default RPC and Request-Reply QoS settings.

This profile contains the QoS that is used to create the DataReaders and DataWriters in a Requester, a Replier, a Client or a Service.

Use this profile as the base profile if you need to customize the QoS settings of any of these entities.

String-version: "Pattern.RPC"

6.137.2.42 pattern_periodic_data() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_periodic_data ( )
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

String-version: "Pattern.PeriodicData"

6.137.2.43 pattern_streaming() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_streaming ( )
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 480) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

String-version: "Pattern.Streaming"

6.137.2.44 pattern_reliable_streaming() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_reliable_streaming ( )
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) QoS Profile and the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 496)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1()** (p. 497)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_last()** (p. 492)

This QoS Snippet also increases the **dds::core::policy::History::depth** (p. 1605) to reduce the probability of losing samples.

String-version: "Pattern.ReliableStreaming"

6.137.2.45 pattern_event() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_event ( )
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 496)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all()** (p. 497)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_all()** (p. 491)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) is broken. This is why this profile sets the **dds::core::policy::Liveliness** (p. 1645). If the **dds::pub::DataWriter** (p. 1138) does not assert its liveliness in a timely manner, the **dds::sub::DataReader** (p. 976) will report 'loss of liveliness' to the application.

String-version: "Pattern.Event"

6.137.2.46 pattern_alarm_event() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_alarm_event ( )
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **rti::core::builtin_profiles::qos_lib::pattern_↩event()** (p. 481).

String-version: "Pattern.AlarmEvent"

6.137.2.47 pattern_status() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_status ( )
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 480) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **rti::core↩::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 480) QoS Profile and publish the data at a fixed rate or it could use the **rti::core::builtin_profiles::qos_lib::pattern_status()** (p. 482) QoS Profile and only publish the temperature when it changes more than 1 degree.

String-version: "Pattern.Status"

6.137.2.48 pattern_alarm_status() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_alarm_status ( )
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from **rti::core::builtin_profiles::qos_lib↩::pattern_status()** (p. 482).

String-version: "Pattern.AlarmStatus"

6.137.2.49 pattern_last_value_cache() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_last_value_cache ( )
```

Used for applications that only need the last published value.

With this QoS Profile, a **dds::pub::DataWriter** (p. 1138) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local()** (p. 477) because the use case requires delivery to late-joiners.

String-version: "Pattern.LastValueCache"

6.137.2.50 library_name() [2/3]

```
std::string rti::core::builtin_profiles::qos_lib_exp::library_name ( )
```

A library of experimental QoS profiles.

Experimental profiles are new profiles that have been tested internally but have not gone through an extensive validation period. Therefore some of the settings may change in future releases based on customer and internal feedback. After validation, experimental profiles will be moved into the non-experimental library.

QoS Profiles in this library are deprecated. They have been moved to "BuiltinQosLib". You should use the QoS Profiles from "BuiltinQosLib" instead of the ones in "BuiltinQosLibExp". The experimental profiles are still defined here to avoid backward compatibility issues.

String-version: "BuiltinQosLibExp"

6.137.2.51 generic_strict_reliable() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable ( )
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) for **dds::core::policy::↩ Reliability** (p. 2149) with a **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607) for the **dds::core::policy::↩ HistoryKind_def** (p. 1606).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

String-version: "Generic.StrictReliable"

6.137.2.52 generic_keep_last_reliable() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable ( )
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

String-version: "Generic.KeepLastReliable"

6.137.2.53 generic_best_effort() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_best_effort ( )
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

String-version: "Generic.BestEffort"

6.137.2.54 generic_strict_reliable_high_throughput() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_high_throughput ( )
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_strict_reliable()** (p. 473) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **rti::core::builtin_profiles::qos_lib↩ ::generic_strict_reliable()** (p. 473) QoS Profile..

String-version: "Generic.StrictReliable.HighThroughput"

6.137.2.55 generic_strict_reliable_low_latency() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_low_latency ( )
```

A profile that can be used to achieve low latency.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_strict_reliable()** (p. 473) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **rti::core::builtin_profiles::qos_lib↩ ::generic_strict_reliable()** (p. 473) QoS Profile.

String-version: "Generic.StrictReliable.LowLatency"

6.137.2.56 generic_participant_large_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data ( )
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

String-version: "Generic.Participant.LargeData"

6.137.2.57 generic_participant_large_data_monitoring() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data_monitoring (
)
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable()** (p. 501)

Enable Large Data optimizations

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_large_data()** (p. 493)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_dynamicmemalloc()** (p. 494)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

rti::core::builtin_profiles::qos_lib::generic_participant_large_data() (p. 474)

rti::core::builtin_profiles::qos_lib::generic_monitoring_common() (p. 471)

6.137.2.58 generic_strict_reliable_large_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data ( )
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_participant_large_data()** (p. 474) QoS Profile to handle sending large samples reliably. This QoS Profile optimizes memory usage per sample within RTI Connext. You can use this QoS Profile directly, which doesn't perform any flow control, or you can use one of the three QoS Profiles below (Generic.StrictReliable.LargeData.∗Flow), which use this QoS Profile as a common base QoS Profile, but additionally enable asynchronous publication. Each of these three QoS Profiles uses one of the three flow controllers defined in **rti::core::builtin_profiles::qos_lib::generic_participant_large_data()** (p. 474) in order to throttle application data flow.

String-version: "Generic.StrictReliable.LargeData"

6.137.2.59 generic_keep_last_reliable_large_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data ( )
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) QoS Profile, but also adds QoS Snippets to handle sending large samples reliably. You can use this QoS Profile directly, which doesn't perform any flow control, or you can use one of the three QoS Profiles below (Generic.KeepLastReliable.↩ LargeData.∗Flow), which use this QoS Profile as a common base QoS Profile, but additionally enable asynchronous publication. Each of these three QoS Profiles uses one of the three flow controllers defined in **rti::core::builtin_↩ profiles::qos_lib::generic_participant_large_data()** (p. 474) in order to throttle application data flow.

String-version: "Generic.KeepLastReliable.LargeData"

6.137.2.60 generic_strict_reliable_large_data_fast_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_fast_flow
( )
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps ($\sim$ 100 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.FastFlow"

6.137.2.61 generic_strict_reliable_large_data_medium_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_medium_↩
flow ( )
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps ($\sim$ 25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

6.137.2.62 generic_strict_reliable_large_data_slow_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_slow_flow
( )
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec ($\sim$ 6.25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

6.137.2.63 generic_keep_last_reliable_large_data_fast_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_fast↩
_flow ( )
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps (∼ 100 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

6.137.2.64 generic_keep_last_reliable_large_data_medium_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_↩
medium_flow ( )
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps (∼ 25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

6.137.2.65 generic_keep_last_reliable_large_data_slow_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_slow↩
_flow ( )
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec (∼ 6.25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

6.137.2.66 generic_keep_last_reliable_transient_local() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient_local (
)
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) profile, but persists the samples of a **dds::pub::DataWriter** (p. 1138) as long as the entity exists in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.TransientLocal"

6.137.2.67 generic_keep_last_reliable_transient() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient ( )
```

Persists samples using RTI Persistence Service.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.Transient"

6.137.2.68 generic_keep_last_reliable_persistent() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_persistent ( )
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining Data↩ Readers.

String-version: "Generic.KeepLastReliable.Persistent"

6.137.2.69 generic_auto_tuning() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_auto_tuning ( )
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

String-version: "Generic.AutoTuning"

6.137.2.70 generic_minimal_memory_footprint() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_minimal_memory_footprint ( )
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

String-version: "Generic.MinimalMemoryFootprint"

6.137.2.71 pattern_periodic_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_periodic_data ( )
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

String-version: "Pattern.PeriodicData"

6.137.2.72 pattern_streaming() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_streaming ( )
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 480) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

String-version: "Pattern.Streaming"

6.137.2.73 pattern_reliable_streaming() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_reliable_streaming ( )
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 473) QoS Profile and the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 496)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1()** (p. 497)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_last()** (p. 492)

This QoS Snippet also increases the **dds::core::policy::History::depth** (p. 1605) to reduce the probability of losing samples.

String-version: "Pattern.ReliableStreaming"

6.137.2.74 pattern_event() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_event ( )
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 496)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all()** (p. 497)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_all()** (p. 491)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **dds::pub::DataWriter** (p. 1138) and **dds::sub::DataReader** (p. 976) is broken. This is why this profile sets the **dds::core::policy::Liveliness** (p. 1645). If the **dds::pub::DataWriter** (p. 1138) does not assert its liveliness in a timely manner, the **dds::sub::DataReader** (p. 976) will report 'loss of liveliness' to the application.

String-version: "Pattern.Event"

6.137.2.75 pattern_alarm_event() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_event ( )
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **rti::core::builtin_profiles::qos_lib::pattern_event()** (p. 481).

String-version: "Pattern.AlarmEvent"

6.137.2.76 pattern_status() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_status ( )
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 480) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 480) QoS Profile and publish the data at a fixed rate or it could use the **rti::core::builtin_profiles::qos_lib::pattern_status()** (p. 482) QoS Profile and only publish the temperature when it changes more than 1 degree.

String-version: "Pattern.Status"

6.137.2.77 pattern_alarm_status() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_status ( )
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from **rti::core::builtin_profiles::qos_lib↩ ::pattern_status()** (p. 482).

String-version: "Pattern.AlarmStatus"

6.137.2.78 pattern_last_value_cache() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_last_value_cache ( )
```

Used for applications that only need the last published value.

With this QoS Profile, a **dds::pub::DataWriter** (p. 1138) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local()** (p. 477) because the use case requires delivery to late-joiners.

String-version: "Pattern.LastValueCache"

6.137.2.79 library_name() [3/3]

```
std::string rti::core::builtin_profiles::qos_snippet_lib::library_name ( )
```

A library of QoS Snippets.

String-version: "BuiltinQosSnippetLib"

6.137.2.80 snippet_optimization_reliability_protocol_common()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_common ( )
```

QoS Snippet that configures the reliability protocol with a common configuration.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet defines parameters common to a set of "alternative" QoS Snippets that configure the reliability protocol.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064)

This QoS Snippet configures the reliability protocol parameters for more aggressive (faster) heartbeats so that sample loss is detected and repaired faster.

This QoS Snippet also sets the **rti::core::policy::RtpsReliableWriterProtocol::max_heartbeat_retries** (p. 2239), which works in combination with the heartbeat rate to determine when the **dds::pub::DataWriter** (p. 1138) considers a **dds::sub::DataReader** (p. 976) non-responsive. This QoS Snippet configures the **rti::core::policy::DataWriter↩ Protocol::rtps_reliable_writer** (p. 1217) parameters so that the **dds::pub::DataWriter** (p. 1138) considers the **dds↩ ::sub::DataReader** (p. 976) to be "inactive" after 500 unresponded heartbeats.

String-version: "Optimization.ReliabilityProtocol.Common"

6.137.2.81 snippet_optimization_reliability_protocol_keep_all()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_keep_all ( )
```

QoS Snippet that configures the reliability protocol for KEEP_ALL.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **dds::pub::DataWriter** (p. 1138) reliable protocol parameters for a reliable **dds::pub↩ ::DataWriter** (p. 1138) with **dds::core::policy::HistoryKind_def** (p. 1606) set to **dds::core::policy::HistoryKind_↩ def::KEEP_ALL** (p. 1607).

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064)

Note that this QoS Snippet does not configure the **dds::core::policy::Reliability** (p. 2149) or **dds::core::policy::↩ History** (p. 1602) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

String-version: "Optimization.ReliabilityProtocol.KeepAll"

6.137.2.82 snippet_optimization_reliability_protocol_keep_last()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_keep_last ( )
```

QoS Snippet that configures the reliability protocol for KEEP_LAST.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **dds::pub::DataWriter** (p. 1138) reliable protocol parameters for a reliable **dds::pub↩ ::DataWriter** (p. 1138) with **dds::core::policy::HistoryKind_def** (p. 1606) set to **dds::core::policy::HistoryKind_↩ def::KEEP_LAST** (p. 1607).

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064)

Note that this QoS Snippet does not configure the **dds::core::policy::Reliability** (p. 2149) or **dds::core::policy::↩ History** (p. 1602) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

String-version: "Optimization.ReliabilityProtocol.KeepLast"

6.137.2.83 snippet_optimization_reliability_protocol_high_rate()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_high_rate ( )
```

QoS Snippet that configures the reliability protocol for sending data at a high rate.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **dds::pub::DataWriter** (p. 1138) reliable protocol parameters for a reliable **dds::pub↩ ::DataWriter** (p. 1138) that is writing messages at high rates, especially in situations where throughput is favored over latency.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064)

This QoS Snippet sets a fast rate of heartbeats so that errors are detected and repaired more swiftly.

Note that to get the highest thoughout you may need to apply additional changes to the final QoS Profile. See the QoS Profile **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_high_throughput()** (p. 474) for further information.

String-version: "Optimization.ReliabilityProtocol.HighRate"

6.137.2.84 snippet_optimization_reliability_protocol_low_latency()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_low_latency ( )
```

QoS Snippet that configures the reliability protocol for sending data at low latency.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet modifies the Reliable Protocol parameters to accomplish low latency.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064)

Note that to get the lowest latency you may need to apply additional changes to the final QoS Profile. See the QoS Profile **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_low_latency()** (p. 474) for further information.

String-version: "Optimization.ReliabilityProtocol.LowLatency"

6.137.2.85 snippet_optimization_reliability_protocol_large_data()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_large_data ( )
```

QoS Snippet that configures the reliability protocol for large data.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

Modifies the Reliable Protocol parameters and Resource Limits to work better with Large Data.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 1217)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 1064)

Note that, to send large data, it is recommended to apply additional changes that configure the data caches, transport buffers, etc. See, for example, **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data()** (p. 476), and derivatives for fully functional Large Data QoS Profiles.

String-version: "Optimization.ReliabilityProtocol.LargeData"

6.137.2.86 snippet_optimization_reliability_protocol_dynamicmemalloc()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↩
protocol_dynamicmemalloc ( )
```

Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::ResourceLimits** (p. 2203)
- **dds::pub::qos::DataWriterQos** (p. 1226) => **rti::core::policy::Property** (p. 1969) named "dds.data_writer.↩ history.memory_manager.∗"
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::ResourceLimits** (p. 2203)
- **rti::core::policy::DataReaderResourceLimits** (p. 1081)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **rti::core::policy::Property** (p. 1969) named "dds.data_reader.↩ history.memory_manager.∗"

This configuration is needed to handle data that contains unbounded sequences or strings. This QoS Snippet is also recommended if samples can have very different sizes and the bigger samples can be very large.

If dynamic memory allocation is not used for the larger samples, then all samples are allocated to their maximum size which can consume a lot of resources.

String-version: "Optimization.DataCache.LargeData.DynamicMemAlloc"

6.137.2.87 snippet_optimization_discovery_common()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_common (
)
```

QoS Snippet that optimizes discovery with a common configuration.

Optimizes the **dds::domain::qos::DomainParticipantQos** (p. 1384) to detect faster discovery changes. This QoS Snippet increases the speed moderately so that it fits the normal scenarios.

Modified QoS Parameters:

- **rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration** (p. 1279)
- **rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period** (p. 1279)
- **rti::core::policy::DiscoveryConfig::max_liveliness_loss_detection_period** (p. 1281)
- **rti::core::policy::DiscoveryConfig::initial_participant_announcements** (p. 1282)
- **rti::core::policy::DiscoveryConfig::publication_writer** (p. 1289)
- **rti::core::policy::DiscoveryConfig::subscription_writer** (p. 1291)

String-version: "Optimization.Discovery.Common"

6.137.2.88 snippet_optimization_discovery_participant_compact()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_participant↩
_compact ( )
```

QoS Snippet that optimizes the Participant QoS to send less discovery information.

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1384) => **rti::core::policy::Property** (p. 1969) named "dds.↩ participant.inter_participant.∗"
- **dds::domain::qos::DomainParticipantQos** (p. 1384) => **rti::core::policy::Property** (p. 1969) named "dds.↩ sys_info.∗"

String-version: "Optimization.Discovery.Participant.Compact"

6.137.2.89 snippet_optimization_discovery_endpoint_fast()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_endpoint↩
_fast ( )
```

QoS Snippet that optimizes the Endpoint Discovery to be faster.

This is useful when using security, to prevent a noticeable delay.

Modified QoS Parameters:

- **rti::core::policy::DiscoveryConfig::publication_writer** (p. 1289)
- **rti::core::policy::DiscoveryConfig::subscription_writer** (p. 1291)

String-version: "Optimization.Discovery.Endpoint.Fast"

6.137.2.90 snippet_optimization_transport_large_buffers()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_transport_large_↩
buffers ( )
```

QoS Snippet that increases the Participant default buffer that shmem and udpv4 use.

This is useful when using Large Data

Modified QoS Parameters:

- **rti::core::policy::ReceiverPool** (p. 2144)
- **rti::core::policy::TransportBuiltin** (p. 2533)

String-version: "Optimization.Transport.LargeBuffers"

6.137.2.91 snippet_qos_policy_reliability_reliable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable
( )
```

QoS Snippet that sets RELIABILITY QoS to RELIABLE.

This also configures a blocking time in case the **dds::pub::DataWriter** (p. 1138) writes faster than the DataReaders can accommodate.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::Reliability** (p. 2149)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::Reliability** (p. 2149)

Note that by itself enabling reliability does not ensure that every sample written is delivered to the DataReaders. This is because the **dds::pub::DataWriter** (p. 1138) and/or **dds::sub::DataReader** (p. 976) can be configured to override samples in its cache based on the configuration of the **dds::core::policy::History** (p. 1602) QoS policy.

To ensure delivery of every sample (at the expense of potentially blocking the **dds::pub::DataWriter** (p. 1138)), use the QoS Profile **rti::core::builtin_profiles::qos_lib::generic_strict_reliable()** (p. 473) or one of the derived QoS Profiles.

String-version: "QosPolicy.Reliability.Reliable"

6.137.2.92 snippet_qos_policy_reliability_best_effort()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_best_↩
effort ( )
```

QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::Reliability** (p. 2149)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::Reliability** (p. 2149)

With best-effort, there are no resources spent to confirm delivery of samples nor repairs of any samples that may be lost.

Best-effort communication reduces jitter; therefore, the delay between sending data and receiving it is more deterministic for the samples that are actually received. Best-effort is good for periodic data where it may be better to get the next value than to wait for the previous one to be repaired.

String-version: "QosPolicy.Reliability.BestEffort"

6.137.2.93 snippet_qos_policy_history_keep_last_1()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1 (
)
```

QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::History** (p. 1602)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::History** (p. 1602)

String-version: "QosPolicy.History.KeepLast_1"

6.137.2.94 snippet_qos_policy_history_keep_all()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all ( )
```

QoS Snippet that sets HISTORY QosPolicy to KEEP_ALL kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::History** (p. 1602)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::History** (p. 1602)

String-version: "QosPolicy.History.KeepAll"

6.137.2.95 snippet_qos_policy_publish_mode_asynchronous()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_publish_mode_asynchronous
( )
```

QoS Snippet that sets PUBLISH_MODE QosPolicy to ASYNCHRONOUS kind.

Modified QoS Parameters:

- **rti::core::policy::PublishMode** (p. 2013)

Asynchronous Publish mode decouples the application thread that calls the **dds::pub::DataWriter** (p. 1138) "write" operation from the thread used to send the data on the network. See https://community.rti.↩ com/glossary/asynchronous-writer

String-version: "QosPolicy.PublishMode.Asynchronous"

6.137.2.96 snippet_qos_policy_durability_transient_local()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient↩
_local ( )
```

QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT_LOCAL kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::Durability** (p. 1433)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::Durability** (p. 1433)

DataWriters will store and send previously published DDS samples for delivery to newly discovered DataReaders as long as the **dds::pub::DataWriter** (p. 1138) still exists. For this setting to be effective, you must also set the **dds::core↩ ::policy::ReliabilityKind_def** (p. 2156) to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 2157) (not Best Effort). Which particular DDS samples are kept depends on other QoS settings such as **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203).

String-version: "QosPolicy.Durability.TransientLocal"

6.137.2.97 snippet_qos_policy_durability_transient()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient
( )
```

QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::Durability** (p. 1433)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::Durability** (p. 1433)

RTI Connext will store previously published DDS samples in memory using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203) of the Persistence Service DataWriters. These QosPolicies can be configured in the Persistence Service configuration file or through the **dds::core::policy::DurabilityKind_def** (p. 1441) of the DataWriters configured with **dds::core::policy::↩ DurabilityKind_def::TRANSIENT** (p. 1442).

You need a Persistence Service instance running to use this behavior.

String-version: "QosPolicy.Durability.Transient"

6.137.2.98 snippet_qos_policy_durability_persistent()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_persistent
( )
```

QoS Snippet that sets DURABILITY QosPolicy to PERSISTENT kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::Durability** (p. 1433)
- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::Durability** (p. 1433)

RTI Connext will store previously published DDS samples in permanent storage, like a disk, using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **dds::core::policy::History** (p. 1602) and **dds::core::policy::ResourceLimits** (p. 2203) in the Persistence Service DataWriters. These QosPolicies can be configured in the Persistence Service configuration file or through the **dds::core::policy::DurabilityKind_def** (p. 1441) of the DataWriters configured with **dds::core::policy::DurabilityKind_def::PERSISTENT** (p. 1442).

You need a Persistence Service instance running to use this behavior.

String-version: "QosPolicy.Durability.Persistent"

6.137.2.99 snippet_qos_policy_batching_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_batching_enable ( )
```

QoS Snippet that sets BATCH QosPolicy to true.

Modified QoS Parameters:

- **rti::core::policy::Batch** (p. 880)

This QoS Snippet specifies and configures the mechanism that allows RTI Connext to collect multiple user data DDS samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

String-version: "QosPolicy.Batching.Enable"

6.137.2.100 snippet_qos_policy_flow_controller_838mbps()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_↩
838mbps ( )
```

QoS Snippet that configures and set a FlowController of 838 Mbps.

Defines a **rti::pub::FlowController** (p. 1572) and configures the **dds::pub::qos::DataWriterQos** (p. 1226) with it.

This is a **rti::pub::FlowController** (p. 1572) of 838 Mbps ($\sim$ 100 MB/sec)

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1384) => **rti::core::policy::Property** (p. 1969) named "dds.↩ flow_controller.token_bucket.$*$"
- **rti::core::policy::PublishMode** (p. 2013)

String-version: "Feature.FlowController.838Mbps"

6.137.2.101 snippet_qos_policy_flow_controller_209mbps()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_↩
209mbps ( )
```

QoS Snippet that configures and sets a FlowController of 209 Mbps.

Defines a **rti::pub::FlowController** (p. 1572) and configures the **dds::pub::qos::DataWriterQos** (p. 1226) with it.

This is a **rti::pub::FlowController** (p. 1572) of 209 Mbps ($\sim$ 25 MB/sec)

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1384) => **rti::core::policy::Property** (p. 1969) named "dds.↩ flow_controller.token_bucket.$*$"
- **rti::core::policy::PublishMode** (p. 2013)

String-version: "Feature.FlowController.209Mbps"

6.137.2.102 snippet_qos_policy_flow_controller_52mbps()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_↩
52mbps ( )
```

QoS Snippet that configures and sets a FlowController of 52 Mbps.

Defines a **rti::pub::FlowController** (p. 1572) and configures the **dds::pub::qos::DataWriterQos** (p. 1226) with it.

This is a **rti::pub::FlowController** (p. 1572) of 52 Mbps ($\sim$ 6.25 MB/sec)

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1384) => **rti::core::policy::Property** (p. 1969) named "dds.↩ flow_controller.token_bucket.$*$"
- **rti::core::policy::PublishMode** (p. 2013)

String-version: "Feature.FlowController.52Mbps"

6.137.2.103 snippet_feature_auto_tuning_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_auto_tuning_enable ( )
```

QoS Snippet that enables auto_throttle and turbo_mode to true.

Sets the **dds::domain::qos::DomainParticipantQos** (p. 1384) properties to enable auto_throttle and turbo_mode to true.

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1384) => **rti::core::policy::Property** (p. 1969) named "dds.↩ domain_participant.auto_throttle"
- **dds::pub::qos::DataWriterQos** (p. 1226) => **rti::core::policy::Property** (p. 1969) named "dds.data_writer.↩ auto_throttle.enable"
- **dds::pub::qos::DataWriterQos** (p. 1226) => **rti::core::policy::Property** (p. 1969) named "dds.data_writer.↩ enable_turbo_mode"

The domain_participant.auto_throttle configures the **dds::domain::DomainParticipant** (p. 1326) to gather internal measurements (during **dds::domain::DomainParticipant** (p. 1326) creation) that are required for the Auto Throttle feature. This allows DataWriters belonging to this **dds::domain::DomainParticipant** (p. 1326) to use the Auto Throttle feature.

The turbo_mode adjusts the batch max_data_bytes based on how frequently the **dds::pub::DataWriter** (p. 1138) writes data.

Data_writer.auto_throttle enables automatic throttling in the **dds::pub::DataWriter** (p. 1138) so it can automatically adjust the writing rate and the send window size; this minimizes the need for repairing DDS samples and improves latency.

String-version: "Feature.AutoTuning.Enable"

6.137.2.104 snippet_feature_monitoring_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable ( )
```

QoS Snippet that enables the use of the RTI Monitoring Library.

To enable the use of RTI Monitoring Library apply this QoS Snippet to the QoS Profile used to create your **dds↩ ::domain::DomainParticipant** (p. 1326). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.Monitoring.Enable</element>

    </base_name>

</qos_profile>
```

String-version: "Feature.Monitoring.Enable"

6.137.2.105 snippet_feature_monitoring2_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable ( )
```

QoS Snippet that enables the use of the RTI Monitoring Library 2.0.

QoS Snippet to enable the use of the RTI Monitoring Library 2.0 with a dedicated DomainParticipant publishing telemetry data from your application in domain ID 2. All metrics are enabled for all resources in this profile.

To enable the use of RTI Monitoring Library 2.0, apply this QoS Snippet to the QoS Profile used to create your DomainParticipantFactory. For example:

```
<qos_profile name="MyProfile" is_default_participant_factory_profile="true">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring2.Enable</element>
  </base_name>
</qos_profile>
```

String-version: "Feature.Monitoring2.Enable"

6.137.2.106 snippet_feature_security_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_security_enable ( )
```

QoS Snippet that enables security using the Builtin Security Plugins.

To enable the use of the Builtin DDS Security Library apply this QoS Snippet to the QoS Profile used to create your **dds::domain::DomainParticipant** (p. 1326). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.Security.Enable</element>

    </base_name>

</qos_profile>
```

String-version: "Feature.Security.Enable"

6.137.2.107 snippet_feature_topic_query_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_topic_query_enable ( )
```

QoS Snippet that enables Topic Query.

To enable the use of the RTI Connext **rti::sub::TopicQuery** (p. 2516) feature, apply this QoS Snippet to the QoS Profile used to create your **dds::pub::DataWriter** (p. 1138). For example:

```
 <qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TopicQuery.Enable</element>

    </base_name>

</qos_profile>
```

For more information on Topic Query see the "Topic Queries" chapter in the `User's Manual`.

String-version: "Feature.TopicQuery.Enable"

6.137.2.108 snippet_feature_type_support_v1_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v1_enable (
)
```

QoS Snippet that enables TypeObject V1 propagation.

To enable TypeObject V1 propagation apply this QoS Snippet to the QoS Profile used to create your **dds::domain::DomainParticipant** (p. 1326). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V1.Enable</element>

    </base_name>

</qos_profile>
```

6.137.2.109 snippet_feature_type_support_v1_disable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v1_disable
( )
```

QoS Snippet that disables TypeObject V1 propagation.

To disable TypeObject V1 propagation apply this QoS Snippet to the QoS Profile used to create your **dds::domain::DomainParticipant** (p. 1326). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V1.Disable</element>

    </base_name>

</qos_profile>
```

6.137.2.110 snippet_feature_type_support_v2_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v2_enable (
)
```

QoS Snippet that enables TypeObject V2 propagation.

To enable TypeObject V2 propagation apply this QoS Snippet to the QoS Profile used to create your **dds::domain::DomainParticipant** (p. 1326). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V2.Enable</element>

    </base_name>

</qos_profile>
```

6.137.2.111 snippet_feature_type_support_v2_disable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_type_support_v2_disable
( )
```

QoS Snippet that disables TypeObject V2 propagation.

To disable TypeObject V2 propagation apply this QoS Snippet to the QoS Profile used to create your **dds::domain::DomainParticipant** (p. 1326). For example:

```
<qos_profile name="MyProfile">

    <base_name>

        <element>BuiltinQosLib::Feature.TypeSupport.V2.Disable</element>

    </base_name>

</qos_profile>
```

6.137.2.112 snippet_transport_tcp_lan_client()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_lan_client ( )
```

QoS Snippet that configures a TCP LAN Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the initial_peers and the property dds.transport.TCPv4.tcp1.server_bind_port are incorrect (just sample strings). Therefore, they must be modified:

- initial_peers: should point to the remote client IP and port.
- server_bind_port: is the port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1520). These new values will overwrite the current invalid values.

String-version: "Transport.TCP.LAN.Client"

6.137.2.113 snippet_transport_tcp_wan_symmetric_client()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_symmetric_
client ( )
```

QoS Snippet that configures a symmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties dds.transport.TCPv4.tcp1.public_address and dds.transport.TCPv4.tcp1.server_bind_port are incorrect (just sample strings). Also the initial_peers information is not correct. Therefore, the following must be modified:

- initial_peers: should point to the remote client IP and port.
- public_address: public IP address where this application can be reached.
- server_bind_port: port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1520). These new values will overwrite the current invalid values.

String-version: "Transport.TCP.WAN.Symmetric.Client"

6.137.2.114 snippet_transport_tcp_wan_asymmetric_server()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_↩
server ( )
```

QoS Snippet that an asymmetric WAN TCP Server over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties dds.transport.TCPv4.tcp1.public_address and dds.transport.TCPv4.tcp1.server_bind_port are incorrect (just sample strings). Therefore, they must be modified to the corresponding public_address and port_↩ number. This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1520). These new values will overwrite the current invalid values.

String-version: "Transport.TCP.WAN.Asymmetric.Server"

6.137.2.115 snippet_transport_tcp_wan_asymmetric_client()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_↩
client ( )
```

QoS Snippet that configures an asymmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The value of discovery.initial_peers and public_ip have to match the values set on the Server side (**rti::core::builtin_↩ profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_server()** (p. 504)). This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1520). This new value will overwrite the current invalid value.

String-version: "Transport.TCP.WAN.Asymmetric.Client"

6.137.2.116 snippet_transport_udp_avoid_ip_fragmentation()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_avoid_ip_fragmentation
( )
```

QoS Snippet that configures RTI Connext and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

For WAN communications and, in general, for communications in third party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

This snippet provides a way to avoid IP fragmentation in Connext applications using the built-in UDP transports. Instead, Connext will be responsible for fragmentation, which is done at the RTPS level.

Among other changes, this configuration changes the transport MTU (message_size_max) to be 1400 bytes. Notice that this change will affect other transports such as SHMEM since Connext chooses the minimum transport MTU across all enabled transports to determine the maximum size of outgoing RTPS messages.

String-version: "Transport.UDP.AvoidIPFragmentation"

6.137.2.117 snippet_transport_udp_wan()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_wan ( )
```

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).

The snippet disables all the other built-in transports and avoids the use of IP fragmentation.

For WAN communications and, in general, for communications in third-party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

String-version: "Transport.UDP.WAN"

6.137.2.118 snippet_compatibility_connext_micro_version_2_4_3()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_connext_micro_↩
version_2_4_3 ( )
```

QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connext Micro 2.4.3.

QoS Snippet that sets the **dds::sub::qos::DataReaderQos** (p. 1072) and **dds::pub::qos::DataWriterQos** (p. 1226) **dds::core::policy::LivelinessKind_def** (p. 1654) to **dds::core::policy::LivelinessKind_def::MANUAL_BY_TOPIC** (p. 1655) It also disables the built-in shared memory transport.

Modified QoS Parameters:

- **dds::sub::qos::DataReaderQos** (p. 1072) => **dds::core::policy::Liveliness** (p. 1645)
- **dds::pub::qos::DataWriterQos** (p. 1226) => **dds::core::policy::Liveliness** (p. 1645)
- **rti::core::policy::TransportBuiltin** (p. 2533)

RTI Connext Micro versions 2.4.3 and earlier only supported **dds::core::policy::LivelinessKind_def::MANUAL_BY↩_TOPIC** (p. 1655) **dds::core::policy::LivelinessKind_def** (p. 1654). In order to be compatible with RTI Connext Micro 2.4.3, the **dds::sub::DataReader** (p. 976) and **dds::pub::DataWriter** (p. 1138) must have their **dds::core::policy::↩LivelinessKind_def** (p. 1654) changed to this value because the default kind in RTI Connext is **dds::core::policy::↩LivelinessKind_def::AUTOMATIC** (p. 1655).

String-version: "Compatibility.ConnextMicro.Version243"

6.137.2.119 snippet_compatibility_other_dds_vendors_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_other_dds_vendors↩
_enable ( )
```

QoS Snippet that configures RTI Connext to interoperate with other DDS vendors.

String-version: "Compatibility.OtherDDSVendor.Enable"

6.137.2.120 snippet_compatibility_5_1_0_transport_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_5_1_0_transport_↩
enable ( )
```

QoS Snippet that configures RTI Connext to interoperate with RTI Connext 5.1.0 and below for UDPv6 and SHMEM transports.

String-version: "Compatibility.510Transport.Enable"

6.138 AsyncWaitSet

<<***extension***>> *(*p. *354)* A specialization of **dds::core::cond::WaitSet** (p. 2617) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **dds::core::cond::Condition** (p. 948).

Classes

- class **rti::core::cond::AsyncWaitSetProperty**

  Specifies the ***rti::core::cond::AsyncWaitSet*** *(*p. *840) behavior.*
- class **rti::core::cond::AsyncWaitSetCompletionToken**

  Implementation of the completion token role element of the asynchronous completion token pattern that is part of the ***AsyncWaitSet*** *(*p. *840) behavior.*
- class **rti::core::cond::AsyncWaitSet**

  <<***extension***>> *(*p. *354) Dispatches* ***dds::core::cond::Condition*** *(*p. *948) objects using separate threads of execution. Unlike a normal* ***dds::core::cond::WaitSet*** *(*p. *2617), which operates on the current thread, an* ***AsyncWaitSet*** *(*p. *840) uses a thread pool.*
- class **rti::core::cond::AsyncWaitSetListener**

  Listener *(*p. *1637) for receiving event notifications related to the thread pool of the* ***AsyncWaitSet*** *(*p. *840).*
- class **rti::core::cond::NoOpAsyncWaitSetListener**

  A convenience implementation of ***AsyncWaitSetListener*** *(*p. *856) where all methods are overridden to do nothing.*
- class **rti::sub::cond::DataReaderStatusConditionHandler**< **T** >

  Realization of a ***functor handler*** *(*p. *2134) that handles the status of a* ***dds::sub::DataReader*** *(*p. *976).*

Functions

- static **AsyncWaitSetCompletionToken rti::core::cond::AsyncWaitSetCompletionToken::Ignore** ()

  For the operations that allow an ***rti::core::cond::AsyncWaitSetCompletionToken*** *(*p. *853), this sentinel can be provided to indicate an* ***rti::core::cond::AsyncWaitSet*** *(*p. *840) to perform the action associating a 'null' completion token.*

6.138.1 Detailed Description

<<***extension***>> *(*p. *354)* A specialization of **dds::core::cond::WaitSet** (p. 2617) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **dds::core::cond::Condition** (p. 948).

This class is a realization of the `Proactor` pattern applied to WaitSets and Conditions that provide a powerful component for your application process events leveraging concurrency.

6.138.2 Function Documentation

6.138.2.1 Ignore()

```
static AsyncWaitSetCompletionToken rti::core::cond::AsyncWaitSetCompletionToken::Ignore ( ) [static]
```

For the operations that allow an **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853), this sentinel can be provided to indicate an **rti::core::cond::AsyncWaitSet** (p. 840) to perform the action associating a 'null' completion token.

This sentinel is a realization of the null object pattern of an **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853). If this object is provided to a **rti::core::cond::AsyncWaitSet** (p. 840) operation, the resulting operation request will be associated with a 'null' completion token that behaves as no-op.

When 'nul' completion token is provided, the **rti::core::cond::AsyncWaitSet** (p. 840) operation returns immediately after it issues the internal request, and there is no mean for your application to wait for the request to complete.

You can use this sentinel when your application can operate on an **rti::core::cond::AsyncWaitSet** (p. 840) without needing to known when operation requests complete or your application uses other strategies to synchronize resources.

This sentinel is also useful when you need to perform operations on **rti::core::cond::AsyncWaitSet** (p. 840) from within one of the threads from its thread pool, where waiting on a valid **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) is forbidden.

6.139 QoS

Quality of Service (QoS) policies.

Modules

- **All QoS Policies**

  All Quality of Service (QoS) policies.
- **QoS by Category**

  Quality of Service (QoS) organized into categories.

6.139.1 Detailed Description

Quality of Service (QoS) policies.

6.140 All QoS Policies

All Quality of Service (QoS) policies.

Modules

- **QoS Policy Traits**

  *The traits types **policy_id** (p. 1940) and **policy_name** (p. 1941) provide information about a QoS policy.*
- **ASYNCHRONOUS_PUBLISHER**

  *<<**extension**>> (p. 116) Specifies the asynchronous publishing settings of the **dds::pub::Publisher** (p. 1993) instances.*
- **AVAILABILITY**

  *<<**extension**>> (p. 116) Configures the availability of data.*
- **BATCH**

  *<<**extension**>> (p. 116) Batch QoS policy used to enable batching in **dds::pub::DataWriter** (p. 1138) instances.*
- **DATABASE**

  *<<**extension**>> (p. 116) Various threads and resource limits settings used by RTI Connext to control its internal database.*
- **DATA_READER_PROTOCOL**

  *<<**extension**>> (p. 116) Specifies the DataReader-specific protocol QoS.*
- **DATA_READER_RESOURCE_LIMITS**

  *<<**extension**>> (p. 116) Various settings that configure how DataReaders allocate and use physical memory for internal resources.*
- **DATA_REPRESENTATION**

  *<<**spec**>> (p. 112) A list of data representations and compression methods supported by a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976).*
- **DATA_WRITER_PROTOCOL**

  *<<**extension**>> (p. 116) Along with **rti::core::policy::WireProtocol** (p. 2630) and **rti::core::policy::DataReader↩ Protocol** (p. 1059), this QoS policy configures the DDS on-the-network protocol (RTPS).*
- **DATA_WRITER_RESOURCE_LIMITS**

  *<<**extension**>> (p. 116) Various settings that configure how a **dds::pub::DataWriter** (p. 1138) allocates and uses physical memory for internal resources.*
- **DATA_WRITER_TRANSFER_MODE**

  *<<**extension**>> (p. 116) Specifies the DataWriter transfer mode QoS.*
- **DATA_TAG**

  *<<**spec**>> (p. 112) Stores (name, value) pairs that can be used to determine access permissions.*
- **DEADLINE**

  *<<**spec**>> (p. 112) Expresses the maximum duration (deadline) within which an instance is expected to be updated.*
- **DESTINATION_ORDER**

  *<<**spec**>> (p. 112) Controls the criteria used to determine the logical order among changes made by **dds::pub::↩ Publisher** (p. 1993) entities to the same instance of data (i.e., matching **dds::topic::Topic** (p. 2474) and key).*
- **DISCOVERY**

  *<<**extension**>> (p. 116) Specifies the attributes required to discover participants in the domain.*
- **DISCOVERY_CONFIG**

  *<<**extension**>> (p. 116) Specifies the discovery configuration QoS.*
- **DOMAIN_PARTICIPANT_RESOURCE_LIMITS**

  *<<**extension**>> (p. 116) Various settings that configure how a **dds::domain::DomainParticipant** (p. 1326) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.*
- **DURABILITY**

  *<<**spec**>> (p. 112) This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **dds::sub::DataReader** (p. 976) entities that join the network later.*
- **DURABILITY_SERVICE**

*<<**spec**>> (p. 112) Various settings to configure the external RTI Persistence Service used by RTI Connext for DataWriters with a **dds::core::policy::Durability** (p. 1433) setting of **dds::core::policy::DurabilityKind_def::PERSISTENT** (p. 1442) or **dds::core::policy::DurabilityKind_def::TRANSIENT** (p. 1442).*

- **ENTITY_FACTORY**

  *<<**spec**>> (p. 112) A QoS policy for all **dds::core::Entity** (p. 1520) types that can act as factories for one or more other **dds::core::Entity** (p. 1520) types.*

- **ENTITY_NAME**

  *<<**extension**>> (p. 116) Assigns a name to a **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976). Except for **dds::pub::Publisher** (p. 1993) and **dds::sub::Subscriber** (p. 2410), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.*

- **EVENT**

  *<<**extension**>> (p. 116) Configures the internal thread in a DomainParticipant that handles timed events.*

- **HISTORY**

  *<<**spec**>> (p. 112) Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.*

- **GROUP_DATA**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.*

- **LATENCY_BUDGET**

  *<<**spec**>> (p. 112) Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.*

- **LIFESPAN**

  *<<**spec**>> (p. 112) Specifies how long the data written by the **dds::pub::DataWriter** (p. 1138) is considered valid.*

- **LIVELINESS**

  *<<**spec**>> (p. 112) Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 976) entities to detect when **dds::pub::DataWriter** (p. 1138) entities become disconnected or "dead."*

- **LOCATORFILTER**

  *<<**extension**>> (p. 116) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **dds::topic::PublicationBuiltinTopicData** (p. 1977).*

- **LOGGING**

  *<<**extension**>> (p. 116) Configures the RTI Connext logging facility.*

- **MONITORING**

  *<<**extension**>> (p. 116) Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.*

- **MULTICHANNEL**

  *<<**extension**>> (p. 116) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.*

- **OWNERSHIP**

  *<<**spec**>> (p. 112) Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 1138) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

- **OWNERSHIP_STRENGTH**

  *<<**spec**>> (p. 112) Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by **dds::topic::Topic** (p. 2474) + key).*

- **PARTITION**

  *<<**spec**>> (p. 112) Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities.*

- **PRESENTATION**

  *<<**spec**>> (p. 112) Specifies how the samples representing changes to data instances are presented to a subscribing application.*

- **PROFILE**

<<***extension***>> (p. 116) Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

- **PROPERTY**

  <<***extension***>> (p. 116) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

- **PUBLISH_MODE**

  <<***extension***>> (p. 116) Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its own thread to send data, instead of the user thread.

- **READER_DATA_LIFECYCLE**

  <<***spec***>> (p. 112) Controls how a DataReader manages the lifecycle of the data that it has received.

- **RECEIVER_POOL**

  <<***extension***>> (p. 116) Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

- **RELIABILITY**

  <<***spec***>> (p. 112) Indicates the level of reliability offered/requested by RTI Connext.

- **RESOURCE_LIMITS**

  <<***spec***>> (p. 112) Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

- **SERVICE**

  <<***extension***>> (p. 116) Service QoS policy is used to indicate what kind of service or tool is associated with the DDS entity.

- **SYSTEM_RESOURCE_LIMITS**

  <<***extension***>> (p. 116) Configures DomainParticipant-independent resources used by RTI Connext.

- **TIME_BASED_FILTER**

  <<***spec***>> (p. 112) Filter that allows a ***dds::sub::DataReader*** (p. 976) to specify that it is interested only in (potentially) a subset of the values of the data.

- **TOPIC_DATA**

  Attaches a buffer of opaque data that is distributed by means of ***Built-in Topics*** (p. 46) during discovery.

- **TOPIC_QUERY_DISPATCH**

  <<***extension***>> (p. 116) Configures the ability of a ***dds::pub::DataWriter*** (p. 1138) to publish historical samples

- **TRANSPORT_BUILTIN**

  <<***extension***>> (p. 116) Specifies which built-in transports are used.

- **TRANSPORT_MULTICAST**

  <<***extension***>> (p. 116) Specifies the multicast address on which a ***dds::sub::DataReader*** (p. 976) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the ***dds::domain::DomainParticipant*** (p. 1326) level) transports with which to receive the multicast data.

- **TRANSPORT_MULTICAST_MAPPING**

  <<***extension***>> (p. 116) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

- **TRANSPORT_PRIORITY**

  <<***spec***>> (p. 112) This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

- **TRANSPORT_SELECTION**

  <<***extension***>> (p. 116) Specifies the physical transports that a ***dds::pub::DataWriter*** (p. 1138) or ***dds::sub::DataReader*** (p. 976) may use to send or receive data.

- **TRANSPORT_UNICAST**

  <<***extension***>> (p. 116) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

- **TYPE_CONSISTENCY_ENFORCEMENT**

*<<**spec**>> (p. 112) Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.*

- **TYPESUPPORT**

  [DEPRECATED] *(p. **296**)* *<<**extension**>> (p. 116) Allows you to attach application-specific values to a **dds::pub::DataWriter*** *(p. 1138) or **dds::sub::DataReader*** *(p. 976), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.*
- **USER_DATA**

  *Attaches a buffer of opaque data that is distributed by means of **Built-in Topics*** *(p. 46) during discovery.*
- **WRITER_DATA_LIFECYCLE**

  *<<**spec**>> (p. 112) Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.*
- **WIRE_PROTOCOL**

  *<<**extension**>> (p. 116) Specifies the wire protocol related attributes for the **dds::domain::DomainParticipant*** *(p. 1326).*

Classes

- class **dds::core::policy::QosPolicyCount**

  *<<**value-type**>> (p. 350) Holds a counter for a QosPolicyId*

Typedefs

- typedef std::vector< **QosPolicyCount** > **dds::core::policy::QosPolicyCountSeq**

  *A vector of **QosPolicyCount*** *(p. 2020).*
- typedef uint32_t **dds::core::policy::QosPolicyId**

  Identifies a QoS policy.

6.140.1 Detailed Description

All Quality of Service (QoS) policies.

Data Distribution Service (DDS) relies on the use of QoS. A QoS is a set of characteristics that controls some aspect of the behavior of DDS. A QoS is comprised of individual QoS policies (objects conceptually deriving from an *abstract* `QosPolicy` class).

"Supported QoS policies"

The QosPolicy provides the basic mechanism for an application to specify quality of service parameters. It has an attribute name that is used to uniquely identify each `QosPolicy`.

QosPolicy implementation is comprised of a name, an ID, and a type. The type of a `QosPolicy` value may be atomic, such as an integer or float, or compound (a structure). Compound types are used whenever multiple parameters must be set coherently to define a consistent value for a QosPolicy.

QoS (i.e., a list of `QosPolicy` objects) may be associated with all **dds::core::Entity** (p. 1520) objects in the system such as **dds::topic::Topic** (p. 2474), **dds::pub::DataWriter** (p. 1138), **dds::sub::DataReader** (p. 976), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), and **dds::domain::DomainParticipant** (p. 1326).

6.140.2 Specifying QoS on entities

QosPolicies can be set programmatically when an **dds::core::Entity** (p. 1520) is created, or modified with the **dds::core::Entity** (p. 1520)'s **set_qos (abstract)** (p. 1522) method.

QosPolicies can also be configured from XML resources (files, strings). With this approach, you can change the QoS without recompiling the application. For more information, see **Configuring QoS Profiles with XML** (p. 302).

To customize a **dds::core::Entity** (p. 1520)'s QoS before creating the entity, the correct pattern is:

- First, initialize a QoS object with the appropriate INITIALIZER constructor.
- Call the relevant get_<entity>_default_qos() method.
- Modify the QoS values as desired.
- Finally, create the entity.

Each `QosPolicy` is treated independently from the others. This approach has the advantage of being very extensible. However, there may be cases where several policies are in conflict. Consistency checking is performed each time the policies are modified via the **set_qos (abstract)** (p. 1522) operation, or when the **dds::core::Entity** (p. 1520) is created.

When a policy is changed after being set to a given value, it is not required that the new value be applied instantaneously; RTI Connext is allowed to apply it after a transition phase. In addition, some `QosPolicy` have immutable semantics, meaning that they can only be specified either at **dds::core::Entity** (p. 1520) creation time or else prior to calling the **dds::core::Entity::enable** (p. 1524) operation on the entity.

Each **dds::core::Entity** (p. 1520) can be configured with a list of `QosPolicy` objects. However, not all QosPolicies are supported by each **dds::core::Entity** (p. 1520). For instance, a **dds::domain::DomainParticipant** (p. 1326) supports a different set of QosPolicies than a **dds::topic::Topic** (p. 2474) or a **dds::pub::Publisher** (p. 1993).

Additional properties that are not exposed through the formal QoS policies can also be set for an **dds::core::Entity** (p. 1520) via the **rti::core::policy::Property** (p. 1969). These properties are described in the `Property Reference Guide`.

6.140.3 QoS compatibility

In several cases, for communications to occur properly (or efficiently), a QosPolicy on the publisher side must be compatible with a corresponding policy on the subscriber side. For example, if a **dds::sub::Subscriber** (p. 2410) requests to receive data reliably while the corresponding **dds::pub::Publisher** (p. 1993) defines a best-effort policy, communication will not happen as requested.

To address this issue and maintain the desirable decoupling of publication and subscription as much as possible, the QosPolicy specification follows the **subscriber-requested, publisher-offered pattern**.

In this pattern, the subscriber side can specify a "requested" value for a particular `QosPolicy`. The publisher side specifes an "offered" value for that `QosPolicy`. RTI Connext will then determine whether the value requested by the subscriber side is compatible with what is offered by the publisher side. If the two policies are compatible, then communication will be established. If the two policies are not compatible, RTI Connext will not establish communications between the two **dds::core::Entity** (p. 1520) objects and will record this fact by means of the **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380) on the publisher end and **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381) on the subscriber end. The application can detect this fact by means of a **Listener** (p. 1637) or a **dds::core::cond::Condition** (p. 948).

The following **properties** are defined on a QosPolicy.

- **RxO (**p. **514) property**
  The QosPolicy objects that need to be set in a compatible manner between the **publisher** and **subscriber** end are indicated by the setting of the **RxO** (p. 514) property:
  - **RxO** (p. 514) = **YES**
    indicates that the policy can be set both at the publishing and subscribing ends and the values must be set in a compatible manner. In this case the compatible values are explicitly defined.
  - **RxO** (p. 514) = **NO**
    indicates that the policy can be set both at the publishing and subscribing ends but the two settings are independent. That is, all combinations of values are compatible.
  - **RxO** (p. 514) = **N/A**
    indicates that the policy can only be specified at either the publishing or the subscribing end, but not at both ends. So compatibility does not apply.
- **Changeable (**p. **514)property**
  Determines whether a QosPolicy can be changed.
  - **NO (**p. **514)** -- policy can only be specified at **dds::core::Entity** (p. 1520) creation time.
  - **UNTIL ENABLE (**p. **514)** -- policy can only be changed before the **dds::core::Entity** (p. 1520) is enabled.
  - **YES (**p. **514)** -- policy can be changed at any time.

6.140.4 Typedef Documentation

6.140.4.1 QosPolicyCountSeq

```
typedef std::vector< QosPolicyCount>  dds::core::policy::QosPolicyCountSeq
```

A vector of **QosPolicyCount** (p. 2020).

6.140.4.2 QosPolicyId

```
typedef uint32_t  dds::core::policy::QosPolicyId
```

Identifies a QoS policy.

The ID for a given policy can be obtained with **dds::core::policy::policy_id** (p. 1940).

For example, the policy ID for the **dds::core::policy::Deadline** (p. 1255) policy is `dds::core::policy::policy_id<dds::core::policy::Deadline>::value`.

6.141 QoS by Category

Quality of Service (QoS) organized into categories.

Modules

- **Basic QoS**

  QoS that are considered basic and fundamental to RTI Connext.
- **DDS Specification QoS**

  QoS that are defined in one of the OMG DDS Specifications.
- **DDS Extension QoS**

  QoS that are RTI extensions to the DDS standard.
- **Functional Categories**

  *These categories help you to discover which QoS may be relevant or related to a desired functionality or feature. For example, if you are interested in **Sending Large Data** (p. 197), then looking at any QoS in that category will be helpful.*
- **QoS Mutability**

  Some QoS are mutable after an entity is enabled, and others are not.
- **Other QoS Attributes**

  *These attributes are characteristics of the QoS – for example if they are **mutable** (p. 280) or **immutable** (p. 243), or if they **apply per-instance** (p. 287).*
- **Deprecated QoS**

  Deprecated QoS.

6.141.1 Detailed Description

Quality of Service (QoS) organized into categories.

The QoS have been grouped into a number of different categories.

These categories can help you to discover which QoS may be relevant or related to a desired functionality or feature. For example, if you are interested in **Sending Large Data** (p. 197), then looking at any QoS in that category will be helpful. The different functional categories are listed on **Functional Categories** (p. 156).

Some categories are not necessarily related to achieving a specific functionality, but are characteristics of the QoS – for example if they are **mutable** (p. 280) or **immutable** (p. 243), or if they **apply per-instance** (p. 287). These categories are listed under **QoS Mutability** (p. 242) and **Other QoS Attributes** (p. 286).

6.142 ASYNCHRONOUS_PUBLISHER

<<***extension***>> *(p. 116)* Specifies the asynchronous publishing settings of the **dds::pub::Publisher** (p. 1993) instances.

Classes

- class **rti::core::policy::AsynchronousPublisher**

  <<***extension***>> *(p. 116) Configures the mechanism to publish data using a separate thread*

6.142.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the asynchronous publishing settings of the **dds::pub::Publisher** (p. 1993) instances.

6.143 AVAILABILITY

<<***extension***>> *(*p. *116)* Configures the availability of data.

Classes

- class **rti::core::EndpointGroup**

  <<***extension***>> *(*p. *354) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.*
- class **rti::core::policy::Availability**

  <<***extension***>> *(*p. *116) Configures data availability in the context of Collaborative DataWriters and Required Subscriptions*

Typedefs

- typedef **dds::core::vector**< **EndpointGroup** > **rti::core::EndpointGroupSeq**

  *A sequence of **rti::core::EndpointGroup** (*p. *1515).*

6.143.1 Detailed Description

<<***extension***>> *(*p. *116)* Configures the availability of data.

6.143.2 Typedef Documentation

6.143.2.1 EndpointGroupSeq

`typedef` **`dds::core::vector< EndpointGroup> rti::core::EndpointGroupSeq`**

A sequence of **rti::core::EndpointGroup** (p. 1515).

In the context of Collaborative DataWriters, it can be used by a **dds::sub::DataReader** (p. 976) to define a group of remote DataWriters that the **dds::sub::DataReader** (p. 976) will wait to discover before skipping missing samples.

In the context of Durable Subscriptions, it can be used to create a set of Durable Subscriptions identified by a name and a quorum count.

See also

rti::core::EndpointGroup (p. 1515)

6.144 BATCH

<<***extension***>> *(*p. *116)* Batch QoS policy used to enable batching in **dds::pub::DataWriter** (p. 1138) instances.

Classes

- class **rti::core::policy::Batch**

  <<***extension***>> *(*p. *116) Allows a* ***dds::pub::DataWriter*** *(*p. *1138) to batch multiple samples into a single network packet to increase throughput.*

6.144.1 Detailed Description

<<***extension***>> *(*p. *116)* Batch QoS policy used to enable batching in **dds::pub::DataWriter** (p. 1138) instances.

6.145 DATABASE

<<***extension***>> *(*p. *116)* Various threads and resource limits settings used by RTI Connext to control its internal database.

Classes

- class **rti::core::policy::Database**

  <<***extension***>> *(*p. *116) Configures threads and resource limits that RTI Connext uses to control its internal database*

6.145.1 Detailed Description

<<***extension***>> *(*p. *116)* Various threads and resource limits settings used by RTI Connext to control its internal database.

6.146 DATA_READER_PROTOCOL

<<***extension***>> *(*p. *116)* Specifies the DataReader-specific protocol QoS.

Classes

- class **rti::core::policy::DataReaderProtocol**

  <<***extension***>> *(*p. *116) Configures DataReader-specific aspects of the RTPS protocol*
- class **rti::core::RtpsReliableReaderProtocol**

  <<***extension***>> *(*p. *354) Configures aspects of the RTPS protocol related to a reliable DataReader*

6.146.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the DataReader-specific protocol QoS.

6.147 DATA_READER_RESOURCE_LIMITS

<<***extension***>> *(*p. *116)* Various settings that configure how DataReaders allocate and use physical memory for internal resources.

Classes

- class **rti::core::policy::DataReaderResourceLimits**

  <<***extension***>> (p. *116) Configures the memory usage of a dds::pub::DataReader*
- struct **rti::core::policy::DataReaderInstanceRemovalKind_def**

  *Sets the kinds of instances that can be replaced when instance resource limits (**dds::core::policy::ResourceLimits**↩ **::max_instances** (p. 2206)) are reached.*
- class **rti::core::DataReaderResourceLimitsInstanceReplacementSettings**

  <<***extension***>> (p. *354) How instances are replaced in the DataReader queue when resource limits are reached.*

Typedefs

- typedef **dds::core::safe_enum**< **DataReaderInstanceRemovalKind_def** > **rti::core::policy::DataReader**↩ **InstanceRemovalKind**

  <<***extension***>> (p. *354)* ***Safe Enumeration*** *(*p. *429) of **DataReaderInstanceRemovalKind_def*** *(*p. *1053)*

Functions

- static DDS_Long **rti::core::policy::DataReaderResourceLimits::auto_max_total_instances** ()

  <<***extension***>> (p. *116) This value is used to make **rti::core::policy::DataReaderResourceLimits::max_total_**↩ **instances** (p. 1096) equal to **dds::core::policy::ResourceLimits::max_instances** (p. 2206).*

6.147.1 Detailed Description

<<***extension***>> *(*p. *116)* Various settings that configure how DataReaders allocate and use physical memory for internal resources.

6.147.2 Typedef Documentation

6.147.2.1 DataReaderInstanceRemovalKind

typedef **dds::core::safe_enum**< **DataReaderInstanceRemovalKind_def**> **rti::core::policy::Data↩ ReaderInstanceRemovalKind**

<<***extension***>> *(*p. *354)* **Safe Enumeration** (p. 429) of **DataReaderInstanceRemovalKind_def** (p. 1053)

See also

DataReaderInstanceRemovalKind_def (p. 1053)

6.147.3 Function Documentation

6.147.3.1 auto_max_total_instances()

static DDS_Long rti::core::policy::DataReaderResourceLimits::auto_max_total_instances ( ) [inline], [static]

<<***extension***>> *(*p. *116)* This value is used to make **rti::core::policy::DataReaderResourceLimits::max_total_↩ instances** (p. 1096) equal to **dds::core::policy::ResourceLimits::max_instances** (p. 2206).

6.148 DATA_REPRESENTATION

<<***spec***>> *(*p. *112)* A list of data representations and compression methods supported by a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976).

Classes

- class **dds::core::policy::DataRepresentation**

  Contains the data representations supported by entities.
- class **rti::core::CompressionIdMask**

  <<***extension***>> *(*p. *354) Mask that specifies which built-in compression method to used.*
- class **rti::core::CompressionSettings**

  <<***extension***>> *(*p. *354) Compression Settings*

Typedefs

- typedef int16_t **dds::core::policy::DataRepresentationId**

  The type of the elements that ***DataRepresentation*** *(*p. *1113) contains.*
- typedef std::vector< **DataRepresentationId** > **dds::core::policy::DataRepresentationIdSeq**

  A vector of DataRepresentationId.

Functions

- static **DataRepresentationId dds::core::policy::DataRepresentation::xcdr** ()

  Extended Common Data Representation encoding version 1.
- static **DataRepresentationId dds::core::policy::DataRepresentation::xml** ()

  XML Data Representation (unsupported)
- static **DataRepresentationId dds::core::policy::DataRepresentation::xcdr2** ()

  Extended Common Data Representation encoding version 2.
- static **DataRepresentationId dds::core::policy::DataRepresentation::auto_id** ()

  Representation automatically chosen based on the type.

6.148.1 Detailed Description

<<***spec***>> *(p. 112)* A list of data representations and compression methods supported by a **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976).

6.148.2 Typedef Documentation

6.148.2.1 DataRepresentationId

```
typedef int16_t  dds::core::policy::DataRepresentationId
```

The type of the elements that **DataRepresentation** (p. 1113) contains.

2-byte signed integers

6.148.2.2 DataRepresentationIdSeq

```
typedef std::vector< DataRepresentationId>  dds::core::policy::DataRepresentationIdSeq
```

A vector of DataRepresentationId.

6.148.3 Function Documentation

6.148.3.1 xcdr()

```
static  DataRepresentationId dds::core::policy::DataRepresentation::xcdr ( )  [inline], [static]
```

Extended Common Data Representation encoding version 1.

6.148.3.2 xml()

```
static DataRepresentationId dds::core::policy::DataRepresentation::xml ( ) [inline], [static]
```

XML Data Representation (unsupported)

Note

This value is currently not supported.

6.148.3.3 xcdr2()

```
static DataRepresentationId dds::core::policy::DataRepresentation::xcdr2 ( ) [inline], [static]
```

Extended Common Data Representation encoding version 2.

6.148.3.4 auto_id()

```
static DataRepresentationId dds::core::policy::DataRepresentation::auto_id ( ) [inline], [static]
```

Representation automatically chosen based on the type.

For plain language binding, if the allowed_data_representation annotation is not specified or if it contains the value XCDR, RTI Connext translates this field to **dds::core::policy::DataRepresentation::xcdr()** (p. 520). Otherwise, it translates this field to **dds::core::policy::DataRepresentation::xcdr2()** (p. 521).

For the **FlatData language binding** (p. 419), RTI Connext translates this field to **dds::core::policy::Data↩ Representation::xcdr2()** (p. 521).

Examples

Foo.hpp.

6.149 DATA_WRITER_PROTOCOL

<<***extension***>> *(p. 116)* Along with **rti::core::policy::WireProtocol** (p. 2630) and **rti::core::policy::DataReader↩ Protocol** (p. 1059), this QoS policy configures the DDS on-the-network protocol (RTPS).

Classes

- class **rti::core::policy::DataWriterProtocol**

  <<***extension***>> *(p. 116) Configures aspects of an the RTPS protocol related to a **dds::pub::DataWriter** (p. 1138)*

6.149.1 Detailed Description

<<***extension***>> *(p. 116)* Along with **rti::core::policy::WireProtocol** (p. 2630) and **rti::core::policy::DataReader↩ Protocol** (p. 1059), this QoS policy configures the DDS on-the-network protocol (RTPS).

6.150 DATA_WRITER_RESOURCE_LIMITS

<<***extension***>> *(p. 116)* Various settings that configure how a **dds::pub::DataWriter** (p. 1138) allocates and uses physical memory for internal resources.

Classes

- class **rti::core::policy::DataWriterResourceLimits**

  <<***extension***>> *(p. 116) Configures the memory usage of a **dds::pub::DataWriter** (p. 1138)*
- struct **rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind_def**

  <<***extension***>> *(p. 354) The enumeration for DataWriter Resource Limits*

Typedefs

- typedef **dds::core::safe_enum< DataWriterResourceLimitsInstanceReplacementKind_def > rti::core↩ ::policy::DataWriterResourceLimitsInstanceReplacementKind**

  <<***extension***>> *(p. 354)* ***Safe Enumeration*** *(p. 429) of **DataWriterResourceLimitsInstanceReplacementKind_def** (p. 1249)*

6.150.1 Detailed Description

<<***extension***>> *(p. 116)* Various settings that configure how a **dds::pub::DataWriter** (p. 1138) allocates and uses physical memory for internal resources.

6.150.2 Typedef Documentation

6.150.2.1 DataWriterResourceLimitsInstanceReplacementKind

```
typedef dds::core::safe_enum< DataWriterResourceLimitsInstanceReplacementKind_def> rti::core↩
::policy::DataWriterResourceLimitsInstanceReplacementKind
```

<<***extension***>> *(p. 354)* **Safe Enumeration** (p. 429) of **DataWriterResourceLimitsInstanceReplacementKind_def** (p. 1249)

See also

DataWriterResourceLimitsInstanceReplacementKind_def (p. 1249)

6.151 DATA_WRITER_TRANSFER_MODE

<<***extension***>> *(*p. *116)* Specifies the DataWriter transfer mode QoS.

Classes

- class **rti::core::policy::DataWriterTransferMode**

  <<***extension***>> *(*p. *116) Configures the transfer mode of a* ***dds::pub::DataWriter*** *(*p. *1138)*
- class **rti::core::DataWriterShmemRefTransferModeSettings**

  <<***extension***>> *(*p. *354) Configures aspects of the shared memory reference transfer mode related to a DataWriter*

6.151.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the DataWriter transfer mode QoS.

6.152 DATA_TAG

<<***spec***>> *(*p. *112)* Stores (name, value) pairs that can be used to determine access permissions.

Classes

- class **dds::core::policy::DataTag**

  Stores name-value (string) pairs that can be used to determine access permissions.

6.152.1 Detailed Description

<<***spec***>> *(*p. *112)* Stores (name, value) pairs that can be used to determine access permissions.

The **dds::core::policy::DataTag** (p. 1132) can be used to associate a set of tags in the form of (name, value) pairs with a **dds::sub::DataReader** (p. 976) or **dds::pub::DataWriter** (p. 1138). This is similar to the **rti::core::policy::Property** (p. 1969), except you cannot select whether or not a particular pair should be propagated (included in the built-in topic). Data tags are always propagated. The Access Control plugin may use the tags to determine publish and subscribe permissions.

6.153 DEADLINE

<<***spec***>> *(*p. *112)* Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Classes

- class **dds::core::policy::Deadline**

  Expresses the maximum duration (deadline) within which an instance is expected to be updated.

6.153.1 Detailed Description

<<***spec***>> *(*p. *112)* Expresses the maximum duration (deadline) within which an instance is expected to be updated.

6.154 DESTINATION_ORDER

<<***spec***>> *(*p. *112)* Controls the criteria used to determine the logical order among changes made by **dds::pub::Publisher** (p. 1993) entities to the same instance of data (i.e., matching **dds::topic::Topic** (p. 2474) and key).

Classes

- struct **dds::core::policy::DestinationOrderKind_def**

  The definition of the ***dds::core::safe_enum*** *(*p. *2265) DestinationOrderKind.*
- class **dds::core::policy::DestinationOrder**

  Controls the logical order of updates to the same instance by a ***dds::pub::Publisher*** *(*p. *1993).*
- struct **rti::core::policy::DestinationOrderScopeKind_def**

  <<***extension***>> *(*p. *354) The definition of the* ***dds::core::safe_enum*** *(*p. *2265) DestinationOrderScopeKind*

Typedefs

- typedef **dds::core::safe_enum**< **DestinationOrderKind_def** > **dds::core::policy::DestinationOrderKind**

  Safe Enumeration *(*p. *429) of* ***DestinationOrderKind_def*** *(*p. *1263)*
- typedef **dds::core::safe_enum**< **DestinationOrderScopeKind_def** > **rti::core::policy::DestinationOrderScopeKind**

  Safe Enumeration *(*p. *429) of* ***DestinationOrderScopeKind_def*** *(*p. *1264)*

6.154.1 Detailed Description

<<***spec***>> *(*p. *112)* Controls the criteria used to determine the logical order among changes made by **dds::pub::Publisher** (p. 1993) entities to the same instance of data (i.e., matching **dds::topic::Topic** (p. 2474) and key).

6.154.2 Typedef Documentation

6.154.2.1 DestinationOrderKind

typedef **dds::core::safe_enum< DestinationOrderKind_def> dds::core::policy::DestinationOrderKind**

Safe Enumeration (p. 429) of **DestinationOrderKind_def** (p. 1263)

See also

DestinationOrderKind_def (p. 1263)

6.154.2.2 DestinationOrderScopeKind

typedef **dds::core::safe_enum< DestinationOrderScopeKind_def> rti::core::policy::DestinationOrderScopeKind**

Safe Enumeration (p. 429) of **DestinationOrderScopeKind_def** (p. 1264)

See also

DestinationOrderScopeKind_def (p. 1264)

6.155 DISCOVERY

<<***extension***>> *(*p. *116)* Specifies the attributes required to discover participants in the domain.

Modules

- **NDDS_DISCOVERY_PEERS**

  Environment variable or a file that specifies the default values of ***rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)*** *(*p. *1268) and* ***rti::core::policy::Discovery::multicast_receive_addresses*** *(*p. *1268) contained in the dds::domain::qos::DomainParticipantQos::discovery qos policy.*

Classes

- class **rti::core::policy::Discovery**

  <<***extension***>> *(*p. *116) Configures entity discovery*

6.155.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the attributes required to discover participants in the domain.

6.156 DISCOVERY_CONFIG

<<***extension***>> *(*p. *116)* Specifies the discovery configuration QoS.

Classes

- class **rti::core::policy::BuiltinTopicReaderResourceLimits**

  <<***extension***>> *(*p. *116) Configures several resource management aspects of the built-in topic DataReaders*
- class **rti::core::policy::DiscoveryConfig**

  <<***extension***>> *(*p. *116) Configures the discovery mechanism*
- class **rti::core::policy::DiscoveryConfigBuiltinPluginKindMask**

  <<***extension***>> *(*p. *354) A mask that selects the built-in discovery plugins to be used*
- class **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask**

  <<***extension***>> *(*p. *354) A mask that selects the built-in channels to be used*
- struct **rti::core::policy::RemoteParticipantPurgeKind_def**

  <<***extension***>> *(*p. *354) The definition of the* ***dds::core::safe_enum*** *(*p. *2265) RemoteParticipantPurgeKind*

Typedefs

- typedef **dds::core::safe_enum**< **RemoteParticipantPurgeKind_def** > **rti::core::policy::Remote↩ ParticipantPurgeKind**

  <<***extension***>> *(*p. *354)* ***Safe Enumeration*** *(*p. *429) of* ***RemoteParticipantPurgeKind_def*** *(*p. *2164)*

Functions

- static **DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannelKind↩ Mask::all** ()

  All the bits are set, indicating that all channels are enabled.
- static **DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannelKind↩ Mask::none** ()

  No bits are set, indicating that all channels are disabled.

6.156.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the discovery configuration QoS.

6.156.2 Typedef Documentation

6.156.2.1 RemoteParticipantPurgeKind

typedef **dds::core::safe_enum**< **RemoteParticipantPurgeKind_def**> **rti::core::policy::RemoteParticipantPurgeKind**

<<***extension***>> *(*p. *354)* **Safe Enumeration** (p. 429) of **RemoteParticipantPurgeKind_def** (p. 2164)

See also

RemoteParticipantPurgeKind_def (p. 2164)

6.156.3 Function Documentation

6.156.3.1 all()

static **DiscoveryConfigBuiltinChannelKindMask** rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::all ( ) [inline], [static]

All the bits are set, indicating that all channels are enabled.

6.157 DOMAIN_PARTICIPANT_RESOURCE_LIMITS

<<***extension***>> *(p. 116)* Various settings that configure how a **dds::domain::DomainParticipant** (p. 1326) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Classes

- class **rti::core::policy::DomainParticipantResourceLimits**

  <<***extension***>> *(p. 116) Configures the memory usage of certain* ***dds::domain::DomainParticipant*** *(p. 1326) resources*
- struct **rti::core::policy::IgnoredEntityReplacementKind_def**

  <<***extension***>> *(p. 354) The enumeration for* ***DomainParticipantResourceLimits*** *(p. 1391) ignored entity replacement kinds*
- class **rti::core::AllocationSettings**

  <<***extension***>> *(p. 354) Resource allocation settings*

Typedefs

- typedef **dds::core::safe_enum< IgnoredEntityReplacementKind_def > rti::core::policy::IgnoredEntity↩ ReplacementKind**

  <<***extension***>> *(p. 354)* ***Safe Enumeration*** *(p. 429) of* ***IgnoredEntityReplacementKind_def*** *(p. 1607)*

6.157.1 Detailed Description

<<***extension***>> *(p. 116)* Various settings that configure how a **dds::domain::DomainParticipant** (p. 1326) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

6.157.2 Typedef Documentation

6.157.2.1 IgnoredEntityReplacementKind

```
typedef dds::core::safe_enum< IgnoredEntityReplacementKind_def> rti::core::policy::Ignored↩
EntityReplacementKind
```

<<***extension***>> *(p. 354)* **Safe Enumeration** (p. 429) of **IgnoredEntityReplacementKind_def** (p. 1607)

See also

IgnoredEntityReplacementKind_def (p. 1607)

6.158 DURABILITY

<<***spec***>> *(p. 112)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **dds::sub::DataReader** (p. 976) entities that join the network later.

Classes

- struct **dds::core::policy::DurabilityKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) DurabilityKind.*
- class **dds::core::policy::Durability**

  *Specifies whether a **dds::pub::DataWriter** (p. 1138) will store and deliver previously published data samples to late-joining **dds::sub::DataReader** (p. 976) entities.*
- class **rti::core::PersistentStorageSettings**

  <<***extension***>> *(p. 354) Configures the persistent storage settings for durable writer history and durable reader state.*

Typedefs

- typedef **dds::core::safe_enum**< **DurabilityKind_def** > **dds::core::policy::DurabilityKind**

  ***Safe Enumeration** (p. 429) of **DurabilityKind_def** (p. 1441)*

Enumerations

- enum class **rti::core::policy::PersistentJournalKind** {
  PersistentJournalKind::delete_journal = DDS_DELETE_PERSISTENT_JOURNAL ,
  PersistentJournalKind::truncate_journal = DDS_TRUNCATE_PERSISTENT_JOURNAL ,
  PersistentJournalKind::persist_journal = DDS_PERSIST_PERSISTENT_JOURNAL ,
  PersistentJournalKind::memory_journal = DDS_MEMORY_PERSISTENT_JOURNAL ,
  PersistentJournalKind::wal_journal = DDS_WAL_PERSISTENT_JOURNAL ,
  PersistentJournalKind::off = DDS_OFF_PERSISTENT_JOURNAL }

  <<***extension***>> *(p. 354) The enumeration for the journal kind of the persistent storage for durable writer history and durable reader state.*
- enum class **rti::core::policy::PersistentSynchronizationKind** {
  PersistentSynchronizationKind::normal = DDS_NORMAL_PERSISTENT_SYNCHRONIZATION ,
  PersistentSynchronizationKind::full = DDS_FULL_PERSISTENT_SYNCHRONIZATION ,
  PersistentSynchronizationKind::off = DDS_OFF_PERSISTENT_SYNCHRONIZATION }

  <<***extension***>> *(p. 354) The enumeration for the synchronization kind of the persistent storage for durable writer history and durable reader state.*

Functions

- int32_t **rti::core::policy::auto_writer_depth** ()

  <<***extension***>> *(p. 116) The default value for **dds::core::policy::Durability::writer_depth** (p. 1439)*

6.158.1 Detailed Description

<<***spec***>> *(p. 112)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **dds::sub::DataReader** (p. 976) entities that join the network later.

6.158.2 Typedef Documentation

6.158.2.1 DurabilityKind

`typedef` **`dds::core::safe_enum< DurabilityKind_def> dds::core::policy::DurabilityKind`**

Safe Enumeration (p. 429) of **DurabilityKind_def** (p. 1441)

See also

DurabilityKind_def (p. 1441)

6.158.3 Enumeration Type Documentation

6.158.3.1 PersistentJournalKind

`enum class` **`rti::core::policy::PersistentJournalKind`** `[strong]`

<<***extension***>> *(p. 354)* The enumeration for the journal kind of the persistent storage for durable writer history and durable reader state.

Enumerator

delete_journal	Deletes the rollback journal at the conclusion of each transaction.
truncate_journal	Commits transactions by truncating the rollback journal to zero-length instead of deleting it.
persist_journal	Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.
memory_journal	Stores the rollback journal in volatile RAM. This saves disk I/O.
wal_journal	Uses a write-ahead log instead of a rollback journal to implement transactions.
off	Disables the rollback journal.

6.158.3.2 PersistentSynchronizationKind

```
enum class rti::core::policy::PersistentSynchronizationKind [strong]
```

<<***extension***>> *(p. 354)* The enumeration for the synchronization kind of the persistent storage for durable writer history and durable reader state.

Enumerator

normal	Data (e.g., new sample) is written to disk at critical moments.
full	Data (e.g., new sample) is written to physical disk immediately.
off	No synchronization is enforced.

6.158.4 Function Documentation

6.158.4.1 auto_writer_depth()

```
int32_t rti::core::policy::auto_writer_depth ( ) [inline]
```

<<***extension***>> *(p. 116)* The default value for **dds::core::policy::Durability::writer_depth** (p. 1439)

Note

This is a standalone function in the namespace rti::core::policy

This values resolves to the following:

- **dds::core::policy::History::depth** (p. 1605) if the history kind is **dds::core::policy::HistoryKind_def::KEEP_LAST** (p. 1607).
- **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 2207) in the **dds::core::policy::ResourceLimits** (p. 2203) if the history kind is **dds::core::policy::HistoryKind_def::KEEP_ALL** (p. 1607).

Referenced by **rti::core::policy::DomainParticipantResourceLimits::local_writer_allocation()**.

6.159 DURABILITY_SERVICE

<<***spec***>> *(p. 112)* Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **dds::core::policy::Durability** (p. 1433) setting of **dds::core::policy::DurabilityKind_def::PERSISTENT** (p. 1442) or **dds::core::policy::DurabilityKind_def::TRANSIENT** (p. 1442).

Classes

- class **dds::core::policy::DurabilityService**

  Configures the external RTI Persistence Service used by persistent and transient DataWriters.

6.159.1 Detailed Description

<<***spec***>> *(*p. *112)* Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **dds::core::policy::Durability** (p. 1433) setting of **dds::core::policy::DurabilityKind_def::↩ PERSISTENT** (p. 1442) or **dds::core::policy::DurabilityKind_def::TRANSIENT** (p. 1442).

6.160 ENTITY_FACTORY

<<***spec***>> *(*p. *112)* A QoS policy for all **dds::core::Entity** (p. 1520) types that can act as factories for one or more other **dds::core::Entity** (p. 1520) types.

Classes

- class **dds::core::policy::EntityFactory**

  *Configures a **dds::core::Entity** (p. 1520) that acts as factory of other entities.*

6.160.1 Detailed Description

<<***spec***>> *(*p. *112)* A QoS policy for all **dds::core::Entity** (p. 1520) types that can act as factories for one or more other **dds::core::Entity** (p. 1520) types.

6.161 ENTITY_NAME

<<***extension***>> *(*p. *116)* Assigns a name to a **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976). Except for **dds::pub::Publisher** (p. 1993) and **dds::sub::Subscriber** (p. 2410), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

Classes

- class **rti::core::policy::EntityName**

  <<***extension***>> *(*p. *116) Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader.*

6.161.1 Detailed Description

<<***extension***>> *(p. 116)* Assigns a name to a **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::pub::DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976). Except for **dds::pub::Publisher** (p. 1993) and **dds::sub::Subscriber** (p. 2410), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

6.162 EVENT

<<***extension***>> *(p. 116)* Configures the internal thread in a DomainParticipant that handles timed events.

Classes

- class **rti::core::policy::Event**

  <<***extension***>> *(p. 116) Configures the thread in a DomainParticipant that handles timed events.*

6.162.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the internal thread in a DomainParticipant that handles timed events.

6.163 HISTORY

<<***spec***>> *(p. 112)* Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Classes

- struct **dds::core::policy::HistoryKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) HistoryKind.*
- class **dds::core::policy::History**

  *Specifies how much historical data a **dds::pub::DataWriter** (p. 1138) and a **dds::sub::DataReader** (p. 976) can store.*

Typedefs

- typedef **dds::core::safe_enum**< **HistoryKind_def** > **dds::core::policy::HistoryKind**

  ***Safe Enumeration** (p. 429) of **HistoryKind_def** (p. 1606)*

6.163.1 Detailed Description

<<***spec***>> *(p. 112)* Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

6.163.2 Typedef Documentation

6.163.2.1 HistoryKind

`typedef` **`dds::core::safe_enum< HistoryKind_def> dds::core::policy::HistoryKind`**

Safe Enumeration (p. 429) of **HistoryKind_def** (p. 1606)

See also

HistoryKind_def (p. 1606)

6.164 GROUP_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.

Classes

- class **dds::core::policy::GroupData**

6.164.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.

6.165 LATENCY_BUDGET

<<***spec***>> *(p. 112)* Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Classes

- class **dds::core::policy::LatencyBudget**

  Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

6.165.1 Detailed Description

<<***spec***>> *(p. 112)* Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

6.166 LIFESPAN

<<***spec***>> *(p. 112)* Specifies how long the data written by the **dds::pub::DataWriter** (p. 1138) is considered valid.

Classes

- class **dds::core::policy::Lifespan**

  *Specifies how long the data written by a **dds::pub::DataWriter** (p. 1138) is considered valid.*

6.166.1 Detailed Description

<<***spec***>> *(p. 112)* Specifies how long the data written by the **dds::pub::DataWriter** (p. 1138) is considered valid.

6.167 LIVELINESS

<<***spec***>> *(p. 112)* Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 976) entities to detect when **dds::pub::DataWriter** (p. 1138) entities become disconnected or "dead."

Classes

- struct **dds::core::policy::LivelinessKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) LivelinessKind.*
- class **dds::core::policy::Liveliness**

  *Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 976)'s to detect when **dds::pub::Data↩ Writer** (p. 1138)'s become disconnected.*

Typedefs

- typedef **dds::core::safe_enum**< **LivelinessKind_def** > **dds::core::policy::LivelinessKind**

  ***Safe Enumeration** (p. 429) of **LivelinessKind_def** (p. 1654)*

6.167.1 Detailed Description

<<***spec***>> *(p. 112)* Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 976) entities to detect when **dds::pub::DataWriter** (p. 1138) entities become disconnected or "dead."

6.167.2 Typedef Documentation

6.167.2.1 LivelinessKind

```
typedef dds::core::safe_enum< LivelinessKind_def> dds::core::policy::LivelinessKind
```

Safe Enumeration (p. 429) of **LivelinessKind_def** (p. 1654)

See also

LivelinessKind_def (p. 1654)

6.168 LOCATORFILTER

<<***extension***>> *(p. 116)* The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **dds::topic::PublicationBuiltinTopicData** (p. 1977).

Classes

- class **rti::core::LocatorFilterElement**

  <<***extension***>> (p. *354)* <<***value-type***>> (p. *350) Specifies the configuration of an individual channel within a Multi↩ Channel DataWriter.*
- class **rti::core::policy::LocatorFilter**

  <<***extension***>> (p. *116) Configures how the* ***dds::topic::PublicationBuiltinTopicData*** (p. *1977) reports the configuration of a* ***MultiChannel*** (p. *1749) DataWriter.*

6.168.1 Detailed Description

<<***extension***>> *(p. 116)* The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **dds::topic::PublicationBuiltinTopicData** (p. 1977).

6.169 LOGGING

<<***extension***>> *(p. 116)* Configures the RTI Connext logging facility.

<<***extension***>> *(p. 116)* Configures the RTI Connext logging facility.

6.170 MONITORING

<<***extension***>> *(p. 116)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

Classes

- class **rti::core::policy::Monitoring**

  *<<**extension**>> (p. 116) Configures the use of the RTI **Monitoring** (p. 1706) Library 2.0 to collect and distribute RTI Connext telemetry data.*
- class **rti::core::MonitoringPeriodicDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of periodic metrics.*
- class **rti::core::MonitoringEventDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of event metrics.*
- class **rti::core::MonitoringLoggingDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of log messages.*
- class **rti::core::MonitoringDedicatedParticipantSettings**

  *<<**extension**>> (p. 354) Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.*
- class **rti::core::MonitoringDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of telemetry data.*
- class **rti::core::MonitoringMetricSelection**

  *<<**extension**>> (p. 354) Configures event and periodic metrics collection and distribution for a specific set of observable resources.*
- class **rti::core::MonitoringLoggingForwardingSettings**

  *<<**extension**>> (p. 354) Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 459).*
- class **rti::core::MonitoringTelemetryData**

  *<<**extension**>> (p. 354) Configures the telemetry data that will be distributed.*

6.170.1 Detailed Description

*<<**extension**>> (p. 116)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

6.171 MULTICHANNEL

*<<**extension**>> (p. 116)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Classes

- class **rti::core::policy::MultiChannel**

  *<<**extension**>> (p. 116) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.*
- class **rti::core::ChannelSettings**

  *<<**extension**>> (p. 354) Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1749)*

Typedefs

- typedef std::vector< **ChannelSettings** > **rti::core::ChannelSettingsSeq**

  <<***extension***>> *(p. 354) A sequence of* ***ChannelSettings*** *(p. 921)*

6.171.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

6.171.2 Typedef Documentation

6.171.2.1 ChannelSettingsSeq

```
typedef std::vector< ChannelSettings>  rti::core::ChannelSettingsSeq
```

<<***extension***>> *(p. 354)* A sequence of **ChannelSettings** (p. 921)

6.172 OWNERSHIP

<<***spec***>> *(p. 112)* Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 1138) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Classes

- struct **dds::core::policy::OwnershipKind_def**

  The definition of the ***dds::core::safe_enum*** *(p. 2265) OwnershipKind.*
- class **dds::core::policy::Ownership**

  Specifies whether it is allowed for multiple ***dds::pub::DataWriter*** *(p. 1138)'s to write the same instance of the data and if so, how these modifications should be arbitrated.*

Typedefs

- typedef **dds::core::safe_enum**< **OwnershipKind_def** > **dds::core::policy::OwnershipKind**

  Safe Enumeration *(p. 429) of* ***OwnershipKind_def*** *(p. 1905)*

6.172.1 Detailed Description

<<***spec***>> *(p. 112)* Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 1138) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

6.172.2 Typedef Documentation

6.172.2.1 OwnershipKind

`typedef` **`dds::core::safe_enum< OwnershipKind_def> dds::core::policy::OwnershipKind`**

Safe Enumeration (p. 429) of **OwnershipKind_def** (p. 1905)

See also

OwnershipKind_def (p. 1905)

6.173 OWNERSHIP_STRENGTH

<<***spec***>> *(p. 112)* Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by **dds::topic::Topic** (p. 2474) + key).

Classes

- class **dds::core::policy::OwnershipStrength**

  *Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by its **dds::topic::Topic** (p. 2474) and key).*

6.173.1 Detailed Description

<<***spec***>> *(p. 112)* Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 1138) objects that attempt to modify the same instance of a data type (identified by **dds::topic::Topic** (p. 2474) + key).

6.174 PARTITION

<<***spec***>> *(p. 112)* Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities.

Classes

- class **dds::core::policy::Partition**

  *Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities.*

6.174.1 Detailed Description

<<***spec***>> *(p. 112)* Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1326), **dds::pub::Publisher** (p. 1993), or **dds::sub::Subscriber** (p. 2410) entities.

6.175 PRESENTATION

<<***spec***>> *(p. 112)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

Classes

- struct **dds::core::policy::PresentationAccessScopeKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) PresentationAccessScopeKind.*
- class **dds::core::policy::Presentation**

  Specifies how the samples representing changes to data instances are presented to a subscribing application.

Typedefs

- typedef **dds::core::safe_enum< PresentationAccessScopeKind_def > dds::core::policy::Presentation↩ AccessScopeKind**

  ***Safe Enumeration** (p. 429) of **PresentationAccessScopeKind_def** (p. 1950)*

6.175.1 Detailed Description

<<***spec***>> *(p. 112)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

6.175.2 Typedef Documentation

6.175.2.1 PresentationAccessScopeKind

`typedef` **`dds::core::safe_enum< PresentationAccessScopeKind_def> dds::core::policy::Presentation↩ AccessScopeKind`**

Safe Enumeration (p. 429) of **PresentationAccessScopeKind_def** (p. 1950)

See also

PresentationAccessScopeKind_def (p. 1950)

6.176 PROFILE

<<***extension***>> *(p. 116)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

Classes

- class **rti::core::QosProviderParams**

  <<***extension***>> (p. *354)* <<***value-type***>> (p. *350) Configure options that control the way that XML documents containing QoS profiles are loaded by a* ***dds::core::QosProvider*** *(p. 2025).*

6.176.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

6.177 PROPERTY

<<***extension***>> *(p. 116)* Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Classes

- class **rti::core::policy::Property**

  <<***extension***>> (p. *116) Stores key/value string pairs that can configure certain parameters of RTI Connext not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a* ***dds::core::Entity*** *(p. 1520).*

6.177.1 Detailed Description

<<***extension***>> *(p. 116)* Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

RTI Connext will automatically set some system properties in the **rti::core::policy::Property** (p. 1969) associated with a **dds::domain::qos::DomainParticipantQos** (p. 1384). See **System Properties** (p. 301) for additional details.

6.178 PUBLISH_MODE

<<***extension***>> *(p. 116)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

Classes

- class **rti::core::policy::PublishMode**

  <<***extension***>> *(p. 116) Specifies whether a* ***dds::pub::DataWriter*** *(p. 1138) sends data synchronously or asynchronously.*
- struct **rti::core::policy::PublishModeKind_def**

  <<***extension***>> *(p. 354) The enumeration for* ***PublishMode*** *(p. 2013) kinds*

Typedefs

- typedef **dds::core::safe_enum< PublishModeKind_def > rti::core::policy::PublishModeKind**

  <<***extension***>> *(p. 354)* ***Safe Enumeration*** *(p. 429) of* ***PublishModeKind_def*** *(p. 2018)*

Variables

- const int32_t **rti::core::PUBLICATION_PRIORITY_UNDEFINED**

  Initializer value for ***rti::core::policy::PublishMode::priority*** *(p. 2017) and/or* ***rti::core::ChannelSettings::priority*** *(p. 924).*
- const int32_t **rti::core::PUBLICATION_PRIORITY_AUTOMATIC**

  Constant value for ***rti::core::policy::PublishMode::priority*** *(p. 2017) and/or* ***rti::core::ChannelSettings::priority*** *(p. 924).*

6.178.1 Detailed Description

<<***extension***>> *(p. 116)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

6.178.2 Typedef Documentation

6.178.2.1 PublishModeKind

```
typedef dds::core::safe_enum< PublishModeKind_def> rti::core::policy::PublishModeKind
```

<<***extension***>> *(p. 354)* **Safe Enumeration** (p. 429) of **PublishModeKind_def** (p. 2018)

See also

PublishModeKind_def (p. 2018)

6.178.3 Variable Documentation

6.178.3.1 PUBLICATION_PRIORITY_UNDEFINED

```
const int32_t rti::core::PUBLICATION_PRIORITY_UNDEFINED
```

Initializer value for **rti::core::policy::PublishMode::priority** (p. 2017) and/or **rti::core::ChannelSettings::priority** (p. 924).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the lowest possible value. For muilti-channel data writers, if either the data writer or channel priority is NOT set to this value, then the publication priority of the entity will be set to the defined value.

6.178.3.2 PUBLICATION_PRIORITY_AUTOMATIC

```
const int32_t rti::core::PUBLICATION_PRIORITY_AUTOMATIC
```

Constant value for **rti::core::policy::PublishMode::priority** (p. 2017) and/or **rti::core::ChannelSettings::priority** (p. 924).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the largest priority value of any sample currently queued for publication by the data writer or data writer channel.

6.179 READER_DATA_LIFECYCLE

<<***spec***>> *(p. 112)* Controls how a DataReader manages the lifecycle of the data that it has received.

Classes

- class **dds::core::policy::ReaderDataLifecycle**

  Controls how a DataReader manages the lifecycle of the data that it has received.

6.179.1 Detailed Description

<<***spec***>> *(p. 112)* Controls how a DataReader manages the lifecycle of the data that it has received.

6.180 RECEIVER_POOL

<<***extension***>> *(p. 116)* Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

Classes

- class **rti::core::policy::ReceiverPool**

  <<***extension***>> *(*p. *116) Configures threads that RTI Connext uses to receive and process data from the transport modules (such as UDP)*

6.180.1 Detailed Description

<<***extension***>> *(*p. *116)* Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

6.181 RELIABILITY

<<***spec***>> *(*p. *112)* Indicates the level of reliability offered/requested by RTI Connext.

Classes

- struct **dds::core::policy::ReliabilityKind_def**

  The definition of the ***dds::core::safe_enum*** *(*p. *2265) ReliabilityKind.*
- class **dds::core::policy::Reliability**

  Indicates the level of reliability in sample delivered that a ***dds::pub::DataWriter*** *(*p. *1138) offers or a* ***dds::sub::Data↩ Reader*** *(*p. *976) requests.*
- struct **rti::core::policy::AcknowledgmentKind_def**

  <<***extension***>> *(*p. *354) The enumeration for Reliability acknowledgment kinds*

Typedefs

- typedef **dds::core::safe_enum< ReliabilityKind_def > dds::core::policy::ReliabilityKind**

  Safe Enumeration *(*p. *429) of* ***ReliabilityKind_def*** *(*p. *2156)*
- typedef **dds::core::safe_enum< AcknowledgmentKind_def > rti::core::policy::AcknowledgmentKind**

  <<***extension***>> *(*p. *354)* ***Safe Enumeration*** *(*p. *429) of* ***AcknowledgmentKind_def*** *(*p. *797)*

Enumerations

- enum class **rti::core::policy::InstanceStateConsistencyKind** {
  InstanceStateConsistencyKind::none ,
  InstanceStateConsistencyKind::recover_state }

  <<***extension***>> *(*p. *354) The enumeration for instance state consistency kinds*

6.181.1 Detailed Description

<<***spec***>> *(*p. *112)* Indicates the level of reliability offered/requested by RTI Connext.

6.181.2 Typedef Documentation

6.181.2.1 ReliabilityKind

typedef **dds::core::safe_enum**< **ReliabilityKind_def**> **dds::core::policy::ReliabilityKind**

Safe Enumeration (p. 429) of **ReliabilityKind_def** (p. 2156)

See also

ReliabilityKind_def (p. 2156)

6.181.2.2 AcknowledgmentKind

typedef **dds::core::safe_enum**< **AcknowledgmentKind_def**> **rti::core::policy::AcknowledgmentKind**

<<***extension***>> *(p. 354)* **Safe Enumeration** (p. 429) of **AcknowledgmentKind_def** (p. 797)

See also

AcknowledgmentKind_def (p. 797)

6.181.3 Enumeration Type Documentation

6.181.3.1 InstanceStateConsistencyKind

enum class **rti::core::policy::InstanceStateConsistencyKind** [strong]

<<***extension***>> *(p. 354)* The enumeration for instance state consistency kinds

Enumerator

none	Instance states on the DataReader are not guaranteed to be correct after liveliness is regained after a disconnect. When DataReaders rediscover DataWriters, they will not request updated instance state data. DataWriters always provide instance state data alongside each sample update regardless of this setting.
recover_state	Instance states on the DataReader are guaranteed to be correct after liveliness is regained after a disconnect. When DataReaders rediscover DataWriters, they will request updated instance state data. DataWriters will respond to requests for updated instance state data and publish updates on a builtin channel. DataWriters still provide instance state data alongside each sample update regardless of this setting. The following limitation applies to using RECOVER_INSTANCE_STATE_CONSISTENCY: If the **dds::core::policy::DestinationOrderKind_def** (p. 1263) is set to **dds::core::policy::DestinationOrderKind_def::BY_SOURCE_TIMESTAMP** (p. 1264),

Generated by Doxygen

6.182 RESOURCE_LIMITS

<<***spec***>> *(*p. *112)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Classes

- class **dds::core::policy::ResourceLimits**

  Controls the memory usage of ***dds::pub::DataWriter*** *(*p. *1138) or a* ***dds::sub::DataReader*** *(*p. *976).*

6.182.1 Detailed Description

<<***spec***>> *(*p. *112)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

6.183 SERVICE

<<***extension***>> *(*p. *116)* Service QoS policy is used to indicate what kind of service or tool is associated with the DDS entity.

Classes

- class **rti::core::policy::Service**

  <<***extension***>> *(*p. *116) Indicates if an Entity is associated with a service or tool and if so, which one.*
- struct **rti::core::policy::ServiceKind_def**

  <<***extension***>> *(*p. *354) The definition of the* ***dds::core::safe_enum*** *(*p. *2265) ServiceKind*

Typedefs

- typedef **dds::core::safe_enum**< **ServiceKind_def** > **rti::core::policy::ServiceKind**

  <<***extension***>> *(*p. *354)* ***Safe Enumeration*** *(*p. *429) of* ***ServiceKind_def*** *(*p. *2357)*

6.183.1 Detailed Description

<<***extension***>> *(*p. *116)* Service QoS policy is used to indicate what kind of service or tool is associated with the DDS entity.

6.183.2 Typedef Documentation

6.183.2.1 ServiceKind

```
typedef dds::core::safe_enum< ServiceKind_def> rti::core::policy::ServiceKind
```

<<***extension***>> *(*p. *354)* **Safe Enumeration** (p. 429) of **ServiceKind_def** (p. 2357)

See also

ServiceKind_def (p. 2357)

6.184 SYSTEM_RESOURCE_LIMITS

<<***extension***>> *(*p. *116)* Configures DomainParticipant-independent resources used by RTI Connext.

Classes

- class **rti::core::policy::SystemResourceLimits**
  <<***extension***>> *(*p. *116) Configures resources that RTI Connext uses*

6.184.1 Detailed Description

<<***extension***>> *(*p. *116)* Configures DomainParticipant-independent resources used by RTI Connext.

6.185 TIME_BASED_FILTER

<<***spec***>> *(*p. *112)* Filter that allows a **dds::sub::DataReader** (p. 976) to specify that it is interested only in (potentially) a subset of the values of the data.

Classes

- class **dds::core::policy::TimeBasedFilter**
  *Allows a **dds::sub::DataReader** (p. 976) to indicate that it is not interested in all the sample updates that occur within a time period.*

6.185.1 Detailed Description

<<***spec***>> *(*p. *112)* Filter that allows a **dds::sub::DataReader** (p. 976) to specify that it is interested only in (potentially) a subset of the values of the data.

6.186 TOPIC_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.

Classes

- class **dds::core::policy::TopicData**

6.186.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.

6.187 TOPIC_QUERY_DISPATCH

<<***extension***>> *(p. 116)* Configures the ability of a **dds::pub::DataWriter** (p. 1138) to publish historical samples

Classes

- class **rti::core::policy::TopicQueryDispatch**

  <<***extension***>> *(p. 116) Configures the ability of a **dds::pub::DataWriter** (p. 1138) to publish samples in response to a **rti::sub::TopicQuery** (p. 2516)*

6.187.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the ability of a **dds::pub::DataWriter** (p. 1138) to publish historical samples

6.188 TRANSPORT_BUILTIN

<<***extension***>> *(p. 116)* Specifies which built-in transports are used.

Classes

- class **rti::core::policy::TransportBuiltin**

  <<***extension***>> *(p. 116) Specifies which built-in transports to use*
- class **rti::core::policy::TransportBuiltinMask**

  <<***extension***>> *(p. 354) Mask that specifies which built-in transports are used*

6.188.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies which built-in transports are used.

6.189 TRANSPORT_MULTICAST

<<***extension***>> *(*p. *116)* Specifies the multicast address on which a **dds::sub::DataReader** (p. 976) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **dds::domain::DomainParticipant** (p. 1326) level) transports with which to receive the multicast data.

Classes

- class **rti::core::policy::TransportMulticast**

  <<***extension***>> *(*p. *116) Specifies the multicast address on which a **dds::sub::DataReader** (*p. *976) wants to receive its data and other settings.*
- struct **rti::core::policy::TransportMulticastKind_def**

  <<***extension***>> *(*p. *354) The definition of the **dds::core::safe_enum** (*p. *2265) TransportMulticastKind*
- class **rti::core::TransportMulticastSettings**

  <<***extension***>> *(*p. *354) Represents a list of multicast locators*

Typedefs

- typedef **dds::core::safe_enum**< **TransportMulticastKind_def** > **rti::core::policy::TransportMulticastKind**

  <<***extension***>> *(*p. *354) **Safe Enumeration** (*p. *429) of **TransportMulticastKind_def** (*p. *2547)*
- typedef std::vector< **TransportMulticastSettings** > **rti::core::TransportMulticastSettingsSeq**

  *A sequence of **TransportMulticastSettings** (*p. *2549).*

6.189.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the multicast address on which a **dds::sub::DataReader** (p. 976) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **dds::domain::DomainParticipant** (p. 1326) level) transports with which to receive the multicast data.

6.189.2 Typedef Documentation

6.189.2.1 TransportMulticastKind

```
typedef dds::core::safe_enum< TransportMulticastKind_def> rti::core::policy::TransportMulticast↩
Kind
```

<<***extension***>> *(*p. *354)* **Safe Enumeration** (p. 429) of **TransportMulticastKind_def** (p. 2547)

See also

TransportMulticastKind_def (p. 2547)

6.189.2.2 TransportMulticastSettingsSeq

```
typedef std::vector< TransportMulticastSettings> rti::core::TransportMulticastSettingsSeq
```

A sequence of **TransportMulticastSettings** (p. 2549).

6.190 TRANSPORT_MULTICAST_MAPPING

<<***extension***>> *(*p. *116)* Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

Classes

- class **rti::core::policy::TransportMulticastMapping**

  <<***extension***>> *(*p. *116) Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.*

6.190.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

6.191 TRANSPORT_PRIORITY

<<***spec***>> *(*p. *112)* This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

Classes

- class **dds::core::policy::TransportPriority**

  Allows applications to take advantage of transports capable of sending messages with different priorities.

6.191.1 Detailed Description

<<***spec***>> *(*p. *112)* This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

6.192 TRANSPORT_SELECTION

<<***extension***>> *(*p. *116)* Specifies the physical transports that a **dds::pub::DataWriter** (p. 1138) or **dds::sub::↩ DataReader** (p. 976) may use to send or receive data.

Classes

- class **rti::core::policy::TransportSelection**

  <<***extension***>> *(*p. *116) Specifies the transports that a **dds::pub::DataWriter** (*p. *1138) or a **dds::sub::DataReader** (*p. *976) may use to send or receive data*

6.192.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the physical transports that a **dds::pub::DataWriter** (p. 1138) or **dds::sub::↩ DataReader** (p. 976) may use to send or receive data.

6.193 TRANSPORT_UNICAST

<<***extension***>> *(*p. *116)* Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Classes

- class **rti::core::policy::TransportUnicast**

  <<***extension***>> *(*p. *116) Specifies a subset of transports and a port number that can be used by a **dds::core::Entity** (*p. *1520) to receive data.*
- class **rti::core::TransportUnicastSettings**

  <<***extension***>> (p. *354) Represents a list of unicast locators*

Typedefs

- typedef std::vector< **TransportUnicastSettings** > **rti::core::TransportUnicastSettingsSeq**

  <<***extension***>> *(p. 354) A sequence of* ***TransportUnicastSettings*** *(p. 2559)*

6.193.1 Detailed Description

<<***extension***>> *(p. 116)* Specifies a subset of transports and a port number that can be used by an Entity to receive data.

6.193.2 Typedef Documentation

6.193.2.1 TransportUnicastSettingsSeq

```
typedef std::vector< TransportUnicastSettings>  rti::core::TransportUnicastSettingsSeq
```

<<***extension***>> *(p. 354)* A sequence of **TransportUnicastSettings** (p. 2559)

6.194 TYPE_CONSISTENCY_ENFORCEMENT

<<***spec***>> *(p. 112)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Classes

- struct **dds::core::policy::TypeConsistencyEnforcementKind_def**

  The definition of the ***dds::core::safe_enum*** *(p. 2265) TypeConsistencyEnforcementKind.*
- class **dds::core::policy::TypeConsistencyEnforcement**

  Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Typedefs

- typedef **dds::core::safe_enum**< **TypeConsistencyEnforcementKind_def** > **dds::core::policy::Type↩ ConsistencyEnforcementKind**

  Safe Enumeration *(p. 429) of* ***TypeConsistencyEnforcementKind_def*** *(p. 2570)*

6.194.1 Detailed Description

<<***spec***>> *(p. 112)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

6.194.2 Typedef Documentation

6.194.2.1 TypeConsistencyEnforcementKind

`typedef` **`dds::core::safe_enum< TypeConsistencyEnforcementKind_def> dds::core::policy::Type↩ ConsistencyEnforcementKind`**

Safe Enumeration (p. 429) of **TypeConsistencyEnforcementKind_def** (p. 2570)

See also

TypeConsistencyEnforcementKind_def (p. 2570)

6.195 TYPESUPPORT

[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Allows you to attach application-specific values to a **dds::pub::↩ DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Classes

- class **rti::core::policy::TypeSupport**

  <<***extension***>> *(p. 116) Allows attaching application-specific information to a **dds::pub::DataWriter** (p. 1138) or **dds::↩ sub::DataReader** (p. 976) that is passed to the serilization and deserialization routines.*
- struct **rti::core::policy::CdrPaddingKind_def**

  <<***extension***>> *(p. 354) The definition of the **dds::core::safe_enum** (p. 2265) CdrPaddingKind*

Typedefs

- typedef **dds::core::safe_enum< CdrPaddingKind_def > rti::core::policy::CdrPaddingKind**

  <<***extension***>> *(p. 354) **Safe Enumeration** (p. 429) of **CdrPaddingKind_def** (p. 920)*

6.195.1 Detailed Description

[DEPRECATED] (p. 296) <<***extension***>> *(p. 116)* Allows you to attach application-specific values to a **dds::pub::↩ DataWriter** (p. 1138) or **dds::sub::DataReader** (p. 976), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

6.195.2 Typedef Documentation

6.195.2.1 CdrPaddingKind

```
typedef dds::core::safe_enum< CdrPaddingKind_def> rti::core::policy::CdrPaddingKind
```

<<***extension***>> *(*p. *354)* **Safe Enumeration** (p. 429) of **CdrPaddingKind_def** (p. 920)

See also

CdrPaddingKind_def (p. 920)

6.196 USER_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.

Classes

- class **dds::core::policy::UserData**
  *Attaches a buffer of opaque data that is distributed by **Built-in Topics** (*p. *46) during discovery.*

6.196.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 46) during discovery.

6.197 WRITER_DATA_LIFECYCLE

<<***spec***>> *(*p. *112)* Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

Classes

- class **dds::core::policy::WriterDataLifecycle**
  *Controls how a **dds::pub::DataWriter** (*p. *1138) handles the lifecycle of the instances (keys) that it writes.*

6.197.1 Detailed Description

<<***spec***>> *(*p. *112)* Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

6.198 WIRE_PROTOCOL

<<***extension***>> *(*p. *116)* Specifies the wire protocol related attributes for the **dds::domain::DomainParticipant** (p. 1326).

Classes

- class **rti::core::policy::WireProtocol**

  <<***extension***>> *(*p. *116) Configures the write protocol of a* ***dds::domain::DomainParticipant*** *(*p. *1326)*
- struct **rti::core::policy::WireProtocolAutoKind_def**

  <<***extension***>> *(*p. *354) The definition of the* ***dds::core::safe_enum*** *(*p. *2265) WireProtocolAutoKind*
- class **rti::core::policy::RtpsReservedPortKindMask**

  <<***extension***>> *(*p. *354) Mask of reserved ports*
- class **rti::core::RtpsWellKnownPorts**

  <<***extension***>> *(*p. *354) Configures the mapping of the RTPS well-known ports*

Typedefs

- typedef **dds::core::safe_enum**< **WireProtocolAutoKind_def** > **rti::core::policy::WireProtocolAutoKind**

  <<***extension***>> *(*p. *354)* ***Safe Enumeration*** *(*p. *429) of* ***WireProtocolAutoKind_def*** *(*p. *2641)*

Functions

- static const **RtpsReservedPortKindMask** **rti::core::policy::RtpsReservedPortKindMask::all** ()

  All bits are set.
- static const **RtpsReservedPortKindMask** **rti::core::policy::RtpsReservedPortKindMask::none** ()

  No bits are set.
- static const **RtpsReservedPortKindMask** **rti::core::policy::RtpsReservedPortKindMask::default_mask** ()

  The default value of ***rti::core::policy::WireProtocol::rtps_reserved_port_mask*** *(*p. *2639).*
- static **RtpsWellKnownPorts** **rti::core::RtpsWellKnownPorts::Interoperable** ()

  Returns an instance containing the port mapping compliant with the OMG DDS Interoperability wire protocol.
- static **RtpsWellKnownPorts** **rti::core::RtpsWellKnownPorts::BackwardsCompatible** ()

  Returns an instance containing the port mapping compatible with previous versions of RTI Connext.

6.198.1 Detailed Description

<<***extension***>> *(*p. *116)* Specifies the wire protocol related attributes for the **dds::domain::DomainParticipant** (p. 1326).

6.198.2 Typedef Documentation

6.198.2.1 WireProtocolAutoKind

```
typedef dds::core::safe_enum< WireProtocolAutoKind_def> rti::core::policy::WireProtocolAutoKind
```

<<***extension***>> *(*p. *354)* **Safe Enumeration** (p. 429) of **WireProtocolAutoKind_def** (p. 2641)

See also

WireProtocolAutoKind_def (p. 2641)

6.198.3 Function Documentation

6.198.3.1 all()

```
static const RtpsReservedPortKindMask rti::core::policy::RtpsReservedPortKindMask::all ( ) [inline],
[static]
```

All bits are set.

All of the ports that may be needed by DDS will be reserved when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **rti::core::RtpsWellKnownPorts** (p. 2258) will be detected at this time, and the enable operation will fail.

Note that this will also reserve the **usertraffic** multicast port which is not actually used unless there are DataReaders that enable multicast but fail to specify a port. To avoid unnecesary resource usage for these ports, use RTPS_↩ RESERVED_PORT_MASK_DEFAULT.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

RtpsReservedPortKindMask (p. 2255)

References **rti::core::policy::RtpsReservedPortKindMask::RtpsReservedPortKindMask()**.

6.198.3.2 none()

```
static const RtpsReservedPortKindMask rti::core::policy::RtpsReservedPortKindMask::none ( ) [inline],
[static]
```

No bits are set.

None of the ports that are needed by DDS will be allocated until they are specifically required. With this value set, automatic participant Id selection will be based on selecting a port for discovery (metatraffic) unicast traffic on a single transport.

See also

RtpsReservedPortKindMask (p. 2255)

References **rti::core::policy::RtpsReservedPortKindMask::RtpsReservedPortKindMask()**.

6.198.3.3 default_mask()

```
static const RtpsReservedPortKindMask rti::core::policy::RtpsReservedPortKindMask::default_mask (
) [inline], [static]
```

The default value of **rti::core::policy::WireProtocol::rtps_reserved_port_mask** (p. 2639).

Most of the ports that may be needed by DDS will be reserved by the transport when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **rti::core::RtpsWellKnownPorts** (p. 2258) will be detected at this time and the enable operation will fail.

This setting will avoid reserving the **usertraffic** multicast port, which is not actually used unless there are DataReaders that enable multicast but fail to specify a port.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

RtpsReservedPortKindMask (p. 2255)

References **rti::core::policy::RtpsReservedPortKindMask::RtpsReservedPortKindMask()**.

6.198.3.4 Interoperable()

```
static RtpsWellKnownPorts rti::core::RtpsWellKnownPorts::Interoperable ( ) [inline], [static]
```

Returns an instance containing the port mapping compliant with the OMG DDS Interoperability wire protocol.

Assign **rti::core::policy::WireProtocol::rtps_well_known_ports** (p. 2638) to this value to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

The following are the `rtps_well_known_ports` values for **rti::core::RtpsWellKnownPorts::Interoperable()** (p. 557):

`port_base` = 7400
`domain_id_gain` = 250
`participant_id_gain` = 2
`builtin_multicast_port_offset` = 0
`builtin_unicast_port_offset` = 10
`user_multicast_port_offset` = 1
`user_unicast_port_offset` = 11

Assuming a maximum port number of 65535 (UDPv4), the above settings enable the use of about 230 domains with up to 120 Participants per node per domain.

These settings are *not* backwards compatible with previous versions of the RTI Connext middleware that used fixed port mappings. For backwards compability, please use **rti::core::RtpsWellKnownPorts::BackwardsCompatible()** (p. 558).

See also

rti::core::policy::WireProtocol::rtps_well_known_ports (p. 2638)

rti::core::RtpsWellKnownPorts::BackwardsCompatible() (p. 558)

6.198.3.5 BackwardsCompatible()

```
static RtpsWellKnownPorts rti::core::RtpsWellKnownPorts::BackwardsCompatible ( ) [inline], [static]
```

Returns an instance containing the port mapping compatible with previous versions of RTI Connext.

Assign **rti::core::policy::WireProtocol::rtps_well_known_ports** (p. 2638) to this value to remain compatible with previous versions of the RTI Connext middleware that used fixed port mappings.

The following are the `rtps_well_known_ports` values for **rti::core::RtpsWellKnownPorts::Backwards↩ Compatible()** (p. 558):

`port_base` = 7400
`domain_id_gain` = 10
`participant_id_gain` = 1000
`builtin_multicast_port_offset` = 2
`builtin_unicast_port_offset` = 0
`user_multicast_port_offset` = 1
`user_unicast_port_offset` = 3

These settings are *not* compliant with OMG's DDS Interoperability Wire Protocol. To comply with the specification, please use **rti::core::RtpsWellKnownPorts::Interoperable()** (p. 557).

rti::core::policy::WireProtocol::rtps_well_known_ports (p. 2638)

rti::core::RtpsWellKnownPorts::Interoperable() (p. 557)

6.199 NDDS_DISCOVERY_PEERS

Environment variable or a file that specifies the default values of **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) and **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268) contained in the dds::domain::qos::DomainParticipantQos::discovery qos policy.

Environment variable or a file that specifies the default values of **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) and **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268) contained in the dds::domain::qos::DomainParticipantQos::discovery qos policy.

The default value of the **dds::domain::qos::DomainParticipantQos** (p. 1384) is obtained by calling **dds::domain::DomainParticipant::default_participant_qos()** (p. 1341)().

NDDS_DISCOVERY_PEERS specifies the default value of the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) and **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268) fields, when the default participant QoS policies have not been explictly set by the user (i.e., **dds::domain::DomainParticipant::default_participant_qos()** (p. 1341)() has never been called or was called using PARTICIPANT_QOS_DEFAULT).

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268), starting at element 0. They will be stored in the order in which they appear in NDDS_DISCOVERY_PEERS.

Note: IPv4 multicast addresses must have a prefix. Therefore, when using the UDPv6 transport: if there are any IPv4 multicast addresses in the peers list, make sure they have "udpv4://" in front of them (such as udpv4://239.255.0.1).

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1268).

NDDS_DISCOVERY_PEERS provides a mechanism to dynamically switch the discovery configuration of an RTI Connext application without recompilation. The application programmer is free to not use the default values; instead use values supplied by other means.

NDDS_DISCOVERY_PEERS can be specified either in an environment variable as comma (',') separated "peer descriptors" (see **Peer Descriptor Format** (p. 560)) or in a file. These formats are described below.

6.199.1 Peer Descriptor Format

A **peer descriptor** string specifies a range of participants at a given `locator`. Peer descriptor strings are used in the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1268) field and the **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1352)() operation.

The anatomy of a `peer` descriptor is illustrated below using a UDPv4 transport and a custom "StarFabric" transport example.

A peer descriptor consists of:

optional **Participant ID Limit**. If a simple integer is specified, it indicates the maximum participant ID to be contacted by the RTI Connext discovery mechanism at the given locator. If that integer is enclosed in square brackets (e.g.: [2]) *only* that Participant ID will be used. You can also specify a range in the form of [a-b]: in this case only the Participant IDs in that specific range are contacted. If omitted, a default value of 4 is implied: participant IDs 0,1,2,3, and 4 will be contacted.

- **Locator (**p. **1673)**. See **Locator Format** (p. 560).

These are separated by the '@' character. The separator may be omitted if a participant ID limit is not explictly specified.

Note that the "participant ID limit" only applies to unicast locators; it is ignored for multicast locators (and therefore should be omitted for multicast peer descriptors).

6.199.1.1 Locator Format

A **locator** string specifies a transport and an address in string format. Locators are used to form peer descriptors. A locator is equivalent to a peer descriptor with the default maximum participant ID.

A locator consists of:

optional **Transport name** (**alias** or class). This identifies the set of transport plugins (**Transport Aliases** (p. 76)) that may be used to parse the `address` portion of the locator. Note that a transport class name is an implicit alias that is used to refer to all the transport plugin instances of that class.

optional **Address**. See **Address Format** (p. 561).

These are separated by the "//:" string. The separator is specified if and only if a transport name is specified.

If a transport name is specified, the address may be omitted; in that case, all the unicast addresses (across all transport plugin instances) associated with the transport class are implied. Thus, a locator string may specify several addresses.

If an address is specified, the transport name and the separator string may be omitted; in that case all the available transport plugins (for the **dds::core::Entity** (p. 1520)) may be used to parse the address string.

6.199.1.2 Address Format

An **address** string specifies a transport-independent network address that qualifies a **transport-dependent** address string. Addresses are used to form locators. Addresses are also used in **rti::core::policy::Discovery::multicast_↩ receive_addresses** (p. 1268), and **rti::core::TransportMulticastSettings::receive_address** (p. 2551) fields. An address is equivalent to a locator in which the transport name and separator are omitted.

An address consists of:

optional **Network Address**. An address in IPv4 or IPv6 string notation. If omitted, the network address of the transport is implied (**Transport Network Address** (p. 79)).

optional **Transport Address**. A string that is passed to the transport for processing. The transport maps this string into **NDDS_Transport_Property_t::address_bit_count** (p. 1788) bits. If omitted the network address is used as the fully qualified address.

These are separated by the '#' character. If a separator is specified, it must be followed by a non-empty string which is passed to the transport plugin. If the separator is omitted, it is treated as a transport address with an implicit network address (of the transport plugin). The implicit network address is the address used when registering the transport: e.g, the UDPv4 implicit network address is 0.0.0.0.0.0.0.0.0.0.0.0.

The bits resulting from the transport address string are combined with the network address. The least or most significant **NDDS_Transport_Property_t::address_bit_count** (p. 1788) bits of the network address are ignored and replaced with the transport address. The sign of the **NDDS_Transport_Property_t::address_bit_count** (p. 1788) value determines whether the most significant bits (negative sign) or least significant bits (positive sign) are ignored (**Transport Network Address** (p. 79)).

You can use a hostname instead of a transport address. If a hostname is used, the transport will attempt to resolve the hostname upon enabling the DomainParticipant. Changes to the hostname resolution will only be detected if the DNS tracker is enabled (it is enabled by default); see `Using DNS Tracker to Keep Peer List Updated`, in the Core Libraries User's Manual. For example:

```
<domain_participant_qos>

    <discovery>

        <initial_peers>

            <element>udpv4://myhostname</element>

        </initial_peers>

    </discovery>

</domain_participant_qos>
```

In this example, the DomainParticipant will attempt to resolve "myhostname" using the UDPv4 transport.

6.199.2 NDDS_DISCOVERY_PEERS Environment Variable Format

NDDS_DISCOVERY_PEERS can be specified via an environment variable of the same name, consisting of a sequence of peer descriptors separated by the comma (',') character.

Examples

Multicast (maximum participant ID is irrelevant)

- 239.255.0.1

Default maximum participant ID on localhost

- localhost

Default maximum participant ID on host 192.168.1.1 (IPv4)

- 192.168.1.1

Default maximum participant ID on host FAA0::0 (IPv6)

- FAA0::1

Default maximum participant ID on host himalaya accessed using the "udpv4" transport plugin(s) (IPv4)

- udpv4://himalaya

Default maximum participant ID on localhost using the "udpv4" transport plugin(s) registered at network address FAA0::0

- udpv4://FAA0::0#localhost

Default maximum participant ID on host 0/0/R (StarFabric)

- 0/0/R
- #0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s)

- starfabric://0/0/R
- starfabric://#0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s) registered at network address FAA0::0

- starfabric://FBB0::0#0/0/R

Default maximum participant ID on all unicast addresses accessed via the "starfabric" (StarFabric) transport plugin(s)

- starfabric://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s) registered at network address FCC0::0

- shmem://FCC0::0

Default maximum participant ID on hosts himalaya and gangotri

- himalaya,gangotri

Maximum participant ID of 1 on hosts himalaya and gangotri

- 1@himalaya,1@gangotri

Combinations of above

- 239.255.0.1,localhost,192.168.1.1,0/0/R
- FAA0::1,FAA0::0#localhost,FBB0::0#0/0/R
- udpv4://himalaya,udpv4://FAA0::0#localhost,#0/0/R
- starfabric://0/0/R,starfabric://FBB0::0#0/0/R,shmem://
- starfabric://,shmem://FCC0::0,1@himalaya,1@gangotri

6.199.3 NDDS_DISCOVERY_PEERS File Format

NDDS_DISCOVERY_PEERS can be specified via a file of the same name in the program's current working directory. A NDDS_DISCOVERY_PEERS file would contain a sequence of peer descriptors separated by whitespace or the comma (',') character. The file may also contain comments starting with a semicolon (';') character till the end of the line.

Example:

```
;; NDDS_DISCOVERY_PEERS - Discovery Configuration File
;;
;;
;; NOTE:
;;   1. This file must be in the current working directory, i.e.
;;      in the folder from which the application is launched.
;;
;;   2. This file takes precedence over the environment variable NDDS_DISCOVERY_PEERS
;;
;; Multicast
```

```
239.255.0.1                 ; The default dds discovery multicast address
;; Unicast
localhost,192.168.1.1       ; A comma can be used a separator
FAA0::1  FAA0::0#localhost  ; Whitespace can be used as a separator
1@himalaya                  ; Maximum participant ID of 1 on 'himalaya'
1@gangotri
;; UDPv4
udpv4://himalaya            ; 'himalaya' via 'udpv4' transport plugin(s)
udpv4://FAA0::0#localhost   ; 'localhost' via 'updv4' transport
                            ;  plugin registered at network address FAA0::0
;; Shared Memory
shmem://                    ; All 'shmem' transport plugin(s)
builtin.shmem://            ; The builtin 'shmem' transport plugin
shmem://FCC0::0             ; Shared memory transport plugin registered
                            ;                at network address FCC0::0
;; StarFabric
0/0/R                       ; StarFabric node 0/0/R
starfabric://0/0/R          ; 0/0/R accessed via 'starfabric'
                            ;             transport plugin(s)
starfabric://FBB0::0#0/0/R  ; StarFabric transport plugin registered
                            ;             at network address FBB0::0
starfabric://               ; All 'starfabric' transport plugin(s)
```

6.199.4 NDDS_DISCOVERY_PEERS Precedence

If the current working directory from which the RTI Connext application is launched contains a file called NDDS_↩ DISCOVERY_PEERS, and an environment variable named NDDS_DISCOVERY_PEERS is also defined, the file takes precedence; the environment variable is ignored.

6.199.5 NDDS_DISCOVERY_PEERS Default Value

If NDDS_DISCOVERY_PEERS is not specified (either as a file in the current working directory, or as an environment variable), it implicitly defaults to the following.

```
;; Multicast (only on platforms which allow UDPv4 multicast out of the box)
;;
;; This allows any dds applications anywhere on the local network to
```

```
;; discover each other over UDPv4.
builtin.udpv4://239.255.0.1  ; dds's default discovery multicast address
                             ; This is also the default multicast receive address
;; Unicast - UDPv4 (on all platforms)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over UDP/IPv4.
builtin.udpv4://127.0.0.1
;; Unicast - Shared Memory (only on platforms that support shared memory)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over shared memory.
builtin.shmem://
```

6.199.6 Builtin Transport Class Names

The class names for the builtin transport plugins are:

- `shmem` - ShmemTransport
- `udpv4` - UDPv4Transport
- `udpv6` - UDPv6Transport

These may be used as the transport names in the **Locator Format** (p. 560).

6.199.7 NDDS_DISCOVERY_PEERS and Local Host Communication

Suppose you want to communicate with other RTI Connext applications on the same host and you are setting NDDS↩ _DISCOVERY_PEERS explicitly (generally in order to use unicast discovery with applications on other hosts).

If the local host platform does not support the shared memory transport, then you can include the name of the local host in the NDDS_DISCOVERY_PEERS list.

If the local host platform supports the shared memory transport, then you can do one of the following:

- Include "shmem://" in the NDDS_DISCOVERY_PEERS list. This will cause shared memory to be used for discovery and data traffic for applications on the same host.

or:

- Include the name of the local host in the NDDS_DISCOVERY_PEERS list and disable the shared memory transport in the **rti::core::policy::TransportBuiltin** (p. 2533) of the **dds::domain::DomainParticipant** (p. 1326). This will cause UDP loopback to be used for discovery and data traffic for applications on the same host.

(To check if your platform supports shared memory, see the `Platform Notes`.)

6.201 ServiceRequest Built-in Topic

Builtin topic for accessing requests from different services within RTI Connext.

Classes

- struct **rti::core::ServiceRequestId_def**

  The definition of the rti::core::safe_enum ServiceRequestId.
- class **rti::topic::ServiceRequest**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A request coming from one of the built-in services*

Typedefs

- typedef **dds::core::safe_enum< ServiceRequestId_def > rti::core::ServiceRequestId**

  ***Safe Enumeration** (p. 429) of **ServiceRequestId_def** (p. 2361)*

Functions

- std::string **rti::topic::service_request_topic_name** ()

  ***ServiceRequest** (p. 2358) built-in topic name.*

6.201.1 Detailed Description

Builtin topic for accessing requests from different services within RTI Connext.

Currently, the **rti::sub::TopicQuery** (p. 2516), Locator Reachability Instance State Consistency and Controlability (part of Observability) all rely on this topic.

See also

Topic Queries (p. 67) for an explanation of how TopicQueries use ServiceRequests and how you can access the ServiceRequests for debugging purposes in the section **The Built-in ServiceRequest DataReader** (p. 70).

6.201.2 Typedef Documentation

6.201.2.1 ServiceRequestId

```
typedef dds::core::safe_enum< ServiceRequestId_def> rti::core::ServiceRequestId
```

Safe Enumeration (p. 429) of **ServiceRequestId_def** (p. 2361)

See also

ServiceRequestId_def (p. 2361)

6.201.3 Function Documentation

6.201.3.1 service_request_topic_name()

```
std::string rti::topic::service_request_topic_name ( )
```

ServiceRequest (p. 2358) built-in topic name.

Topic name of the builtin **dds::sub::DataReader** (p. 976) for the **rti::topic::ServiceRequest** (p. 2358) type

6.202 Topic-type serialization and deserialization

Provides functions to serialize and deserialize user data types to and from Common Data Representation (CDR) format.

Functions

- template<typename TopicType >
  void **rti::topic::from_cdr_buffer_no_alloc** (TopicType &sample, const std::vector< char > &buffer)

  Deserializes a sample from a buffer of bytes in CDR format.
- template<typename TopicType >
  TopicType **rti::topic::from_cdr_buffer** (const std::vector< char > &buffer)

  Creates a sample by deserializing a buffer of bytes in CDR format.
- template<typename TopicType >
  std::vector< char > & **rti::topic::to_cdr_buffer** (std::vector< char > &buffer, const TopicType &sample, **dds::core::policy::DataRepresentationId** representation)

  Serializes a sample into a buffer of octets in CDR format.
- template<typename TopicType >
  std::vector< char > & **rti::topic::to_cdr_buffer** (std::vector< char > &buffer, const TopicType &sample)

  Serializes a sample into a buffer of octets in CDR format.

6.202.1 Detailed Description

Provides functions to serialize and deserialize user data types to and from Common Data Representation (CDR) format.

CDR defines how a data sample is encoded before being sent over the network. In DDS, topic-types are serialized into bytes in CDR format to transmit them between DataWriters and DataReaders. The functions rti::topic::to_cdr() and rti::topic::from_cdr() expose this functionality so applications can take advantage of this capability. For more information, see `Data Representation` in the Core Libraries Extensible Types Guide.

6.202.2 Function Documentation

6.202.2.1 from_cdr_buffer_no_alloc()

```
template<typename TopicType >
void rti::topic::from_cdr_buffer_no_alloc (
            TopicType & sample,
            const std::vector< char > & buffer )
```

Deserializes a sample from a buffer of bytes in CDR format.

This function does the same as **from_cdr_buffer()** (p. 569) but it doesn't create a new sample. When deserializing multiple samples this operation will be more efficient.

Template Parameters

TopicType	A valid topic-type. Valid types are **IDL-generated types** (p. 606), the **built-in types** (p. 50) and **dds::core::xtypes::DynamicData** (p. 1461).

Parameters

sample	The destination (see precondition)
buffer	The CDR buffer to deserialize

References **rti::topic::from_cdr_buffer()**.

Referenced by **rti::topic::from_cdr_buffer()**.

6.202.2.2 from_cdr_buffer()

```
template<typename TopicType >
TopicType rti::topic::from_cdr_buffer (
            const std::vector< char > & buffer )
```

Creates a sample by deserializing a buffer of bytes in CDR format.

Template Parameters

TopicType	A valid topic-type. Valid types are **IDL-generated types** (p. 606), the **built-in types** (p. 50) and **dds::core::xtypes::DynamicData** (p. 1461).

Parameters

buffer	The CDR buffer to desrialize

Returns

The deserialized sample

See also

from_cdr_buffer_no_alloc() (p. 568)

References **rti::topic::from_cdr_buffer_no_alloc()**.

Referenced by **rti::topic::from_cdr_buffer_no_alloc()**.

6.202.2.3 to_cdr_buffer() [1/2]

```
template<typename TopicType >
std::vector< char > & rti::topic::to_cdr_buffer (
            std::vector< char > & buffer,
            const TopicType & sample,
             dds::core::policy::DataRepresentationId representation )
```

Serializes a sample into a buffer of octets in CDR format.

Template Parameters

TopicType	A valid topic-type. Valid types are **IDL-generated types** (p. 606), the **built-in types** (p. 50) and **dds::core::xtypes::DynamicData** (p. 1461).

Parameters

buffer	The destination buffer. It will be resized to fit the serialized sample
sample	The sample to serialize
representation	The representation to serialize the data into

Returns

A reference to the parameter `buffer`

References **rti::topic::to_cdr_buffer()**.

6.202.2.4 to_cdr_buffer() [2/2]

```
template<typename TopicType >
std::vector< char > & rti::topic::to_cdr_buffer (
```

```
std::vector< char > & buffer,
const TopicType & sample )
```

Serializes a sample into a buffer of octets in CDR format.

This overload uses dds::core::policy::DataRepresentationId::auto_id() as the data representation.

References **rti::topic::to_cdr_buffer()**.

Referenced by **rti::topic::to_cdr_buffer()**.

6.203 Custom Content Filters

Classes and associated types used to implement custom content filters.

Classes

- struct **rti::topic::no_compile_data_t**

  *The type to specify as the CompileData template parameter to your **ContentFilter** (p. 950) if your compile function does not return any data.*
- class **rti::topic::ContentFilter< T, CompileData >**

  *<<**extension**>> (p. 354) A class to inherit from when implementing a custom content filter*
- class **rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >**

  *<<**extension**>> (p. 354) A class to inherit from when implementing a writer-side custom content filter*
- class **rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >**

  *<<**extension**>> (p. 354) A class to inherit from when implementing a writer-side custom content filter.*
- class **rti::topic::CustomFilter< T >**

  *<<**extension**>> (p. 354) <<**reference-type**>> (p. 351) A wrapper class for the user-defined implementation of a **ContentFilter** (p. 950).*
- class **rti::topic::ExpressionProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Provides additional information about the filter expression passed to the writer_compile method of **rti::topic::WriterContentFilter** (p. 2652)*
- class **rti::topic::FilterSampleInfo**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Provides meta information associated with the sample.*

Functions

- template<typename T >
  CustomFilter< T > rti::topic::find_content_filter (const **dds::domain::DomainParticipant** &participant, const std::string &filter_name)

  *Lookup a content filter previously registered with **dds::domain::DomainParticipant::register_contentfilter** (p. 1349).*

Variables

- **no_compile_data_t no_compile_data**

  A constant to return if your compile function does not create any compile data

6.203.1 Detailed Description

Classes and associated types used to implement custom content filters.

6.203.2 Function Documentation

6.203.2.1 find_content_filter()

```
template<typename T >
CustomFilter< T > rti::topic::find_content_filter (
            const  dds::domain::DomainParticipant & participant,
            const std::string & filter_name )
```

Lookup a content filter previously registered with **dds::domain::DomainParticipant::register_contentfilter** (p. 1349).

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

You cannot lookup the RTI Connext built-in content filters.

Template Parameters

T	The user-defined content filter type that the **CustomFilter** (p. 967) was created with

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) that the content filter is registered with.
filter_name	Name of the filter to lookup.

Returns

The found **rti::topic::CustomFilter** (p. 967) or **dds::core::null** (p. 438) if it is not found

References **dds::core::null**.

6.203.3 Variable Documentation

6.203.3.1 no_compile_data

```
template<typename T , typename CompileData = no_compile_data_t>
no_compile_data_t no_compile_data  [related]
```

A constant to return if your compile function does not create any compile data

6.204 Discovery Snapshot

Utilities to print discovery snapshots of DDS entities.

Functions

- void **rti::util::discovery::take_snapshot** (**dds::domain::DomainParticipant** participant)

  <<***extension***>> *(*p. *354) Take a snapshot of the remote participants discovered by a local one.*
- void **rti::util::discovery::take_snapshot** (**dds::domain::DomainParticipant** participant, const std::string &file_name)

  <<***extension***>> *(*p. *354) Take a snapshot of the remote participants discovered by a local one.*
- void **rti::util::discovery::take_snapshot** (**dds::pub::AnyDataWriter** writer)

  <<***extension***>> *(*p. *354) Take a snapshot of the compatible and incompatible remote readers matched by a local writer.*
- void **rti::util::discovery::take_snapshot** (**dds::pub::AnyDataWriter** writer, const std::string &file_name)

  <<***extension***>> *(*p. *354) Take a snapshot of the compatible and incompatible remote readers matched by a local writer.*
- void **rti::util::discovery::take_snapshot** (**dds::sub::AnyDataReader** reader)

  <<***extension***>> *(*p. *354) Take a snapshot of the compatible and incompatible remote writers matched by a local reader.*
- void **rti::util::discovery::take_snapshot** (**dds::sub::AnyDataReader** reader, const std::string &file_name)

  <<***extension***>> *(*p. *354) Take a snapshot of the compatible and incompatible remote writers matched by a local reader.*

6.204.1 Detailed Description

Utilities to print discovery snapshots of DDS entities.

6.204.2 Function Documentation

6.204.2.1 take_snapshot() [1/6]

```
void rti::util::discovery::take_snapshot (
              dds::domain::DomainParticipant participant )
```

<<***extension***>> *(*p. *354)* Take a snapshot of the remote participants discovered by a local one.

Note

This is a standalone function in the namespace **rti::util::discovery** (p. 778)

Parameters

participant	The local participant.

The snapshot will be printed through the **rti::config::Logger** (p. 1683). A possible output may be the following:

```
Remote participants that match the local participant domain=0

name="participantTestName" role="participantTestRole" id="1"

guid_prefix="0x0101D8D1,0x20B83C0D,0x4495246E"

6.205 Network Capture

Save network traffic into a capture file for further analysis.

Classes

- class **rti::util::network_capture::ContentKindMask**

*<<**extension**>> (p. 354) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.*

- class **rti::util::network_capture::TrafficKindMask**

  *<<**extension**>> (p. 354) Mask indicating the traffic direction to capture.*

- class **rti::util::network_capture::NetworkCaptureParams**

  *<<**extension**>> (p. 354) Input parameters for starting Network Capture.*

Functions

- bool **rti::util::network_capture::enable** ()

  Enable Network Capture.

- bool **rti::util::network_capture::disable** ()

  Disable Network Capture.

- bool **rti::util::network_capture::set_default_params** (const **NetworkCaptureParams** &params)

  Set the default Network Capture parameters.

- bool **rti::util::network_capture::start** (const std::string &filename)

  Start Network Capture.

- bool **rti::util::network_capture::start** (**dds::domain::DomainParticipant** participant, const std::string &filename)

  Start Network Capture for a participant.

- bool **rti::util::network_capture::start** (const std::string &filename, const **NetworkCaptureParams** &params)

  Start Network Capture with parameters.

- bool **rti::util::network_capture::start** (**dds::domain::DomainParticipant** participant, const std::string &filename, const **NetworkCaptureParams** &params)

  Start Network Capture with parameters for a participant.

- bool **rti::util::network_capture::stop** ()

  Stop Network Capture.

- bool **rti::util::network_capture::stop** (**dds::domain::DomainParticipant** participant)

  Stop Network Capture.

- bool **rti::util::network_capture::pause** ()

  Pause Network Capture.

- bool **rti::util::network_capture::pause** (**dds::domain::DomainParticipant** participant)

  Pause Network Capture.

- bool **rti::util::network_capture::resume** ()

  Resume Network Capture.

- bool **rti::util::network_capture::resume** (**dds::domain::DomainParticipant** participant)

  Resume Network Capture.

6.205.1 Detailed Description

Save network traffic into a capture file for further analysis.

RTI Connext allows you to capture the network traffic that one or more DomainParticipants send or receive. This feature can be used to analyze and debug communication problems between your DDS applications. When network capture is enabled, each DomainParticipant will generate a pcap-based file that can then be opened by a packet analyzer like Wireshark, provided the right dissectors are installed.

To some extent, network capture can be used as an alternative to existing pcap-based network capture software (such as Wireshark). This will be the case when you are only interested in analyzing the traffic a DomainParticipant sends/receives. In this scenario, network capture will actually have some advantages over using more general pcap-based network capture applications: RTI's network capture includes additional information such as security-related data; it also removes information that is not needed, such as user data, when you want to reduce the capture size. That said, RTI's network capture is not a replacement for other pcap-based network capture applications: it only captures the traffic exchanged by the DomainParticipants, but it does not capture any other traffic exchanged through the system network interfaces.

To capture network traffic **network_capture::enable()** (p. 581) must be invoked before creating any DomainParticipant. Similarly, **network_capture::disable()** (p. 581) must be called after deleting all participants. In between these calls, you may start, stop, pause or resume capturing traffic for one or all participants.

6.205.2 Capturing

Shared Memory Traffic

Every RTPS frame in network capture has a source and a destination associated with it. In the case of shared memory traffic, a process identifier and a port determine the source and destination endpoints.

Access to the process identifier (PID) of the source for inbound traffic requires changes in the shared memory segments. These changes would break shared memory compatibility with previous versions of RTI Connext. For this reason, by default, network capture will not populate the value of the source PID for inbound shared memory traffic.

If interoperability with previous versions of RTI Connext is not necessary, you can generate capture files containing the source PID for inbound traffic. To do so, configure the value of the *'dds.transport.minimum_compatibility_version'* property to 6.1.0. (See **rti::core::policy::Property** (p. 1969)).

```
<domain_participant_qos>

    <property>

        <value>

            <element>

                <name>dds.transport.minimum_compatibility_version</name>

                <value>6.1.0</value>

                <propagate>false</propagate>

            </element>

        </value>

    </property>

</domain_participant_qos>
```

This property is never propagated, so it must be consistently configured throughout the whole system.

Note: Changing the value of this property affects the type of shared memory segments that RTI Connext uses. For that reason, you may see the following warning, resulting from leftover shared memory segments:

```
[0xC733A001,0xB248F671,0xAEC4A0C1:0x000001C1{Domain=200}|CREATE DP|ENABLE]
       NDDS_Transport_Shmem_is_segment_compatible:incompatible shared memory protocol detected.

Current version 4.0 not compatible with 2.0.
```

The leftover shared memory segments can be removed using the `ipcrm` command. See `https://community.rti.com/kb/what-are-possible-solutions-common-shared-memory-issues` for more information.

6.205.3 Function Documentation

6.205.3.1 enable()

```
bool rti::util::network_capture::enable ( )
```

Enable Network Capture.

This method must be called before any other Network Capture method. It must also be called before creating the participants for which we want to capture traffic.

Use this method only for debugging purposes, since it may introduce a significant performance impact.

Returns

true if success. Otherwise, false

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Caputre related method, including this one.

See also

network_capture::disable() (p. 581)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

Referenced by **rti::queuing::QueueConsumerParams::enable_availability()**, **rti::queuing::QueueRequester↩ Params::enable_availability()**, **rti::queuing::QueueReplierParams::enable_availability()**, **rti::queuing::↩ QueueRequesterParams::enable_sample_replication()**, **rti::queuing::QueueReplierParams::enable_sample↩ _replication()**, **rti::queuing::QueueProducerParams::enable_wait_for_ack()**, **rti::queuing::QueueRequester↩ Params::enable_wait_for_ack()**, and **rti::queuing::QueueReplierParams::enable_wait_for_ack()**.

6.205.3.2 disable()

```
bool rti::util::network_capture::disable ( )
```

Disable Network Capture.

This method must be the last Network Capture method to be called. It must also be called after deleting the participants for which we captured traffic. Disabling Network Capture without stopping it first is not ok!

Returns

true if success. Otherwise, false

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Capture related method, including this one.

See also

network_capture::enable() (p. 581)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.3 set_default_params()

```
bool rti::util::network_capture::set_default_params (
            const  NetworkCaptureParams & params )
```

Set the default Network Capture parameters.

The default parameters are used when Network Capture is started without parameters, i.e., **network_capture::start()** (p. 583).

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Parameters

params	<<***in***>> *(p. 355)*. Configuration parameters that we want to set as defaults.

Returns

true if success. Otherwise, false

See also

network_capture::start() (p. 583)

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 583)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.4 start() [1/4]

```
bool rti::util::network_capture::start (
            const std::string & filename )
```

Start Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Parameters

filename	<<***in***>> *(p. 355)*. The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 586)

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 583)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.5 start() [2/4]

```
bool rti::util::network_capture::start (
              dds::domain::DomainParticipant participant,
             const std::string & filename )
```

Start Network Capture for a participant.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Parameters

participant	<<***in***>> (p. *355*). DomainParticipant for which we want to capture traffic.
filename	<<***in***>> (p. *355*). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 586)

network_capture::start(dds::domain::DomainParticipant, const std::string &, const NetworkCapture↩ Params &) (p. 585)

network_capture::enable() (p. 581)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.6 start() [3/4]

```
bool rti::util::network_capture::start (
             const std::string & filename,
             const  NetworkCaptureParams & params )
```

Start Network Capture with parameters.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Perfoms the same function as **network_capture::start()** (p. 583) except that it uses the provided parameters, instead of the default ones.

Parameters

filename	<<***in***>> *(*p. *355)*. The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Parameters

params	<<***in***>> *(*p. *355)*. Configuration parameters for the capture.

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 586)

network_capture::start(dds::domain::DomainParticipant, const std::string &, const NetworkCapture↩ Params &) (p. 585)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.7 start() [4/4]

```
bool rti::util::network_capture::start (
              dds::domain::DomainParticipant participant,
             const std::string & filename,
             const  NetworkCaptureParams & params )
```

Start Network Capture with parameters for a participant.

Precondition

This method requires enabling first Network Capture. See **network_capture::enable()** (p. 581).

Parameters

participant	<<***in***>> *(*p. *355)*. DomainParticipant for which we want to capture traffic.
filename	<<***in***>> *(*p. *355)*. The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Parameters

params	<<***in***>> *(p. 355)*. Parameters for configuring the capture.

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 586)

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 583)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.8 stop() [1/2]

```
bool rti::util::network_capture::stop ( )
```

Stop Network Capture.

Precondition

This method requires enabling first Network Capture. See **network_capture::enable()** (p. 581).

This method can (and must) be called after **network_capture::start()** (p. 583), not **network_capture::start(dds↩ ::domain::DomainParticipant, const std::string &)** (p. 583). That is, if we start capturing traffic globally (for all DomainParticipants), we must stop capturing traffic also globally. It is not possible to start capturing traffic for a participant but stop it globally.

It is possible to start capturing globally and then stop capturing for a participant, as long as we eventually stop capturing traffic globally.

We must stop capturing for a participant before deleting it.

Returns

true if success. Otherwise, false

See also

network_capture::start() (p. 583)

network_capture::stop() (p. 586)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.9 stop() [2/2]

```
bool rti::util::network_capture::stop (
            dds::domain::DomainParticipant participant )
```

Stop Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Parameters

participant	<<***in***>> *(p. 355).* DomainParticipant for which we want to stop capturing traffic.

Returns

true if success. Otherwise, false

See also

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 583)
network_capture::stop() (p. 586)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.10 pause() [1/2]

```
bool rti::util::network_capture::pause ( )
```

Pause Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Returns

true if success. Otherwise, false

See also

network_capture::resume() (p. 588)
network_capture::pause() (p. 587)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.11 pause() [2/2]

```
bool rti::util::network_capture::pause (
            dds::domain::DomainParticipant participant )
```

Pause Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Parameters

participant	<<***in***>> *(p. 355).* DomainParticipant for which we want to pause capturing traffic.

Returns

true if success. Otherwise, false

See also

network_capture::resume() (p. 588)
network_capture::pause() (p. 587)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.12 resume() [1/2]

```
bool rti::util::network_capture::resume ( )
```

Resume Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Returns

true if success. Otherwise, false

See also

network_capture::pause() (p. 587)
network_capture::resume() (p. 588)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.205.3.13 resume() [2/2]

```
bool rti::util::network_capture::resume (
              dds::domain::DomainParticipant participant )
```

Resume Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 581).

Parameters

participant	<<***in***>> *(p. 355).* DomainParticipant for which we want to resume capturing traffic.

Returns

true if success. Otherwise, false

See also

network_capture::pause() (p. 587)

network_capture::resume() (p. 588)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 780)

6.206 Heap Monitoring

Monitor memory allocations done by the middleware on the native heap.

Classes

- struct **rti::util::heap_monitoring::SnapshotOutputFormat_def**

  Specify the format of the output of the snapshot. RTI Connext.
- struct **rti::util::heap_monitoring::SnapshotContentFormat_def**

  Bitmap used to decide which information of the snapshot will be displayed.
- class **rti::util::heap_monitoring::HeapMonitoringParams**

  Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

Typedefs

- typedef **dds::core::safe_enum**< **SnapshotOutputFormat_def** > **rti::util::heap_monitoring::Snapshot↩ OutputFormat**

  Specify the format of the output of the snapshot.
- typedef **dds::core::safe_enum**< **SnapshotContentFormat_def** > **rti::util::heap_monitoring::Snapshot↩ ContentFormat**

  Bitmap used to decide which information of the snapshot will be displayed.

Functions

- bool **rti::util::heap_monitoring::enable** ()

  Starts monitoring the heap memory used by RTI Connext.
- bool **rti::util::heap_monitoring::enable** (const **HeapMonitoringParams** &params)

  Starts monitoring the heap memory used by RTI Connext with params.
- void **rti::util::heap_monitoring::disable** ()

  Stops monitoring the heap memory used by RTI Connext.
- bool **rti::util::heap_monitoring::pause** ()

  Pauses heap monitoring.
- bool **rti::util::heap_monitoring::resume** ()

  Resumes heap monitoring.
- bool **rti::util::heap_monitoring::take_snapshot** (const std::string &filename, bool print_details=false)

  Saves the current heap memory usage in a file.

6.206.1 Detailed Description

Monitor memory allocations done by the middleware on the native heap.

RTI Connext allows you to monitor the memory allocations done by the middleware on the native heap. This feature can be used to analyze and debug unexpected memory growth.

After heap_monitoring::enable() is called, you may invoke **heap_monitoring::take_snapshot()** (p. 593) to save the current heap memory usage to a file. By comparing two snapshots, you can tell if new memory has been allocated and, in many cases, where.

6.206.2 Typedef Documentation

6.206.2.1 SnapshotOutputFormat

typedef **dds::core::safe_enum**< **SnapshotOutputFormat_def**> **rti::util::heap_monitoring::Snapshot↩ OutputFormat**

Specify the format of the output of the snapshot.

See also

SnapshotOutputFormat_def (p. 2371)

6.206.2.2 SnapshotContentFormat

typedef **dds::core::safe_enum**< **SnapshotContentFormat_def**> **rti::util::heap_monitoring::Snapshot↩ ContentFormat**

Bitmap used to decide which information of the snapshot will be displayed.

See also

SnapshotContentFormat_def (p. 2370)

6.206.3 Function Documentation

6.206.3.1 enable() [1/2]

bool rti::util::heap_monitoring::enable ( )

Starts monitoring the heap memory used by RTI Connext.

This function must be called before any other function in the RTI Connext library is called.

Once heap monitoring is enabled, you can take heap snapshots by using **heap_monitoring::take_snapshot()** (p. 593).

Use this method only for debugging purposes, since it may introduce a significant performance impact.

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another heap-related method, including this one.

Returns

true if success. Otherwise, false

See also

heap_monitoring::disable() (p. 592)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 779)

6.206.3.2 enable() [2/2]

```
bool rti::util::heap_monitoring::enable (
            const  HeapMonitoringParams & params )
```

Starts monitoring the heap memory used by RTI Connext with params.

Perfoms the same function as **heap_monitoring::enable()** (p. 591) except that it also provides the values in params. Those values will set the format used in the snapshot **heap_monitoring::take_snapshot()** (p. 593).

Returns

true if success. Otherwise, false

See also

heap_monitoring::disable() (p. 592)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 779)

6.206.3.3 disable()

```
void rti::util::heap_monitoring::disable ( )
```

Stops monitoring the heap memory used by RTI Connext.

This method must be the last method called from RTI Connext.

See also

heap_monitoring::enable() (p. 591)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 779)

6.206.3.4 pause()

```
bool rti::util::heap_monitoring::pause ( )
```

Pauses heap monitoring.

New memory allocations will not be monitored and they will not appear in the snapshot generated by **heap_monitoring::take_snapshot()** (p. 593).

Returns

true if success. Otherwise, false

See also

heap_monitoring::resume() (p. 593)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 779)

6.206.3.5 resume()

```
bool rti::util::heap_monitoring::resume ( )
```

Resumes heap monitoring.

Returns

true if success. Otherwise, false

See also

heap_monitoring::pause() (p. 592)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 779)

6.206.3.6 take_snapshot()

```
bool rti::util::heap_monitoring::take_snapshot (
             const std::string & filename,
             bool print_details = false )
```

Saves the current heap memory usage in a file.

After **heap_monitoring::enable()** (p. 591) is called, you may invoke this method periodically to save the current heap memory usage to a file.

By comparing two snapshots, you can tell if new memory has been allocated and in many cases where. This is why this operation can be used to debug unexpected memory growth.

The format of a snapshot is as follows:

First, there is a memory usage summary like this:

```
<P>
                    Product Version: NDDSCORE_BUILD_6.0.0.0_20200316T123411Z_RTI_ENG

                    Process virtual memory: 2552352768

                    Process physical memory: 16187392

                    Current application heap usage: 10532131

                    Approximate total heap usage: 203331110

                    High watermark: 10532131

                    Alloc count: 17634

                    Free count: 3518
```

- Process virtual memory: The amount of virtual memory in bytes taken by the process. This memory includes RTI Connext and non-RTI Connext memory.
- Process virtual memory: The amount of physical memory in bytes taken by the process.
- Current application heap usage: The amount of heap memory in bytes used by the middleware. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connext memory, not memory living in the managed heap. This value does not include overhead memory allocations that are used by the Heap Monitoring utility. It therefore provides the heap usage that is used when Heap Monitoring is disabled and does not reflect the actual amount of memory that has been allocated by the middleware. That value is accounted for in 'Approximate total heap usage'.
- Approximate total heap usage: The amount of heap memory in bytes used by the middleware, including overhead allocations from the Heap Monitoring utility. When the Heap Monitoring utility is enabled, every allocation has an additional overhead number of bytes allocated so that the middleware can keep track of the meta-data that is output in the heap snapshots. This overhead is not accounted for in the 'Current application heap usage' summary field, but is included in this field. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connext memory, not memory living in the managed heap.
- High watermark: The maximum amount of heap usage by RTI Connext since **heap_monitoring::enable()** (p. 591) was invoked.
- Alloc count: The number of invocations to malloc, realloc, or calloc operations done by RTI Connext.
- Free count: The number of invocations to the free operation done by RTI Connext.

After the previous summary, and only if you set the parameter print_details to true, the method will print the details of every single outstanding heap allocation done by RTI Connext. For example:

```
<P>
                block_id, timestamp, block_size, alloc_method_name, type_name, pool_alloc, pool_buffer_size,
    pool_buffer_count, topic_name, function_name, activity_context

                23087, 1586943520, 16, RTIOsapiHeap_allocateArray, struct RTIEncapsulationInfo, MALLOC, 0,
    0, PRESServiceRequest, PRESWriterHistoryDriver_new,
    "0X101175A,0X76DD63D7,0X984377BC:0X1C1{Name=ShapeTypeParticipant,Domain=110}|CREATE
    Participant|ENABLE|:0X80000088{Entity=Pu,Domain=110}|CREATE Writer WITH TOPIC PRESServiceRequest"
```

- block_id: Block ID of the allocation. This number increases with every allocation.
- timestamp: Timestamp in UTC seconds corresponding to the time where the allocation was done.
- block_size: The number of bytes allocated.
- alloc_method_name: The allocation RTI Connext method name.
- type_name: The allocation typename.
- pool_alloc: Indicates if the heap allocation is a RTI Connext pool allocation (POOL) or a regular allocation (MALLOC).
- pool_buffer_size: For pool allocations, this number indicates the size of the elements in the pool in number of bytes. block_size is equal to (pool_buffer_size ∗ pool_buffer_count).
- pool_buffer_count: For pool allocations, this number indicates the number of buffers allocated for the pool. block↩ _size is equal to (pool_buffer_size ∗ pool_buffer_count).
- topic_name: The topic name associated with the allocation or 'n/a' if it is not available.
- function_name: function name associated with the allocation or 'n/a' if it is not available.
- activity_context: **Activity Context** (p. 449)

Parameters

filename	<<***in***>> *(p. 355)*. Name of file in which to store the snapshot.
print_details	<<***in***>> (p. *355)*. Indicates if the snapshot will contain only the memory usage summary or the details of the individual allocations.

Returns

true if success. Otherwise, false

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 779)

6.207 Other Utilities

Other Utilities, such as **rti::util::spin()** (p. 597)

Functions

- void **rti::config::enable_automatic_tss_cleanup** (bool enable)

  Enable automatic thread-specific storage (TSS) cleanup on platforms that support it.
- void **rti::util::sleep** (const **dds::core::Duration** &durationIn)

  Blocks the calling thread for the specified duration.
- uint64_t **rti::util::spin_per_microsecond** ()

  Returns the number of spin operations needed to wait 1 microsecond.
- void **rti::util::spin** (uint64_t spin_count)

  Performs a spin operation (active wait) as many times as indicated.
- bool **rti::util::activation::unload_activation_library** ()

  Unloads the Activation Library (rti_activation) if it was previously loaded.

6.207.1 Detailed Description

Other Utilities, such as **rti::util::spin()** (p. 597)

6.207.2 Function Documentation

6.207.2.1 enable_automatic_tss_cleanup()

```
void rti::config::enable_automatic_tss_cleanup (
            bool enable )
```

Enable automatic thread-specific storage (TSS) cleanup on platforms that support it.

This API must be called before any other RTI Connext API.

Setting it to one value and then setting it to the opposite value after any RTI Connext API has been called may result in undefined behavior.

See also

DomainParticipantFactory::unregister_thread

Note

This is a standalone function in the namespace rti::util::config

6.207.2.2 sleep()

```
void rti::util::sleep (
            const  dds::core::Duration & durationIn )
```

Blocks the calling thread for the specified duration.

Note that the achievable resolution of sleep is OS-dependent. That is, do not assume that you can sleep for 1 nanosecond just because you can specify a 1-nanosecond sleep duration via the API. The sleep resolution on most operating systems is usually 10 ms or greater.

Parameters

duration↩ In	<<***in***>> *(*p. *355)* Sleep duration.

MT Safety:

safe

Examples

Foo_publisher.cxx.

6.207.2.3 spin_per_microsecond()

```
uint64_t rti::util::spin_per_microsecond ( )
```

Returns the number of spin operations needed to wait 1 microsecond.

This utility can be used to measure how many spin operations must be performed to wait 1 microsecond. Since the time that it takes the CPU to perform 1 spin operation depends on the CPU frequency, it is recommended to use this utility before using **spin()** (p. 597).

Returns

Number of spin operations to wait 1 microsecond.

See also

rti::util::spin() (p. 597)

6.207.2.4 spin()

```
void rti::util::spin (
             uint64_t spin_count )
```

Performs a spin operation (active wait) as many times as indicated.

Spinning is the action of performing useless operations in a for loop in order to actively wait some time without yielding the CPU. Given that the resolution of sleep is in the order of ms, you can use this utility to wait times in the order of microseconds. To properly use this functionality, it is useful to measure previously the number of spin operations needed to wait the equivalent to microsecond (using the utility get_spin_per_microsecond) and then compute the corresponding spin count desired.

Parameters

spin_count	<<***in***>> *(p. 355)* Number of spin operations to perform.

See also

rti::util::spin_per_microsecond() (p. 597)

6.207.2.5 unload_activation_library()

```
bool rti::util::activation::unload_activation_library ( )
```

Unloads the Activation Library (rti_activation) if it was previously loaded.

This function should be called just before your process finishes. See the License Management section in the `Installation Guide` for additional details.

Returns

true if successful. Otherwise, false

6.208 Monitoring Library 2.0

RTI Monitoring Library 2.0 public API.

Functions

- void **RTI_Monitoring_initialize** (void)
  Initializes Monitoring Library 2.0.

Variables

- const char ∗const **RTI_MONITORING_PERIODIC_TOPIC_NAME**
  The name of the Monitoring Topic used for periodic metrics distribution.
- const char ∗const **RTI_MONITORING_EVENT_TOPIC_NAME**
  The name of the Monitoring Topic used for event metrics distribution.
- const char ∗const **RTI_MONITORING_LOGGING_TOPIC_NAME**
  The name of the Monitoring Topic used for log messages distribution.

6.208.1 Detailed Description

RTI Monitoring Library 2.0 public API.

RTI Monitoring Library 2.0 is one component of the RTI Connext Observability Framework which allows collecting and distributing telemetry data (metrics and logs) associated with the observable resources created by an RTI Connext application.

In this release, the only Observable resources are the following entities: **dds::pub::DataWriter** (p. 1138), **dds::sub↩ ::DataReader** (p. 976), **dds::pub::Publisher** (p. 1993), **dds::sub::Subscriber** (p. 2410), **dds::domain::Domain↩ Participant** (p. 1326), **dds::topic::Topic** (p. 2474) and Application (a process running RTI Connext).

The library also accepts remote commands to change the set of distributed telemetry data at run-time.

The data distributed by RTI Monitoring Library 2.0 is sent to an RTI Observability Collector Service instance, which forwards the data to other RTI Observability Collector Service instances or stores the data in third-party observability backends such as Prometheus or Grafana Loki.

RTI Monitoring Library 2.0 is a separate library (rtimonitoring2), and applications can use it in three different modes:

- **Dynamically loaded:** This is the default mode, and it requires that the rtimonitoring2 shared library is in the library search path.
- **Dynamic linking:** The application is linked with the rtimonitoring2 shared library.
- **Static linking:** The application is linked with the rtimonitoring2 static library.

The last two modes require calling the API **RTI_Monitoring_initialize** (p. 599) in your application before any other RTI Connext APIs. This API is defined in the header file `ndds/monitoring/monitoring_monitoringClass.h`.

Dynamic and static linking are only supported in C and C++ applications.

To enable use of RTI Monitoring Library 2.0 and configure its behavior, use the **rti::core::policy::Monitoring** (p. 1706) QoS policy on the **dds::domain::DomainParticipant::participant_factory_qos()** (p. 1340). This QoS policy can be configured programmatically or via XML.

6.208.2 Function Documentation

6.208.2.1 RTI_Monitoring_initialize()

```
void RTI_Monitoring_initialize (
             void  )
```

Initializes Monitoring Library 2.0.

This method must be called before calling any other RTI Connext API if the application links with RTI Monitoring Library 2.0 dynamically or statically.

6.208.3 Variable Documentation

6.208.3.1 RTI_MONITORING_PERIODIC_TOPIC_NAME

```
const char* const RTI_MONITORING_PERIODIC_TOPIC_NAME
```

The name of the Monitoring Topic used for periodic metrics distribution.

String version: "DCPSPeriodicStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

6.208.3.2 RTI_MONITORING_EVENT_TOPIC_NAME

```
const char* const RTI_MONITORING_EVENT_TOPIC_NAME
```

The name of the Monitoring Topic used for event metrics distribution.

String version: "DCPSEventStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

6.208.3.3 RTI_MONITORING_LOGGING_TOPIC_NAME

```
const char* const RTI_MONITORING_LOGGING_TOPIC_NAME
```

The name of the Monitoring Topic used for log messages distribution.

String version: "DCPSLoggingStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

6.209 Built-in Types Examples

Using Built-in Types.

Using Built-in Types.

RTI Connext provides a set of simple data types for you to use with the topics in your application (see **Built-in Types** (p. 50))

If you use these built-in types you do not have to generate any code using rtiddsgen.

- StringTopicType has one field, `data`, of type **dds::core::string** (p. 435).

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<dds::core::StringTopicType> topic(participant, "MyTopic");
dds::pub::DataWriter<dds::core::StringTopicType> writer(
   dds::pub::Publisher(participant), topic);
// Create a StringTopicType sample with data = "Example Data"
dds::core::StringTopicType sample("Example Data");
// Change the value of data
sample.data("New Data Value");
// Write the sample
writer.write(sample);
// You can also write a sample like this, making use of an implicit
// conversion between string and StringTopicType
writer.write("Example Data 2");
```

- KeyedStringTopicType has two fields, `key` and `value`, both of type **dds::core::string** (p. 435).

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<dds::core::KeyedStringTopicType> topic(
   participant, "MyTopic");
dds::pub::DataWriter<dds::core::KeyedStringTopicType> writer(
   dds::pub::Publisher(participant), topic);
// Create a StringTopicType sample with data = "Example Data"
dds::core::KeyedStringTopicType sample("Example Key", "Example Value");
// Change the value of value and key
sample.key("New Key");
sample.value("New Value");
// Write the sample
writer.write(sample);
```

- BytesTopicType represents an array of bytes:

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<dds::core::BytesTopicType> topic(participant, "MyTopic");
dds::pub::DataWriter<dds::core::BytesTopicType> writer(
    dds::pub::Publisher(participant), topic);
// Create a BytesTopicType sample with some data
std::vector<uint8_t> byte_vector;
byte_vector.push_back(100);
byte_vector.push_back(200);
dds::core::BytesTopicType sample(byte_vector);
// You can modify it with the operator[]:
sample[0] = 150;
// Write the sample
writer.write(sample);
// You can also write the std::vector directly, using the implicit
// BytesTopicType constructor:
writer.write(byte_vector);
```

6.210 Exceptions

How DDS return codes map to C++ exceptions.

How DDS return codes map to C++ exceptions.

6.210.1 Exceptions

The following is a list of the exceptions that may be thrown by RTI Connext. They are a part of the **dds::core** (p. 616) namespace and can also be found in hpp/dds/core/Exception.hpp. The ∗Error classes can be caught simply by catching an std::exception.

modern C++ API Exception Class	DDS PIM Return Code	Std C++ Parent Exception
Normal return; no exception	RETCODE_OK	N/A
An informational state attached to a normal return; no exception	RETCODE_NO_DATA	N/A
Error	RETCODE_ERROR	std::logic_error
InvalidArgumentError	RETCODE_BAD_PARAMETER	std::invalid_argument
TimeoutError	RETCODE_TIMEOUT	std::runtime_error
UnsupportedError	RETCODE_UNSUPPORTED	std::logic_error
AlreadyClosedError	RETCODE_ALREADY_DELETED	std::logic_error
IllegalOperationError	RETCODE_ILLEGAL_OPERATION	std::logic_error
NotEnabledError	RETCODE_NOT_ENABLED	std::logic_error
PreconditionNotMetError	RETCODE_PRECONDITION_NOT_↩ MET	std::logic_error
ImmutablePolicyError	RETCODE_IMMUTABLE_POLICY	std::logic_error
InconsistentPolicyError	RETCODE_INCONSISTENT_POLICY	std::logic_error
NotAllowedBySecurityError	RETCODE_NOT_ALLOWED_BY_↩ SECURITY	std::logic_error
OutOfResourcesError	RETCODE_OUT_OF_RESOURCES	std::runtime_error
InvalidDowncastError	N/A	std::runtime_error
NullReferenceError	N/A	std::runtime_error
InvalidDataError	N/A	std::logic_error

6.211 Qos Use Cases

The different QoS classes are containers of QoS policies of a concrete **dds::core::Entity** (p. 1520). Each Entity has a qos() getter and setter.

- **dds::domain::qos::DomainParticipantQos** (p. 1384) is the container of the **dds::domain::DomainParticipant** (p. 1326) QoS policies.
- **dds::topic::qos::TopicQos** (p. 2509) is the container of the **dds::topic::Topic** (p. 2474) QoS policies.
- **dds::pub::qos::PublisherQos** (p. 2007) is the container of the **dds::pub::Publisher** (p. 1993) QoS policies.
- **dds::sub::qos::SubscriberQos** (p. 2423) is the container of the **dds::sub::Subscriber** (p. 2410) QoS policies.
- **dds::pub::qos::DataWriterQos** (p. 1226) is the container of the **dds::pub::DataWriter** (p. 1138) QoS policies.
- **dds::sub::qos::DataReaderQos** (p. 1072) is the container of the **dds::sub::DataReader** (p. 976) QoS policies.

6.211.1 Setting Qos Values

There are a few different ways to set the values of a QoS policy within an entity's QoS object

- Setting a QoS policy with operator <<

```
using namespace dds::core::policy;
// Construct a Reliability QoS object with default values
dds::core::policy::Reliability reliability;
// Construct a DataReaderQos object with default values
dds::sub::qos::DataReaderQos reader_qos;
// Set the Reliability Qos policy field of the DataReaderQos using operator «,
// setting the ReliabilityKind to RELIABLE inline
reader_qos « reliability.kind(ReliabilityKind::RELIABLE);
```

- Many of the QoS policies have appropriately named constructors that will construct a QoS policy object with values for some of the fields in the policy. The following code example is equivalent to the above example.

```
using namespace dds::core::policy;
// Use a named constructor to set the ReliabilityKind
reader_qos « Reliability::Reliable();
```

- You can also set a QoS policy on a QoS object using the QoS object's policy() setter which is templatized on the QoS policy that it is being used to set. The following code example is equivalent to the above two examples.

```
using namespace dds::core::policy;
// Set the reliability Qos on the DataReaderQos object
reader_qos.policy<Reliability>(Reliability::Reliable());
// Note that the above statement sets the whole policy, possibly overriding
// other fields of Reliability (such as Reliability::acknowledgment_kind())
// with their default values. If you only want to change a specific field
// of the policy, get it by reference and modify it:
reader_qos.policy<Reliability>().kind(ReliabilityKind::RELIABLE);
```

6.211.2 Getting Qos Values

There are a few different ways to get the values of a QoS policy from an entity's QoS object

- Getting a QoS policy with operator >>

```
using namespace dds::core::policy;
// Construct a Reliability QoS object with default values
dds::core::policy::Reliability reliability;
// Construct a DataReaderQos object with default values
dds::sub::qos::DataReaderQos reader_qos;
// Populate the Reliability Qos object with the values from the
// DataReaderQos object using operator »
reader_qos » reliability;
```

- You can also get a QoS policy from a QoS object using the QoS object's policy() getter which is templatized on the QoS policy that it is being used to get. The following code example is equivalent to the above example.

```
using namespace dds::core::policy;
// Get the reliability Qos from the DataReaderQos object
reliability = reader_qos.policy<Reliability>();
```

6.212 Qos Provider Use Cases

How to use **dds::core::QosProvider** (p. 2025) to access XML QoS profiles.

How to use **dds::core::QosProvider** (p. 2025) to access XML QoS profiles.

6.212.1 Managing Qos Profiles

This section provides several examples on how to use a **dds::core::QosProvider** (p. 2025) to load QoS profiles from XML. The class documentation provides general usage information.

These examples use the following file, `ExampleQos.xml`, which defines only the `EntityName` QoS policy for the `DomainParticipant` and `DataWriter` to illustrate how the profiles are loaded:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="https://community.rti.com/schema/current/rti_dds_profiles.xsd">
    <qos_library name="MyLibrary">
        <qos_profile name="MyProfile" is_default_qos="true">
            <domain_participant_qos>
                <participant_name>
                    <name>ExampleParticipantName</name>
                </participant_name>
            </domain_participant_qos>
            <datawriter_qos>
                <publication_name>
                    <name>ExamplePublicationName</name>
                </publication_name>
            </datawriter_qos>
        </qos_profile>
    </qos_library>
    <qos_library name="MySecondLibrary">
        <qos_profile name="MySecondProfile">
            <domain_participant_qos>
                <participant_name>
                    <name>SecondExampleParticipantName</name>
                </participant_name>
            </domain_participant_qos>
            <datawriter_qos>
                <publication_name>
                    <name>SecondExamplePublicationName</name>
                </publication_name>
            </datawriter_qos>
        </qos_profile>
    </qos_library>
</dds>
```

The example code shows how to create a QosProvider, load QoS profiles from the provider, and create entities with those QoS values:

```
    // Load the contents of an XML file:
    dds::core::QosProvider my_provider("ExampleQos.xml");
    // Create a participant with the default profile:
    auto participant_qos = my_provider.participant_qos();
    dds::domain::DomainParticipant participant(0, participant_qos);
    // This prints ExampleParticipantName because MyLibrary::MyProfile is marked
    // with is_default_qos="true"
    std::cout « participant.qos().policy<EntityName>().name().value()
              « std::endl;
    // Load a specific profile. This time it prints SecondExampleParticipantName
    participant_qos =
            my_provider.participant_qos("MySecondLibrary::MySecondProfile");
    std::cout « participant_qos.policy<EntityName>().name().value()
              « std::endl;
    // Change the default profile:
    my_provider.extensions().default_profile("MySecondLibrary::MySecondProfile");
    // Now when the profile is not specified, participant_qos() looks at
    // "MySecondLibrary::MySecondProfile", printing SecondExampleParticipantName
    participant_qos = my_provider.participant_qos();
    std::cout « participant_qos.policy<EntityName>().name().value()
              « std::endl;
```

```
// Create a topic, publisher and writer:
dds::topic::Topic<Foo> topic(participant, "Example Foo");
dds::pub::Publisher publisher(participant);
dds::pub::DataWriter<Foo> writer(
        publisher,
        topic,
        my_provider.datawriter_qos());
// Prints SecondExamplePublicationName
std::cout << writer.qos().policy<EntityName>().name().value()
          << std::endl;
// If you don't want to specify the QoS argument for each writer you create
// you can set the default value:
publisher.default_datawriter_qos(
        my_provider.datawriter_qos("MyLibrary::MyProfile"));
dds::pub::DataWriter<Foo> other_writer(publisher, topic);
// Prints ExamplePublicationName
std::cout << writer.qos().policy<EntityName>().name().value() << std::endl;
// You can also load the QoS profiles from a string:
const char * my_xml_str =
    "str://\"<dds>"
        "<qos_library name=\"MyThirdLibrary\">"
            "<qos_profile name=\"MyThirdProfile\">"
                "<domain_participant_qos>"
                    "<participant_name>"
                        "<name>ThirdExampleParticipantName</name>"
                    "</participant_name>"
                "</domain_participant_qos>"
            "</qos_profile>"
        "</qos_library>"
    "</dds>\"";
// In this case we're also specifying which profile we want to load by
// default in the constructor
dds::core::QosProvider my_provider2(
        my_xml_str,
        "MyThirdLibrary::MyThirdProfile");
// This prints ThirdExampleParticipantName
participant_qos = my_provider2.participant_qos();
std::cout << participant_qos.policy<EntityName>().name().value()
          << std::endl;
// You can also examine which libraries and profiles that have been
// loaded:
auto libraries = my_provider.extensions().qos_profile_libraries();
for (const std::string& library : libraries) {
    std::cout << library << std::endl;
    auto profiles = my_provider.extensions().qos_profiles(library);
    for (const std::string& profile : profiles) {
        std::cout << " -" << profile << std::endl;
    }
}
```

XML Application Creation (p. 342)

6.212.2 The Default Qos Provider

This example shows how to configure the default QosProvider:

```
// We're going to configure the default QoS Provider to load ExampleQos.xml
// and to ignore the NDDS_QOS_PROFILES environment variable and the file
// USER_QOS_PROFILES.xml
rti::core::QosProviderParams params;
params.url_profile({ "ExampleQos.xml" });
params.ignore_environment_profile(true);
params.ignore_user_profile(true);
// To ensure that the new configuration takes effect before any other
// profiles are loaded, set the new parameters before accessing
// QosProvider::Default().
rti::core::default_qos_provider_params(params);
dds::core::QosProvider default_provider = dds::core::QosProvider::Default();
dds::domain::DomainParticipant participant1(0, default_provider.participant_qos());
// Prints "ExampleParticipantName"
std::cout << participant1.qos().policy<EntityName>().name().value()
```

```
            « std::endl;
    // Change the default profile
    default_provider.extensions().default_profile("MySecondLibrary::MySecondProfile");
    dds::domain::DomainParticipant participant2(1, default_provider.participant_qos());
    // Prints "SecondExampleParticipantName"
    std::cout « participant2.qos().policy<EntityName>().name().value()
            « std::endl;
    // Reset the QosProviderParams for the default QosProvider
    dds::core::QosProvider::reset_default();
    // This participant will not have a participant name (the default
    // RTI Connext value) because we reset the default QosProviderParams,
    // meaning that the value for string_profile is empty and the above example
    // XML Qos profile is not loaded.
    dds::domain::DomainParticipant participant3(2, default_provider.participant_qos());
    // Prints false
    std::cout « std::boolalpha
            « participant2.qos().policy<EntityName>().name().has_value()
            « std::endl;
```

6.213 Working with IDL types

How IDL types map to C++ classes.

Classes

- class **Foo**

  An example topic-type.

6.213.1 Detailed Description

How IDL types map to C++ classes.

6.213.2 Example IDL types

The following IDL code defines the types we will use in these examples.

```
struct Foo {
    long x; //@key
    long y;
};
struct MyType {
    long my_long;
    string<512> my_string;
    Foo my_foo;
    sequence<long, 10> my_sequence;
    Foo my_array[5];
    Foo my_optional; //@Optional
};
```

To generate C++ code for these types, see the `Code Generator User's Manual`.

6.213.3 Constructors and operators

C++ types generated from IDL have **value semantics** (p. 350) and provide a default constructor, a copy constructor, a move constructor <<***C++11***>> *(p. 353)*, a constructor with parameters to set all the type's members, a destructor, a copy-assignment operator, and a move-assignment operator <<***C++11***>> *(p. 353)*. Types also include equality operators, the operator << to `std::ostream` <<***extension***>> *(p. 354)* and a namespace-level `swap` function.

```
// The default constructor recursively initializes all members of a sample
MyType default_sample;
// A copy constructor is also provided
MyType copied_sample = default_sample;
// For convenience, another constructor allows initializing all the members
MyType initialized_sample (
    7, // my_long
    std::string("Hello, World!"), // my_string
    Foo(1, 2), // my_foo (initializing its members 'x' and 'y')
    std::vector<int32_t>(3, 2), // my_sequence containing 3 times the value 2
    dds::core::array<Foo, 5>(), // my_array
    Foo(2, 3) // my_optional (initialized with a non-empty value)
);
// An assignment operator is also available
copied_sample = initialized_sample;
// Equals operator (!= also available)
if (copied_sample == initialized_sample) {
    std::cout « "Samples are equal\n";
}
// You can move a value into a member:
std::vector<int32_t> tmp_vector {1, 2, 3, 4};
copied_sample.my_sequence() = std::move(tmp_vector);
std::cout « "You can print samples to an output stream: "
          « copied_sample
          « std::endl;
```

In addition to that, a number of **traits** (p. 444) provide additional information and utilities for IDL-generated types.

6.213.4 Accessing the type members

Struct members are public. Setters and getters provide access to union members.

The following table summarizes how different IDL types map to C++.

IDL type	C++ type
`string`	`std::string`
bounded sequence (`sequence<T, M>`)	**rti::core::bounded_sequence**<**T, M**> (p. 887)
unbounded sequence (`sequence<T>`)	`std::vector<T>`
array (`T member`[N])	std::array<T, N>
optional member (`@optional T member;`)	**dds::core::optional**<**T**> (p. 1879)
external member (`@external T member;`)	**dds::core::external**<**T**> (p. 1551)

The type **`rti::core::bounded_sequence`** (p. 887) offers similar functionality to that of a `std::vector`. But because it has an upper bound `M`, it provides two advantages:

1) A better memory management strategy for deserializing data samples in a DataReader, improving the overall performance of the middleware.

2) Its member functions check for out-of-bounds growth.

It is possible to use `std::vector` for bounded sequences by annotating them with `@use_vector` in IDL. For example:

```
struct SequenceExample {
    @use_vector sequence<long, 10> bounded_sequence_as_vector;
    sequence<long, 10> bounded_sequence;
    sequence<long> unbounded_sequence;
};
```

The type `dds::core::array` is just an alias of `std::array` if available, or an alias of `boost::array` otherwise.

6.213.5 Enumerations

IDL enums map to `enum class` types in C++.

6.213.6 Unions

IDL unions map to C++ classes with getters and setters for each member, plus a especial getter and setter for the discriminator, `_d()`. At any moment only one member, the one selected by the discriminator, is considered active. A member getter will throw **dds::core::PreconditionNotMetError** (p. 1941) if the discriminator selects a different member.

Member setters set the correct discriminator value automatically.

The default constructor default-constructs all the members and selects the discriminator returned by the static member function `default_discriminator()`.

The following example shows an IDL union and C++ code to manipulate it.

- IDL definition:

```
enum MyUnionDiscriminator {
    USE_LONG,
    USE_STRING,
    USE_FOO
};
union MyUnion switch (MyUnionDiscriminator) {
case USE_LONG:
    long my_long;
case USE_STRING:
    string my_string;
case USE_FOO:
    Foo my_foo;
};
```

- C++ example:

```
    MyUnion my_sample;
    // Set a member
    my_sample.my_string("Hello, World!");
    // The discriminator is automatically updated
    assert (my_sample._d() == MyUnionDiscriminator::USE_STRING);
    // Access that member
    std::cout « my_sample.my_string() « std::endl;
    // Trying to access my_long() will throw an exception:
    try {
        std::cout « my_sample.my_long() « std::endl;
    } catch (const dds::core::PreconditionNotMetError&) {
        std::cout « "my_long is not selected!\n";
    }
    // First, set it
    my_sample.my_long(4);
    std::cout « my_sample.my_long() « std::endl;
    // Trying to access my_foo() to modify a nested member will also fail
    try {
        my_sample.my_foo().x(3);
    } catch (const dds::core::PreconditionNotMetError&) {
        std::cout « "my_foo is not selected!\n";
    }
    // First change the discriminator
    my_sample._d(MyUnionDiscriminator::USE_FOO);
    my_sample.my_foo().x(3); // now it works
    std::cout « my_sample « std::endl;
```

6.214 DynamicType and DynamicData Use Cases

Using DynamicType and DynamicData.

Using DynamicType and DynamicData.

The following #includes are needed for the examples on this page

```
#include <dds/core/ddscore.hpp>
#include <dds/pub/ddspub.hpp>
#include <dds/sub/ddssub.hpp>
#include "Foo.hpp"
```

6.214.1 Creating a DynamicType

In this section we'll see the different ways to create a **dds::core::xtypes::DynamicType** (p. 1504) that represents the following **IDL type** (p. 606) `MyType` **:**

```
struct Foo {
    long x; //@key
    long y;
};
struct MyType {
    long my_long;
    string<512> my_string;
    Foo my_foo;
    sequence<long, 10> my_sequence;
    Foo my_array[5];
    Foo my_optional; //@Optional
};
```

6.214.1.1 Create a DynamicType by instantiating it and adding members

(Note this example uses C++11 code that can easily be converted to similar C++03 code)

```
dds::core::xtypes::StructType create_mytype()
{
    using namespace dds::core::xtypes;
    // First, let's create Foo. We're using an initializer_list of Members
    StructType foo(
        "Foo", {
            Member("x", primitive_type<int32_t>()).key(true),
            Member("y", primitive_type<int32_t>())
        }
    );
    // Create MyType and add members
    StructType mytype("MyType");
    mytype.add_member(Member("my_long", primitive_type<int32_t>()));
    mytype.add_member(Member("my_string", StringType(512)));
    mytype.add_member(Member("my_foo", foo));
    mytype.add_member(Member("my_sequence", SequenceType(primitive_type<int32_t>(), 10)));
    mytype.add_member(Member("my_array", ArrayType(foo, 5)));
    mytype.add_member(Member("my_optional", foo).optional(true));
    rti::core::xtypes::print_idl(mytype);
    return mytype;
}
```

6.214.1.2 Create a DynamicType from an XML description

We can define the type in this XML file, MyType.xml:

```
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="https://community.rti.com/schema/current/rti_dds_profiles.xsd">
    <types>
        <struct name= "Foo">
            <member name="x" type="int32" key="true"/>
            <member name="y" type="int32"/>
        </struct>
        <struct name= "MyType">
            <member name="my_long" type="int32"/>
            <member name="my_string" stringMaxLength="512" type="string"/>
            <member name="my_foo" type="nonBasic" nonBasicTypeName= "Foo"/>
            <member name="my_sequence" sequenceMaxLength="10" type="int32"/>
            <member name="my_array" type="nonBasic" nonBasicTypeName= "Foo" arrayDimensions="5"/>
            <member name="my_optional" type="nonBasic" nonBasicTypeName= "Foo" optional="true"/>
        </struct>
    </types>
</dds>
```

And then load it as follows:

```
    using namespace dds::core::xtypes;
    // Create a QosProvider (or use the default one)
    dds::core::QosProvider qos_provider("path/to/MyType.xml");
    // Get the type called MyType
    const DynamicType& mytype = qos_provider.extensions().type("MyType");
    // Downcast to StructType if needed
    const StructType& mytype_struct = static_cast<const StructType&>(mytype);
    rti::core::xtypes::print_idl(mytype);
```

See also

Qos Provider Use Cases (p. 604)

6.214.1.3 Get the DynamicType from its equivalent IDL-generated type

<<***extension***>> *(p. 354)* When we have the IDL type definition at hand, obtaining its equivalent DynamicType is as simple as:

```
    const dds::core::xtypes::StructType& mytype = rti::topic::dynamic_type<MyType>::get();
    rti::core::xtypes::print_idl(mytype);
```

6.214.1.4 Create a DynamicType using tuples

<<***C++11***>> *(p. 353)* <<***experimental***>> *(p. 355)* <<***extension***>> *(p. 354)* Note this code requires the additional header `<rti/core/xtypes/DynamicDataTuples.hpp>`.

Since this feature only supports structures containing primitive types or strings, we'll create the following simpler IDL type:

```
struct MyOtherType {
    long m1;
    double m2;
    string m3;
};
```

We can create the type in a single line:

```
    dds::core::xtypes::StructType mytype = rti::core::xtypes::create_type_from_tuple<
            int32_t, double, std::string>("MyOtherType");
    rti::core::xtypes::print_idl(mytype);
```

For convenience, we can also use a `std::tuple`, which allows us to typedef it:

```
    typedef std::tuple<int32_t, double, std::string> MyOtherTypeTuple;
    mytype = rti::core::xtypes::create_type_from_tuple<MyOtherTypeTuple>("MyOtherType");
    rti::core::xtypes::print_idl(mytype);
```

6.214.2 Using DynamicData

Now that we know how to create a DynamicType, we will see how to use DynamicData to publish and subscribe to data that we can manipulate reflectively.

We will use the DynamicType that we **created before** (p. 609).

6.214.2.1 Publishing data using DynamicData

Make sure you are already familiar with the regular **publication example** (p. 304).

Unlike the regular publication example, using dynamic data we can write code where the type is unknown at compilation type.

```
using namespace dds::core::xtypes;
StructType mytype = create_mytype(); // create the type as we saw before
dds::domain::DomainParticipant participant(0);
// The template parameter is DynamicData. The third argument is the
// DynamicType, instead of the type name.
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::pub::DataWriter<DynamicData> writer(dds::pub::Publisher(participant), topic);
// Create a data sample and assign its values
DynamicData sample(mytype);
sample.value("my_long", 23); // my_long = 23
sample.value<std::string>("my_string", "hello"); // my_string = hello
// To set my_foo we have two options:
// 1) Create a new DynamicData and assigning it:
// We can get the DynamicType of Foo from MyType::my_foo
DynamicData foo_data(mytype.member("my_foo").type());
foo_data.value("x", 1);
foo_data.value("y", 2);
sample.value("my_foo", foo_data);
// 2) Obtain the loaned member and assign its values
rti::core::xtypes::LoanedDynamicData loaned_member = sample.loan_value("my_foo");
loaned_member.get().value("x", 2);
loaned_member.get().value("y", 3);
loaned_member.return_loan(); // The destructor would do this as well.
// To set the values of my_sequence we can use a vector
std::vector<int32_t> sequence_values;
sequence_values.push_back(10);
sequence_values.push_back(20);
sequence_values.push_back(30);
sample.set_values("my_sequence", sequence_values);
// To set the values of my_array, since the element type is another struct
// we will use a LoanedDynamicData to access the array elements. To modify
// each element we will use another LoanedDynamicData
loaned_member = sample.loan_value("my_array");
rti::core::xtypes::LoanedDynamicData array_element = loaned_member.get().loan_value(1);
array_element.get().value("x", 10);
array_element.get().value("y", 11);
loaned_member.get().loan_value(array_element, 2); // reuse array_element
array_element.get().value("x", 20);
array_element.get().value("y", 21);
array_element.return_loan();
loaned_member.return_loan();
// We're not setting the remaining 3 elements, so they will have default values
// We manipulate optional members as regular members. By setting a value
// we are implicitly asserting its presence in the sample.
sample.value("my_optional", foo_data);
// This is how we can unset it:
sample.clear_optional_member("my_optional");
// Finally we just write the sample
writer.write(sample);
std::cout « sample « std::endl;
```

6.214.2.2 Subscribing to data using DynamicData

```
using namespace dds::core::xtypes;
using namespace rti::core::xtypes;
using namespace std; // for cout and endl
StructType mytype = create_mytype(); // create the type as we saw before
dds::domain::DomainParticipant participant(0);
// The template parameter is DynamicData. The third argument is the
// DynamicType, instead of the type name.
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::sub::DataReader<DynamicData> reader(dds::sub::Subscriber(participant), topic);
// ...
// Read/take samples normally
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        DynamicData& data = const_cast<DynamicData&>(sample.data());
        cout « data.value<int32_t>("my_long") « endl;
        // To inspect a complex member we can get a copy of it:
        DynamicData foo_copy = data.value<DynamicData>("my_foo");
        cout « foo_copy.value<int32_t>("x") « endl;
        // Or a loan:
        LoanedDynamicData loaned_member = data.loan_value("my_foo");
        cout « loaned_member.get().value<int32_t>("y") « endl;
        loaned_member.return_loan(); // Note: the destructor also returns the loan if needed
        // Note that we could have taken advantage of the destructor to save
        // the call to return_loan:
        cout « data.loan_value("my_foo").get().value<int32_t>("y") « endl;
        // To get the values of my_sequence we can use a vector:
        std::vector<int32_t> sequence_values = data.get_values<int32_t>("my_sequence");
        // We could also have reused a vector:
        data.get_values("my_sequence", sequence_values);
        // To get the values of my_array, since the element type is another
        // struct we will use a LoanedDynamicData to access the array
        // elements.
        loaned_member = data.loan_value("my_array"); // Note: this move-assignment only works in C++11
        for (size_t i = 1; i <= loaned_member.get().member_count(); i++) {
            LoanedDynamicData array_element = loaned_member.get().loan_value(i);
            cout « array_element.get().value<int32_t>("x") « endl;
            cout « array_element.get().value<int32_t>("y") « endl;
        }
        // When getting an unset optional member, value() will throw
        // dds::core::InvalidArgumentError, but we can check if it's set:
        if (data.member_exists("my_optional")) {
            foo_copy = data.value<DynamicData>("my_optional");
            cout « foo_copy.value<int32_t>("x") « endl;
            cout « foo_copy.value<int32_t>("y") « endl;
        } else {
            cout « "my_optional is not set" « endl;
        }
    }
}
```

6.214.2.3 Manipulating data reflectively using C++ tuples

*<<**C++11**>> (p. 353) <<**experimental**>> (p. 355) <<**extension**>> (p. 354)*

This feature allows publishing and subscribing to simple data types without code generation and directly using C++ types instead of the DynamicData getters and setters.

This is an example publisher:

```
using namespace dds::core::xtypes;
// Create the type
StructType mytype = rti::core::xtypes::create_type_from_tuple<
    int32_t, double, std::string>("MyType");
// Create participant, topic and writer
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::pub::DataWriter<DynamicData> writer(dds::pub::Publisher(participant), topic);
// Create a data sample and assign its values
DynamicData sample(mytype);
rti::core::xtypes::set_tuple(
    sample, std::make_tuple(10, 50.5, std::string("Hello")));
// Write the sample
```

```
writer.write(sample);
std::cout « sample « std::endl;
```

And this is a subscriber:

```
using namespace dds::core::xtypes;
using namespace rti::core::xtypes;
// Create the type
StructType mytype = rti::core::xtypes::create_type_from_tuple<
    int32_t, double, std::string>("MyType");
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::sub::DataReader<DynamicData> reader(dds::sub::Subscriber(participant), topic);
// Read/take samples normally
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        // We obtain a std::tuple from the DynamicData sample
        auto my_tuple =  rti::core::xtypes::get_tuple<
            int32_t, double, std::string>(sample.data());
        std::cout « std::get<0>(my_tuple) « std::endl;
        std::cout « std::get<1>(my_tuple) « std::endl;
        std::cout « std::get<2>(my_tuple) « std::endl;
    }
}
```

Chapter 7

Namespace Documentation

7.1 dds Namespace Reference

The dds namespace. The dds namespace includes all of the standard types, classes, and functions.

Namespaces

- namespace **all**

  <<***extension***>> *(*p. *354) A single namespace where all standard symbols are included.*
- namespace **core**

  The core namespace contains infrastructure types and functions.
- namespace **domain**

  The domain namespace contains types, classes, and functions related to DomainParticipants.
- namespace **pub**

  Contains the type and functions to support publishing topics.
- namespace **sub**

  Contains the types and functions to support subscribing to topics.
- namespace **topic**

  Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types.

7.1.1 Detailed Description

The dds namespace. The dds namespace includes all of the standard types, classes, and functions.

7.2 dds::all Namespace Reference

<<***extension***>> *(*p. *354)* A single namespace where all standard symbols are included.

7.2.1 Detailed Description

<<***extension***>> *(*p. *354)* A single namespace where all standard symbols are included.

The namespace **dds::all** (p. 615) brings all symbols to a single namespace as an alternative way of using the different namespaces such as **dds::core** (p. 616), **dds::core::cond** (p. 627), **dds::sub** (p. 658), etc.

For example:

```
#include <dds/dds.hpp>
void test_namespace()
{
    using namespace dds::all;
    DomainParticipant participant(MY_DOMAIN_ID); // dds::domain
    Topic<StringTopicType> topic(participant, "My Topic"); // dds::topic and dds::core
}
```

7.3 dds::core Namespace Reference

The core namespace contains infrastructure types and functions.

Namespaces

- namespace **cond**

  Contains the ***Condition*** *(*p. *948) classes.*
- namespace **policy**

  Contains the standard Qos policy classes.
- namespace **status**

  Contains the Status and State classes.
- namespace **xtypes**

  Contains the types and functions to support Extensible Types.

Classes

- class **AlreadyClosedError**

  Indicates that an object has been closed.
- class **basic_string**

  <<***value-type***>> *(*p. *350) A string convertible to std::string and with similar functionality*
- class **BytesTopicType**

  Built-in type consisting of a variable-length array of opaque bytes.
- class **Duration**

  <<***value-type***>> *(*p. *350) Represents a time interval*
- class **Entity**

  <<***reference-type***>> *(*p. *351) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.*
- class **Error**

  A generic, unspecified ***Error*** *(*p. *1539).*
- class **Exception**

The abstract base class for all of the DDS exceptions which may be thrown by the API.

- class **external**

  A managed reference to an object.

- class **IllegalOperationError**

  Indicates that an operation was called under improper circumstances.

- class **ImmutablePolicyError**

  Indicates that the application attempted to modify an immutable QoS policy.

- class **InconsistentPolicyError**

  Indicates that the application specified a set of QoS policies that are not consistent with each other.

- class **InstanceHandle**

  *<<**value-type**>> (p. 350) Handle to identify different instances of the same **dds::topic::Topic** (p. 2474) of a certain type.*

- class **InvalidArgumentError**

  Indicates that the application passed an illegal parameter value into an operation.

- class **InvalidDowncastError**

  Indicates that a downcast was incorrect.

- class **KeyedBytesTopicType**

  Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

- class **KeyedStringTopicType**

  Built-in type consisting of a string payload and a second string that is the key.

- class **NotAllowedBySecurityError**

  Indicates that an operation on the DDS API fails because the security plugins do not allow it.

- class **NotEnabledError**

  *A **NotEnabledError** (p. 1869) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1520) that is not yet enabled.*

- class **NullReferenceError**

  Indicates an attempt to access a null object.

- class **optional**

  *<<**value-type**>> (p. 350) Represents an object that may not contain a valid value*

- class **OutOfResourcesError**

  Indicates that RTI Connext ran out of the resources needed to complete the operation.

- class **PreconditionNotMetError**

  *A **PreconditionNotMetError** (p. 1941) is thrown when a pre-condition for the operation was not met.*

- class **QosProvider**

  *<<**reference-type**>> (p. 351) The **QosProvider** (p. 2025) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connext*

- class **Reference**

  Base class for all reference types.

- class **safe_enum**

  *<<**value-type**>> (p. 350) Provides a safe, scoped enumeration based on def::type*

- class **StringTopicType**

  Built-in type consisting of a single character string.

- class **TEntityQos**

  Acts as a container for Qos policies allowing to set and retrieve all the policies of an entity as a unit.

- class **Time**

  *<<**extension**>> (p. 354) Represents a point in time*

- class **TimeoutError**

  Indicates that an operation has timed out.

- class **UnsupportedError**

  Indicates that the application used an unsupported operation.
- class **Value**
- class **vector**

  *<<**value-type**>> (p. 350) A vector convertible to std::vector and with similar functionality*
- class **WeakReference**

Typedefs

- typedef std::vector< **InstanceHandle** > **InstanceHandleSeq**

  *A sequence of **dds::core::InstanceHandle** (p. 1612).*
- typedef **basic_string**< char, rti::core::memory::OsapiAllocator< char > > **string**

  A string convertible to std::string and with similar functionality.
- typedef **basic_string**< DDS_Wchar, rti::core::memory::OsapiAllocator< DDS_Wchar > > **wstring**

  An IDL-derived wide string.
- typedef std::vector< uint8_t > **ByteSeq**

  A vector of bytes.
- typedef std::vector< std::string > **StringSeq**

  A vector of strings.
- typedef std::nullptr_t **null_type**

  *<<**C++11**>> (p. 353) The type of **dds::core::null** (p. 438)*

Functions

- template<typename TO , typename FROM >
  TO **polymorphic_cast** (const FROM &from)

  *Downcasts an **Entity** (p. 1520) to a subclass.*
- **Duration operator*** (uint32_t lhs, const **Duration** &rhs)

  *Multiply a **Duration** (p. 1448) object by an unsigned integer.*
- **Duration operator*** (const **Duration** &lhs, uint32_t rhs)

  *Multiply a **Duration** (p. 1448) object by an unsigned integer.*
- **Duration operator/** (const **Duration** &lhs, uint32_t rhs)

  *Divide a **Duration** (p. 1448) object by an unsigned integer.*
- void **swap** (**Duration** &lhs, **Duration** &rhs) OMG_NOEXCEPT

  *Swap the contents of two **Duration** (p. 1448) objects.*
- template<typename def , typename inner >
  std::ostream & **operator<<** (std::ostream &out, const **safe_enum**< def, inner > &the_enum)

  Applies `operator<<` to the underlying enum.
- template<typename CharType , typename Allocator >
  std::ostream & **operator<<** (std::ostream &out, const **basic_string**< CharType, Allocator > &the_string)

  Prints the string.
- **Time operator+** (const **Time** &time, const **Duration** &duration)

  *Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.*
- **Time operator+** (const **Duration** &duration, const **Time** &time)

  *Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.*
- **Time operator-** (const **Time** &time, const **Duration** &duration)

*Subtract a **Duration** (p. 1448) from a **Time** (p. 2457).*

- **Duration operator-** (const **Time** &time1, const **Time** &time2)

  Calculate the duration between two times.

- template<typename T >
  bool **operator==** (const **optional**< T > &a, const **optional**< T > &b)

  Compares two optional values.

- template<typename T >
  bool **operator!=** (const **optional**< T > &a, const **optional**< T > &b)

  Compares two optional values.

- template<typename T >
  bool **operator==** (const **optional**< T > &optional_value, const T &value)

  Compares an optional member and a value of the underlying type.

- template<typename T >
  bool **operator==** (const T &value, const **optional**< T > &optional_value)

  Compares an optional member and a value of the underlying type.

- template<typename T >
  bool **operator!=** (const **optional**< T > &optional_value, const T &value)

  Compares an optional member and a value of the underlying type.

- template<typename T >
  bool **operator!=** (const T &value, const **optional**< T > &optional_value)

  Compares an optional member and a value of the underlying type.

- template<typename T >
  std::ostream & **operator**<< (std::ostream &out, const **optional**< T > & **optional**)

  Applies `operator<<` to `*optional` or to the string `"NULL"` if `!optional.has_value()`.

- template<typename T >
  std::ostream & **operator**<< (std::ostream &out, const **vector**< T > &v)

  Print a vector applying << to all of its elements.

Variables

- const int32_t **LENGTH_UNLIMITED** = -1

  A special value indicating an unlimited quantity.

- const **null_type null**

  Indicates an empty reference.

7.3.1 Detailed Description

The core namespace contains infrastructure types and functions.

7.3.2 Typedef Documentation

7.3.2.1 InstanceHandleSeq

```
typedef std::vector< InstanceHandle>  dds::core::InstanceHandleSeq
```

A sequence of **dds::core::InstanceHandle** (p. 1612).

7.3.3 Function Documentation

7.3.3.1 polymorphic_cast()

```
template<typename TO , typename FROM >
TO polymorphic_cast (
             const FROM & from )
```

Downcasts an **Entity** (p. 1520) to a subclass.

Note

- Header: <dds/core/ref_traits.hpp>
- Namespace: **dds::core** (p. 616)

Template Parameters

TO	The type to cast to
FROM	The type to cast from

Parameters

from	The object to cast to type TO

Returns

A reference to the same object from, but cast to the type TO. Both objects share ownership of the underlying entity.

For example:

```
using namespace dds::core;
using namespace dds::domain;
DomainParticipant participant(0);
Entity entity = participant; // Assignment to base
DomainParticipant participant2 = polymorphic_cast<DomainParticipant>(entity);
assert (participant == participant2); // Same reference
```

See also

Reference types (p. 351)

7.3.3.2 operator*() [1/2]

```
Duration operator* (
            uint32_t lhs,
            const  Duration & rhs )
```

Multiply a **Duration** (p. 1448) object by an unsigned integer.

Parameters

lhs	The unsigned integer to multiply the **Duration** (p. 1448) object by
rhs	The **Duration** (p. 1448) object to multiply

Returns

Duration (p. 1448) The result of the multiplication

7.3.3.3 operator*() [2/2]

```
Duration operator* (
            const  Duration & lhs,
            uint32_t rhs )
```

Multiply a **Duration** (p. 1448) object by an unsigned integer.

Parameters

lhs	The **Duration** (p. 1448) object to multiply
rhs	The unsigned integer to multiply the **Duration** (p. 1448) object by

Returns

Duration (p. 1448) The result of the multiplication

7.3.3.4 operator/()

```
Duration operator/ (
            const  Duration & lhs,
            uint32_t rhs )
```

Divide a **Duration** (p. 1448) object by an unsigned integer.

Parameters

lhs	The dividend
rhs	The divisor

Returns

Duration (p. 1448) The result of dividing the two **Duration** (p. 1448) objects

7.3.3.5 swap()

```
void swap (
              Duration & lhs,
              Duration & rhs )
```

Swap the contents of two **Duration** (p. 1448) objects.

Parameters

lhs	One of the **Duration** (p. 1448) objects
rhs	One of the **Duration** (p. 1448) objects

7.3.3.6 operator<<() [1/4]

```
template<typename def , typename inner >
std::ostream & operator<< (
             std::ostream & out,
             const  safe_enum< def, inner > & the_enum )
```

Applies operator<< to the underlying enum.

7.3.3.7 operator<<() [2/4]

```
template<typename CharType , typename Allocator >
std::ostream & operator<< (
             std::ostream & out,
             const  basic_string< CharType, Allocator > & the_string )
```

Prints the string.

7.3.3.8 operator+() [1/2]

```
Time operator+ (
            const  Time & time,
            const  Duration & duration )
```

Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.

Parameters

time	The **Time** (p. 2457) object to add
duration	The **Duration** (p. 1448) object to add

Returns

Time (p. 2457) The result of the addition represented as a **Time** (p. 2457) object

7.3.3.9 operator+() [2/2]

```
Time operator+ (
            const  Duration & duration,
            const  Time & time )
```

Add a **Time** (p. 2457) and a **Duration** (p. 1448) together.

Parameters

duration	The **Duration** (p. 1448) object to add
time	The **Time** (p. 2457) object to add

Returns

Time (p. 2457) The result of the addition represented as a **Time** (p. 2457) object

7.3.3.10 operator-() [1/2]

```
Time operator- (
            const  Time & time,
            const  Duration & duration )
```

Subtract a **Duration** (p. 1448) from a **Time** (p. 2457).

Parameters

time	The **Time** (p. 2457) object to subtract from
duration	The **Duration** (p. 1448) object to subtract

Returns

Time (p. 2457) The result of the subtraction represented as a **Time** (p. 2457) object

7.3.3.11 operator-() [2/2]

```
Duration operator- (
            const  Time & time1,
            const  Time & time2 )
```

Calculate the duration between two times.

Parameters

time1	The first ("before") time
time2	The second ("after") time

Exceptions

std::overflow_error	if duration exceeds the infinite limit

Returns

The duration elapsed between time1 and time2. If time1 $>$ time2 the duration is zero. If time1 is **Time::maximum()** (p. 2459), the duration is **Duration::infinite()** (p. 1451);

7.3.3.12 operator==() [1/3]

```
template<typename T >
bool operator== (
            const  optional< T > & a,
            const  optional< T > & b )
```

Compares two optional values.

Returns

true if both are unset or both are set and `*a == *b`.

7.3.3.13 operator"!=() [1/3]

```
template<typename T >
bool operator!= (
            const  optional< T > & a,
            const  optional< T > & b )
```

Compares two optional values.

Returns

false if both are unset or both are set and `*a == *b`.

7.3.3.14 operator==() [2/3]

```
template<typename T >
bool operator== (
            const  optional< T > & optional_value,
            const T & value )
```

Compares an optional member and a value of the underlying type.

Returns

Return true if `optional_value` is set and `*optional_value == value`

7.3.3.15 operator==() [3/3]

```
template<typename T >
bool operator== (
            const T & value,
            const  optional< T > & optional_value )
```

Compares an optional member and a value of the underlying type.

Returns

Return true if optional_value is set and `*optional_value == value`

7.3.3.16 operator"!=() [2/3]

```
template<typename T >
bool operator!= (
            const  optional< T > & optional_value,
            const T & value )
```

Compares an optional member and a value of the underlying type.

Returns

Return false if optional_value is set and `*optional_value == value`

7.3.3.17 operator"!=() [3/3]

```
template<typename T >
bool operator!= (
            const T & value,
            const  optional< T > & optional_value )
```

Compares an optional member and a value of the underlying type.

Returns

Return false if optional_value is set and `*optional_value == value`

7.3.3.18 operator<<() [3/4]

```
template<typename T >
std::ostream & operator<< (
            std::ostream & out,
            const  optional< T > & optional )
```

Applies `operator<<` to `*optional` or to the string `"NULL"` if `!optional.has_value()`.

7.3.3.19 operator<<() [4/4]

```
template<typename T >
std::ostream & operator<< (
            std::ostream & out,
            const  vector< T > & v )
```

Print a vector applying << to all of its elements.

7.4 dds::core::cond Namespace Reference

Contains the **Condition** (p. 948) classes.

Classes

- class **Condition**

  <<***reference-type***>> *(p. 351) Abstract base class of all the conditions*
- class **GuardCondition**

  <<***reference-type***>> *(p. 351) A condition whose trigger value is under the control of the application.*
- class **StatusCondition**

  <<***reference-type***>> *(p. 351) A condition associated with each* ***dds::core::Entity*** *(p. 1520)*
- class **WaitSet**

  <<***reference-type***>> *(p. 351) Allows an application to wait until one or more of the attached* ***Condition*** *(p. 948) objects have a trigger_value of true or else until the timeout expires.*

7.4.1 Detailed Description

Contains the **Condition** (p. 948) classes.

7.5 dds::core::policy Namespace Reference

Contains the standard Qos policy classes.

Classes

- class **DataRepresentation**

  Contains the data representations supported by entities.
- class **DataTag**

  Stores name-value (string) pairs that can be used to determine access permissions.
- class **Deadline**

  Expresses the maximum duration (deadline) within which an instance is expected to be updated.
- class **DestinationOrder**

  Controls the logical order of updates to the same instance by a ***dds::pub::Publisher*** *(p. 1993).*
- struct **DestinationOrderKind_def**

  The definition of the ***dds::core::safe_enum*** *(p. 2265) DestinationOrderKind.*
- class **Durability**

  Specifies whether a ***dds::pub::DataWriter*** *(p. 1138) will store and deliver previously published data samples to late-joining* ***dds::sub::DataReader*** *(p. 976) entities.*
- struct **DurabilityKind_def**

  The definition of the ***dds::core::safe_enum*** *(p. 2265) DurabilityKind.*
- class **DurabilityService**

  Configures the external RTI Persistence Service used by persistent and transient DataWriters.

- class **EntityFactory**

  *Configures a **dds::core::Entity*** (p. *1520*) *that acts as factory of other entities.*
- class **GroupData**
- class **History**

  *Specifies how much historical data a **dds::pub::DataWriter*** (p. *1138*) *and a **dds::sub::DataReader*** (p. *976*) *can store.*
- struct **HistoryKind_def**

  *The definition of the **dds::core::safe_enum*** (p. *2265*) *HistoryKind.*
- class **LatencyBudget**

  Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.
- class **Lifespan**

  *Specifies how long the data written by a **dds::pub::DataWriter*** (p. *1138*) *is considered valid.*
- class **Liveliness**

  *Specifies and configures the mechanism that allows **dds::sub::DataReader*** (p. *976*)*'s to detect when **dds::pub::Data↩ Writer*** (p. *1138*)*'s become disconnected.*
- struct **LivelinessKind_def**

  *The definition of the **dds::core::safe_enum*** (p. *2265*) *LivelinessKind.*
- class **Ownership**

  *Specifies whether it is allowed for multiple **dds::pub::DataWriter*** (p. *1138*)*'s to write the same instance of the data and if so, how these modifications should be arbitrated.*
- struct **OwnershipKind_def**

  *The definition of the **dds::core::safe_enum*** (p. *2265*) *OwnershipKind.*
- class **OwnershipStrength**

  *Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter*** (p. *1138*) *objects that attempt to modify the same instance of a data type (identified by its **dds::topic::Topic*** (p. *2474*) *and key).*
- class **Partition**

  *Set of strings that introduces logical partitions in **dds::domain::DomainParticipant*** (p. *1326*)*, **dds::pub::Publisher*** (p. *1993*)*, or **dds::sub::Subscriber*** (p. *2410*) *entities.*
- class **policy_id**

  Obtains the QosPolicyId of a QoS Policy.
- class **policy_name**

  Obtains the policy name.
- class **Presentation**

  Specifies how the samples representing changes to data instances are presented to a subscribing application.
- struct **PresentationAccessScopeKind_def**

  *The definition of the **dds::core::safe_enum*** (p. *2265*) *PresentationAccessScopeKind.*
- class **QosPolicyCount**

  *<<**value-type**>>* (p. *350*) *Holds a counter for a QosPolicyId*
- class **ReaderDataLifecycle**

  Controls how a DataReader manages the lifecycle of the data that it has received.
- class **Reliability**

  *Indicates the level of reliability in sample delivered that a **dds::pub::DataWriter*** (p. *1138*) *offers or a **dds::sub::Data↩ Reader*** (p. *976*) *requests.*
- struct **ReliabilityKind_def**

  *The definition of the **dds::core::safe_enum*** (p. *2265*) *ReliabilityKind.*
- class **ResourceLimits**

  *Controls the memory usage of **dds::pub::DataWriter*** (p. *1138*) *or a **dds::sub::DataReader*** (p. *976*)*.*
- class **TimeBasedFilter**

*Allows a **dds::sub::DataReader** (p. 976) to indicate that it is not interested in all the sample updates that occur within a time period.*

- class **TopicData**
- class **TransportPriority**

  Allows applications to take advantage of transports capable of sending messages with different priorities.
- class **TypeConsistencyEnforcement**

  Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.
- struct **TypeConsistencyEnforcementKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) TypeConsistencyEnforcementKind.*
- class **UserData**

  *Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 46) during discovery.*
- class **WriterDataLifecycle**

  *Controls how a **dds::pub::DataWriter** (p. 1138) handles the lifecycle of the instances (keys) that it writes.*

Typedefs

- typedef **dds::core::safe_enum**< **OwnershipKind_def** > **OwnershipKind**

  ***Safe Enumeration** (p. 429) of **OwnershipKind_def** (p. 1905)*
- typedef **dds::core::safe_enum**< **DurabilityKind_def** > **DurabilityKind**

  ***Safe Enumeration** (p. 429) of **DurabilityKind_def** (p. 1441)*
- typedef **dds::core::safe_enum**< **PresentationAccessScopeKind_def** > **PresentationAccessScopeKind**

  ***Safe Enumeration** (p. 429) of **PresentationAccessScopeKind_def** (p. 1950)*
- typedef **dds::core::safe_enum**< **ReliabilityKind_def** > **ReliabilityKind**

  ***Safe Enumeration** (p. 429) of **ReliabilityKind_def** (p. 2156)*
- typedef **dds::core::safe_enum**< **DestinationOrderKind_def** > **DestinationOrderKind**

  ***Safe Enumeration** (p. 429) of **DestinationOrderKind_def** (p. 1263)*
- typedef **dds::core::safe_enum**< **HistoryKind_def** > **HistoryKind**

  ***Safe Enumeration** (p. 429) of **HistoryKind_def** (p. 1606)*
- typedef **dds::core::safe_enum**< **LivelinessKind_def** > **LivelinessKind**

  ***Safe Enumeration** (p. 429) of **LivelinessKind_def** (p. 1654)*
- typedef **dds::core::safe_enum**< **TypeConsistencyEnforcementKind_def** > **TypeConsistency↩ EnforcementKind**

  ***Safe Enumeration** (p. 429) of **TypeConsistencyEnforcementKind_def** (p. 2570)*
- typedef std::vector< **QosPolicyCount** > **QosPolicyCountSeq**

  *A vector of **QosPolicyCount** (p. 2020).*
- typedef int16_t **DataRepresentationId**

  *The type of the elements that **DataRepresentation** (p. 1113) contains.*
- typedef std::vector< **DataRepresentationId** > **DataRepresentationIdSeq**

  A vector of DataRepresentationId.
- typedef uint32_t **QosPolicyId**

  Identifies a QoS policy.

7.5.1 Detailed Description

Contains the standard Qos policy classes.

7.6 dds::core::status Namespace Reference

Contains the Status and State classes.

Classes

- class **InconsistentTopicStatus**

  *Information about the status **dds::core::status::StatusMask::inconsistent_topic()** (p. 2379)*
- class **LivelinessChangedStatus**

  *Information about the status **dds::core::status::StatusMask::liveliness_changed()** (p. 2383)*
- class **LivelinessLostStatus**

  *Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2383)*
- class **OfferedDeadlineMissedStatus**

  *Information about the status **dds::core::status::StatusMask::offered_deadline_missed()** (p. 2379)*
- class **OfferedIncompatibleQosStatus**

  *Information about the status **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2380)*
- class **PublicationMatchedStatus**

  *Information about the status **dds::core::status::StatusMask::publication_matched()** (p. 2384)*
- class **RequestedDeadlineMissedStatus**

  *Information about the status **dds::core::status::StatusMask::requested_deadline_missed()** (p. 2380)*
- class **RequestedIncompatibleQosStatus**

  *Information about the status **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2381)*
- class **SampleLostStatus**

  *Information about the status **dds::core::status::StatusMask::sample_lost()** (p. 2381)*
- class **SampleRejectedState**

  Reasons why a sample was rejected.
- class **SampleRejectedStatus**

  *Information about the status **dds::core::status::StatusMask::sample_rejected()** (p. 2382)*
- class **StatusMask**

  A std::bitset (list) of statuses.
- class **SubscriptionMatchedStatus**

  *Information about the status **dds::core::status::StatusMask::subscription_matched()** (p. 2384)*

Functions

- template<typename STATUS >
  StatusMask get_status ()

  *Obtains the **StatusMask** (p. 2375) mask associated to a status class.*

7.6.1 Detailed Description

Contains the Status and State classes.

7.6.2 Function Documentation

7.6.2.1 get_status()

```
template<typename STATUS >
StatusMask dds::core::status::get_status ( )
```

Obtains the **StatusMask** (p. 2375) mask associated to a status class.

For example:
```
using namespace dds::core::status;
StatusMask mask = get_status<PublicationMatchedStatus>();
assert(mask == StatusMask::publication_matched());
```

7.7 dds::core::xtypes Namespace Reference

Contains the types and functions to support Extensible Types.

Classes

- class **AbstractConstructedType**

  The base class of types that have members and an extensibility kind.
- class **AliasType**

  <<***value-type***>> *(p. 350) Represents an IDL* `typedef`
- class **ArrayType**

  <<***value-type***>> *(p. 350) Represents an IDL array type.*
- class **CollectionType**

  <<***value-type***>> *(p. 350) The base class of all collection types*
- class **DynamicData**

  <<***value-type***>> *(p. 350) A data sample of any complex data type, which can be inspected and manipulated reflectively.*
- class **DynamicType**

  <<***value-type***>> *(p. 350) Represents a runtime type.*
- class **EnumMember**

  <<***value-type***>> *(p. 350) Represents a* ***EnumType*** *(p. 1535) member*
- class **EnumType**

  <<***value-type***>> *(p. 350) Represents an IDL* `enum` *type*
- struct **ExtensibilityKind_def**

  The definition of the ***dds::core::safe_enum*** *(p. 2265) ExtensibilityKind.*
- class **Member**

  <<***value-type***>> *(p. 350) Represents a* ***StructType*** *(p. 2400) member*
- class **PrimitiveType**

  <<***value-type***>> *(p. 350) Represents an IDL primitive type*
- class **SequenceType**

<<***value-type***>> (p. *350) Represents an IDL* `sequence` *type.*

- class **StringType**

  <<***value-type***>> (p. *350) Represents an IDL* `string` *type.*
- class **StructType**

  <<***value-type***>> (p. *350) Represents an IDL* `struct` *type*
- struct **TypeKind_def**

  The definition of TypeKind.
- class **UnidimensionalCollectionType**

  <<***value-type***>> (p. *350) The base class of collection types with only one dimension.*
- class **UnionMember**

  <<***value-type***>> (p. *350) Represents a* ***UnionType*** (p. *2584) member*
- class **UnionType**

  <<***value-type***>> (p. *350) Represents an IDL* `union` *type*
- class **WStringType**

  <<***value-type***>> (p. *350) Represents an IDL* `wstring` *type.*

Typedefs

- typedef **dds::core::safe_enum**< **ExtensibilityKind_def** > **ExtensibilityKind**

  The extensibility of a type.
- typedef **dds::core::safe_enum**< **TypeKind_def** > **TypeKind**

  The different type kinds.

Functions

- bool **is_primitive_type** (const **DynamicType** &t)

  Determines if a ***DynamicType*** (p. *1504) is a* ***PrimitiveType*** (p. *1959).*
- bool **is_constructed_type** (const **DynamicType** &t)

  Determines if a ***DynamicType*** (p. *1504) is a constructed type.*
- bool **is_collection_type** (const **DynamicType** &t)

  Determines if a ***DynamicType*** (p. *1504) is a* ***CollectionType*** (p. *939).*
- bool **is_aggregation_type** (const **DynamicType** &t)

  Determines if a ***DynamicType*** (p. *1504) is an aggregation type.*
- template<typename T >
  const **PrimitiveType**< T > & **primitive_type** ()

  Obtains a singleton of PrimitiveType<T>
- std::ostream & **operator**<< (std::ostream &out, const **DynamicType** &type)

  <<***extension***>> (p. *354) Converts the* ***DynamicType*** (p. *1504) to a string.*

7.7.1 Detailed Description

Contains the types and functions to support Extensible Types.

7.7.2 Typedef Documentation

7.7.2.1 ExtensibilityKind

```
typedef  dds::core::safe_enum< ExtensibilityKind_def>  dds::core::xtypes::ExtensibilityKind
```

The extensibility of a type.

See also

DynamicType (p. 1504)

7.7.3 Function Documentation

7.7.3.1 is_primitive_type()

```
bool is_primitive_type (
             const  DynamicType & t )
```

Determines if a **DynamicType** (p. 1504) is a **PrimitiveType** (p. 1959).

7.7.3.2 is_constructed_type()

```
bool is_constructed_type (
             const  DynamicType & t )
```

Determines if a **DynamicType** (p. 1504) is a constructed type.

This includes **EnumType** (p. 1535), **AliasType** (p. 801), collection types and aggregation types.

See also

is_collection_type (p. 633)

is_aggregation_type (p. 634)

7.7.3.3 is_collection_type()

```
bool is_collection_type (
            const  DynamicType & t )
```

Determines if a **DynamicType** (p. 1504) is a **CollectionType** (p. 939).

This includes **ArrayType** (p. 828), **SequenceType** (p. 2344), **StringType** (p. 2399), and **WStringType** (p. 2665).

7.7.3.4 is_aggregation_type()

```
bool is_aggregation_type (
            const  DynamicType & t )
```

Determines if a **DynamicType** (p. 1504) is an aggregation type.

This includes **StructType** (p. 2400) and **UnionType** (p. 2584).

7.7.3.5 primitive_type()

```
template<typename T >
const  PrimitiveType< T > & primitive_type ( )
```

Obtains a singleton of PrimitiveType<T>

7.7.3.6 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const  DynamicType & type )
```

<<***extension***>> *(p. 354)* Converts the **DynamicType** (p. 1504) to a string.

This operator writes the **DynamicType** (p. 1504) type to the ostream out using default values for **DynamicTypePrint↩ FormatProperty** (p. 1509) and returns a reference to out.

7.8 dds::domain Namespace Reference

The domain namespace contains types, classes, and functions related to DomainParticipants.

Namespaces

- namespace **qos**

  *Contains **DomainParticipantQos** (p. 1384).*

Classes

- class **DomainParticipant**

  *<<**reference-type**>> (p. 351) Container for all **dds::core::Entity** (p. 1520) objects.*
- class **DomainParticipantListener**

  *The listener class for a **DomainParticipant** (p. 1326).*
- class **NoOpDomainParticipantListener**

  *A convenience implementation of **DomainParticipantListener** (p. 1382) where all methods are overridden to do nothing.*

Functions

- void **ignore** (const **dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)

  *Instructs RTI Connext to locally ignore a remote **dds::domain::DomainParticipant** (p. 1326).*
- template<typename FwdIterator >
  void **ignore** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, FwdIterator end)

  *Instructs RTI Connext to locally ignore a group of remote **dds::domain::DomainParticipant** (p. 1326).*
- **dds::core::InstanceHandleSeq discovered_participants** (const **dds::domain::DomainParticipant** &participant)

  Retrieves the list of other participants discovered by this participant.
- template<typename FwdIterator >
  FwdIterator **discovered_participants** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, FwdIterator end)

  Retrieves the list of other participants discovered by this participant.
- **dds::topic::ParticipantBuiltinTopicData discovered_participant_data** (const **dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &participant_handle)

  Retrieves the information about one participant discovered by this participant.
- **DomainParticipant find** (int32_t domain_id)

  *Locates an existing **dds::domain::DomainParticipant** (p. 1326).*

7.8.1 Detailed Description

The domain namespace contains types, classes, and functions related to DomainParticipants.

7.8.2 Function Documentation

7.8.2.1 ignore() [1/2]

```
void ignore (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & handle )
```

Instructs RTI Connext to locally ignore a remote **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

From the time of this call onwards, RTI Connext will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **dds::domain::DomainParticipant** (p. 1326).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **dds::topic::ParticipantBuiltinTopicData** (p. 1908) to provide access control.

Application data can be associated with a **dds::domain::DomainParticipant** (p. 1326) by means of the **USER_DATA** (p. 554) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The **dds::domain::DomainParticipant** (p. 1326) to ignore is identified by the handle argument. This `handle` is the one that appears in the **dds::sub::SampleInfo** (p. 2285) retrieved when reading the data-samples available for the built-in **dds::sub::DataReader** (p. 976) to the **dds::domain::DomainParticipant** (p. 1326) topic. The built-in **dds::sub::DataReader** (p. 976) is read with the same **dds::sub::DataReader::read** (p. 996) and **dds::sub::DataReader::take** (p. 997) operations used for any **dds::sub::DataReader** (p. 976).

Parameters

participant	The **DomainParticipant** (p. 1326) for which the remote entity will be ignored.
handle	The **dds::core::InstanceHandle** (p. 1612) of the remote entity that will be ignored.

Referenced by **dds::domain::DomainParticipant::ignore()**.

7.8.2.2 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            FwdIterator end )
```

Instructs RTI Connext to locally ignore a group of remote **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

The series of entities whose instance handles are made available via the provided iterators will be ignored.

Parameters

participant	The **DomainParticipant** (p. 1326) for which the remote entity will be ignored
begin	The begin iterator for the series of InstanceHandles to ignore
end	The end iterator for the series of InstanceHandles to ignore

See also

ignore(const dds::domain::DomainParticipant& participant, const dds::core::InstanceHandle& handle) (p. 635)

7.8.2.3 discovered_participants() [1/2]

```
dds::core::InstanceHandleSeq discovered_participants (
            const  dds::domain::DomainParticipant & participant )
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

This operation retrieves the list of **dds::domain::DomainParticipant** (p. 1326) entities that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **dds::domain::ignore** (p. 635) operation. When using **rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::SPDP2** (p. 1324), this list only includes **dds::domain::DomainParticipant** (p. 1326) entities that the application has received configuration information from.

Parameters

participant	The **DomainParticipant** (p. 1326) where to look up the discovered participants

Returns

The list of `InstanceHandles` that can be passed to **dds::domain::discovered_participant_data** (p. 638).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

Referenced by **dds::domain::DomainParticipant::discovered_participants()**.

7.8.2.4 discovered_participants() [2/2]

```
template<typename FwdIterator >
FwdIterator discovered_participants (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            FwdIterator end )
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandleSeq** (p. 619)

This overload copies the instance handles into an iterator range.

Parameters

participant	The participant whose discovered participants are looked up
begin	The begin iterator where to copy the instance handles
end	One past the last position where instance handles are copied

7.8.2.5 discovered_participant_data()

```
dds::topic::ParticipantBuiltinTopicData discovered_participant_data (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & participant_handle )
```

Retrieves the information about one participant discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

This operation retrieves information on a **dds::domain::DomainParticipant** (p. 1326) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 635) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 1326). Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Use the operation **dds::domain::discovered_participants** (p. 637) to find the **dds::domain::DomainParticipant** (p. 1326) entities that are currently discovered.

MT Safety:

Safe.

Parameters

participant	The **DomainParticipant** (p. 1326) where to look up the information
participant_handle	<<***in***>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of **dds::domain::DomainParticipant** (p. 1326).

Returns

The participant information about `participant_handle`

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::ParticipantBuiltinTopicData (p. 1908)

dds::domain::discovered_participants (p. 637)

7.8.2.6 find()

```
DomainParticipant find (
            int32_t domain_id )
```

Locates an existing **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/domain/find.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 634)

If no such **DomainParticipant** (p. 1326) exists, the operation will return **dds::core::null** (p. 438).

If multiple DomainParticipants belonging to that domain id exist, then the operation will return one of them. It is not specified which one.

Parameters

domain_id	The domain id of the **DomainParticipant** (p. 1326) to find

7.9 dds::domain::qos Namespace Reference

Contains **DomainParticipantQos** (p. 1384).

Classes

- class **DomainParticipantFactoryQos**

  <<***value-type***>> (p. *350) Container of the QoS policies that do not apply to a specific entity*

- class **DomainParticipantQos**

  <<***value-type***>> (p. *350) Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1326) supports*

Functions

- std::string **to_string** (const **DomainParticipantFactoryQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> (p. *354) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)*

- std::string **to_string** (const **DomainParticipantFactoryQos** &qos, const **DomainParticipantFactoryQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> (p. *354) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)*

- std::string **to_string** (const **DomainParticipantFactoryQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> (p. *354) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)*

- std::ostream & **operator**<< (std::ostream &out, const rti::domain::qos::DomainParticipantFactoryQos &qos)

  <<***extension***>> (p. *354) Prints a dds::sub::qos::DomainParticipantFactoryQos to an output stream.*

- std::string **to_string** (const **DomainParticipantQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> (p. *354) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)*

- std::string **to_string** (const **DomainParticipantQos** &qos, const **DomainParticipantQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::domain::qos::DomainParticipantQos*** *(p. 1384)*
- std::string **to_string** (const **DomainParticipantQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::domain::qos::DomainParticipantQos*** *(p. 1384)*
- std::ostream & **operator**<< (std::ostream &out, const rti::domain::qos::DomainParticipantQos &qos)

  <<***extension***>> *(p. 354) Prints a dds::sub::qos::DomainParticipantQos to an output stream.*

7.9.1 Detailed Description

Contains **DomainParticipantQos** (p. 1384).

7.9.2 Function Documentation

7.9.2.1 to_string() [1/6]

```
std::string to_string (
            const  DomainParticipantFactoryQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantFactoryQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantFactoryQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantFactoryQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
```

```
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.9.2.2 to_string() [2/6]

```
std::string to_string (
            const  DomainParticipantFactoryQos & qos,
            const  DomainParticipantFactoryQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.9.2.3 to_string() [3/6]

```
std::string to_string (
            const  DomainParticipantFactoryQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1378)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.9.2.4 operator<<() [1/2]

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::domain::qos::DomainParticipantFactoryQos & qos )  [inline]
```

<<***extension***>> *(p. 354)* Prints a dds::sub::qos::DomainParticipantFactoryQos to an output stream.

7.9.2.5 to_string() [4/6]

```
std::string to_string (
            const  DomainParticipantQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.9.2.6 to_string() [5/6]

```
std::string to_string (
            const  DomainParticipantQos & qos,
            const  DomainParticipantQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.9.2.7 to_string() [6/6]

```
std::string to_string (
            const  DomainParticipantQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(*p. *354)* Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1384)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.9.2.8 operator<<() [2/2]

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::domain::qos::DomainParticipantQos & qos )  [inline]
```

<<***extension***>> *(*p. *354)* Prints a dds::sub::qos::DomainParticipantQos to an output stream.

7.10 dds::pub Namespace Reference

  uint32_t **find** (const **dds::pub::Publisher** &publisher, RTI_STRING_IN topic_name, BinIterator begin)

  *Retrieves the **dds::pub::DataWriter*** (p. *1138) for a specific topic name.*

7.10.1 Detailed Description

Contains the type and functions to support publishing topics.

7.10.2 Function Documentation

7.10.2.1 get()

```
template<typename T >
DataWriter< T > get (
             const  AnyDataWriter & any_writer )
```

Same as **AnyDataWriter::get()** (p. 819)

7.10.2.2 ignore() [1/2]

```
void ignore (
              dds::domain::DomainParticipant & participant,
             const  dds::core::InstanceHandle & handle )
```

Instructs RTI Connext to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the **dds::pub::Publisher** (p. 1993) (see **dds::topic::PublicationBuiltinTopicData** (p. 1977)). After this call, any data written by that publication's **dds::pub::DataWriter** (p. 1138) will be ignored.

This operation can be used to ignore local *and* remote DataWriters.

The publication (**DataWriter** (p. 1138)) to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataWriter** (p. 1138), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 2285) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 976) for the publication topic.
- To ignore a *local* **DataWriter** (p. 1138), the `handle` can be obtained by calling **dds::core::Entity::instance_handle()** (p. 1525) for the local **DataWriter** (p. 1138).

There is no way to reverse this operation.

Parameters

participant	The DomainParticipant where the publication will be ignored
handle	<<***in***>> *(p. 355)* Handle of the **dds::pub::DataWriter** (p. 1138) to be ignored.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::PublicationBuiltinTopicData (p. 1977)

dds::topic::publication_topic_name() (p. 443)

dds::sub::builtin_subscriber (p. 671)

Referenced by **dds::pub::DataWriter< T >::ignore()**.

7.10.2.3 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
              dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             FwdIterator end )
```

Instructs RTI Connext to locally ignore several publications.

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 647);

7.10.2.4 matched_subscriptions() [1/2]

```
template<typename T >
dds::core::InstanceHandleSeq matched_subscriptions (
             const  dds::pub::DataWriter< T > & writer )
```

Retrieve the list of subscriptions currently associated with a **dds::pub::DataWriter** (p. 1138).

A subscription is considered to be matching if all of the following criteria are true:

- The subscription is within the same domain as this publication.
- The subscription has a matching **dds::topic::Topic** (p. 2474).
- The subscription has compatible QoS.
- If the applications are using partitions, the subscription shares a common partition with this publication.
- The **dds::domain::DomainParticipant** (p. 1326) has not indicated that the subscription's **dds::domain::DomainParticipant** (p. 1326) should be "ignored" by means of the **dds::pub::ignore** (p. 647) API.
- If the publication is using the **rti::core::policy::MultiChannel** (p. 1749) and the subscription is using a **dds::topic::ContentFilteredTopic** (p. 954), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the writer has completed the key exchange with reader.

The handles returned list are the ones that RTI Connext uses to locally identify the corresponding matched **dds::sub::DataReader** (p. 976) entities. These handles match the ones that appear in the **dds::sub::SampleInfo::instance_handle** (p. 2290) field of the **dds::sub::SampleInfo** (p. 2285) when reading the **dds::topic::subscription_topic_name()** (p. 444) builtin topic.

This API may return the subscription handles of subscriptions that are inactive. **dds::pub::DataWriter::is_matched_subscription_active** (p. 1191) can be used to check this.

The maximum number of matches possible is configured with **rti::core::policy::DomainParticipantResourceLimits** (p. 1391). .

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::NotEnabledError** (p. 1869)

Referenced by **dds::pub::DataWriter< T >::matched_subscriptions()**.

7.10.2.5 matched_subscriptions() [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_subscriptions (
            const  dds::pub::DataWriter< T > & writer,
            FwdIterator begin,
            FwdIterator end )
```

Retrieve the list of subscriptions currently associated with a **dds::pub::DataWriter** (p. 1138).

This operation is similar to **matched_subscriptions(const dds::pub::DataWriter<T>&)** (p. 648) but it copies the instance handles into an iterator range.

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

7.10.2.6 matched_subscription_data()

```
template<typename T >
const  dds::topic::SubscriptionBuiltinTopicData matched_subscription_data (
             const  dds::pub::DataWriter< T > & writer,
             const  dds::core::InstanceHandle & subscription_handle )
```

Retrieves information on a subscription that is currently associated with a **dds::pub::DataWriter** (p. 1138).

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138). Otherwise, the operation will fail and fail with **dds::core::InvalidArgumentError** (p. 1619). Use **dds::pub::matched_subscriptions()** (p. 648) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 1138).

The above information is also available through **dds::sub::DataReaderListener::on_data_available()** (p. 1058) (if a reader listener is installed on the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>).

When the subscription data is updated, for example when the content filter property changes, there is a small window of time in between when the **DataWriter** (p. 1138) is made aware of these changes and when they actually take effect. Taking effect in this example means that the **DataWriter** (p. 1138) will perform writer-side filtering using the new filter property values (filter expression and/or parameters).

When the **DataWriter** (p. 1138) is made aware of the changes they will first be seen in the **dds::sub::DataReaderListener::on_data_available()** (p. 1058) of the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>. When these changes are applied, they will be seen in the output of this API because this API blocks until the most recent changes known to the **DataWriter** (p. 1138) have taken effect. This API will only block when called outside of a listener callback, in order to not block the internal threads from making progress.

If application behavior depends on being made aware of information about a subscription only after it has taken effect on the **DataWriter** (p. 1138), the recommended pattern for usage of this API is to wait for subscription data to be received either through polling this API or by installing a listener on the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>. When a new sample is received by the builtin DataReader, this API may be called in a separate thread and will return the expected matched subscription data once it has been applied to the **DataWriter** (p. 1138).

Because this API blocks, it is possible for this API to time out while waiting for the changes to be applied. A timeout may happen if the DataReader's subscription data is changing rapidly, preventing the **DataWriter** (p. 1138) from returning valid information before newer data has been received, or if an application is performing a task in a listener callback, thereby preventing the middleware's threads from executing events in a timely manner.

Note: This operation does not retrieve the **dds::topic::SubscriptionBuiltinTopicData::type** (p. 2434). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 1058) (if a reader listener is installed on the dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>).

Parameters

writer	The **DataWriter** (p. 1138) to which the subscription is associated
subscription_handle	*<<**in**>> (p. 355).* Handle to a specific subscription associated with the **dds::sub::DataReader** (p. 976). Must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::NotEnabledError** (p. 1869), or **dds::core::TimeoutError** (p. 2473)

7.10.2.7 find() [1/2]

```
template<typename WRITER , typename FwdIterator >
uint32_t find (
             const  dds::pub::Publisher & publisher,
             RTI_STRING_IN topic_name,
             FwdIterator begin,
             uint32_t max_size )
```

Retrieves the **dds::pub::DataWriter** (p. 1138) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 1138) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p. 1138) is attached to the **dds::pub::Publisher** (p. 1993) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 1138) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 1138).

This function retrieves a previously-created **DataWriter** (p. 1138) belonging to the **dds::pub::Publisher** (p. 1993) that is attached to a **dds::topic::Topic** (p. 2474) with a matching topic name. If no such **DataWriter** (p. 1138) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p. 1993) allows access to the built-in **DataWriter** (p. 1138) entities for the built-in topics

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
FwdIterator	The type of forward iterator passed to this function

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the **DataWriter** (p. 1138) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataWriter** (p. 1138) that is to be looked up.
begin	A forward iterator to the position in the destination container to insert the found **DataWriter** (p. 1138) in
max_size	Only 1 **DataWriter** (p. 1138) will be returned from this function

Returns

The number of DataWriters that were found (either 0 or 1)

7.10.2.8 find() [2/2]

```
template<typename WRITER , typename BinIterator >
uint32_t find (
             const  dds::pub::Publisher & publisher,
             RTI_STRING_IN topic_name,
             BinIterator begin )
```

Retrieves the **dds::pub::DataWriter** (p. 1138) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 1138) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p. 1138) is attached to the **dds::pub::Publisher** (p. 1993) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 1138) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 1138).

This function retrieves a previously created **DataWriter** (p. 1138) belonging to the **dds::pub::Publisher** (p. 1993) that is attached to a **dds::topic::Topic** (p. 2474) with a matching topic name. If no such **DataWriter** (p. 1138) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p. 1993) allows access to the built-in **DataWriter** (p. 1138) entities for the built-in topics

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
BinIterator	BinIterator The type of back-inserting iterator passed to this function

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the **DataWriter** (p. 1138) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataWriter** (p. 1138) that is to be looked up.
begin	A back-inserting iterator to the position in the destination container to insert the found **DataWriter** (p. 1138) into

Returns

The number of DataWriters that were found (either 0 or 1)

7.11 dds::pub::qos Namespace Reference

Contains **PublisherQos** (p. 2007) and **DataWriterQos** (p. 1226).

Classes

- class **DataWriterQos**

  <<***value-type***>> *(p. 350) Container of the QoS policies that a* ***dds::pub::DataWriter*** *(p. 1138) supports*

7.11.1 Detailed Description

Contains **PublisherQos** (p. 2007) and **DataWriterQos** (p. 1226).

7.11.2 Function Documentation

7.11.2.1 to_string() [1/6]

```
std::string to_string (
            const  DataWriterQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 1226)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataWriterQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataWriterQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataWriterQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.11.2.2 to_string() [2/6]

```
std::string to_string (
             const  DataWriterQos & qos,
             const  DataWriterQos & base,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 1226)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.11.2.3 to_string() [3/6]

```
std::string to_string (
             const  DataWriterQos & qos,
             const  rti::core::qos_print_all_t & qos_print_all,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the dds::sub::qos::DataWriterQos

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
`to_string(qos, rti::core::qos_print_all);`

Returns

The string representation of the qos

7.11.2.4 operator<<() [1/2]

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::pub::qos::DataWriterQos & qos )  [inline]
```

<<***extension***>> *(p. 354)* Prints a **dds::pub::qos::DataWriterQos** (p. 1226) to an output stream.

7.11.2.5 swap()

```
void swap (
            PublisherQosImpl & left,
            PublisherQosImpl & right )
```

Swap the contents of two **PublisherQos** (p. 2007) objects.

Parameters

left	A **PublisherQos** (p. 2007)
right	The other **PublisherQos** (p. 2007)

7.11.2.6 to_string() [4/6]

```
std::string to_string (
            const  PublisherQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 2007)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos

object.

```
PublisherQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for PublisherQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
PublisherQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.11.2.7 to_string() [5/6]

```
std::string to_string (
            const  PublisherQos & qos,
            const  PublisherQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 2007)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.11.2.8 to_string() [6/6]

```
std::string to_string (
            const  PublisherQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 2007)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
`to_string(qos, rti::core::qos_print_all);`

Returns

The string representation of the qos

7.11.2.9 operator<<() [2/2]

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::pub::qos::PublisherQos & qos )  [inline]
```

<<***extension***>> *(p. 354)* Prints a **dds::pub::qos::PublisherQos** (p. 2007) to an output stream.

7.12 dds::sub Namespace Reference

Contains the types and functions to support subscribing to topics.

Namespaces

- namespace **cond**

  Contains Conditions specific to DataReaders.
- namespace **qos**

  *Contains **DataReaderQos** (p. 1072) and **SubscriberQos** (p. 2423).*
- namespace **status**

  *Contains **DataState** (p. 1118).*

Classes

- class **AnyDataReader**

  *<<**reference-type**>> (p. 351) This class provides an non-template holder for representing a **DataReader** (p. 976) of any type*
- class **AnyDataReaderListener**

  *The listener to notify status changes for a **dds::sub::DataReader** (p. 976) of a generic type.*
- class **CoherentAccess**

  *<<**value-type**>> (p. 350) Controls whether RTI Connext will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_changes.*
- class **DataReader**

  *<<**reference-type**>> (p. 351) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **dds::sub::Subscriber** (p. 2410).*
- class **DataReaderListener**

  *The **Listener** (p. 1637) to notify status changes for a **dds::sub::DataReader** (p. 976).*
- class **GenerationCount**

  *<<**value-type**>> (p. 350)*
- class **LoanedSamples**

  *<<**move-only-type**>> (p. 353) Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 976).*
- class **NoOpDataReaderListener**

  *A convenience implementation of **DataReaderListener** (p. 1055) where all methods are overridden to do nothing.*
- class **NoOpSubscriberListener**

  *A convenience implementation of **SubscriberListener** (p. 2422) where all methods are overridden to do nothing.*
- class **Query**

  *<<**value-type**>> (p. 350) Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 2059).*
- class **Rank**

  *<<**value-type**>> (p. 350) Contains the sample and generation ranks of a data-sample*
- class **ReadModeDummyType**
- class **Sample**

  *<<**value-type**>> (p. 350) This class encapsulate the data and meta-data associated with DDS samples.*
- class **SampleInfo**

  *<<**value-type**>> (p. 350) Information that accompanies each sample received by a **DataReader** (p. 976)*
- class **SharedSamples**

  *<<**reference-type**>> (p. 351) A sharable and container-safe version of **LoanedSamples** (p. 1663).*
- class **Subscriber**

  *<<**reference-type**>> (p. 351) A subscriber is the object responsible for actually receiving data from a subscription.*
- class **SubscriberListener**

  *The listener to notify status changes for a **dds::sub::Subscriber** (p. 2410).*

Functions

- template<typename T >
  DataReader< T > **get** (const **AnyDataReader** &any_reader)

  *Same as **AnyDataReader::get()** (p. 810)*
- bool **read** (**dds::sub::ReadModeDummyType**)

  The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.
- bool **take** (**dds::sub::ReadModeDummyType**)

  The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.
- dds::sub::functors::MaxSamplesManipulatorFunctor **max_samples** (uint32_t n)

  Stream manipulator to set the maximum number of samples to read or take.
- dds::sub::functors::ContentFilterManipulatorFunctor **content** (const **dds::sub::Query** &query)

  *Stream manipulator to set a **Query** (p. 2053) to use during the subsequent read/take operation.*
- dds::sub::functors::ConditionManipulatorFunctor **condition** (const **dds::sub::cond::ReadCondition** &condition)

  Stream manipulator to set a QueryCondition to use during the subsequent read/take operation.
- dds::sub::functors::StateFilterManipulatorFunctor **state** (const **dds::sub::status::DataState** &s)

  Stream manipulator to specify the DataState of the samples that should be read/taken.
- dds::sub::functors::InstanceManipulatorFunctor **instance** (const **dds::core::InstanceHandle** &h)

  Stream manipulator to specify the instance whose samples should be read or taken.
- dds::sub::functors::NextInstanceManipulatorFunctor **next_instance** (const **dds::core::InstanceHandle** &h)

  Stream manipulator to specify the samples belonging to the 'next' instance after the provided instance handle should be accessed.
- void **ignore** (**dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)

  Instructs RTI Connext to locally ignore a subscription.
- template<typename FwdIterator >
  void **ignore** (**dds::domain::DomainParticipant** &participant, FwdIterator **begin**, FwdIterator **end**)

  Instructs RTI Connext to locally ignore subscriptions.
- template<typename T >
  const **::dds::core::InstanceHandleSeq** **matched_publications** (const **dds::sub::DataReader**< T > &reader)

  *Retrieve the list of publications currently "associated" with a **DataReader** (p. 976).*
- template<typename T , typename FwdIterator >
  FwdIterator **matched_publications** (const **dds::sub::DataReader**< T > &reader, FwdIterator **begin**, FwdIterator **end**)

  *Retrieve the list of publications currently "associated" with a **DataReader** (p. 976).*
- template<typename T >
  const **dds::topic::PublicationBuiltinTopicData** **matched_publication_data** (const **dds::sub::DataReader**< T > &reader, const **dds::core::InstanceHandle** &handle)

  *This operation retrieves the information on a publication that is currently "associated" with the **DataReader** (p. 976).*
- **dds::sub::Subscriber** **builtin_subscriber** (const **dds::domain::DomainParticipant** &dp)

  *Access the built-in **Subscriber** (p. 2410).*
- template<typename READER , typename FwdIterator >
  uint32_t **find** (const **dds::sub::Subscriber** &subscriber, RTI_STRING_IN topic_name, FwdIterator **begin**, uint32_t max_size)

  *This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching topic name.*
- template<typename READER , typename BinIterator >
  uint32_t **find** (const **dds::sub::Subscriber** &subscriber, RTI_STRING_IN topic_name, BinIterator **begin**)

  *This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching topic name.*

- template<typename READER , typename T , typename FwdIterator >
  uint32_t **find** (const **dds::sub::Subscriber** &sub, const **dds::topic::TopicDescription**< T > &topic_description, FwdIterator **begin**, uint32_t max_size)
- template<typename READER , typename T , typename BinIterator >
  uint32_t **find** (const **dds::sub::Subscriber** &subscriber, const **dds::topic::TopicDescription**< T > &topic_description, BinIterator **begin**)

  *This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching TopicDescription.*
- template<typename AnyDataReaderFwdIterator >
  uint32_t **find** (const **dds::sub::Subscriber** &subscriber, const **dds::sub::status::DataState** &data_state, AnyDataReaderFwdIterator **begin**, uint32_t max_size)

  *Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::DataState** (p. 1118).*
- template<typename AnyDataReaderBackInsertIterator >
  uint32_t **find** (const **dds::sub::Subscriber** &subscriber, const **dds::sub::status::DataState** &data_state, AnyDataReaderBackInsertIterator **begin**)

  *Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::DataState** (p. 1118).*
- template<typename T >
  LoanedSamples< T > **move** (**LoanedSamples**< T > &ls) OMG_NOEXCEPT

  *Creates a new **LoanedSamples** (p. 1663) instance by moving the contents of an existing one.*
- template<typename T >
  LoanedSamples< T >::iterator **begin** (**LoanedSamples**< T > &ls)
- template<typename T >
  LoanedSamples< T >::const_iterator **begin** (const **LoanedSamples**< T > &ls)
- template<typename T >
  LoanedSamples< T >::iterator **end** (**LoanedSamples**< T > &ls)
- template<typename T >
  LoanedSamples< T >::const_iterator **end** (const **LoanedSamples**< T > &ls)
- template<typename T >
  void **swap** (**LoanedSamples**< T > &ls1, **LoanedSamples**< T > &ls2) throw ()

7.12.1 Detailed Description

Contains the types and functions to support subscribing to topics.

7.12.2 Function Documentation

7.12.2.1 get()

```
template<typename T >
DataReader< T > get (
            const  AnyDataReader & any_reader )
```

Same as **AnyDataReader::get()** (p. 810)

7.12.2.2 read()

```
bool read (
            dds::sub::ReadModeDummyType  )
```

The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.

Usage:
```
reader » read » loaned_samples;
```

See also

dds::sub::DataReader::operator >>(bool(*manipulator)(**ReadModeDummyType** (p. 2144)))

7.12.2.3 take()

```
bool take (
            dds::sub::ReadModeDummyType  )
```

The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.

Usage:
```
reader » take » loaned_samples;
```

The default mode to access samples is to take, so the above is equivalent to:
```
reader » loaned_samples;
```

See also

dds::sub::DataReader::operator >>(bool(*manipulator)(**ReadModeDummyType** (p. 2144)))

7.12.2.4 max_samples()

```
dds::sub::functors::MaxSamplesManipulatorFunctor max_samples (
            uint32_t n )  [inline]
```

Stream manipulator to set the maximum number of samples to read or take.

Use this function to set the maximum number of samples to read/take by passing it to the **DataReader::operator >>(Functor f)** (p. 995) operator.

Parameters

n	The maximum number of samples to take

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

7.12.2.5 content()

```
dds::sub::functors::ContentFilterManipulatorFunctor content (
            const  dds::sub::Query & query )  [inline]
```

Stream manipulator to set a **Query** (p. 2053) to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the **Query** (p. 2053)'s expression. If the **DataReader** (p. 976) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the condition(const dds::sub::cond::QueryCondition& query_condition) manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **condition()** (p. 663), then the previously set QueryCondition will be cleared.

Parameters

query	The **Query** (p. 2053) to use during the read/take

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

dds::sub::condition(const dds::sub::cond::QueryCondition& query_condition)

7.12.2.6 condition()

```
dds::sub::functors::ConditionManipulatorFunctor condition (
            const  dds::sub::cond::ReadCondition & condition )  [inline]
```

Stream manipulator to set a QueryCondition to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the Query↩ Conditions's expression and state. If the **DataReader** (p. 976) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the **content(const dds::sub::Query& query)** (p. 663) manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **content()** (p. 663) and/or **state(const dds::sub::status::DataState& s)** (p. 664), then the previously set **Query** (p. 2053) and DataState will be cleared.

This manipulator is effectively a combination of the content and state manipulators.

For example:

```
reader » read
       » content(dds::sub::Query(system.reader, "foo = 7"))
       » state(dds::sub::status::DataState::new_data())
       » samples;
```

is equivalent to:

```
reader » read
       » condition(Query(system.reader, "foo = 7"), DataState()::new_data())
       » samples;
```

Parameters

condition	The QueryCondition to use during the read/take

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

content(const dds::sub::Query& query) (p. 663)

Referenced by **dds::sub::DataReader< T >::condition()**, and **dds::sub::cond::ReadCondition::create_read_↩ condition_ex()**.

7.12.2.7 state()

```
dds::sub::functors::StateFilterManipulatorFunctor state (
             const  dds::sub::status::DataState & s )  [inline]
```

Stream manipulator to specify the DataState of the samples that should be read/taken.

By setting the **dds::sub::status::DataState** (p. 1118) you can specify the state of the samples that should be read or taken. The DataState of a sample encapsulates the **dds::sub::status::SampleState** (p. 2316), **dds::sub::status::↩ ViewState** (p. 2614), and **dds::sub::status::InstanceState** (p. 1615) of a sample.

If this stream manipulator comes before a call to the condition(const dds::sub::cond::QueryCondition& query_condition) manipulator then it will be overridden and will not have any effect on the read or take operation.

Parameters

s	The DataState of the samples to be read or taken

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

7.12.2.8 instance()

```
dds::sub::functors::InstanceManipulatorFunctor instance (
            const  dds::core::InstanceHandle & h )  [inline]
```

Stream manipulator to specify the instance whose samples should be read or taken.

This operation causes the subsequent read or take operation to access only samples belonging the single specified instance whose handle is `h`.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **SampleInfo** (p. 2285) verifies **SampleInfo.instance_handle()** (p. 2290) == `h`.

The subsequent read/take operation will be semantically equivalent to a read or take without specifying the instance, except in building the collection, the **DataReader** (p. 976) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The subsequent read/take may operation may fail with **dds::core::InvalidArgumentError** (p. 1619) if the Instance↩Handle does not correspond to an existing data-object known to the **DataReader** (p. 976).

Parameters

h	The handle of the instance to access

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

7.12.2.9 next_instance()

```
dds::sub::functors::NextInstanceManipulatorFunctor next_instance (
            const  dds::core::InstanceHandle & h )  [inline]
```

Stream manipulator to specify the samples belonging to the 'next' instance after the provided instance handle should be accessed.

This operation causes the subsequent read or take operation to access only samples belonging a single instance whose handle is considered 'next' after the provided InstanceHandle `h`.

The accessed samples will all belong to the 'next' instance with InstanceHandle 'greater' than the specified previous handle that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the **dds::sub::DataReader** (p. 976). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of **dds::sub::DataReader::Selector::next_instance** (p. 2322) is 'as if' the **dds::sub::DataReader** (p. 976) invoked **dds::sub::instance(const dds::core::InstanceHandle& h)** (p. 665), passing the smallest instance_handle among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **dds::core::InstanceHandle::nil()** (p. 1614) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle` == **dds::core::InstanceHandle::nil()** (p. 1614) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation **dds::sub::DataReader::Selector::next_instance** (p. 2322) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle` == **dds::core::InstanceHandle::nil()** (p. 1614), examines the samples returned, and then uses the `instance_handle` returned in the **dds::sub::SampleInfo** (p. 2285) as the value of the `previous_handle` argument to the next call to **dds::sub::DataReader::Selector::next_instance** (p. 2322). The iteration continues until the read/take operation doesn't return any more samples. This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the **dds::sub::DataReader::Selector::next_instance** (p. 2322) operation with a `previous_handle` that does not correspond to an instance currently managed by the **dds::sub::DataReader** (p. 976). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the **dds::sub::DataReader** (p. 976). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1617) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

Parameters

h	The reference instance. The instance after this one will be selected

See also

dds::sub::DataReader::operator >>(Functor f) (p. 995)

7.12.2.10 ignore() [1/2]

```
void ignore (
              dds::domain::DomainParticipant & participant,
             const  dds::core::InstanceHandle & handle )
```

Instructs RTI Connext to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the **dds::sub::Subscriber** (p. 2410) (see **dds::topic::SubscriptionBuiltinTopicData** (p. 2428)). After this call, any data received related to that subscription's **dds::sub::DataReader** (p. 976) will be ignored.

This operation can be used to ignore local *and* remote DataReaders.

The subscription to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataReader** (p. 976), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 2285) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 976) for the subscription topic.

- To ignore a *local* **DataReader** (p. 976), the `handle` can be obtained by calling **dds::core::Entity::instance_handle()** (p. 1525) for the local **DataReader** (p. 976).

There is no way to reverse this operation.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::SubscriptionBuiltinTopicData (p. 2428)

dds::topic::subscription_topic_name() (p. 444)

dds::sub::builtin_subscriber (p. 671)

Parameters

participant	The DomainParticipant for which the remote entity will be ignored
handle	The InstanceHandle of the remote entity that has to be ignored

Referenced by **dds::sub::DataReader< T >::ignore()**.

7.12.2.11 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
              dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             FwdIterator end )
```

Instructs RTI Connext to locally ignore subscriptions.

Parameters

participant	The DomainParticipant for which the remote entity will be ignored
begin	A forward iterator to the initial position in a **dds::core::InstanceHandleSeq** (p. 619) holding the handles to the remote DataReaders to be ignored.
end	A forward iterator to the final position in a **dds::core::InstanceHandleSeq** (p. 619) holding the handles to the remote DataReaders to be ignored.

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 667);

7.12.2.12 matched_publications() [1/2]

```
template<typename T >
const  ::dds::core::InstanceHandleSeq matched_publications (
             const  dds::sub::DataReader< T > & reader )
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 976).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2474).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1326) has not indicated that the publication's **dds::domain::DomainParticipant** (p. 1326) should be "ignored" by means of the **dds::pub::ignore** (p. 647) API.

- If the subscription is using a **dds::topic::ContentFilteredTopic** (p. 954) and the publication is using the **rti::core::policy::MultiChannel** (p. 1749), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **dds::pub::DataWriter** (p. 1138) entities. These handles match the ones that appear in the `instance_handle` field of the **dds::sub::SampleInfo** (p. 2285) when reading the **dds::topic::publication_topic_name()** (p. 443) builtin topic.

This API may return the publication handles of publications that are not alive. **dds::sub::DataReader::is_matched_publication_alive** (p. 1035) can be used to check the liveliness of the remote publication.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::OutOfResourcesError** (p. 1898) if the sequence is too small and the system cannot resize it, or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to

Parameters

reader	The reader whose publications are being retrieved

Returns

An InstanceHandleSeq containing the InstanceHandles of the matched publications for the provided **DataReader** (p. 976)

Referenced by **dds::sub::DataReader< T >::matched_publications()**.

7.12.2.13 matched_publications() [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_publications (
             const  dds::sub::DataReader< T > & reader,
             FwdIterator begin,
             FwdIterator end )
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 976).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2474).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1326) has not indicated that the publication's **dds::domain::DomainParticipant** (p. 1326) should be "ignored" by means of the **dds::pub::ignore** (p. 647) API.
- If the subscription is using a **dds::topic::ContentFilteredTopic** (p. 954) and the publication is using the **rti::core::policy::MultiChannel** (p. 1749), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **dds::pub::DataWriter** (p. 1138) entities. These handles match the ones that appear in the `instance_handle` field of the **dds::sub::SampleInfo** (p. 2285) when reading the **dds::topic::publication_topic_name()** (p. 443) builtin topic.

This API may return the publication handles of publications that are not alive. **dds::sub::DataReader::is_matched_publication_alive** (p. 1035) can be used to check the liveliness of the remote publication.

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::OutOfResourcesError** (p. 1898) if the sequence is too small and the system cannot resize it, or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to
FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

Parameters

reader	The reader whose publications are being retrieved
begin	A forward iterator to the beginning position in the destination container of matching InstanceHandles
end	A forward iterator to the ending position in the destination container of matching InstanceHandles

Returns

An iterator placed at the last position in the container where a InstanceHandle was inserted

7.12.2.14 matched_publication_data()

```
template<typename T >
const  dds::topic::PublicationBuiltinTopicData matched_publication_data (
```

```
const  dds::sub::DataReader< T > & reader,
const  dds::core::InstanceHandle & handle )
```

This operation retrieves the information on a publication that is currently "associated" with the **DataReader** (p. 976).

The publication_handle must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 976). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). Use the operation **dds::sub::matched_publications** (p. 668) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 976).

Note: This operation does not retrieve the **dds::topic::PublicationBuiltinTopicData::type** (p. 1985). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 1058) (if a reader listener is installed on the dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData>).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the **DataReader** (p. 976) subscribes to

Parameters

reader	The reader associated with the publication whose data is being retrieved
handle	The InstanceHandle Handle to a specific publication associated with the DataWriter. Must correspond to a publication currently associated with the **DataReader** (p. 976).

Returns

The **dds::topic::PublicationBuiltinTopicData** (p. 1977) of the publication that is associated with the provided handle

7.12.2.15 builtin_subscriber()

```
dds::sub::Subscriber builtin_subscriber (
            const  dds::domain::DomainParticipant & dp )
```

Access the built-in **Subscriber** (p. 2410).

Each **dds::domain::DomainParticipant** (p. 1326) contains several built-in **dds::topic::Topic** (p. 2474) objects as well as corresponding **dds::sub::DataReader** (p. 976) objects to access them. All of these **dds::sub::DataReader** (p. 976) objects belong to a single built-in **dds::sub::Subscriber** (p. 2410).

The built-in Topics are used to communicate information about other **dds::domain::DomainParticipant** (p. 1326), **dds::topic::Topic** (p. 2474), **dds::sub::DataReader** (p. 976), and **dds::pub::DataWriter** (p. 1138) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

Returns

The built-in **dds::sub::Subscriber** (p. 2410) singleton.

See also

dds::topic::SubscriptionBuiltinTopicData (p. 2428)

dds::topic::PublicationBuiltinTopicData (p. 1977)

dds::topic::ParticipantBuiltinTopicData (p. 1908)

dds::topic::TopicBuiltinTopicData (p. 2493)

Parameters

dp	The DomainParticipant that the built-in subscriber belongs to.

7.12.2.16 find() [1/6]

```
template<typename READER , typename FwdIterator >
uint32_t find (
             const  dds::sub::Subscriber & subscriber,
             RTI_STRING_IN topic_name,
             FwdIterator begin,
             uint32_t max_size )
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2410) (**Built-in Topics** (p. 46)) to access the built-in **dds::sub::DataReader** (p. 976) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 976) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 976) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 976) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 976) before the **dds::domain::DomainParticipant** (p. 1326) is enabled. Looking up builtin **dds::sub::DataReader** (p. 976) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 976) (see **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1326).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 671).

- Call **dds::sub::find()** (p. 672).
- Call **enable()** (p. 581) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 976) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 976) is attached to the **dds::sub::Subscriber** (p. 2410), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 976) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 976).

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
FwdIterator	The type of forward iterator passed to this function

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the **DataReader** (p. 976) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataReader** (p. 976) that is to be looked up.
begin	A forward iterator to the position in the destination container where the DataReaders will be copied into
max_size	Only 1 **DataReader** (p. 976) will be returned from this function

Returns

The number of DataReaders that were found (either 0 or 1)

Referenced by **dds::sub::DataReader< T >::find()**.

7.12.2.17 find() [2/6]

```
template<typename READER , typename BinIterator >
uint32_t find (
             const  dds::sub::Subscriber & subscriber,
             RTI_STRING_IN topic_name,
             BinIterator begin )
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2410) (**Built-in Topics** (p. 46)) to access the built-in **dds::sub::DataReader** (p. 976) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 976) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 976) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 976) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 976) before the **dds::domain::DomainParticipant** (p. 1326) is enabled. Looking up builtin **dds::sub::DataReader** (p. 976) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 976) (see **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1326).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 671).
- Call **dds::sub::find()** (p. 672).
- Call **enable()** (p. 581) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 976) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 976) is attached to the **dds::sub::Subscriber** (p. 2410), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 976) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 976).

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))
BinIterator	The type of back-inserting iterator passed to this function

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the **DataReader** (p. 976) belongs to
topic_name	Name of the **dds::topic::Topic** (p. 2474) associated with the **DataReader** (p. 976) that is to be looked up.
begin	A back-inserting iterator to the position in the destination container to insert the found **DataReader** (p. 976) into

Returns

The number of DataReaders that were found (either 0 or 1)

7.12.2.18 find() [3/6]

```
template<typename READER , typename T , typename FwdIterator >
uint32_t find (
            const  dds::sub::Subscriber & subscriber,
            const  dds::topic::TopicDescription< T > & topic_description,
            FwdIterator begin,
            uint32_t max_size )
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching TopicDescription.

See also

find(const dds::sub::Subscriber& subscriber,RTI_STRING_IN topic_name,FwdIterator begin,uint32_t max_size) (p. 672)

7.12.2.19 find() [4/6]

```
template<typename READER , typename T , typename BinIterator >
uint32_t find (
            const  dds::sub::Subscriber & subscriber,
            const  dds::topic::TopicDescription< T > & topic_description,
            BinIterator begin )
```

This function retrieves a previously-created **DataReader** (p. 976) belonging to the **Subscriber** (p. 2410) that is attached to a Topic with a matching TopicDescription.

See also

uint32_t **find(const dds::sub::Subscriber& subscriber,RTI_STRING_IN topic_name,BinIterator begin)** (p. 673)

7.12.2.20 find() [5/6]

```
template<typename AnyDataReaderFwdIterator >
uint32_t dds::sub::find (
             const  dds::sub::Subscriber & subscriber,
             const  dds::sub::status::DataState & data_state,
             AnyDataReaderFwdIterator begin,
             uint32_t max_size )
```

Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::DataState** (p. 1118).

Allows the application to access the **dds::sub::DataReader** (p. 976) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.

If the application is outside a begin_access()/end_access() block, or if the **dds::core::policy::Presentation::access_scope** (p. 1947) of the **dds::sub::Subscriber** (p. 2410) is **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) or **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951), or if the **dds::core::policy::Presentation::ordered_access** (p. 1948) of the **dds::sub::Subscriber** (p. 2410) is false, the returned collection is a 'set' containing each **dds::sub::DataReader** (p. 976) at most once, in no specified order.

If the application is within a begin_access()/end_access() block, and the **PRESENTATION** (p. 540) policy of the **dds::sub::Subscriber** (p. 2410) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951) or **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1951), and **dds::core::policy::Presentation::ordered_access** (p. 1948) in the **dds::sub::Subscriber** (p. 2410) is true, the returned collection is a 'list' of DataReaders where a **DataReader** (p. 976) may appear more than one time.

To retrieve the samples in the order they were published across DataWriters of the same group (**dds::pub::Publisher** (p. 1993) configured with **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951)), the application should **read()** (p. 661)/take() from each **DataReader** (p. 976) in the same order as it appears in the output sequence. The application will move to the next **DataReader** (p. 976) when the **read()** (p. 661)/take() operation does not return any data.

Access to data samples (p. 62)

dds::sub::CoherentAccess::CoherentAccess() (p. 930)

dds::sub::CoherentAccess::end() (p. 931)

PRESENTATION (p. 540)

Template Parameters

AnyDataReaderFwdIterator	A forward iterator whose `value_type` is **dds::sub::AnyDataReader** (p. 807)

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the DataReaders belong to
data_state	The DataState describing what kinds of samples the returned DataReaders must contain

Parameters

begin	A forward iterator to the position in the destination container where the DataReaders will be copied into. This container should be a container of AnyDataReaders, not typed DataReaders
max_size	The maximum number of DataReaders to return

Returns

The number of DataReaders that were found with a matching DataState

References **begin()**, **dds::sub::status::DataState::instance_state()**, **dds::sub::status::DataState::sample_state()**, and **dds::sub::status::DataState::view_state()**.

7.12.2.21 find() [6/6]

```
template<typename AnyDataReaderBackInsertIterator >
uint32_t dds::sub::find (
            const  dds::sub::Subscriber & subscriber,
            const  dds::sub::status::DataState & data_state,
            AnyDataReaderBackInsertIterator begin )
```

Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::DataState** (p. 1118).

Allows the application to access the **dds::sub::DataReader** (p. 976) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.

If the application is outside a begin_access()/end_access() block, or if the **dds::core::policy::Presentation::access_scope** (p. 1947) of the **dds::sub::Subscriber** (p. 2410) is **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1951) or **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1951), or if the **dds::core::policy::Presentation::ordered_access** (p. 1948) of the **dds::sub::Subscriber** (p. 2410) is false, the returned collection is a 'set' containing each **dds::sub::DataReader** (p. 976) at most once, in no specified order.

If the application is within a begin_access()/end_access() block, and the **PRESENTATION** (p. 540) policy of the **dds::sub::Subscriber** (p. 2410) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951) or **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1951), and **dds::core::policy::Presentation::ordered_access** (p. 1948) in the **dds::sub::Subscriber** (p. 2410) is true, the returned collection is a 'list' of DataReaders where a **DataReader** (p. 976) may appear more than one time.

To retrieve the samples in the order they were published across DataWriters of the same group (**dds::pub::Publisher** (p. 1993) configured with **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1951)), the application should **read()** (p. 661)/take() from each **DataReader** (p. 976) in the same order as it appears in the output sequence. The application will move to the next **DataReader** (p. 976) when the **read()** (p. 661)/take() operation does not return any data.

dds::sub::CoherentAccess::end() (p. 931)

PRESENTATION (p. 540)

Template Parameters

AnyDataReaderBackInsertIterator	A back-inserting iterator whose `value_type` is **dds::sub::AnyDataReader** (p. 807)

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the DataReaders belong to
data_state	The DataState describing what kinds of samples the returned DataReaders must contain
begin	A back-inserting iterator to the position in the destination container to insert the found DataReaders into. This container should be a container of AnyDataReaders, not typed DataReaders

Returns

The number of DataReaders that were found with a matching DataState

References **begin()**, **dds::sub::status::DataState::instance_state()**, **dds::sub::status::DataState::sample_state()**, and **dds::sub::status::DataState::view_state()**.

7.12.2.22 move()

```
template<typename T >
LoanedSamples< T > move (
              LoanedSamples< T > & ls )
```

Creates a new **LoanedSamples** (p. 1663) instance by moving the contents of an existing one.

This function existed to provide move semantics before C++11, but is now deprecated in favor of std::move.

[DEPRECATED] Use std::move and the move constructor of **LoanedSamples** (p. 1663) instead. For example:

```
LoanedSamples<Foo> samples1 = reader.take();
LoanedSamples<Foo> samples2 = std::move(samples1);
```

Parameters

ls	The **LoanedSamples** (p. 1663) object that transfers its ownership of the contained samples into the returned object. After this call, `ls` is empty.

Returns

A new **LoanedSamples** (p. 1663) object, the new loan owner, with the same contents as `ls` had.

See also

LoanedSamples (p. 1663)

Referenced by **dds::sub::LoanedSamples< T >::move()**.

7.12.2.23 begin() [1/2]

```
template<typename T >
LoanedSamples< T >::iterator begin (
            LoanedSamples< T > & ls )
```

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::sub::qos::SubscriberQos*** *(p. 2423)*
- std::string **to_string** (const **SubscriberQos** &qos, const **SubscriberQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::sub::qos::SubscriberQos*** *(p. 2423)*
- std::string **to_string** (const **SubscriberQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::sub::qos::SubscriberQos*** *(p. 2423)*
- std::ostream & **operator<<** (std::ostream &out, const rti::sub::qos::SubscriberQos &qos)

  <<***extension***>> *(p. 354) Prints a* ***dds::sub::qos::SubscriberQos*** *(p. 2423) to an output stream.*

7.14.1 Detailed Description

Contains **DataReaderQos** (p. 1072) and **SubscriberQos** (p. 2423).

7.14.2 Function Documentation

7.14.2.1 to_string() [1/6]

```
std::string to_string (
            const  DataReaderQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(*p. *354)* Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 1072)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataReaderQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataReaderQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataReaderQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.14.2.2 to_string() [2/6]

```
std::string to_string (
            const  DataReaderQos & qos,
            const  DataReaderQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 1072)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.14.2.3 to_string() [3/6]

```
std::string to_string (
             const  DataReaderQos & qos,
             const  rti::core::qos_print_all_t & qos_print_all,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 1072)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.14.2.4 operator<<() [1/2]

```
std::ostream & operator<< (
             std::ostream & out,
             const rti::sub::qos::DataReaderQos & qos )  [inline]
```

<<***extension***>> *(p. 354)* Prints a **dds::sub::qos::DataReaderQos** (p. 1072) to an output stream.

7.14.2.5 to_string() [4/6]

```
std::string to_string (
             const  SubscriberQos & qos,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2423)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
SubscriberQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for SubscriberQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
SubscriberQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.14.2.6 to_string() [5/6]

```
std::string to_string (
            const  SubscriberQos & qos,
            const  SubscriberQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2423)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.14.2.7 to_string() [6/6]

```
std::string to_string (
             const  SubscriberQos & qos,
             const  rti::core::qos_print_all_t & qos_print_all,
             const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2423)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.14.2.8 operator<<() [2/2]

```
std::ostream & operator<< (
             std::ostream & out,
             const rti::sub::qos::SubscriberQos & qos )  [inline]
```

<<***extension***>> *(p. 354)* Prints a **dds::sub::qos::SubscriberQos** (p. 2423) to an output stream.

7.15 dds::sub::status Namespace Reference

Contains **DataState** (p. 1118).

Classes

- class **DataState**

  *The **DataState** (p. 1118) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1615), **ViewState** (p. 2614), and **SampleState** (p. 2316).*
- class **InstanceState**

  *Indicates if the samples are from a live **dds::pub::DataWriter** (p. 1138) or not.*
- class **SampleState**

  Indicates whether or not a sample has ever been read.
- class **ViewState**

  Indicates whether or not an instance is new.

Functions

- std::ostream & **operator<<** (std::ostream &os, const **SampleState** &s)

  Prints a sample state as a readable string.
- std::ostream & **operator<<** (std::ostream &os, const **ViewState** &s)

  Prints a view state as a readable string.
- std::ostream & **operator<<** (std::ostream &os, const **InstanceState** &s)

  Prints an instance state as a readable string.
- std::ostream & **operator<<** (std::ostream &os, const **DataState** &s)

  Prints a data state as a readable string.

7.15.1 Detailed Description

Contains **DataState** (p. 1118).

7.15.2 Function Documentation

7.15.2.1 operator<<() [1/4]

```
std::ostream & operator<< (
            std::ostream & os,
            const  SampleState & s )
```

Prints a sample state as a readable string.

7.15.2.2 operator<<() [2/4]

```
std::ostream & operator<< (
            std::ostream & os,
            const  ViewState & s )
```

Prints a view state as a readable string.

7.15.2.3 operator<<() [3/4]

```
std::ostream & operator<< (
            std::ostream & os,
            const  InstanceState & s )
```

Prints an instance state as a readable string.

7.15.2.4 operator<<() [4/4]

```
std::ostream & operator<< (
            std::ostream & os,
            const  DataState & s )
```

Prints a data state as a readable string.

7.16 dds::topic Namespace Reference

Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types.

Namespaces

- namespace **qos**

  *Contains **TopicQos** (p. 2509).*

Classes

- class **AnyTopic**

  *<<**reference-type**>> (p. 351) This class provides an non-template holder for representing a **Topic** (p. 2474) of any type*
- class **BuiltinTopicKey**

  The key of the built-in topics.
- class **ContentFilteredTopic**

  *<<**reference-type**>> (p. 351) Specialization of **TopicDescription** (p. 2503) that allows for content-based subscriptions.*
- class **Filter**

  *Defines the filter to create a **ContentFilteredTopic** (p. 954).*
- struct **is_topic_type**

  *Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2474).*
- class **NoOpTopicListener**

  *A convenience implementation of **TopicListener** (p. 2508) where all methods are overridden to do nothing.*
- class **ParticipantBuiltinTopicData**

  *Entry created when a **dds::domain::DomainParticipant** (p. 1326) is discovered.*
- class **PublicationBuiltinTopicData**

  *Entry created when a **dds::pub::DataWriter** (p. 1138) is discovered in association with its **dds::pub::Publisher** (p. 1993).*
- class **SubscriptionBuiltinTopicData**

  *Entry created when a **dds::sub::DataReader** (p. 976) is discovered in association with its **dds::sub::Subscriber** (p. 2410).*
- class **Topic**

  *<<**reference-type**>> (p. 351) **Topic** (p. 2474) is the most basic description of the data to be published and subscribed.*
- struct **topic_type_name**

  Provides the name of a topic-type.
- struct **topic_type_support**

  Provides convenience operations for a topic-type.
- class **TopicBuiltinTopicData**

  *Entry created when a **dds::topic::Topic** (p. 2474) object is discovered.*
- class **TopicDescription**

  *Abstract base class of **Topic** (p. 2474) and **ContentFilteredTopic** (p. 954).*
- class **TopicInstance**

  Encapsulates a sample and its associated instance handle.
- class **TopicListener**

  *The listener to notify status changes for a **dds::topic::Topic** (p. 2474).*

Functions

- template<typename T >
  Topic< T > **get** (const **AnyTopic** &any_topic)

  *Same as **AnyTopic::get()** (p. 827)*
- template<typename FwdIterator >
  int32_t **discover_any_topic** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, int32_t max_size)

  Retrieves the topics discovered in a DomainParticipant.
- template<typename BinIterator >
  int32_t **discover_any_topic** (const **dds::domain::DomainParticipant** &participant, BinIterator begin)

Retrieves the topics discovered in a DomainParticipant.

- **dds::topic::TopicBuiltinTopicData discover_topic_data** (const **dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &topic_handle)

  Gets the information about a discovered topic.

- template<typename FwdIterator >
  int32_t **discover_topic_data** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, const **dds::core::InstanceHandleSeq** &handles)

  Gets the information about several topics.

- template<typename FwdIterator >
  int32_t **discover_topic_data** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, int32_t max_size)

  Gets the information about all topics.

- template<typename BinIterator >
  int32_t **discover_topic_data** (const **dds::domain::DomainParticipant** &participant, BinIterator begin)

  Gets the information about all topics.

- void **ignore** (**dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)

  Instructs a DomainParticipant to ignore a topic.

- template<typename FwdIterator >
  void **ignore** (**dds::domain::DomainParticipant** &participant, FwdIterator begin, FwdIterator end)

  Ignores a range of topics.

- template<typename TOPIC >
  TOPIC **find** (const **dds::domain::DomainParticipant** &participant, const std::string &topic_name)

  *Looks up a **Topic** (p. 2474) from a DomainParticipant.*

- std::string **participant_topic_name** ()

  Participant builtin topic name.

- std::string **topic_topic_name** ()

  ***Topic** (p. 2474) topic name.*

- std::string **publication_topic_name** ()

  Publication topic name.

- std::string **subscription_topic_name** ()

  Subscription topic name.

7.16.1 Detailed Description

Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types.

7.16.2 Function Documentation

7.16.2.1 get()

```
template<typename T >
Topic< T > get (
            const  AnyTopic & any_topic )
```

Same as **AnyTopic::get()** (p. 827)

7.16.2.2 discover_any_topic() [1/2]

```
template<typename FwdIterator >
int32_t discover_any_topic (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            int32_t max_size )
```

Retrieves the topics discovered in a DomainParticipant.

Template Parameters

FwdIterator	A forward iterator whose value type is **dds::core::InstanceHandle** (p. 1612)

Parameters

participant	The DomainParticipant where to look up the discovered topics
begin	The beginning of the range where to insert the InstanceHandles that correspond to the discovered topics
max_size	The maximum number of topics to insert or **dds::core::LENGTH_UNLIMITED** (p. 438)

Referenced by **dds::topic::Topic< T >::discover_any_topic()**.

7.16.2.3 discover_any_topic() [2/2]

```
template<typename BinIterator >
int32_t discover_any_topic (
            const  dds::domain::DomainParticipant & participant,
            BinIterator begin )
```

Retrieves the topics discovered in a DomainParticipant.

This is equivalent to discover_any_topic(participant, begin, dds::core::LENGTH_UNLIMITED)

7.16.2.4 discover_topic_data() [1/4]

```
dds::topic::TopicBuiltinTopicData dds::topic::discover_topic_data (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & topic_handle )
```

Gets the information about a discovered topic.

Returns **dds::topic::TopicBuiltinTopicData** (p. 2493) for the specified **dds::topic::Topic** (p. 2474).

This operation retrieves information on a **dds::topic::Topic** (p. 2474) that has been discovered by the local Participant and must not have been "ignored" by means of the **dds::topic::ignore()** (p. 693) operation.

The `topic_handle` must correspond to such a topic. Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

This call is not supported for remote topics. If a remote `topic_handle` is used, the operation will fail with **dds::core::UnsupportedError** (p. 2590).

Use the operation **dds::topic::discover_any_topic()** (p. 690) to find the topics that are currently discovered.

Parameters

participant	The DomainParticipant where to look up the topic information
topic_handle	<<***in***>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of **dds::topic::Topic** (p. 2474).

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::TopicBuiltinTopicData (p. 2493)

dds::topic::discover_any_topic() (p. 690)

Referenced by **dds::topic::Topic< T >::discover_topic_data()**.

7.16.2.5 discover_topic_data() [2/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
             const  dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             const  dds::core::InstanceHandleSeq & handles )
```

Gets the information about several topics.

7.16.2.6 discover_topic_data() [3/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
             const  dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             int32_t max_size )
```

Gets the information about all topics.

Template Parameters

A	forward iterator whose value type is **dds::topic::TopicBuiltinTopicData** (p. 2493)

Parameters

participant	The DomainParticipant where to look up all the topics
begin	The beginning of a range where to copy the topic data
max_size	The maximum number of items to copy or **dds::core::LENGTH_UNLIMITED** (p. 438)

7.16.2.7 discover_topic_data() [4/4]

```
template<typename BinIterator >
int32_t discover_topic_data (
             const  dds::domain::DomainParticipant & participant,
             BinIterator begin )
```

Gets the information about all topics.

7.16.2.8 ignore() [1/2]

```
void ignore (
              dds::domain::DomainParticipant & participant,
             const  dds::core::InstanceHandle & handle )
```

Instructs a DomainParticipant to ignore a topic.

Instructs RTI Connext to locally ignore a **dds::topic::Topic** (p. 2474).

This means it will locally ignore any publication, or subscription to the **dds::topic::Topic** (p. 2474).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The **dds::topic::Topic** (p. 2474) to ignore is identified by the `handle` argument. This is the handle of a **dds::topic::Topic** (p. 2474) that appears in the **dds::sub::SampleInfo** (p. 2285) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 976) for the **dds::topic::Topic** (p. 2474).

Parameters

participant	The DomainParticipant where to ignore the topic
handle	<<***in***>> *(p. 355)* Handle of the **dds::topic::Topic** (p. 2474) to be ignored.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::OutOfResourcesError** (p. 1898) or **dds::core::NotEnabledError** (p. 1869)

See also

dds::topic::TopicBuiltinTopicData (p. 2493)

dds::topic::topic_topic_name() (p. 442)

dds::sub::builtin_subscriber (p. 671)

Referenced by **dds::topic::Topic< T >::ignore()**.

7.16.2.9 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
              dds::domain::DomainParticipant & participant,
             FwdIterator begin,
             FwdIterator end )
```

Ignores a range of topics.

See also

ignore(dds::domain::DomainParticipant&,const dds::core::InstanceHandle&) (p. 693)

7.16.2.10 find()

```
template<typename TOPIC >
TOPIC find (
             const  dds::domain::DomainParticipant & participant,
             const std::string & topic_name )
```

Looks up a **Topic** (p. 2474) from a DomainParticipant.

Template Parameters

TOPIC	The topic to find; it can be one of the following: • A typed **TopicDescription** (p. 2503), such as `dds::topic::TopicDescription<Foo>`, • A typed **Topic** (p. 2474), such as `dds::topic::Topic<Foo>` • A typed **ContentFilteredTopic** (p. 954), such as `dds::topic::ContentFilteredTopic<Foo>` • **`dds::topic::AnyTopic`** (p. 825)

Parameters

participant	The DomainParticipant that contains the **Topic** (p. 2474)
topic_name	The topic name

Returns

A reference to an existing **Topic** (p. 2474) in this participant or an empty reference (i.e. equals to **dds::core::null** (p. 438)) if it doesn't exist.

Exceptions

dds::core::InvalidDowncastError *(p. 1620)*	If the concrete type of the topic description identified by `topic_name` is not `TOPIC`. For example, if the topic_name identifies a topic of type `Bar`, but the template parameter was dds::topic::Topic<Foo>.

The participant doesn't need to be enabled. The returned topic may be enabled or disabled.

7.17 dds::topic::qos Namespace Reference

Contains **TopicQos** (p. 2509).

Classes

- class **TopicQos**

  *<<**value-type**>> (p. 350) Container of the QoS policies that a **dds::topic::Topic** (p. 2474) supports*

Functions

- std::string **to_string** (const **TopicQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrint↩ Format**())

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::topic::qos::TopicQos*** *(p. 2509)*

- std::string **to_string** (const **TopicQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core↩ ::QosPrintFormat** &format= **rti::core::QosPrintFormat**())

  <<***extension***>> *(p. 354) Obtains a string representation of the* ***dds::topic::qos::TopicQos*** *(p. 2509)*
- std::ostream & **operator**<< (std::ostream &out, const rti::topic::qos::TopicQos &qos)

  <<***extension***>> *(p. 354) Prints a* ***dds::topic::qos::TopicQos*** *(p. 2509) to an output stream.*

7.17.1 Detailed Description

Contains **TopicQos** (p. 2509).

7.17.2 Function Documentation

7.17.2.1 to_string() [1/3]

```
std::string to_string (
            const  TopicQos & qos,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2509)

Parameters

qos	The qos object to convert to a string
format	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
TopicQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for TopicQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
```

```
TopicQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.17.2.2 to_string() [2/3]

```
std::string to_string (
            const  TopicQos & qos,
            const  TopicQos & base,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2509)

Parameters

qos	The qos object to convert to a string
base	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a **rti::core::qos_print_all_t** (p. 2019).
format	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.17.2.3 to_string() [3/3]

```
std::string to_string (
            const  TopicQos & qos,
            const  rti::core::qos_print_all_t & qos_print_all,
            const  rti::core::QosPrintFormat & format =  rti::core::QosPrintFormat() )
```

<<***extension***>> *(p. 354)* Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2509)

Parameters

qos	The qos object to convert to a string
qos_print_all	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
format	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 439)

For example:
```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.17.2.4 operator<<()

```
std::ostream & operator<< (
            std::ostream & out,
            const rti::topic::qos::TopicQos & qos )  [inline]
```

<<***extension***>> *(p. 354)* Prints a **dds::topic::qos::TopicQos** (p. 2509) to an output stream.

7.18 rti Namespace Reference

<<***extension***>> *(p. 354)* The namespace that contains the extension types and functions to the DDS standard.

Namespaces

- namespace **all**
  <<***extension***>> *(p. 354) A single namespace where all symbols are included.*
- namespace **config**
  <<***extension***>> *(p. 354) Logging configuration and version information.*
- namespace **core**
  <<***extension***>> *(p. 354) Extensions to* ***dds::core*** *(p. 616)*

The rti namespace mirrors the structure of the dds namespace with the same sub-namespaces and two more: **rti↩ ::config** (p. 699) and **rti::util** (p. 777).

7.19 rti::all Namespace Reference

<<***extension***>> *(p. 354)* A single namespace where all symbols are included.

7.19.1 Detailed Description

<<***extension***>> *(p. 354)* A single namespace where all symbols are included.

This is similar to **dds::all** (p. 615) but it also includes the extension symbols. This namespace is defined in "rti/rti.hpp".

See also

dds::all (p. 615)

7.20 rti::config Namespace Reference

<<***extension***>> *(p. 354)* Logging configuration and version information.

Classes

- class **LibraryVersion**

  <<***extension***>> (p. *354*) <<***value-type***>> (p. *350*) *The version of a single library shipped as part of an RTI Connext distribution.*
- struct **LogCategory_def**

  The definition of the ***dds::core::safe_enum*** (p. *2265*) *LogCategory.*
- class **Logger**

  The singleton type used to configure RTI Connext logging.
- struct **LogLevel_def**

  The definition of the ***dds::core::safe_enum*** (p. *2265*) *LogLevel;.*
- struct **LogMessage**

  A log message's input parameter to an output handler, including the text and additional information.
- struct **PrintFormat_def**

  The definition of the ***dds::core::safe_enum*** (p. *2265*) *PrintFormat.*
- class **ScopedLoggerVerbosity**

  Changes the logger verbosity temporarily during the scope of a variable.
- struct **Verbosity_def**

  The definition of the ***dds::core::safe_enum*** (p. *2265*) *Verbosity.*

Typedefs

- typedef **dds::core::safe_enum**< **LogLevel_def** > **LogLevel**

  The log level at which RTI Connext diagnostic information is logged.
- typedef **dds::core::safe_enum**< **Verbosity_def** > **Verbosity**

  The verbosities at which RTI Connext diagnostic information is logged.
- typedef **dds::core::safe_enum**< **LogCategory_def** > **LogCategory**

  Categories of logged messages.
- typedef **dds::core::safe_enum**< **PrintFormat_def** > **PrintFormat**

  The format used to output RTI Connext diagnostic information.

Enumerations

- enum class **SyslogLevel** {
  SyslogLevel::emergency ,
  SyslogLevel::alert ,
  SyslogLevel::critical ,
  SyslogLevel::error ,
  SyslogLevel::warning ,
  SyslogLevel::notice ,
  SyslogLevel::informational ,
  SyslogLevel::debug }

- enum class **SyslogVerbosity** {
  SyslogVerbosity::silent ,
  SyslogVerbosity::emergency ,
  SyslogVerbosity::alert ,
  SyslogVerbosity::critical ,
  SyslogVerbosity::error ,
  SyslogVerbosity::warning ,
  SyslogVerbosity::notice ,
  SyslogVerbosity::informational ,
  SyslogVerbosity::debug }
- enum class **LogFacility** {
  LogFacility::user ,
  LogFacility::security_event ,
  LogFacility::service ,
  LogFacility::middleware }

Functions

- XMQCPP2DllExport **rti::core::ProductVersion request_reply_api_version** ()

  Get the version of the C++ API library.
- XMQCPP2DllExport std::string **request_reply_build_number** ()

  Get the build number of the C++ API library.
- void **enable_automatic_tss_cleanup** (bool enable)

  Enable automatic thread-specific storage (TSS) cleanup on platforms that support it.
- **LibraryVersion core_version** ()

  Get the version of the core library.
- std::string **core_build_number** ()

  Get the build number of the core library.
- **LibraryVersion c_api_version** ()

  Get the version of the C API library.
- std::string **c_build_number** ()

  Get the build number of the C API library.
- **LibraryVersion cpp_api_version** ()

  Get the version of the C++ API library.
- std::string **cpp_build_number** ()

  Get the build number of the C++ API library.
- **rti::core::ProductVersion product_version** ()

  Get the RTI Connext product version.

7.20.1 Detailed Description

<<***extension***>> *(*p. *354)* Logging configuration and version information.

7.21 rti::core Namespace Reference

<<***extension***>> *(*p. *354)* Extensions to **dds::core** (p. 616)

Namespaces

- namespace **builtin_profiles**

  *<<**extension**>> (p. 354) Contains the names of the built-in profiles*
- namespace **xtypes**

  *<<**extension**>> (p. 354) Extensions to **dds::core::xtypes** (p. 631)*

Classes

- class **AllocationSettings**

  *<<**extension**>> (p. 354) Resource allocation settings*
- class **bounded_sequence**

  *<<**value-type**>> (p. 350) A bounded sequence of elements*
- class **ChannelSettings**

  *<<**extension**>> (p. 354) Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1749)*
- class **CoherentSetInfo**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A CoherentSampleInfo provides information about the coherent set associated with a sample.*
- class **CompressionIdMask**

  *<<**extension**>> (p. 354) Mask that specifies which built-in compression method to used.*
- class **CompressionSettings**

  *<<**extension**>> (p. 354) Compression Settings*
- class **ContentFilterProperty**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Provides all the required information to enable content filtering.*
- class **Cookie**

  Unique identifier for a written data sample in the form of a sequence of bytes.
- class **DataReaderResourceLimitsInstanceReplacementSettings**

  *<<**extension**>> (p. 354) How instances are replaced in the DataReader queue when resource limits are reached.*
- class **DataWriterShmemRefTransferModeSettings**

  *<<**extension**>> (p. 354) Configures aspects of the shared memory reference transfer mode related to a DataWriter*
- class **EndpointGroup**

  *<<**extension**>> (p. 354) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.*
- class **Guid**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Class for GUID (Global Unique Identifier) representation*
- class **ListenerBinder**

  *<<**reference-type**>> (p. 351) Automatically manages the association of an Entity and a **Listener** (p. 1637)*
- class **Locator**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.*
- class **LocatorFilterElement**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Specifies the configuration of an individual channel within a Multi↩ Channel DataWriter.*
- struct **LocatorKind_def**

  *The definition of the **dds::core::safe_enum** (p. 2265) LocatorKind.*
- class **LongDouble**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Encapsulates an IDL `long double`*

- class **MonitoringDedicatedParticipantSettings**

  *<<**extension**>> (p. 354) Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1326) to distribute the RTI Connext application telemetry data.*
- class **MonitoringDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of telemetry data.*
- class **MonitoringEventDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of event metrics.*
- class **MonitoringLoggingDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of log messages.*
- class **MonitoringLoggingForwardingSettings**

  *<<**extension**>> (p. 354) Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 459).*
- class **MonitoringMetricSelection**

  *<<**extension**>> (p. 354) Configures event and periodic metrics collection and distribution for a specific set of observable resources.*
- class **MonitoringPeriodicDistributionSettings**

  *<<**extension**>> (p. 354) Configures the distribution of periodic metrics.*
- class **MonitoringTelemetryData**

  *<<**extension**>> (p. 354) Configures the telemetry data that will be distributed.*
- class **optional_value**

  *<<**extension**>> (p. 354) Represents a value that can be initialized or not*
- class **PersistentStorageSettings**

  *<<**extension**>> (p. 354) Configures the persistent storage settings for durable writer history and durable reader state.*
- class **pointer**
- class **ProductVersion**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Represents the current version of RTI Connext*
- class **ProtocolVersion**

  *<<**extension**>> (p. 354) Represents the current version of RTI Connext*
- struct **qos_print_all_t**

  A tag type that selects the to_string overload that prints all the values of a Qos object.
- class **QosPrintFormat**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A collection of attributes used to configure how QoS will be formatted when converted to strings.*
- class **QosProviderParams**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 2025).*
- class **Result**

  A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.
- class **RtpsReliableReaderProtocol**

  *<<**extension**>> (p. 354) Configures aspects of the RTPS protocol related to a reliable DataReader*
- class **RtpsWellKnownPorts**

  *<<**extension**>> (p. 354) Configures the mapping of the RTPS well-known ports*
- class **SampleFlag**

  *<<**extension**>> (p. 354) A set of flags that can be associated with a sample.*
- class **SampleIdentity**

  *<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A **SampleIdentity** (p. 2282) defines a pair (Virtual Writer **Guid** (p. 1596), **SequenceNumber** (p. 2335)) that uniquely identifies a sample within a DDS domain and a Topic.*
- class **SequenceNumber**

<<**extension**>> (p. 354) <<**value-type**>> (p. 350) A class representing the DDS 64-bit Sequence Number

- struct **ServiceRequestId_def**

  The definition of the rti::core::safe_enum ServiceRequestId.

- class **ThreadSettings**

  <<**extension**>> (p. 354) *The properties of a thread of execution.*

- struct **ThreadSettingsCpuRotationKind_def**

  Determines how **rti::core::ThreadSettings::cpu_list** (p. 2451) *affects processor affinity for thread-related QoS policies that apply to multiple threads.*

- class **ThreadSettingsKindMask**

  <<**extension**>> (p. 354) *A collection of flags used to configure threads of execution*

- struct **TransportClassId_def**

  The definition of the **dds::core::safe_enum** (p. 2265) *TransportClassId.*

- class **TransportInfo**

  <<**extension**>> (p. 354) <<**value-type**>> (p. 350) *Contains the class id and message max size of an installed transport*

- class **TransportMulticastSettings**

  <<**extension**>> (p. 354) *Represents a list of multicast locators*

- class **TransportUnicastSettings**

  <<**extension**>> (p. 354) *Represents a list of unicast locators*

- class **UnregisterThreadOnExit**

  <<**extension**>> (p. 354) *Utility that calls* **rti::core::unregister_thread** (p. 437) *when leaving scope*

- class **VendorId**

  <<**extension**>> (p. 354) *Represents the vendor of the service implementing the RTPS protocol.*

Typedefs

- typedef **dds::core::vector**< **EndpointGroup** > **EndpointGroupSeq**

  A sequence of **rti::core::EndpointGroup** (p. 1515).

- typedef **dds::core::safe_enum**< **LocatorKind_def** > **LocatorKind**

  Safe Enumeration (p. 429) *of* **LocatorKind_def** (p. 1681)

- typedef std::vector< **TransportUnicastSettings** > **TransportUnicastSettingsSeq**

  <<**extension**>> (p. 354) *A sequence of* **TransportUnicastSettings** (p. 2559)

- typedef std::vector< **TransportMulticastSettings** > **TransportMulticastSettingsSeq**

  A sequence of **TransportMulticastSettings** (p. 2549).

- typedef std::vector< **ChannelSettings** > **ChannelSettingsSeq**

  <<**extension**>> (p. 354) *A sequence of* **ChannelSettings** (p. 921)

- typedef std::vector< **MonitoringMetricSelection** > **MonitoringMetricSelectionSeq**

  <<**extension**>> (p. 354) *A sequence of* **rti::core::MonitoringMetricSelection** (p. 1736).

- typedef **dds::core::safe_enum**< **ServiceRequestId_def** > **ServiceRequestId**

  Safe Enumeration (p. 429) *of* **ServiceRequestId_def** (p. 2361)

- typedef **dds::core::safe_enum**< **ThreadSettingsCpuRotationKind_def** > **ThreadSettingsCpuRotation↩ Kind**

  Safe Enumeration (p. 429) *of* **ThreadSettingsCpuRotationKind_def** (p. 2453)

- typedef **dds::core::safe_enum**< **TransportClassId_def** > **TransportClassId**

  Safe Enumeration (p. 429) *of* **TransportClassId_def** (p. 2540)

- typedef **dds::core::vector**< **TransportInfo** > **TransportInfoSeq**

  A sequence of **TransportInfo** (p. 2541).

Functions

- template<typename T , size_t N>
  void **fill_array** (dds::core::array< T, N > &array, const T &value)
- template<typename FinalType , typename ArrayType , size_t N, size_t M>
  void **fill_array** (dds::core::array< dds::core::array< ArrayType, N >, M > &multi_array, const FinalType &value)
- template<typename CType , typename T , size_t N, typename InitFunc >
  void **initialize_native_array** (dds::core::array< T, N > &array, InitFunc init_func)
- template<typename T , size_t N>
  std::ostream & **operator**<< (std::ostream &out, const **bounded_sequence**< T, N > &v)

  Print a vector applying << to all of its elements.
- template<typename Entity , typename **Listener** >
  ListenerBinder< Entity, **Listener** > **bind_listener** (Entity entity, **Listener** *the_listener, **dds::core::status::StatusMask** mask)

  *Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets it when all references go out of scope.*
- template<typename Entity , typename **Listener** >
  ListenerBinder< Entity, **Listener** > **bind_listener** (Entity entity, **Listener** *the_listener)

  *Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets it when all references go out of scope.*
- template<typename Entity , typename **Listener** >
  ListenerBinder< Entity, **Listener** > **bind_and_manage_listener** (Entity entity, **Listener** *the_listener, **dds::core::status::StatusMask** mask)

  *Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets and deletes it when all references go out of scope.*
- template<typename Entity , typename **Listener** >
  ListenerBinder< Entity, **Listener** > **bind_and_manage_listener** (Entity entity, **Listener** *the_listener)

  *Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets and deletes it when all references go out of scope.*
- template<typename T >
  std::ostream & **operator**<< (std::ostream &out, const **pointer**< T > &ptr)
- **QosProviderParams** **default_qos_provider_params** ()

  *<<**extension**>> (p. 354) Get the **rti::core::QosProviderParams** (p. 2049) for the default QosProvider*
- void **default_qos_provider_params** (const **rti::core::QosProviderParams** &params)

  *<<**extension**>> (p. 354) Set the **rti::core::QosProviderParams** (p. 2049) for the default QosProvider*
- void **unregister_thread** ()

  *<<**extension**>> (p. 354) Allows you to release thread-specific resources kept by RTI Connext on platforms that do not support automatic thread-specific storage (TSS) cleanup.*

Variables

- constexpr int32_t **length_auto** = -2

  A special value indicating an auto quantity.
- const int32_t **PUBLICATION_PRIORITY_UNDEFINED**

  *Initializer value for **rti::core::policy::PublishMode::priority** (p. 2017) and/or **rti::core::ChannelSettings::priority** (p. 924).*
- const int32_t **PUBLICATION_PRIORITY_AUTOMATIC**

  *Constant value for **rti::core::policy::PublishMode::priority** (p. 2017) and/or **rti::core::ChannelSettings::priority** (p. 924).*
- const **qos_print_all_t** **qos_print_all**

  Sentinel value that selects the to_string overload that prints all of the values of a Qos object.

7.21.1 Detailed Description

<<***extension***>> *(p. 354)* Extensions to **dds::core** (p. 616)

7.21.2 Typedef Documentation

7.21.2.1 LocatorKind

```
typedef dds::core::safe_enum< LocatorKind_def> rti::core::LocatorKind
```

Safe Enumeration (p. 429) of **LocatorKind_def** (p. 1681)

See also

LocatorKind_def (p. 1681)

7.21.2.2 MonitoringMetricSelectionSeq

```
typedef std::vector< MonitoringMetricSelection> rti::core::MonitoringMetricSelectionSeq
```

<<***extension***>> *(p. 354)* A sequence of **rti::core::MonitoringMetricSelection** (p. 1736).

7.21.2.3 ThreadSettingsCpuRotationKind

```
typedef dds::core::safe_enum< ThreadSettingsCpuRotationKind_def> rti::core::ThreadSettingsCpu↩
RotationKind
```

Safe Enumeration (p. 429) of **ThreadSettingsCpuRotationKind_def** (p. 2453)

See also

ThreadSettingsCpuRotationKind_def (p. 2453)

7.21.2.4 TransportClassId

```
typedef dds::core::safe_enum< TransportClassId_def> rti::core::TransportClassId
```

Safe Enumeration (p. 429) of **TransportClassId_def** (p. 2540)

See also

TransportClassId_def (p. 2540)

7.21.2.5 TransportInfoSeq

```
typedef dds::core::vector< TransportInfo> rti::core::TransportInfoSeq
```

A sequence of **TransportInfo** (p. 2541).

7.21.3 Function Documentation

7.21.3.1 fill_array() [1/2]

```
template<typename T , size_t N>
void rti::core::fill_array (
            dds::core::array< T, N > & array,
            const T & value )
```

Initializes all the elements of an array to a value

Referenced by **fill_array()**.

7.21.3.2 fill_array() [2/2]

```
template<typename FinalType , typename ArrayType , size_t N, size_t M>
void rti::core::fill_array (
            dds::core::array< dds::core::array< ArrayType, N >, M > & multi_array,
            const FinalType & value )
```

Initializes all the elements of an array of arbitrary dimensions

References **fill_array()**.

7.21.3.3 initialize_native_array()

```
template<typename CType , typename T , size_t N, typename InitFunc >
void rti::core::initialize_native_array (
            dds::core::array< T, N > & array,
            InitFunc init_func )
```

Initializes all the elements of an array using a C function

7.21.3.4 operator<<() [1/2]

```
template<typename T , size_t N>
std::ostream & rti::core::operator<< (
            std::ostream & out,
            const  bounded_sequence< T, N > & v )
```

Print a vector applying << to all of its elements.

7.21.3.5 bind_listener() [1/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_listener (
            Entity entity,
             Listener * the_listener,
             dds::core::status::StatusMask mask )
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

The **ListenerBinder** (p. 1641) created from this function does not delete the listener, it simply sets the listener back to NULL in the Entity. The application is responsible for the life-cycle of the listener.

To also delete the listener when all references go out of scope, see **bind_and_manage_listener()** (p. 709).

```
MyListener my_listener;
dds::sub::DataReader<Foo> reader(subscriber, topic);
// reader will have no listener after scoped_listener (and any other
// references created from scoped_listener) go out of scope--note that
// my_listener is a stack variable so scoped_listener should not delete it
auto scoped_listener = bind_listener(
    reader, &my_listener, dds::core::status::StatusMask::data_available());
```

7.21.3.6 bind_listener() [2/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_listener (
             Entity entity,
              Listener * the_listener )
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

See also

bind_listener(Entity, Listener*, dds::core::status::StatusMask) (p. 708)

7.21.3.7 bind_and_manage_listener() [1/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_and_manage_listener (
             Entity entity,
              Listener * the_listener,
              dds::core::status::StatusMask mask )
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

Example:

```
dds::sub::DataReader<Foo> reader(subscriber, topic);
// The instance of MyListener we are creating and attaching to reader will be
// unset and deleted when scoped_listener (and any other references create
from
// scoped_listener) go out of scope
auto scoped_listener = bind_and_manage_listener(
    reader, new MyListener(),
dds::core::status::StatusMask::data_available());
```

See also

bind_listener() (p. 708)

7.21.3.8 bind_and_manage_listener() [2/2]

```
template<typename Entity , typename  Listener >
ListenerBinder< Entity,  Listener > bind_and_manage_listener (
             Entity entity,
              Listener * the_listener )
```

Sets the listener and creates a **ListenerBinder** (p. 1641) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1641) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

See also

bind_and_manage_listener(Entity, Listener*, dds::core::status::StatusMask) (p. 709)

7.21.3.9 operator<<() [2/2]

```
template<typename T >
std::ostream & rti::core::operator<< (
             std::ostream & out,
             const  pointer< T > & ptr )
```

Write pointer contents or the string "NULL"

References **dds::core::null**.

7.21.3.10 default_qos_provider_params() [1/2]

```
 QosProviderParams rti::core::default_qos_provider_params ( )
```

<<***extension***>> *(p. 354)* Get the **rti::core::QosProviderParams** (p. 2049) for the default QosProvider

Note

This is a standalone function in the namespace **rti::core** (p. 701)

Returns

rti::core::QosProviderParams (p. 2049)

7.21.3.11 default_qos_provider_params() [2/2]

```
void rti::core::default_qos_provider_params (
            const  rti::core::QosProviderParams & params )
```

<<***extension***>> *(*p. *354)* Set the **rti::core::QosProviderParams** (p. 2049) for the default QosProvider

Note

This is a standalone function in the namespace **rti::core** (p. 701)

Use this function to configure the profiles that **`dds::core::QosProvider::Default()`** (p. 2036) loads.

```
rti::core::QosProviderParams params;
params.url_profile({"my_profiles.xml"});
rti::core::default_qos_provider_params(params);
auto participant_qos =
    dds::core::QosProvider::Default().participant_qos("my_library::my_profile");
```

Parameters

params	The **QosProviderParams** (p. 2049) to set

7.22 rti::core::builtin_profiles Namespace Reference

<<***extension***>> *(*p. *354)* Contains the names of the built-in profiles in the regular (non-experimental) qos library

Functions

- std::string **library_name** ()

  A library of non-experimental QoS profiles.
- std::string **baseline** ()

  The most up-to-date QoS default values.
- std::string **baseline_5_0_0** ()

  The QoS default values for version 5.0.0.
- std::string **baseline_5_1_0** ()

  The QoS default values for version 5.1.0.
- std::string **baseline_5_2_0** ()

  The QoS default values for version 5.2.0.
- std::string **baseline_5_3_0** ()

  The QoS default values for version 5.3.0.
- std::string **baseline_6_0_0** ()

  The QoS default values for version 6.0.0.
- std::string **baseline_6_1_0** ()

  The QoS default values for version 6.1.0.
- std::string **baseline_7_0_0** ()

  The QoS default values for version 7.0.0.
- std::string **baseline_7_1_0** ()

  The QoS default values for version 7.1.0.
- std::string **generic_common** ()

  A common Participant base profile.
- std::string **generic_monitoring_common** ()

  Enables RTI Monitoring Library.
- std::string **generic_connext_micro_compatibility** ()

  Sets the values necessary to communicate with RTI Connext Micro.
- std::string **generic_connext_micro_compatibility_2_4_9** ()

  Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.
- std::string **generic_connext_micro_compatibility_2_4_3** ()

  Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and ealier.
- std::string **generic_other_dds_vendor_compatibility** ()

  Sets the values necessary to interoperate with other DDS vendors.
- std::string **generic_510_transport_compatibility** ()

  Sets the values necessary to interoperate with RTI Connext 5.1.0 using the UDPv6 and/or SHMEM transports.
- std::string **generic_security** ()

  Loads the DDS Secure builtin plugins.
- std::string **generic_strict_reliable** ()

  Enables strict reliability.
- std::string **generic_keep_last_reliable** ()

  Enables keep-last reliability.

- std::string **generic_best_effort** ()

  Enables best-effort reliability kind.
- std::string **generic_strict_reliable_high_throughput** ()

  A profile that can be used to achieve high throughput.
- std::string **generic_strict_reliable_low_latency** ()

  A profile that can be used to achieve low latency.
- std::string **generic_participant_large_data** ()

  A common Participant base profile to facilitate sending large data.
- std::string **generic_participant_large_data_monitoring** ()

  Configures Participants for large data and monitoring.
- std::string **generic_strict_reliable_large_data** ()

  Configures endpoints for sending large data with strict reliability.
- std::string **generic_keep_last_reliable_large_data** ()

  Configures endpoints for sending large data with keep-last reliability.
- std::string **generic_strict_reliable_large_data_fast_flow** ()

  Configures strictly reliable communication for large data with a fast flow controller.
- std::string **generic_strict_reliable_large_data_medium_flow** ()

  Configures strictly reliable communication for large data with a medium flow controller.
- std::string **generic_strict_reliable_large_data_slow_flow** ()

  Configures strictly reliable communication for large data with a slow flow controller.
- std::string **generic_keep_last_reliable_large_data_fast_flow** ()

  Configures keep-last reliable communication for large data with a fast flow controller.
- std::string **generic_keep_last_reliable_large_data_medium_flow** ()

  Configures keep-last reliable communication for large data with a medium flow controller.
- std::string **generic_keep_last_reliable_large_data_slow_flow** ()

  Configures keep-last reliable communication for large data with a slow flow controller.
- std::string **generic_keep_last_reliable_transient_local** ()

  Persists the samples of a DataWriter as long as the entity exists.
- std::string **generic_keep_last_reliable_transient** ()

  Persists samples using RTI Persistence Service.
- std::string **generic_keep_last_reliable_persistent** ()

  Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- std::string **generic_auto_tuning** ()

  Enables the Turbo Mode batching and Auto Throttle experimental features.
- std::string **generic_minimal_memory_footprint** ()

  Uses a set of QoS which reduces the memory footprint of the application.
- std::string **generic_monitoring2** ()

  The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.
- std::string **generic_monitoring2_wan** ()

  The QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use to communicate over WAN with a Collector Service.
- std::string **pattern_rpc** ()

  This profile contains the default RPC and Request-Reply QoS settings.
- std::string **pattern_periodic_data** ()

  Used for applications that expect periodic data.
- std::string **pattern_streaming** ()

  Used for applications that stream data.

- std::string **pattern_reliable_streaming** ()

  Used for applications that stream data and require reliable communication.
- std::string **pattern_event** ()

  Used for applications that handle events.
- std::string **pattern_alarm_event** ()

  Used for applications that handle alarm events.
- std::string **pattern_status** ()

  Used for applications whose samples represent statuses.
- std::string **pattern_alarm_status** ()

  Used for applications in which samples represent alarm statuses.
- std::string **pattern_last_value_cache** ()

  Used for applications that only need the last published value.

  Used for applications that only need the last published value.

7.24.1 Detailed Description

<<***extension***>> *(p. 354)* <<***experimental***>> *(p. 355)* Contains the names of the built-in profiles in the experimental qos library.

This qos library is deprecated. These profiles have been moved to **qos_lib** (p. 712).

The library name is **rti::core::builtin_profiles::qos_lib_exp::library_name()** (p. 482)

7.25 rti::core::builtin_profiles::qos_snippet_lib Namespace Reference

<<***extension***>> *(p. 354)* Contains the names of the built-in QoS Snippets

Functions

- std::string **library_name** ()
  A library of QoS Snippets.
- std::string **snippet_optimization_reliability_protocol_common** ()
  QoS Snippet that configures the reliability protocol with a common configuration.
- std::string **snippet_optimization_reliability_protocol_keep_all** ()
  QoS Snippet that configures the reliability protocol for KEEP_ALL.
- std::string **snippet_optimization_reliability_protocol_keep_last** ()
  QoS Snippet that configures the reliability protocol for KEEP_LAST.
- std::string **snippet_optimization_reliability_protocol_high_rate** ()
  QoS Snippet that configures the reliability protocol for sending data at a high rate.
- std::string **snippet_optimization_reliability_protocol_low_latency** ()
  QoS Snippet that configures the reliability protocol for sending data at low latency.
- std::string **snippet_optimization_reliability_protocol_large_data** ()
  QoS Snippet that configures the reliability protocol for large data.
- std::string **snippet_optimization_reliability_protocol_dynamicmemalloc** ()
  Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.
- std::string **snippet_optimization_discovery_common** ()
  QoS Snippet that optimizes discovery with a common configuration.
- std::string **snippet_optimization_discovery_participant_compact** ()
  QoS Snippet that optimizes the Participant QoS to send less discovery information.
- std::string **snippet_optimization_discovery_endpoint_fast** ()
  QoS Snippet that optimizes the Endpoint Discovery to be faster.
- std::string **snippet_optimization_transport_large_buffers** ()
  QoS Snippet that increases the Participant default buffer that shmem and udpv4 use.
- std::string **snippet_qos_policy_reliability_reliable** ()
  QoS Snippet that sets RELIABILITY QoS to RELIABLE.
- std::string **snippet_qos_policy_reliability_best_effort** ()
  QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.
- std::string **snippet_qos_policy_history_keep_last_1** ()
  QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.

- std::string **snippet_qos_policy_history_keep_all** ()

  QoS Snippet that sets HISTORY QosPolicy to KEEP_ALL kind.
- std::string **snippet_qos_policy_publish_mode_asynchronous** ()

  QoS Snippet that sets PUBLISH_MODE QosPolicy to ASYNCHRONOUS kind.
- std::string **snippet_qos_policy_durability_transient_local** ()

  QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT_LOCAL kind.
- std::string **snippet_qos_policy_durability_transient** ()

  QoS Snippet that sets DURABILITY QosPolicy to TRANSIENT kind.
- std::string **snippet_qos_policy_durability_persistent** ()

  QoS Snippet that sets DURABILITY QosPolicy to PERSISTENT kind.
- std::string **snippet_qos_policy_batching_enable** ()

  QoS Snippet that sets BATCH QosPolicy to true.
- std::string **snippet_qos_policy_flow_controller_838mbps** ()

  QoS Snippet that configures and set a FlowController of 838 Mbps.
- std::string **snippet_qos_policy_flow_controller_209mbps** ()

  QoS Snippet that configures and sets a FlowController of 209 Mbps.
- std::string **snippet_qos_policy_flow_controller_52mbps** ()

  QoS Snippet that configures and sets a FlowController of 52 Mbps.
- std::string **snippet_feature_auto_tuning_enable** ()

  QoS Snippet that enables auto_throttle and turbo_mode to true.
- std::string **snippet_feature_monitoring_enable** ()

  QoS Snippet that enables the use of the RTI Monitoring Library.
- std::string **snippet_feature_monitoring2_enable** ()

  QoS Snippet that enables the use of the RTI Monitoring Library 2.0.
- std::string **snippet_feature_security_enable** ()

  QoS Snippet that enables security using the Builtin Security Plugins.
- std::string **snippet_feature_topic_query_enable** ()

  QoS Snippet that enables Topic Query.
- std::string **snippet_feature_type_support_v1_enable** ()

  QoS Snippet that enables TypeObject V1 propagation.
- std::string **snippet_feature_type_support_v1_disable** ()

  QoS Snippet that disables TypeObject V1 propagation.
- std::string **snippet_feature_type_support_v2_enable** ()

  QoS Snippet that enables TypeObject V2 propagation.
- std::string **snippet_feature_type_support_v2_disable** ()

  QoS Snippet that disables TypeObject V2 propagation.
- std::string **snippet_transport_tcp_lan_client** ()

  QoS Snippet that configures a TCP LAN Client over DDS.
- std::string **snippet_transport_tcp_wan_symmetric_client** ()

  QoS Snippet that configures a symmetric WAN TCP Client over DDS.
- std::string **snippet_transport_tcp_wan_asymmetric_server** ()

  QoS Snippet that an asymmetric WAN TCP Server over DDS.
- std::string **snippet_transport_tcp_wan_asymmetric_client** ()

  QoS Snippet that configures an asymmetric WAN TCP Client over DDS.
- std::string **snippet_transport_udp_avoid_ip_fragmentation** ()

  QoS Snippet that configures RTI Connext and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

- std::string **snippet_transport_udp_wan** ()

  QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).
- std::string **snippet_compatibility_connext_micro_version_2_4_3** ()

  QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connext Micro 2.4.3.
- std::string **snippet_compatibility_other_dds_vendors_enable** ()

  QoS Snippet that configures RTI Connext to interoperate with other DDS vendors.
- std::string **snippet_compatibility_5_1_0_transport_enable** ()

  QoS Snippet that configures RTI Connext to interoperate with RTI Connext 5.1.0 and below for UDPv6 and SHMEM transports.

7.26.1 Detailed Description

<<***extension***>> *(p. 354)* Extensions to **dds::core::xtypes** (p. 631)

7.26.2 Enumeration Type Documentation

7.26.2.1 DynamicTypePrintKind

```
enum class  rti::core::xtypes::DynamicTypePrintKind  [strong]
```

The different formats to print a **dds::core::xtypes::DynamicType** (p. 1504).

Enumerator

idl	Indicates that a **dds::core::xtypes::DynamicType** (p. 1504) is to be printed in IDL format.
xml	Indicates that a **dds::core::xtypes::DynamicType** (p. 1504) is to be printed in XML format.
json_schema	Indicates that a **dds::core::xtypes::DynamicType** (p. 1504) is printed in JSON Schema format.

7.26.3 Function Documentation

7.26.3.1 convert() [1/3]

```
template<typename TopicType >
DynamicDataImpl rti::core::xtypes::convert (
            const TopicType & sample )
```

<<***extension***>> *(p. 354)* Creates a DynamicData sample from a typed sample

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

TopicType	An IDL topic-type

Parameters

sample	The typed sample to convert to DynamicData

Returns

A new DynamicData object whose type is rti::topic::dynamic_type<TopicType> and contains the data from `sample`

7.26.3.2 resolve_alias()

```
const  dds::core::xtypes::DynamicType & rti::core::xtypes::resolve_alias (
            const  dds::core::xtypes::DynamicType & type )
```

<<***extension***>> *(p. 354)* If the type is an alias returns its related type recursively until it is not an alias.

7.26.3.3 to_cdr_buffer()

```
std::vector< char > & rti::core::xtypes::to_cdr_buffer (
            std::vector< char > & buffer,
            const DynamicData & sample,
             dds::core::policy::DataRepresentationId representation_id =  dds::core::policy::↩
DataRepresentation::auto_id() )
```

<<***extension***>> *(p. 354)* Serializes a DynamicData sample into CDR format

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Parameters

buffer	The output buffer, which will be resized to the correct size
sample	The sample to serialize
representation↩ _id	The data representation used to serialize the data

Returns

A reference to `buffer`

7.26.3.4 from_cdr_buffer()

```
DynamicData & rti::core::xtypes::from_cdr_buffer (
            DynamicData & sample,
            const std::vector< char > & buffer )
```

<<***extension***>> *(p. 354)* Creates a DynamicData sample by deserializing a CDR buffer'

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Parameters

sample	The sample to deserialize.
buffer	The buffer containing the CDR data

Returns

A reference to `sample`

7.26.3.5 convert() [2/3]

```
template<typename TopicType >
TopicType rti::core::xtypes::convert (
            const DynamicData & sample )
```

<<***extension***>> *(p. 354)* Creates a typed sample from a DynamicData sample.

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

This function is useful when an application uses DynamicData and regular typed Topics at the same time.

For example, given this IDL type:

```
struct Foo {
    long x;
};
```

We can convert from **`Foo`** (p. 1588) and `DynamicData`:

```
using dds::core::xtypes::DynamicData;
// Receive a DynamicData sample
dds::sub::DataReader<DynamicData> reader = // ...;
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
assert (samples.size() > 0);
// Create a Foo sample
const DynamicData& dynamic_data = samples[0].data();
assert (rti::core::xtypes::can_convert<Foo>(dynamic_data));
Foo typed_data = rti::core::xtypes::convert<Foo>(dynamic_data);
assert (typed_data.x() == dynamic_data.value<int32_t>("x"));
```

Precondition

can_convert<TopicType>(sample), otherwise the behavior is undefined.

Template Parameters

TopicType	An IDL topic-type

Parameters

sample	The DynamicData sample to convert to type `TopicType`

Returns

An instance of `TopicType` containing the data in `sample`.

7.26.3.6 convert() [3/3]

```
template<typename TopicType >
DynamicData rti::core::xtypes::convert (
            const TopicType & sample )
```

<<***extension***>> *(p. 354)* Creates a DynamicData sample from a typed sample

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

TopicType	An IDL topic-type

Parameters

sample	The typed sample to convert to DynamicData

Returns

A new DynamicData object whose type is rti::topic::dynamic_type<TopicType> and contains the data from `sample`

7.26.3.7 can_convert()

```
template<typename TopicType >
bool rti::core::xtypes::can_convert (
            const DynamicData & sample )
```

<<***extension***>> *(p. 354)* Determines if the DynamicType of this sample is equal to the DynamicType of `TopicType`

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

TopicType	An IDL topic-type

Returns

True if the DynamicType of TopicType is the same as this sample's and therefore it is possible to create an instance of `TopicType` from this DynamicData object.

convert() (p. 1491)

7.26.3.8 get_tuple()

```
template<typename... Types>
std::tuple< Types... > rti::core::xtypes::get_tuple (
            const dds::core::xtypes::DynamicData & data )
```

<<***C++11***>> *(p. 353)* <<***experimental***>> *(p. 355)* <<***extension***>> *(p. 354)* Retrieves all the values of a DynamicData object into an std::tuple at once

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

See also

Manipulating data reflectively using C++ tuples (p. 612)

7.26.3.9 set_tuple()

```
template<typename... Types>
void rti::core::xtypes::set_tuple (
             dds::core::xtypes::DynamicData & data,
            const std::tuple< Types... > & value )
```

*<<**C++11**>> (p. 353) <<**experimental**>> (p. 355) <<**extension**>> (p. 354)* Assigns the values of a std::tuple to a DynamicData object at once

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

See also

Manipulating data reflectively using C++ tuples (p. 612)

7.26.3.10 create_type_from_tuple()

```
template<typename... Types>
dds::core::xtypes::StructType rti::core::xtypes::create_type_from_tuple (
            const std::string & name )
```

*<<**C++11**>> (p. 353) <<**experimental**>> (p. 355) <<**extension**>> (p. 354)* Creates a StructType from a list of types or a std::tuple

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 718)

Template Parameters

Types	A list of types or a std::tuple. The types must be primitive (see **dds::core::xtypes::PrimitiveType** (p. 1959)) or `std::string`.

The StructType members are all default-created (i.e. non-key, non-optional, with default IDs...) and their names are m0, m1, m2, etc.

See also

Create a DynamicType using tuples (p. 610)

7.26.3.11 print_idl()

```
void rti::core::xtypes::print_idl (
            const DynamicType & type,
            unsigned int indent = 0 )
```

<<***extension***>> *(p. 354)* Prints the IDL representation of this DynamicType to the standard output

7.26.3.12 to_string() [1/2]

```
std::ostream & rti::core::xtypes::to_string (
            std::ostream & out,
            const DynamicType & type,
            const  rti::core::xtypes::DynamicTypePrintFormatProperty & format =  DynamicType↩
PrintFormatProperty() )
```

<<***extension***>> *(p. 354)* Writes the string representation of this DynamicType to an output stream.

Parameters

out	The output stream to which the string representation of the DynamicType should be printed.
type	The DynamicType to be printed.
format	The **DynamicTypePrintFormatProperty** (p. 1509) used to define the format of the string.

Returns

A reference to out.

7.26.3.13 to_string() [2/2]

```
std::string rti::core::xtypes::to_string (
            const DynamicType & type,
            const  rti::core::xtypes::DynamicTypePrintFormatProperty & format =  DynamicType↩
PrintFormatProperty() )
```

<<***extension***>> *(p. 354)* Creates the string representation of this DynamicType to a string.

Parameters

type	The DynamicType to be printed.
format	The **DynamicTypePrintFormatProperty** (p. 1509) used to define the format of the string.

Returns

The string representation of the DynamicType.

7.27.1 Detailed Description

<<***extension***>> *(p. 354)* Extensions to **dds::domain** (p. 634)

7.27.2 Function Documentation

7.27.2.1 banish_ignored_participants()

```
void rti::domain::banish_ignored_participants (
            const  dds::domain::DomainParticipant & participant )
```

<<***extension***>> *(p. 354)* Prevents ignored remote DomainParticipants from receiving traffic from the local DomainParticipant.

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

This method complements **dds::domain::ignore** (p. 635): ignore_participant prevents the local **dds::domain::DomainParticipant** (p. 1326) from processing traffic from the remote DomainParticipant, while this method prevents already ignored remote DomainParticipants from processing traffic from the local DomainParticipant.

Note: this method is currently only supported when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941), **dds::core::NotEnabledError** (p. 1869)

See also

dds::domain::ignore (p. 635)

7.27.2.2 discovered_participant_subject_name()

```
rti::core::optional_value< std::string > rti::domain::discovered_participant_subject_name (
            const  dds::domain::DomainParticipant & participant,
            const  dds::core::InstanceHandle & participant_handle )
```

<<***extension***>> *(p. 354)* Returns **rti::core::policy::EntityName::name** (p. 1531) for the specified DomainParticipant.

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

This operation retrieves the **rti::core::policy::EntityName::name** (p. 1531) of a **dds::domain::DomainParticipant** (p. 1326) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 635) operation.

The `participant_handle` must correspond to such a DomainParticipant. If the `participant_handle` is **dds::core::InstanceHandle::nil()** (p. 1614) or is not a valid **dds::core::InstanceHandle** (p. 1612) for a DomainParticipant, then the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). If the `participant_handle` corresponds to a DomainParticipant that has not been discovered, then the operation will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Use the operation **dds::domain::discovered_participants** (p. 637) to find the **dds::domain::DomainParticipant** (p. 1326) entities that are currently discovered.

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

participant	The DomainParticipant that has discovered the discovered participant.
participant_handle	<<***in***>> *(p. 355)* **dds::core::InstanceHandle** (p. 1612) of **dds::domain::DomainParticipant** (p. 1326).

Returns

The **rti::core::policy::EntityName::name** (p. 1531) for the `participant_handle`

Exceptions

One	of the **Standard Exceptions** (p. 428), **dds::core::PreconditionNotMetError** (p. 1941) or **dds::core::NotEnabledError** (p. 1869)

See also

rti::core::policy::EntityName::name (p. 1531)

dds::domain::discovered_participants (p. 637)

7.27.2.3 discovered_participants_from_subject_name()

```
dds::core::InstanceHandleSeq rti::domain::discovered_participants_from_subject_name (
            const  dds::domain::DomainParticipant & participant,
            const  rti::core::optional_value< std::string > & subject_name )
```

<<***extension***>> *(p. 354)* Returns a list of discovered DomainParticipant entities that have the given **rti::core::policy::EntityName::name** (p. 1531).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

This operation retrieves the same list as **dds::domain::discovered_participants** (p. 637), except this list contains only the participants that have the given **rti::core::policy::EntityName::name** (p. 1531).

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

participant	The DomainParticipant whose discovered participants this operation will look up.
subject_name	<<***in***>> *(p. 355)* The **rti::core::policy::EntityName::name** (p. 1531) by which to filter the list.

Returns

The list of `InstanceHandles` corresponding to participants with the given **rti::core::policy::EntityName::name** (p. 1531).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

7.27.2.4 find_participant_by_name()

```
dds::domain::DomainParticipant rti::domain::find_participant_by_name (
            const std::string & participant_name )
```

<<***extension***>> *(p. 354)* Locates an existing **dds::domain::DomainParticipant** (p. 1326) by name.

Note

`#include <rti/domain/find.hpp>` This function is in the **`rti::domain`** (p. 727) namespace

If no such DomainParticipant exists, the operation will return **dds::core::null** (p. 438).

7.27.2.5 find_participants() [1/2]

```
template<typename ParticipantFwdIterator >
uint32_t rti::domain::find_participants (
            ParticipantFwdIterator begin,
            uint32_t max_size )
```

<<***extension***>> *(p. 354)* Retrieves all the participants created by the application up to a maximum number.

Note

`#include <rti/domain/find.hpp>` This function is in the **`rti::domain`** (p. 727) namespace

If no such DomainParticipant exists, the operation will return **dds::core::null** (p. 438).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

ParticipantFwdIterator	A forward iterator whose value type is **dds::domain::DomainParticipant** (p. 1326)

Parameters

begin	The iterator where to begin adding DomainParticipants.
max_size	The maximum number of elements to add

Returns

The number of elements added

7.27.2.6 find_participants() [2/2]

```
template<typename ParticipantFwdIterator >
uint32_t rti::domain::find_participants (
            ParticipantFwdIterator begin )
```

<<***extension***>> *(p. 354)* Retrieves all the participants created by the application.

Note

`#include <rti/domain/find.hpp>` This function is in the **`rti::domain`** (p. 727) namespace

If no such DomainParticipant exists, the operation will return **dds::core::null** (p. 438).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

ParticipantFwdIterator	A forward iterator whose value type is **dds::domain::DomainParticipant** (p. 1326)

Parameters

begin	The iterator where to begin adding DomainParticipants.

Returns

The number of elements added

7.27.2.7 find_type()

```
const  dds::core::xtypes::DynamicType & rti::domain::find_type (
            const  dds::domain::DomainParticipant & participant,
            const std::string & type_name )
```

<<***extension***>> *(p. 354)* Retrieves a type registered with this participant

`#include <rti/domain/find.hpp>`

Note

This is a standalone function in the namespace **rti::domain** (p. 727)

Every data type used in a DomainParticipant has a registered type name, which in most cases is the same as the type's name (the name used to define the type), but it can be different.

Types are registered by the creation of a **dds::topic::Topic** (p. 2474), whose constructors optionally receive a registered type name different from the type's name.

Types can also be registered when parsing an XML configuration and calling **dds::core::QosProvider::create_↩ participant_from_config()** (p. 2046).

Parameters

participant	The DomainParticipant where the type is registered
type_name	The name used to register the type in this participant

Returns

If `type_name` exists in this `participant`, this function returns the DynamicType describing the type. It can be cast down to **dds::core::xtypes::StructType** (p. 2400) or **dds::core::xtypes::UnionType** (p. 2584), depending on whether the type is a struct or a union.

Exceptions

dds::core::Error *(p. 1539)*	If the type doesn't exist or the operation fails for any other reason

Example:

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic1(participant, "Foo Topic"); // registered as "Foo"
dds::topic::Topic<Foo> topic2(participant, "MyFoo Topic", "MyFoo"); // registered as "MyFoo"
const auto& type1 = rti::domain::find_type(participant, "Foo");
const auto& type2 = rti::domain::find_type(participant, "MyFoo");
std::cout « type1 « std::endl;
std::cout « type2 « std::endl;
assert(type1 == type2); // Same type registered with different names
// Cast to StructType to access more information about the type
const auto& type1_struct =
        static_cast<const dds::core::xtypes::StructType&>(type1);
std::cout « type1_struct.member(0).name() « std::endl;
```

7.27.2.8 register_type() [1/2]

```
void rti::domain::register_type (
              dds::domain::DomainParticipant & participant,
             const std::string & name,
             const  dds::core::xtypes::DynamicType & type,
             const  rti::core::xtypes::DynamicDataTypeSerializationProperty & serialization_↩
property =  rti::core::xtypes::DynamicDataTypeSerializationProperty::DEFAULT )
```

<<***extension***>> *(p. 354)* Registers a DynamicType with specific serialization properties

Typically you don't need to call this function, since the topic constructor takes care of that automatically. You do need to call this function before creating the topic if you want to change the default data-serialization property.

Calling this function also allows to change the registered name of the type, which by default is `type.name()`.

Parameters

participant	The participant where to register this type
name	The name to use to register this type
type	The type definition
serialization_property	The data-serialization property

See also

dds::core::xtypes::DynamicType (p. 1504)

dds::core::xtypes::DynamicData (p. 1461)

7.27.2.9 register_type() [2/2]

```
template<typename T >
void rti::domain::register_type (
             const std::string & registered_type_name =  dds::topic::topic_type_name<T>::value()
)
```

<<***extension***>> *(p. 354)* Registers a User-Generated Type with RTI Connext. This function is used along with XML Application Creation.

When using XML Application creation, you must use this function to register any user-generated types with RTI Connext before creating your system.

When you don't use XML Application creation, you don't typically need to call this function, since the topic constructor takes care of that automatically.

Template Parameters

T	The user-generated type that is being registered

Parameters

registered_type_name	The name to use when registering the type. This is the name that will be used in your XML configuration file to refer to the type.

Classes

- class **AbstractAlignedList**

  Base class of Offsets to sequences and arrays of non-primitive members.
- class **AbstractBuilder**

  *Base class of all **Builders** (p. 409).*
- class **AbstractListBuilder**

  Base class of all array and sequence builders.
- class **AbstractPrimitiveList**

  Base class for Offsets to sequences and arrays of primitive types.
- class **AbstractSequenceBuilder**

  Base class of Builders for sequence members.
- class **AggregationBuilder**

  Base class of struct and union builders.
- class **FinalAlignedArrayOffset**

  Offset to an array of final elements.
- class **FinalArrayOffset**

  Offset to an array of final elements.
- class **FinalOffset**

  The base class of all Offsets to a final struct type.
- class **FinalSequenceBuilder**

  Builds a sequence member of fixed-size elements.
- struct **flat_type_traits**

  *Given a **Sample** (p. 2274), an Offset or a Builder, it allows obtaining the other types.*
- class **MutableArrayBuilder**

  Builds an array member of variable-size elements.
- class **MutableArrayOffset**

  Offset to an array of variable-size elements.
- class **MutableOffset**

  The base class of all Offsets to a final struct type.
- class **MutableSequenceBuilder**

  Builds a sequence member of variable-size elements.
- class **OffsetBase**

  Base class of all Offset types.
- class **PrimitiveArrayOffset**

  Offset to an array of primitive elements.

- struct **PrimitiveConstOffset**

  A const Offset to an optional primitive member.
- struct **PrimitiveOffset**

  An Offset to an optional primitive member.
- class **PrimitiveSequenceBuilder**

  Builds a sequence of primitive members.
- class **PrimitiveSequenceOffset**

  Offset to a sequence of primitive elements.
- class **Sample**

  The generic definition of FlatData topic-types.
- class **SequenceIterator**

  Iterator for collections of Offsets.
- class **SequenceOffset**

  Offset to a sequence of non-primitive elements.
- class **StringBuilder**

  Builds a string.
- class **StringOffset**

  Offset to a string.
- class **UnionBuilder**

  Base class of builders for user-defined mutable unions.

Functions

- template<typename OffsetType >
  flat_type_traits< OffsetType >::plain_type * **plain_cast** (OffsetType &offset)

  Casts into an equivalent plain C++ type.
- template<typename OffsetType >
  const **flat_type_traits**< OffsetType >::plain_type * **plain_cast** (const OffsetType &offset)

  Const version of plain_cast.
- template<typename TopicType >
  rti::flat::flat_type_traits< TopicType >::builder **build_data** (**dds::pub::DataWriter**< TopicType > &writer)

  Begins building a new sample.
- template<typename TopicType >
  void **discard_builder** (**dds::pub::DataWriter**< TopicType > &writer, typename **rti::flat::flat_type_traits**< TopicType >::builder &builder)

  Discards a sample builder.

  *Retrieves an existing **FlowController** (p. 1572).*

7.29.1 Detailed Description

*<<**extension**>> (p. 354)* Extensions to **dds::pub** (p. 645)

7.29.2 Function Documentation

7.29.2.1 implicit_publisher()

```
dds::pub::Publisher rti::pub::implicit_publisher (
            const  dds::domain::DomainParticipant & dp )
```

<<***extension***>> *(p. 354)* Get the implicit **dds::pub::Publisher** (p. 1993) for a given **dds::domain::Domain↩ Participant** (p. 1326).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

If an implicit Publisher does not already exist, this creates one.

The implicit Publisher is created with default **dds::pub::qos::PublisherQos** (p. 2007) and no listener. When a Domain↩ Participant is deleted, if there are no attached **dds::pub::DataWriter** (p. 1138) that belong to the implicit Publisher, the implicit Publisher will be implicitly deleted.

MT Safety:

UNSAFE. It is not safe to create an implicit Publisher while another thread may be simultaneously calling **dds↩ ::domain::DomainParticipant::default_publisher_qos** (p. 1342).

Parameters

dp	The DomainParticipant that the implicit publisher belongs to

Returns

The implicit publisher

7.29.2.2 matched_subscription_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData rti::pub::matched_subscription_participant_data (
            const  dds::pub::DataWriter< T > & writer,
            const  dds::core::InstanceHandle & handle )
```

<<***extension***>> *(p. 354)* This operation retrieves the information on the discovered **dds::domain::Domain↩ Participant** (p. 1326) associated with the subscription that is currently matching with the **dds::pub::DataWriter** (p. 1138).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 1138). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1941) if the subscription corresponds to the same **dds::domain::DomainParticipant** (p. 1326) that the DataWriter belongs to. Use **dds::pub::matched_subscriptions()** (p. 648) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 1138).

Exceptions

One	of the **Standard Exceptions** (p. 428), or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the DataWriter subscribes to

Parameters

writer	The writer to lookup the matched participant data of
handle	The InstanceHandle to a specific subscription. Must correspond to a subscription currently associated with the DataWriter.

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1908) of the DomainParticipant of a matched subscription of a **dds::pub::DataWriter** (p. 1138)

7.29.2.3 matched_subscriptions_locators()

```
template<typename T >
rti::core::LocatorSeq rti::pub::matched_subscriptions_locators (
            const  dds::pub::DataWriter< T > & writer )
```

<<***extension***>> *(p. 354)* Retrieve the list of locators for subscriptions currently associated with this DataWriter.

The locators returned are the ones that are used by the DDS implementation to communicate with the corresponding matched DataReaders.

Template Parameters

T	The topic-type that the DataWriter publishes.

Parameters

writer	The DataWriter.

Returns

The list of locators

7.29.2.4 is_matched_subscription_active()

```
template<typename T >
bool rti::pub::is_matched_subscription_active (
            const  dds::pub::DataWriter< T > & writer,
            const  dds::core::InstanceHandle & handle )
```

<<***extension***>> *(p. 354)* Check if a matched subscription is active.

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

T	The topic-type that the DataWriter publishes.

Parameters

writer	The DataWriter.
handle	The **dds::core::InstanceHandle** (p. 1612) of the matched subscription.

This API is used for querying the endpoint liveliness of a matched subscription. A matched subscription will be marked as inactive when it becomes nonprogessing (e.g., not responding to a DataWriter's heartbeats, or letting its internal queue fill up without taking the available data). Note that if the participant associated with the matched subscription loses liveliness, the **dds::core::InstanceHandle** (p. 1612) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1619).

Returns

A boolean indicating whether or not the matched subscription is active.

7.29.2.5 matched_subscription_data()

```
template<typename T >
std::vector<  dds::topic::SubscriptionBuiltinTopicData > rti::pub::matched_subscription_data (
            const  dds::pub::DataWriter< T > & writer )
```

<<***extension***>> *(p. 354)* Obtain the SubscriptionBuiltinTopicData for all of the subscriptions matched with a DataWriter.

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

This API retrieves the matched publication data from all of the subscriptions currently matched a DataWriter.

Template Parameters

T	The topic-type that the DataWriter publishes.

Parameters

writer	The DataWriter.

Returns

A std::vector containing all of the matched subscription data.

7.29.2.6 find_publishers() [1/2]

```
template<typename PublisherForwardIterator >
uint32_t rti::pub::find_publishers (
            const  dds::domain::DomainParticipant participant,
            PublisherForwardIterator begin,
            uint32_t max_size )
```

<<***extension***>> *(p. 354)* Retrieve all of the **dds::pub::Publisher** (p. 1993) created from this **dds::domain::Domain↩ Participant** (p. 1326)

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

PublisherForwardIterator	A forward iterator whose value type is **dds::pub::Publisher** (p. 1993)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Publishers belong to
begin	A forward iterator to the position in the destination container to insert the found Publishers into
max_size	The maximum number of Publishers to add

Returns

The number of found Publishers

See also

Looking up DataWriters (p. 314)

7.29.2.7 find_publishers() [2/2]

```
template<typename PublisherBackInsertIterator >
uint32_t rti::pub::find_publishers (
            const  dds::domain::DomainParticipant participant,
            PublisherBackInsertIterator begin )
```

Retrieve all the **dds::pub::Publisher** (p. 1993) created from this **dds::domain::DomainParticipant** (p. 1326).

Template Parameters

PublisherBackInsertIterator	A back-inserting iterator whose value type is **dds::pub::Publisher** (p. 1993)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Publishers belong to
begin	A back-inserting iterator to the position in the destination container to insert the found Publishers in

Returns

The number of found Publishers

See also

Looking up DataWriters (p. 314)

7.29.2.8 find_publisher()

```
dds::pub::Publisher rti::pub::find_publisher (
            const  dds::domain::DomainParticipant participant,
            const std::string & publisher_name )
```

<<***extension***>> *(p. 354)* Looks up a **dds::pub::Publisher** (p. 1993) by its entity name within the **dds::domain::DomainParticipant** (p. 1326).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::Publisher** (p. 1993) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves a **dds::pub::Publisher** (p. 1993) within the **dds::domain::DomainParticipant** (p. 1326) given the entity's name. If there are several **dds::pub::Publisher** (p. 1993) with the same name within the **dds::domain::DomainParticipant** (p. 1326), this function returns the first matching occurrence.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) to look for the **dds::pub::Publisher** (p. 1993) in.
publisher_name	Entity name of the Publisher

Returns

The first Publisher found with the specified name or **dds::core::null** (p. 438) if it is not found.

See also

Looking up DataWriters (p. 314)

7.29.2.9 find_datawriters() [1/2]

```
template<typename AnyDataWriterBackInsertIterator >
uint32_t rti::pub::find_datawriters (
              dds::pub::Publisher publisher,
             AnyDataWriterBackInsertIterator begin )
```

Retrieve all the **dds::pub::DataWriter** (p. 1138) created from this **dds::pub::Publisher** (p. 1993).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

AnyDataWriterBackInsertIterator	An iterator whose `value_type` is **dds::pub::AnyDataWriter** (p. 815)

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the DataWriters belong to
begin	A back-inserting iterator to the position in the destination container to insert the found DataWriters into

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 314)

7.29.2.10 find_datawriters() [2/2]

```
template<typename AnyDataWriterForwardIterator >
uint32_t rti::pub::find_datawriters (
              dds::pub::Publisher publisher,
             AnyDataWriterForwardIterator begin,
             uint32_t max_size )
```

Retrieve all the **dds::pub::DataWriter** (p. 1138) created from this **dds::pub::Publisher** (p. 1993).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Template Parameters

AnyDataWriterForwardIterator	An iterator whose `value_type` is **dds::pub::AnyDataWriter** (p. 815)

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) the DataWriters belong to
begin	A forward iterator to the first position in the destination container to copy the found DataWriters into
max_size	The maximum number of DataWriters to return

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 314)

7.29.2.11 find_datawriter_by_topic_name()

```
template<typename Writer >
Writer rti::pub::find_datawriter_by_topic_name (
              dds::pub::Publisher publisher,
             const std::string & topic_name )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::pub::DataWriter** (p. 1138) with the given name within the **dds::pub::↩ Publisher** (p. 1993)

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::DataWriter** (p. 1138) in the system has an entity name which is configured and stored in the <<***extension***>> *(p. 354)* EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves the **dds::pub::DataWriter** (p. 1138) within the **dds::pub::Publisher** (p. 1993) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 1138) with the same name within the **dds::pub::Publisher** (p. 1993), the operation returns the first matching occurrence.

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) that created the DataWriter to find
topic_name	Entity name of the DataWriter to find

Returns

The AnyDataWriter with the given name

See also

Looking up DataWriters (p. 314)

7.29.2.12 find_datawriter_by_name() [1/2]

```
template<typename Writer >
Writer rti::pub::find_datawriter_by_name (
              dds::pub::Publisher publisher,
             const std::string & datawriter_name )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::pub::DataWriter** (p. 1138) with the given name within the **dds::pub::Publisher** (p. 1993)

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::DataWriter** (p. 1138) in the system has an entity name which is configured and stored in the <<***extension***>> *(p. 354)* EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves the **dds::pub::DataWriter** (p. 1138) within the **dds::pub::Publisher** (p. 1993) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 1138) with the same name within the **dds::pub::Publisher** (p. 1993), the operation returns the first matching occurrence.

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

publisher	The **dds::pub::Publisher** (p. 1993) that created the DataWriter to find
datawriter_name	Entity name of the DataWriter to find

Returns

The WRITER with the given name

See also

Looking up DataWriters (p. 314)

7.29.2.13 find_datawriter_by_name() [2/2]

```
template<typename Writer >
Writer rti::pub::find_datawriter_by_name (
              dds::domain::DomainParticipant participant,
             const std::string & datawriter_name )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::pub::DataWriter** (p. 1138) within the **dds::domain::DomainParticipant** (p. 1326) with the given name

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Every **dds::pub::DataWriter** (p. 1138) in the system has an entity name which is configured and stored in the Entity↩ Name policy, **ENTITY_NAME** (p. 532).

Every **dds::pub::Publisher** (p. 1993) in the system has an entity name which is also configured and stored in the EntityName policy.

This operation retrieves a **dds::pub::DataWriter** (p. 1138) within a **dds::pub::Publisher** (p. 1993) given the specified name which encodes both to the **dds::pub::DataWriter** (p. 1138) and the **dds::pub::Publisher** (p. 1993) name.

If there are several **dds::pub::DataWriter** (p. 1138) with the same name within the corresponding **dds::pub::Publisher** (p. 1993) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::pub::Publisher** (p. 1993) to which the **dds::pub::Data↩ Writer** (p. 1138) belongs and the entity name of of the **dds::pub::DataWriter** (p. 1138) itself, separated by a double colon "::". For example: MyPublisherName::MyDataWriterName

The plain name contains the **dds::pub::DataWriter** (p. 1138) name only. In this situation it is implied that the **dds::pub↩ ::DataWriter** (p. 1138) belongs to the implicit **dds::pub::Publisher** (p. 1993) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::pub::Publisher** (p. 1993) name part being "implicit". For example: the plain name "MyDataWriterName" is equivalent to specifiying the fully qualified name "implicit::MyDataWriterName"

The **dds::pub::DataWriter** (p. 1138) is only looked up within the **dds::pub::Publisher** (p. 1993) specified in the fully qualified name, or within the implicit **dds::pub::Publisher** (p. 1993) if the name was not fully qualified.

Template Parameters

Writer	The type of the writer. It can be **dds::pub::AnyDataWriter** (p. 815), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) within which the **dds::pub::DataWriter** (p. 1138) exists
datawriter_name	**EntityName** (p. 1530) of the DataWriter to find

Returns

The WRITER with the given name

See also

implicit_publisher(const dds::domain::DomainParticipant& dp) (p. 738);

Looking up DataWriters (p. 314)

7.29.2.14 find_flow_controller()

```
FlowController find_flow_controller (
            dds::domain::DomainParticipant participant,
           const std::string & name )
```

Retrieves an existing **FlowController** (p. 1572).

Note

This is a standalone function in the namespace **rti::pub** (p. 736)

Parameters

participant	The DomainParticipant associated to the **FlowController** (p. 1572)
name	The name used to create the **FlowController** (p. 1572) or the name of one of the built-in FlowControllers (**FlowController::DEFAULT_NAME** (p. 58), **FlowController::FIXED_RATE_NAME** (p. 59), **FlowController::ON_DEMAND_NAME** (p. 60))

Returns

The flow controller with that name in that participant or an empty reference (equals to **dds::core::null** (p. 438)) if it doesn't exist

See also

FlowController::retain() (p. 1576)

7.30.1 Detailed Description

<<***extension***>> *(*p. *354)* Extensions to **dds::sub** (p. 658)

7.30.2 Function Documentation

7.30.2.1 implicit_subscriber()

```
dds::sub::Subscriber rti::sub::implicit_subscriber (
            const  dds::domain::DomainParticipant & dp )
```

<<***extension***>> *(*p. *354)* Retrieves the implicit **dds::sub::Subscriber** (p. 2410) for the given **dds::domain::↩ DomainParticipant** (p. 1326).

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

If an implicit Subscriber does not already exist, this creates one.

The implicit Subscriber is created with default **dds::sub::qos::SubscriberQos** (p. 2423) and no listener. When a DomainParticipant is deleted, if there are no attached **dds::sub::DataReader** (p. 976) that belong to the implicit Subscriber, the implicit Subscriber will be implicitly deleted.

MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1343).

Parameters

dp	The DomainParticipant that the implicit subscriber belongs to.

Returns

The implicit Subscriber

7.30.2.2 matched_publication_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData rti::sub::matched_publication_participant_data (
            const  dds::sub::DataReader< T > & reader,
            const  dds::core::InstanceHandle & handle )
```

<<***extension***>> *(p. 354)* This operation retrieves the information on the discovered **dds::domain::Domain↩ Participant** (p. 1326) associated with the publication that is currently matching with the **dds::sub::DataReader** (p. 976).

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

The `publication_handle` must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 976). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1619). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1941) if the publication corresponds to the same **dds::domain::↩ DomainParticipant** (p. 1326) that the DataReader belongs to. Use the operation **dds::sub::matched_publications** (p. 668) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 976).

Exceptions

One	of the **Standard Exceptions** (p. 428) or **dds::core::NotEnabledError** (p. 1869)

Template Parameters

T	The topic-type that the DataReader subscribes to

Parameters

reader	The reader to lookup the matched participant data of
handle	The InstanceHandle to a specific publication. Must correspond to a publication currently associated with the DataReader. This handle is available in the **dds::sub::SampleInfo::publication_handle()** (p. 2290)

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1908) of the DomainParticipant of a matched publication of a **dds::sub::DataReader** (p. 976)

7.30.2.3 is_matched_publication_alive()

```
template<typename T >
bool rti::sub::is_matched_publication_alive (
            const  dds::sub::DataReader< T > & reader,
            const  dds::core::InstanceHandle & handle )
```

<<***extension***>> *(p. 354)* Check if a matched publication is alive.

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

T	The topic-type that the DataReader subscribes to.

Parameters

reader	The DataReader.
handle	The **dds::core::InstanceHandle** (p. 1612) of the matched publication.

This API is used for querying the endpoint liveliness of a matched publication. A matched publication will be marked as not alive if the liveliness that it committed to through its **LIVELINESS** (p. 535) QoS policy was not respected. Note that if the participant associated with the matched publication loses liveliness, the **dds::core::InstanceHandle** (p. 1612) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1619).

of the matched publication. See **dds::sub::matched_publications** (p. 668) for a description of what is considered a matched publication.

Exceptions

One	of the **Standard Exceptions** (p. 428)

Returns

A boolean indicating whether or not the matched publication is alive.

7.30.2.4 matched_publication_data()

```
template<typename T >
std::vector<  dds::topic::PublicationBuiltinTopicData > rti::sub::matched_publication_data (
            const  dds::sub::DataReader< T > & reader )
```

<<***extension***>> *(p. 354)* Obtain the PublicationBuiltinTopicData for all of the publications matched with a DataReader.

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

This API retrieves the matched subscription data from all of the publications currently matched a DataReader.

Template Parameters

T	The topic-type that the DataReader subscribes to.

Parameters

reader	The DataReader.

Returns

A std::vector containing all of the matched publication data.

7.30.2.5 find_subscribers() [1/2]

```
template<typename SubscriberForwardIterator >
uint32_t rti::sub::find_subscribers (
            const  dds::domain::DomainParticipant participant,
            SubscriberForwardIterator begin,
            uint32_t max_size )
```

<<***extension***>> *(p. 354)* Retrieve all of the **dds::sub::Subscriber** (p. 2410) created from this **dds::domain::DomainParticipant** (p. 1326)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

SubscriberForwardIterator	Type of the forward iterator passed into this function, whose value_type must be **dds::sub::Subscriber** (p. 2410).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Publishers belong to
begin	A forward iterator to the position in the destination container where to begin copying the found Subscribers into
max_size	The maximum size of Subscribers to add

Returns

The number of found Subscribers

7.30.2.6 find_subscribers() [2/2]

```
template<typename SubscriberBackInsertIterator >
uint32_t rti::sub::find_subscribers (
            const  dds::domain::DomainParticipant participant,
            SubscriberBackInsertIterator begin )
```

<<***extension***>> *(p. 354)* Retrieve all of the **dds::sub::Subscriber** (p. 2410) created from this **dds::domain::DomainParticipant** (p. 1326)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderBackInsertIterator	Type of the back-inserting iterator passed into this function, whose value_type must be **dds::sub::Subscriber** (p. 2410).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Subscribers belong to
begin	A back-inserting iterator to the position in the destination container to insert the found Subscribers into

Returns

The number of found Subscribers

7.30.2.7 find_subscriber()

```
dds::sub::Subscriber rti::sub::find_subscriber (
            const  dds::domain::DomainParticipant participant,
            const std::string & subscriber_name )
```

<<***extension***>> *(p. 354)* Finds a Subscriber by name

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderBackInsertIterator	Type of the back-inserting iterator passed into this function, whose value_type must be **dds::sub::AnyDataReader** (p. 807).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Subscribers belong to
subscriber_name	The name of the Subscriber

Returns

A valid reference if the a subscriber with that name exists or a reference equals to **dds::core::null** (p. 438) otherwise.

7.30.2.8 find_datareaders() [1/2]

```
template<typename AnyDataReaderBackInsertIterator >
uint32_t rti::sub::find_datareaders (
             dds::sub::Subscriber subscriber,
            AnyDataReaderBackInsertIterator begin )
```

<<***extension***>> *(p. 354)* Retrieve all the **dds::sub::DataReader** (p. 976) created from this **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderBackInsertIterator	Type of the back-inserting iterator passed into this function, whose value_type must be **dds::sub::AnyDataReader** (p. 807).

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the DataReaders belong to
begin	A back-inserting iterator to the position in the destination container to insert the found DataReaders into

Returns

The number of found DataReaders

See also

Looking up DataReaders (p. 322)

7.30.2.9 find_datareaders() [2/2]

```
template<typename AnyDataReaderForwardIterator >
uint32_t rti::sub::find_datareaders (
             dds::sub::Subscriber subscriber,
            AnyDataReaderForwardIterator begin,
            uint32_t max_size )
```

<<***extension***>> *(*p. *354)* Retrieve all the readers created from a subscriber.

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

AnyDataReaderForwardIterator	A forward iterator whose `value_type` is **dds::sub::AnyDataReader** (p. 807)

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) the readers belong to
begin	A forward iterator to the position in the destination container where to begin copying the found readers into.
max_size	The maximum number of readers to return

Returns

The number of found readers

See also

Looking up DataReaders (p. 322)

7.30.2.10 find_datareader_by_topic_name()

```
template<typename Reader >
Reader rti::sub::find_datareader_by_topic_name (
```

```
    dds::sub::Subscriber subscriber,
const std::string & topic_name )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) with the given topic name within the **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Use this operation on the built-in **dds::sub::Subscriber** (p. 2410) (**Built-in Topics** (p. 46)) to access the built-in **dds::sub::DataReader** (p. 976) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 976) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 976) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1326) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 976) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 976) before the **dds::domain::DomainParticipant** (p. 1326) is enabled. Looking up builtin **dds::sub::DataReader** (p. 976) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 976) (see **Built-in Transport Plugins** (p. 83) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1326).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 671).
- Call **dds::sub::find()** (p. 672).
- Call **enable()** (p. 581) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 976) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 976) is attached to the **dds::sub::Subscriber** (p. 2410), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 976) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 976).

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) that created the DataReader to find
topic_name	Topic name of the DataReader to find

Returns

The DataReader with the given topic name, or **dds::core::null** (p. 438) if it doesn't exist

See also

Looking up DataReaders (p. 322)

7.30.2.11 find_datareader_by_name() [1/2]

```
template<typename Reader >
Reader rti::sub::find_datareader_by_name (
              dds::sub::Subscriber subscriber,
             const std::string & datareader_name )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) with the given name within the **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Every **dds::sub::DataReader** (p. 976) in the system has an entity name which is configured and stored in the <<***extension***>> *(p. 354)* EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves the **dds::sub::DataReader** (p. 976) within the **dds::sub::Subscriber** (p. 2410) whose name matches the one specified. If there are several **dds::sub::DataReader** (p. 976) with the same name within the **dds::sub::Subscriber** (p. 2410), the operation returns the first matching occurrence.

Parameters

subscriber	The **dds::sub::Subscriber** (p. 2410) that created the DataReader to find
datareader_name	Entity name of the DataReader to find

Returns

The DataReader with the given name, or **dds::core::null** (p. 438) if it doesn't exist

See also

Looking up DataReaders (p. 322)

7.30.2.12 find_datareader_by_topic_description()

```
template<typename Reader , typename T >
Reader rti::sub::find_datareader_by_topic_description (
            const  dds::sub::Subscriber & subscriber,
            const  dds::topic::TopicDescription< T > & topic_description )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) with the given TopicDescription within the **dds::sub::Subscriber** (p. 2410)

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

Reader	The type of the reader returned, for example, dds::sub::DataReader<Foo>, or **dds::sub::AnyDataReader** (p. 807)
T	The topic-type

Parameters

subscriber	The Subscriber to which the DataReader belongs
topic_description	The TopicDescription identifying the DataReader to find

Returns

The found DataReader, or **dds::core::null** (p. 438) if it doesn't exist

7.30.2.13 find_datareader_by_name() [2/2]

```
template<typename Reader >
Reader rti::sub::find_datareader_by_name (
```

```
dds::domain::DomainParticipant participant,
const std::string & datareader_name )
```

<<***extension***>> *(p. 354)* Retrieves a **dds::sub::DataReader** (p. 976) within the **dds::domain::DomainParticipant** (p. 1326) with the given name

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

Template Parameters

Reader	The type of the reader. It can be **dds::sub::AnyDataReader** (p. 807), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws **dds::core::InvalidDowncastError** (p. 1620))

Every **dds::sub::DataReader** (p. 976) in the system has an entity name which is configured and stored in the Entity↩ Name policy, **ENTITY_NAME** (p. 532).

Every **dds::sub::Subscriber** (p. 2410) in the system has an entity name which is also configured and stored in the EntityName policy, **ENTITY_NAME** (p. 532).

This operation retrieves a **dds::sub::DataReader** (p. 976) within a **dds::sub::Subscriber** (p. 2410) given the specified name which encodes both to the **dds::sub::DataReader** (p. 976) and the **dds::sub::Subscriber** (p. 2410) name.

If there are several **dds::sub::DataReader** (p. 976) with the same name within the corresponding **dds::sub::Subscriber** (p. 2410) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::sub::Subscriber** (p. 2410) to which the **dds::sub::Data↩ Reader** (p. 976) belongs and the entity name of of the **dds::sub::DataReader** (p. 976) itself, separated by a double colon "::". For example: MySubscriberName::MyDataReaderName

The plain name contains the **dds::sub::DataReader** (p. 976) name only. In this situation it is implied that the **dds::sub↩ ::DataReader** (p. 976) belongs to the implicit **dds::sub::Subscriber** (p. 2410) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::sub::Subscriber** (p. 2410) name part being "implicit". For example: the plain name "MyDataReaderName" is equivalent to specifiying the fully qualified name "implicit::MyDataReaderName"

The **dds::sub::DataReader** (p. 976) is only looked up within the **dds::sub::Subscriber** (p. 2410) specified in the fully qualified name, or within the implicit **dds::sub::Subscriber** (p. 2410) if the name was not fully qualified.

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) within which the **dds::sub::DataReader** (p. 976) exists
datareader_name	EntityName of the DataReader to find

Returns

The first reader with the given name or **dds::core::null** (p. 438) if it is not found.

See also

rti::sub::find_datareader_by_name(const dds::sub::Subscriber&, const std::string&)

7.30.2.14 copy_to_sample()

```
template<typename T >
dds::sub::Sample< T > copy_to_sample (
            const  rti::sub::LoanedSample< T > & ls )
```

Copies the contents of a **rti::sub::LoanedSample** (p. 1659) into a **dds::sub::Sample** (p. 2270).

Example:

```
dds::sub::LoanedSamples<Foo> samples = reader.take();
std::vector<Sample<Foo> > sample_vector;
std::transform(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(sample_vector),
    rti::sub::copy_to_sample<Foo>);
```

7.30.2.15 operator<<()

```
template<typename T >
std::ostream & operator<< (
            std::ostream & out,
            const  LoanedSample< T > & sample )
```

Calls the operator on the data or prints [invalid data].

7.30.2.16 begin() [1/2]

```
template<typename T >
ValidLoanedSamples< T >::iterator begin (
             ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::begin() (p. 2597)

Referenced by **dds::sub::DataReader< T >::find_datareaders()**, and **dds::sub::Subscriber::find_subscribers()**.

7.30.2.17 begin() [2/2]

```
template<typename T >
ValidLoanedSamples< T >::const_iterator begin (
            const  ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::begin() (p. 2597)

7.30.2.18 end() [1/2]

```
template<typename T >
ValidLoanedSamples< T >::iterator end (
             ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::end() (p. 2598)

7.30.2.19 end() [2/2]

```
template<typename T >
ValidLoanedSamples< T >::const_iterator end (
            const  ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::end() (p. 2598)

7.30.2.20 swap()

```
template<typename T >
void swap (
             ValidLoanedSamples< T > & ls1,
             ValidLoanedSamples< T > & ls2 ) throw ( )
```

See also

ValidLoanedSamples::swap() (p. 2600)

7.30.2.21 valid_data() [1/2]

```
template<typename T >
ValidLoanedSamples< T > rti::sub::valid_data (
            LoanedSamples< T > && samples )
```

*<<**C++11**>> (p. 353) <<**extension**>> (p. 354)* Returns a collection that provides access only to samples with valid data

Template Parameters

T	The topic-type. It has to match the type of the DataReader.

This function transforms a LoanedSamples collection into another collection whose iterators only access valid-data samples, skipping any sample such that !sample.info().valid().

This operation is O(1) and will not copy the data samples or allocated any additional memory.

The typical way to use this function is to directly call it on the return value of a **read()** (p. 1024)/take() operation and use it in a for-loop. For example:

```
auto valid_samples = rti::sub::valid_data(reader.read());
for (auto sample : valid_samples) {
    // no need to check sample.info().valid()
    std::cout « sample.data() « std::endl;
}
```

Parameters

samples	The collection of LoanedSamples to transform into a **ValidLoanedSamples** (p. 2595). It must be an rvalue, so valid actual parameters are the result of one of the read/take operations:
	`auto vs = rti::sub::valid_data(reader.take());`
	Or an `std::move'd` existing collection:
	`auto ls = reader.take(); auto vs = rti::sub::valid_data(std::move(ls));`
	`// 'ls' is now invalid and can't be further used`

Returns

A forward-iterable collection that provides access only to samples with valid data. Note that this collection doesn't provide random access.

Postcondition

`samples` is invalid cannot be used after this call

See also

rti::sub::valid_data(const SampleIterator<T>&) (p. 767), which applies to an iterator rather to the whole collection

Reading data samples (p. 318)

7.30.2.22 operator==()

```
bool rti::sub::operator== (
            const SampleInfoImpl & other ) const
```

Compare two **dds::sub::SampleInfo** (p. 2285) objects for equality.

7.30.2.23 valid_data() [2/2]

```
template<typename T >
ValidSampleIterator< T > rti::sub::valid_data (
            const  SampleIterator< T > & sample_iterator )
```

<<***extension***>> *(p. 354)* Returns an iterator that skips invalid samples

Given a regular sample iterator, this functions creates another iterator `it` that behaves exactly the same except that `it++` moves to the next valid sample (or to the end of the collection). That is, if `it` doesn't point to the end of the collection, `it->info.valid()` is always true.

This is useful when your application doesn't need to deal with samples containing meta-information only.

For example, the following code copies all the data in a LoanedSamples collection skipping any invalid samples (otherwise, attempting to copy the data from an invalid sample would throw an exception, see rti::sub::LoanedSample::operator const DataType& ()).

```
dds::sub::LoanedSamples<KeyedType> samples = reader.take();
std::vector<KeyedType> data_vector;
std::copy(
     rti::sub::valid_data(samples.begin()),
     rti::sub::valid_data(samples.end()),
     std::back_inserter(data_vector));
```

Note that `valid_data`(samples.begin()) won't point to the first element if that element is not a valid sample.

A similar utility is the functor **rti::sub::IsValidData** (p. 1624).

dds::sub::LoanedSamples (p. 1663)

rti::sub::IsValidData (p. 1624)

dds::sub::SampleInfo::valid() (p. 2289)

rti::sub::valid_data(LoanedSamples<T>&&) (p. 766), which applies to the whole collection instead of an iterator

Reading data samples (p. 318)

7.30.2.24 create_topic_query_data_from_service_request()

```
TopicQueryData create_topic_query_data_from_service_request (
            const  rti::topic::ServiceRequest & service_request )
```

Creates a **TopicQueryData** (p. 2520) from a ServiceRequest.

This operation will extract the content from the request body of the **rti::topic::ServiceRequest** (p. 2358) to create a **rti::sub::TopicQueryData** (p. 2520) object.

The specified **rti::topic::ServiceRequest** (p. 2358) must be a valid sample associated with the service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2362). Otherwise this operation will return false.

This operation can be called within the context of a **dds::pub::DataWriterListener::on_service_request_accepted** (p. 1209) to retrieve the **rti::sub::TopicQueryData** (p. 2520) of a **rti::topic::ServiceRequest** (p. 2358) that has been received with service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2362)

Parameters

service_request	The **rti::topic::ServiceRequest** (p. 2358) that contains the **rti::sub::TopicQueryData** (p. 2520) as part of its request body.

Returns

A **rti::sub::TopicQueryData** (p. 2520) object where the content from the service request is extracted.

7.30.2.25 find_topic_query()

```
TopicQuery find_topic_query (
             dds::sub::AnyDataReader datareader,
            const  rti::core::Guid & guid )
```

Looks up a **TopicQuery** (p. 2516) by its GUID.

Parameters

datareader	The DataReader used to create the **TopicQuery** (p. 2516)
guid	The **TopicQuery** (p. 2516)'s GUID

Returns

The **TopicQuery** (p. 2516) if it exists or a **dds::core::null** (p. 438) reference otherwise.

See also

rti::sub::TopicQuery::guid() (p. 2518)

7.30.2.26 unpack() [1/3]

```
template<typename T >
void rti::sub::unpack (
            const  dds::sub::SharedSamples< T > & samples,
            std::vector< std::shared_ptr< const T > > & sample_vector )
```

<<***extension***>> *(p. 354)* <<***C++11***>> *(p. 353)* Unpacks a **SharedSamples** (p. 2367) collection into individual shared_ptr's in a vector

Note

`#include <rti/sub/unpack.hpp>`

This is a standalone function in the namespace **rti::sub** (p. 751)

This function creates a reference (not a copy) to each sample with valid data in a **SharedSamples** (p. 2367) container and pushes it back into a vector.

Each individual sample in the vector retains a reference to the original **SharedSamples** (p. 2367) that controls when the loan is returned. These references can be further shared. When all the references go out of scope, the loan is returned.

This can be also useful to insert samples from different calls to **read()** (p. 1024)/take() into the same vector. It is however recommended to not hold these samples indefinitely, since they use internal resources.

Example:

```
dds::sub::SharedSamples<Foo> shared_samples = reader.take();
std::vector<std::shared_ptr<const Foo» sample_vector;
rti::sub::unpack(shared_samples, sample_vector);
std::cout « *sample_vector[0] « std::endl;
// ...
// Read more samples, unpack them at the end of the same vector
shared_samples = reader.take();
rti::sub::unpack(shared_samples, sample_vector);
// References to the samples can be shared freely
std::shared_ptr<const Foo> sample = sample_vector[3];
// ...
// The loans will be returned automatically
```

Note

To finalize a DataReader, all the shared_ptr obtained via **unpack()** (p. 769) need to have been released. Otherwise DataReader::close() will fail with **dds::core::PreconditionNotMetError** (p. 1941).

Template Parameters

T	The topic-type

Parameters

samples	The collection of samples obtained from the DataReader
sample_vector	The destination where the samples are pushed back.

Referenced by **dds::sub::SharedSamples< T, DELEGATE >::unpack()**.

7.30.2.27 unpack() [2/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > rti::sub::unpack (
            const  dds::sub::SharedSamples< T > & samples )
```

*<<**extension**>> (p. 354) <<**C++11**>> (p. 353)* Unpacks a **SharedSamples** (p. 2367) collection into individual shared_ptr's in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

This overload returns a new vector instead of adding into an existing one.

See also

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 769)

7.30.2.28 unpack() [3/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > rti::sub::unpack (
            dds::sub::LoanedSamples< T > && samples )
```

<<***extension***>> *(p. 354)* <<***C++11***>> *(p. 353)* Unpacks a LoanedSamples collection into individual shared_ptr's in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 751)

This overload is a shortcut for `unpack(SharedSamples<T>(loaned_samples))` to simplify code like the following:

```
auto sample_vector = unpack(reader.take());
```

- template<typename FwdIterator >
  uint32_t **find_registered_content_filters** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, uint32_t max_size)

  <<***extension***>> (p. *354) Lookup the names of up to max_size number of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1326)*
- template<typename BinIterator >
  uint32_t **find_registered_content_filters** (const **dds::domain::DomainParticipant** &participant, BinIterator begin)

  *Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1326).*
- template<typename TopicType >
  std::ostream & **to_string** (std::ostream &out, const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormatProperty::Default**())

  Prints a data sample to an output stream.
- template<typename TopicType >
  std::string **to_string** (const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormatProperty::Default**())

  Tranforms a data sample into a human-readable string format.
- template<typename TopicType >
  TopicType **from_string** (RTI_STRING_IN str, **PrintFormatKind** format_kind=PrintFormatKind::JSON)

Creates a data sample from a JSON string representation.

- std::string **service_request_topic_name** ()

  ServiceRequest *(p. 2358) built-in topic name.*

7.31.1 Detailed Description

<<***extension***>> *(p. 354)* Extensions to **dds::topic** (p. 688)

7.31.2 Function Documentation

7.31.2.1 find_topics() [1/2]

```
template<typename AnyTopicBackInsertIterator >
uint32_t rti::topic::find_topics (
             dds::domain::DomainParticipant participant,
            AnyTopicBackInsertIterator begin )
```

<<***extension***>> *(p. 354)* Retrieve all the **dds::topic::Topic** (p. 2474) created from this **dds::domain::Domain↩ Participant** (p. 1326)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

Template Parameters

AnyTopicBackInsertIterator	Type of the back-inserting iterator, whose value_type is **dds::topic::AnyTopic** (p. 825).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Topics belong to
begin	A back-inserting iterator to the position in the destination container to insert the found Topics into

Returns

The number of found Topics

7.31.2.2 find_topics() [2/2]

```
template<typename AnyTopicForwardIterator >
uint32_t rti::topic::find_topics (
             dds::domain::DomainParticipant participant,
            AnyTopicForwardIterator begin,
            uint32_t max_size )
```

<<***extension***>> *(p. 354)* Retrieve all the **dds::topic::Topic** (p. 2474) created from this **dds::domain::Domain↩ Participant** (p. 1326)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

Template Parameters

AnyTopicBackInsertIterator	Type of the back-inserting iterator, whose value_type is **dds::topic::AnyTopic** (p. 825).

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) the Topics belong to
begin	A forward iterator to the position in the destination container to insert the found Topics in
max_size	The maximum number of Topics to return

Returns

The number of found Topics

7.31.2.3 find_registered_content_filters() [1/2]

```
template<typename FwdIterator >
uint32_t rti::topic::find_registered_content_filters (
            const  dds::domain::DomainParticipant & participant,
            FwdIterator begin,
            uint32_t max_size )
```

<<***extension***>> *(p. 354)* Lookup the names of up to max_size number of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1326)

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

The names of the RTI Connext built-in content filters will not be returned as part of the list.

Template Parameters

FwdIterator	A forwward iterator whose value type is `std::string` (or convertible to)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) that the content filters are registered with
begin	A forward iterator to the position in the destination container to insert the names of the found content filters into
max_size	The maximum number of filters to lookup

Returns

The number of found content filters

Referenced by **dds::topic::ContentFilteredTopic< T >::find_registered_content_filters()**.

7.31.2.4 find_registered_content_filters() [2/2]

```
template<typename BinIterator >
uint32_t rti::topic::find_registered_content_filters (
             const  dds::domain::DomainParticipant & participant,
             BinIterator begin )
```

Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1326).

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 771)

The names of the RTI Connext built-in content filters will not be returned as part of the list.

Template Parameters

BinIterator	A back-inserting iterator whose value type is `std::string` (or convertible to)

Parameters

participant	The **dds::domain::DomainParticipant** (p. 1326) that the content filters are registered with
begin	A back-inserting iterator to the position in the destination container to insert the the names of the found content filters into

Returns

The number of found content filters

7.36 rti::util::heap_monitoring Namespace Reference

<<***extension***>> *(*p. *354)* Contains the functions to enable and use the heap-monitoring utility.

Classes

- class **HeapMonitoringParams**

  Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.
- struct **SnapshotContentFormat_def**

  Bitmap used to decide which information of the snapshot will be displayed.
- struct **SnapshotOutputFormat_def**

  Specify the format of the output of the snapshot. RTI Connext.

Typedefs

- typedef **dds::core::safe_enum**< **SnapshotOutputFormat_def** > **SnapshotOutputFormat**

  Specify the format of the output of the snapshot.
- typedef **dds::core::safe_enum**< **SnapshotContentFormat_def** > **SnapshotContentFormat**

  Bitmap used to decide which information of the snapshot will be displayed.

Functions

- bool **enable** ()

  Starts monitoring the heap memory used by RTI Connext.
- bool **enable** (const **HeapMonitoringParams** &params)

  Starts monitoring the heap memory used by RTI Connext with params.
- void **disable** ()

  Stops monitoring the heap memory used by RTI Connext.
- bool **pause** ()

  Pauses heap monitoring.
- bool **resume** ()

  Resumes heap monitoring.
- bool **take_snapshot** (const std::string &filename, bool print_details=false)

  Saves the current heap memory usage in a file.

7.36.1 Detailed Description

<<***extension***>> *(*p. *354)* Contains the functions to enable and use the heap-monitoring utility.

7.37 rti::util::network_capture Namespace Reference

<<***extension***>> *(*p. *354)* Contains the functions to enable and use the Network Capture utility.

Classes

- class **ContentKindMask**

  <<***extension***>> *(*p. *354) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.*
- class **NetworkCaptureParams**

  <<***extension***>> *(*p. *354) Input parameters for starting Network Capture.*
- class **TrafficKindMask**

  <<***extension***>> *(*p. *354) Mask indicating the traffic direction to capture.*

Functions

- bool **enable** ()

  Enable Network Capture.
- bool **disable** ()

  Disable Network Capture.
- bool **set_default_params** (const **NetworkCaptureParams** &params)

  Set the default Network Capture parameters.
- bool **start** (const std::string &filename)

  Start Network Capture.
- bool **start** (**dds::domain::DomainParticipant** participant, const std::string &filename)

  Start Network Capture for a participant.
- bool **start** (const std::string &filename, const **NetworkCaptureParams** &params)

  Start Network Capture with parameters.
- bool **start** (**dds::domain::DomainParticipant** participant, const std::string &filename, const **NetworkCaptureParams** &params)

  Start Network Capture with parameters for a participant.
- bool **stop** ()

  Stop Network Capture.
- bool **stop** (**dds::domain::DomainParticipant** participant)

  Stop Network Capture.
- bool **pause** ()

  Pause Network Capture.
- bool **pause** (**dds::domain::DomainParticipant** participant)

  Pause Network Capture.
- bool **resume** ()

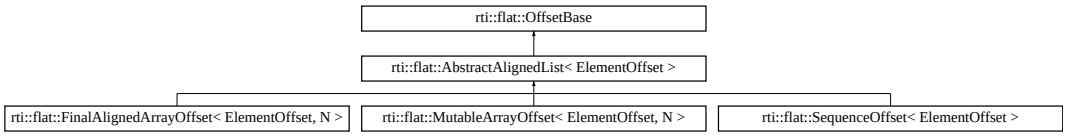
  Resume Network Capture.
- bool **resume** (**dds::domain::DomainParticipant** participant)

  Resume Network Capture.

7.37.1 Detailed Description

<<***extension***>> *(*p. *354)* Contains the functions to enable and use the Network Capture utility.

Chapter 8



Class Documentation

8.1 rti::flat::AbstractAlignedList< ElementOffset > Class Template Reference

Base class of Offsets to sequences and arrays of non-primitive members.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::AbstractAlignedList< ElementOffset >:

Public Types

- typedef **SequenceIterator**< ElementOffset, typename ElementOffset::offset_kind > **iterator**
  *The iterator type, **SequenceIterator** (p. 2328).*

Public Member Functions

- **iterator begin** ()
  Gets an iterator to the first Offset.
- **iterator end** ()
  Gets an iterator to the past-the-end element.

8.1.1 Detailed Description

template<typename ElementOffset>
class rti::flat::AbstractAlignedList< ElementOffset >

Base class of Offsets to sequences and arrays of non-primitive members.

Template Parameters

ElementOffset	The Offset type of the elements

8.1.2 Member Typedef Documentation

8.1.2.1 iterator

```
template<typename ElementOffset >
typedef SequenceIterator<ElementOffset, typename ElementOffset::offset_kind> rti::flat::↩
AbstractAlignedList< ElementOffset >::iterator
```

The iterator type, **SequenceIterator** (p. 2328).

8.1.3 Member Function Documentation

8.1.3.1 begin()

```
template<typename ElementOffset >
iterator rti::flat::AbstractAlignedList< ElementOffset >::begin ( ) [inline]
```

Gets an iterator to the first Offset.

begin() (p. 782) and **end()** (p. 782) enable the use of range-for loops, for example:

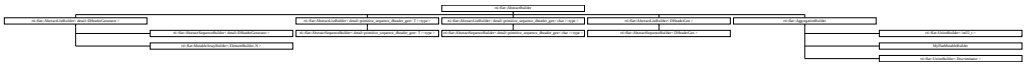
```
SequenceOffset<MyFlatMutableOffset> sequence_offset = my_type_offset.my_sequence();
for (auto element : sequence_offset) {
    std::cout « element.x() « std::endl;
}
```

References **rti::flat::OffsetBase::get_buffer_size()**.

8.1.3.2 end()

```
template<typename ElementOffset >
iterator rti::flat::AbstractAlignedList< ElementOffset >::end ( ) [inline]
```

Gets an iterator to the past-the-end element.



References **rti::flat::OffsetBase::get_buffer_size()**.

8.2 rti::flat::AbstractBuilder Class Reference

Base class of all **Builders** (p. 409).

`#include <Builder.hpp>`

Inheritance diagram for rti::flat::AbstractBuilder:

Public Member Functions

- void **discard** ()

  Discards a member in process of being built.
- bool **is_nested** () const

  Returns whether this is a member Builder.
- bool **is_valid** () const

  Whether this Builder is valid.
- rti::xcdr::length_t **capacity** () const

  Returns the total capacity in bytes.

Protected Member Functions

- virtual ~**AbstractBuilder** ()

  If this is a member Builder, it calls finish().

8.2.1 Detailed Description

Base class of all **Builders** (p. 409).

8.2.2 Constructor & Destructor Documentation

8.2.2.1 ~AbstractBuilder()

`virtual rti::flat::AbstractBuilder::~AbstractBuilder ( )  [inline], [protected], [virtual]`

If this is a member Builder, it calls finish().

If this Builder is building a member (that is, **is_nested()** (p. 784) is true), and the object goes out of scope before finish() has been called, its destructor calls finish(). Note, however, that it won't report any error.

If this Builder is building a sample (!is_nested()), its destructor doesn't do anything.

8.2.3 Member Function Documentation

8.2.3.1 discard()

```
void rti::flat::AbstractBuilder::discard ( )  [inline]
```

Discards a member in process of being built.

This function ends the creation of a member, returning the Builder of the type that contains the member to its previous state, as if this member had never been built.

Precondition

This object must be a member Builder, not a sample Builder.

This method is useful when during the building of a member an error occurs and the application wants to roll back, instead of finishing an incomplete member.

8.2.3.2 is_nested()

```
bool rti::flat::AbstractBuilder::is_nested ( ) const  [inline]
```

Returns whether this is a member Builder.

A member Builder is a Builder that has been created by calling a "`build_<member>`" function on another Builder (for example, **MyFlatMutableBuilder::build_my_mutable()** (p. 1769)).

Returns

True if this is a member Builder, or false if this is a sample Builder.

8.2.3.3 is_valid()

```
bool rti::flat::AbstractBuilder::is_valid ( ) const  [inline]
```

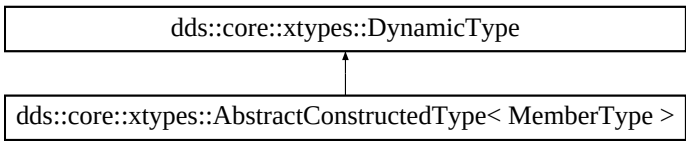
Whether this Builder is valid.

A Builder is not valid when it is default-constructed, or after any of these functions is called: finish(), finish_sample(), **discard()** (p. 784).

8.2.3.4 capacity()

```
rti::xcdr::length_t rti::flat::AbstractBuilder::capacity ( ) const  [inline]
```

Returns the total capacity in bytes.



The capacity is the total number of bytes this Builder can contain. For a sample Builder (that is, one such that **is_nested()** (p. 784) returns false), **rti::flat::build_data** (p. 411) reserves enough bytes to accommodate any sample of a given type.

8.3 dds::core::xtypes::AbstractConstructedType< MemberType > Class Template Reference

The base class of types that have members and an extensibility kind.

```
#include <DynamicTypeImpl.hpp>
```

Inheritance diagram for dds::core::xtypes::AbstractConstructedType< MemberType >:

Public Types

- typedef MemberType **Member**

  The member type (specified by the subclasses of this class)
- typedef uint32_t **MemberIndex**

  The member index type.

Public Member Functions

- **dds::core::xtypes::ExtensibilityKind extensibility_kind** () const

  Gets the extensibility kind.
- size_t **member_count** () const

  Gets the number of members.
- const MemberType & **member** (**MemberIndex** index) const

  Gets a member by its index.
- const MemberType & **member** (const std::string & **name**) const

  Gets a member by its name.
- **MemberIndex find_member_by_name** (const std::string & **name**) const

  Obtains the member index from its name.
- std::vector< MemberType > **members** () const

Gets a copy of all the members.

- uint32_t **cdr_serialized_sample_max_size** (**dds::core::policy::DataRepresentationId** representation_id=DDS_AUTO_DATA_REPRESENTATION) const

  Gets the maximum serialized size of samples of this type.

- uint32_t **cdr_serialized_sample_min_size** (**dds::core::policy::DataRepresentationId** representation_id=DDS_AUTO_DATA_REPRESENTATION) const

  Gets the minimum serialized size of samples of this type.

- uint32_t **cdr_serialized_sample_key_max_size** (**dds::core::policy::DataRepresentationId** representation_id=DDS_AUTO_DATA_REPRESENTATION) const

  Gets the maximum serialized size of sample keys of this type.

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE const **MemberIndex INVALID_INDEX**

  Indicates that a member doesn't exist.

Additional Inherited Members

8.3.1 Detailed Description

template<typename MemberType>
class dds::core::xtypes::AbstractConstructedType< MemberType >

The base class of types that have members and an extensibility kind.

Template Parameters

MemberType	The concrete member type, specified by the subclasses, can be **Member** (p. 1700), **UnionMember** (p. 2578) and **EnumMember** (p. 1533)

This is the base class of **StructType** (p. 2400), **UnionType** (p. 2584) and **EnumType** (p. 1535).

8.3.2 Member Typedef Documentation

8.3.2.1 Member

```
template<typename MemberType >
typedef MemberType  dds::core::xtypes::AbstractConstructedType< MemberType >::Member
```

The member type (specified by the subclasses of this class)

8.3.2.2 MemberIndex

```
template<typename MemberType >
typedef uint32_t  dds::core::xtypes::AbstractConstructedType< MemberType >::MemberIndex
```

The member index type.

8.3.3 Member Function Documentation

8.3.3.1 extensibility_kind()

```
template<typename MemberType >
dds::core::xtypes::ExtensibilityKind  dds::core::xtypes::AbstractConstructedType< MemberType >↩
::extensibility_kind ( ) const
```

Gets the extensibility kind.

8.3.3.2 member_count()

```
template<typename MemberType >
size_t  dds::core::xtypes::AbstractConstructedType< MemberType >::member_count ( ) const
```

Gets the number of members.

8.3.3.3 member() [1/2]

```
template<typename MemberType >
const MemberType &  dds::core::xtypes::AbstractConstructedType< MemberType >::member (
              MemberIndex index ) const
```

Gets a member by its index.

Parameters

index	The index of the member (0 to **member_count()** (p. 787) - 1)

8.3.3.4 member() [2/2]

```
template<typename MemberType >
const MemberType &  dds::core::xtypes::AbstractConstructedType< MemberType >::member (
            const std::string & name ) const
```

Gets a member by its name.

8.3.3.5 find_member_by_name()

```
template<typename MemberType >
MemberIndex  dds::core::xtypes::AbstractConstructedType< MemberType >::find_member_by_name (
            const std::string & name ) const
```

Obtains the member index from its name.

This method is applicable to **dds::core::xtypes::DynamicType** (p. 1504) objects representing structs (**dds::core::xtypes::TypeKind_def::STRUCTURE_TYPE** (p. 2574)) and union (**dds::core::xtypes::TypeKind_def::UNION_TYPE** (p. 2574)) types.

Parameters

name	<<***in***>> *(p. 355)* The member name.

Returns

The index of the member of the given name or **dds::core::xtypes::AbstractConstructedType::INVALID_INDEX** (p. 790) if the member is not found.

MT Safety:

SAFE.

8.3.3.6 members()

```
template<typename MemberType >
std::vector< MemberType >  dds::core::xtypes::AbstractConstructedType< MemberType >::members ( )
const
```

Gets a copy of all the members.

8.3.3.7 cdr_serialized_sample_max_size()

```
template<typename MemberType >
uint32_t  dds::core::xtypes::AbstractConstructedType< MemberType >::cdr_serialized_sample_max_↩
size (
              dds::core::policy::DataRepresentationId representation_id = DDS_AUTO_DATA_REPRESENTATION
) const
```

Gets the maximum serialized size of samples of this type.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

representation↩ _id	The serialized data representation for which we calculate the maximum size.

Returns

The maximum size

8.3.3.8 cdr_serialized_sample_min_size()

```
template<typename MemberType >
uint32_t  dds::core::xtypes::AbstractConstructedType< MemberType >::cdr_serialized_sample_min_↩
size (
              dds::core::policy::DataRepresentationId representation_id = DDS_AUTO_DATA_REPRESENTATION
) const
```

Gets the minimum serialized size of samples of this type.

Obtains the minimum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

representation↩ _id	The serialized data representation for which we calculate the minimum size.

Returns

The minimum size

8.3.3.9 cdr_serialized_sample_key_max_size()

```
template<typename MemberType >
uint32_t  dds::core::xtypes::AbstractConstructedType< MemberType >::cdr_serialized_sample_key_↩
max_size (
            dds::core::policy::DataRepresentationId representation_id = DDS_AUTO_DATA_REPRESENTATION
) const
```

Gets the maximum serialized size of sample keys of this type.

Obtains the maximum possible size in bytes of the serialized keys of any data sample of this type

Precondition

The type is an aggregation type (struct, union)

Parameters

representation↩ _id	The serialized data representation for which we calculate the maximum key size.

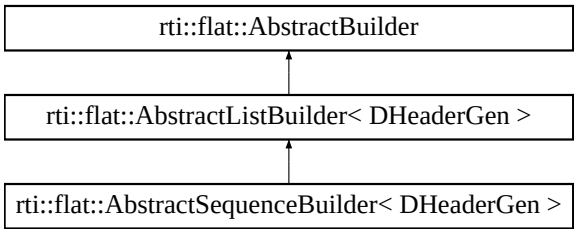
Returns

The maximum key size

8.3.4 Member Data Documentation

8.3.4.1 INVALID_INDEX

```
template<typename MemberType >
OMG_DDS_API_CLASS_VARIABLE const  MemberIndex  dds::core::xtypes::AbstractConstructedType< Member↩
Type >::INVALID_INDEX  [static]
```



Indicates that a member doesn't exist.

8.4 rti::flat::AbstractListBuilder< DHeaderGen > Class Template Reference

Base class of all array and sequence builders.

`#include <SequenceBuilders.hpp>`

Inheritance diagram for rti::flat::AbstractListBuilder< DHeaderGen >:

Protected Member Functions

- unsigned int **element_count** () const

  Returns the current number of elements that have been added.

Additional Inherited Members

8.4.1 Detailed Description

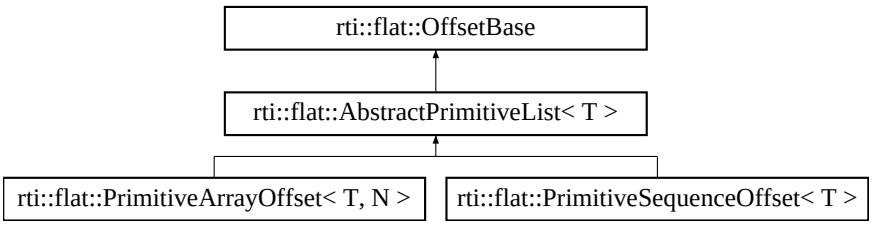
template<typename DHeaderGen>
class rti::flat::AbstractListBuilder< DHeaderGen >

Base class of all array and sequence builders.

8.4.2 Member Function Documentation

8.4.2.1 element_count()

```
template<typename DHeaderGen >
unsigned int  rti::flat::AbstractListBuilder< DHeaderGen >::element_count ( ) const  [inline],
[protected]
```



Returns the current number of elements that have been added.

8.5 rti::flat::AbstractPrimitiveList< T > Class Template Reference

Base class for Offsets to sequences and arrays of primitive types.

`#include <SequenceOffsets.hpp>`

Inheritance diagram for rti::flat::AbstractPrimitiveList< T >:

Public Member Functions

- T **get_element** (unsigned int i) const
  Returns an element by index.
- bool **set_element** (unsigned int i, T value)
  Sets an element by index.

8.5.1 Detailed Description

template<typename T>
class rti::flat::AbstractPrimitiveList< T >

Base class for Offsets to sequences and arrays of primitive types.

Template Parameters

T	The primitive type

8.5.2 Member Function Documentation

8.5.2.1 get_element()

```
template<typename T >
T  rti::flat::AbstractPrimitiveList< T >::get_element (
            unsigned int i ) const  [inline]
```

Returns an element by index.

Parameters

i	The zero-based index of the element

See also

rti::flat::plain_cast() (p. 417) for a method to access **all** (p. 699) the elements at once

8.5.2.2 set_element()

```
template<typename T >
bool  rti::flat::AbstractPrimitiveList< T >::set_element (
            unsigned int i,
            T value )  [inline]
```

Sets an element by index.

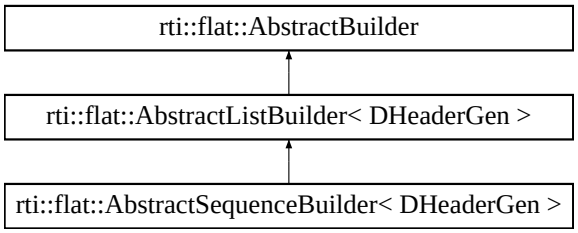
Parameters

i	The zero-based index of the element to set
value	The value to set

Returns

true if it was possible to set the element, or false if this collection has less than i - 1 elements.

See also



rti::flat::plain_cast() (p. 417) for a method to access **all** (p. 699) the elements at once

8.6 rti::flat::AbstractSequenceBuilder< DHeaderGen > Class Template Reference

Base class of Builders for sequence members.

`#include <SequenceBuilders.hpp>`

Inheritance diagram for rti::flat::AbstractSequenceBuilder< DHeaderGen >:

Public Member Functions

- unsigned int **element_count** () const

  Returns the current number of elements that have been added.

Additional Inherited Members

8.6.1 Detailed Description

template<typename DHeaderGen>
class rti::flat::AbstractSequenceBuilder< DHeaderGen >

Base class of Builders for sequence members.

This class contains only implementation details and doesn't add any public function to **AbstractListBuilder** (p. 791).

8.6.2 Member Function Documentation

8.6.2.1 element_count()

```
template<typename DHeaderGen >
unsigned int  rti::flat::AbstractListBuilder< DHeaderGen >::element_count ( ) const  [inline]
```

Returns the current number of elements that have been added.

8.7 rti::pub::AcknowledgmentInfo Class Reference

<<***extension***>> *(p. 354)* <<***value-type***>> *(p. 350)* Information about an application-acknowledged sample

```
#include <AcknowledgmentInfo.hpp>
```

Public Member Functions

- **dds::core::InstanceHandle subscription_handle** () const

  *Gets the subscription handle of the acknowledging **dds::sub::DataReader** (p. 976).*
- **rti::core::SampleIdentity sample_identity** () const

  Gets the identity of the sample being acknowledged.
- bool **valid_response_data** () const

  Flag indicating validity of the user response data in the acknowledgment.
- **rti::sub::AckResponseData response_data** () const

  User data payload of application-level acknowledgment message.

8.7.1 Detailed Description

*<<**extension**>> (p. 354) <<**value-type**>> (p. 350)* Information about an application-acknowledged sample

When acknowledging a sample, the reader provides the writer with information about the sample being acknowledged. The **AcknowledgmentInfo** (p. 795) structure provides the identity and cookie of the sample being acknowledged, as well as user data payload provided by the reader.

8.7.2 Member Function Documentation

8.7.2.1 subscription_handle()

```
dds::core::InstanceHandle rti::pub::AcknowledgmentInfo::subscription_handle ( ) const
```

Gets the subscription handle of the acknowledging **dds::sub::DataReader** (p. 976).

8.7.2.2 sample_identity()

```
rti::core::SampleIdentity rti::pub::AcknowledgmentInfo::sample_identity ( ) const
```

Gets the identity of the sample being acknowledged.

See also

rti::core::SampleIdentity (p. 2282)

8.7.2.3 valid_response_data()

```
bool rti::pub::AcknowledgmentInfo::valid_response_data ( ) const
```

Flag indicating validity of the user response data in the acknowledgment.

This flag is true when the **rti::core::RtpsReliableReaderProtocol::min_app_ack_response_keep_duration** (p. 2227) has not yet elapsed for the acknowledgment's response data.

The flag is false when that duration has elapsed for the response data.

8.7.2.4 response_data()

```
rti::sub::AckResponseData rti::pub::AcknowledgmentInfo::response_data ( ) const
```

User data payload of application-level acknowledgment message.

Response data set by **dds::sub::DataReader** (p. 976) when sample was acknowledged.

8.8 rti::core::policy::AcknowledgmentKind_def Struct Reference

<<***extension***>> *(p. 354)* The enumeration for Reliability acknowledgment kinds

`#include <PolicyKind.hpp>`

Public Types

- enum **type** {
  PROTOCOL ,
  APPLICATION_AUTO ,
  APPLICATION_ORDERED ,
  APPLICATION_EXPLICIT }
  The underlying `enum` type.

8.8.1 Detailed Description

<<***extension***>> *(p. 354)* The enumeration for Reliability acknowledgment kinds

8.8.2 Member Enumeration Documentation

8.8.2.1 type

```
enum rti::core::policy::AcknowledgmentKind_def::type
```

The underlying `enum` type.

Enumerator

PROTOCOL	Samples are acknowledged by RTPS protocol. Samples are acknowledged according to the Real-Time Publish-Subscribe (RTPS) interoperability protocol.

Enumerator

APPLICATION_AUTO	Samples are acknowledged automatically after a subscribing application has accessed them. The DataReader automatically acknowledges a sample after it has been taken and the loan returned. **See also** **dds::sub::DataReader::take()** (p. 997) **dds::sub::LoanedSamples::~LoanedSamples()** (p. 1666).
APPLICATION_ORDERED	Samples up to a specified sequence number are acknowledged.
APPLICATION_EXPLICIT	Samples are acknowledged after the subscribing application explicitly calls acknowledge on the samples. Samples received by a **dds::sub::DataReader** (p. 976) are explicitly acknowledged by the subscribing application, after it calls either **dds::sub::DataReader::acknowledge_all** (p. 1013) or **dds::sub::DataReader::acknowledge_sample** (p. 1015).

8.9 rti::sub::AckResponseData Class Reference

<<***extension***>> *(p. 354)* Data payload associated to an application-level acknowledgment

`#include <rti/sub/AckResponseData.hpp>`

Public Member Functions

- **AckResponseData** ()
  Creates an empty sequence of bytes.
- **AckResponseData** (const **dds::core::ByteSeq** &sequence)
  Creates an instance by copying a sequence of bytes.
- **dds::core::ByteSeq value** () const
  Gets the sequence of bytes.
- **dds::core::ByteSeq** & **value** (**dds::core::ByteSeq** &dst) const
  Sets the sequence of bytes.
- const uint8_t * **begin** () const
  Provides access to the beginning of the sequence of bytes.
- const uint8_t * **end** () const
  Gets the end of the sequence.

8.9.1 Detailed Description

<<***extension***>> *(p. 354)* Data payload associated to an application-level acknowledgment

When a **dds::sub::DataReader** (p. 976) explicitly acknowledges samples with **dds::sub::DataReader::acknowledge_sample** (p. 1015) or **dds::sub::DataReader::acknowledge_all** (p. 1013), it may specify opaque data to send as payload in the acknowledgment message sent to the **dds::pub::DataWriter** (p. 1138).

8.9.2 Constructor & Destructor Documentation

8.9.2.1 AckResponseData() [1/2]

```
rti::sub::AckResponseData::AckResponseData ( )  [inline]
```

Creates an empty sequence of bytes.

8.9.2.2 AckResponseData() [2/2]

```
rti::sub::AckResponseData::AckResponseData (
            const  dds::core::ByteSeq & sequence )  [inline], [explicit]
```

Creates an instance by copying a sequence of bytes.

8.9.3 Member Function Documentation

8.9.3.1 value() [1/2]

```
dds::core::ByteSeq rti::sub::AckResponseData::value ( ) const  [inline]
```

Gets the sequence of bytes.

8.9.3.2 value() [2/2]

```
dds::core::ByteSeq & rti::sub::AckResponseData::value (
             dds::core::ByteSeq & dst ) const
```

Sets the sequence of bytes.

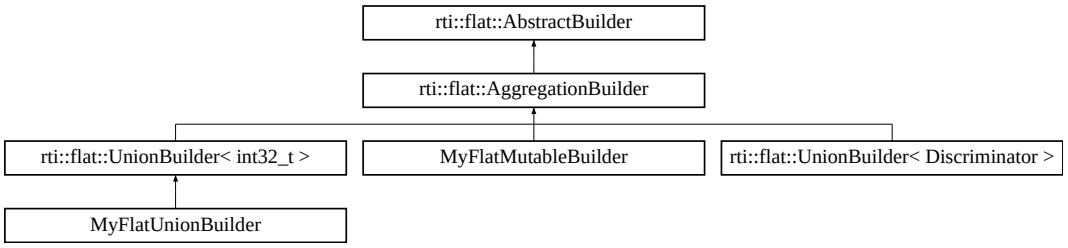
8.9.3.3 begin()

```
const uint8_t * rti::sub::AckResponseData::begin ( ) const
```

Provides access to the beginning of the sequence of bytes.

8.9.3.4 end()

```
const uint8_t * rti::sub::AckResponseData::end ( ) const
```



Gets the end of the sequence.

8.10 rti::flat::AggregationBuilder Class Reference

Base class of struct and union builders.

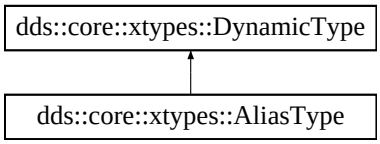
```
#include <AggregationBuilders.hpp>
```

Inheritance diagram for rti::flat::AggregationBuilder:

Additional Inherited Members

8.10.1 Detailed Description

Base class of struct and union builders.



This class contains implementation details and doesn't add any public function to **AbstractBuilder** (p. 783). See **My↩ FlatMutableBuilder** (p. 1763) for a concrete example of a struct builder.

8.11 dds::core::xtypes::AliasType Class Reference

<<***value-type***>> *(*p. *350)* Represents an IDL `typedef`

`#include <dds/core/xtypes/AliasType.hpp>`

Inheritance diagram for dds::core::xtypes::AliasType:

Public Member Functions

- **AliasType** (const std::string & **name**, const DynamicTypeImpl & **related_type**, bool **is_pointer**=false)
  Creates an alias with a name and a related type.
- const **dds::core::xtypes::DynamicType** & **related_type** () const
  Gets the related type.
- bool **is_pointer** () const
  <<***extension***>> *(*p. *354) Gets whether this alias makes related_type a pointer.*
- **dds::core::optional**< std::string > **unit** () const
  <<***extension***>> *(*p. *354) Gets a copy of the unit annotations of this alias.*

Related Functions

(Note that these are not member functions.)

- const **dds::core::xtypes::DynamicType** & **resolve_alias** (const **dds::core::xtypes::DynamicType** &type)
  <<***extension***>> *(*p. *354) If the type is an alias returns its related type recursively until it is not an alias.*

8.11.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents an IDL `typedef`

8.11.2 Constructor & Destructor Documentation

8.11.2.1 AliasType()

```
dds::core::xtypes::AliasType::AliasType (
            const std::string & name,
            const DynamicTypeImpl & related_type,
            bool is_pointer = false )
```

Creates an alias with a name and a related type.

Parameters

name	The name of this alias
related_type	The aliased type
is_pointer	Whether this alias makes the type a pointer

For example, to create the following two IDL aliases:

```
typedef long my_long;
typedef long * my_long_ptr;
```

We can use the following code:

```
AliasType my_long("my_long", primitive_type<int32_t>());
AliasType my_long_ptr("my_long_ptr", primitive_type<int32_t>(), true);
```

8.11.3 Member Function Documentation

8.11.3.1 related_type()

```
const  dds::core::xtypes::DynamicType & dds::core::xtypes::AliasType::related_type ( ) const
```

Gets the related type.

8.11.3.2 is_pointer()

```
bool dds::core::xtypes::AliasType::is_pointer ( ) const
```

<<***extension***>> *(*p. *354)* Gets whether this alias makes related_type a pointer.

8.11.3.3 unit()

```
dds::core::optional< std::string > dds::core::xtypes::AliasType::unit ( ) const
```

<<***extension***>> *(*p. *354)* Gets a copy of the unit annotations of this alias.

8.11.4 Friends And Related Function Documentation

8.11.4.1 resolve_alias()

```
const  dds::core::xtypes::DynamicType & resolve_alias (
             const  dds::core::xtypes::DynamicType & type )  [related]
```

<<***extension***>> *(p. 354)* If the type is an alias returns its related type recursively until it is not an alias.

8.12 rti::core::AllocationSettings Class Reference

<<***extension***>> *(p. 354)* Resource allocation settings

`#include <rti/core/PolicySettings.hpp>`

Public Member Functions

- **AllocationSettings** ()
  Creates an instance with an initial, max and incremental count set to zero.
- **AllocationSettings** (int32_t the_initial_count, int32_t the_max_count, int32_t the_incremental_count)
  Creates an instance with the given initial, maximum and incremental values.
- int32_t **initial_count** () const
  Getter (see setter with the same name)
- **AllocationSettings** & **initial_count** (int32_t the_initial_count)
  Sets the initial count of resources.
- int32_t **max_count** () const
  Getter (see setter with the same name)
- **AllocationSettings** & **max_count** (int32_t the_max_count)
  Sets the maximum count of resources.
- int32_t **incremental_count** () const
  Getter (see setter with the same name)
- **AllocationSettings** & **incremental_count** (int32_t the_incremental_count)
  Sets the incremental count of resources.

Static Public Attributes

- static const int32_t **AUTO_COUNT** = -2
  A special value indicating that the quantity is derived from a different Qos value.

8.12.1 Detailed Description

<<***extension***>> *(p. 354)* Resource allocation settings

QoS:

rti::core::policy::DomainParticipantResourceLimits (p. 1391)

8.12.2 Constructor & Destructor Documentation

8.12.2.1 AllocationSettings() [1/2]

```
rti::core::AllocationSettings::AllocationSettings ( )  [inline]
```

Creates an instance with an initial, max and incremental count set to zero.

8.12.2.2 AllocationSettings() [2/2]

```
rti::core::AllocationSettings::AllocationSettings (
            int32_t the_initial_count,
            int32_t the_max_count,
            int32_t the_incremental_count )  [inline]
```

Creates an instance with the given initial, maximum and incremental values.

8.12.3 Member Function Documentation

8.12.3.1 initial_count() [1/2]

```
int32_t rti::core::AllocationSettings::initial_count ( ) const  [inline]
```

Getter (see setter with the same name)

8.12.3.2 initial_count() [2/2]

```
AllocationSettings & rti::core::AllocationSettings::initial_count (
            int32_t the_initial_count )  [inline]
```

Sets the initial count of resources.

The initial resources to be allocated.

[default] It depends on the case.

[range] [0, 1 million], <= max_count

8.12.3.3 max_count() [1/2]

```
int32_t rti::core::AllocationSettings::max_count ( ) const  [inline]
```

Getter (see setter with the same name)

8.12.3.4 max_count() [2/2]

```
AllocationSettings & rti::core::AllocationSettings::max_count (
            int32_t the_max_count )  [inline]
```

Sets the maximum count of resources.

The maximum resources to be allocated.

[default] Depends on the case.

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 438), >= initial_count

8.12.3.5 incremental_count() [1/2]

```
int32_t rti::core::AllocationSettings::incremental_count ( ) const  [inline]
```

Getter (see setter with the same name)

8.12.3.6 incremental_count() [2/2]

```
AllocationSettings & rti::core::AllocationSettings::incremental_count (
            int32_t the_incremental_count )  [inline]
```

Sets the incremental count of resources.

The resource to be allocated when more resources are needed.

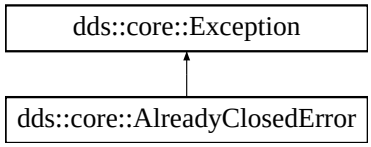
[default] Depends on the case.

[range] -1 (Double the amount of extra memory allocated each time memory is needed) or [1,1 million] (or = 0 only if initial_count == max_count)

8.12.4 Member Data Documentation

8.12.4.1 AUTO_COUNT

```
const int32_t rti::core::AllocationSettings::AUTO_COUNT = -2  [static]
```



A special value indicating that the quantity is derived from a different Qos value.

8.13 dds::core::AlreadyClosedError Class Reference

Indicates that an object has been closed.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::AlreadyClosedError:

Public Member Functions

- virtual const char * **what** () const throw ()

  *Access the message contained in this **AlreadyClosedError** (p. 806) exception.*

8.13.1 Detailed Description

Indicates that an object has been closed.

Inherits also from `std::logic_error`

See also

Tearing Down An Entity (p. 328)

8.13.2 Member Function Documentation

8.13.2.1 what()

```
virtual const char * dds::core::AlreadyClosedError::what ( ) const throw ( )   [virtual]
```

Access the message contained in this **AlreadyClosedError** (p. 806) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1547).

8.14 dds::sub::AnyDataReader Class Reference

<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **DataReader** (p. 976) of any type

  DataReader< T > **get** (const **AnyDataReader** &any_reader)

  *Same as **AnyDataReader::get()** (p. 810)*

8.14.1 Detailed Description

<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **DataReader** (p. 976) of any type

This class is useful for code that uses DataReaders of different types. It provides access to type-independent **DataReader** (p. 976) functions.

An **AnyDataReader** (p. 807) is always created from a typed **DataReader** (p. 976), increasing its reference count. The member function **get()** (p. 810) allows getting the typed **DataReader** (p. 976) back.

8.14.2 Constructor & Destructor Documentation

8.14.2.1 AnyDataReader()

```
template<typename T >
dds::sub::AnyDataReader::AnyDataReader (
            const  dds::sub::DataReader< T > & reader )  [inline]
```

Create an **AnyDataReader** (p. 807) that represents a generic, untyped **DataReader** (p. 976).

Template Parameters

T	The type of the **DataReader** (p. 976) that this **AnyDataReader** (p. 807) is being created from

Parameters

reader	The typed **DataReader** (p. 976) that this **AnyDataReader** (p. 807) will represent

Referenced by **operator=()**.

8.14.3 Member Function Documentation

8.14.3.1 operator=() [1/2]

```
AnyDataReader & dds::sub::AnyDataReader::operator= (
            const  AnyDataReader & other )  [inline]
```

Copy assignment operator.

MT Safety:

UNSAFE. It is not safe to call the assignment while another thread may be calling other methods on this object.

8.14.3.2 qos() [1/2]

```
const  dds::sub::qos::DataReaderQos dds::sub::AnyDataReader::qos ( ) const  [inline]
```

Get the QoS for this **AnyDataReader** (p. 807).

Returns

dds::sub::qos::DataReaderQos (p. 1072) The DataReaderQos

8.14.3.3 qos() [2/2]

```
void dds::sub::AnyDataReader::qos (
            const  dds::sub::qos::DataReaderQos & the_qos )  [inline]
```

Set the QoS for this **AnyDataReader** (p. 807).

Parameters

the_qos	The QoS to set

8.14.3.4 topic_name()

```
const std::string & dds::sub::AnyDataReader::topic_name ( ) const  [inline]
```

Get the topic name for this **AnyDataReader** (p. 807).

Returns

The topic name

8.14.3.5 type_name()

```
const std::string & dds::sub::AnyDataReader::type_name ( ) const  [inline]
```

Get the type name for this **AnyDataReader** (p. 807).

Returns

The type name

8.14.3.6 subscriber()

```
const  dds::sub::Subscriber & dds::sub::AnyDataReader::subscriber ( ) const  [inline]
```

Get the publisher for this **AnyDataReader** (p. 807).

Returns

The subscriber

8.14.3.7 operator=() [2/2]

```
template<typename T >
AnyDataReader & dds::sub::AnyDataReader::operator= (
            const  DataReader< T > & other )  [inline]
```

Assign a different **DataReader** (p. 976).

Replaces the reference to the current reader with a new one, whose type `T` can be different.

MT Safety:

UNSAFE. It is not safe to call the assignment while another thread may be calling other methods on this object.

References **AnyDataReader()**.

8.14.3.8 get()

```
template<typename T >
dds::sub::DataReader< T > dds::sub::AnyDataReader::get ( ) const  [inline]
```

Gets the typed **DataReader** (p. 976) from this **AnyDataReader** (p. 807).

Template Parameters

T	The type of the **DataReader** (p. 976) to extract

Returns

The typed **DataReader** (p. 976) that this **AnyDataReader** (p. 807) represents

Exceptions

dds::core::InvalidDowncastError *(p. 1620)*	If this **AnyDataReader** (p. 807) doesn't represent a DataReader<T>.

MT Safety:

UNSAFE. It is not safe to call **get<T>()** (p. 810) while another thread may be calling other methods on this object.

Referenced by **get()**.

8.14.3.9 close()

```
void dds::sub::AnyDataReader::close ( )  [inline]
```

Close this **AnyDataReader** (p. 807).

See also

DataReader::close() (p. 1024)

8.14.3.10 retain()

```
void dds::sub::AnyDataReader::retain ( )  [inline]
```

Retain this **AnyDataReader** (p. 807).

See also

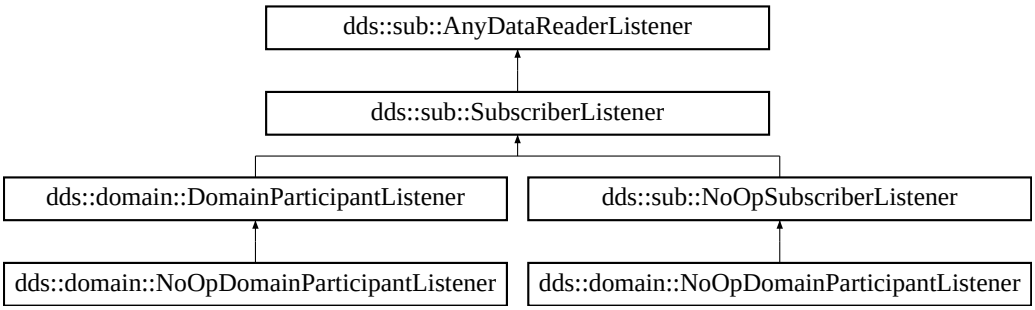
DataReader::retain() (p. 1526)

8.14.4 Friends And Related Function Documentation

8.14.4.1 get()

```
template<typename T >
DataReader< T > get (
            const  AnyDataReader & any_reader )  [related]
```

Same as **AnyDataReader::get()** (p. 810)



References **get()**.

8.15 dds::sub::AnyDataReaderListener Class Reference

The listener to notify status changes for a **dds::sub::DataReader** (p. 976) of a generic type.

`#include <dds/sub/AnyDataReaderListener.hpp>`

Inheritance diagram for dds::sub::AnyDataReaderListener:

Public Member Functions

- virtual void **on_requested_deadline_missed** (**AnyDataReader** &the_reader, const **dds::core::status::RequestedDeadlineMissedStatus** &status)=0

  *Handles the **dds::core::status::RequestedDeadlineMissedStatus** (p. 2184) status.*
- virtual void **on_requested_incompatible_qos** (**AnyDataReader** &the_reader, const **dds::core::status::RequestedIncompatibleQosStatus** &status)=0

  *Handles the **dds::core::status::RequestedIncompatibleQosStatus** (p. 2185) status.*
- virtual void **on_sample_rejected** (**AnyDataReader** &the_reader, const **dds::core::status::SampleRejectedStatus** &status)=0

  *Handles the **dds::core::status::SampleRejectedStatus** (p. 2315) status.*
- virtual void **on_liveliness_changed** (**AnyDataReader** &the_reader, const **dds::core::status::LivelinessChangedStatus** &status)=0

  *Handles the **dds::core::status::LivelinessChangedStatus** (p. 1652) status.*
- virtual void **on_data_available** (**AnyDataReader** &the_reader)=0

  Handles the dds::core::status::DataAvailableStatus status.
- virtual void **on_subscription_matched** (**AnyDataReader** &the_reader, const **dds::core::status::SubscriptionMatchedStatus** &status)=0

  *Handles the **dds::core::status::SubscriptionMatchedStatus** (p. 2439) status.*
- virtual void **on_sample_lost** (**AnyDataReader** &the_reader, const **dds::core::status::SampleLostStatus** &status)=0

  *Handles the **dds::core::status::SampleLostStatus** (p. 2303) status.*

8.15.1 Detailed Description

The listener to notify status changes for a **dds::sub::DataReader** (p. 976) of a generic type.

This class is only intended to act as the base of **SubscriberListener** (p. 2422).

See also

DataReaderListener (p. 1055)

SubscriberListener (p. 2422)

8.15.2 Member Function Documentation

8.15.2.1 on_requested_deadline_missed()

```
virtual void dds::sub::AnyDataReaderListener::on_requested_deadline_missed (
              AnyDataReader & the_reader,
             const  dds::core::status::RequestedDeadlineMissedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::RequestedDeadlineMissedStatus** (p. 2184) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1865), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1850).

8.15.2.2 on_requested_incompatible_qos()

```
virtual void dds::sub::AnyDataReaderListener::on_requested_incompatible_qos (
              AnyDataReader & the_reader,
             const  dds::core::status::RequestedIncompatibleQosStatus & status )  [pure virtual]
```

Handles the **dds::core::status::RequestedIncompatibleQosStatus** (p. 2185) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1865), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1850).

8.15.2.3 on_sample_rejected()

```
virtual void dds::sub::AnyDataReaderListener::on_sample_rejected (
             AnyDataReader & the_reader,
            const  dds::core::status::SampleRejectedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::SampleRejectedStatus** (p. 2315) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1865), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1850).

8.15.2.4 on_liveliness_changed()

```
virtual void dds::sub::AnyDataReaderListener::on_liveliness_changed (
             AnyDataReader & the_reader,
            const  dds::core::status::LivelinessChangedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::LivelinessChangedStatus** (p. 1652) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1866), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1851).

8.15.2.5 on_data_available()

```
virtual void dds::sub::AnyDataReaderListener::on_data_available (
             AnyDataReader & the_reader )  [pure virtual]
```

Handles the dds::core::status::DataAvailableStatus status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1866), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1851).

8.15.2.6 on_subscription_matched()

```
virtual void dds::sub::AnyDataReaderListener::on_subscription_matched (
             AnyDataReader & the_reader,
            const  dds::core::status::SubscriptionMatchedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::SubscriptionMatchedStatus** (p. 2439) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1866), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1851).

8.15.2.7 on_sample_lost()

```
virtual void dds::sub::AnyDataReaderListener::on_sample_lost (
              AnyDataReader & the_reader,
             const  dds::core::status::SampleLostStatus & status )  [pure virtual]
```

Handles the **dds::core::status::SampleLostStatus** (p. 2303) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1866), and **dds::domain::NoOpDomainParticipant↩ Listener** (p. 1851).

8.16 dds::pub::AnyDataWriter Class Reference

<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **DataWriter** (p. 1138) of any type

```
#include "dds/pub/AnyDataWriter.hpp"
```

Public Member Functions

- template<typename T >
  AnyDataWriter (const **dds::pub::DataWriter**< T > &writer)

  *Create an **AnyDataWriter** (p. 815) that represents a generic, untyped **DataWriter** (p. 1138).*

  *Same as **AnyDataWriter::get()** (p. 819)*

8.16.1 Detailed Description

<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **DataWriter** (p. 1138) of any type

This class is useful for code that uses DataWriters of different types. It provides access to type-independent **DataWriter** (p. 1138) functions.

An **AnyDataWriter** (p. 815) is always created from a typed **DataWriter** (p. 1138), increasing its reference count. The member function **get()** (p. 819) allows getting the typed **DataWriter** (p. 1138) back.

8.16.2 Constructor & Destructor Documentation

8.16.2.1 AnyDataWriter()

```
template<typename T >
dds::pub::AnyDataWriter::AnyDataWriter (
            const  dds::pub::DataWriter< T > & writer )  [inline]
```

Create an **AnyDataWriter** (p. 815) that represents a generic, untyped **DataWriter** (p. 1138).

Template Parameters

T	The type of the **DataWriter** (p. 1138) that this **AnyDataWriter** (p. 815) is being created from

Parameters

writer	The typed **DataWriter** (p. 1138) that this **AnyDataWriter** (p. 815) will represent

Referenced by **operator=()**.

8.16.3 Member Function Documentation

8.16.3.1 operator=() [1/2]

```
AnyDataWriter & dds::pub::AnyDataWriter::operator= (
            const  AnyDataWriter & other )  [inline]
```

Copy assignment operator.

MT Safety:

UNSAFE. It is not safe to call the assignment while another thread may be calling other methods on this object.

8.16.3.2 qos() [1/2]

```
const  dds::pub::qos::DataWriterQos dds::pub::AnyDataWriter::qos ( ) const  [inline]
```

Get the QoS for this **AnyDataWriter** (p. 815).

Returns

dds::pub::qos::DataWriterQos (p. 1226) The DataWriterQos

8.16.3.3 qos() [2/2]

```
void dds::pub::AnyDataWriter::qos (
            const  dds::pub::qos::DataWriterQos & the_qos )  [inline]
```

Set the QoS for this **AnyDataWriter** (p. 815).

Parameters

the_qos	The QoS to set

8.16.3.4 topic_name()

```
const std::string & dds::pub::AnyDataWriter::topic_name ( ) const  [inline]
```

Get the topic name for this **AnyDataWriter** (p. 815).

Returns

The topic name

8.16.3.5 type_name()

```
const std::string & dds::pub::AnyDataWriter::type_name ( ) const  [inline]
```

Get the type name for this **AnyDataWriter** (p. 815).

Returns

The type name

8.16.3.6 publisher()

```
const  dds::pub::Publisher & dds::pub::AnyDataWriter::publisher ( ) const  [inline]
```

Get the publisher for this **AnyDataWriter** (p. 815).

Returns

The publisher

8.16.3.7 wait_for_acknowledgments()

```
void dds::pub::AnyDataWriter::wait_for_acknowledgments (
            const  dds::core::Duration & timeout )  [inline]
```

See also

DataWriter::wait_for_acknowledgments (p. 1168)

8.16.3.8 close()

```
void dds::pub::AnyDataWriter::close ( )  [inline]
```

Close the **DataWriter** (p. 1138).

See also

DataWriter::close() (p. 1525)

8.16.3.9 retain()

```
void dds::pub::AnyDataWriter::retain ( )  [inline]
```

Retain this **AnyDataWriter** (p. 815).

See also

DataWriter::retain() (p. 1526)

8.16.3.10 operator=() [2/2]

```
template<typename T >
AnyDataWriter & dds::pub::AnyDataWriter::operator= (
            const  dds::pub::DataWriter< T > & other )  [inline]
```

Assign a different **DataWriter** (p. 1138).

Replaces the reference to the current writer with a new one, whose type `T` can be different.

MT Safety:

UNSAFE. It is not safe to call the assignment while another thread may be calling other methods on this object.

References **AnyDataWriter()**.

8.16.3.11 get()

```
template<typename T >
DataWriter< T > dds::pub::AnyDataWriter::get ( )  [inline]
```

Gets the typed **DataWriter** (p. 1138) from this **AnyDataWriter** (p. 815).

Template Parameters

T	The type of the **DataWriter** (p. 1138) to extract

Returns

The typed **DataWriter** (p. 1138) that this **AnyDataWriter** (p. 815) represents

Exceptions

dds::core::InvalidDowncastError *(p. 1620)*	If this **AnyDataWriter** (p. 815) doesn't represent a DataWriter<T>.

MT Safety:

UNSAFE. It is not safe to call **get<T>()** (p. 819) while another thread may be calling other methods on this object.

Referenced by **get()**.

8.16.4 Friends And Related Function Documentation

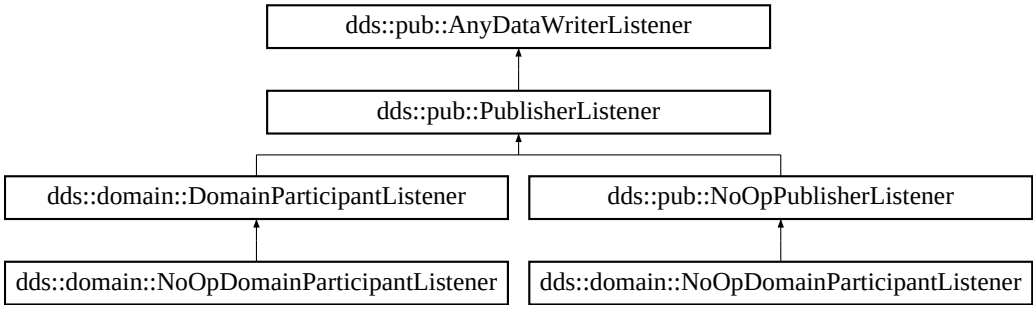
8.16.4.1 get()

```
template<typename T >
DataWriter< T > get (
            const  AnyDataWriter & any_writer )  [related]
```

Same as **AnyDataWriter::get()** (p. 819)

Examples

Foo.hpp.



References **get()**.

8.17 dds::pub::AnyDataWriterListener Class Reference

The listener to notify status changes for a **dds::pub::DataWriter** (p. 1138) of a generic type.

  *<<**extension**>> (p. 354) Called when a sample that has been received on a the built-in service channel is intended for the **DataWriter** (p. 1138) that has installed this listener*

8.17.1 Detailed Description

The listener to notify status changes for a **dds::pub::DataWriter** (p. 1138) of a generic type.

This class is only intended to act as the base of **PublisherListener** (p. 2006).

See also

DataWriterListener (p. 1202)

PublisherListener (p. 2006)

8.17.2 Member Function Documentation

8.17.2.1 on_offered_deadline_missed()

```
virtual void dds::pub::AnyDataWriterListener::on_offered_deadline_missed (
             dds::pub::AnyDataWriter & writer,
            const  ::dds::core::status::OfferedDeadlineMissedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::OfferedDeadlineMissedStatus** (p. 1871) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1847), and **dds::pub::NoOpPublisherListener** (p. 1853).

8.17.2.2 on_offered_incompatible_qos()

```
virtual void dds::pub::AnyDataWriterListener::on_offered_incompatible_qos (
             dds::pub::AnyDataWriter & writer,
            const  ::dds::core::status::OfferedIncompatibleQosStatus & status )  [pure virtual]
```

Handles the **dds::core::status::OfferedIncompatibleQosStatus** (p. 1873) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1847), and **dds::pub::NoOpPublisherListener** (p. 1854).

8.17.2.3 on_liveliness_lost()

```
virtual void dds::pub::AnyDataWriterListener::on_liveliness_lost (
             dds::pub::AnyDataWriter & writer,
            const  ::dds::core::status::LivelinessLostStatus & status )  [pure virtual]
```

Handles the **dds::core::status::LivelinessLostStatus** (p. 1655) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1847), and **dds::pub::NoOpPublisherListener** (p. 1854).

8.17.2.4 on_publication_matched()

```
virtual void dds::pub::AnyDataWriterListener::on_publication_matched (
             dds::pub::AnyDataWriter & writer,
            const  ::dds::core::status::PublicationMatchedStatus & status )  [pure virtual]
```

Handles the **dds::core::status::PublicationMatchedStatus** (p. 1990) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848), and **dds::pub::NoOpPublisherListener** (p. 1854).

8.17.2.5 on_reliable_writer_cache_changed()

```
virtual void dds::pub::AnyDataWriterListener::on_reliable_writer_cache_changed (
             dds::pub::AnyDataWriter & writer,
            const  rti::core::status::ReliableWriterCacheChangedStatus & status )  [pure virtual]
```

<<***extension***>> *(p. 354)* Handles the dds::core::status::ReliableWriterCacheChangedStatus status

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848), and **dds::pub::NoOpPublisherListener** (p. 1854).

8.17.2.6 on_reliable_reader_activity_changed()

```
virtual void dds::pub::AnyDataWriterListener::on_reliable_reader_activity_changed (
             dds::pub::AnyDataWriter & writer,
            const  rti::core::status::ReliableReaderActivityChangedStatus & status )  [pure virtual]
```

<<***extension***>> *(p. 354)* Handles the dds::core::status::ReliableReaderActivityChangedStatus status

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848), and **dds::pub::NoOpPublisherListener** (p. 1855).

8.17.2.7 on_sample_removed()

```
virtual void dds::pub::AnyDataWriterListener::on_sample_removed (
             dds::pub::AnyDataWriter & writer,
            const  rti::core::Cookie & cookie )  [pure virtual]
```

<<***extension***>> *(p. 354)* Notifies when a sample is removed from **DataWriter** (p. 1138) queue.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1848), and **dds::pub::NoOpPublisherListener** (p. 1855).

8.17.2.8 on_instance_replaced()

```
virtual void dds::pub::AnyDataWriterListener::on_instance_replaced (
             dds::pub::AnyDataWriter & writer,
            const  dds::core::InstanceHandle & handle )  [pure virtual]
```

<<***extension***>> *(p. 354)* Notifies when an instance is replaced in **DataWriter** (p. 1138) queue.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849), and **dds::pub::NoOpPublisherListener** (p. 1855).

8.17.2.9 on_application_acknowledgment()

```
virtual void dds::pub::AnyDataWriterListener::on_application_acknowledgment (
             dds::pub::AnyDataWriter & writer,
            const  rti::pub::AcknowledgmentInfo & acknowledgment_info )  [pure virtual]
```

<<***extension***>> *(p. 354)* Called when a sample is application-acknowledged.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849), and **dds::pub::NoOpPublisherListener** (p. 1855).

8.17.2.10 on_service_request_accepted()

```
virtual void dds::pub::AnyDataWriterListener::on_service_request_accepted (
             dds::pub::AnyDataWriter & writer,
            const  rti::core::status::ServiceRequestAcceptedStatus & status )  [pure virtual]
```

<<***extension***>> *(p. 354)* Called when a sample that has been received on a the built-in service channel is intended for the **DataWriter** (p. 1138) that has installed this listener

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1849), and **dds::pub::NoOpPublisherListener** (p. 1856).

8.18 dds::topic::AnyTopic Class Reference

<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **Topic** (p. 2474) of any type

`#include "dds/topic/AnyTopic.hpp"`

Public Member Functions

- template<typename T >
  AnyTopic (const **dds::topic::Topic**< T > &topic)
  *Create an **AnyTopic** (p. 825) that represents a generic, untyped **Topic** (p. 2474).*
- **dds::domain::DomainParticipant domain_participant** () const
  Gets the DomainParticipant this topic belongs to.
- **dds::core::status::InconsistentTopicStatus inconsistent_topic_status** ()
  Gets the InconsistentTopicStatus of this topic.
- const **dds::topic::qos::TopicQos qos** () const
  Get the TopicQos.
- void **qos** (const **dds::topic::qos::TopicQos** &the_qos)
  Sets the TopicQos.
- std::string **name** () const
  Gets the topic name.
- std::string **type_name** () const
  Gets the type name.
- void **close** ()
  *Closes the **Topic** (p. 2474).*
- template<typename T >
  Topic< T > **get** ()
  *Gets the typed **Topic** (p. 2474) from this **AnyTopic** (p. 825).*

Related Functions

- template<typename T >
  Topic< T > **get** (const **AnyTopic** &any_topic)
  *Same as **AnyTopic::get()** (p. 827)*

8.18.1 Detailed Description

<<***reference-type***>> *(p. 351)* This class provides an non-template holder for representing a **Topic** (p. 2474) of any type

This class is useful for code that uses Topics of different types. It provides access to type-independent **Topic** (p. 2474) functions.

An **AnyTopic** (p. 825) is always created from a typed **Topic** (p. 2474), increasing its reference count. The member function **get()** (p. 827) allows getting the typed **Topic** (p. 2474) back.

8.18.2 Constructor & Destructor Documentation

8.18.2.1 AnyTopic()

```
template<typename T >
dds::topic::AnyTopic::AnyTopic (
            const  dds::topic::Topic< T > & topic )  [inline]
```

Create an **AnyTopic** (p. 825) that represents a generic, untyped **Topic** (p. 2474).

Template Parameters

T	The type of the **Topic** (p. 2474) that this **AnyTopic** (p. 825) is being created from

Parameters

topic	The typed **Topic** (p. 2474) that this **AnyTopic** (p. 825) will represent

8.18.3 Member Function Documentation

8.18.3.1 domain_participant()

```
dds::domain::DomainParticipant dds::topic::AnyTopic::domain_participant ( ) const  [inline]
```

Gets the DomainParticipant this topic belongs to.

8.18.3.2 inconsistent_topic_status()

```
dds::core::status::InconsistentTopicStatus dds::topic::AnyTopic::inconsistent_topic_status ( )
[inline]
```

Gets the InconsistentTopicStatus of this topic.

8.18.3.3 qos() [1/2]

```
const  dds::topic::qos::TopicQos dds::topic::AnyTopic::qos ( ) const  [inline]
```

Get the TopicQos.

8.18.3.4 qos() [2/2]

```
void dds::topic::AnyTopic::qos (
            const  dds::topic::qos::TopicQos & the_qos )  [inline]
```

Sets the TopicQos.

8.18.3.5 name()

```
std::string dds::topic::AnyTopic::name ( ) const  [inline]
```

Gets the topic name.

8.18.3.6 type_name()

```
std::string dds::topic::AnyTopic::type_name ( ) const  [inline]
```

Gets the type name.

8.18.3.7 close()

```
void dds::topic::AnyTopic::close ( )  [inline]
```

Closes the **Topic** (p. 2474).

See also

Topic::close() (p. 1525)

8.18.3.8 get()

```
template<typename T >
Topic< T > dds::topic::AnyTopic::get ( )  [inline]
```

Gets the typed **Topic** (p. 2474) from this **AnyTopic** (p. 825).

Template Parameters

T	The type of the **Topic** (p. 2474) to extract

Returns

The typed **Topic** (p. 2474) that this **AnyTopic** (p. 825) represents

Exceptions

dds::core::InvalidDowncastError *(p. 1620)*	If this **AnyTopic** (p. 825) doesn't represent a Topic<T>.

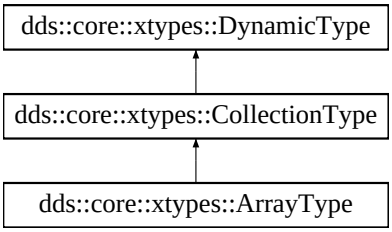
Referenced by **get()**.

8.18.4 Friends And Related Function Documentation

8.18.4.1 get()

```
template<typename T >
Topic< T > get (
            const  AnyTopic & any_topic )  [related]
```

Same as **AnyTopic::get()** (p. 827)



References **get()**.

8.19 dds::core::xtypes::ArrayType Class Reference

<<***value-type***>> *(p. 350)* Represents an IDL array type.

`#include <dds/core/xtypes/CollectionTypes.hpp>`

Inheritance diagram for dds::core::xtypes::ArrayType:

Public Member Functions

- **ArrayType** (const **dds::core::xtypes::DynamicType** &type, uint32_t the_dimension)

  Creates an unidimensional array.
- template<typename IntegerFwdIterator >
  ArrayType (const **dds::core::xtypes::DynamicType** &type, IntegerFwdIterator dimensions_begin, IntegerFwdIterator dimensions_end)

  Creates a multidimensional array.
- **ArrayType** (const **dds::core::xtypes::DynamicType** &type, std::initializer_list< uint32_t > dimensions)

  <<***C++11***>> *(*p. *353) Creates a multidimensional array*

  <<***C++11***>> *(*p. *353) Creates an unidimensional array*
- template<typename IntegerFwdIterator >
  ArrayType (**dds::core::xtypes::DynamicType** &&type, IntegerFwdIterator dimensions_begin, IntegerFwdIterator dimensions_end)

  <<***C++11***>> *(*p. *353) Creates a multidimensional array*
- **ArrayType** (**dds::core::xtypes::DynamicType** &&type, std::initializer_list< uint32_t > dimensions)

  <<***C++11***>> *(*p. *353) Creates a multidimensional array*
- uint32_t **dimension_count** () const

  Returns the number of dimensions.
- uint32_t **dimension** (uint32_t dimension_index) const

  Returns the ith dimension.
- uint32_t **total_element_count** () const

  Returns the sum of all the dimensions.

Additional Inherited Members

8.19.1 Detailed Description

<<***value-type***>> *(*p. *350)* Represents an IDL array type.

8.19.2 Constructor & Destructor Documentation

8.19.2.1 ArrayType() [1/6]

```
dds::core::xtypes::ArrayType::ArrayType (
            const  dds::core::xtypes::DynamicType & type,
            uint32_t the_dimension )  [inline]
```

Creates an unidimensional array.

Parameters

type	The element type
the_dimension	The dimension of this unidimensional array

8.19.2.2 ArrayType() [2/6]

```
template<typename IntegerFwdIterator >
dds::core::xtypes::ArrayType::ArrayType (
            const  dds::core::xtypes::DynamicType & type,
            IntegerFwdIterator dimensions_begin,
            IntegerFwdIterator dimensions_end )  [inline]
```

Creates a multidimensional array.

For example, to create the following IDL array:
```
double x[10][20];
```

We can use this code:
```
std::vector<uint32_t> dim(2);
dim[0] = 10;
dim[1] = 20;
ArrayType my_array(primitive_type<double>(), dim.begin(), dim.end());
```

Parameters

type	The element type
dimensions_begin	The beginning of range of dimensions (uint32_t)
dimensions_end	The end of a range of dimensions (uint32_t)

8.19.2.3 ArrayType() [3/6]

```
dds::core::xtypes::ArrayType::ArrayType (
            const  dds::core::xtypes::DynamicType & type,
            std::initializer_list< uint32_t > dimensions )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a multidimensional array

For example, to create the following IDL array:
```
double x[10][20];
```

We can use this code:
```
ArrayType my_array(primitive_type<double>(), {10, 20});
```

Parameters

type	The element type
dimensions	The dimensions of this array

8.19.2.4 ArrayType() [4/6]

```
dds::core::xtypes::ArrayType::ArrayType (
             dds::core::xtypes::DynamicType && type,
            uint32_t the_dimension )  [inline]
```

<<***C++11***>> *(p. 353)* Creates an unidimensional array

Parameters

type	The element type (to be moved)
the_dimension	The dimension of this unidimensional array

8.19.2.5 ArrayType() [5/6]

```
template<typename IntegerFwdIterator >
dds::core::xtypes::ArrayType::ArrayType (
             dds::core::xtypes::DynamicType && type,
            IntegerFwdIterator dimensions_begin,
            IntegerFwdIterator dimensions_end )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a multidimensional array

Parameters

type	The element type (to be moved)
dimensions_begin	The beginning of range of dimensions (uint32_t)
dimensions_end	The end of a range of dimensions (uint32_t)

8.19.2.6 ArrayType() [6/6]

```
dds::core::xtypes::ArrayType::ArrayType (
             dds::core::xtypes::DynamicType && type,
            std::initializer_list< uint32_t > dimensions )  [inline]
```

<<***C++11***>> *(p. 353)* Creates a multidimensional array

Parameters

type	The element type (to be moved)
dimensions	The dimensions of this array

8.19.3 Member Function Documentation

8.19.3.1 dimension_count()

```
uint32_t dds::core::xtypes::ArrayType::dimension_count ( ) const
```

Returns the number of dimensions.

8.19.3.2 dimension()

```
uint32_t dds::core::xtypes::ArrayType::dimension (
            uint32_t dimension_index ) const
```

Returns the ith dimension.

8.19.3.3 total_element_count()

```
uint32_t dds::core::xtypes::ArrayType::total_element_count ( ) const
```

Returns the sum of all the dimensions.

8.20 rti::core::policy::AsynchronousPublisher Class Reference

<<***extension***>> *(p. 116)* Configures the mechanism to publish data using a separate thread

```
#include <rti/core/policy/CorePolicy.hpp>
```

  Getter (see setter with the same name)

Static Public Member Functions

- static **AsynchronousPublisher Enabled** (bool enable_async_batch=false)

  Returns a policy that enables asynchronous write and optionally asynchronous batch flushing.
- static **AsynchronousPublisher Disabled** ()

  Creates a policy that disables asynchronous writing.

8.20.1 Detailed Description

<<***extension***>> *(p. 116)* Configures the mechanism to publish data using a separate thread

Specifies the asynchronous publishing and asynchronous batch flushing settings of the **dds::pub::Publisher** (p. 1993) instances.

The QoS policy specifies whether asynchronous publishing and asynchronous batch flushing are enabled for the **dds::pub::DataWriter** (p. 1138) entities belonging to this **dds::pub::Publisher** (p. 1993). If so, the publisher will spawn up to two threads, one for asynchronous publishing and one for asynchronous batch flushing.

This policy also configures the settings of the **rti::sub::TopicQuery** (p. 2516) publication thread. The publisher will spawn this thread only if one or more DataWriters enable TopicQueries.

See also

rti::core::policy::Batch (p. 880).

rti::core::policy::PublishMode (p. 2013).

Entity:

dds::pub::Publisher (p. 1993)

Properties:

RxO (p. 514) = N/A

Changeable (p. 514) = **NO** (p. 514)

8.20.2 Usage

You can use this QoS policy to reduce the amount of time your application thread spends sending data.

The asynchronous *publisher* thread is shared by all **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019) **dds::pub::DataWriter** (p. 1138) instances that belong to this publisher and handles their data transmission chores.

The asynchronous *batch flushing* thread is shared by all **dds::pub::DataWriter** (p. 1138) instances with batching enabled that belong to this publisher.

This QoS policy also allows you to adjust the settings of the asynchronous publishing and the asynchronous batch flushing threads. To use different threads for two different **dds::pub::DataWriter** (p. 1138) entities, the instances must belong to different **dds::pub::Publisher** (p. 1993) instances.

A **dds::pub::Publisher** (p. 1993) must have asynchronous publishing enabled for its **dds::pub::DataWriter** (p. 1138) instances to write asynchronously.

A **dds::pub::Publisher** (p. 1993) must have asynchronous batch flushing enabled in order to flush the batches of its **dds::pub::DataWriter** (p. 1138) instances asynchronously. However, no asynchronous batch flushing thread will be started until the first **dds::pub::DataWriter** (p. 1138) instance with batching enabled is created from this **dds::pub::Publisher** (p. 1993).

8.20.3 Constructor & Destructor Documentation

8.20.3.1 AsynchronousPublisher()

```
rti::core::policy::AsynchronousPublisher::AsynchronousPublisher ( )  [inline]
```

Creates the default policy.

8.20.4 Member Function Documentation

8.20.4.1 disable_asynchronous_write() [1/2]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::disable_asynchronous_write (
            bool the_disable_asynchronous_write )
```

[DEPRECATED] (p. **296**) <<***extension***>> *(*p. *116)* Disable asynchronous publishing.

If set to true, any **dds::pub::DataWriter** (p. 1138) created with **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 2019) will fail with **dds::core::InconsistentPolicyError** (p. 1610).

[default] false

Getter (see setter with the same name)

8.20.4.16 Enabled()

```
static AsynchronousPublisher rti::core::policy::AsynchronousPublisher::Enabled (
            bool enable_async_batch = false ) [inline], [static]
```

Returns a policy that enables asynchronous write and optionally asynchronous batch flushing.

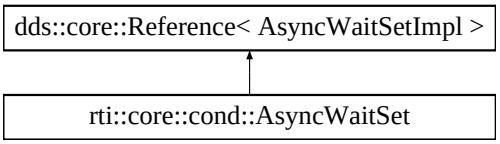
It uses the default thread settings.

For example:

```
using namespace rti::core::policy;
publisher_qos « AsynchronousPublisher::Enabled()
```

8.20.4.17 Disabled()

```
static AsynchronousPublisher rti::core::policy::AsynchronousPublisher::Disabled ( ) [inline],
[static]
```



Creates a policy that disables asynchronous writing.

8.21 rti::core::cond::AsyncWaitSet Class Reference

<<***extension***>> *(p. 354)* Dispatches **dds::core::cond::Condition** (p. 948) objects using separate threads of execution. Unlike a normal **dds::core::cond::WaitSet** (p. 2617), which operates on the current thread, an **AsyncWaitSet** (p. 840) uses a thread pool.

```
#include <rti/core/cond/AsyncWaitSet.hpp>
```

  *Retrieves the list of attached **dds::core::cond::Condition** (p. 948) (s).*

8.21.1 Detailed Description

<<***extension***>> *(p. 354)* Dispatches **dds::core::cond::Condition** (p. 948) objects using separate threads of execution. Unlike a normal **dds::core::cond::WaitSet** (p. 2617), which operates on the current thread, an **AsyncWaitSet** (p. 840) uses a thread pool.

rti::core::cond::AsyncWaitSet (p. 840) provides a proactive model to process application events through **dds::core↩ ::cond::Condition** (p. 948) objects. **rti::core::cond::AsyncWaitSet** (p. 840) owns a pool of threads to asynchronously wait for the attached **dds::core::cond::Condition** (p. 948) objects to trigger and dispatch them upon wakeup. The asynchronous behavior is the main key different with regards to the **dds::core::cond::WaitSet** (p. 2617).

The class diagram and its collaborators is shown below:

8.21.2 AsyncWaitSet Thread Orchestration

rti::core::cond::AsyncWaitSet (p. 840) internally applies a leader-follower pattern for the orchestration of the thread pool. Once a **rti::core::cond::AsyncWaitSet** (p. 840) starts, it will create the thread pool of `M` threads from which only one thread will become the Leader thread, and remaining threads will become the Followers, where:

- The `Leader` thread is the one waiting for the attached **dds::core::cond::Condition** (p. 948) to trigger. Remaining threads in the pool, if any, are either idle awaiting to become the leader or busy while processing active **dds::core::cond::Condition** (p. 948).
- Upon wait wakeup, the `Leader` thread resigns its leader status to become a `Processor` thread and dispatch the next active **dds::core::cond::Condition** (p. 948) through the **dds::core::cond::Condition::dispatch** (p. 949) operation.
- One of the `Follower` threads wakes up and becomes the new leader to resume the wait for **dds::core::cond↩ ::Condition** (p. 948).

"Thread orchestration in a rti::core::cond::AsyncWaitSet"

This behavior implies the following considerations:

- Only one thread a time can wait for the attached **dds::core::cond::Condition** (p. 948) objects to trigger. From a pool of `M` threads, only one is the leader, `P` are processing active **dds::core::cond::Condition** (p. 948), and `F` are idle followers.
- A thread can dispatch only one active **dds::core::cond::Condition** (p. 948) at a time.
- **rti::core::cond::AsyncWaitSet** (p. 840) efficiently distributes threads to dispatch **dds::core::cond::Condition** (p. 948) objects on demand. This avoids underutilizing a thread if **dds::core::cond::Condition** (p. 948) objects do not trigger or trigger unfrequently.
- At a given time, all the threads in the pool could be in processing state. In this situation, the **rti::core::cond::↩ AsyncWaitSet** (p. 840) is not able to wait for more **dds::core::cond::Condition** (p. 948) objects until one thread becomes the leader.

rti::core::cond::AsyncWaitSet (p. 840) has a built-in dispatcher that guarantees fairness and avoids starvation of **dds::core::cond::Condition** (p. 948) objects. By applying a round-robin distribution policy, each attached and active **dds::core::cond::Condition** (p. 948) is dispatched within a finite period of time, assuming the **functor handler** (p. 2134) always return control after the **dds::core::cond::Condition::dispatch** (p. 949) operation.

8.21.3 AsyncWaitSet Thread Safety

A key aspect of the **rti::core::cond::AsyncWaitSet** (p. 840) is the thread safety. **rti::core::cond::AsyncWaitSet** (p. 840) interface is thread safe, so you can concurrently call any operation on the **rti::core::cond::AsyncWaitSet** (p. 840) object from multiple threads in your application.

Furthermore, **rti::core::cond::AsyncWaitSet** (p. 840) also safely interacts with its own thread pool. Internally, the **rti::core::cond::AsyncWaitSet** (p. 840) applies the asynchronous completion token pattern to perform activities that involve synchronization with the thread pool.

For instance to detach a **dds::core::cond::Condition** (p. 948), the **rti::core::cond::AsyncWaitSet** (p. 840) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token.

Note

The asynchronous completion token behavior only takes place if the **rti::core::cond::AsyncWaitSet** (p. 840) is started. Otherwise the internal request will be directly executed by the calling thread.

For a finer control on this behavior, each **rti::core::cond::AsyncWaitSet** (p. 840) operation where this applies comes in two flavors:

- `Default:` the operation hides all the details of the completion token and returns after the operation completes. Operations of this kind internally use an implicit **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853). The **rti::core::cond::AsyncWaitSet** (p. 840) creates and reuses **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) objects as needed. This is the recommended flavor unless your application has special resource needs.
- `With completion token:` An overloaded version of the default one that also receives an **rti::core::cond↩ ::AsyncWaitSetCompletionToken** (p. 853) object on which you can wait on at any time for the actual operation to complete. This flavor is available to assist applications with resource constraints and that want more control on the interaction with the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 840).

8.21.3.1 Condition Locking

rti::core::cond::AsyncWaitSet (p. 840) incorporates a safety mechanism that prevents calling **dds::core::cond::↩ Condition::dispatch** (p. 949) concurrently. **rti::core::cond::AsyncWaitSet** (p. 840) locks the **dds::core::cond::↩ Condition** (p. 948) while a processor thread is dispatching it so no other thread within the pool can dispatch it again.

This mechanism ensures not only unexpected concurrent dispatch of a **dds::core::cond::Condition** (p. 948) but also spurious thread activity. Because it is responsibility of your application to reset the Condition trigger, there is a period of time in which the dispatched condition may remain active, causing the **rti::core::cond::AsyncWaitSet** (p. 840) to enter in a continous immediate wakeup from the wait. This behavior typically leads to thread hogging and high CPU usage.

Nevertheless, your application may still want to receive concurrent and controlled dispatch notifications. **rti::core↩ ::cond::AsyncWaitSet** (p. 840) will still allows you to unlock a **dds::core::cond::Condition** (p. 948) so any other available thread can dispatch the same condition concurrently while preventing the above mentioned problems. You can achive this by calling **rti::core::cond::AsyncWaitSet::unlock_condition** (p. 852) on the Condition being dispatched within the dispatch callback. Note that the **AsyncWaitSet** (p. 840) locks a Condition each time it dispatches it. Hence you need to unlock the Condition each time you want to enable a concurrent dispatch.

8.21.4 AsyncWaitSet Events and Resources

Besides **dds::core::cond::Condition** (p. 948) processing, you can listen to other kind of internal events related to the **rti::core::cond::AsyncWaitSet** (p. 840) and its thread pool by means of the **rti::core::cond::AsyncWaitSetListener** (p. 856).

rti::core::cond::AsyncWaitSet (p. 840) exposes operations to start and stop the asynchronous wait, which involves the creation and deletion of the thread pool respectively.

rti::core::cond::AsyncWaitSet (p. 840) relies on thread-specific storage to provide the described functionality. Each application thread that calls an operation on a **rti::core::cond::AsyncWaitSet** (p. 840) will generate resources that will be associated with such thread. You can free these resources upon thread termination by calling DomainParticipant↩ Factory::unregister_thread.

MT Safety:

Safe.

8.21.5 Constructor & Destructor Documentation

8.21.5.1 AsyncWaitSet() [1/3]

```
rti::core::cond::AsyncWaitSet::AsyncWaitSet ( )  [inline]
```

Constructor without arguments that create an **rti::core::cond::AsyncWaitSet** (p. 840) with default property.

See also

rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty() (p. 859)

8.21.5.2 AsyncWaitSet() [2/3]

```
rti::core::cond::AsyncWaitSet::AsyncWaitSet (
            const  AsyncWaitSetProperty & the_property )  [inline]
```

Single-argument constructor that allows creating a a **rti::core::cond::AsyncWaitSet** (p. 840) with custom behavior.

You can provide **rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty()** (p. 859) as `property` to create an **rti::core::cond::AsyncWaitSet** (p. 840) with default behavior.

The **rti::core::cond::AsyncWaitSet** (p. 840) is created with no listener installed.

Parameters

the_property	<<***in***>> *(p. 355)* configuration **rti::core::cond::AsyncWaitSetProperty** (p. 858)

8.21.5.3 AsyncWaitSet() [3/3]

```
rti::core::cond::AsyncWaitSet::AsyncWaitSet (
            const  AsyncWaitSetProperty & the_property,
             AsyncWaitSetListener * listener )  [inline]
```

Constructor that allows specifying a **rti::core::cond::AsyncWaitSetListener** (p. 856).

Creates a new **rti::core::cond::AsyncWaitSet** (p. 840) with the specified property **rti::core::cond::AsyncWaitSet↩ Property** (p. 858) and **rti::core::cond::AsyncWaitSetListener** (p. 856).

Parameters

the_property	<<***in***>> *(p. 355)* configuration **rti::core::cond::AsyncWaitSetProperty** (p. 858)
listener	<<***in***>> *(p. 355)* the **rti::core::cond::AsyncWaitSetListener** (p. 856). Cannot be NULL.

8.21.6 Member Function Documentation

8.21.6.1 start() [1/2]

```
void rti::core::cond::AsyncWaitSet::start ( )  [inline]
```

Initiates the asynchronous wait on this **rti::core::cond::AsyncWaitSet** (p. 840).

This operation blocks until the start request completes. Upon successful return, it is guaranteed that this **rti::core↩ ::cond::AsyncWaitSet** (p. 840) has initiated the asynchronous wait and dispatch.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken) (p. 845)

rti::core::cond::AsyncWaitSet::stop (p. 846)

8.21.6.2 start() [2/2]

```
void rti::core::cond::AsyncWaitSet::start (
            AsyncWaitSetCompletionToken completion_token )  [inline]
```

Initiates the asynchronous wait on this **rti::core::cond::AsyncWaitSet** (p. 840).

If this operation succeeds, a start request has been scheduled and your application can use the provided `completion_token` to wait for this **rti::core::cond::AsyncWaitSet** (p. 840) to process the request. If the **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) operation returns successfully, it is guranteed that the thread pool has been created and the leader thread is waiting for the attached **dds::core::cond::Condition** (p. 948) to trigger.

Once this **rti::core::cond::AsyncWaitSet** (p. 840) is started, attached **dds::core::cond::Condition** (p. 948) will be dispatched through the **dds::core::cond::Condition::dispatch** (p. 949) operation when they trigger.

The start procedure causes the **rti::core::cond::AsyncWaitSet** (p. 840) to spawn all the threads within the thread pool, which involves the underlying operating system to allocate the associated thread stack and context for each thread. If a **rti::core::cond::AsyncWaitSetListener** (p. 856) is installed, this **rti::core::cond::AsyncWaitSet** (p. 840) will sequentially invoke the **rti::core::cond::AsyncWaitSetListener::on_thread_spawned** (p. 857) once per spwaned thread.

A **rti::core::cond::AsyncWaitSet** (p. 840) can be restarted after a stop. If this **rti::core::cond::AsyncWaitSet** (p. 840) is already started, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

completion_token	<<***inout***>> *(p. 355)* a valid **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) instance that can be used by your application to wait for the start request to complete. You can provide the special sentinel **rti::core::cond::AsyncWaitSetCompletionToken::Ignore()** (p. 508).

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::cond::AsyncWaitSet::start (p. 845)

rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken) (p. 845)

dds::core::cond::WaitSet::wait (p. 2621)

8.21.6.3 stop() [1/2]

```
void rti::core::cond::AsyncWaitSet::stop ( )  [inline]
```

Initiates the stop procedure on this **rti::core::cond::AsyncWaitSet** (p. 840) that will stop the asynchronous wait.

This operation will block until the stop request completes. Upon successful return, it is guaranteed that this **rti::core::cond::AsyncWaitSet** (p. 840) stopped the asynchronous wait and dispatch.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken) (p. 845)

rti::core::cond::AsyncWaitSet::stop (p. 846)

8.21.6.4 stop() [2/2]

```
void rti::core::cond::AsyncWaitSet::stop (
            AsyncWaitSetCompletionToken completion_token )  [inline]
```

Initiates the stop procedure on this **rti::core::cond::AsyncWaitSet** (p. 840) that will stop the asynchronous wait.

If this operation succeeds, a stop request has been scheduled and your application can use the provided `completion_token` to wait for this **rti::core::cond::AsyncWaitSet** (p. 840) to process the request. If the **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) operation returns successfully, it is guranteed that the thread pool has been deleted and this **rti::core::cond::AsyncWaitSet** (p. 840) no longer process any of the attached **dds::core::cond::Condition** (p. 948) objects.

Once this **rti::core::cond::AsyncWaitSet** (p. 840) is stopped, the **dds::core::cond::Condition::dispatch** (p. 949) will no longer be called on any of the attached **dds::core::cond::Condition** (p. 948), no matter what their trigger value is.

The stop procedure causes the **rti::core::cond::AsyncWaitSet** (p. 840) to delete all the threads within the thread pool, which involves the underlying operating system to release the associated thread stack and context of each thread. If a **rti::core::cond::AsyncWaitSetListener** (p. 856) is installed, this **rti::core::cond::AsyncWaitSet** (p. 840) will sequentially invoke the **rti::core::cond::AsyncWaitSetListener::on_thread_deleted** (p. 857) once per deleted thread.

If this **rti::core::cond::AsyncWaitSet** (p. 840) is already stopped, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

completion_token	<<***inout***>> *(p. 355)* a valid **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) instance that can be used by your application to wait for the stop request to complete. You can provide the special sentinel **rti::core::cond::AsyncWaitSetCompletionToken::Ignore()** (p. 508).

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::cond::AsyncWaitSet::stop (p. 846)

rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken) (p. 845)

8.21.6.5 attach_condition() [1/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::attach_condition (
            dds::core::cond::Condition condition ) [inline]
```

Attaches the specified **dds::core::cond::Condition** (p. 948) to this **rti::core::cond::AsyncWaitSet** (p. 840).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **dds::core::cond::Condition** (p. 948) is attached.

If the same **dds::core::cond::Condition** (p. 948) is attached multiple times, only the first attachment has any effect. Subsequent attempts to attach the same **dds::core::cond::Condition** (p. 948) are silently ignored. As a result, the **dds::core::cond::Condition** (p. 948) is only considered attached once and must only be detached once.

Parameters

condition	<<***in***>> *(p. 355)* **dds::core::cond::Condition** (p. 948) to be attached.

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::cond::AsyncWaitSet::attach_condition(dds::core::cond::Condition, AsyncWaitSetCompletion↩ Token) (p. 848)

8.21.6.6 attach_condition() [2/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::attach_condition (
            dds::core::cond::Condition condition,
            AsyncWaitSetCompletionToken completion_token ) [inline]
```

Attaches the specified **dds::core::cond::Condition** (p. 948) to this **rti::core::cond::AsyncWaitSet** (p. 840).

If this operation succeeds, an attach request has been scheduled and your application can use the output parameter `completion_token` to wait for this **rti::core::cond::AsyncWaitSet** (p. 840) to process the request. **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) operation returns successfully, it is guaranteed that the **dds::core::cond::Condition** (p. 948) is attached to this **rti::core::cond::AsyncWaitSet** (p. 840).

Once the **dds::core::cond::Condition** (p. 948) is attached, its trigger value may cause the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 840) to wake up call the **dds::core::cond::Condition::dispatch** (p. 949) operation.

dds::core::cond::Condition (p. 948) may be attached at any time independently of the state of the **rti::core::cond::AsyncWaitSet** (p. 840).

Parameters

condition	*<<**in**>> (p. 355)* **dds::core::cond::Condition** (p. 948) to be attached.
completion_token	*<<**inout**>> (p. 355)* a valid **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) instance that can be used by your application to wait for the attach request to complete. You can provide the special sentinel **rti::core::cond::AsyncWaitSetCompletionToken::Ignore()** (p. 508).

Exceptions

One	of the **Standard Exceptions** (p. 428)

See also

rti::core::cond::AsyncWaitSetCompletionToken::wait (p. 855)

8.21.6.7 detach_condition() [1/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::detach_condition (
            dds::core::cond::Condition condition ) [inline]
```

Deaches the specified **dds::core::cond::Condition** (p. 948) from this **rti::core::cond::AsyncWaitSet** (p. 840).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **dds::core::cond::Condition** (p. 948) is detached.

Parameters

condition	*<<**in**>> (p. 355)* **dds::core::cond::Condition** (p. 948) to be detached.

Exceptions

One	of the **Standard Exceptions** (p. 428)

rti::core::cond::AsyncWaitSet::detach_condition(dds::core::cond::Condition, AsyncWaitSetCompletion↩ Token) (p. 850)

8.21.6.8 detach_condition() [2/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::detach_condition (
            dds::core::cond::Condition condition,
            AsyncWaitSetCompletionToken completion_token )  [inline]
```

Detaches the specified **dds::core::cond::Condition** (p. 948) from this **rti::core::cond::AsyncWaitSet** (p. 840).

If this operation succeeds, a detach request has been scheduled and your application can use the provided `completion_token` to wait for this **rti::core::cond::AsyncWaitSet** (p. 840) to process the request. If the **rti↩ ::core::cond::AsyncWaitSetCompletionToken::wait** (p. 855) operation returns successfully, it is guaranteed that the **dds::core::cond::Condition** (p. 948) is detached from this **rti::core::cond::AsyncWaitSet** (p. 840).

Once the **dds::core::cond::Condition** (p. 948) is detached, it is guaranteed that the **rti::core::cond::AsyncWaitSet** (p. 840) will no longer process it so it is safe for your application to release any resources associated with the detached **dds::core::cond::Condition** (p. 948).

dds::core::cond::Condition (p. 948) may be detached at any time independently of the state of the **rti::core::cond↩ ::AsyncWaitSet** (p. 840).

If the same **dds::core::cond::Condition** (p. 948) had been previously attached multiple times, only a single detach is required; the **dds::core::cond::Condition** (p. 948) is considered attached only once.

Parameters

condition	*<<**in**>> (p. 355)* **dds::core::cond::Condition** (p. 948) to be detached.
completion_token	*<<**inout**>> (p. 355)* a valid **rti::core::cond::AsyncWaitSetCompletionToken** (p. 853) instance that can be used by your application to wait for the detach request to complete. You can provide the special sentinel **rti::core::cond::AsyncWaitSetCompletionToken::Ignore()** (p. 508).

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.21.6.9 operator+=()

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::operator+= (
            dds::core::cond::Condition condition ) [inline]
```

Attaches the specified **dds::core::cond::Condition** (p. 948) to this **rti::core::cond::AsyncWaitSet** (p. 840).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **dds::core::cond::Condition** (p. 948) is attached.

If the same **dds::core::cond::Condition** (p. 948) is attached multiple times, only the first attachment has any effect. Subsequent attempts to attach the same **dds::core::cond::Condition** (p. 948) are silently ignored. As a result, the **dds::core::cond::Condition** (p. 948) is only considered attached once and must only be detached once.

Parameters

condition	<<***in***>> *(p. 355)* **dds::core::cond::Condition** (p. 948) to be attached.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.21.6.10 operator-=()

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::operator-= (
            dds::core::cond::Condition condition ) [inline]
```

Deaches the specified **dds::core::cond::Condition** (p. 948) from this **rti::core::cond::AsyncWaitSet** (p. 840).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **dds::core::cond::Condition** (p. 948) is detached.

Parameters

condition	<<***in***>> *(*p. *355)* **dds::core::cond::Condition** (p. 948) to be detached.

Exceptions

One	of the **Standard Exceptions** (p. 428)

8.21.6.11 unlock_condition()

```
void rti::core::cond::AsyncWaitSet::unlock_condition (
            dds::core::cond::Condition condition )  [inline]
```

Allows the **dds::core::cond::Condition** (p. 948) under dispatch to be available for concurrent dispatch from another thread from the pool.
